PREFACE.

NEITHER American nor English literature has hitherto possessed a Cyclopædia of Political Science and Political Economy. The want of a work of reference on these important branches of knowledge has long been felt, especially by lawyers, journalists, members of our state and national legislatures, and the large and intelligent class of capitalists and business men who give serious thought to the political and social questions of the day. The present work, which will be completed in three volumes, is the first to supply that want. It is also the first Political History of the United States in encyclopædic form—the first to which the reader can refer for an account of the important events or facts in our political history, as he would to a dictionary for the precise meaning of a word. The French, the Germans and even the Italians are richer in works of reference on political science and political economy than the Americans or the English. The Germans have Rotteck and Welcker's *Staatslexikon*, and Bluntschli and Brater's *Staatswörterbuch*; the French, Block's *Dictionnaire Général de la Politique*, and the celebrated *Dictionnaire de l'Economie Politique*, edited by Guillaumin and Coquelin.

The "Cyclopædia of Political Science, Political Economy, and of the Political History of the United States" is intended to be to the American and English reader what the above-named works are to French and German students of political science and political economy. The articles by foreigners in our work are largely translations from the *Dictionnaire de l'Economie Politique*, the *Dictionnaire Général de la Politique*, the *Staatswörterbuch*, and original articles by Mr. T. E. Cliffe Leslie, the eminent English economist; while the American articles are by the best American and Canadian writers on political economy and political science. The task of writing the articles on the political history of the United States was confided to one person, Mr. Alexander Johnston, of Norwalk, Connecticut, thoroughness, conciseness and the absence of repetition and of redundancy being thus secured.

It has been our aim to produce a work covering ground not covered by other cyclopædias. Hence, the biographies of American statesmen are made purposely very short, ours not being a biographical dictionary. The biographies in question are intended mainly to supplement the articles on the political history of the United States; just as our Cyclopædia itself is intended as a supplement to every other cyclopædia in the English language. It is, in fact, a *special* Cyclopædia, and bears the same relation to other cyclopædias that, for instance, a cyclopædia of law, medicine or engineering does. Great care has been taken in the articles from the French and German to preserve the exact meaning of the writer. In no instance has any liberty been taken with the thought of a contributor. The editor has not sought to harmonize the ideas of so many writers, and yet in very few instances will the opinions of one writer be found in direct conflict with those of another. The same subject is, in some cases, treated by two writers,

but from a somewhat different point of view, under titles almost identical; and in these cases the difference of title serves merely for convenience of reference.

A little familiarity with the work will satisfy the reader that the articles from French and German writers are as applicable in the United States as in France and Germany. There is no more a French or German or American political economy or political science than there is a German or French or American science of astronomy or chemistry. It would have been well, some may think, if all the articles had been supplied by American writers. No one, however, can regret that those not written by Americans are from the pens of the most eminent European writers, men like T. E. Cliffe Leslie, J. C. Bluntschli, Brater, Bastiat, Barthélemy Saint-Hilaire, Baudrillart, Chevalier, Clément, Coquelin, Coquerel, Finali, Joseph Garnier, Guizot, v. Holtzendorff, Horn, Paul Janet, Laboulaye, v. Mangoldt, de Molinari, de Quatrefages, Remusat, Roscher, J. B. Say, Léon Say, Jules Simon, Thiers, Wolowski, Wagner and Wirth. The fact that every article is signed by the writer of it, and that each writer is an authority on the subject on which he writes, gives to the work a value which it would not otherwise possess. This feature is, we feel confident, one which the reader will appreciate.

In no country in the world is the necessity of the study of political science and political economy greater than in the United States, in which every citizen is, directly or indirectly—through the medium of his vote—a legislator; and yet, in no great country, perhaps, has the study of politics as a science been so utterly neglected. Our experience as a people during the last decade has demonstrated how very important it is to lay before the great body of readers reliable works to which they may refer, when occasion requires, for the principles by which all great national questions are solved. The people of the United States for the past ten years, to go no farther back in their history, have been, so to speak, one great debating club, discussing such questions as the resumption of specie payments, contraction of the currency, inflation of the currency, money, paper money, the nature and cure of commercial depressions, the demonetization of silver, banks, savings banks, bi-metallism, the relations of capital and labor, the right of employment, socialism, communism, strikes, railroad policy, civil service, civil service reform, etc., etc. The thinking portion of the people have eagerly devoured whatever they could find on these topics.

Other questions equally important are springing up every year, both in the national and state legislatures, questions relating to interest, the hours of labor, taxation, temperance, etc. These and kindred questions are, or may very easily become, questions of practical politics, or of political economy as applied to politics. In the present work these and similar subjects can be found discussed, from the standpoint of the statesman and legislator, by the best minds of the age, each under its proper title and in alphabetical order.

We think that the time at which our work appears is peculiarly opportune, for never before was the attention of the American people turned to questions of political science and political economy, more than now.

The publishers and editor desire to thank the contributors to this work for the readiness with which they accepted the invitation to write for its pages; and the unselfish interest they have one and all manifested in its success. Our acknowledgments, however, are due in a special manner to Mr. Horace White, of New York; to Mr. A. R. Spofford, Librarian of Congress; to Mr. Edward Atkinson, of Boston; to Mr. John Jay Knox, Comptroller of the Currency, and to Mr. Max. Eberhardt, of Chicago.

CYCLOPÆDIA

OF

POLITICAL SCIENCE, POLITICAL ECONOMY,

AND OF THE

POLITICAL HISTORY OF THE UNITED STATES.

ABDICATION.

ABDICATION, the renunciation of sovereign, monarchical or imperial power. It would seem natural that a prince, weary of the burdens and even of the pleasures of government, should have the right to lay down his crown and end his days in the repose of private life. It seems just as natural that he should have the right to leave the throne, of his own free will, when military reverses, the disaffection of his people, or other causes, render his abdication useful or necessary to the general well-being of the state. History gives us an account of many abdications, some of which are still fresh in the minds of men. These important acts, if not always accomplished with the consent of the nation affected by them, have been generally considered an exercise of right on the part of sovereigns. Many publicists, however, have thought proper to justify them, by advancing reasons which, in most cases, are weak enough. There are authors, on the other hand, who have denied to princes the right of abdication, but, with few exceptions, it has been denied only by the opponents of kingly power. Their chief objections may be summed up as follows: 1. According to natural law, a king has not the right to abdicate, because he has not the right to reign. In other words: We deny that a prince has the right to reign; therefore he has no right to abdicate. A thing or a right is not wiped out simply because it pleases me to assert that neither the one nor the other exists. We see nothing in natural law (by which we mean law conformable to human nature) opposed to monarchy. We even find arguments somewhat in favor of this form of government. Besides, we might ask: Where is your code of natural law? who drew it up? who has accepted it? where is it in force? 2. Constitutional kings can reign only with the

formal consent of the nation, or its representatives, there being here a question of a mutual agreement which can be dissolved only with the consent of both parties. To this it may be answered that this consent would never be wanting, since the nation has every interest not to retain on the throne a prince who has weighty reasons for wanting to leave it. We find this argument altogether out of place in the mouths of men or from the pens of writers who maintain that a nation has always the right to set aside a king. What in this case becomes of the mutual agreement? How prohibit one party doing what the other claims a right to do? 3. From the point of view of divine right, abdication is unlawful, for the reason that the prince having been invested with supreme power by an act not of his own volition, can not, of his own motion, divest himself of that power. Various arguments may be used to refute this objection, which, be it remarked, does not come from the legitimist side. But if the refutation is to have full force, we must remain at the divine-right point of view. All that follows from investiture by divine right is that the nation can not dethrone its prince legally. But if monarchy is a divine institution, it follows that it is the monarch's duty to leave nothing undone to accomplish his mission, even to disappearing from the scene when it seems to him that the public interest demands that sacrifice from him. These are the chief objections brought forward against the right of abdication. In England the right of abdication is denied to the king, but it does not appear whether in the name of the constitution or of divine right. We simply find the following axiom: "The king of England may not abdicate except with the consent of parliament." When we ask why he may not,

the only answer we get is, that an abdication made at his sole instance would be inconsistent with the nature of the royal function. This is assertion, not argument. Should an English king abdicate, what would be the consequence? We have no doubt that parliament would take cognizance of the fact and sanction it as perfectly conformable to natural law. We here give a list of the abdications most remarkable for their causes, their results, or the name of the sovereign who laid down his crown. Among the Roman emperors, Diocletian and Maximianus put aside the purple in 305. In France it suffices to mention Napoleon I. (1814 and 1815), Charles X. (1830), and Louis Philippe (1848). In Germany Charles V. exchanged the imperial and royal crowns for the habit of a monk (1556). In 1848 the emperor of Austria preferred his ease to the struggles with which the events of that time threatened him. Successors of Charles V. in Spain abdicated for several reasons, Philip V. in 1724 and Charles IV. in 1808. The dynasty of Savoy affords more numerous examples of abdication: Amadeus, in 1494; Victor Amadeus, in 1750; Charles Emmanuel, in 1802; Victor Emmanuel I., in 1819; Charles Albert, in 1849. In Poland we find, since the abdication of the prince who afterwards became Henry III. of France, that of Augustus. in 1707; Augustus Stanislas, in 1735; and Poniatowski, in 1795. All are familiar with the abdication of Queen Christina of Sweden, in 1654. That of Richard II. of England (1399), is not so well remembered. As to James II., he did not formally abdicate, but the English parliament declared, in 1688, that he "having endeavored to subvert the constitution of the kingdom by breaking the original contract between king and people; and, by the advice of Jesuits and other wicked persons, having violated the fundamental laws, and having withdrawn himself out of the kingdom, has abdicated the government, and that the throne is thereby vacant." There was, in this case, a lively discussion as to whether the word "desert" or "abdicate" should be used. To sum up, we may mention the abdication of King Louis of Holland in 1810, of Louis of Bavaria in 1848, of the Hohenzollern Princes in favor of Prussia in 1849, and of the Duke of Saxe Altenburg in favor of his brother in 1849. Abdication is performed generally by a solemn act, and almost always in favor of the natural heir; but it is not always voluntary, and history shows us that it is often followed by regret. (See RESIGNATION.)

MAURICE BLOCK.

ABOLITION AND ABOLITIONISTS (in U. S. HISTORY). I. GRADUAL ABOLITION (1776-1830). At the beginning of our national history abolition was a desire rather than a purpose, a matter of sentiment rather than of endeavor. In this sense every humane and thinking man, north or south, was an abolitionist. It would be waste of space to quote the words of Washington, Jefferson, Madison, Henry, Mason, Laurens, and

other southerners, in order to show the drift of feeling in the south on this subject. All concurred in deploring the existence of slavery in their section, and in hoping that in some way not yet imagined its gradual and peaceful abolition would finally be accomplished. In the north the feeling was the same, except that the Quakers, or Society of Friends, had, since 1760, taken higher ground, and had made slave-holding and slave-trading matter for church discipline. In 1777 Vermont, not yet admitted to the Union, formed a state constitution abolishing slavery. State constitutions were formed by Massachusetts, including Maine, in 1780, and by New Hampshire in 1783, which the courts at once construed as abolishing slavery. Gradual abolition was secured by statute in Pennsylvania in 1780, in Rhode Island and Connecticut in 1784, in New York in 1799, and in New Jersey in 1804. Abolition of slavery in the Northwest territory, north of the Ohio and east of the Mississippi, including the present states of Ohio, Illinois, Indiana, Michigan, Wisconsin, and part of Minnesota, was secured by the ordinance of 1787. Here the process of abolition ceased for a long time, except that in 1817 New York totally abolished slavery after July 4, 1827, and that slavery in part of the Louisiana purchase, including the present states of Iowa, Oregon, Kansas, Nebraska, a part of Colorado, and part of Minnesota, was abolished by the Missouri compromise (see COMPROMISES, IV, V), whose validity was rejected by the supreme court (see DRED SCOTT CASE); but the provision for abolition was embedded in the state constitutions of the states named as they were severally admitted. In process of time gradual abolition took effect in the states which had adopted it by statute, but so slowly that there were, in 1840, 674 slaves in New Jersey, 331 in Illinois, 64 in Pennsylvania, and from 1 to 17 in Connecticut, Indiana, Iowa, New Hampshire, New York, Ohio, Rhode Island and Wisconsin, respectively. In 1850 slavery had disappeared in all these states except New Jersey, which still had 236 slaves in 1850 and 18 in 1860, the latter number being "apprentices for life," under the state act of April 18, 1846. In 1831-32 the insurrection of Nat Turner excited a strong desire for gradual abolition in Virginia, which was with great difficulty smothered after a three weeks' debate in the legislature.—**ABOLITION SOCIETIES**, based on the idea of gradual abolition, were formed in Pennsylvania in 1774, in New York in 1785, in Rhode Island in 1786, in Maryland in 1789, in Connecticut in 1790, in Virginia in 1791, and in New Jersey in 1792. These societies held annual conventions, and their operations were viewed by the more humane slave-holders with some favor, since they aimed at nothing practical or troublesome, except petitions to congress, and served as a moral palliative to the continuance of the practice. The abolition of the African slave-trade by Great Britain in 1807, and by the United States in 1808, came as a great relief to the aboli-

tion societies, which had grown discouraged by the evident impossibility of effecting anything in the south, and were now ready to accept this success as the limit of possibility for the present. Their annual national meetings became more infrequent and soon ceased altogether, though some state branches remained alive.—**COLONIZATION SOCIETY.** In 1801 Jefferson and Governor James Monroe, of Virginia, had considerable correspondence on the subject of colonizing free blacks out of the country. In the autumn of 1816 a society for this purpose was organized in Princeton, N. J. Dec. 23, 1816, by resolution, the Virginia legislature commended the matter to the attention of the general government, and a few days afterwards the society was reorganized at Washington as the "National Colonization Society," its president being Bushrod Washington, and its organ, "The African Repository." Its expressed object was to encourage emancipation by procuring a place outside of the United States, preferably in Africa, to which free negroes could be aided in emigrating. Its indirect object was to rid the south of the free black population, which had already become a nuisance. Its branches spread into almost every state, and for fourteen years its organization was warmly furthered by every philanthropist in the south as well as in the north. Henry Clay, Charles Carroll and James Madison, in the south, were as hearty colonizationists as Bishop Hopkins, Rufus King, President Harrison and Dr. Channing, in the north. And it is noteworthy that, although the society made no real attack on slavery, as an institution, nearly every person noted after 1831 as an abolitionist was before that year a colonizationist. Benjamin Lundy's travels through North America were for the purpose of finding a location for a free black colony in Texas or elsewhere in Mexico. James G. Birney was for some time the society's agent and superintendent for Alabama and Tennessee. Gerrit Smith, the Tappans, and many others, began their career as colonizationists and ended it as abolitionists.—**LIBERIA.** At first free negroes were sent to the British colony of Sierra Leone. In 1820 the society tried and became dissatisfied with Sherbrooke Island, and Dec. 15, 1821, a permanent location was purchased at Cape Mesurado. In 1847 the colony declared itself an independent republic under the name of Liberia, its capital being Monrovia.—**II. IMMEDIATE ABOLITION (1830-60).** In 1829-30 William Lloyd Garrison, a Massachusetts printer, engaged with Lundy in publishing "The Genius of Universal Emancipation," at Baltimore, flung a fire-brand into the powder magazine so long covered by the decorous labors of colonization and gradual abolition societies. He insisted on *immediate* abolition, meaning thereby not instant abolition so much as the use of every means at all times toward abolition without regard to the wishes of slave-owners. The effects were almost immediately apparent. Abolition, with

its new elements of effort and intention, was no longer a doctrine to be quietly and benignantly discussed by slave-owners, and from 1830 the name of abolitionist took a new and aggressive significance. Garrison's first efforts were directed against the colonization society. Jan. 1, 1831, he began publishing "The Liberator," in Boston, and through its pages converted so many colonizationists, that the "New England Anti-Slavery Society," founded on "immediate" abolition, was formed Jan. 1, 1832. In 1833 Garrison visited England, and secured from Wilberforce, Zachary Macaulay, Daniel O'Connell, and other English abolitionists, a condemnation of the colonization society. In December, 1833, the "American Anti-Slavery Society" was formed in Philadelphia by an abolition convention, Beriah Green being president, and Lewis Tappan and John G. Whittier, secretaries. From this time the question became of national importance. Able and earnest men, such as Theodore D. Weld, Samuel J. May, and Wendell Phillips, traversed the northern states as the agents of the national society, founding state branches and lecturing everywhere on abolition. The consequent indignation in the south found a response in the north with many who saw that the south would never willingly accept "immediate" abolition, and that the continuance of the abolition agitation would involve sectional conflict, and perhaps a convulsion which would destroy the Union. Abetted or tacitly countenanced by this class, a more ignorant and violent class at once began to break up abolition meetings by mob violence. In Connecticut, in 1833, Miss Prudence Crandall, of Canterbury, Windham county, opened her school to negro girls. The legislature, by act of May 24, 1833, forbade such schools, and Miss Crandall was imprisoned under the act. As this was ineffectual, she was ostracized by her neighbors, and finally, by arson and violence, her school was broken up. In the autumn of 1834 George Thompson, who had been instrumental in securing British emancipation in the West Indies, came to Boston, and for a year lectured throughout the north. He was denounced as a paid agent of the British government for the destruction of the Union, was mobbed, and finally escaped from Boston in disguise, in November, 1835. For some years abolition riots were epidemic throughout the north. Nov. 7, 1837, Elijah P. Lovejoy, a Presbyterian minister, who had established an abolition newspaper in Alton, Ill., was mobbed and shot to death. May 17, 1838, in Philadelphia, Pennsylvania Hall, an abolitionist building, dedicated three days before, was burned by a mob. Abolition riots then became only sporadic, but never ceased entirely until 1861.—In the south the import of the single word "immediate" was instantly perceived. By unofficial bodies rewards were offered for the capture of prominent abolitionists, a suspension of commercial intercourse with the north was threatened, and northern legislatures were called

upon to put down abolition meetings by statute. Southern grand juries indicted several abolitionists, and, when the accused naturally declined to appear for trial, their extradition as "fugitives from justice" was demanded by the state governor, but without success. The anti-slavery society had been quick to take advantage of the United States mails as an easy and secure means of introducing its publications into the south, where the society's private agents would have had short shrift. Remonstrances were at once sent to the postmaster general against this use of the mails, and he, while he regretted his official inability to interfere, gave southern postmasters a strong hint that they would do well to settle the difficulty by rejecting abolitionist publications from the mails. President Jackson, in his message of Dec. 2, 1835, requested congress to pass a law forbidding the circulation of abolitionist publications in the mails. A bill to this effect was introduced in the senate, carried just far enough to compel Van Buren, a candidate for the presidency, to take open ground in its favor, and then lost. In its stead, the care of abolition documents was left, with excellent success, to the states and the postmasters.—Congress, in accepting the District of Columbia, had re-enacted the whole body of Virginia and Maryland law, and thus left slavery in full existence; but few persons seem to have denied the power of congress to abolish slavery in the District at will. From February, 1833, a vast number of petitions were introduced, praying congress to abolish slavery in the District, and, after 1836, to abolish the "gag rules" by which the house had resolved to lay all such petitions on the table without consideration. (See ADAMS, J. Q.; PETITION.)—The Garrisonian abolitionists were, from the first, the radical wing. They believed in no union with slave-holders; they declared the constitution "a league with death and a covenant with hell," on account of its slavery compromises, and for this reason refused to vote, hold office or recognize the government; they attacked the churches freely and angrily, for sympathy with slavery; they made the public speaking of female members a prominent part of their work; and woman's rights, free love, community of property, and every novel social theory, found among them the first and most sympathetic audience. Many who would willingly have joined in opposition to slavery, were repelled by dread of the odium, theological and social, consequent upon a public identification with Garrisonian license of thought, speech and action; and a large and growing element in the American anti-slavery society felt that its influence was thus impaired. In 1838 the annual report of the society made the suggestion that abolitionist candidates for office should be nominated and supported. On this convenient rock the society split into two parts in the following year. The political abolitionists, including Birney, the Tappans, Gerrit Smith, Whittier,

Judge Jay, Edward Beecher, Thomas Morris, and others, seceded and left the original society name and organization to the Garrisonians, who at once became, in the opinion of the seceders, "a woman's rights, non-government, anti-slavery society." In 1840 the seceders organized the "American and Foreign Anti-Slavery Society," and under this name prosecuted their work with more success than the original society of irreconcilables.—THE LIBERTY PARTY. Nov. 13, 1839, a convention of abolitionists met at Warsaw, N. Y., and incidentally nominated James G. Birney for president, and Francis J. Lemoyne, of Pennsylvania, for vice-president. Birney had been a slave-holder in Kentucky and Alabama, and was now corresponding secretary of the national society. These nominations were confirmed by a national convention at Albany, April 1, 1840, mainly composed of New York delegates, which adopted the name of the "liberty party." The nominees declined the nomination, but received 7,059 votes in the presidential election of 1840, ranging from 42 in Rhode Island to 2,798 in New York. Liberty party tickets were now put forth in various local elections, and the political abolitionists went into training for the election of 1844. Aug. 30, 1844, the liberty party's national convention met at Buffalo. Clay had made public, Aug. 16, a temporizing letter to the effect that he "would be glad to see" Texas annexed at some future day. (See ANNEXATIONS, III.) His letter cut off the slight previous possibility that the Buffalo convention might be induced to refrain from nominations. Birney and Thomas Morris, of Ohio, were nominated, and an active canvass was begun, quite as much against Clay as against Polk. In the presidential election of 1844, Birney and Morris received 62,300 votes, all in northern states, ranging from 107 in Rhode Island to 15,812 in New York. Had the Buffalo convention refrained from nominations this vote would have gone to Clay; at the least, it could not have gone to Polk. Clay would thus have had a popular majority in the Union, and the electoral votes of Michigan and New York would have gone to him instead of to Polk, giving Clay 146 and Polk 129 electoral votes. The liberty party's first appearance in national politics had therefore resulted in the election of Polk, the annexation of Texas, and the addition of a vast amount of slave soil to the United States. But it seems also to have convinced the thinking abolitionists that a union of the northern voters in favor of abolition, pure and simple, was, as yet, impossible. Slavery restriction, the exclusion of slavery from the territories lately acquired from Mexico, offered a more promising field, and the abolitionists, therefore, in the next two presidential elections voted the ticket of the free-soil party. In 1856 and subsequent years, they followed the fortunes of the republican party, which was also based on slavery restriction, but they always retained a semi-detached organization, acting

rather as auxiliaries than as an integral portion of the republican party.—**UNDERGROUND RAILROAD.** During the period 1850–60 the most active exertions of the abolitionists were centred in assisting fugitive slaves to reach places of safety in Canada. (See **FUGITIVE SLAVE LAWS.**) From the border of the slave states to Canada, chains of communication were formed by persons living about a day's journey apart. These were constantly engaged in secreting runaways, providing them with outfits and passing them on to the next post, or in bringing back intelligence of those who had already escaped. In addition to these duties, committees in the larger cities were busied in providing for the rescue, by law or by force, of captured slaves from the hands of the officers. The whole organization was commonly known as the "Underground Railroad."—**III. FINAL ABOLITION (1840–65).** The secession of a number of southern states in 1860–61, and the establishment of a *de facto* government in the south, was welcome to the extreme abolitionists, who rejoiced to be rid of the slave-holders and of political union with them. But the first shock of actual warfare brought to the surface an intense determination throughout the north and west that secession should not be allowed to become an accomplished fact. The ensuing war (see **REBELLION**) was begun in the spirit of the congressional resolution of July, 1861, that the war "was not prosecuted with the purpose of interfering with the established institutions of the southern states." But the southern leaders had not taken into account the fact that their system of slavery offered a fair mark for confiscation by an enemy which they could in no way retaliate. This species of warfare was early begun by the federal government. The act of Aug. 6, 1861, forfeited all claim, by the master, to the services of slaves employed in arms or labor against the government. This was not strictly a confiscation, but only a bar to proof of ownership. No blow at slavery, as an institution, was intended, and when proclamations abolishing slavery were issued by Gen. J. C. Fremont, in Missouri, Aug. 30, 1861, and by Gen. David Hunter, in South Carolina, May 9, 1862, they were promptly disavowed by the president. But the next session of congress, 1861–62, saw a more decidedly anti-slavery feeling. An additional article of war, March 13, 1862, prohibited the army from returning fugitive slaves; various other acts were passed to hinder the rendition of fugitive slaves in the northern states; slavery in the territories (see **WILMOT PROVISION**) was abolished, June 19; and the act of July 17 freed the captured, deserted or fugitive slaves of all persons engaged in rebellion, and authorized the employment of negro soldiers. The fugitive slave laws were not finally abolished until June 28, 1864. In all these provisions no invasion of slavery as a state institution was made; all were meant as blows at the tender spot of the confederacy.—The president's own wish was at first for

compensated emancipation, and, in accordance with his special message of March 6, a joint resolution of April 10, 1862, declared that the United States ought to co-operate with any state which should adopt gradual "abolishment" of slavery, by paying the state for the slaves emancipated. The act of April 16, 1862, abolished slavery in the District of Columbia on this principle; but the border states were deaf to the repeated entreaties of the president up to the close of the session of congress in July. In September the president, yielding to the growing anti-slavery feeling in the north, issued his preliminary proclamation, followed, Jan. 1, 1863, by the emancipation proclamation. But this, by its terms, did not affect the slaves in loyal states, or within the federal lines, nor did it affect the principle of slavery even in the rebellious states. Had the war ended without further action against slavery, every slave in the rebellious states would, indeed, have been a free man, but there would have been no bar to the immediate importation of fresh supplies of slaves from the states where slavery had not been abolished.—In his message of Dec. 1, 1862, the president again brought up his favorite project. He now recommended the adoption of three amendments to the constitution, providing (1) for the issue of bonds to compensate states which should abolish slavery before 1900; (2) for the validation of the emancipation proclamation and kindred measures; and (3) for colonizing free negroes out of the country. Bills to compensate Missouri and Maryland for abolishing slavery were introduced, by members from those states early in 1863, and received favorable votes in both houses; but the shortness of the session prevented their final passage. In West Virginia, by constitutional amendment adopted March 26, 1862, gradual emancipation after July 4, 1863, was secured. In Missouri the state convention, which had originally been called to consider an ordinance of secession, was reconvened, and passed, June 24, 1863, an ordinance of emancipation, taking effect gradually after July 4, 1870. Congress, by act of Feb. 24, 1864, emancipated negro soldiers, a compensation of \$300 for each being paid to loyal owners, and by act of March 3, 1865, emancipation was extended to the wives and children of such soldiers. This measure closed the record of attempts at gradual, partial or compensated abolition of slavery.—Oct. 12–13, 1864, Maryland adopted a new constitution whose 23d article finally abolished slavery in the state. Ordinances of immediate emancipation, without submission to popular vote, were passed Feb. 13, 1864, by a convention of delegates from those portions of Virginia within the federal lines, and, Jan. 11, 1865, by a new state convention in Missouri. A recapitulation of all these partial assaults on slavery will make it apparent that, after Jan. 11, 1865, slavery had a legal existence only in the states of Kentucky and Delaware, if the action of Maryland, secured by soldiers' votes, and of irreg-

ular conventions in Virginia, Tennessee, Louisiana and Arkansas were valid. To resolve all doubts, and give the corpse of slavery a legal burial, a constitutional amendment in 1865 (see CONSTITUTION, IV.) was passed and ratified, by which slavery and involuntary servitude, except for crime, was abolished within the United States. The same year saw the cessation of the publication of "The Liberator," and the dissolution of the American anti-slavery society. The work of both had been done, and done mainly, after all, by the "political" abolitionists. By yielding the impossible point of present abolition in the States, and joining with the republicans in the demand for the restriction of slavery to state limits, they had aided in bringing on a conflict of a slaveholding section against the federal Union. In such a conflict it was inevitable that every blow at rebellion should rebound upon slavery. Had the conflict been postponed until the north and west could have been united in the ultra Garrisonian object of a crusade against slavery, it would not have come until the population and destructive power of both sections had grown so large that the peaceable formation of two or more nationalities on this continent would have been imperatively demanded by humanity. ALEX. JOHNSTON.

ABSENTEEISM, an expression which has arisen out of the discussions on the miserable condition of the Irish people, and which, as its derivation shows, denotes the habitual absence of the landed proprietors of a country from their estates. From such absenteeism has naturally sprung a

system of farming out these estates to intermediaries, which has proved in its consequences of ever increasing injury to the tenant. These absentee Irish proprietors grant long leases of their estates to rich English capitalists, who sublet at a profit to other speculators, commonly known as middlemen, and these latter, dealing directly with the tenants, sublet for short terms, and contrive, by the minutest possible subdivisions, so to increase the number of bidders as to obtain for each holding the highest rental possible. Besides the effect of this feudal system of rack-rents in impoverishing the tenant to the last degree, the bulk of the rentals so accruing is annually exported without any return in exchange. No portion of such rentals is ever applied to the introduction of improved methods of agriculture, nor even to the development of either the manufacturing industries or the commercial enterprises of Ireland, as would naturally be the case were these proprietors themselves residents. It is unquestionable, then, that absenteeism is one of the causes of the wretched condition of Ireland.—The politico-economical effects of absenteeism are everywhere the same, and are more marked in Ireland only because more general there than elsewhere. All export of capital or of income, without any counter-balancing return, is hurtful to the country from which such capital is withdrawn, and beneficial to that to which it is exported; it takes from the one for the use of the other, the means for the maintenance of labor, for the improvement of the natural capacities of the soil, and for the accumulation of wealth; and these results are in exact proportion to the magnitude of the sums exported. Among the causes provocative of absenteeism may be cited a corrupt administration of public affairs, or too burdensome taxation. These and like causes have determined many English families to seek homes in other countries. They thus escape a taxation which in England is very great upon all articles of consumption, and hence the government, to obtain the same amount of revenue, has no alternative but to impose upon the resident classes those taxes which the non-residents escape. Of all the factors which determine this emigration of capital, the most powerful is the feeling of insecurity. The political turmoils which at times so greatly unsettled the state of continental Europe, drove many families of wealth to seek a refuge in England, although the cost of living is greater there than anywhere else.

AMBROISE CLÉMENT.

ABSOLUTE POWER. The opinion that absolute power is essential to the state, is very prevalent among statesmen and publicists. They disagree, however, as to who should be invested with this absolute power, the executive or the people; but they agree in the opinion that it should be lodged somewhere. Without absolute power, they say, there is no peace, no unity in the state, no authority which is either final or supreme. Absolute power and sovereignty are sometimes

called synonymous. There are whole families of nations, with which a high respect for absolute power seems to be a natural tendency, which submit to it willingly and without reserve. It is not simply the lower races of negroes which have submitted to an absolute ruler. The Mongolian race and the superior Semitic peoples even, favored an absolute form of government. And though the noblest nations, the Aryan, did not willingly submit to this form of government, and were jealous of it, they still have shown similar tendencies, both in theory and practice. The democratic Greeks sought the most perfect political freedom in an absolute government of the people. The aristocratic Romans, the first in the science of law, adhered, in the principles underlying their private and public laws, and by way of national preference, to the idea of absolute power. Individuals of great energy and superior intellect, when at the head of the government, are most apt to be provoked to resistance by any limit imposed to their universal authority, and seek to justify their action whenever they overstep the limit imposed, by an appeal to the necessity of absolute power. Instances of a leaning toward absolute power are, therefore, frequently met with in the history of modern European states, and were the causes provocative of a great many political events. And it is not always bad men who incline toward absolutism.—What is the meaning of absolute power? Absolute, in the full sense of the word, means freedom from all limitation. Really, there is nothing absolute but what is without beginning and end; a beginning and an end are limitations. The truly absolute, therefore, can be predicated only of a being unlimited and infinite, that is, only of God. Hence, absolute power, in the real sense of the word, can be conceived only as divine omnipotence. Absolute law is the law of God.—All human law, on the other hand, is necessarily limited, because its condition precedent, what it supposes, man, is a limited being. Absolute power can not be attributed to man, because the limits of human nature render it impossible to attribute such power to him.—In this extreme sense men have but seldom understood absolute power, and hardly ever claimed it. They understood and claimed this power in that extreme sense only when they regarded their ruler in the light of a divine being. A great many rulers of antiquity were worshipped as gods, and many of them may have felt themselves gods. Wherever polytheism prevailed, the people took little umbrage at this deification of man. And even where polytheism did not prevail, a people inclined to pantheism might worship certain heroes and princes as a temporary incarnation of the Deity. Even in our day such ideas have not totally disappeared. But as far as the more civilized nations and European nations are concerned, we need not fear that they will thus mistake the eternal God for man. The fiction of human omnipotence is, in our opinion, too ludicrous to serve as the basis of any political right. We

know, indeed, that possessors of power, be they king or people, have a broader vision and exercise greater power than private persons, since they can command the services of many. But we know too well that the perception of those in power is subject to the limits of human vision; that there are some things it can not reach, and that they are subject in all their action to the same limitations as other men, and can neither change God's creation in any essential particular, nor even create the smallest organic being.—All human law or rights, and consequently the absolute power which man can claim, is necessarily limited:

(a) *By the divine law.* Since man, as a creature, supposes the Creator, and always depends on God, he must recognize the divine law as superior to him, and as conditioning human law. The divine law is really absolute, because it proceeds from the absolute Spirit and is infinite. Man can not even think of the divine law as non-existing; still less can he break its power. Whether he will or not, he remains subject to the great law of nature, and to the law of the divine guidance of the world. He can not do away with the order of the world any more than with the elements, nor withdraw himself from the irresistible power of time.

(b) *By the limited physical nature of man,* from which human law, because it pertains to the visible, earthly order of things, can not be separated. These limits may be disregarded in individual cases, but they can not be removed nor argued away. When, therefore, as in recent times, it is claimed that absolute power is necessary, those who approve it seek to introduce it into the state in a covert manner, and to moderate it by the recognition of the above limits. They admit that absolute law or right is not of human origin, and they give it a divine source. God, according to this view, has invested man with the right of absolute rule for the purpose of securing and maintaining social order, and has raised human rulers to the dignity of his representatives and plenipotentiaries. To this extent, therefore, they claim that man may properly exercise absolute power. This view is a dangerous one in this age, because it mixes the true and the false so adroitly that it may easily mislead the unthinking. While maintaining an appearance of reverence for God, who alone possesses absolute power, it seeks to secure to the sovereign the most unlimited power possible. It protests against human assumption, and still would reap the fruits of that assumption. It will not allow a ruler to make himself a god, but puts him in the place of God, and encourages him to entertain the strange delusion that his thoughts and actions are under divine control, in a manner different from the thoughts and actions of other men. It derives the absolute power of man from God, and, with due humility, recognizes the dependence of man on his Maker, while it encourages, in the mind of the ruler, the insolent idea that he only exercises the power possessed by God before He delegated it to him. In the actual exercise of his powers the sovereign is thus raised

to a level with the Deity, infinitely above the rest of mankind who are certainly his equals and not his creatures. The errors of this view are therefore essentially the same as if divine power were ascribed to man. Man can have rights and exercise power only within the limits of his nature.—To the extent that God confides the exercise of divine right to man, He, by confiding it to him, confides it to a being with all the limitations of human nature, and hence the right so confided is changed from one absolute and divine into one human and limited. If this be not admitted, the human ruler arrogates to himself a power which can be but a source of evil to him, for the reason that it is not in human nature to exercise such power. By giving his limited freedom the dimensions of divine power, he becomes the plaything of his own caprices; and the person who knows how to influence these, has the ruler under his control.—Absolute power, as thus defined, is most frequently advocated in Europe by absolutist parties, and there is a close relationship between such absolutism and these parties. Yet this idea of absolutism is not peculiar to absolutists, nor is it held by all absolutists. Neither is the political character of absolutism fully described by this definition.—But the term *absolute power* is frequently used to express limited power wielded by man. We call those forms of government absolute in which the sovereign is the sole source, representative and dispenser of power—though that power may be limited in its nature—and not obliged to secure, by virtue of a constitutional provision, the co-operation and consent of others to his measures (especially of legislative bodies, ministers and counselors), nor limited in the exercise of his power by the rights—those of a political nature at least—of others. It is evident that of such absolute power there are different grades. In proportion as the recognized limitations of absolute power are increased, the absolutism of that power itself diminishes. It is admitted that this power is political in its nature, and hence is subject to the same limitations as the state itself. And just here we notice, with increasing civilization and the growing maturity of the human race, a deeper insight into the natural limitations of the state, its functions and its laws, an insight which has in no way weakened the power of the state. To the limitations already noticed we may add the following: (1) The limitation, unknown to the Romans, which is represented by the Church, whose religious authority is independent of the state, and which is freely recognized as an independent institution by all civilized governments. (2) The limitation of international law, which sees to it that the different states may co-exist side by side—a limitation the extent of which increases in proportion to the increasing solidarity of mankind. (3) Private law, which defines the rights of individuals, of the family, and of corporations, and which, though it is the duty of the government to regulate and protect it, is not in its nature the product of the will of the state, and whose changes

are determined by the freedom of private individuals. (4) By the special nature and history of the people living in a state, and of the country they control. There have been, and still are, states in which, though all these limitations were recognized, absolute power was claimed for the central organ of government. And such was the case, not in absolute monarchies only, but also in absolute aristocracies and in absolute democracies. It can not be said that this idea of absolute power is so monstrous as the idea of absolute power spoken of in the first place above. A peaceful observance and a just administration of the law are reconcilable with the present idea of absolute power. The sovereign is not imagined to be a god or a fetic; he may be conscious of his own human nature and its limitations, and have an honest intention of faithfully discharging his duties to God and his fellow-men.—We are obliged to admit, indeed, that in certain cases such a close concentration of all the powers of government in the hands of one man may be needful, and hence justifiable. Nations of inferior races need the absolute rule of a superior prince, or of nobler races, in order to enjoy life in peace, or to attain a higher grade of civilization. Such inferior races frequently have neither the desire nor the means of limiting the power of their rulers. Most of the Asiatic and African nations, and those in the northeast of Europe, are subject to this sort of absolute governmental power, and the doctrinarian introduction of constitutional limitations would render their condition worse rather than improve it.—But to the more masculine and energetic people of a higher type, among whom there is also an aristocratic element, and among whom even the lower classes have a sense of justice and honor, the absolute form of government is, as a rule, unsuitable and intolerable. They can not bear the thought that all political rights accorded them are simply the gifts of royal grace. Having a knowledge of their own moral worth, and of the fact that they contribute to the welfare and share the fortunes of the state to which they belong, they can not understand why they should have political duties without also having political rights. And although they admit that the sovereign is entitled to share the highest prerogatives, and such a degree of political power as the unity of the state requires, they do not admit that the sovereign should enjoy all rights, and that the rest of the body politic should have none. They know that in an organism every one of its members, be it ever so inferior, has a significance of its own, and hence certain rights; and that, though the head may control the hands and feet, its control is limited by the power inherent in the latter, and that its rule over them can not, therefore, be absolute.—The humane state, in harmony with what is noblest in human nature—the civilized state—though it requires an efficient central power, has no tendency toward absolute, that is, unlimited, political power, as against which the political

rights of others count for nothing, and which is not controlled by some sort of limitation. It is only in exceptional cases, in times of great public danger, that the government seeks its own protection in the temporary exercise of absolute power. Threatened by the military force of a foreign enemy, or greatly agitated by party struggles,—exhausted and alarmed by outbursts of revolutionary passion,—nations even by whom freedom is highly prized may demand that protection which none but a dictator can give. When, in times of great need, the concentration of all public power in the hands of one man to save the nation becomes necessary, and when the confidence of the people in some great prince or soldier from whom help is expected is such as to remove all objections which can rightly be raised against a dictatorship, masculine nations grant absolute power to one man or else approve it, even when that one man assumes that power of his own motion. But the danger over, public order and peace re-established, the people again claim the free exercise of their political rights and privileges. The rule, therefore, in relation to civilized states is: Nowhere in the state should there be absolute power, while all power exercised should be regulated by law and defined by constitutional limitations. The exception to this rule is: In cases of actual necessity and great public danger, the sovereign power of the government, in answer to that necessity, may become absolute.—Whenever, in modern times, nations have shown a tendency toward absolute power, it was either because they believed it to be necessary for the removal of obsolete institutions, or for the promotion of freedom and reform; or because the people, in their struggle for a liberal system of government, yielded to the despotism of their terrorizing leaders, or because they were compelled to seek, for the time being, the protection of a dictator, to re-establish public order, or to defend the government against domestic or foreign enemies. In such cases the principle of constitutional freedom and the public order were the object of the struggle. Absolute power was used as a means to these ends, or suffered by the people to gain new strength for the work of progress and reform. Absolute power was nowhere the ideal people desired to see realized. Whenever it has been sought to be permanently established, the attempt has been, among the civilized nations of our age, unsuccessful. The character of our age demands an efficient and energetic government, but at the same time insists that its powers shall be limited, and exercised with moderation. The people of our age are not willing to submit to absolute power beyond the actual necessities of the case. A government which tries to secure absolute power for any purpose other than the maintenance of public order and a free exercise of its organic functions, is at war with the spirit of the age, and thereby endangers its own existence.

MAX EBERHART, Tr.

J. C. BLUNTSCHLI.

ABSOLUTISM.¹ This word is generally used to describe a form of government in which the head of the state wields power without any regular control, and without any limits imposed to his power by political institutions. Absolutism is found outside of monarchies, as in an aristocracy, a democratic legislature with a single house, or an assembly of the people in a very small state, where the majority unite in themselves all power. These are all examples of absolutism. As a rule, however, when absolutism is mentioned we have almost always a monarchy in view. A distinction is made between absolutism and despotism in this, that an absolute monarch may be naturally well disposed and inclined to remain within the bounds of law, or what is relatively legal, while the despot respects no law, and acts according to his caprice without regard to the interests of the people. There may be partisans of absolutism, but who would confess to any indulgence for despotism?—If we seek for arguments in favor of absolute monarchy, we can find scarcely anything more solid than sentiment, and a certain distortion of sentiment called mysticism. To speak of a divine gift of paternal authority is mysticism. Who in our day is not convinced that government exists for the good of the nation, and that men were not created that a king may have numerous servants and dependents? If, however, mysticism sometimes favors absolutism, there are other feelings which are shocked at the thought of having a master, and it is these feelings that constitute the dignity of human nature.—The only rational argument in favor of this form of government is found in the political immaturity or backwardness of certain nations. It is said that barbarous people need a strong hand to restrain them; but why should a barbarous or semi-civilized nation need a stronger government than a people altogether savage, who frequently recognize no authority at all? There is no logical necessity here. Should it happen to a barbarous people to fall into the hands of a man of genius, a monarch in advance of his subjects, of course a great advantage would result; they would be urged forward with vigor and intelligence in the path of progress. This, however, would be but chance, a happy accident, and would furnish no argument in favor of the system. What nation with even a pretense to civilization cares to be called barbarian?—Let us now see if absolute power is really exercised anywhere in political life. It seems to us that it is not. We find checks and limits to the human will on every side, and the most powerful of these checks comes from the will of others. Sometimes these restraints are evident; again they are occult, and are felt only instinctively; but they always exist.—According to the degree of civiliz-

¹ The articles **ABSOLUTE POWER**, by Bluntschli, and **ABSOLUTISM**, by Block, cover the same ground, to a great extent; but there are valuable ideas in each not to be found in the other. Therefore, it has been thought best to use both, with the names given them by their authors respectively.—Ed.

ation of a state, power, unrestricted by law, is limited in various ways. On the one hand, by manners, customs and traditions; on the other, by religion; still again, by the fear of revolt or the vengeance of the injured. In the most enlightened countries, public opinion exercises, at times, an influence which can not be gainsaid. It is so difficult to rise above: "What will they say?"—Thus far we have discussed absolute power in the hands of a monarch, but it may also be exercised by collective governing bodies, either aristocratic or democratic.—When absolute power is the attribute of an aristocracy, it becomes odious sooner than in any other form of government. First of all, because it enters more quickly into the period of abuse, and because, if in an absolute monarchy the sovereign with his favorites and devoted servants may commit much wrong, they can not do so much in this direction as aristocratic families with their hangers-on and partisans. It is often the case that these dominant families are descended from conquerors belonging to another nationality and a different religion, that they are distinguished by the color of their skin or other external marks. In this case, these families have, on the one hand, a greater tendency to abuse their power and become tyrants, and on the other, the subject populations are less inclined to give them credit even for the good they receive from their government. An aristocracy as a collective body is less influenced by the restraints which limit the excesses of absolute monarchs; they fear the loss of power less.—In a democracy, absolute power seems to be the just and natural attribute of government. Is not this government the result of election? Does it not perfectly represent the will of the nation? Is it not theoretically, at least, responsible to the nation?—Still, absolute power is, in every case, too weighty a burden to be easily borne by men. While a despot may allow the reins of power to drop from his feeble hands to see them picked up by some favorite, a representative assembly may often be led into excess by even a generous sentiment, and thereby still further increase the burden on its shoulders. Absolute power in democratic governments is not altogether rational except when the government is elected unanimously. In that case each man would be the subject of his own will or of the power which he himself created. In practice, this never takes place, for majorities govern and often oppress minorities. They oppress them with the less scruple since they are the majority and have the letter of the law on their side.—The question may be put whether the nation itself has absolute power over one of its own members. The assertion, pure and simple, of such a principle would seem revolting in our day, although eminent men have upheld a doctrine which favors this view. To admit the absolute power of a nation is to justify religious persecution, slavery, and many other horrors with which humanity has stained its annals.—From deduction to deduction we have

come implicitly to the question whether laws can command absolute obedience. We shall not give a definite answer to this question here, for we are not writing a treatise on casuistry. We have not to seek for the special cases in which a nation uses or abuses its power, nor in what cases the abuse should be submitted to and suffered. We shall say, simply, that we owe some sacrifice to society in exchange for the benefits which we receive from it. But the measure of the sacrifice must be found by each man in his own conscience. (See DESPOTISM, TYRANNY.)

MAURICE BLOCK.

ABSTENTION. This word was formerly employed in the civil law, and was synonymous with renunciation of the right of inheritance. It is now used only in a political sense, and means the renunciation of the exercise of one's rights.—Abstention is resorted to by political parties in a minority. These parties, sometimes, seeing that their efforts to bring about the triumph of their views are fruitless, feel loath to allow their adversaries to witness their defeat. Sometimes they propose to protest against oppression, real or imaginary. At such times they think that by voting they recognize the rightfulness of the act or of the government which they oppose.—Abstention is likewise resorted to in cases arising from a conflict of duties, feelings or interests.—We would call attention only to the case in which persons abstain from voting through neglect. An abstention so causeless and even so culpable can not be justified.—Can abstention by a political party be justified? We think not. In the first place, it is a species of self-annulment, a kind of political suicide, which can no more be excused than the act of taking one's own life. Besides, by retiring from the field, a party loses the chance of gaining an advantage by a sudden change in public opinion. By taking a part in political movements, by mingling with his fellow-citizens at election times, and by presenting himself as a candidate for their votes, a man may expect to propagate his political views with more or less success, and to exercise some influence on the destiny of his country. One owes his country not only his blood, but his self-devotion and his talent.—To the orator who remains silent, we might say: If you had spoken, we should perhaps have yielded to your arguments. You have no right to question the intelligence, the loyalty and the patriotism of your fellow-citizens, even when they profess opinions opposed to your own. What right have you to consider yourself infallible? Are you very sure that our reply would not have convinced you of your error, and converted you to our way of thinking?—We might remind those who practice abstention—which generally happens in special cases—on account of a conflict of duties or interests, of the law of Solon, which provided that every citizen should decide in favor of one or other of the parties of the country, because abstention often prolongs in-

testine struggles. Besides, it is seldom that after sifting things to the bottom, we do not find that one or other of these duties or interests should prevail. Under these circumstances, the failure to come to a decision is an evidence of intellectual indolence.—In conflicts of feeling or sentiment, if patriotism is at stake, there can be no doubt as to which side one should take. Did Brutus hesitate between patriotism and paternal love? A private citizen may hesitate; a public man, never: *noblesse oblige*.—It is apparent that we do not approve abstention in any case, and we seldom see cases in which it can be excused. Sometimes we are forced to look upon it as a weakness, and for weakness there can be only pity.

MAURICE BLOCK.

ABUSES IN POLITICS. Abuses are a consequence of human weakness. No form of government, no organization can prevent them altogether. The more ignorant a people, the more frequent abuses are. If, instead of being supposed to know the law, every man really knew it, he would vindicate his rights and obtain justice, in the majority of cases. The fear of having a complaint entered by the injured party would of itself prevent many abuses. Unfortunately there is a certain amount of inertia in us all, which prevents the seeking of reparation, whenever the damage done us is not very great. Sometimes, it is true, we are inspired by a laudable feeling of forbearance when the question is one of fact, and that an isolated one; but when it is a question of principle or of precedent, it is the duty of every man to defend his own rights as well as the rights of those who are injured in his person. BLOCK.

ABYSSINIA, an extensive country of eastern Africa, in the upper valley of the Nile. It is bounded on the north by Nubia; on the east by Adel, and by a narrow belt of Arab coast land washed by the Red sea; on the south and southwest by almost unexplored regions; and on the west by lands which are little known to us, and inhabited by negro tribes. Its length from north to south may be 540 geographical miles; its breadth from east to west is about the same as its length. Approximately its area is equal to, if not larger than, that of France. The population is supposed to be nearly 4,500,000.—Taken as a whole, Abyssinia is a great mountainous plateau which rises to a height of 8,000 feet or more above the level of the Red sea and the extensive plains of Adel. On the north and west, the plateau slopes toward the plains of Athara; on the southwest it inclines toward the valley of the Bahr-el-Azrek or Blue river; on the south it extends in the direction of Kafa and Enarea, countries as yet but little known. Its surface, which is very uneven, presents a succession of plains of different elevations, of abrupt mountains and deep valleys. In the south there is a great depression containing a large lake known by the two names of Tzana and Dembéa. About its middle the plateau is cut in two, from west to

east, by a broad fissure or furrow more than 2,000 feet deep, through which flow the tumultuous waters of the river Takkazze, one of the two great rivers of the Abyssinian plateau. The other river is the Abai, which in Nubia is called the Bahr-el-Azrek or Blue river. This cut between the north and the south of Abyssinia, establishes a natural division which, at different periods, was considered as a political line of demarkation, and which to a certain extent may also be called an ethnographical boundary. North of the Takkazze and as far as the sea-board the country is called Tigré. On the south it is called Amhara, of which Shoa, which was formerly an independent kingdom, is now a subdivision. The capital of Tigré was formerly Axoun. It is now Adowa. The capital of Amhara is Gondar; it is the residence of the emperors of Abyssinia. Ankober is the capital of Shoa. There are about 7,000 or 8,000 inhabitants in Ankober, and the same number in Adowa. Gondar may have twice that number.—The Abyssinians divide their country into three natural parts: first the *kolla* or lower plains, then the *déza* or uplands, and the *ouinadéga* or intermediary provinces. The lowlands, which are naturally the warmer, produce nearly all the vegetables and fruit trees grown in tropical countries, such as cotton, indigo, the gum tree, the ebony tree, the sugar-cane, the date tree, bananas, the coffee tree, etc. The lands in the middle part of the country have a temperature which may be likened to that of lower Italy and of the south of Spain. They readily produce most of the cereals, fruits and vegetables found in the temperate and the southern parts of Europe.—With the exception of the gold washings in the extreme western and southwestern sections, the mineral wealth of Abyssinia, or the greater part of it, is still locked up in the recesses of the earth. Small squares of salt constitute the currency of the country. This salt comes mostly from the lagoons lying between the northeast top of the plateau and the beach of the Red sea.—The inhabitants belong to several distinct races. The Semitic element, the immigration of which dates back to an unknown period, spread particularly over the Tigré country. Its language is called the *Giz*. This region was colonized by the Greeks who came to Egypt during the reign of Ptolemy Euergetes. The so-called Ethiopian race is also spread over the Tigré; but it predominates almost exclusively in Amhara and the rest of the country. It presents striking points of resemblance to the Galla tribes in the southwest of Abyssinia, a remnant of the Berber nation which possessed northern Africa in ancient times, and whose origin has been so much mooted. Abyssinian society has adopted some of the manners and customs of civilized nations, while in other respects it still retains the barbaric usages of African tribes. The Abyssinians are Christians of the Greek rite. The Gallas are Mussulmans.—In Abyssinia there are three remnants of civilization. The first was contemporaneous with ancient

Egypt, and was attributed by Herodotus to the Ethiopians. The Jews revived it. The Abyssinian dynasty is said to date back to Menilek, the son of Solomon and the legendary queen of Sheba. His descendants, it is related, reigned without interruption down to the eleventh century after Christ, when they were expelled by other Jewish kings who had not, like the descendants of Menilek, embraced Christianity. They were reinstated three centuries later. Their last descendant was living in 1840. The second civilization, introduced by the Greek kings of Axoum and by Christian missionaries of the fourth century, partook of the Greek and Egyptian character. The use of the Greek language became pretty general, at least among the higher classes. It was used in public inscriptions either alone or together with the Giz.—In Abyssinia Christianity has neither hastened nor followed the progress of civilization. Like other countries subject to Greek empire, and still more on account of its remoteness, Abyssinia was left isolated, by the Mussulmans, from European civilization. Of the laws of Europe it has preserved only a few fragments of the Theodosian code.—Abyssinian Christians are monophysites; in other words, they believe that there is only one nature in Jesus Christ. One of their confessions of faith is peculiarly Nestorian, like the confessions of nearly all the Christian churches in Asia. A Portuguese expedition overran Abyssinia in the sixteenth century, after which the Jesuits came and made three hundred thousand proselytes; but persecution soon blotted out every vestige of Catholicism in Abyssinia.—The Abyssinian, like every other monarchy, has had its changes and its revolutions. Sometimes it extended its authority over the entire territory, and often it had to contend against independent chiefs. Subdivision of the country and a state of anarchy, favored by local circumstances and the difference of origin of the population, have been frequent during the last century and a half. Tigré and Shoa recognized, it is true, the nominal supremacy of the king or emperor, who resided at Goudar, in Amhara, but in reality they were independent of him. The emperor, or the *Alé*, had been gradually stripped of his authority by the *Ras*, a sort of mayor of the palace. But the *Ras* had to contend for the mastery over each province, with feudal chiefs, the most powerful among whom assumed the title of king (*négous*). Oubié rose to power in 1840. He had conquered nearly all Abyssinia, when he was defeated and killed by Kassa. The latter took the name of Theodore, and proclaimed himself the restorer of the ancient Abyssinian power. His intelligence seemed to be equal to his pretensions; but subsequently he lost much of his force of character in the exercise of his authority which was menaced, and in the struggle in which he imprudently engaged with England.—In 1861, Négousieh, a relative of Oubié, proclaimed himself *négous* of Tigré. In Europe, Négousieh was thought to favor French

influence in Abyssinia; while Theodore was looked upon as a friend of the English. Négousieh was vanquished and cruelly put to death by his rival. The triumph of the latter was considered, in Europe, the success of English policy, and England was supposed to entertain plans of colonization in Abyssinia.—Suddenly the news was brought to England that king Theodore had imprisoned Mr. Cameron, the British consul, at Massowah, a small Arab town situated on the coast beyond the limits of Abyssinia. The consul had wished to negotiate a commercial treaty between Theodore and the English government, as Lefèvre had endeavored to do between Oubié and France, in 1840. Theodore had consented to the treaty, and had even sent a communication to the queen of England, not, as some have said, to offer her his hand in marriage, but to propose an alliance between England and Abyssinia (1863). Mr. Cameron was intrusted to carry the dispatch to England, but he brought back no answer. Besides, on his way, he had tarried among the Turks of Nubia, the hereditary enemies of the Abyssinians. Theodore caused him to be imprisoned, as also several English and German missionaries and their families. The British government, which up to that time had rather discouraged than encouraged intermeddling with Abyssinian affairs by Mr. Cameron, sent Mr. Rassam, bearer of a dispatch from the queen, to demand the liberation of the prisoners. At first Mr. Rassam was kindly received, and all the captives were set free in his presence. Afterward, suddenly, on account of some unexplained suspicion, Theodore caused to be put in irons all the Europeans in Abyssinia, together with the envoy himself (1866).—It was then resolved to send an expedition to Abyssinia, for the sole purpose of obtaining reparation for this outrage against the law of nations. The expedition was prepared in India, which offered better resources than Europe to carry on a war in Africa. Between September and December, 1867, about 15,000 men were forwarded to Abyssinia. Sir Robert Napier, the commander of the expedition, demanded of Theodore the setting at liberty of the prisoners as the only condition of peace. Among the prisoners were 61 Europeans and 150 Abyssinians. Upon his refusal, one-third of the army of invasion was ordered to advance, across the table-lands and the precipices, to compel him into acquiescence, in the fortress of Magdala, where he had retired with the captives. On the 15th of March, 1868, 5,000 men appeared on the plateau of Dalanta, in front of the fortress. The army of Theodore which at first was 150,000 strong, had been reduced by desertion to 6,000 men. These 6,000 men attacked the English and were repulsed, leaving on the field of battle 2,000 of their number. The English had only 20 wounded, and not one killed. On the following day Theodore sued for peace on the terms proposed to him before the expedition, and which were refused. Then the king set free the Euro-

pean and put to death the Abyssinian captives, and when an assault was made on the fortress he took his own life. The English army retired from Abyssinia without broaching the subject of establishing themselves there. It was sufficient for them to renew the prestige of their arms, which enables them to rule in the East by the maintenance of only small armies.—Neither nature nor man has adapted Abyssinia to commerce on a large scale. The surface of the country and the absence of navigable streams render communication with the interior very difficult. In the whole country there is not a single road which deserves the name of a highway. Each canton has its own market for daily needs. Foreign commodities are carried to Abyssinia every year by caravans between the coast and Ambara. There is a special demand for coarse but showy cloths, silk and cotton fabrics, velvets, printed handkerchiefs and calicoes, all of an inferior or middling quality; also for toys, looking-glasses, needles, articles of glass-ware, weapons and firearms, black pepper, and various trinkets. In exchange, the caravans bring back principally gums, coffee, ivory, myrrh, wax, honey, ostrich feathers, peltries, horns, gold, musk, mules, wheat, and slaves.—The manufacture of cotton-ades is the chief industry of the country. The principal trades are those of weavers, metal-workers, blacksmiths, metal-founders, gunsmiths, goldsmiths. The various industries are centered mainly at Gondar. As a rule, and for ordinary purposes, every man in Abyssinia is his own artisan.—All traffic between Abyssinia and foreign lands converges at Massowah, one of the best harbors on the Red sea. The city and the fort are now governed by a Turkish officer appointed by the Ottoman government at Djedda. France, England and Austria have each a consul at Massowah. In 1859 France acquired Adulis, and in 1860, Obbok.—In ordinary times two principal caravans, the larger in the month of July or June, arrive at Massowah from Gondar every year. Smaller caravans come in every month. Caravans also come from Taka and Khartoum. A document published by the minister of agriculture and commerce estimates at 14,000,000 francs the general business transacted at the port of Massowah in 1859. Of this sum the imports amounted to 12,000,000 francs in round numbers, and the exports, 2,000,000. If these figures are correct, they show a great increase, as compared with the estimates for the preceding years.

MAURICE BLOCK.

ACADEMIES. "To give unity to truths scattered over the earth:" nothing proves more clearly the need of academic bodies than these simple words dropped, as if by chance, from the pen of a celebrated French writer, Bernardin de Saint-Pierre, at the beginning of his *Chaumière Indienne*. Unity and multiplicity: such is the law of nature, as well in the intellectual and moral as in the material order. Hence the need of bringing thinking men together, so as to unite at a common focus their scattered and unconnected ideas.—Academic bodies continue the work of the great teaching bodies: in the latter, masters and scholars come together; in the former, masters only. The word *academy* often means a school, as for instance, the philosophical school of Plato, in the garden of Academus at Athens. This meaning of the word was preserved through the middle ages, as it has been down to our own time, in the universities of Germany, whose graduates continue to bear the title of *civis academicus*, although academies are devoted to the advancement of science, while universities, taking the branches of knowledge at their present state of advancement, confine themselves to giving an exposition of such branches of knowledge to those who attend them. This distinction made, we shall consider academies in the generally accepted sense of the term, as societies of men distinguished for their knowledge and their talents, who confer together on certain questions of literature, science and art.—It is the duty of every government to know and to follow the intellectual movement of the nation. Learned societies afford it the means of doing this. Their origin is frequently a modest one. Sometimes patrons of literature lay their foundation. Liberty and independence are of their essence. An academy which would consent to endure any pressure, especially that of authority, would soon be stricken with impotence. Thought, in order to labor fruitfully in the search after truth, should be free from all embarrassing prepossession and preoccupation. The interference of power, when limited to moral protection and material assistance, in no way affects the liberty of academic action. Learned societies when deprived of governmental aid are able, only in exceptional cases, to rise to the height of really national institutions and exercise on men's minds all the influence of which they are capable. It follows that there are two kinds of academies: state academies and *free* academies, just as there are in high education, free universities (few in number, it is true) and state universities. What the state can and should do, if only in its own interest, is to surround its academies and learned men with the consideration due them. Great monarchs, powerful ministers, such as Peter the Great in Russia and Richelieu in France, understood perfectly well the power which the cultivation of letters, science and art gives the state. The efforts of vulgar levelers will always fail when opposed by classes of men distinguished for their intelligence. Intelligence is a privilege which

can not be abolished since it is not conventional, but inherent in the very nature of man.—Independent of the functions peculiar to an academy and dependent on its internal organization, there are functions common to all academies because they belong to them from the very principle of their existence. Academies, therefore, as central organs of the intellectual life of the nation, acquainted with the progress of the human mind at home and abroad, cause the public to share that progress by means of oral discussion, by their periodical transactions, and by all the means which the greatest publicity can suggest. In this regard, academies partake of the nature of legislative bodies in democratic states, with this difference, however, that scientific questions can not be decided by majorities. As a scientific jury, however, an academy decides by a plurality of votes for or against the merits of papers written in answer to questions which it has proposed for discussion.—It would be difficult to give an idea of the number of academies and learned societies in the civilized world. A learned German, Dr. Ami Boué, member of the imperial academy of sciences of Vienna, in a work which forms a part of *The Report of the Third Session of the International Statistical Congress*, gives the number at 19,000, of which 18,436 are still in existence. Chronologically, the 19,000 associations (or, more correctly, 18,955) are divided into 2 classes, the first containing 1,021, founded during the 589 years which elapsed between the thirteenth century and 1790, and the second, 17,934, in the short subsequent period. After having thus shown the progress made by learned societies, "it is not possible to go backwards," says the author; "it is a mathematical, material and political impossibility."—Ethnographically considered, the Anglo-Saxon races have twice as many learned societies as the Latin races, to which the Germanic races are a little inferior in this respect. From the point of view of religion, the Protestants have, in proportion to their population, four times as many learned societies as the Catholics, and a hundred and forty times as many as the Greeks.—These statistics, as we have just seen, carry us back to the thirteenth century—the epoch from which the revival of letters dates. It was the age of Brunetto Latini, Dante's teacher. The first quarter of the succeeding century in France witnessed the establishment of the *academy of floral games*, at Toulouse, the work of the troubadours of Languedoc and Provence. From Italy came the literary impetus, afterwards felt by all Christian nations; during the fifteenth century by the Platonic academy established under Lorenzo di Medici, which professed Neoplatonism (Pico della Mirandola was a member of it); in the sixteenth century by the academy *della Crusca*; in the seventeenth century by the *del Cimento*, all in Florence, which is justly considered the cradle of existing learned bodies. We shall now consider the most celebrated societies, classifying them by countries.—FRANCE. The

Institut National, established at Paris, is the realization of a thought expressed in the following terms in the constitution of the 5th Fructidor, year III.: "There shall be for the entire republic a national institute, charged with collecting and preserving the results of scientific and other discoveries and perfecting the arts and sciences." Consisting at first of 3 classes: physical and mathematical sciences, moral and political sciences, literature and the fine arts, the institute was reorganized in 1803 into 4 classes: physical and mathematical sciences, the French language and literature, history and ancient literature, and the fine arts. The salary of members was 1,500 francs. In 1816 the institute was reorganized as the French academy, the academy of inscriptions and belles-lettres, the academy of sciences, and the academy of fine arts. In 1832, on the motion of M. Guizot, the academy of moral and political sciences was re-established. The institute held its first session at the Louvre in the *Salle des Antiques*. In 1806 it was located opposite the Louvre, at the hotel Mazarin, which was afterwards called the *Palais de l'Institut*. The academy holds sessions every Munday; the French academy, on Thursdays; the academy of inscriptions, on Fridays; the academy of moral and political sciences and fine arts, on Saturdays. By a decree of April 14, 1855, it was provided that the public sessions of the five academies should take place on the 15th of August of each year. At these sessions lectures are given, and the Volney prize for linguistics awarded; but since 1871 this session takes place on October 25th, the anniversary of the founding of the institute. The institute is under the supervision of the minister of public instruction. It appoints a central administrative commission from among its own members, to oversee the expenses of the five academies, as well as a special commission to award the prize in linguistics established by Volney.—Cardinal Richelieu gave legal authorization to a private society, founded by young men about the year 1629. This was the origin of the French academy. Its letters patent, signed by Louis XIII., date as far back as the year 1635. Established for the study and advancement of the French language, of grammar, poetry and eloquence, it was charged especially with the composition of the dictionary of the French language, *Dictionnaire de l'Académie*, the first edition of which appeared in 1694, and the sixth in 1835. The French academy, composed of 40 members, admitted neither corresponding nor associate members. It granted prizes for eloquence and poetry, prizes from the bequest of Montyon for virtuous acts and for books most useful to morals, as well as prizes from the bequests of Gobert, Bordin, Lambert, Count de Maillé Latour-Landry, Edmond Halphen, Thérouranne, and Langlois. The academy has published 6 volumes of memoirs since 1816.—The academy of inscriptions and belles-lettres, originally called the little academy, its members being recruited

from among those of the French academy, was founded in 1663 by Colbert, to examine and pass upon the embellishments of Versailles, as well as the designs for the tapestry of the king; the devices for the fêtes, tokens for the treasury, and the inscriptions on monuments and medals. In the month of February, 1712, its establishment was confirmed by letters patent of Louis XIV. It was only under the regency that it joined to its title of *belles-lettres* that of inscriptions. It numbers 40 members, 8 foreign associates, and 50 corresponding members. Besides prizes for the best works on the antiquities of France, and the prize of numismatics, it awards those of the Allier, Hauteroche, Gobert, Bordin, Fould, La Fons-Mélicocq and Brunet foundations. The memoirs of the members have been published since 1701. The current series commencing with 1816, comprises 24 volumes, besides 9 volumes of the memoirs of foreign scholars.—The academy of sciences is also a creation of Colbert, who established it in 1666, without any official act of royal authority. It was approved and confirmed in 1699 by letters patent of the king. Its constitution has always been considered one of the most liberal in existence. The academy is to-day divided into 11 sections; 5 for the mathematical sciences, including geometry, mechanics, astronomy, geography and navigation, and general physics; and 6 for the physical sciences, including chemistry, mineralogy, botany, agriculture, anatomy and zoölogy, medicine and surgery. It has 66 titular members, 10 free academicians, 8 foreign associates, and 100 corresponding members. It gives prizes on its own account; also prizes for medicine and surgery, experimental physiology, mechanics and statistics, all founded by Montyon; as well as the prizes founded by Lalande, Baron de Morogues, Laplace, Cuvier, Bordin, Allumbert, Trémont, Bréant, Damoiseau, Poncelet, Jecker, Barbier, Godard, Savigny, Desmazières, Thore, Fourneyron, Dalmot, Chaussier, de la Fons-Mélicocq, Gegner, Serres, Lacaze. The collection of the memoirs of the academy of sciences since 1816, comprises 87 volumes, and 19 from foreign scholars, besides the series of reports of its sessions which numbers 70 volumes.—In France, as well as in Italy, there have been free associations of painters since the fourteenth century. In 1648 Cardinal Mazarin founded an academy of painting and sculpture, to which Colbert, in 1671, added an academy of architecture. The academy had been regularly established by letters patent of King Louis XIV. in 1655. Its province embraces the arts of design, the competitions for the great prizes for painting, sculpture, architecture, engraving and musical composition, and the presentation to the minister of candidates for professorships in the schools of the fine arts. It has 40 members, divided into 5 sections: painting, sculpture, architecture, engraving and musical composition; 10 foreign associate members, and an indefinite number of corresponding members. The prizes founded by Madame Leprince, by Deschaumes,

by Count de Maillé Latour Landry, by Boré, Lambert, Trémont, Achille Leclère, Troyon, and by Duc, are bestowed by this academy.—The academy of moral and political sciences is comparatively modern. It dates only from the organization of the institute, 3d Brumaire, year IV. But, suppressed 3rd Pluviôse, year XI., it was re-established by royal ordinance Oct. 26, 1832. Its aim is the cultivation and encouragement of philosophical science, and the science of government, as is evident from the 5 sections into which it is divided: philosophy; morals; legislation, public law and jurisprudence; political economy, finance and statistics; general and philosophical history; (decrees of April 14, 1855, and May 9, 1866). It has 40 titular members, 6 free academicians, with 6 foreign associate and 45 corresponding members. In addition to the prizes which they decree, are those from the bequests of the following persons: Baron Félix de Beaujour, Baron de Morogues, Bordin, Léon Faucher, Edmond Halphen, Cousin, and Stassart. It has published 12 volumes of memoirs since 1816, and 2 volumes from foreign scholars. Besides this, since 1842, a report of the sessions is published regularly. These reports make in all 60 volumes in 4 series: the first 4 are by MM. Loiseau and Vergé, and the succeeding by the latter alone.—The Paris academy of medicine was created by Louis XVIII., Dec. 28, 1820, for the purpose of keeping the government informed of everything affecting public health, especially epidemics, epizootics, the different kinds of medicine, new remedies and secret remedies, mineral waters, natural or artificial. It replaced the academy of surgery in Paris, founded by Louis XV. in 1731. Its sessions are on Tuesdays. The academy is composed of 97 titular members, 8 free associate members, 12 national associate members, 12 foreign associate members, 109 national and 50 corresponding members. It is divided into 11 sections: 1, anatomy and physiology; 2, medical pathology; 3, surgical pathology; 4, therapeutics, and medical natural history; 5, operative medicine; 6, pathological anatomy; 7, midwifery; 8, public hygiene, medical jurisprudence and medical police; 9, veterinary medicine; 10, medical chemistry and physics; 11, pharmacy. Its publications are its annual memoirs, commenced in 1828; a semi-monthly bulletin, from the year 1836 to the year 1847; and a weekly bulletin since the latter year. In the annual of 1848 the titles of all its memoirs published up to that time were given.—The society of surgery, at Paris, acknowledged to be an establishment of public utility by an imperial decree of Aug. 29, 1859, was founded July 1, 1843, by 17 surgeons of the hospitals of Paris. The surgical society is very well known. Besides the regular publication of its memoirs and bulletins, the *Gazette des hôpitaux*, *Moniteur des Sciences* and the *Union Médicale* have special editors charged with attending the sessions and giving an account of them every week.

The sessions take place every Wednesday. The society is composed of 35 regular members, 70 national corresponding members, 70 foreign corresponding and 20 foreign associate members. On the second Wednesday of January an official session is held, at which the Duval prize of books is awarded. An annual contribution by the members, together with the profits from the sale of books and the charge for diplomas, make up the income of the society.—On May 19 of the same year (1859) the Paris society of anthropology was founded for the purpose of centralizing and directing research relating to the study of the races of mankind. Its programme does not comprise simply the description of these races; it includes also the investigation of their origin, their relations, their migrations, their civilization present and past, their languages and their monuments. The society is comprised of 115 French members, 26 foreign members, and 21 corresponding members. Its sessions are held on the first and third Thursdays of each month. Its resources are the same as those of the surgical society, and, like the latter, it publishes memoirs and bulletins. Mention should also be made of the central agricultural society of France, the society of acclimation, the central horticultural society, and the society for the encouragement of national industry, as among those which enjoy most consideration. Before leaving France we may refer to its numerous provincial societies. Each department has at least one, and the taste for historical studies predominates among their members. A special publication is devoted to them under the title: *Annuaire de l'institut des provinces, des sociétés savantes et des congrès scientifiques*, Paris, 1846, and the following years.—ENGLAND. The royal society of London was established in 1660, for the advancement of experimental science. A royal charter of July 15, 1662, and a second, more complete, of April 22 of the following year, constituted it a corporation; a charter of 1663 is still the fundamental law of the royal society, which had in 1859, 691 members. The society is divided into 8 scientific committees: on mathematics, astronomy, physics, chemistry, geology, botany, zoölogy, and animal physiology. It holds its sessions every Thursday, in the great hall of Burlington House, and has an annual session on St. Andrew's day for the award and distribution of medals. Its publications are the *Philosophical Transactions*, a yearly volume; and the *Proceedings*, a monthly bulletin. The most recent history of the royal society of London is that of Mr. Charles Weld.—The London astronomical society is composed of 431 members, and 49 associate members. The astronomical society holds its sessions on the second Friday of every month, at Somerset House on the Strand. The regular annual meeting takes place on the second Friday in February. The yearly dues from members are 2 guineas, besides an admission fee of 2 guineas. The society publishes memoirs and a monthly bul-

letin, which mutually supplement each other.—The geological society of London, which has its headquarters in Somerset House, had 1,245 members in 1870, of whom 39 were foreigners, 40 foreign corresponding members, and 3 honorary members. It was founded Nov. 13, 1807, and received a royal charter in 1826. The dues are 2 guineas a year or 20 guineas for life membership, and 6 guineas admission fee. The receipts of the society amounted to 2,560 pounds sterling in 1870. A quarterly review, containing many maps and pictures, has been published since 1845. The publication of the *Transactions* and the *Proceedings* has ceased, since the establishment of the *Quarterly Journal*, edited by the adjunct secretaries of the society.—The British association for the advancement of science was founded by Sir David Brewster, at York, Sept. 27, 1831. It meets annually, but not always at the same place. The first meeting, composed of 300 members, was held at York on the 27th of September, 1831; the succeeding ones in other towns. The association is divided into 7 or 8 sections: the sections of the mathematical and physical sciences; chemistry and mineralogy; geology; zoölogy; botany; animal and vegetable physiology; geography and ethnology; statistics and political economy. A central committee, with a fixed place of abode, does the society's business and publishes an annual volume of reports.—The Irish academy for the study and advancement of science, politics, literature and antiquities, at Dublin, recognized by royal patent of Jan. 28, 1786, but which existed as far back as 1782, was formed by the union of the physico-historical society of Dublin and the archæological association, societies founded respectively in 1740 and in 1772. The academy consists of 245 paying members, 62 honorary members, and 21 corresponding members. It is divided into 3 classes: sciences; history and belles-lettres; and archæology. It receives 300 pounds sterling from the government, and publishes memoirs under the usual title of *Transactions*, as well as *Proceedings*.—In 1731 a society was founded at Edinburgh, which in 1739 became the society of literature and science. After absorbing the society of medicine and surgery, it received the title of philosophical society, and published 3 volumes of essays in succession. It was recognized by the government March 29, 1783. It has 279 members, 136 paying members. The fee is 3 guineas annually, or 50 guineas for life membership, besides 5 pounds for a diploma. The *Philosophical Transactions* have been published regularly since 1788, and the *Proceedings* since 1836.—England has a number of historical societies, among which are the royal society of literature of the United Kingdom, at London, founded in 1823, which, besides books, has published a great work on hieroglyphics, with 60 plates; the historical society of London, founded in 1837 or 1838, and which has 100 members, who pay a yearly fee of

5 guineas, to which is due the publication of a history of the Anglican church; the historical society of sciences, at London, founded in 1840, for the publication of documents on the history of the sciences and their condition at different periods, the members paying an annual fee of one pound sterling. Another society founded also in London, in 1842, is devoted to the ancient history of England. — GERMANY. The academy of sciences at Berlin, founded in 1707, by Frederick I., at the suggestion of the illustrious Leibnitz, its first president, is governed by the royal statutes of March 31, 1838, which replaced those of Jan. 24, 1812. On Jan. 1, 1871, it had 46 regular members, 22 of the class of the physical and mathematical sciences, and 24 of the philosophical and historical class. It has 13 foreign members of the former, and 2 of the latter class, besides 11 honorary members, 83 corresponding members of the class of sciences, and 100 of the class of philosophy. All regular members receive an annual salary of 200 thalers. There are weekly sessions, and three solemn public sessions each year: on January 24th, the anniversary of the birth of King Frederick II.; July 3rd, in memory of Leibnitz; and on the anniversary of the birth of the reigning sovereign. The publications of this society consist in memoirs and monthly reports. — The royal society of sciences at Göttingen, the foundation of which dates from 1751, has always been among the most celebrated in Germany. At present, the number of its regular members is 8 in the class of physical sciences, 6 in the mathematical sciences, and 10 in that of history and philology; it has honorary members, foreign associate members, and corresponding members. The *maximum* number of associate members is fixed at 25, and of corresponding members at 50, for each class. Besides a weekly critical journal, which appears under its auspices, the society publishes a monthly bulletin of its sessions, and yearly memoirs, of which the last series, dating from 1811, makes 20 volumes, the first 8 volumes being in Latin. The title of the critical journal is: *Goettingische gelehrte Anzeigen*; that of the bulletin: *Nachrichten von der koeniglichen Gesellschaft der Wissenschaften und der G. A. Universität*. — The royal academy of sciences at Munich, organized according to law on the 28th of March, 1759, is divided into 3 classes: philosophy and philology; physical and mathematical sciences; and history. The first class numbers 13 ordinary members and 1 member extraordinary, 62 foreign and 8 corresponding members. There are respectively 17, 8, 85, 81 members of the second class, and 16, 6, 37, 35 for the third class above referred to, besides 15 honorary members of the 3 classes together. The class of mathematical and physical sciences is subdivided into 8 sections: natural history; astronomy; mathematics and mechanics; physics, chemistry; zoölogy, anatomy and physiology; botany; mineralogy and geognosy. — We may mention further in Germany, the Leopold

academy, a society of naturalists, established at present in Jena. Its members, native and foreign, take or receive each as a surname, that of some scientific celebrity.¹ It is a great institution whose history has been published by one of its own members, Mr. Neigebaur. It takes its name from the Emperor Leopold I., who took it under his protection in 1677. — AUSTRIA. The imperial academy of sciences of Vienna was founded in 1652, and reorganized under letters patent of the Emperor Ferdinand I., dated May 14, 1847. It is divided into 2 classes, the class of mathematical and natural sciences, and the class of philosophy and history. Its personnel consists of 60 active members, 30 of each class, 120 corresponding members, 60 of each class, (30 from the empire and 30 from foreign countries), and 24 honorary members, (8 from the empire and 16 from foreign countries). — The other great academies of Austria are: the imperial and royal academy of fine arts at Vienna, founded in 1704; the imperial and royal academy of medicine and surgery, named after Joseph II., and founded at Vienna in 1786; the imperial geographical society of Vienna, a free association founded January, 1856; the royal society of sciences, at Prague, founded as a free society in 1769, and divided into 2 classes like the academy of Vienna, having 21 regular members, 46 members extraordinary, 7 honorary, 75 foreign and corresponding members; the Hungarian academy of sciences, at Pesth, founded by the Hungarian estates in the diet 1825-1827, for the cultivation and propagation mainly of science in the Hungarian language, and divided into 3 sections: languages and belles-lettres; philosophical, social and historical sciences; and the mathematical and natural sciences. — ITALY. Twelve principal academies fix the attention of the learned world in the Italian peninsula: the royal academy of Turin, divided into 2 classes, the class of physical and mathematical sciences, and that of the moral, historical and philological sciences; the academy of painting and fine arts, in the same city, founded during the last century; the royal academy *della Crusca*, at Florence, which has edited the fifth edition of its dictionary of the Italian language; the academy of science and art of the *Fisicocritici*, founded in 1691, at Sienna, where the purest Italian is spoken; the royal academy of sciences and belles-lettres of Naples, founded in 1780, and reorganized in the month of September, 1860; the academy of fine arts of the same city; the royal academy of science, letters and art, of Milan, founded in 1812 and reorganized in 1860; the academy of sciences, letters and arts, of Milan, founded in 1812 and reorganized in 1860; the academy of sciences, letters and arts, of Padua, founded by a decree of the Venetian senate, March 18, 1779; the institute of science, letters and arts, of Venice, which was established

¹ In the Palatine school founded by Charlemagne and improperly called the academy, the members were also obliged to assume a literary name for equality's sake.

in 1802 by the Cisalpine republic; the academy of sciences of the institute of Bologna, which dates back to the year 1690, and in which Pope Benedict XIV. established a class of bursars in 1745; the academy of sciences and belles-lettres of Palermo, certainly the oldest in existence, since its origin goes back to 1231; the academy of sciences of Catania, founded in 1744.—**SPAIN AND PORTUGAL.** Besides the literary and scientific, known as the academy of jurisprudence and legislation, the academy of medicine, the academy of archaeology, the atheneum, etc., there are in Madrid 5 royal academies subsidized by the government, viz.: the Spanish academy or academy of the national language; the academy of history; the academy of higher arts, painting, sculpture and architecture, called also the academy of San Fernando, founded under Philip V., but which began its labors only in 1752, under Ferdinand VI.; the academy of exact sciences, physical and natural, which dates only from 1847; and the academy of moral and political sciences, more recent still, since it was created by article 160 of the law of Sept. 9, 1857, and by royal decree of the 30th of the same month.—After the academy of sciences of Thomar, in Estramadura, in 1752, and after the royal Portuguese academy of Mafra, founded by the Marquis of Pombal, the royal academy of sciences at Lisbon was founded Dec. 24, 1779. It is divided into 2 departments: the first of natural, and the second of political and moral sciences. The president of it is always a prince of the reigning dynasty. The royal academy of fine arts at Lisbon, the academy of fine arts and the polytechnic academy, both at Oporto, are institutions in which special branches of knowledge are taught.—**RUSSIA.** The imperial academy of sciences of St. Petersburg is a creation of Peter the Great, who after conferring with Leibnitz and other illustrious personages of the time, founded it Jan. 28, 1724. The empress Catharine II. founded the Russian academy in 1783, to encourage the development of literature, and in 1841 the Russian academy was incorporated with the academy of sciences by the emperor Nicholas. As at present organized, the imperial academy is divided into 3 classes or sections: 1, that of the physico-mathematical sciences; 2, the class of literature and the Russian language, with a separate management; 3, the historico-philological class. The researches of the academy are contained in 8 different collections of commentaries, acts, memoirs, and in a scientific bulletin intended for short notices, the publication of which should not be delayed.—The imperial academy of medicine and surgery, at St. Petersburg, founded Feb. 12, 1799, and reorganized in 1802, is a school of medicine, attended both by a great number of medical students and students of the veterinary art and pharmacy. It publishes three different collections of reports, in Russian, German and French.—The imperial academy of fine arts at St. Petersburg is an educational institution, with 300 students of

painting, sculpture, architecture, engraving, etc. There are also museums of painting, sculpture and architecture, with models of different edifices, ancient and modern, of Christian archaeological objects, and a library; likewise an institution and studio of mosaic painting, where the mosaic art is taught and orders executed under the direction of a professor of the academy, and belonging to the academy. In one of the halls meetings of architects and other artists are held.—The imperial Russian geographical society of St. Petersburg dates only from 1845. It was founded August 6th of that year, and has 4 sections: mathematical geography, physical geography, ethnography, and statistics. Separate sections were established in 1851 at Irkutsk, in Siberia, and in 1850 in the Caucasus. In 1867 2 new sections were founded: the section of the western provinces and that of Orenburg. The publications of the society comprise, in addition to several special collections, 18 volumes of memoirs, a monthly bulletin, monographs, maps and atlases.—**SWEDEN.** The Swedish academy at Stockholm was founded by Gustavus III., March 20, 1786. In the discourse with which this sovereign inaugurated the sessions, he announced that his object was to fix the rules and extend the knowledge of the Swedish language, to celebrate and revive national memories, as well as to pronounce the eulogy of great men who had served or saved the country, and thus contribute not only to ennobling the language, but to increasing the glory of the most illustrious sons of Sweden. The memoirs of the academy are published annually, and contain biographies of distinguished Swedes, the compositions which have taken the prize for eloquence and poetry as well as literary, historical, philosophical and philological dissertations by members of the academy. These memoirs, published from 1786 to 1871, contain 51 volumes 8vo. In 1857 the prize for poetry was awarded to Prince Oscar, for his songs in honor of the Swedish fleet. In 1870 the academy published the first number of its great dictionary of the Swedish language.—**DENMARK.** In 1742 was founded the *Societas Hafniensis bonis artibus promovendis*. Christian VI. recognized it the following year, and four years later it became the present royal society of science of Copenhagen. Its publications, illustrated by a great number of plates, are numerous and important, especially in the domain of the mathematical sciences, physics and natural history. At present the fifth series of the memoirs of the two classes of sciences and letters has been reached. For six years past the memoirs as well as the bulletins are accompanied by French summaries. Its first centennial history, from 1742 to 1842, has been published by Molbeck.—**BELGIUM.** The imperial and royal academy of sciences and belles-lettres at Brussels, created by letters patent of the empress Maria Theresa, (Dec. 16, 1772), ceased to exist under the French régime. Re-established May 7, 1816, it was reorganized by a royal decision of Dec. 1, 1845, as the royal academy of sciences.

21172

literature and fine arts of Belgium. Each of these 3 branches constitutes a class composed of 30 members, 10 corresponding members, and 50 associates, besides 7 academicians, forming a royal commission on history, to publish inedited Belgian chronicles. In the class of literature two commissions have been appointed, one charged with the publication of the ancient monuments of Flemish literature, the other with collecting the works of the great writers of the country. The members of the 3 classes have undertaken the editing of a national biography. It is very difficult to get a complete collection of the publications of the academy since its foundation, monographs, memoirs, notices, reports of meetings, and annuals. In the first volume of the *Annuaire de la bibliothèque royale de Belgique*, by Baron de Reiffenberg, the extent of this collection may be seen, with additions in the volumes of the following years.—A royal Belgian academy of medicine exists also at Brussels. Created by a royal decision of Sept. 19, 1841, it is composed of regular members, associate members, corresponding members, and honorary members. Its publications consist of memoirs and monthly bulletins.—HOLLAND. The royal academy of sciences at Amsterdam, instituted by royal ordinance of Oct. 26, 1851, has taken the place of the royal institute of Holland, established in May, 1808, by the king of Holland, Louis Napoleon. The academy, divided into 2 sections, has published a great number of works. The titles of which may be found in a pamphlet: *Revue des sociétés savantes de la Néerlande*, published in 1857, by W. Vrolik.—ASIA. The society of arts and sciences at Batavia is the oldest of all the learned bodies of Asia. Founded April 24, 1778, it felt the influence of the East India company, with its alternations of prosperity and decline. There are two other learned societies in Batavia: the royal academy of natural sciences, founded in 1850, and the industrial and agricultural society of the Dutch East Indies.—BIBLIOGRAPHY: Haymann, *Kurzgefasste Geschichte der vornehmsten Gesellschaften der Gelehrten*, Leipzig, 1743; *Verzeichniss der Universitäten, Akademien, gelehrten Gesellschaften*, Leipsig, 1795; A. d'Héricourt, *Annuaire des Sociétés savantes de la France et de l'étranger*, Paris, 1866; *Manual of Public Libraries, Institutions and Societies in the United States and British provinces of North America*, Philadelphia, 1859. XAVIER HEUSCHLING.

ACADEMIES (IN AMERICA). The oldest among the American academies devoted to the progress of science, is the American philosophical society at Philadelphia, founded by Benjamin Franklin and his associates in 1743. It has published, from 1771 to 1881, two series of transactions in quarto, numbering 21 volumes, (besides 20 volumes of proceedings), and filled with papers of value on a great variety of subjects. The American academy of arts and sciences, established at Boston, 1780, has issued many costly volumes, illustrating natural history and other sciences.

The academy of natural sciences of Philadelphia, started in 1814, has devoted itself to original investigations and publications, as to the plants, animals and minerals of the United States, and has collected a very fine and extensive museum of objects of natural history. The lyceum of natural history in New York city, founded 1818, has published many volumes of annals devoted to science. The Boston society of natural history, 1834, has done much to promote investigation in its special field. The Connecticut academy of arts and sciences, founded in 1799, at New Haven, is still publishing valuable memoirs. The Essex institute, of Salem, Mass., formed in 1848 from the union of a county natural history society and a historical society, has nearly 500 members, and has printed a long series of collections illustrating history, biography, and almost every department of science. The Albany (N. Y.) institute, organized in 1824, has collected a library and a natural history collection, and published 8 volumes of transactions. The Franklin institute of Philadelphia, which dates from 1824, is for the promotion of the mechanic arts, and has published 110 volumes of its journal. The American institute, New York city, dating from 1829, devoted chiefly to agriculture and the mechanic arts. Thirty-two volumes of its transactions have been published by the state.—Of institutions or academies devoted to the fine arts, may be named the national academy of design, organized at New York in 1828, the Pennsylvania academy of fine arts, Philadelphia, 1807, and the metropolitan museum of art, established in New York city in 1870; these have annual or permanent exhibitions of painting and sculpture, and the last named has gathered a most valuable archaeological collection.—Of the historical societies of the United States, the oldest is the Massachusetts historical society, organized at Boston in 1791, "to collect, preserve and communicate materials for a complete history of the country." It has published more than 70 volumes. Since the birth of this Nestor of the historical societies, more than 170 others have been formed, representing states or localities, of which we can only name the more vigorous or extensive: New York historical society (1804); American antiquarian society, Worcester, Mass., (1812); Rhode Island, Providence, (1822); Maine, (1822); New Hampshire, (1823); Pennsylvania, Philadelphia, (1824); Connecticut, Hartford, (1825); Ohio historical and philosophical society, Cincinnati, (1831); Virginia, Richmond, (1831); Vermont, Montpelier, (1838); Georgia, Savannah, (1839); Maryland, Baltimore, (1844); New Jersey, Newark, (1845); New England historic-genealogical society, Boston, (1845); Minnesota, St. Paul, (1849); Wisconsin, Madison, (1849); Iowa, Iowa City, (1857); Long Island, Brooklyn, N. Y., (1863); and Southern historical society, Richmond, (1869). Most of these have published volumes of original contributions to history or early manuscripts.—Of academies devoted to special sciences, there are the American geographical society, organized at New York in 1851; American philological

society, New York; American institute of architects, New York; American oriental society, founded at New Haven, in 1842; American numismatic and archæological society, 1857; American society of civil engineers and architects, New York; the American ethnological society, New York, 1842; Washington philosophical society, Washington, D. C., 1871; Cooper union for the advancement of science and art, New York, 1854, with a freeschool of art and science, lectures, library and periodical reading room; Lowell institute, Boston, 1839; Peabody institute, Baltimore, 1857 [the last two devoted, the one to public lectures, the other to a library, popular lectures, a conservatory of music, and an academy of art]; American association for advancement of social science, Boston, 1869, which has published 10 volumes; American medical association, Philadelphia, 1847; American public health association, Washington, 1872; American pharmaceutical society, Philadelphia, 1852.—There are in the United States, 3 more prominently national organizations or academies, viz.: The national academy of sciences, Washington, incorporated by congress in 1863, with a membership originally limited to 50; this academy is required to investigate and report upon any subjects referred to it by the government, and its proceedings and papers (hitherto small in extent) are printed by congress. The American association for advancement of science, organized in 1848, 30 volumes of whose annual proceedings have been issued. The Smithsonian institution, Washington, created by act of congress in 1846, in pursuance of a legacy left by an Englishman to found an institution for the increase and diffusion of knowledge among men. Its large income, of about \$35,000 annually, is expended in procuring and publishing original researches in science, and to an efficient and widely useful international exchange. It has published more than 75 volumes of contributions to knowledge, miscellaneous collections and annual reports.—In America, outside of the United States, may be named the natural history society of Montreal; the literary and historical society of Quebec; the *real sociedad económica de la Habana* (Cuba); the *sociedad Mexicana de geografía y estadística* (México); the *instituto histórico geográfico e ethnográfico do Brazil* (Rio Janeiro), an active scientific academy, the most important in South America, founded in 1838, and enjoying an annual grant of \$3,500 from the government; and the *universidad de Chile* (Santiago), an institution for liberal education, which has published over 50 volumes of valuable *anales* and scientific memoirs.

A. R. SPOFFORD.

ACCLAMATION. This term, which signifies a unanimous call, is to be understood in the language of politics to mean that spontaneous expression of general consent which excludes all discussion, and bears down the isolated opposition of individuals. When an assembly votes by acclamation, whether there have been debates on

the question at issue or not, it means that an immense majority have agreed on some matter, and that it would be useless to have recourse to the taking of a vote to demonstrate such agreement.—In Portugal the word has a special significance which is worth calling to mind. It refers to the accession of the house of Braganza to the throne after the overthrow of the Spanish dominion (Dec. 1, 1640). The vote calling the duke of Braganza to power was so unanimous that the word acclamation was perfectly fitted to mark the date when the dynasty of Braganza began. The Portuguese have made it an historic epoch from which they date, and say such an event took place before, during or after the *acclamation*.
M. B.

ACCUMULATION OF WEALTH. It is to the power of accumulation or saving (two terms which in political economy are almost equivalent) that we owe all our capital, all our wealth.—All the utilities created by man are susceptible of accumulation, whether these utilities are identified with the men themselves, as those which consist in acquired knowledge, in the perfection given our physical, intellectual or moral faculties, or those added to external objects.—Of the accumulation of utilities of this last class, the most important are those realized in the cultivation of the soil. They consist in the clearing and reclaiming of land; in the increase of its natural fertility by manuring, irrigation or other means; in the substitution of plants useful to man for those with which the ground was primitively covered and not useful to man; in the multiplication and domestication of animals or beasts of burden employed as forces or intended for food; and finally, in the buildings, structures, machines or instruments used in exploitation of any kind. Accumulation of this kind forms the great mass of the material wealth of all nations whose civilization is advanced.—Next in order of importance come accumulations of wealth under the form of dwelling houses, of factories, shops, machines and tools, roads, railroads, canals, bridges, ships, harbors, etc.; in a word, all the creations of industry destined to facilitate manufacturing or commercial operations, or to satisfy the wants of shelter, of intercourse, communication, etc.—After these, the most important accumulations in the material order appear under the form of a supply of products destined either for the immediate satisfaction of our wants—such as furniture, utensils, fuel, food, linen, clothing, etc., with which every household is more or less amply provided, or those which have to undergo various changes or modifications, to fit them for consumption.—Among the utilities which are identified with man, those whose accumulation or extension is most important, consist in the perfection given to the *industrial faculties*, under which term we comprise: 1st, all positive knowledge capable of rendering man's labors more fruitful; 2nd, the art of applying this knowledge, and the spirit of invention; 3rd,

skill in performing all the details in the different kinds of work; 4th, the practice of the habits, individual or collective, most favorable to the development and power of the industrial faculties, and the harmony of economic relations.—It is plain that the accumulation of utilities, of capital, of wealth, may and really does take place under a multitude of forms. Among these forms we have not included that of money or coin. In reality, accumulations in no way need an increase in the quantity of that particular product; and it is undoubted that a people may double their wealth or increase it tenfold without a single cent being added to their monetary medium. Accumulation of wealth does not take this form except in countries which produce the precious metals. —Nevertheless it is the almost universal opinion that the greater part of the accumulations of wealth or savings is made under the form of money, and as this false idea is the source of a multitude of economic errors, it seems to us useful to show clearly that although much of the accumulation of wealth appears for a time in the form of money, it consists in reality of something very different. This, a few examples will show. A ditch-digger, by working continuously for six months, has, let us suppose, drained a marsh; the value of his labor is estimated at \$400. Of this sum the workman has spent, let us say, \$300 for his own personal wants, and there remain to him \$100 which he puts into a savings bank. Here is an accumulation equal in value to \$100; and all the circumstances remaining the same, this value should be found as an addition to the wealth of the country in one form or another. Is it in the form of money? Evidently not; for the \$100, before going into the savings bank, were in possession of the proprietor who received them, let us suppose, from his tenant, who received them from the butcher, who, in turn, received them from the consumer of meat, etc. In short, this money existed in the country before as well as after the operation. The wealth here accumulated, then, does not exist in the form of money, and it can only be found in the improvement given the land by the labor of the ditch-digger, an improvement equal in value to \$400, and exceeding by \$100 the value of the articles consumed by the workman.—A builder constructs a house; he expends in its construction, in wages, materials, purchase of land, etc., a sum of \$110,000. When he sells the house for \$120,000 the excess of \$10,000 is his profit, or the price of his services. Of this last sum, \$5,000 have been spent in unproductive consumption, and \$5,000 are added to the capital which he employs in his business. Does the accumulation here consist in money? By no means; since the money existed before in the hands of the purchaser. It is found in the value of the house which exceeds by \$5,000 all that was spent.—The purchaser of the house receives from his tenants a yearly sum of \$6,000. He uses two-thirds of this sum for the personal wants of his family, and he puts the \$2,000 of surplus in the bank. Here we have a new

accumulation of \$2,000, which, although it does not come from new labor, must exist as additional wealth in the country under some form, and, no more than in the preceding cases, under the form of money, since the same money already existed, and has now merely changed hands. In what, then, can the new value acquired to the nation consist? In order to discover this, it is necessary to remark that the service rendered to the tenants by the house is really equal to the value of \$6,000, since they have freely consented to pay that sum for its use. They might have applied that service to an industrial purpose and received back its price in that of the products created. But we will suppose that they have consumed it unproductively for their personal wants. Now even in this case the savings of the proprietor add none the less a value of \$2,000 to the wealth of the country; and this value must necessarily be found in a form different from that of money. This will be easily understood by noting that without this saving, it would have been necessary to add to the unproductive consumption of the premises other productive consumption still by the proprietor, amounting to the value of \$2,000. The saving, therefore, must be found in this case in the form of the different objects which the proprietor has abstained from consuming, the preservation of which has diminished the sum total of consumption in the country and consequently increased its actual wealth to that extent, production remaining the same.—We might take up in this manner, one after another, all the individual savings accumulated in a year, and it would be seen that all have increased the general wealth in proportion to their importance, either by adding to the utilities which the country already possessed, or by preserving a greater part of these, by limiting consumption. It will be seen, at the same time, that these accumulations were made under a multitude of different forms other than money, though most of them appear for a moment under this last form. Thus, that which is accumulated in reality is not money; it is objects fitted to satisfy our needs—utilities of various forms.—It is to be remarked, that these utilities scarcely ever remain in the hands of those to whom they are due; for even when they are exchanged for money, this money is usually given to others by those who have accumulated its values. Now, to place at the disposition of society a utility under one form or another is to render it a service, to furnish it with the means of labor or satisfaction, of which without this it would have been deprived. He who saves renders to society, therefore, a service proportionate to the value of his savings. It is true that he thus acquires the right of demanding equivalent services in return; but so long as he does not actually demand them, so long as he abstains from consuming their value for his personal wants, this value serves others than himself.—Thus, for example, the owner of land or capital who obtains from these kinds of productive property an annual revenue of \$10,000, and who saves half of it every year,

renders to society a new yearly service worth \$5,000; and although he reserves to himself the power of demanding back at a later time the sum total of these services, increased by the total of the interest, it is none the less evident that while he abstains from demanding it and consuming it, society has the benefit of it in his place. A family which during several generations, during two centuries, for example, should have saved uninterruptedly half of its annual income, would have really admitted society during all this time to an equal partition with itself of the means of production and satisfaction which this income brought; in other terms, it would have added to the sum total of the enjoyments of society, an amount twice as great as the family itself could have obtained from it. The means of creating new wealth or satisfaction of which the family would have deprived itself, would have been acquired by others. The only exclusive benefit which its savings brought the family consisted in the feeling of security resulting from the power which it preserved of demanding from society, in case of need, services equal to those which it had ceded to it.—These results of saving are incontestable. It follows, therefore, that it does not profit exclusively those who save, and that it is a very positive public benefit. The rich man who spends the whole of his revenue every year, in personal and unproductive consumption, does not exceed his rights; but in this way he only renders to others services exactly equal to those he receives from them; he is, therefore, of less use to others, and consequently less worthy of approbation and esteem in this regard, than the rich man who saves.—Nevertheless, common opinion is more disposed to approve him who spends all his income for his personal wants, than him who saves a part of it. Strange fact, that the person who preserves for his family and society the greater number of utilities of every kind, and does it by restricting his personal enjoyments, is just the man whom the vulgar mind is inclined to reproach with egoism, while it attributes laudable and generous sentiments to him who denies himself nothing.—To explain this unjust judgment it is affirmed that he whose personal wants are few *does not quicken the circulation of wealth*, that he deprives industry and commerce of its outlets and of the encouragement which the consumption of wealth might give them. In this way men come to believe and to profess that every one renders more service to society the more value he consumes unproductively. Thus, men justify the expenses of luxury, pride, profusion, etc. This error was so generally disseminated in France, that in the greater part of the pamphlets, etc., written in 1848 and 1849, with the intention of combating the aberrations of socialism, it was thought necessary to praise the expenses of luxury, and endeavor to prove that it is, above all, on account of this kind of outlay, that the poor classes are interested in respecting wealth; so that, to combat lamentable economic errors,

others as great were propagated. This we shall try to prove in a few words.—Wealth is made up of all objects having value in exchange, no matter what their nature or their form. When a portion of wealth is consumed, that portion exists no longer; after which, if the want which it has satisfied appear again and we have still the means of providing for it, the object consumed must be reproduced, and the necessity of this reproduction gives new food to labor.—But we may consume a portion of wealth in two ways: in the first place, we can absorb its entire value, in such manner that absolutely nothing may remain of it. This is a case of *unproductive* consumption, which takes place, for example, in the case of a sumptuous repast, of fireworks, etc. We consume in this way the services of those who have furnished and prepared the food, those of the pyrotechnist, the powder manufacturer, the decorators, the costumers, the musicians, the actors, etc. We have thus furnished, but for once only, labor and pay to all these persons. In the second place, we may consume wealth in such a manner that after the operation a value may remain equal to or even greater than that consumed. This is a case of *reproductive* (or productive) consumption. Suppose, for example, that the value consumed at the banquet or the fête, instead of being used in this way, had been employed in improving a barren hillside or in making a vineyard of it: by this application of the value consumed, we should have given work and wages to ditchers, to vine-dressers, to teamsters, to manufacturers of compost, to producers of plants and of props; and we should thus have furnished remunerated employment to a number of laborers at least as great as the number hired at the banquet; and, while *nothing* remained after the banquet, from this there would remain a vineyard, the annual product of which, the income from it, would furnish every year, and during an indefinite period, an entirely new article of food, in consideration of a certain amount of labor. This example suffices to show how much it is to the interest of workmen in general, that the rich, instead of spending all their income in unproductive consumption, in outlays for luxury, should devote the greatest part possible of it to *reproductive* consumption. Even if they do not watch directly over these operations, and if they confine themselves to placing the sum of their savings *at interest*, they still render a greater service to the working classes than spending their wealth unproductively. Deposited with a banker or a loan agent, their savings go to the farmer, the artisan, the contractor, who utilize them in reproductive consumption.—Do not men complain every day that we have not enough of capital; that it is lacking in manufactures, in commerce, in great works of public utility, and above all in agriculture; and that, by reason of its insufficiency, the rate of interest is too high? But if such is the case, what should we desire? Should we not desire that savings and investments should be multiplied as much as possible, that

capital should increase and its abundance make the use of it less costly, that is to say, lower the rate of interest?—Now, rich persons are the only ones who can make savings with ease. It should, therefore, be recommended to them, not by the law, for all liberty should be left them in this regard, but by morals, by the esteem attached to such conduct by an enlightened public opinion, by their own self-interest properly understood, which is here completely in accord with that of the laboring classes. Those who give other counsels to the rich, and desire to persuade them that they render more service and have more merit in proportion as they spend more for their wants, their tastes, their fancies, their vanities, their personal satisfaction, obey, in so doing, a prejudice which is much to be regretted. (See *WEALTH, SAVING.*)

AMBROISE CLÉMENT.

ACT, the completion or attestation of any transaction in public, and, in certain cases, in private life. By the word act are specially designated certain decisions the result of conferences, congresses, and of various political bodies, such as diets, chambers and parliaments. Thus, the decisions of the diets of the German empire have appeared, since 1729, under the title of *Acta Publica*. The word act is often used as a synonym of document and even of contract.—This word has another and special meaning. It applies to the laws emanating from the British parliament and clothed with the royal sanction. It is important to note this last formality; for, in parliament, every proposed law preserves the title of bill, and does not acquire the name of act, until it has received the sanction of the crown. The most ancient act still in force is the celebrated *Magna Charta*.—Some acts receive their title from the place where the parliament which passed them met. Others still, from their initial designations. Since the reign of Edward II., the most common usage is to give the year of the reign of the king or queen under whom the act or statute was passed, and also the number of the chapter.—In the United States the term act is applied to any statute or law made by a legislative body, whether the national congress or the legislature of a state. General or public acts in the United States are those which bind the whole community; special acts affect only certain persons or interests. X.

ADAMS, Charles Francis, son of John Quincy Adams, was born at Boston, Aug. 18, 1807, was admitted to the bar in 1828, was the candidate of the free-soil party for vice-president in 1848, representative in congress (republican) 1859-61, and minister to Great Britain 1861-68. (See *ALABAMA CLAIMS.*)

A. J.

ADAMS, John, president of the United States 1797-1801, was born Oct. 19, 1735, in Braintree (now Quincy), Massachusetts, where he died July 4, 1826. He was graduated at Harvard in 1755, was admitted to the bar in 1758, and in 1770

entered public life as a representative in the legislature. He was a delegate to the continental congresses of 1774-77, (see *DECLARATION OF INDEPENDENCE*). He entered the diplomatic service in 1777 as minister to France and (in 1785) to England. In 1788 he returned so free from domestic political entanglements that, next to Washington, he was the most available presidential candidate. He became vice-president in 1789 (see *ELECTORAL VOTES*), and retained that office until 1797, his casting vote as president of the senate being very useful in support of Hamilton's federalist measures. (See *FEDERAL PARTY*.) In 1797 he was generally accepted (see *CAUCUS, CONGRESSIONAL*) as the federalist candidate for the presidency, and was elected over Jefferson. His fatal mistake lay in his retaining Washington's cabinet. His own mind was bent on Washington's policy of neutrality between England and France, and his hearty dislike of Great Britain was a sufficient make-weight against commercial inclinations to enable him to keep the balance fairly even. But his cabinet was as strongly inclined to the Hamiltonian policy, which was not averse to the idea of war with France, and Adams was by no means as successful as Washington in controlling his political household.—At first the new administration was extremely popular. The X. Y. Z. mission created an intense anti-Gallican feeling in the United States, and while Adams was willing to direct the storm, he was as popular with the Hamiltonian federalists as he had always been with those of New England. But he soon became satisfied that his cabinet was "Hamilton's rather than his," and that the main Hamiltonian object was to force a war upon France. In February, 1799, he therefore nominated ministers to France, and in November imperatively ordered their departure, in both cases without the previous knowledge of his cabinet. His action, dictated by pure patriotism and by a clear perception of the country's best interests, ruined the political prospects of himself and his party. The republicans, (see *DEMOCRATIC-REPUBLICAN PARTY*), relieved from the necessity of choosing between France and the United States, gathered fresh strength and renewed the struggle for the presidency; and the two factions of the federalists were more successful in proving one another unworthy of public confidence than in repelling the attacks of the common enemy. Upon Adams was thrown the entire responsibility for the alien and sedition laws, the increase of the army for political purposes, and every other "high-flying" federalist measure which had originated in congress. He was beaten by Jefferson, though really only by the vote of South Carolina, and there by a very slender majority (see *ELECTORS*), and, embittered by the virulence of the campaign, retired from Washington on the morning of March 4, 1801, without taking part in Jefferson's inauguration. The breach between them was not healed until some thirteen years after.—

The federal party never forgave Adams for his share in their overthrow. Their animosity was kept warm by the open desertion of his son (see ADAMS, JOHN QUINCY) to their opponents, and for many years the private life of the ex-president was made busy by recurring newspaper controversies. He and Jefferson died on the same day, the fiftieth anniversary of their joint work, the adoption of the Declaration of Independence.—See 1-3, 7-9 C. F. Adams' *Life and Letters of John Adams*; *Correspondence of John Adams and Wm. Cunningham*, 1803-12; 2 Gibbs' *Memoirs of the Administrations of Washington and Adams*; Trescott's *Diplomatic History of the Administration of John Adams*; Parton's *Life of Burr*, 225; Wood's *History of the Administration of John Adams*, and *Correct Statement of the Sources of the history* (both entirely untrustworthy, but interesting); and authorities under articles referred to.

ALEXANDER JOHNSTON.

ADAMS, John Quincy, president of the United States 1825-29, eldest son of John Adams, was born in Braintree (now Quincy), Massachusetts, July 11, 1767, and died in Washington, Feb. 23, 1848. He was graduated at Harvard in 1788, was admitted to the bar in 1791, and in 1794, by Washington's appointment, became minister to the Hague. In 1803 he was chosen, as a federalist, United States senator from Massachusetts. In 1803 his support of the embargo was censured by his state legislature, and he at once resigned and went over to the opposite party, by which he was made minister to Russia and (in 1815) to Great Britain. In 1817 he became secretary of state under Monroe. In 1825 he was chosen president (see DISPUTED ELECTIONS, II.) His support came mainly from the same commercial and business interests which had formed the federal party, but which now, while accepting, without any thought of dissimulation, the republican name, retained all the federalist tendencies. He received but a few (6) scattering electoral votes from the south and west, and these two sections united in a determined opposition to him, which lasted through his administration, and in the next election (1828) was successful in gaining over the middle states and overthrowing Adams, as his father had been overthrown. (See DEMOCRATIC-REPUBLICAN PARTY, II., III.; FEDERAL PARTY, II. Adams has been blamed in part for his own defeat, on the score of his action in raking up, in 1828, the embers of a former charge of secessionist designs against the federalist leaders of New England (see SECESSION, I.; EMBARGO); but as he received the solid New England vote in 1828, the causes of his defeat are evidently to be sought elsewhere.—Adams retired, but not to permanent private life. His anti-federalist action above mentioned cut him off from all hopes of advancement at the hands of the national republican party in Massachusetts, but the anti-masons (see ANTI-MASONRY, I.) of his district sent him to congress in 1831, and he was regularly re-elected

until his death, seventeen years after. In congress he was his own party, and became one of the most prominent members of the house. He opposed or supported the democratic administrations with absolute independence, and when the abolitionist petitions were cut off by the passage of "gag-rules" (see PETITION), he fought the obnoxious rules for years. In February, 1836, on the second of Pinckney's resolutions (see SLAVERY), that congress had no constitutional right to interfere with slavery in the states, which was carried by a vote of 201 to 7, Adams voted in the minority, and defended his vote by a full, though hypothetical, statement of the war powers of the federal government, under which slavery was eventually abolished. In February, 1837, for asking permission to offer a petition from a number of slaves, he was threatened with the censure of the house, but rode out the storm successfully. In 1839-40, he was counsel for the slaves in the Amistad case. In the course of this series of anti-slavery labors, he gradually drifted into co-operation with the abolitionists (see ABOLITION), though in his mind his abolitionist warfare seems to have been only an incidental feature in his nationalizing struggle against the overbearing particularism, developed by slavery, of southern leaders. In this sense his work was unfortunate in being 20 years before its time, and he may be considered as a republican of 1856, developed 20 years too early, and almost equally distasteful to both whigs and democrats. He died almost in harness, having fallen from his seat in the house through a paralytic stroke, from whose effects he died two days afterwards.—See W. H. Seward's *Life of John Quincy Adams*; C. F. Adams' *Memoirs of John Quincy Adams*; Quincy's *Memoir of John Quincy Adams*; and authorities under articles referred to.

ALEXANDER JOHNSTON.

ADAMS, Samuel, one of the founders of American independence. He was born in Boston, on the 27th of Sept., 1722. He studied theology, but not finding the pulpit congenial, engaged in business in a small way. England's commercial policy towards the colonies led him into the opposition. He vigorously opposed the stamp duties, and was one of the first to advocate separation of the colonies from the mother country. He became a member of the Massachusetts colonial legislature in 1765, and was the first to suggest the establishment of the corresponding societies, with their rendezvous in Boston, which did much to promote the cause of the revolution. As early as 1770, in a speech on the rights of the colonies, he declared that the colonies were free, and would be free; just as in 1740, on the occasion of his taking his degree of A. M., he defended the thesis that "when the commonwealth can not otherwise be preserved, it is lawful to resist the supreme magistrate." A delegate to congress from 1774 to 1782 for Massachusetts, he did all in his power to give effect to the declaration of independence. He was always on the

best of terms with Franklin, Jefferson and others of the revolutionary chieftains, but not with Washington, whose endeavors to strengthen the federal government he erroneously considered dangerous to the liberties of the people. He was an influential member of the Massachusetts convention of 1788, which favored the adoption of the federal constitution, with some modifications, and he contributed more than any other one man to its final adoption by the eastern states. He was elected lieutenant governor of Massachusetts in 1789, and governor in 1794. He resigned the latter office in 1797, partly on account of old age. He died in Boston, Oct. 2, 1802, at the age of 81.—Samuel Adams was a man of great independence of character, fiery and resolute. He was a democrat by nature and an agitator of the first class. He was a particularist in American politics, and opposed to the federal party. Samuel Adams' judgment may not have been always correct, but he will always retain a place in the hearts of his countrymen as an example of unselfishness, inflexibility and political virtue, as in his lifetime he was styled the American Cato. X.

ADJOURNMENT. (See PARLIAMENTARY LAW.)

ADMINISTRATION. (See CIVIL ADMINISTRATION.)

ADMINISTRATIONS (IN U. S. HISTORY.) Under the confederation, the only substitute for an executive power was a series of boards of war, treasury, etc., working under the supervision of committees of congress. Under the constitution these were succeeded by a system of executive departments, organized by acts of congress but filled by appointment of the president. The principal officers of these departments form a body of advisers to the president, for which the name *cabinet* has been borrowed from English political language; but the word has no original significance in this country, and the president is not even required by the constitution, but merely permitted, to demand the written opinions of heads of departments.—The present departments were organized by acts of the following dates: *War*, (then including the Navy), Aug. 7, 1789; *Treasury*, Sept. 2, 1789; *State*, (originally *Foreign Affairs*), Sept. 15, 1789; *Justice*, (as a part of the Judiciary), Sept. 24, 1789; *Postoffice*, (temporary) Sept. 22, 1789, (permanent) May 8, 1794; *Navy*, April 30, 1798; *Interior*, March 3, 1849. The postmaster general was not considered a cabinet officer until invited by Jackson to cabinet meetings in 1829. Until that time this officer was considered a subordinate of the treasury department. A list of postmasters general, 1789–1829, is given at the end of this article.—**1ST ADMINISTRATION.** George Washington, Va., pres., John Adams, Mass., vice pres. *State*, Thomas Jefferson, Va., Sept. 26, 1789; *Treas.*, Alex. The acts of Aug. 7, Sept. 2, Sept. 15, Sept. 22, and Sept. 24, 1789, May 8, 1794, and April 30, 1798, (above referred to), are in 1 *Stat. at Large*, 49, 63, 68, 70, 93, 354 and 553 respectively. The act of March 3, 1849 (*Interior Dept.*), is in 9 *Stat. at Large*, 395.

ALEXANDER JOHNSTON.

AFRICA, one of the five divisions of the globe. Africa would be a continent were it not for the isthmus of Suez which connects it with Asia. At all other points it is bathed by the sea: on the north by the Mediterranean; on the northeast by the Red sea; on the east by the Indian ocean; and on the west by the Atlantic. Its entire area is estimated at 11,556,600 square miles. Its population, of which not even an approximate census has ever been taken, is estimated to be from 60,000,000 to 200,000,000, mostly of the black race. The truth here, as in most cases, is likely to be found between the two extremes.—Politically, Africa is divided into independent states and peoples, dependent states, and European colonies. 1. The independent states and peoples are: In the north, 1, the empire of Morocco, with

about 216,000 square miles and a population variously estimated at from 2,500,000 to 8,000,000; 2, Tunis, claimed by Turkey as a vassal province, but whose bey exercises sovereign power (in 1871 the bey recognized anew the suzerainty of the porte), with a population of 2,100,000, and an area of about 42,000 English square miles. — On the west is the republic of Liberia, founded by free black immigrants from America. It has an area of 14,465 square miles; and a population of about 720,000. — In the east, the island of Madagascar. — In the south, in the interior, 1, the republic of Orange, established by the Boers, independent Dutch colonists, and 2, the republic of the Transvaal. — In the northeast, Abyssinia, situated on the lofty plateau between the upper Nile and the Red sea. — In the interior of Africa, and on certain parts of the coast, native tribes form a multitude of little nations, independent of all foreign power. Some of these are isolated; others are grouped into confederations, or formed into states subject to chiefs, whose dominions assume the titles and extent of kingdoms and empires, the limits of which vary according to the fortunes of war, and are more easily recognized by the people within them than by the territory they enclose. Without pretending to make a complete enumeration of these kingdoms, we may mention the following: in the great desert, the Touraegs and the Tibbous; in Senegambia, the Moorish and Berber tribes, and the Yolof, Bambaras and Mandingoes states (the Cayor Fouta-Djalon, Djiolof, Bambouk, Kharta, Kasso); in central Soudan or Takrou, Segou, Macina, the empire of the Fellatahs formed of a dozen vassal kingdoms, and besides Bornu, Baghirmi, Adamana, Waday, Darfour, etc.; in upper Guinea, the kingdoms of Ashantee and Dahomey. As to the inhabitants of central Africa, unknown to Europeans, those of southern Africa (Hottentots and Kaffres), and those of eastern Africa (Gallas and Somahs), they do not appear to have emerged from the condition of savage and patriarchal tribes, so as to form the body of a nation. — II. The dependent states are: Egypt proper, an hereditary vice-royalty under the sovereignty of the porte, with an entire area of 175,130 English square miles, and a population of about 5,517,627; Tunis (see above); Tripoli, governed despotically by a pasha named by the sultan; Zanzibar, dependent on the iman of Mascate. To these may be added the coast between Abyssinia and the sea, on which Massouah is situated, administered financially by the porte, and Madagascar, over which France claims sovereign rights of long standing. — III. The European nations which possess trading posts and colonies on the coast and in the seas of Africa are France, England, Portugal, Spain and Holland. About twenty years ago, Denmark sold her establishments on the Gold coast to England — Africa, owing to its Mediterranean coast, has always played a considerable part in the world's history. To mention Egypt and Carthage is to recall the glory and

wisdom of antiquity, and the immortal struggles against Rome. In the middle ages the Mussulman sovereigns of Magbreb extended their dominions over Spain, and the regency of Algiers in the hands of the Barbarossas and their successors defied the threats of the Christian world during three centuries. In our own day the cutting of the isthmus of Suez promises a brilliant future to Egypt, situated as it is between Asia and Africa, the Mediterranean and a gulf of the Indian ocean. At all other points Africa has only commercial connections with the rest of the world — The economical and commercial position of Africa is a result of its geographical situation. — Traversed by the equator and both tropics it is within the torrid zone, most of whose vegetable and mineral products are found within its borders, but extending 35° to the north and south. It extends 12° into the northern temperate and 12° into the southern temperate zone, whose southern character is not unlike that of the Mediterranean coast. Two topographical peculiarities greatly modify the effects of its geographical situation. The first is the great deserts which, under the name of the Great Sahara in the north, and the Kalahari in the south, strike with almost absolute sterility immense tracts of land, and oppose almost insurmountable barriers to communication. The second are the high mountains, of which there are five systems: the Atlas in the north, the Abyssinian mountains in the east, the Kong range in the west, the mountains of the Moon in the centre, and the South African range. These mountains attain a height of from 6,000 to 18,000 feet, and temper the heat of the region by reason of their altitude. Communication with the world outside has been facilitated by the waters which surround Africa. Two great basins, the Mediterranean and the Red sea, were in antiquity the great water highways of the ancient world. Since the discovery of the cape of Good Hope all the rest of the coast has been visited by ships in great numbers, and has witnessed the rise of commercial houses, factories, dépôts, villages and colonies. In spite of the distance it was possible to establish relations between China and Africa in early times, owing to the monsoons which, in the Indian ocean, blow regularly during six months from the northwest, and six months in the opposite direction. Commercial enterprise, however, has rarely penetrated into the immense interior of Africa, on account of the small number of large rivers there, suitable for navigation. There are in Africa three rivers of the first magnitude: the Nile, the Niger, and the Zambeze; and four of the second magnitude: the Senegal, the Gambia, the Zaïre or Congo, and the Orange river. This paucity of rivers on such a vast surface indicates either the absence of rain in the interior, which seems to be the real cause of the deserts, or the rapidity of evaporation, a natural result of the heat, or, finally, a depression in the central region attended by the formation of lakes, where the rivers are lost. The existence of this last cause,

scarcely suspected in former times, has been confirmed in recent years by the discoveries of travelers.—All these peculiarities taken together explain the general character and local variations of African commerce and economy. The hottest climate on earth puts its powerful and glowing imprint on the flora and fauna of the country; while the climate grows milder at the north and south, and on the highest points of land, until we reach the temperature of temperate countries, with a sub-tropical tint. It follows from this that the products of southern Europe and central Asia must be found growing together in the north and south as well as in the islands with those of regions characteristically African.—The vast natural wealth of this continent is in the hands of the black race, who, with a thousand varieties of color, form and aptitudes, inhabit almost the whole of Africa, since they have not been subjected to foreign influence except on some narrow strips of coast-land. In the north, however, all the region of the Atlantic with the Sahara is divided between three principal varieties of the white race: the Aryans of Europe, masters of Algeria and settled somewhat numerous in the commercial towns; the Arabs, who invaded and conquered the country; and the Berbers, inhabitants of the land from time immemorial, and who are so ancient that they may be considered autochthonous. The black race begins on the southern rim of the Sahara and occupies all the rest of Africa from east to west, save a few spots on the eastern coast inhabited by Arabs, by Malay Hovas in Madagascar, by whites in different European colonies, and by the Turks in Egypt. The black race, according to a widely received opinion, inferior to the white in intellectual faculties, has been so enslaved by the latter at every point at which they have come in contact, that by an odious violation of human rights they were for centuries the principal article of export from Africa to Asia and America; but this is something which we can merely refer to here. (See SLAVERY, NEGROES.)—Still relegated to a lower scale in social life, the black race gains but meagre benefit from the gifts of nature. Their culture, their industry, their commerce, are but rudimentary. The ground is tilled by hand, rarely with the plow. Commerce is carried on by land on the backs of camels and by caravans, and by water. But these people, no matter how low they be, are susceptible of education. The most advanced among them are those who have been most under European influence. This influence operates on their manners as well as their industry, and at length progress manifests itself everywhere in their commerce which has already attained the sum of about \$240,000,000. If we consider that France alone does five times as much business as all Africa, we shall see how much the latter is behind Europe, and what inexhaustible resources she offers to the intelligent use of capital, brain and muscle.—BIBLIOGRAPHY: Ritter, *Allgemeine vergleichende Geographie*, Berlin, 1822;

JULES DUVAL.

AGE, Political Aspects of. The attainment of a certain age is one of the conditions attached to the exercise of civil and political rights. A man must have reached a certain age before he can be held responsible for his acts, or be entrusted with his own fate or that of others. This age is fixed by law and generally in accordance with the usages and customs of the country.—But age plays a part in the political life of a people altogether independent of the rights conferred by law on those who have reached their legal majority. Youth, ripe manhood and old age do not always look on questions from the same point of view. In fact they rarely do so. Youth lacks experience. It has not gone through the process of deception. It seizes questions with a generous spirit and looks at their bright side. It does not recoil before danger, and seems disposed, at times, to seek it. Manhood is less dazzled by appearances. It has been deceived only too often, and is not so easily caught with words. Old age is often skeptical, or makes it a point of honor to remain faithful to the opinions of a lifetime. Hence youth most frequently ranges itself on the side of democracy; middle age on that of the liberals; old age with conservatives. This of course refers only to the first impulse. On reflection the young man casts aside his utopian ideas, and, later on, takes the position which reason points out as the best or toward which his temperament inclines him. The mature man hesitates in the presence of new ideas, and takes no position without first obtaining ample information. The old man is naturally hostile to change. In a greater or less degree it is necessary to convince him of the reality of the advance before he will approve the step; not unfrequently he feels it a point of honor to stand aloof; he does not wish to give the lie to the beliefs, acts and feelings of his whole life.—There is, however, a force which frequently neutralizes or weakens the influence of age on political opinion. It is the fact of having been reared in a family with strong and well defined political convictions. In such families the sons generally take the opinions of their fathers as they do their names, and remain faithful to these opinions through life. The exceptions to this are more rare than is supposed, for here education has produced fixed ideas in the minds of the sons and caused them to take a fixed position. The child has often heard the arguments opposed to the views of his parent brought up and refuted in a manner convincing to his prejudiced mind. They

have been ridiculed, perhaps treated with contempt. These impressions have sunk deeply into the mind of the young man. They dictate his modes of thought, so that opposing ideas have slight influence on him. He does not listen to them willingly, and if his temperament, not to mention his interest, come to the aid of education it is nearly impossible to change his mind.—It may now be understood why democracies fix the accession to the right of suffrage at as early an age as possible, and why liberals, and still more conservatives, wish it fixed at a later age. In hereditary aristocracies political majority is often fixed at an early age because education there curbs the spirit of innovation, while in very small democratic states it is fixed at a more advanced age, each citizen looking on himself as invested with a position of trust, on which the welfare of his country depends. MAURICE BLOCK.

AGENT, Diplomatic. A diplomatic agent is a functionary commissioned to represent one state at the capital of another, or to negotiate and treat with that other on national affairs.—1. HISTORY. It may be said that there were diplomatic agents from the time that two or more political communities existed and began to hold intercourse. The Egyptians, the Persians, the Jews, the Greeks, the Romans, especially the latter, received and sent political agents to discuss their public interests with other nations. The Greeks and Romans called their agents *προσβέτις*, *legati oratores*, and conferred on them special rights. Antiquity did not possess, however, a well developed international code. For this there are very excellent reasons, among others, that then the civilized world was frequently confined within the limits of a single empire. The middle ages witnessed the formation of distinct states, independent of one another. During many centuries, however, these states held but little intercourse. Agents were sent abroad by princes on private business which they did not distinguish from public affairs. Men of quality were also sent on formal missions. At times the pope demanded of princes to send him embassies of obeisance on their accession to power. In modern times these have been modified into simple embassies of respect or politeness. The popes alone had envoys, *responsales*, in early times near the kings of France and the Byzantine emperors. Later, we find permanent papal envoys, called legates, near the kings of France and England and the sovereign of the holy Roman empire.—The kings of France were the first secular princes who established a regular system of diplomacy. Louis XI. had permanent envoys residing near the king of England and the duke of Burgundy. His son, Charles VIII., by his Neapolitan expedition, brought about a complication of affairs in Europe which forced princes to be represented near foreign sovereigns.—The diplomatic agent is, therefore, a product of the cabinet policy which began to be developed in the 16th century.—Diplomacy had nothing

regular about it in its early stages. At first there was but one class of diplomatic agents—ambassadors who, by diplomatic fiction, were supposed to have the high office of representing the person of the sovereign. This gave rise to ceremonial difficulties and great outlay of money, which neither contributed to the dispatch of business nor smoothed the way of negotiation. In order to avoid these difficulties simple agents were sent, who had nothing to do with ceremony because they did not represent the person of the sovereign. At first they received the name of agents, then of resident ministers at foreign courts. These agents were entrusted with the earliest permanent political missions. Ambassadors became permanent only subsequently to the establishment of political missions during the course of the 18th century, and from that time, were divided into several classes. It was in the 17th century that the rules of diplomatic etiquette began to be applied to envoys of the second degree. From the treaty of Westphalia we may date the establishment of more fixed rules for diplomatic agents. The treaty of Utrecht, in 1713, had the same result as that of Westphalia. In the 18th century there were three classes of public ministers: Ministers plenipotentiary, resident ministers, and *chargés d'affaires*. The sphere of action of the diplomatic agent has not undergone less modification than has the rank and distinction of the classes of ministers. Under Louis XI., and generally during the 16th century, diplomacy meant deceit and trickery. The question for the diplomat was not so much to represent the general interests of his own country as to find out the secrets of the court to which he was accredited. In proportion as political interests became separated from the private business of the prince, the activity of the agent began to lose its character of *finesse*, sharp practice and espionage. The establishment of permanent missions which became obligatory on all states, contributed greatly to the advance of international law. By degrees the adoption of a uniform *modus vivendi*, and of general rules of negotiation, created a certain equality among states, and also that feeling of right which forms the basis of the European system. In this respect above all, the establishment of permanent missions has been of great service. But on the whole it is impossible to form an idea of the part played by diplomatic agents without taking into account the general system of politics prevalent in civilized states. The purer politics become, and the higher its motives, the more fruitful in good results is the action of the diplomatic agent.—It may be said without fear of mistake that the great epoch of European diplomacy commenced with the era of absolutism, between the peace of Westphalia and the congress of Vienna, from 1648 to 1815. When a single will, looking only to its own pleasure, directed the destinies of states, the task of diplomacy was far different from what it is now. In our day public opinion urges on instead of following the march of events,

and diplomat, king or prince must be on good terms with public opinion if he hopes to hold his place. Besides, the multiplicity of interests in our days is such as to render it impossible for one man to represent his country in everything; and it now happens more frequently than in former times, that important negotiations, such as treaties of commerce, are confided to ministers plenipotentiary *ad hoc*. To this must be added the numberless means of communication. When the capitals, that is, the centres of negotiation, were separated from each other by long distances, instructions, general, special, ostensible, or secret, had much more importance than now. At the present time, the diplomat, like other men, utilizes the telegraph wire. There is no longer either time or distance. Cabinets are in a condition to profit by all the changes of circumstance, to act directly and immediately. Real diplomatic action will fall more and more into the hands of the ministers of foreign affairs of their several governments, and the diplomatic agent will become more and more a simple bearer of instructions. Adroitness, the power of studying and influencing men, will doubtless continue to be necessary qualifications of a diplomat; but his responsibility and independent action will tend to decrease, and consequently the importance of his functions will lessen. Men fit to devote themselves to public affairs have now open to them other careers than that of diplomacy, which does not, as formerly, furnish the only way, except that of arms, to honor, influence and reputation. It is much less sought after than in the beginning of this century, and great names are less frequently found in it.—

II. RIGHT OF LEGATION. The right of legation is active and passive, that is, the state which has the right to receive diplomatic envoys has also the right to send them to other states. The right of legation is a consequence of sovereignty. Its exercise belongs to the representative of the state. It is optional and not obligatory. Nevertheless the refusal to receive the minister of a foreign power in time of peace may be considered as a cause of rupture, if the refusal be not founded on plausible reasons. Among these the most important may be the person of the minister himself, who may be objectionable to the government to which he is accredited. When one state denies to another the right to accredit ministers to it, it refrains from exercising the like right itself. The right of legation having its origin in sovereignty, belongs equally to monarchies and republics. The class to which a minister may belong is a question for the government which appoints him to decide. Nevertheless this principle is subject to certain restrictions resulting from inequality from the standpoint of diplomatic ceremonial. In general the right of sending ministers of the first class is reserved to states whose rulers enjoy royal honors, and to great republics. Dependent, semi-sovereign states can not accredit diplomatic agents. A state connected with another which is charged to negotiate concerning their common

interests with third parties, has not the right to receive or accredit diplomatic agents. Such are Norway at present, and Poland under the constitution of 1815. The grand duchy of Luxemburg was in this condition for a long time, but since 1867 that country, which is connected with Holland through the person of the sovereign, has special diplomatic representatives. The states forming part of the German empire have not the right of legation. Some of them, nevertheless, still exercise that right by simple toleration. The Danubian principalities and other vassal states of Turkey maintain semi-official agents, but matters of importance which concern these dependent states are treated by the Turkish representative. A limited right of receiving public ministers is sometimes accorded to governors general, viceroys, etc. A monarch who has abdicated can no longer exercise the right of legation. A more disputed question is, whether this right ceases with the involuntary loss of the throne. The answer here is dictated by reasons of state. Formerly, the legitimate but dethroned monarch retained the right of embassy which was refused to the usurper. At present, when the tendency is more and more to recognize accomplished facts as the basis of new rights, the world is inclined to drop the distinction between governments *de facto* and *de jure*. From the moment that the successor of the dethroned prince really represents authority, it is in order to receive his envoys. It is admitted, in any and every case, that the reception of a minister being equivalent to a recognition of the sovereign whose mandatory he is, the minister of a dethroned monarch can not be received with the same title and in the same official character as the minister of the monarch who supplanted him. There is one exception, however, in favor of the pope. Since Italy took possession of Rome certain states have a representative near the King of Italy and also one near the chief of the Catholic church.—

III. CLASSIFICATION OF DIPLOMATIC AGENTS. They may first of all be classed in accordance with the object of their mission. There are ministers for negotiation, ministers of etiquette and of ceremony. There are embassies of excuse, of obedience, or reverence. Finally, the mission of a diplomatic agent may be permanent or temporary, extraordinary or ordinary. These distinctions, however, do not refer to what is specially understood by classification, which has essentially in view the rank of the diplomatic agent. The difficulties raised formerly on account of ceremonial and the disputes on questions of rank led the eight powers who subscribed to the treaty of Vienna to adopt one and the same rule on this subject. By the act of March 19, 1815, diplomatic agents were divided into three classes: Ambassadors, legates or nuncios; envoys or ministers accredited near sovereigns; *chargés d'affaires*, accredited near ministers of foreign affairs. Ambassadors and legates or nuncios alone have the representative character. Diplomatic envoys on extraordinary

missions have no superiority of rank on that account. Diplomatic envoys take rank in their classes in accordance with the date of the official notification of their arrival. It became necessary for each state to fix a uniform mode of reception for the diplomatic envoys of each class.—The protocol of Aix-la-Chapelle, dated Nov. 21, 1818, added a fourth class, that of ministers resident, who took rank between ministers of the second order and *chargés d'affaires*. It is proper to add that but few states are represented by ministers resident. The most numerous classes are the second and fourth. In the majority of cases governments accredit near foreign courts diplomatic agents bearing the title of envoy extraordinary and minister plenipotentiary. This title was first employed by the English. Notwithstanding the regulation of 1815, a species of superiority over the ordinary was attributed to the envoy extraordinary. This is the reason why most ministers on a permanent mission take the title of envoy extraordinary. Diplomatic agents of the first three classes are accredited from one sovereign to another. The fourth class, that of *chargés d'affaires*, receive their credentials from the ministers of foreign affairs of their own country, and are accredited to the ministers of foreign affairs of the government near whose court they reside. The rules of Aix-la-Chapelle do not hinder any power from fixing the hierarchy of the diplomatic corps as it thinks fit. In France the hierarchy is at present the following: Ambassadors, envoys extraordinary and ministers plenipotentiary, *chargés d'affaires*, secretaries of embassy, secretaries of legation, attachés or diplomatic aspirants. The consuls general of France in Mussulman countries and in South America have the rank of *chargés d'affaires*. Diplomatic tradition ascribes to an ambassador (see AMBASSADOR) the privilege of representing more particularly the person of his sovereign; it has been concluded from this that he has a right to be received by the prince near whom he is accredited every time he presents himself, but in constitutional countries this right, if it still exists, is purely honorary, for the sovereign can not make any decision without consulting his ministers. The four classes of ministers admitted by the protocol of Aix-la-Chapelle, Nov. 21, 1818, comprise, properly speaking, public ministers. Besides these classes the following diplomatic agents may be mentioned: 1st. Semi-official agents sent by non-recognized or usurping governments. These are not members of the diplomatic corps. They have not letters of credence, but simply letters of recommendation. 2nd. Commissioners with a special mission, such as the fixing of boundaries or the settling of claims. 3rd. Great personages charged with important missions in which it is desired to avoid diplomatic ceremonial without at the same time placing the envoy in an inferior position. The public minister establishes his character by the delivery of his letters of credence, which are presented to the sovereign when

the minister belongs to one of the first three classes, or to the minister of foreign affairs when he is merely a *chargé d'affaires*.—IV. PRIVILEGES OF DIPLOMATIC AGENTS. These were formerly very great, but at present they consist especially in the following: 1st. Inviolability of the person of the agent and the couriers of the legation. 2nd. Exemption from foreign jurisdiction. There is a certain number of undetermined questions here, the solution of which often depends on the manner in which the case presents itself, for the exemption from civil jurisdiction is not absolute. One thing well established, however, is, that the building in which the legation is located is inviolable, and that the local authorities can not cross its threshold even to serve a legal writ. Neither is the exemption of the diplomatic agent from criminal jurisdiction absolute. It does not extend to cases of flagrant conspiracy against the government to which he is accredited. Finally, as to the suite of the minister. There is a distinction to be made between the suite proper and persons simply attached to the legation, and even among the latter a distinction may be made between natives and foreigners. 3rd. The right of exercising freely the agent's religion in the residence of the legation. This privilege will cease to be one whenever universal freedom of worship shall prevail. 4th. The preceding prerogatives belong to diplomatic agents only in countries where they are resident in an official capacity. In countries through which they are passing, these privileges are purely a question of courtesy.—V. DUTIES OF DIPLOMATIC AGENTS. To the privileges of diplomatic agents there are corresponding duties, resulting either from the nature of their functions or from that of their privileges themselves. If a diplomatic agent enjoys inviolability it is on condition of not going beyond his proper sphere of action. Straight-forward honesty in his intercourse with the government to which he is accredited, is the first duty of a diplomatic agent. In case of offenses committed by public ministers against the safety of the state in which they are resident, their persons and papers may be seized if the danger be pressing, and they may be sent out of the country. If circumstances are not sufficiently imperative to oblige a recourse to such violent action, the recall of the objectionable minister is asked of his government. History affords many examples of both these cases. It is difficult to fix rules of action for exceptional cases. The residence of the legation should never become a centre of intrigue against the government of the country, and the minister should never maintain any relations with the chiefs of parties which might give umbrage to those charged with the direction of state affairs. In a political crisis, during the interval between the overthrow of one government and the establishment of another, the conduct of the minister ought to tend toward allaying irritation and not precipitating a rupture. Individual tact is the best counselor in these difficult circumstances. It is not possible to act in the

same manner in all places. Moderation in one country would be weakness in another. It must be acknowledged that diplomatic agents generally observe neutrality and a proper reserve. Conspiracies like that of Cellamare are unheard of in our day. Still, some eight or nine years ago many complaints were heard of the conduct of the Sardinian minister at Florence in 1859, and of the minister of the same power in 1860 at Naples; and an English minister boasted of the influence which he said he had in causing the overthrow of Louis Philippe's government.—Besides, a diplomatic agent ought not to confine himself to any one class of society, if he wishes to know and be able to describe the condition of the country in which he resides. Diplomates have been justly reproached for restricting themselves to a social circle which is at once narrow and cosmopolitan, being the same everywhere without a local character of its own. In fine, the diplomate should be zealous in defending the rights of his countrymen. There is nothing which makes a government more respected abroad, and, as a consequence, at home, than the protection which it affords its own citizens, not *per fas et nefas*, but whenever the right of the person in question seems beyond doubt.—VI. CEREMONIAL. Questions of ceremonial were formerly very difficult to settle, and caused many a controversy. In our day whenever points of etiquette are not settled by usage, means are sought to avoid them, and generally with success. Article 7, of the treaty of Vienna, lays it down that when a treaty is to be signed between several powers, which recognize the *alternat*,¹ the order to be followed in signing shall be decided by lot. At present the alphabetical order is more frequently used. In ceremonies the place of honor is the centre, and each member of the diplomatic corps takes his place according to his rank on the right of this centre. But it is frequently sought to avoid this ceremonial arrangement. Chance is allowed to assign each his place, or it is declared that each place should be considered as the first. The formalities for a reception audience differ according to the rank of the envoy. An ambassador has the right of wearing his hat in the presence of the sovereign before reading his address of audience to him. Ministers of the first class alone have the right to the title of excellency. They may ride in a carriage drawn by six horses. Papal nuncios at Catholic courts have precedence of all other envoys.—VII. A diplomatic mission comes to an end: 1st. Through the extinction of sovereignty in the state which sent the envoy, or in the state to which he is accredited; 2nd. By the death or abdication of the envoy's own sovereign, or the sovereign near whom he is accredited; 3rd. By the extinction of his letters of credence; 4th. By the annulling of his powers; 5th. By the recall or promotion of the envoy; 6th. In consequence of diplomatic rupture; 7th. By the

accomplishment of his mission, if it is temporary or special. (See AMBASSADOR, CONSUL, DIPLOMACY.) JULES GRENIER and MAURICE BLOCK.

AGENTS, Natural, a politico-economical term. The earlier economists were wont to say that three distinct elements concur in the production of wealth, to wit: land, labor and capital, the last being nothing else than previous labor accumulated. But this nomenclature soon seemed too narrow, at least in regard to the first of the terms composing it, in that it appeared to imply that land, properly speaking, is the only one of the natural forces which associates itself with human labor. It is evident that such is not the truth. Man finds agents everywhere in nature to second his efforts. The sea spontaneously yields to him a number of products which he needs only to gather up. The air, the wind, water courses, electricity, all the powers of the physical world, supply him with force of which he makes useful employment in the series of his industrial labors.—The need has been felt, therefore, of putting in the place of *land*, words of more general meaning, applicable to all the powers of nature whose existence is useful to man. To-day the term *natural agents* is almost universally accepted.—Natural agents are of various kinds. Some, like arable land, mines and quarries, furnish both the materials and the workshop of production. They constitute the foundation of all industry. To the arable land, the mines and the quarries may be added the sea, lakes and rivers, in so far as they are considered productive of fish; the others are merely simple agents, aids which second the labor of man either of themselves and naturally, or after they have been, so to speak, tamed and conquered. Such, for example, are the heat of the sun, which develops and ripens plants; the rains which make them fruitful; the water courses which turn hydraulic wheels; the wind which moves ships at sea, or whirls the windmill's arms on land; the seas, lakes and rivers, in so far as they are navigable routes; the weight of bodies, electricity, the force of expansion or contraction of metals, and generally, all the forces which man has found the means of bending to his service.—At no time has human industry been entirely deprived of the aid of natural agents; otherwise it would have produced nothing. But the number of forces which come to man's aid goes on increasing in proportion as his knowledge extends and his means of action grow. Man taxes his brain to conquer the powers of nature and shape them to his use, making them work to his profit, and he gradually succeeds in getting from them the better service. There is scarcely a discovery in science, or at least in the industrial arts, whose object it is not either to put some natural power hitherto unknown at the service of man or to make a new use of an agent already known. It is thus that the discovery of Daguerre compelled the rays of light to trace the image of external objects with a marvellous truth which the pencil of the painter will never

¹ The *alternat* means that each power stands first in the copy of the treaty destined for it.

attain. It is thus that electricity, that power hitherto so mysterious and disobedient, is forced to furnish us with the means of instant communication with most distant places. The admirable discovery of the steam engine is nothing else than putting a natural agent at the service of man, a natural agent of incalculable power which has been successfully mastered. From day to day the number of natural agents in our service increases, and we obtain from them better work. This is one of the aspects of human progress, and not the one least worthy of interest.—This progress is visible in all directions. New mines and new quarries are constantly being discovered. On the other hand, the extent of arable land increases, either by the clearing up of forests, the draining of morasses or the converting of plains and heather into cultivated fields. In the meanwhile new seas are discovered by navigators, their surfaces are explored more exactly and their depths are sounded with increasing accuracy. Lakes by degrees disclose the wealth which they conceal. Rivers and lakes are confined within their beds, and, freed from the obstacles which barred their course, they become, thanks to the labor of engineers, channels of navigation which grow more perfect every day. The force of gravitation, which human ingenuity at first knew so little how to use, and which was even an obstacle to it in most cases, has become, owing to the discoveries of science, one of our most powerful auxiliaries at the present day. Again, the most mysterious forces of nature, as well as the most hidden properties of bodies, formerly rebellious to such a degree that frequently they were a source of trouble to man in his labors, but now conquered and pliant, have been put under contribution, and have become useful instruments in our hands. This is one of the chief causes of the relative fruitfulness of modern industry as compared with the industry of ancient times. "Analyze the progress made by industry," says J. B. Say, "and you will find that it can be reduced to having turned to best advantage the forces and the things which nature has placed at the disposal of man."—Among the natural agents of industry some are capable of being appropriated, others not. And this is true not only of those which constitute the ground-work itself on which industry operates, but also of those which act only as simple auxiliaries. Thus arable land, mines and quarries can be and are almost always appropriated. But the sea, which is productive as well as the land, though not in the same degree, since it produces fish, coral, pearls, salt, etc., the sea, we repeat, is not capable of appropriation, unless perhaps in some of its interior bays. A waterfall considered as a motive power can be appropriated, and we see in practice that most waterfalls have become private property in civilized countries. But the wind, which fills, very nearly, the same office either for windmills on land or vessels which sail on the seas, is not susceptible of appropriation, and there are really but rare and very exceptional cases in

which we may say that it was appropriated to a certain extent.—This distinction is important because of the serious consequences which it involves. It has therefore been laid down carefully by all economists.—The services of unappropriated natural agents is always gratuitous, in this sense, at least, that all men are free to use them gratuitously, on the sole condition of assuming whatever care and expense may be necessary to reap a benefit from them. On the contrary, the service of natural agents already appropriated, is generally burdened with certain dues for the benefit of those who have become their owners. It can be readily understood that he who has succeeded in obtaining exclusive possession of a productive force, should not wish to yield the use of it to others without compensation. If he lends or rents it he is paid for its use. If he uses it himself for the purpose of selling the products which he obtains from it, he charges a little more for these products than the ordinary cost of production.—Looking at things from this point of view we are tempted to believe at first that the appropriation of natural agents is always an evil. But reflection is not slow in correcting this first impression. If it be true that the man who has become master of a productive force of nature to the exclusion of his fellows generally exacts a price for its use, it must be remarked also that he is impelled by his own interest to increase its power when he can do so by his labor and his pains. There are certain natural agents which work for man spontaneously, but the greater number need to be constrained by various means which science suggests, and which are sometimes very costly. Who would burden himself with these costs, if he were not sure of reaping a benefit? The appropriation of these agents therefore is often necessary, since, without it, we should not obtain the services which they can render, and in this case it is surely beneficial to all.—Let us hear J. B. Say on this subject. "If the instruments furnished by nature were all private property, the use of them would not be gratuitous, the man who became master of the winds would let their service to us for money; carriage of goods by sea would be more expensive and products consequently would be dearer.—On the other hand, if natural instruments capable of becoming property, as tracts of land, had not become such, no one would run the risk of making them useful lest he might not enjoy the fruit of his labors. We could not have at any price commodities in the production of which land has a part, which would be equivalent to excessive dearness. Thus, although the product of a field may be made dearer by the rental of the field which must be paid to its owner, this product is less dear than if the field had not become property."—These words sum up sufficiently well the two aspects of the question.—It must be said, nevertheless, that certain questions of another order are connected with this subject, which it suffices to refer to here. Can the appropriation of natural agents, useful or not, be justified in law? Is it

legitimate in its origin, leaving out of consideration the advantages admitted to result from it?—To what point may this appropriation be extended? It has long been applied to arable lands, mines and quarries, to water courses, and a great number of other tangible natural agents. Can it also be applied legitimately and with the same advantage to those intangible natural agents whose services industry is enlisting every day by aid of new methods which it invents?—There remains a last question raised by some distinguished economists, and which merits a solution. It is: Are the services of appropriated natural agents really paid for, if the price which one is obliged to give the proprietors for their use is anything else in reality than the just remuneration for their actual labor or for their accumulated previous labor? (See APPROPRIATION, LAND, RENT.)

CHARLES COQUELIN.

AGIO. Agio is the corruption of an Italian word which signifies additional value. It meant at first a price exceeding the ordinary or natural value of a thing. Later, it was used more especially to designate the difference in value between metallic money and paper money, or between one metallic money and another. And it is with this latter signification that it has come down to us. In the old banks of deposit, such as those of Amsterdam and Hamburg, bank money (*banco*) had generally a value a little different from that of the same denomination which circulated in the country. Thus, at Amsterdam the ducatoon (*banco*) had almost always a little greater value than the current ducatoon. At Hamburg the crown (*banco*) was sometimes more and sometimes less in value than the crown of the empire which circulated in the country. This difference was called and is still called by the name of agio. Several economists have thought it worth while to seek the cause of this agio, and the question was really not without interest. But they had not at hand all the data necessary to solve it. Some have adopted without examination the explanation given by Adam Smith. Unfortunately this explanation is more ingenious than correct. It is not astonishing that the author of the "Wealth of Nations" should have been deceived as to certain details relative to a foreign institution little known at that time, and concerning which he had only imperfect information. Adam Smith supposes that the money deposited in the bank of Amsterdam was always received there at its intrinsic value, and that it acquired there a superior value from the fact, that, being put in a secure place, it was sheltered from changes to which current money was constantly exposed. "The money of such banks," he says, "being better than the common currency of the country, necessarily bore an agio, which was greater or smaller according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburg, for example, which is said to be commonly about 14

per cent., is the supposed difference between the good standard money of the state and the clipped, worn and diminished currency poured into it from all the neighboring states." Speaking, afterward, of the credit which the bank opens for every depositor on its books, "this credit," he says, "was called bank money, which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more than current money."—And further on he adds: "Bank money, over and above both its intrinsic superiority to currency, and the additional value which this demand necessarily gives it, has likewise some other advantages. It is secure from fire, robbery and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In consequence of those different advantages, it seems from the beginning to have borne an agio."—All the advantages which Adam Smith here enumerates are real; but, as every one could make these advantages his own to the extent that he desired, it does not appear why this would have sufficed to secure to the bank money a value always superior to that of current money, if there had not been some other cause for it. When he adds, further on, that depositors avoided drawing their money from the bank, through fear of having to pay for its safe keeping, and finds therein a new reason for the superiority in value of the bank money, he errs; for the deposits were never made for more than six months, and when they were renewed at the end of that time, it was necessary to pay again for their safe keeping. The fact is, that there were exceptional dues to pay when a new account was opened.—The exact facts are as follows: From the beginning the bank of Amsterdam laid it down as a rule not to receive money deposited with it at its full value, and to attribute to it a value always 5 per cent. less than its real value. Thus, the ducatoon of Holland, which had a current value of 63 *stubers* (3 florins and 3 *stubers*) was received at the bank for only 60 *stubers*, or 3 florins, and the individual who deposited it was credited for every ducatoon according to this scale. Every depositor had, therefore, 5 per cent. more than he was credited with by the books. This did not prevent the bank from restoring to him the full amount when he withdrew his deposit, with the exception of a small charge which the bank claimed. This was a method of counting, and nothing more. But it suffices to explain why the money of the bank was always worth something more than current money. It was not, as Adam Smith thought, on account of the preference given to the money of the bank; it was only because the bank, while adopting the denominations of the current money, applied them to values really greater.—The bank money, far from being held in very high favor, was, we are inclined to think, looked upon with some slight discredit, either on account of the difficulty of withdrawal

or of some other cause. In fact, as we have just seen, the bank money had always a real advantage of about 5 per cent. over the current money. The agio, therefore, should have risen to 5 to represent par. Now, it was almost always under that figure, generally between 3 and 4, although the variations were sometimes greater. In certain extraordinary cases, it disappeared altogether, and the value of the bank money fell below that of the current money. This happened, for example, in 1672. It is true that it was on the occasion of the approach of the armies of Louis XIV. But this situation did not last long, the bank having immediately resolved to restore all deposits.—At Hamburg the circumstances were different. At first the bank of this city did not wish to establish, as at Amsterdam, a difference between its own and the current money. It had adopted as a type the crown of the empire, which was worth 540 *ases* of Holland, and had accepted it at this rate; but later it was constrained to depart from this rule, in consequence of alterations of the coinage undertaken by certain sovereigns. In the 17th century, the emperor Leopold I., and in the 18th century Maria Theresa, of Austria, overturned the plan of the Hamburg people by coining, as Busch says, crowns of the empire, which were really worth only 516 *ases*.—A certain number of these new crowns having slipped into the bank, unknown to its administrators, a great embarrassment in making payments was the result. As it was not known who should bear the loss, they wished to distribute it among all the depositors, by paying them partly in crowns of standard quality and partly in adulterated crowns. To straighten the accounts an average was sought between the old and the new crown; it was found that this mean was 528 *ases* to each crown. This is how the crown *banco* of Hamburg was fixed at this time at 528 *ases*, an ideal value inferior to that of the ancient crown of the empire, but greater than that of the new crown, and which has remained unchanged in the midst of the variations upward and downward, which the current money underwent.—Thus, at Amsterdam on account of a premeditated design of the founders of the bank, at Hamburg through circumstances more potent than the will of the administration, an actual difference in value was established between the money of the bank and the current money. This naturally explains the agio. It should be added, however, that the agio fell or rose according as the money of the bank was more or less in demand. If there was a great number of payments to make in bank money, certificates of deposit delivered by the bank were more sought for, and the agio rose. In the opposite case it fell. But these are natural fluctuations which we need not stop to analyze. It is exactly like the varying relations established between the respective values of gold and silver.—At Amsterdam the course of the agio was quoted every day, and known by all interested parties. It is probably the variations to which it was sub-

ject, and the speculations of which these variations became the object, that gave birth to the word *Agiotage*. CHARLES COQUELIN.

AGIOTAGE. Commercial speculation is useful to society. Agiotage (stock-jobbing) is harmful to it. Besides, it is always contrary to good morals. Speculation takes its natural course and develops in free and peaceful countries; stock-jobbing is never so active as in times of calamity and national trouble. Speculation is a regular operation; stock-jobbing is a game in which the players cherish the purpose of cheating, if need be. Speculation is an investment of capital intelligently made by the purchase of commodities, etc., at a low price, with the intention of selling them afterward when the price rises; the difference in the prices covers the expense of keeping the goods, the interest on the capital employed, and the profit of the speculator. By the first operation speculation prevents the fall of prices to a degree which would be fatal to producers; by the second it stops an excessive rise which would be disadvantageous to consumers. In stock-jobbing, on the contrary, the purchase is made with the intent of selling as soon as possible. Most frequently a bargain is made on time in order not to employ capital. There is not the least intention of receiving the thing bought. Again, a sale is made with a promise to deliver a thing not possessed and which the seller has no idea of acquiring. It is calculated in the interval to effect payment by a contrary operation at prices whose difference would be a profit. Fortuitous circumstances are depended on to bring about this result; also the chances of the harvest, the effect of good or bad news which is invented and spread abroad as needed. The stock-jobber, in a word, bases his profit only on a loss which he causes others. When his operation is over, no service is rendered, no value produced. What is produced is a simple transfer of wealth, while a heavy blow is struck at public morality.—As the passion for play is one of the infirmities natural to man, stock-jobbing does not fail to increase whenever circumstances produce great or rapid changes in the prices of things. Men do not fail at such times to gamble in bonds, stocks and merchandise. According to the times, stock-jobbing has been directed to the shares of the India company, Mississippi lands, the assignats, French national property, building lots in cities, shares in industrial enterprises of every kind, the working of mines, the draining of swamps, canal or railroad enterprises, Marseilles soap, oil, coffee, sugar, bread, etc.—If it were desired to write the history of stock-jobbing, the year 1719 would occupy a large place in it. Law's *system* reached its highest point of development at that time; intoxication was at its height; every one thought to make a fortune by what was called in France *dealing in paper* (*le commerce des papiers*.) For those who were skillful enough and realized on the paper in time, it became positive wealth; but disenchant-

ment and ruin overtook all others; and in the month of December, of the same year, a rapid fall of values set in.—In view of the deficit and financial embarrassments of every kind left by Louis XIV., the regent, after having had recourse to the ordinary expedients of loans, the selling of favors and adulterating money, listened to the suggestions of Law. Educated, skillful, enthusiastic, Law, who had not been able to succeed in Scotland, his native country, was none the less convinced himself of the soundness and practicability of all his financial views. According to him, wealth is greater in proportion as the chief instrument of exchange becomes more abundant, and the bank-note above all is useful, in this, that it lends itself to as rapid an increase as possible of the *representative sign*. But as the sovereign power of the state alone gives value to money, the bank note, in order to keep its value, should rest on the state. To gain this support, a bank should accept the obligations of the state, as capable of forming an important part of its capital. On the other hand, it was necessary that the bank should be a joint stock institution, and in order to attract shareholders, it was necessary to offer them the bait of commercial profits, by obtaining the concession of certain great privileges. The *system* had thus as its essential elements bank notes and shares of stock.—Law obtained, May 2, 1716, the privilege of founding a private bank, for which the capital might be subscribed, three-fourths payable in *state paper*. The following year he obtained a decision that the notes issued by the bank should be received as cash by the State. Nevertheless the success of the scheme was far from remarkable; the shares were below par, and it became necessary to lend them some new attraction. Commerce with distant countries was carried on in those days by privileged companies, and there was in a monopoly of this kind to be found all the chances fitted to awaken hope in the minds of men. Law was permitted to succeed Crozat in the right of developing the commerce of Louisiana and the beaver trade of Canada. Consequently his bank founded the *Occidental Company*. When we to-day see the degree of wealth of the vast country drained by the Mississippi, and the present splendor of New Orleans, we can easily understand what were the illusions of the people who were promised that the development of this part of the globe would be carried on for their benefit.—The director of these enterprises governed at the same time the finances of the state. The general bank soon became a royal bank. To the monopoly of the commerce of the west was added the monopoly of the commerce of China and the Indies. The *Occidental Company*, which besides had acquired the lease of the *fermes générales*, and also the monopoly of commerce with Senegal, finally assumed the title of the *India Company*. Every transformation was followed by the issue of new stock. The wish to use the state notes, which were depreciated, attracted shareholders at first, then the habit of

trading in stock commenced to take root. Stock-jobbing did the rest. Law excited it by every means in his power, and at the beginning of 1719 he inaugurated the *margin market*, by buying at par 200 shares of the *Occidental Company*, paying 40,000 livres on account of 100,000 livres which represented their value, and consenting to lose the earnest money thus given, should he not fulfill his engagement within a fixed time.—The centre of operations was in Rue Quincampoix, occupied then by bankers and money changers. The report of sudden fortunes made in this place attracted the crowd to it. Operations soon reached dimensions which would appear fabulous even to-day. The gutter of this street was called the Mississippi, and anecdotes abound concerning the strange incidents which happened in those places. It is related that a hunchback made a fortune by letting out his hump to serve as a desk on which to sign contracts.—The first shares had for a long time failed to reach par, 500 livres. The new ones, with the same nominal value, were issued at 5,000 livres. At the end of November, 1719, they were sold at forty times their nominal value. During this time, paper money was increased imprudently, and the moment of the crash drew near. The most adroit stock-jobbers commenced to retire first. They kept up prices as long as they could, in order to have time to change the fictitious values which they held for real values; but the bulk of the public, composed of simple people and bungling speculators, supported the whole weight of the bankruptcy.—Since that time stock-jobbing has not again appeared with that ensemble of characteristics which lent it, for a time, an effect truly dramatic. Operations have been more varied; stock gambling has become in some degree regulated, by division and by spending itself on objects of different kinds. State paper has furnished it its most constant and most regular food. Representative governments have been obliged to keep their accounts in public and to give up the precarious resource, left to absolute monarchies, of adulterating money. It was easy to make it a principle that the national honor is bound to the punctual payment of debts contracted in the name of the country. In this way, public credit has been developed; but, with this system, expenses have increased in gigantic proportions, loan has succeeded loan, and the public debt of every state has saddled the future with a heavy burden of interest.—In order to facilitate the circulation of loans, they established the non-distinction of origin of debts in entering them in the state ledger. State bonds were exempt from seizure by attachment against the owner. Markets were opened at which daily sales were made at auction and for cash; but, above all, the passion for gambling was excited by special privileges reserved to the brokers. Real operations served as a cloak to a much greater number of fictitious ones, and the confusion of transactions of different kinds was so great, that in sales on time, some of which, no doubt, were

very legitimate, it was difficult to discover which were the mere result of stock-jobbing. The number and nature of transactions were therefore multiplied.—At different times, especially in 1827 and 1828, there was veritable stock-jobbing in building lots in Paris. Peace, and commercial prosperity which resulted from it, increased the population. With greater prosperity every one sought to obtain better lodgings, cleaner, better situated, better ventilated: whence the necessity of new buildings. Speculation sought the best investments, and when a happy choice had been made, the sale was attended by a large profit. Hence large pieces of land were sought for, in spaces where new wards could be opened, or new streets laid out. So far the transaction was quite legitimate. It was not always so, however, with the means employed to obtain purchasers for the land and raise the price of the lots. For this the ordinary tricks of jobbing were put in play. One of the means employed, with disastrous consequences to many people, was to build houses in many parts of the new ward without spending a cent. For this purpose the speculator, who had bought all the land, selected a lot desirably situated for a residence for himself. He had plans made by an architect. Then he called in contractors of masonry and carpentry, blacksmiths, joiners, roofers, glaziers and painters. He asked each contractor to undertake his part of the building in consideration of pay in land in the same ward, worth more than the work to be done, and at prices which stock-jobbing had raised greatly. Many sub-contractors allowed themselves to be taken by the bait, proud of thus becoming land owners. They commenced to build houses on their own lots, giving their own services for the lots. One returned in carpentry the value which he received in masonry, another in roofing what he received in lock-smithing, and so on to the end of the chapter. But the speculation did not always succeed. The ground was sold at too high a price; the apartments were rarely rented, and the houses still more rarely sold. All this work was accomplished only by delivery of materials by dealers in timber, iron, plaster, stone, paints, materials of every kind. These dealers prosecuted the sub-contractors, and the latter demanded the sale of the houses constructed by them. A settlement was generally effected at a low price. The original speculator became the purchaser, and thus found himself possessor of lots covered with houses, without other expense to himself than the original payment for the bare ground on which he had conceived the ingenious idea of laying out streets. Let this suffice as an example.—The chances of gambling will, doubtless, have at all times a great attraction for many people; and it will be difficult to abolish stock-jobbing altogether; but it is beyond doubt that the principal remedy for the evil is found, in this as in many other things, in complete liberty. What is needed after this is a repressive law, clearly defining all kinds of fraud, and competent to reach them.

There is still another remedy of real efficacy, but which, it appears, our modern legislators will not give us so soon. It is necessary to stop the enormous public expenses, annual deficits, loans which alienate the future, and consume the savings of the present. Then there would be no further need of the aid of those who subscribe to, and negotiate public loans, and there would no longer be any interest in protecting stock-jobbery. (See *PRODUCTS ON PAPER, CHAMBER OF COMMERCE.*) Consult, upon this subject, J. B. Say, *Cours complet*, 2e ed., t. II., ch. 16, *de l'agiotage*. (*Collect. des princip. Econom.*) HORACE SAY.

AGRICULTURE. The connection between agriculture and politics is not very apparent, but it is vital. Let us first show the influence of a nation's politics on its agriculture, and then discuss the influence of agriculture on the political life of a nation.—The following words of a clever minister of finance have been frequently quoted: *Give me good politics, and I will give you good finances.* It might be said with equal truth: *Give me good politics, and I will give you good agriculture.* Agriculture can really flourish only in a country where person and property are respected, where taxes are apportioned equitably and spent with economy, where the good condition of the means of communication increases the extent of the market; in a word, where liberty, justice and peace prevail. Let us take as an example, two nations at the opposite extremities of Europe: England and Turkey. The former has a foggy climate and a wet soil; the latter the finest of climates and the richest of soils. In spite of this, we find that for the same extent of surface, agriculture is a hundred times more productive in England than in Turkey. Why is this? Because England has a good political constitution, while Turkey groans under a wretched government.—Insecurity is the greatest scourge of agriculture, as well as of every other industry. No one tills and no one sows unless he is sure of the harvest. The first duty of a government is to guarantee the security of person and property. When this condition is wanting, everything is wanting. Insecurity arises from two causes, either from an excess of weakness or an excess of power, in the government. Anarchic governments are powerless to defend private interests; despotic governments disregard these interests themselves. Both vices are found too frequently united, and governments which respect the rights of their own subjects the least are, at the same time, very little concerned with making them respected by others.—The second duty of a government toward agriculture is this: to tax it as little as possible for the security guaranteed it. Taxes and soldiers are necessary to make law respected, but neither should be in excess. Burdensome taxes and enormous armies exhaust agriculture, by imposing on it exorbitant sacrifices, either in men or money.—The taxes which affect agriculture most directly are those levied on land. These taxes may be

doubly harmful, by their amount and apportionment. An unequal or too arbitrary assessment may have as fatal effects as an excessive tax. Under the ancient régime in France the sum total of taxation was in no way excessive, but it was collected with such violence, so unequally and with such attendant abuses, that it ruined the rural districts. It often happened that tillers of the soil preferred to abandon their land rather than pay the tax. By the side of these overburdened lands were others enjoying almost complete exemption from taxation. Even now complaints are made in France of inequalities in the collection of the land tax, but these differences bear no relation to those of the olden time.—Agriculturists imagine that indirect taxes do not concern them; they are mistaken. Indirect taxation, by affecting everything consumed, weighs upon agriculture in two ways: it raises the price of the commodities which agriculturists consume, and lowers the price of those which they sell.¹ It is a bad calculation on the part of the tillers of the soil, therefore, to allow indirect taxation to increase indefinitely, while land taxes do not increase. The sum total of public receipts press on all industries. Agriculturists pay their part of indirect taxation, just as other taxpayers pay their part of the land tax, through the rise in the price of agricultural products. There is a complete solidarity in a nation. Under whatever form it be collected, a tax is legitimate only when it is necessary; it should be strictly reduced to the exigencies of the public service.—According to the happy expression of Montesquieu, agriculture has all the more interest that *the State should not derive from the real wants of the people the wherewithal to satisfy imaginary wants*, since extravagant outlay is always made far from the agricultural districts and in opposition to their interests. It is in great cities and especially in capitals, that the imaginary wants, spoken of by Montesquieu, are developed, that sumptuous entertainments are frequent and the prodigality that ruins and demoralizes is found. The more parasites of every kind swarm in them, the more is the capital which might support useful labor lost in unproductive employments. Agriculture loses in these places both the money which it gives and that which it fails to receive.—Among the unproductive expenses of a country, one of the most fatal is that of great armies. Every nation contains an enormous number of women, children, old people and infirm, who furnish but a small contingent to the labor of the nation. The number of strong and vigorous workmen does not exceed a sixth of the whole population; that is, in France, for example, it is 6,000,000 out of 36,000,000. An army of 600,000 men takes away, therefore, one-tenth of the labor power of the country, and it is the agricultural interest which almost entirely incurs this loss. If the same security could be obtained with half the army, 300,000 additional men would be

annually employed in the labor of agriculture, and would increase its production in that proportion.—On the other hand, the first rank among productive expenses is occupied by public works, not by the building of palaces and theatres, but by such as facilitate the movement of men and products over the whole face of the country. Harbors, canals, rivers, bridges, roads of every description, from country roads to railroads, everything capable of quickening commerce has the greatest effect on agriculture. Every industry prospers through the extent of the market, and an abundance of the means of communication extends the market. In France a thousand examples prove this; either in proportion as carriage roads are extended, or new railroads are opened, whole districts take on a new face at once.—When a government has guaranteed to agriculture security, moderation in public expenses, the reduction of the army to what is strictly necessary, and a good system of roads, etc., it has fulfilled all its duties toward it. To go further, would be useless and might become dangerous.—We find the minds of statesmen divided between two systems of farming. One party extols the advantages of large farming; the other, small proprietorship and small farming. The discussion of the relative merits of these systems is proper and useful enough when confined to theory, but harmful and bad when it is sought to impose one or the other of the two systems by force or by law on a country.—English legislation here favors concentration of property through primogeniture and entailment. French legislation, on the contrary, favors division of land. At first sight the English system seems to be superior to the French, from the point of view of agricultural interest, since agriculture is twice as rich in England as in France; but on closer examination it is seen that the real effect of their legislation is not so great. First of all, the land is more divided in England and less divided in France than is generally supposed, because the force of things in both countries corrects the extreme provisions of the law; and secondly, the size of landed estates has not in both countries the same effect on the development of agriculture.—In general the soil and climate of England is better adapted to large farming, the soil and climate of France to small farming. The two nations will, therefore, to all appearances, preserve their present land legislation, but will modify whatever is excessive in it. Entail is now very frequently attacked in England, on account of its driving capital away from agriculture. It has already received many severe blows and will probably receive still more. The right of primogeniture itself begins to be called in question, at least in its most absolute formulation. In France, on the other hand, the legislation which now favors excessive division of land into small parcels will have to be modified, sooner or later.—Public authority has frequently interfered by other measures in agricultural matters, with good intentions, no doubt, but with the most disastrous results.

¹ If taxation increases the price of the goods taxed, how can it at the same time lower it?

Governments naturally anxious that the people should have the means of subsistence, believed they were providing them, by prescribing or prohibiting certain kinds of farming, by regulating the distribution of crops, by fixing the price of wheat, etc. Such regulations as these were in special favor under the ancient régime in France. Royal edicts prohibited the setting out of grape vines, without permission; decisions of parliament prohibited potato planting under heavy penalties. In one place artificial prairies were forbidden; in another, men were punished even for cutting wheat with the scythe. It took a long time for people to understand that agriculture was hindered by this action and that it was vastly better to leave it to regulate itself. It is best that agriculturists should ask for the intervention of government in their affairs as seldom as possible. The best political institutions are those which leave them the broadest liberty. The least centralized governments are the best, even in cases which absolutely demand the interference of public authority. If the nations of Europe be examined, it will be seen that agriculture prospers most under the governments which are least centralized. Political liberty is good for every class: it is a safeguard for the interests of agriculture, as well as every other occupation. It not only prevents arbitrary and ill-judged measures, but it develops self-reliant habits; it stimulates the spirit of enterprise and manly resolution. Governments sometimes imagine that they help agriculture by what they call prizes, etc. It would be unjust to deny altogether the utility of public competition, by prizes, marks of distinction, etc., but too much importance should not be attached to these things. As a general rule, the agriculture which needs *encouragement* is not in an enviable condition. Its real encouragement should be in the sale its products meet with. All great industries have grown up of themselves without artificial stimulation, by the sole influence of the market.—Agricultural societies, and, still better, agricultural journals, are among the best agents for disseminating information useful to agriculture. Free discussion, no matter what the question be, is the best servant of truth. Interference by authority does more harm than good, at least in the great majority of cases. It is all important to accustom agriculturists as far as possible to attend to everything themselves, and to assume the initiative in everything that may be useful to them. The author of this article, in a book on the *rural economy of England*, has endeavored to point out the influence of free institutions on the development of agriculture. He has endeavored to show why country life is more sought after in England than in France: "The richest landholder of a county in England is generally the lord lieutenant, more an honorary than a profitable title, but one which reflects on its possessor the éclat of English royalty. The richest men after the lord lieutenants are the justices of the peace, that is the first and almost the only administrative and

judicial magistrates. In France officials are almost all strangers in the departments which they administer, connected with local interests by no tie. In England the proprietors themselves are officials in their districts, and though the crown formally appoints them, they are officials by the sole fact of their being landed proprietors. There is perhaps not an example of a commission of justice of the peace having been refused to a rich and respected landholder. In France when a landholder wishes to play an important part he must leave his land; in England, he must remain there."—Every nation has a character of its own. It would be folly to dream of having the same institutions and the same manners in France, for instance, as in England, but without changing in anything the basis of French national organization, such as it has been formed by all French history, the French may seek to resemble their neighbors in those points which have contributed most to their prosperity. If political institutions and habits have an influence on agricultural wealth, agricultural wealth in its turn has an influence on political life. Wherever agriculture prospers, a general feeling of peace and stability reigns in the social body; ambition is less violent, passion less inflammable, revolution less frequent. Here again we may cite the example of England. If England is the nation of Europe which for two centuries has had the fewest revolutions, much here must be ascribed to the influence of the agricultural class. Commerce and industry, whose prodigious development forms the chief wealth of that country, occupy but a secondary place in public esteem. Every one there understands that when agriculture suffers, all things suffer. Agriculture, in turn, recognizes that the progress of trade and manufactures is necessary to its own prosperity.—What nations seek above all is power, and population makes power. Two hundred years ago the population of England was about one-fourth the population of France; a century ago it was one-half; to-day it is almost as great. For some years past it has become so dense that the soil does not suffice to support the inhabitants; but up to the middle of this century English agriculture was able to satisfy the increasing demands of consumption. And even to-day the population of England increases so rapidly that the importation of provisions does not keep pace with it.—Let us see what took place simultaneously in France, toward the end of the reign of Louis XIV. Instead of increasing, the population had diminished by one-fourth, and the provinces supported the survivors with difficulty. One of the most terrible proofs of this general abandonment of farming in France is the royal edict of Oct. 13, 1693, worded as follows: "The king having been informed that many persons and laboring men, little knowing that the high price of grain arises solely from the tricks of merchants and others engaged in commerce, who have hoarded these products in order to increase their price, through fear of a want of

food for their families during the year, *intend to leave their lands untilled*, his majesty enjoins upon all laborers, farmers and other persons obtaining profit from their lands through the labor of their hands, to cultivate those lands which according to the custom of the country ought to be cultivated and to do it at the proper time, according to the nature of the grain and the custom of the place; *if they fail to do this, his majesty permits all persons to seed these places, by the doing of which they shall be entitled to all the fruits thereof, and not be held to give any part to the proprietors or the tenants or pay any rent.*" What a fearful light is thrown on the general situation of the country by a document like this! We can readily understand how France, reduced to this point of depopulation and lifelessness, fell into the state of *stagnation* in which she languished for three-fourths of the 18th century, and how she was able neither to defend her colonies nor continue the unfortunate seven years war. If France were as thickly settled as Belgium, she would have 75,000,000 inhabitants. We can easily see that with such a population she would have more weight in European affairs. What is true of men is none the less true of capital. Whatever be the productiveness of trade and industry, agriculture is more productive still, in this sense, that it furnishes the raw materials for all the other branches of national labor. A nation merely commercial and industrial would have no foundation; its wealth would be precarious and uncertain. On the contrary, a people with a great agricultural development furnishes immense support to commerce and industry, and by the combination of the three sources of production, may reach the highest point of wealth and power.¹ Capital invested in the soil is the solid basis of all other capital. This is abundantly shown, even in France, by the richest departments, such as the department of the Nord or lower Seine. The most successful war consequently does not increase a nation's power as much as a few years of peace and agricultural labor.

L. DE LAVERGNE.

ALABAMA, a state of the American union, formed mainly from territory ceded to the United States by Georgia, the strip of land on the northern border having been ceded by South Carolina, and the southwestern corner by Spain, (see *MISSISSIPPI; ANNEXATIONS, II.*) It was separated from Mississippi territory, as Alabama territory, by act of March 3, 1817, St. Stephens being the temporary capital; an enabling act was passed March 2, 1819; a state constitution was formed at Huntsville, August 2, 1819, and the state was

¹ It is certain that a country purely industrial or commercial lacks a foundation, and that agriculture is indispensable to give firmness and stability to a state, but agriculture alone does not make a country rich. What is the income from agricultural capital, and what from industrial capital? Besides, if there were no industry in a country who would buy the surplus products of agriculture? Is not the market the best stimulant to production? The most prosperous country is one in which agriculture, industry and commerce form together a harmonious whole. M. B.

admitted by joint resolution, Dec. 14, 1819. Its boundaries, as prescribed by the enabling act, were as follows: Beginning at the point where the 31st degree of north latitude intersects the Perdido river; thence, east, to the western boundary line of the state of Georgia; thence, along said line, to the southern boundary line of the state of Tennessee; thence, west, along said boundary line, to the Tennessee river; thence, up the same, to the mouth of Bear creek; thence, by a direct line, to the northwest corner of Washington county; thence, due south, to the Gulf of Mexico; thence, eastwardly, including all islands within six leagues of the shore, to the Perdido river; and thence, up the same, to the beginning. —The original constitution, closely following that of Mississippi, formed a free and independent state, with its capital at Catawba (changed in 1826 to Tuscaloosa, and in 1846-7 to Montgomery, its present location); the governor was to hold office for two years; and the legislature was forbidden to pass laws for the emancipation of slaves without consent of the owners, to prohibit immigrants from bringing slaves with them, or to deprive slaves of trial by jury for offenses above the grade of petit larceny; but power was given to prohibit the importation of slaves as merchandise. —Prior to the rebellion the political history of the state was uneventful. Its electoral vote was always cast for the democratic candidates, and all its governors were democrats. During the years 1838-46 a whig opposition was formed, and in 1856 the american, or know nothing, party nominated candidates for state offices. In all other state elections the struggle was rather personal than political, the opposing candidates being of the same party. The state government took part with Georgia against the federal government in the Cherokee case until the removal of the Indians beyond the Mississippi in 1836-7. The only other local political feeling was caused by an unsuccessful effort, 1838-45, to repudiate the debt assumed by the state through its guarantee of various state banks. —Feb. 24, 1860, the legislature by resolution instructed the governor to call a state convention "in the event of the election of a black republican to the presidency." The convention met Jan. 7, 1861, at Montgomery, and, Jan. 11, passed the following ordinance of secession: "1. That the state of Alabama now withdraws, and is hereby withdrawn, from the union known as 'The United States of America,' and henceforth ceases to be one of said United States, and is, and of right ought to be, a sovereign and independent state. 2. That all the powers over the territory of said state, and of the people thereof, heretofore delegated to the government of the United States of America, be and they are hereby withdrawn from said government, and are hereby resumed and vested in the people of Alabama." —Feb. 4, the provisional congress of the confederate states met in Montgomery, Alabama being represented and so remaining until the close of the rebellion. —The ordinance of

secession was bitterly opposed in northern Alabama, and its passage was at once followed by arrangements, as in West Virginia, for the formation of a new state with its capital at Huntsville. The name was to have been *The state of Nickajack*, from a former Indian town; but an irruption of confederate troops soon stamped out the inchoate state.—At the close of the rebellion, Lewis E. Parsons, the provisional governor, (see RECONSTRUCTION), called a state convention for Sept. 12, 1865, which adopted a new constitution prohibiting slavery, and by ordinance declared null and void the ordinance of secession and all other unconstitutional ordinances of the convention of 1861. A governor and legislature were chosen, and in December, 1865, the state government was in operation again until superseded by the act of March 2, 1867. The state then passed under military rule. Nov. 5, 1867, a state convention framed a new constitution. In its first article universal suffrage was established, slavery was abolished, and the state renounced all claim to any right of secession and acknowledged paramount allegiance to be due to the United States. This constitution was ratified in February, 1868, as congress afterward decided, and the state was re-admitted to the union by ratifying the 14th amendment, July 11, 1868, as announced by the president's proclamation of July 20. A new constitution was ratified by popular vote, Nov. 16, 1875. It attempted no change in the points above referred to, except in the use of the new phrase that "the people of this state accept as final the established fact that from the federal union there can be no secession of any State," but it took away the permission given in the previous constitution to sue the State in its own courts.—The name of Alabama is taken from that of its principal river, popularly supposed to mean *Here we rest*; and these words are placed as a motto upon the coat of arms of the State. But the name really has no known meaning, and was first given to the river by the French, in the form "Alibamon," from the name of a Muscogee tribe living on its banks.—GOVERNORS: Wm. W. Bibb (term 1819–21, died in July, 1820), Israel Pickens (1821–25), John Murphy (1825–9), Gabriel Moore (1829–31), John Gayle (1831–3), Clement C. Clay (1835–7), Arthur P. Bagby (1837–41), Benj. Fitzpatrick (1841–5), Joshua L. Martin (1845–7), Reuben Chapman (1847–9), Henry W. Collier (1849–53), Andrew B. Moore (1857–61), John G. Shorter (1861–3), Thos. H. Watts (1863–5), Lewis E. Parsons (provisional), Robt. M. Patton (1865–7), Wager Swayne (military governor under Maj. Gen. Pope, March, 1867–July, 1868), W. H. Smith (July, 1868–November, 1870), R. B. Lindsay (1870–2), D. V. Lewis (1872–4), Geo. S. Houston (1874–8), R. W. Cobb (1878–82).—(See CONSTITUTIONS, STATE, UNITED STATES.) See Pickett's *History of Alabama*; Brewer's *History of Alabama*; Poore's *Federal and State Constitutions*; Davenport's *American Gazetteer*; Murray's *United States*; Tanner's *Canals and Railroads of the United States*; Apple-

ton's *Annual Cyclopædia*, 1861–70. For the acts of March 3, 1817, and March 2, 1819, and the resolution of Dec. 14, 1819, see 3 *Stat. at Large*, 371, 489, 608. ALEXANDER JOHNSTON.

ALABAMA CLAIMS (IN U.S. HISTORY). April 16, 1856, the representatives of Great Britain, Austria, France, Russia, Prussia and Turkey, assembled in congress at Paris, adopted the following declaration, to which nearly all other civilized nations afterwards acceded: 1st. Privateering is and remains abolished. 2nd. The neutral flag covers enemy's goods, with the exception of contraband of war. 3rd. Neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag. 4th. Blockades, in order to be binding, must be effective; that is to say, maintained by forces sufficient really to prevent access to the coast of the country. To this Declaration of Paris the United States refused to accede, being unwilling, by abolishing privateering, while other nations maintained enormous fleets, to accept the necessity of keeping up a large fleet in self-defense, but the President offered, July 29, 1856, to go further and adopt an additional article which should entirely exempt private property, even of citizens of belligerents, from capture on the sea, either by privateers or national vessels. Great Britain refused to agree to this, and the negotiation failed. The United States was therefore, in 1861, the only commercial nation not committed to the abolition of privateering.—The fall of Fort Sumter, in April, 1861, (see REBELLION), was followed by a series of retaliatory measures, to which the use of the telegraph gave an extraordinary swiftness of succession. On the 15th of that month the President, by proclamation, announced the existence of the rebellion, and called for volunteers to suppress it; on the 17th Jefferson Davis offered letters of marque and reprisal, against the commerce of the United States, to private armed vessels, and privateers at once began to issue from southern ports; and on the 19th, by proclamation, the President declared a partial blockade of the southern ports, which was made general on the 27th. On the 24th Secretary Seward applied to the powers which had made the Declaration of Paris for permission to accede to it without qualification. To this Great Britain, acting in unison with France, consented, on condition that the engagement should not "have any bearing, direct or indirect, on the internal differences now prevailing in the United States." As this seemed to imply that the *de facto* government of the southern confederacy should still be allowed to keep privateers afloat, the United States declined to accept it and allowed this negotiation to drop, with the following concluding monition, May 21: "Great Britain has but to wait a few months, and all her present inconveniences will cease with all our own troubles. If she take a different course she will calculate for herself the ultimate as well as the immediate consequences." In the meantime the Queen's procla-

mation of May 13 had announced her neutrality between the United States and the confederate states, had forbidden her citizens to take part with either, and had ordered her official servants to accord belligerent rights to both. This included the refusal of warlike equipments to the vessels of both parties, the preservation of the peace between their vessels in British harbors, and the detention of a war vessel of either for twenty-four hours after a hostile vessel had left the port. Under this proclamation the position of Great Britain was difficult at the best, because of the great number and extent of her colonies in every part of the world, for whose action she was responsible; but the active, notorious and undisguised sympathy of many of her colonial officers and citizens for the rebellion and its cruisers contributed very largely to the difficulties of the home government and to the subsequent American demands upon it for damages. While the rule prohibiting the obtaining, in British harbors, of warlike equipments, and particularly of coal except within certain limits, was stringently enforced against federal vessels, confederate privateers generally found little difficulty in evading them by the connivance of colonial officials; and several colonial harbors, particularly that of Nassau, became depots of supplies for this species of vessel, to which they resorted to prepare for new voyages of destruction. However impartial the treatment of belligerent vessels may have been in the ports of Great Britain, in the ports of British colonies United States war vessels found a neutrality so rigorous in its exactions as to be, in contrast with the open or hidden privileges accorded to rebel cruisers, fully tantamount to unfriendliness. They were frequently denied the privilege of taking coal on board which had been left on deposit in British harbors by the United States government, while rebel privateers, though without a port of their own, found no great difficulty in obtaining in British harbors the same "article of warlike equipment," without which they could not have kept the sea a single month. On these grounds the American minister to Great Britain, C. F. Adams, repeatedly warned the British government that the United States had a fair claim for compensation for the damage done to its commerce; and this was subsequently enlarged by the claim that the queen's proclamation of May 13 was itself issued precipitately and in violation of treaties, and that it gave possibility to rebel depredations which would have been impossible without it. It is but fair to add that the proclamation was defended by the Queen's ministers on the ground that rebel privateers were already upon the sea, and that it was necessary to free British officers who should meet them from the necessity of treating them as pirates.—The British foreign enlistment act of July 3, 1819, (59 Geo. III., cap. 69), prohibits under penalties, and empowers the government to prevent the equipment of any land or sea forces within the British dominions to operate against the terri-

tory or commerce of a friendly nation. In the United States the act of April 20, 1818, which is closely similar in its terms, preceded it, and the two governments are supposed to have acted with a common understanding in the matter. During the Crimean war the United States had fulfilled their obligations promptly and fully by seizing and detaining vessels represented to be destined for the service of Russia; and the claim was now advanced, and finally established, (see GENEVA AWARD), that Great Britain did not correspondingly exercise "due diligence" to fulfill its obligations. The first privateers, during the year 1861, were equipped in southern ports, and gained the open sea by running the blockade. When the most formidable of these, the Sumter, was hopelessly blocked up in Gibraltar by the U. S. steamer Tuscarora, and had to be sold in January, 1862, the confederate agents in Great Britain at once began the construction of armed vessels there, evading the provisions of the enlistment act by fictitious ownership. From Feb. 18, until March 22, 1862, minister Adams represented to the British government that a war vessel then building by the Messrs. Miller, of Liverpool, the Oreto, (afterward the Florida), though nominally destined for Palermo, in Sicily, was evidently and notoriously intended for war against the United States. As she contained no arms or munitions of war, she was allowed to sail, and proceeded to Green Bay, near Nassau, where she enlisted additional men, and was transformed into a confederate privateer, arms and munitions having been brought from Great Britain in another vessel. The Florida was seized by a British steamer, the Greyhound, at Nassau, but released; and the British government refused to satisfy the demands of the United States that the vessel should be seized as a violator of the enlistment act whenever she should come within British jurisdiction. — Soon after the departure of the Oreto, or Florida, minister Adams began collecting evidence against another vessel then building by the Messrs. Laird at Birkenhead, near Liverpool, and called, from the number of merchants who had subscribed the expense of her construction, the 290 (afterward the Alabama). June 23, he gave notice to Earl Russell of what he believed to be the real character of the vessel, and solicited "such action as might tend either to stop the projected expedition, or to establish the fact that its purpose was not inimical to the people of the United States." That action was never taken. July 16, the American minister submitted to Earl Russell his evidence, and the opinion of distinguished English counsel, that "the evidence was almost conclusive." A week afterward, July 23, he offered fresh evidence, and a most emphatic opinion of the same counsel, to the following effect: "I have perused the above affidavits, and I am of opinion that the collector of customs would be justified in detaining the vessel. Indeed, I should think it his duty to detain her, and that if, after the application which has been made

to him, supported by the evidence which has been laid before me, he allows the vessel to leave Liverpool, he will incur a heavy responsibility—a responsibility of which the board of customs, under whose direction he appears to be acting, must take their share. It appears difficult to make out a stronger case of infringement of the foreign enlistment act, which, if not enforced on this occasion, is little better than a dead letter. It well deserves consideration whether, if the vessel be allowed to escape, the federal government would not have serious grounds of remonstrance." The vessel *was* allowed to escape. The board of customs referred the papers to their counsel; the Queen's advocate, Sir John D. Harding, fell ill; other counsel were called in, who advised the seizure of the vessel; but, before this opinion could be acted upon, the Alabama had sailed, July 29, without register or clearance, to the Terceira, one of the Azores, where she took her equipment from two British vessels and became a confederate war vessel, commissioned "to sink, burn and destroy" the commerce of the United States. No effective pursuit of the vessel was made by Great Britain, and she was hospitably received, without any attempt to arrest her, in several British colonies afterward.—In April, 1863, the Japan, afterward called the Georgia, left Greenock, and soon after, upon the coast of France, she took an equipment from another steamer and became a confederate cruiser. For over a year she continued her cruise until she was captured off Lisbon, Aug. 15, 1864, by the United States steamer Niagara, after a transfer to a Liverpool merchant.—In September, 1864, the steamer Sea King, owned by a Liverpool merchant, cleared at London for India. At Madeira she met another vessel, the Laurel, of Liverpool, from which she received her armament and men, and she then became the confederate war vessel Shenandoah. During her career as a cruiser, before her surrender to the British government, Nov. 6, 1865, the Shenandoah took in supplies and enlisted men at Melbourne, Australia, with the connivance, as the American consul asserted, of the British authorities at that port.—Besides the devastation wrought by the rebel cruisers, the United States considered the toleration by Great Britain of confederate administrative bureaux on British soil, by means of which alone offensive operations against American commerce were possible, as ground of reclamation. The action of the British government in maintaining an official union with France upon questions growing out of the rebellion, was also considered unfriendly to the United States in the absence of any recognition of the confederate states as an independent nation. The whole mass of grievances of which the United States expected satisfaction from Great Britain, and to which the name "Alabama Claims" was commonly given, may best be summed up in the words of the American members of the joint high commission: "Extensive direct losses in the capture and destruction of a

large number of vessels, with their cargoes, and in the heavy national expenditures in the pursuit of the cruisers; and indirect injury in the transfer of a large part of the American commercial marine to the British flag, in the enhanced payment of insurance, in the prolongation of the war, and in the addition of a large sum to the cost of the war and the suppression of the rebellion."—When it first became apparent that the neutrality of Great Britain would be a source of danger to the United States, minister Adams was very active in pressing each fresh violation of neutrality upon the attention of the British government, not, as he explained to his own government, with any hope of obtaining more stringent laws, or greater diligence in the execution of existing laws, but with the intention of "making a record" to which the United States could thereafter appeal. The American ill-feeling toward Great Britain, which was developed by her haste to accord belligerent rights to the confederacy, had grown upon every new grievance until, when the rebellion was at last suppressed, it had settled into a dangerous disposition to leave the matter unsettled for the purpose of applying the British system of neutrality to British commerce in the event of any future war or rebellion against Great Britain. The American government, however, did not share this disposition. It continued to press its claim for compensation in the higher tone which was justified by its altered circumstances, but at the same time, Jan. 12, 1866, offered to submit "the whole controversy" to arbitration. The British government offered to accept an arbitration limited to the depredations of the Alabama and similar vessels, but this was declined by the United States for the reason that it involved a waiver of the position, which they had always held, that the Queen's proclamation of 1861, which accorded belligerent rights to insurgents against the authority of the United States, was not justified on any grounds, either of necessity or of moral right, and therefore was an act of wrongful intervention, a departure from the obligations of existing treaties, and without the sanction of the law of nations.—Jan. 14, 1869, Reverdy Johnson, American minister to Great Britain, arranged a treaty which, without mentioning the Alabama claims in particular, provided for the submission to arbitration of "all claims" of either country against the other since Feb. 8, 1853. In the senate this treaty had but a single vote in its favor, and was not ratified. Negotiations on this subject then practically came to a stand until Jan. 26, 1871, when the British government proposed the appointment of a joint commission to sit at Washington and arrange the terms of a treaty to cover the disputes as to the Canadian fisheries and other questions at issue between the United States and Canada. The proposition was accepted on condition that the treaty should also make some disposition of the Alabama claims. To this condition Great Britain agreed, and five

high commissioners from each country met in joint session at Washington, Feb. 27, 1871. After thirty-four meetings, the commission agreed upon the terms of the *Treaty of Washington*, which was signed by the commissioners May 8, ratified by the senate, by a vote of 50 to 12, May 24; ratified by Great Britain, June 17, and proclaimed in force July 4, 1871, by president Grant. It provided for arbitration (1) as to the Alabama claims, (2) as to claims of British subjects against the United States, (3) as to the fisheries, and (4) as to the northwest boundary of the United States. The arbitrators upon the Alabama claims were to be five in number, appointed by the president of the United States, her Britannic majesty, the king of Italy, the president of the Swiss confederation, and the emperor of Brazil; and were to hold their sessions at Geneva, Switzerland. (For the constitution and award of the tribunal of arbitration, and the provisions of the treaty governing its deliberations, see GENEVA AWARD.)—See *The Case of the United States to be laid before the Tribunal of Arbitration to be convened at Geneva*, London, 1872; *Case presented on the part of Her Britannic Majesty to the Tribunal of Arbitration*, London, 1872; *Official Correspondence on the Claims in respect to the Alabama*, London, 1867; Bluntschli, *Opinion impartiale sur la question de la Alabama*, Berlin, 1870; Geffcken, *Die Alabamafrage*, Stuttgart, 1872; *Diplomatic Correspondence of the United States* (with messages) 1861–71; Cushing's *Treaty of Washington*. The act of April 20, 1818, is in 3 *Stat. at Large*, 448. The treaty is in *Stat. at Large*.

ALBANY PLAN OF UNION (IN U. S. HISTORY). The lords of trade, in 1754, directed that commissioners from the several provinces should assemble at Albany, N. Y., to arrange a treaty with the Six Nations. June 19, 1754, commissioners from New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania and Maryland met, and, after concluding their business with the Indians, proceeded to consider a plan of colonial union, proposed by Franklin, one of their number, which was adopted, July 10–11. It comprised the appointment by the crown of a president general for all the colonies, with the veto power; the election by the colonial assemblies of a grand council, who, with the assent of the president general, should make Indian treaties, regulate Indian trade, purchase and dispose of Indian lands, raise and equip armies and navies for colonial defense, and lay taxes to support them. Members of the grand council were to serve three years, and to be chosen in proportion to the amount paid by the colony to the general treasury; but no colony was to have more

than seven members, or less than two. Laws were to be valid unless disapproved by the king in council within three years.—It was agreed that this plan, in order to prevent a possible secession by any colony, should be made binding by act of parliament. The whole plan was disapproved by the crown, on the ground that it gave too much power to the colonies, and by the colonies that it gave too much power to the crown. (See REVOLUTION, UNITED STATES.)—See 4 Franklin's *Life and Writings*, 22–68 (containing the plan in full, and the *Letters to Shirley*); 2 Trumbull's *History of Connecticut*, 355; 3 Hutchinson's *History of Massachusetts*, 23; 1 Pitkin's *United States*, 142; 2 Hildreth's *United States*, 443.

ALEXANDER JOHNSTON.

ALBANY REGENCY, The (IN U. S. HISTORY), the name given to the politicians who, from 1820 until about 1854–5, unofficially managed the machinery of the democratic party in New York. It would be difficult to give an exhaustive list of those who, at various times, were recognized members of "the Regency"; but a partial list would include Martin Van Buren, who graduated from it upon his election to the United States senate in 1821, but still remained in close alliance with it; William L. Marcy, who graduated to the senate in the same manner in 1831; Silas Wright, until his election to the senate in 1833; John A. Dix, until his election to the senate in 1845; Edwin Croswell, editor of the "Albany Argus," and State printer; Benj. F. Butler, who was Attorney General under Van Buren, (see ADMINISTRATIONS); Azariah C. Flagg, secretary of state and afterwards comptroller of the state; Benjamin Knower, treasurer of the state; Roger Skinner; Dean Richmond; Peter Caggar; and Samuel A. Talcott. Although, as has been said, several of these "graduated," the graduates were expected, whenever necessary for the success of the party and the regency, to return to the field of state politics. Thus Van Buren in 1828, Marcy in 1832, and Wright in 1844, returned from the senate to accept a nomination for the governorship at the hands of the regency.—About 1819–20, when the system of nominating conventions began to be used, the regency began to be recognized as a political factor, and as the business of nominations was further abandoned to these smaller and irresponsible bodies the regency obtained progressively a stronger control over the conventions and thus over the action of the party. This control was not necessarily obtained by corrupt means. Those delegates to the conventions who were ambitious of office were controlled by the knowledge that the regency never forgot or forgave insubordination or rebellion, and never forgot or abandoned a friend who had suffered in its service; the great mass of delegates were controlled by the conspicuous success which usually followed a deference to the discreet and experienced politicians who composed the regency. In this way, and, in emergencies, by a judicious use of the State printing

and other contracts, the Albany regency (so called from the fact that its members lived at the capital of the state) continued to reward its friends, punish its enemies, control the party, and keep New York generally democratic, until its opponents in great measure accepted its machinery and overthrew it by its own methods. This last result, however, was much assisted by the split in the New York democratic party in 1848 (see NEW YORK, BARNBURNERS, FREE SOIL PARTY) and subsequent years, and when this division had lasted long enough to deprive the regency of the state patronage its most efficient weapon was gone, and its former power departed. (See DEMOCRATIC-REPUBLICAN PARTY.)—See 2 Hammond's *Political History of New York*, 157, 429; Hammond's *Life of Silas Wright*; 2 von Holst's *United States*, 21; Mackenzie's *Lives of Butler and Hoyt*; Mackenzie's *Life of Van Buren*, 29, 168; Sedgwick's *Political Writings of Leggett*. ALEXANDER JOHNSTON.

ALCALDE, the Spanish equivalent of the French *Maire*, the German *Bürgermeister* and *Schulze*, the Italian *Podesta*, the English *Mayor*. The powers of this office were much more extensive formerly than now, for they united judicial with administrative functions. The history of alcaldes may be found in the excellent work of Don Manuel Colmeiro, entitled *Direcho Administrativo Español*, Madrid and Santiago, 1850, 2 vols. 8vo. M. B.

ALCOHOL, Tax on. (See DISTILLED SPIRITS.)

ALGERIA. Since its assimilation with France declared by the decree of Oct. 24, 1870, Algeria should be described as a part of France situated in the north of Africa, and forming the three departments of Oran, Algiers and Constantine.—**GEOGRAPHY.** Algeria is the central part of the geographical region which comprises, together with Algeria itself, Morocco on the west and Tunis on the east. It extends from parallel 33° to 37° north latitude, and lies between longitude 6° east and 5° west, reckoning from the meridian of Paris. The meridian of Paris cuts it into two almost equal parts, in the centre of which is Algiers on the north coast of Africa, at 0° 44' of east longitude.—The mountainous region of the Atlas has been called "the isle of the Occident" by Arab geographers. It is a sort of island bounded on the north and west by the ocean; on the north and east by the Mediterranean; on the south by the Sahara, which seems to be the bed of a dried-up sea, extending from Cape Noun and Bajador to the Gulf of Gabès. It forms a distinct geographical system, devoid of apparent connection with other regions of Africa. The desert separates it from Africa, and the sea connects it with Europe. It is, properly speaking, a *minor Africa* or a European Africa. Its climate and flora remind one of southern Europe, Andalusia, Sicily and Provence. The chain of the Atlas rising in the west, opposite the Canary islands which be-

long to its system, stretches northward to ~~Fez~~, and enters the provinces of Taflelt and Morocco, where it is 4,000 metres in height, and covered with perpetual snow. Thence it bends to the east; running parallel with the Mediterranean coast to the mountains of Fossato on the confines of Tunis. It stops at the heights of Gabès, where the sandy region commences.—Two great chains of mountains are to be distinguished in this region, that of the Sahara and the Central chain, and a third range which reaches to the sea. Only one group of the Sahara chain sends its waters to the sea, that of Djebel-Amour on whose northern slope the Shelliff, the largest river of Algiers, has its origin. The Central chain pours its waters, on the south, into the sands where they are lost, and into the basins where they evaporate in summer. On the north its waters enter the sea.—Algeria has three natural divisions. 1st. The Tell on the north, which is arable. It embraces all the Mediterranean slope between the sea and the Central chain, and in addition certain tracts of the Sahara slope of this chain, such as the country of Batna, Medjana and Hodna, in the province of Constantine. On the east the Tell extends further inland than in the other provinces. The Tell contains about 14,000,000 hectares. 2nd. That south of the Central chain, the region of lofty table-lands and the *Chotts*, a country of steppes and flats only fit for pastoral life. 3rd. The Sahara which properly speaking only begins south of the Sahara range. On both slopes pasture lands are found during the rainy season. Further on, a forest of date palms may be seen, from time to time, as a green island in a sea of sand. These oases situated on the flats are nourished by rivers which are almost always under ground, and whose waters, brought to the surface through ordinary or artesian wells, render possible the culture of the palm and a certain number of vegetables. In the mountains large hamlets, called *kaours*, serve as dwelling places for a settled population, as well as markets and granaries for the pastoral tribes of the country about.—The climate of the Tell is that of warm temperate regions; it calls to mind southern Europe. On the sea-coast and on the plains, there is no winter, simply a rainy season. The hottest part of the Tell is in the plains of the west and the valley of the lower Shelliff. In the Tell there is winter only in the mountains, and the interior towns usually situated at high altitudes. Sétif is 1,085 metres above the sea; Médéah, 940; Milliana, 900; Aumale, 850; Tlemcen, 800; Constantine, 650; Mascara, 600. In these towns the summer is hot, and the cold comparatively severe in the winter. Snows prevent terraced roofs. The rainy season commences everywhere in October, at the earliest, and ends completely at the close of April. The yearly average rainfall increases toward the east from Oran to Algiers, Constantine and Tunis. The proportion is approximately 3, 4, 5, 6.—South of Tell the heat is great in summer, but the winter is cold on the

elevated plateaux. The nights in summer too are cold. In the oases as well as on the flats there is no winter perceptible to the European, and the nights are hot.—All the agricultural products of France thrive, and all French fruit trees yield well in Algiers. Winter wheat is the indigenous variety. Sicilian flax is cultivated for its seed. The *alfa*, a kind of grass which Spain alone exported at one time, and of which cords and mats are made, and in England paper, is exported in large quantities from Oran. The climate has allowed the naturalization in Algeria of the banana and cotton. The *hénna* of the south and Mostaganem is sent to the dye works of France. In the torrid basin of the lower Shelliff and the west certain modes of tropical culture are possible, provided irrigation be practiced. When the damming of the Habra is finished, the greatest work of its kind in the world (30,000,000 cubic metres) it is proposed to utilize its water for the cultivation of the sugar cane.—In addition to the domestic animals of France, we find in Algeria the dromedary used for transporting burdens, for food, for clothing and furniture of the natives. The southern steppes afford pasture to countless flocks of sheep; many of these are sent to France and Spain, and their wool supplies the factory of Roubaix. Algeria is very rich in marbles and minerals. Between Oran and Tlemcen, the mine of transparent onyx so celebrated in antiquity has been re-discovered and is worked. The white marbles of Filfila are of the highest quality. The lack of coal prevents the smelting of iron ore, but it abounds to such a degree that the ore of Souma is sent abroad from Algiers, and at Bona a thousand tons of the magnetic iron of Moktar-el-Adid are shipped each day. At Gar-Rouban, near Morocco, a mine of lead with veins of silver ore, is worked. Zinc can be had in the district of Bona, and there are many beds of copper ore.—ETHNOLOGY. *Berbers* or *Kabyles*. Among all the races inhabiting northern Africa, at the present time, the Berbers have been longest in the land. All the conquerors of Africa, Carthaginians, Romans, Vandals, Arabs, Turks and French, have had to struggle with them. The Arab conquest forced them into the mountains where they still remain. Converted to Islamism, at a later period they took a prominent part in the different invasions of Spain by the Mussulmans. To them is attributed the high state of agriculture in Mussulman Spain. Their language belongs to the Semitic type, but differs more from the Arabic than the Hebrew and Syriac. An experienced eye never mistakes a Kabyle for an Arab of pure blood. The Kabyles and Arabs differ in everything,—in language, in physical type, in aptitudes in manners, and institutions. They have nothing in common but religion. In contrast, however, with the Arab the Kabyle is little inclined to religion.—In the mountains where the population is dense, land is scarce, and living difficult. The laboring Kabyle is rather a gardener and an artisan than an agriculturist. He prepares

oil and figs for export, makes powder, arms, tools and household implements, soap, cloth, trinkets and earthenware. He peddles these articles in the Arab districts, and gets in exchange for them cereals which his own mountains do not produce in sufficient quantity. He goes to the villages and plains, to work for the Arab agriculturist, or the European manufacturer. He lives in a house and not under a tent or a *gourbis* like the Arab, who is always a half nomad. The Kabyle villages built on the crests of hills are little fortresses. The women are not veiled, and when guests are entertained they are not sent away. The land belongs to the family, not to the tribe.—Each Kabyle tribe is a little democratic republic, with an assembly, *djemmâa*, composed of all men able to bear arms. The *djemmâa* makes the laws, decides cases, regulates the administration, elects a chief *amin*, who is charged with carrying out its decisions; it concludes alliances between tribes, and decides on peace and war. The Kabyle tribes arrange themselves in confederations like the ancient leagues of the Grisons. Personal rivalries almost always separate them into two parties called *sofs*. Each one of these allies itself to the *sofs* of the neighboring tribes.—Hospitality is regulated by law, and is exercised in turns; it is not considered as a religious but a public duty. The Kabyles have an institution of international or rather inter-tribal law peculiar to themselves, the *anaya*. It consists in the protection afforded an individual either by a private person or by a tribe. A stranger, and even an enemy, who has obtained the *anaya*, is held inviolable, under pain of death. War breaks out between tribes frequently because the *anaya* has not been respected. Peace is concluded between tribes by the exchange of pledges, the withdrawal or giving up of which is a declaration of war.—The authority of France is exercised in Kabylia only in the following manner: it reserves to itself the exercise of the police power, criminal and correctional matters; it confirms the *amin* elected by the tribe, has agents called *amin-el-oumena*, who act for it as intermediaries with the *amins* of the several villages; it collects a poll tax in accordance with a list of names drawn up by the *djemmâa*. In this list the Kabyles are ranged in four categories, according to their fortunes. Of these the last is exempt from taxation; in the other three the tax varies, but is the same for all members of the same class. It was sought to introduce the office of *cadi* in civil cases, but the Kabyles wished to judge themselves by their own laws in general assemblies. They admit neither *cadis* nor the authority of the law of Islam. Justice is, in their eyes, a social question to be regulated by men, and a matter of religion decided in a sovereign manner by the Koran. These institutions are preserved intact only in Great Kabylia.—In Algeria the Berbers are called Kabyles, which, in their language, means confederates. In Aurès alone they are called *Chaouia*. The population of the oases

and the *ksours* of the Sahara is mainly of Berber origin, and has preserved in part the communal institutions of the Kabyles. The Touaregs in the depths of the Sahara and half way to Soudan are of the pure Berber race.—*Arabs*. The Arab tribes lead a pastoral life in the south, and are agriculturists in the Tell. There are some who change their habitations and mode of life according to the season of the year. Each tribe forms a kind of little nation with its territory, chiefs and history. The tribe is scarcely more than one family grown to the maximum of extension which in Mohammedan countries is great.—The Mussulman family has more affinities than the Christian. By polygamy, by adoption, through foster parents more numerous ties are formed than with us, and even divorce does not break them up completely, if children have been born of the marriage. Moreover the parents are not separated by material interests, for their landed property remains undivided (land *melk*), and they live together on the family estate. The life of relations in common and innumerable alliances determine the formation of a natural group, the tribe, which is almost entirely made up of relatives or allies. The fractions of the tribe are called, according to their importance, *Ferka*, *Khoms* or *Douar*. The chiefs of families or of tents, are the representatives of the tribe, and they make up its *djemma* which is its national assembly. If there is a family more ancient or more powerful than the rest, it is the natural head of the tribe.—The Arab tribal government is, therefore, patriarchal and aristocratic. In Arab countries there are three kinds of nobility, the *chorfa*, nobles by origin through descent from the daughter or uncle of the prophet; the *djouad* or military nobility; the *marabouts*, descendants of the saints of Islam. In certain tribes all the men lay claim to nobility, others are composed of *marabouts* alone.—The noble is not jealous, and his authority is not called in question. He is the honor of his tribe. This social organization gives a common interest to the tribe, and causes its members to render mutual assistance in time of need and against the stranger. Such was the Arab tribe before conquest changed its character.—The conqueror, Turk or Frenchman, has been frequently obliged, in the interests of his own power, to deprive the natural chief of authority and confer it on an inferior and sometimes a stranger. This chief has become a functionary in the service of France, charged with subjecting the tribe to French policy; he is imposed upon it and supported against it by the power of France. He often lacks authority and has tradition against him. If he is guilty of exactions the tribe must endure them, or go to war with France. Complaints against a chief whom they can not depose are regarded as opposition to French dominion, and are generally rejected. In a word, the imposed functionary often takes the place of the natural chief.—Moreover the prohibition by France of inter-tribal wars and the personal security afforded

by the French police have made it unnecessary for the Arab nobility to uphold and protect, for purposes of self-defense, numerous clients who in return used to fight for them.—The exportation of wheat, which began since the conquest, has resulted in decreasing the reserve stock of cereals. Let a bad year come, and the *khammès*, who tills for the fifth part of the produce, no longer finds open to him the corn pits of his master which in old times were filled with the surplus of fruitful years. This grain has been sold, its value has been already spent, or if the master has hid the grain away in the ground, he is less disposed to lend money to the *khammès* than he was formerly to furnish wheat at nominal prices. In case of scarcity the *khammès* dies of hunger, as in 1867.—The rule of conquerors has deprived the government of its patriarchal character, the security established by the French has relaxed the bonds of mutual interest which united the aristocracy to its clients. The grain trade has interfered with the assistance given by the rich to the poor in time of scarcity. A social and political revolution is going on through the force of circumstances, and independent of the will of man. This revolution will bring about dislocation of the tribe, the destruction of traditional relations between the nobility and their clients, and, consequently, the destruction of aristocratic power.—*Moors*. These are Mussulmans who do not belong to any tribe, and who inhabit the cities or their outskirts. They are called *hadri* or citizens. A few of them are descendants of the Moors expelled from Spain, and the majority are Arabs or sons of Arabs who have left their tribes in order to become citizens. A few are landed proprietors. The chief means of subsistence for the others is commerce, principally the manufacture of articles used by the tribes—shoes, saddles, implements, etc. In Tlemcen and Constantine whole streets are lined with the shops of Mussulman artisans.—The Moorish population is in a state of decadence. Living has become more expensive, and provisions and rents have risen enormously since the conquest. Processes of labor have not improved among them. The native consumers of the outlying districts have been replaced by Europeans. For the artisan of the towns the temptations to expense are greater than formerly. The result is that families once rich, but destitute of foresight, sold their farms, (*haouch*), then their country houses, later their houses in town, and at last pawned the pearls and jewelry of the women, in Algiers at the pawnbrokers, and elsewhere to Jews. These pledges are rarely redeemed. The Moorish population is sinking little by little and will never rise again. At Constantine, Tlemcen and other towns the artisan holds out yet, but even now, in the case of certain articles used by the natives, he has to struggle against the competition of European factories; perhaps he will be driven from the market in the case of other articles.—*Kouloughlis*. These are descendants of the children of Turkish fathers and Arab mothers. They

are found especially in the towns which were the centres of Turkish domination. They retain the overbearing pride of the conqueror toward a vanquished race. At Tlemcen they are equal in number to the *hadri* and are always in rivalry with them, which causes difficulties to the French administration.—The Kouloughlis, like the Turks, follow the *Hanefi* rite, while the Arabs observe the *Maleki*. These are two of the four rites equally recognized as orthodox by the Sunnite Mussulmans. These two rites differ by a few legal provisions, concerned particularly about the inheritance of women and the forms of prayer. At Algiers and Constantine each rite has its mosques, its ministers of worship and its *cadi* — *Mozabites* or *Beni-Mzab*, merchants and artisans, temporary emigrants from their oases situated at 1° east long. and 33° lat. They are Abadites, partisans of the assassins of Ali, and equally regarded as heretics by the Sunnites and Chilites. Their *imans* or sovereigns had Tiaré as their capital at the epoch of Mussulman conquest. At present their iman resides at Muscat. They are puritans of great probity, and look down on everything not Mozabite. Laborious, industrious, economical, they make large profits in business. A Mozabite who emigrates is forbidden to take with him his wife, or his children of a tender age, to marry a foreign woman, to visit women of improper life or to neglect the practice of his religion. He is obliged to render an account of his commercial transactions to the federal council. Emigrants in the same village hold meetings for prayer and the censorship of private life. Corporal punishment is inflicted during the meetings. But if a Mozabite has met with reverses in business, and it is shown by the assembly that he was not at fault, his co-religionists make good his losses.—*Native Jews*. Their mother tongue is the Arabic, but a certain number have learned French. Among them are found rich merchants, wholesale and retail, who lend money (in Algiers there is no legal maximum of interest). Many of them are shopkeepers, a certain number artisans, factotums of great Arab lords, hawkers, who compete sharply with the Kabyles among the Arab tribes, traveling jewelers, who manufacture on the spot and deliver in jewelry the same weight as the Arabs give them in coin. Active, industrious, economical, and selling at the highest figure, they succeed as a rule. The French conquest has freed them from exactions and humiliations. It is only in the extreme south under the rule of great Arab chiefs, who are sometimes vassals and sometimes enemies of the French, that the Jews are still obliged to remove their shoes in passing before a mosque, not to ride on horseback, and to give bonds whenever they absent themselves. A decree issued Oct. 24, 1870, by the assembly at Tours, granted to natives the rights of French citizens. They are now electors and jurors.—*Negroes*. Brought from the Soudan as slaves. The trade in negroes, by way of the Sahara, was continued for a long time after its prohibition by the republic in 1848. They are

not numerous, and tend to disappear, either by extinction or by mingling with other races. Some of them are like Arabs of dark complexion.—*Europeans*. The Spaniards are settled mostly in the provinces of the west and centre, the Italians and Maltese in the east and centre. The French are most numerous in the province of Algiers. The census of 1866 gives a total of 2,912,630 inhabitants classified as follows. Mussulmans, 2,652,072; Native Jews, 33,952; Europeans, 226,000. Official statistics do not distinguish the Kabyles from the Arabs.—The European population, in which the army is not included, is made up of two elements: the inmates of the hospitals, lyceums, schools, orphan asylums, seminaries, convents and prisons, 8,616; the fixed population, 217,990. The figures for each nationality have been determined only in the case of the fixed population. They are reckoned as follows: 122,119 French; 58,510 Spaniards; 16,655 Italians; 10,627 Anglo-Maltese; 5,436 Germans; 4,643 of other nationalities. Since the census of 1866, the famine which desolated the Mussulman territory in 1867-8 carried off perhaps 500,000 Mussulmans. Certain tribes have been almost destroyed and certain regions depopulated. In the same period the drought which prevailed in Spain, and later the exportation of *alfa*, brought into the west a great number of Spaniards.—*HISTORY*. This is conjectural up to the foundation of Carthage, 850 B. C. This city became mistress of northern Africa, which furnished its mercenary armies with their famous Numidian cavalry. In 250 B. C. the Romans began to struggle with the Carthaginians for northern Africa. In 146 they destroyed Carthage. In 646 A. D. the Arabs showed themselves in Tunis for the first time. The Goths were the masters of Tingitane. In 670, the fiftieth year of the Hegira, Okba founded in the southeast of Tunis, Kairouan, the Mussulman metropolis of the province of Africa.—After the fall of the Almohades, northern Africa was in a state of political decomposition, when two corsairs, the brothers, Baba-Aroudj and Kheir-ed-Din, established Turkish dominion by taking Djidjelli from the Genoese (1504), Shershell and Algiers from the Arabs (1515) and the rocks in front of Algiers from the Spaniards in 1530. By connecting these rocks with each other and with the land by a dike, Kheir-ed-Din created the port of Algiers. The successors of the two corsairs completed the conquest of Algiers.—The Turkish government, in Algiers, was a piracy on sea against Christians and on land against Arabs. Its instruments were: 1st. Janissaries recruited in Turkey; 2nd. Kouloughlis, descendants of Turkish fathers and Arab mothers; 3rd. Arab tribes known under the generic name of Maghzem, and who were settled from east to west along the strategic line north of the Central chain of mountains. These tribes, exempt from tribute and occupying their own land granted by the Turks, were bound to lend physical aid in collecting taxes, and against such tribes as might rebel. They also had their share

of the spoils. In general the Turks left the Arabs to their own devices, provided only that they paid tribute and yielded to the exactions of the conquerors. The Kabyles, protected by their mountains, preserved their independence almost everywhere.—*French Conquest.* It will be remembered that in 1827, in consequence of a fruitless claim addressed to the French government by the dey, Hassein-ben-Hassem, on account of grain furnished in 1796, by the Jew Bacri, a debtor of the dey, the latter struck the French consul, M. Deval, with his fan. Algiers was blockaded directly, and all reparation being refused, a French army landed June 14, 1830, at Sidi-Ferruch and entered Algiers in triumph July 5. From that day is dated the abolition of piracy and the foundation of African France.—Algiers taken, it remained to conquer Algeria. Oran was occupied for good in 1831, Bona in 1832, the ports of Arzew and Mostaganem in 1833, when Bougie also was taken. Tlemcen, occupied in 1836, was held by Cavaignac for seven months, at the end of which time General Bugeaud came to relieve the place. Clausel failed the same year before Constantine which was taken Oct. 13, 1837, by General Vallée after the death of General Damremont. Djidjelli was captured in 1839, Shershell, Médéa and Miliana in 1840. But it was only in 1841 on the accession of Gen. Bugeaud to the office of governor general, that the great African war commenced.—Abd-el-Khader, saluted emir in 1832 by the Hashems south of Mascara, had been recognized as sovereign in a treaty of peace concluded by Gen. Desmichels in 1834. After breaking this treaty he defeated Gen. Trezel at Macta. It was a rout, and the enemy massacred the French wounded. Clausel, the same year, avenged this defeat by taking and destroying Mascara, the capital of the emir. The following year Bugeaud defeated Abd-el-Khader at Shiffa. Unfortunately he concluded with him, in 1837, the famous treaty of Tafna which gave up to the emir half of Algeria.—The passage of the Iron Gates in 1839 by Marshal Vallée and the Duke of Orleans, was the occasion of a rupture with Abd-el-Khader. By the treaty of Tafna, the frontier line of the east, settled upon, was the road from Algiers to Constantine which no longer exists. The emir pretended that that line had been crossed by the French, and declared war. Marshal Vallée allowed the Arabs to invade and devastate Mitidja. They arrived in the neighborhood (*sahel*) of Algiers and their horsemen came to the sea-coast within cannon shot of the French forts. In 1840 the war became general in the centre and west. Gen. Bugeaud, appointed governor general in 1841, inaugurated a new system of war that was to bring about the ruin of Abd-el-Khader.—The French base of operations, till then the sea, was transferred to the centre of the Tell between the sea and the mountain range which separates the Tell from the elevated plateaux. Military forces were firmly established from east to west at all points which commanded this strategic line. Thence light expeditionary corps were dispatched continually,

operating near their basis, and forming a net which covered the country. At the same time Abd-el-Khader was isolated from his allies of the south by the erection of a chain of small forts which guarded the passes leading to the lofty plateaux of the Tell, of Oran and Algiers. When the net was extended the campaign began. The work lasted six years. Abd-el-Khader's permanent establishment at Boghar, at Taza, at Tackdemt, at Goudjela, were destroyed. All the tribes of the Tell, one after another, saw the French columns enter their territory, and learned by experience that neither the mountains of the Ouarensenis nor those of Dahra and Great Kabylia could protect them against the arms of France. The attacks made in the south by Yousouf, at Djebel-Amour, by Cavaignac, Renault and Gély among the Oulad-Sidi-Chikh, by Marey-Monge at Laghouat, deprived the enemy of every chance of succor from the Sahara populations. Abd-el-Khader still relied on the Moroccans, but these were repulsed in May and June, 1844, by Lamoricière and Bedeau, and finally conquered at Isly, Aug. 14, by Marshal Bugeaud.—Nevertheless Abd-el-Khader could not be captured. If, during his absence in 1843, the Duc d'Aumale deprived him at Taguin of his headquarters, that great nomad town, the wandering capital of the emir, the latter, by a prodigious march executed the same year, over one-half of Algeria, eluded five army corps who were watching his passage. He came again in 1846 to Great Kabylia, which refused to rise up in his behalf. Having taken refuge in Morocco, he was afraid of being delivered up to France by the sultan of Fez. After the submission of his two lieutenants, Ben-Salim and Bel-Kacem, as well as Bou-Maja soon after, he surrendered to Gen. Lamoricière Dec. 23, 1847, at Sidi-Brahim, where two years before he had carried off Col. Montagnac and his column. The great African war came to an end with the downfall of the redoubtable chieftain. It only remained to finish the conquest and repress uprisings.—In 1849, the taking of the oasis of Zaatcha after a siege of 52 days, the occupation of Bousada in 1852, the capture of Laghouat and the founding of Djelfa; in 1853, the creation of Gélyville assured the French supremacy in the south. Great Kabylia, roused to rebellion from 1851 to 1853 by the cherif Bon-Barla, was finally subdued in 1857, under the government of marshal Randon. The posts of Tizi-Ouzon (1851), of Dra-el-Mizan (1855), and fort Napoleon (1857), now fort Republic, guarantees French rule in the interior of Great Kabylia.—In 1859 the fruitless expedition of Gen. Martimprey, in Morocco, cost the lives of many thousand men from cholera. In 1864 a quarrel with the chiefs of Oulad-Sidi-Shikh, a tribe of Marabouts in the extreme south, whose religious influence is very great, brought about a war with the French of long duration. It caused an insurrection, the same year, in the Tell of Oran and in the south of the province of Algiers.—It was hoped that the war with Prussia would be finished without an insurrection in

Algeria, though there was not a single regiment of French regulars in the country. There were merely native regiments and *garnies mobiles* without military training and not feared by the Arabs. An order for the mobilization of the *spahis* to France led to an uprising Jan. 23, 1871. At Ain Guettar, on the frontiers of Tunis, the neighboring tribes joined with the *spahis*. Later, when peace was concluded, Mokhrani, grand chief of Medjana, who owed nearly a million at Constantine, rose up in his turn and carried with him all Great Kabylia. Soon the whole province of the east was in arms. The revolt was completely crushed only in November, 1871.—French supremacy in Algeria is secured by three chains of posts, each extending from the boundary of Morocco to that of Tunis, the maritime line, the central, and the frontier line of the Tell. South of this last advance posts have been established in the Sahara.—On the seaboard, from west to east, are the ports of Nemours, Mers-el-Kébir, Oran, Arzem, Mostaganem, Ténès, Shersbell, Algiers, Dellys, Bouzie, Djidjelli, Collo, Stora, Philippeville, Bona, and Calle. There are two fine natural harbors, Mers-el-Kébir and Bouzie; an excellent natural harbor, Arzem, which has been improved; two other natural harbors, Djidjelli and Collo, the latter of which is in good condition; the great harbor of Algiers, created, like that of Cherbourg, by means of dikes; that of Bona, less extensive, but which French engineers have made better than Algiers. The harbor of Oran was created by means of dikes. The harbor of Philippeville has been greatly improved. There are no other real harbors, but merely foreign roadsteads, at other points on the coast.—The central line of the Tell is the great strategic line of Algeria. The power that controls it is master of the country. The French hold it by virtue of a chain of settlements nearly all of which are situated at the points formerly occupied by the Turks and the Romans. On a line from west to east, the settlements are Lalla Maghnia, Tlemcen, and Bel-Abbes, the strategic centre of the province of Oran; Mascara, Relizane, Orléansville, Miliana, Médéa, Aumale, Bordj-bou-Argeridj, Sétif, Constantine, Guelma, and Souk-Ahras. The Arab invasions followed this line, from east to west, thence fell back to the northward and southward. The Romans, the Turks, and Marshal Bugeaud, conquered Algeria by occupying the central line as a basis of operations, while the Spaniards failed because they occupied the coast only.—The frontier posts in the province of the Tell bar the entrance against invasions from the southward. These posts, in the mountainous districts, guard the passes which give ingress to the Tell; and on the plains they occupy the points which command the great roads of the south. From west to east, the posts are Sebdon, El-Hacaïba, Daïa, Saïda, Frenda, Tiaret, Tenièt-el-Haad, Boghar, which covers the entrance into the Tell through the valley of the Chelif; and Batua and Tebessa. These posts close the Tell against invasions by the herd-

ers from the south, while they open it to trade with them. Through these posts the herders come to barter the dates of the oasis and the wool of their flocks, for the cereals of the Tell which afford food to the south.—On the south of the frontier of the Tell and on the road to the Sahara, the French permanently occupy Djelfa and Boucauda; and within the Sahara they occupy the oasis of Laghouat and Biskra, together with the post of Géryville. This occupation is intended to protect and confine, by crowding them between the northern posts and the frontier of the Tell, the pastoral tribes which their geographical position renders dependent on the Tell for their natural market.—GOVERNMENT. The character of the government of Algeria is one of instability, and its normal condition change of form. The following are its principal phases of transformation: 1st. A provisory organization (1830-34). Authority exercised by the commander-in-chief of the army of occupation, who had under his immediate control a council called successively government commission, committee, administrative commission, and administrative council of the regency. Marshal Clausel confided the presidency of the committee and the territorial administration to the military *intendant*. The duke of Rovigo instituted a civil administration.—2nd. Governor generalship. The ordinance of July 22, 1834, created a governor general of the French possessions in the north of Africa. The ordinance of April 15, 1845, changed this title to governor general of Algeria, divided Africa into three provinces, and each of these into a civil, an Arab and a mixed territory. It instituted a general mode of administration of civil affairs, an upper council, and a council of claims.—In 1847 the ordinance of Sept. 1 inaugurated decentralization by appointing in each province a director of civil affairs and a council of administration. The progressive assimilation to France was commenced by the republic of 1848, which suppressed, on Dec. 9, the general administration of civil affairs, and created a department in each province with a prefect and a council of prefecture. Algeria had been in the jurisdiction of the ministry of war, where there had been created in 1837 a department under the name of division of Algiers, and later a department of the direction of affairs of Algeria, charged with the political and civil affairs, and besides a committee of consultation to examine all proposed laws, ordinances or regulations, as well as all affairs referred to it by the minister.—3rd. Ministry of Algeria and the colonies, (decree of June 24, 1858). The governor general was replaced by a minister residing in Paris. The council of government was suppressed. Councils general were instituted. The jurisdiction of prefects in civil affairs and of generals of division in military affairs was amplified. Under the name of upper commandant of the land and sea forces, a general officer is made chief of the army of Africa.—4th. Re-establishment of the governor generalship, (decrees of Nov. 24, and Dec. 10, 1860).

The ministry of Algeria and the colonies was suppressed. A governor general is entrusted with the command of the land and sea forces, the government and administration of Algeria. This officer is tantamount to chief of the state. He prepares the budget to be approved and presented to the chambers by the minister of war, as an addition to the military budget, and orders what grants shall be allowed. He prepares the decrees which the minister of war submits to the chief of the state for his signature and countersign. He appoints to certain offices. But the administration of justice, and French public instruction, religious worship, the custom and postal service, and the treasury, are each under the jurisdiction of a special ministry.—Under the authority of the governor general the administration of Algeria is divided between two high functionaries, a sub-governor and a director of civil affairs, independent of each other. The sub-governor, in addition to his duties as chief of staff of the army of Africa, governs the military territory through three generals of division, with generals of brigade or colonels commanding subdivisions, and chief commanders of circuits. Each of these officers continues to keep under his orders one of those bureaux celebrated under the generic name of Arab bureaux, and which are named according to their degree, descending from the sub-governor to the commander of a circuit.—The director of civil affairs administers the civil territory through three prefects, with sub-prefects and civil commissioners. These unite in themselves in places where the commune has not yet been organized, the functions of mayor, sub-prefect, and, at certain points, those of justice of the peace.—To sum up, a superior council, of which six delegates from three general councils form a part, prepares the project of the budget for the general government and the assessment of taxes. A consulting council gives its advice on all affairs placed before it by the governor.—In this organization the civil and the military authority were independent of each other, and each free on its own territory. Marshal Pélissier used to say, "I am neither civil nor military governor; I am governor general."—By the decree of July 7, 1864, the civil was everywhere subordinated to the military authority. The generals commanding the three divisions took the title of commanders of provinces. The prefects were placed under their authority, received their instructions from them and addressed their reports to them. Algeria was subjected to a purely military government, which had, under its orders, a certain number of civil agents. Nevertheless, two decrees of 1866 and 1870 made the municipal and general councils elective.—3th. A civil governor generalship, (law of Oct. 24, 1870). By this decree the delegation of Tours founded in principle the civil government such as it still exists, at least in form.—The civil governor general retains the political, military and administrative powers of the military governor. He administers the former civil terri-

tory through a secretary general and three prefects, and the military territory through a chief commandant of the land and sea forces, who has under his orders as administrators of these territories, three generals of division, with commandants of subdivisions and circuits.—To sum up, a superior council of government and a consulting committee are appointed, the first with more elective members than formerly, the second with some elective members, which was not the case in the council of the previous government.—During the war with Germany, this government, as a whole, existed only on paper. The councils-general of Algeria had been dissolved simultaneously with those of France; the superior council could not be brought together for lack of members. Besides, the delegation of Tours, on account of representations from Algeria, had, in November, decided in principle on the abolition of the governor generalship, with the attendant offices which had been established or retained by it in October. Algeria was to be assimilated to France and its local institutions were to disappear. A decree had already deprived the chief commandant of the army and navy of authority over the tribes of the military territory, and another decree suppressed the special budget of Algeria by distributing it among the budgets of the different ministries. Of the institutions founded by the decree of Oct. 24 some could not come into existence, others existed only temporarily, and deprived of all assistance from the councils-general and the superior council could not come into regular operation.—The government of M. Thiers retained the governor generalship and the superior council; it abolished *de facto* the office of commander of the army and navy and re-established the special budget of Algeria. Algeria has retained the six representatives in the national assembly accorded it by the delegation of Tours. Natives appointed by the government form a part of the general councils, in which the great majority are Frenchmen, and are elected. The natives have a deliberative voice. This has given rise to formal protests in the three councils.—It would be difficult to define and classify the actual government of Algeria (1872.) Let it suffice to state that it bears the name of civil government and has as chief a naval officer who governs the regular military territory, that is, almost all of Algeria, through officers of the army.—**TERRITORIAL ADMINISTRATION.** Before the revolution of September it had as basis the division of each province into two territories, one civil which constituted the department and was governed by a prefect, the other military and governed by the general commanding the military division. The decree of Oct. 24, 1870, has in principle suppressed the military, but in fact it has left the administration of the government to the officers who exercised it before without subjecting them to the prefect. The original military territory is yet (1872) in practice outside the authority of prefects. Officers manage it, under the direct

authority of the civil governor general. The original civil territory forms but a diminutive part of Algeria. The administration of the country, as we see, has remained military in fact, although the governor bears the title of civil governor, and the designation 'military territory' no longer exists. The situation is undefined. There is no correspondence between things as they exist and the words which describe them. Algeria is in a state of transition between the military régime existing in fact and the civil régime which exists only in name. It is intended to increase the number of Algerian departments. The councils-general and municipal have the same attributes as in France. The councils-general have native members appointed by the government. The municipal councils are made up of members native and foreign, both elected, like the French council. There are no councils of the *arrondissements*.—The Arab and Kabyle tribes of the original military territory are governed as formerly by military commandants who have Arab bureaus at their disposal. The title of these French agents has changed, but their powers have remained the same. They continue, among the tribes, to take charge of politics, the administration, the legal police, the assessment of taxes. They have always native chiefs at command called *caïds*, who, each in his own tribe, see their orders executed and collect the taxes.—FINANCE. The Arab taxation has retained its former character. 1st. *Achour*, or tithes of grain, the taxable unit being the plow, (*djebda*), that is to say, the area which it is possible to cultivate annually with one plow. Every year the tax on a *plow* is determined by the amount of the crop. 2nd. The *zekkat*, tax on flocks and herds; the rate is fixed annually. 3rd. The *hockor*, or rent of lands, *azel*, belonging to the state and worked on a permanent lease by the natives. 4th. The *lezma* or obligation. It is collected in different ways. 5th. In the south, various taxes on trade, on the purchase of grain, on date palms.—One-tenth of the Arab tax goes to the native chiefs who collect it, four-tenths of the remainder goes to the state, and six-tenths to the departmental budget.—There has been long under consideration a project to replace the *achour* and *zekkat*, the tax on grain and cattle, by a land tax. Lands belonging to Europeans are not taxed, but registration dues, stamp dues, the customs, licenses, indirect taxes, postal and telegraphic charges, come almost exclusively upon Europeans. The budget of the governor generalship of Algeria furnishes the following figures:

1865, receipts.....	17,713,804 francs.
1865, expenses.....	25,350,000 "
1870, receipts.....	16,500,000 "
1870, expenses.....	14,616,000 "
1872, receipts.....	17,043,000 "
1872, expenses.....	22,615,014 "

The following are the chief items in the budget of 1872:

RECEIPTS.

Registration, stamps, domains and forests,	5,647,500 francs.
Customs.....	2,351,000 "

Income from various sources.....	7,421,500 francs.
Four-sixths of the Arab tax according to gov.....	4,605,000 "
Post office.....	1,000,000 "
Receipts from various sources of which	
535,000 francs are from the telegraph ..	623,000 "

EXPENSES.

Central administration.....	514,500 francs.
Departmental administration.....	969,660 "
Prisons.....	973,200 "
Telegraphic service.....	1,041,700 "
Administration and management of Arab	
tribes.....	1,586,890 "
Financial service.....	3,122,762 "
Maritime and military service.....	500,000 "
Colonization.....	1,325,600 "
Topography and land registers.....	1,035,500 "

The budget commission of 1872 estimates that by transferring the collection of the Arab taxes which, on the average, yield ten millions, from native to French financial agents, the product of these taxes would be perhaps doubled, while the burdens of the Arab tax payer would be at the same time decreased.—Maritime duties, imposed on the frontier and collected by the custom house for the benefit of Algeria, yield on an average four millions net. Of this, four-fifths, distributed according to the number of the population,¹ go to the municipal budgets, the rest to the departmental budgets, which are mainly supplied by the six-tenths of the Arab tax which the state has surrendered to them.—The administration of justice in the case of the Europeans is the same as in France. The natives remain, so far as the civil law is concerned, under the law of Islam; but crimes and misdemeanors committed by Mussulmans are punished according to the French law. Civil cases are judged in Kabylia by the *djemmâa*, everywhere else by the *cadis*. Councils called *Medjêles* may revise the judgment of the *cadis*, but an appeal, properly speaking, is only made to

¹ The following statistical tables are from the Statesman's Year Book for 1881:

Area of each of the three civil departments, and the three military divisions of Algeria, according to the returns of 1877:

TERRITORIES.	Area—Square Kilometres	Population.
Algiers—Civil Department.....	8,268	484,771
" Military Division.....	96,899	587,896
Oran—Civil Department.....	15,855	416,465
" Military Division.....	70,747	236,716
Constantine—Civil Department.....	17,976	414,714
" Military Division.....	109,089	727,124
Total.....	318,334	2,867,626

The number of French settlers was given at 127,321, and the total population of European descent at 302,576 in the returns of 1877.

The total commerce of Algeria was as follows in each of the seven years from 1870 to 1877:

YEARS.	Total Imports.	Total Exports.
1870.....	£6,907,628	£4,978,250
1872.....	7,881,251	6,565,123
1873.....	8,268,685	6,088,256
1874.....	7,852,173	5,976,280
1875.....	7,696,562	5,756,317
1876.....	9,235,464	7,162,464
1877.....	8,112,132	6,880,251

the court of appeal at Algiers, and tribunals of the first resort at Oran and Constantine to which are attached, for this purpose, Mussulman assessors. Imperial legislation has forbidden appeal in questions of state and of marriage. It does not permit a case to come directly from the *cadis* to a French judge unless with the consent of both parties. Complaints are raised against these two regulations and against the institution of the *Medjès*.—RELIGIONS. To the three religions in France, where ministers are paid by the state, Mohammedanism is added in Algeria. The government has appropriated the estates of the mosques, the property which before the conquest contributed to the support of public instruction, charity and pilgrimages to Mecca.—Algeria has an archbishop and two bishops. There is a Protestant and a Jewish consistory in each province.—PUBLIC INSTRUCTION. The academy of Algiers embraces three departments. Its rector is aided by two inspectors. There is a lyceum at Algiers and communal colleges at Oran, Constantine, Bona and Philippeville, and a secondary school of medicine at Algiers. In 1870 the municipal council withdrew everywhere their aid from clerical schools. The communal are lay schools.—MEANS OF COMMUNICATION. Algeria had neither roads nor bridges; many of both have been constructed, but the military government has neglected to build a road from Constantine to Algiers. The more important half of Algiers is connected with the centre of administration only by sea, and Constantine is in more frequent connection with Marseilles and even with Paris than with Algiers. Neither is there a road between Bona and Constantine. On the other hand, roads have been built along lines which are little frequented (1872).—The railroad from Algiers to Oran unites the east with the centre of Algeria. Constantine is put in communication with the sea by the Philippeville railroad.—COMMERCE. The principal articles of exportation are winter wheat, wool, and sheep, which the steppes of the south produce in almost unlimited numbers, tobacco, oil, alfa, oranges, mineral ores. Algeria imports textile fabrics, iron, sugar, coffee, soap, spirits, etc.—COLONIZATION. Since France decided to establish herself definitely on the north coast of Africa, it was understood, that in face of a conquered population which was hostile to her by reason even of their religion, French rule would be very precarious until a great many European settlements should have formed a point of support for the army and a basis for French power in Africa. Armed occupation could only be temporary; possession by the plow could be the only permanent and definite one. Therefore the government of July, the republic and the empire, at least till 1861, were favorable to colonization.—But colonization encountered many obstacles, some arising from war, others from the nature of the country, still others from the errors of the administration. Till the submission of Abd-el-Khader in 1847, the want of security prevented the spread of colonization beyond the vicinity of

towns. The colonists were established in a region where everything had to be, so to speak, created—roads, bridges, villages, towns, and, we might add, even the soil itself. Moreover it was necessary for the colonists to change all their European habits. They had to learn, by rude experience, that in Africa, from June 15 to Oct. 15, there is a dead season between harvest and the working period, when the earth requires but little care, and hard labor in the sun is a cause of death. They did not know that the climate of Algeria demands more sobriety, and that the man who works with his hands needs more substantial nourishment than does the farm laborer of France. They needed time to accustom themselves to live after the manner of Africans and become acclimated. On the other hand, the exigencies of war and the errors of administration raised up artificial bars to colonization. Instead of concentrating the settlers in a limited circle where they might have aided each other, both in a military and industrial sense, they scattered new villages about to insure communication along strategic lines. Large concessions of land made through favor exhausted the domain of colonization and remained uncultivated, while *bona fide* settlers, village agriculturists, received only from 7 to 10 hectares. Roads were wanting for the transport of products to market, transportation for a short distance was more costly than the freight from Marseilles to Algiers. Military administration found it profitable to have wheat and even forage brought from France instead of buying them at a distance of a few miles from the coast. If Algerian products arrived in a port of the metropolis, they were stopped on the way for the payment of customs dues. To sum up, the delays of French administration discouraged immigration. A settler having arrived in Algiers with a little capital, and the vague promise of a concession of land, spent everything before obtaining what he sought, and returned to France by free passage to tell his fellow villagers that there was nothing to be done in Algeria.—Still colonization advanced. During the last period of the monarchy of July a large body of immigrants arrived in Algeria. The republic of 1848 established a large number in Africa. The *coup d'état*, and the proscription which followed it, sent to Algeria a large number of involuntary colonists who took a liking to the country and remained there. The military authorities continued faithful to the idea of the French government and of the generals who had conquered Algeria. They desired greatly the establishment of an African France, created, according to the notion of Marshal Bugeaud, by the sword and the plow. But when the military government was replaced in 1858 by the ministry of Algeria, that is to say, by a civil government, the military party suddenly changed its politics. Their unforeseen fall taught them that the progress of colonization must have, as a necessary consequence, the setting aside of military power and the establishment of civil government. In their own interest, therefore, they became hostile

to colonization and began a campaign against it which is not yet terminated (1872).—The military party persuaded Napoleon III. that colonization was impossible, that settlers were the natural enemies of the Arabs, that there was no future in Algeria except for the Arabs, and that a military government alone could elevate the Arab race and restore it to something of its ancient splendor. Napoleon III. resolved, therefore, to hinder colonization, and, instead of an African France, he undertook the foundation of his famous Arab kingdom.—The Arab people were to be subjected in perpetuity to great native chiefs rendering obedience to generals. It was even a question of re-establishing a native feudalism and superimposing on it a French military feudalism. They thought of creating great military fiefs. The emperor, king of Algeria, would then have great French and petty Mohammedan vassals. As to the French colonists who were an obstacle to this plan, it was thought at one time of depriving them of their property. Marshal Pélissier put an end to this idea by answering the emperor that its realization would cost four milliards of francs. But it was decided and declared that the colonists could not be agriculturists, and that they should, as in Java and British India, confine themselves to playing the part of overseers of the native industries, managers of factories, and merchants.—Colonization alone can save the Arab race from complete ruin. We have seen, during the last famine, Arabs of the military districts, where there are no colonists, perish by hundreds of thousands, while those of the civil territory, finding work, supplies, and support among the colonists, withstood the effects of the crisis.—BIBLIOGRAPHY : *Annuaire administratif de l'Algérie*, 16 Alger, 1879; *Annuaire général de l'Algérie, sur des documents officiels*, 8 Paris, 1879; *Etat actuel de l'Algérie, publié d'après les documents officiels, sous la direction du directeur général des services civils*, 8 Paris, 1879; *Tableau de la situation des établissements français*, 4 Paris, 1879; *L'Algérie et les Colonies françaises, par Jules Duval*, 8 Paris, 1877; *L'Algérie ancienne et moderne, par A. CHARLES DU BOUZET.

ALGERINE WAR (IN U. S. HISTORY). From the time when Mohammedanism first gained a foothold in northern Africa, the Barbary powers carried on a naval warfare, at first for religion and afterward for profit, against every nation which refused to buy a peace from them. Before the American revolution, the American trade in the Mediterranean, amounting to about 20,000 tons of shipping, was protected by passes from the imperial government at London. In July, 1785, the Algerines began capturing American vessels, and continued to do so until 1793, except when their vessels were blockaded by a Portuguese fleet. In 1786-7 a treaty was concluded with Morocco; one with Algiers, Sept. 5, 1795; one with Tripoli, Nov. 4, 1796; and one with Tunis, Aug. 26, 1799. By these treaties the United States purchased peace either by a gross sum or by a yearly tribute; but the notorious doubt and difficulty of making the treaties, had at least compelled the formation of a small American navy, against the opposition of the republicans. (See DEMOCRATIC PARTY, II.) The payment of the tribute did not diminish the insolence of the recipients, and, in 1800, Bainbridge, who commanded the frigate George Washington, wrote to the navy department, "I hope I shall never again be sent to Algiers with tribute, unless I am authorized to deliver it from the mouths of our cannon."—In 1801, Tripoli, dissatisfied with inequalities in the tribute, declared war, and the other Barbary powers began to be clamorous for fresh presents. In 1802, congress having recognized the existence of war with Tripoli, Commodore Morris was sent to the Mediterranean with six vessels, and four other vessels were rapidly equipped to follow him. The grounding of the frigate Philadelphia in the harbor of Tripoli, Oct. 31, 1803, her capture, and her subsequent destruction by Decatur, and the bombardment of Tripoli, were the principal events of this war until a land expedition by Eaton, American consul at Tunis, compelled Tripoli to make peace, June 4, 1805. The restrictive policy, which soon after was begun by the republican party, (see EMBARGO), by checking American commerce, diminished the temptations to attack it; but the abandonment of this policy in 1810, renewed the temptation which the Barbary powers always found in an unprotected flag. In 1812 the dey of Algiers declared war against the United States, and from that time

until 1815 British cruisers were allowed to capture American vessels in the Barbary ports. In May, 1815, Decatur was sent to the Mediterranean with ten vessels. He sailed directly to Algiers, capturing on his way the largest frigate in the Algerine navy, and compelled the terrified dey to appear in person on the quarter deck of the American flagship and there sign a treaty, June 30, 1815, which formally abandoned any claim to tribute in future. He then compelled Tunis and Tripoli to pay indemnity for British captures. The payment of tribute was thus terminated.—The political importance of the Algerine wars lay only in the fact that they compelled the republican administration, in spite of its dislike to a navy, (see DEMOCRATIC PARTY, II., III., GUNBOAT SYSTEM), to retain a nucleus of it and thus to insure the principal successes of the war of 1812. But the administration was embarrassed by the effort to combine its two opposite lines of policy, a sea-going fleet against the Barbary powers and gunboats against Great Britain and France; and many of its naval budgets were passed by its supporters in congress in secret sessions. The Algerine wars also led to an increase in the tariff. By the act of March 26, 1804, renewed at intervals until 1815, 2½ per cent. additional *ad valorem* duties were imposed on all importations in American vessels, and 10 per cent. on foreign vessels, to form a fund for protecting American vessels against the Barbary powers (commonly called the Mediterranean Fund).—See 1 Lyman's *Diplomacy of the United States*, 370; 2, 3, Hildreth's *United States*; 1 Cooper's *Naval History*; 4 Jefferson's *Works* (ed. 1829), 21; 1 *Statesman's Manual* (Jefferson's *Messages*, 1804-7); 3 Benton's *Debates of Congress*, 158 foll. The act of March 26, 1804, is in 2 *Stat. at Large*, 291; the treaties of 1786-7, of Sept. 5, 1795, of Nov. 4, 1796, of Aug. 26, 1799, of June 4, 1805, and of June 30, 1815, are in 8 *Stat. at Large*, 100, 133, 154, 157, 214, 224. ALEXANDER JOHNSTON.

ALIEN AND SEDITION LAWS (IN U. S. HISTORY), two acts passed by the federalist majority in the summer of 1798. The session opened in December, 1797, with a strong federalist majority in the senate, and a democratic-republican majority in the house, which for several months voted down every attempt to resist by force the aggressions of France upon American commerce. But the publication of the dispatches from the X. Y. Z. mission in April, 1798, erased party divisions for the time, silenced the republican leaders, converted all the lukewarm republicans to an intense hostility to France, and gave both houses to federalist control. The leading republican journalists were mostly foreigners, Frenchmen, and refugee Scotchmen, Irishmen, and Englishmen, who had excited the warmest hatred of the federalists by their scurrilous and intemperate language, and by their open advocacy of the extreme violence of French republicanism. One of the first objects of the federalists, after providing for an increase of the army and navy, was to muzzle

these aliens, and to this end the acts above mentioned were passed.—There were three alien laws. The *first* was an amendment of the naturalization laws, extending the necessary previous residence to fourteen years instead of five, and requiring five years previous declaration of intention to become a citizen instead of three. Alien enemies could not become citizens at all. A register was to be kept of all aliens resident in the country, who were to enter their names under penalties in case of neglect; and in case of application to be naturalized the certificate of an entry in this register was to be the only proof of residence whenever residence began after the date of this act. The *second*, passed June 25, was limited by its terms to two years of operation. It authorized the president to order out of the country all such aliens as he might judge dangerous to the peace and safety of the United States, or might suspect to be concerned in any treasonable or secret machinations. The *third* provided that, whenever any foreign nation declared war against or invaded the United States, all resident aliens, natives or citizens of the hostile nation, might, upon a proclamation to that effect, to be issued at the president's discretion, be apprehended and secured, or removed. The first and third of these acts met no warm opposition, though the first was repealed when the republicans gained power. The second is the one which is known pre-eminently as the *alien act*. It was opposed as an unconstitutional interference with the right secured to the existing states to permit until 1808 the importation or emigration of any such persons as they might think proper; as an attempt to usurp undelegated powers over aliens who were legally under the jurisdiction and protection of the laws of the state wherein they lived (see KENTUCKY RESOLUTIONS, IV.); and as an unconstitutional interference with the right of trial by jury. The first alien act, as to naturalization, was repealed by the act of April 14, 1802, which re-established the former requisites of time of residence. The second and third of these acts have no further history, for no prosecutions or direct presidential action took place under or by virtue of them. They are important only as one moving cause of the Kentucky and Virginia resolutions, and of the overthrow of the federal party at the next presidential election.—According to Jefferson a sedition law had been threatened in April, but no steps toward it were taken in congress, until June 26, when Lloyd, of Maryland, a federalist senator, introduced a bill in four sections, to define more precisely the crime of treason, and to define and punish the crime of sedition. The first section of Lloyd's bill declared the people of France enemies of the United States, and adherence to them, giving them aid or comfort, to be treason, punishable with death. The second section defined misprision of treason and prescribed its penalties. The third section made it a high misdemeanor, punishable by fine not exceeding \$5,000, imprisonment from six months to five years, and bind-

ing to good behavior at the discretion of the court, for any persons unlawfully to combine and conspire together, with intent to oppose any measures of the government of the United States, directed by proper authority, or to impede the operation of any law of the United States, or to intimidate or prevent any person holding office under the government of the United States from executing his trust, or with like intent to commit, advise, or attempt to procure any insurrection, riot, unlawful assembly, or combination. The fourth section provided that any person who, by writing, printing, publishing, or speaking, should attempt to justify the hostile conduct of the French, or to defame or weaken the government or laws of the United States by any seditious or inflammatory declarations or expressions, tending to induce a belief that the government or any of its officers were influenced by motives hostile to the constitution, or to the liberties or happiness of the people, might be punished by fine or imprisonment, the amount and time being left blank in the draft of the bill. The first and second sections were struck out, and the bill, having thus been razed to a bill of two sections, the third and fourth of Lloyd's draft, passed the senate by a vote of 12 to 6. In the house it also passed, by a vote of 44 to 41, but with a very material change. The extremely objectionable second section, (the fourth of the draft above given), whose intentional looseness and vagueness of expression could have made criminal every form of party opposition to the federalist majority, was struck out. In place of it was inserted a new second section which subjected to a fine not exceeding \$2,000, and imprisonment not exceeding two years, the printing or publishing any false, scandalous and malicious writings against the government of the United States, or either house of the congress, or the president, with intent to defame them, or to bring them into contempt or disrepute, or to excite against them the hatred of the good people of the United States, or to stir up sedition, or with intent to excite any unlawful combination for opposing or resisting any law of the United States, or any lawful act of the president, or to excite generally to oppose or to resist any such law or act, or to aid, abet or encourage any hostile designs of any foreign nation against the United States. A third section was then added, providing that in all prosecutions under this section the truth of the matter stated might be given in evidence, as a good defense, the jury to be judges both of law and fact; and by a fourth section the act was to continue in force only until March 4, 1801. The credit of the last two sections is due to Bayard of Delaware. The bill as finally passed, therefore, consisted of four sections, the first being the third of Lloyd's draft, and the second, third and fourth the ones just given. The objections to it are its evident intention to restrain freedom of speech and of the press, both of which are guaranteed by the constitution, and its attempt to enlarge the sphere of

the federal judiciary by impliedly recognizing its common law jurisdiction in criminal matters. The first objection can hardly be met successfully; in this respect the law was patently unconstitutional, partisan, and dangerous, and the only precedents in justification of it are drawn from the action of state legislatures or the federal government during the revolution or under the confederation, (but see WAR POWER). The second requires further consideration.—In civil matters the rules of the common law have always been followed by federal as by state courts. In criminal matters the state courts, in addition to the jurisdiction given them by statute, had always exercised a very extensive jurisdiction, which they still exercise, though to a less extent, over a class of offenses which are so not by any statutory enactment, but by custom, that is, by common law. Any of these could of course, at any time, be taken out of the common law by statute, and made a statutory offense with strict bounds of punishment; and libel has since been so treated by all the states. But in 1798 libel was still a common law offense, and the state courts claimed and exercised arbitrary power as to the extent of the punishment to be inflicted in case of conviction. It had never been decided whether the federal courts possessed this common law criminal jurisdiction, but it was known that most of the federal judges believed that they did possess it, and most of the federalists were inclined to the same opinion. The republicans, on the contrary, believed that the crimes expressly enumerated in the constitution—treason, counterfeiting United States coin or securities, piracy, and offenses against the laws of nations—were the only crimes over which federal courts had jurisdiction. If the doctrine of the federalists was correct (and it was certainly never contradicted by the federal courts until 14 years had passed, and the judiciary, with the other departments of government, had fallen into democratic hands) then the sedition law was a very salutary remedial modification of the common law, since it allowed the truth to be given in evidence, and laid down bounds of punishment, which the judges could not pass. If, on the other hand, the republican doctrine was correct, the sedition law was a pernicious precedent, since, by making a common law offense statutory, it implied a common law criminal jurisdiction in the federal courts, wherever statutes did not interfere. The republicans had little legal talent in their ranks in 1798, and had made little open opposition to the federalist claims on this point. But Jefferson at once perceived the limitless consequences which were entailed by the admission and permanent establishment of the principle implied in the sedition law. It was law, until overthrown by the supreme court, which was not at all likely while the supreme court was under federalist control. Individuals were thus irrevocably brought under the operation of a law which, under the very general term of "opposing" the government, made party opposition criminal. To prevent the exten-

sion to the state governments of the same prohibition of opposition, under some as yet unthought-of product of federalist legal ingenuity, the Virginia and Kentucky resolutions were prepared and passed, (see KENTUCKY RESOLUTIONS).—It is not a little characteristic, however, of the immature politics of 1798, that the alien law directed mainly against French refugees, provoked far more republican rhetoric than the sedition law, directed against native born citizens as well, though there were at least six prosecutions under the latter act and none at all under the former. Neither party had yet advanced far enough in political experience to learn that “the common law offense of libeling a government is ignored in constitutional systems, as inconsistent with the genius of free institutions.” In the case of the sedition law the republicans felt the blow rather because it was aimed at them as a party than because of any deep-seated aversion to such laws as legitimate weapons in party warfare; in the case of the alien law, its apparent enmity to France was the touchstone by which alone most of the republicans judged of its iniquity. (See KENTUCKY AND VIRGINIA RESOLUTIONS, FEDERAL PARTY, DEMOCRATIC-REPUBLICAN PARTY.)—See 2 Benton's *Debates of Congress*; 1 von Holst's *United States*, 142; 5 Hildreth's *United States*, 215-236; 1 Schouler's *United States*, 393; and authorities under articles above referred to. The alien acts of June 18, June 25, and July 6, are in 1 *Stat. at Large*, 566, 570, 577, (see also authorities under AMERICAN PARTY). The sedition law of July 14 is in 1 *Stat. at Large*, 596. For the subsequent denial of common law criminal jurisdiction, by federal courts, see 7 *Cranch*, 32; 1 *Wheat*, 415; 8 *Pet.*, 658 (per McLean, J.). The argument in favor of such jurisdiction will be found in Story's *Commentaries*, § 158 (note), and authorities there cited; against it, in 1 Bishop's *Criminal Law*, §§ 16-18, and authorities there cited. Lyon's fine was refunded by act of July 4, 1840, (6 *Stat. at Large*, 802), and Cooper's by act of July 29, 1850, (9 *Stat. at Large*, 799), the money in both cases going to the heirs.

ALEXANDER JOHNSTON.

ALIENS. In the early days of Rome, a foreigner, unless under the protection of a *patron* and occupying the position of a *client*, was without the protection of the law, both as to his person and his property. Whatever the Roman citizen took from him, he acquired by the same title that he did the “unclaimed shell on the beach” which he picked up. Exceptions to this general rule owed their origin to special treaties which secured to members of a foreign political community certain rights within the commonwealth of Rome; and it is not unlikely that these treaties formed the primitive structure which gradually gave rise to the body of private international law known as the *ius gentium*, side by side with the civil law. The principle of the total and absolute exclusion of foreigners, is clearly traceable in both the constitution and the civil law of the Roman common-

wealth during its early period. But the presence of a large number of foreigners within the dominion, and the necessities of trade, not only gave rise to the treaties referred to, but led the Roman lawyers to devise means whereby disputes between aliens and the citizens of Rome might be settled. They refused to decide these cases in accordance with the civil law, to whose benefits none but the citizens of the Roman commonwealth were admitted. From the rules of law, which were common to Rome and the several Italian tribes, and which were applied in settling the controversies to which members of such tribes might be a party, the Roman jurists built up a system of law which, though suggested in its origin by the spirit of scorn and disdain with which the Roman citizen looked upon all foreigners, became, with the aid of Greek ideas—as a body of laws common to all nations—the source of many of the principles of natural justice.¹—In England an alien is defined as one born out of the allegiance of the king. In the United States an alien is one born out of the jurisdiction of the United States, who has not been naturalized under the constitution and laws of the United States. The children of ambassadors and ministers at foreign courts, though born on foreign soil, are not aliens.—As distinguished from aliens, natives are all persons born within the jurisdiction and allegiance of the United States. This follows the rule of the common law. In settling the rule relative to the distinction between aliens and citizens, in the jurisprudence of the United States, the courts held that the subject of alienage, under our constitution, is a *national* subject, and that the law on this subject, which prevailed in the states, became the common law of the United States when the federal union was established. Citizenship as distinguished from alienage is a national right.—To create allegiance by birth, the person must be born, not only within the territory, but within the allegiance of the government. A citizen can not renounce his allegiance to the government of the United States without its permission, to be declared by law; and as there is no existing legislation bearing on this subject, the rule of the common law remains unchanged.—By the fourteenth amendment to the constitution, “all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the state wherein they reside.” The citizens of the federal union are, therefore, not to be treated, within the territory and jurisdiction of the different states, as aliens.—During the residence of aliens in a country, they owe a local allegiance to its government, and are equally bound with natives to obey all laws for the maintenance of the peace and the preservation of public order, which do not especially relate to the rights and the conduct of citizens. This principle is universally recognized and adopted, as being alike dictated by justice and the public safety. If an alien commits an unlawful act, or is involved in disputes

¹ Maine, *Ancient Law*.

with a citizen, or any other resident foreigner, he is amenable to the ordinary tribunals of the country. In New York, resident aliens are liable to be enrolled in the militia, provided they are lawfully seized of any real estate within the state; and they are, in that case, declared to be subject to duties, assessments, and taxes, as if they were citizens. They can not, however, exercise any of the political rights and privileges which do, and ought to, form the sole and exclusive prerogatives of citizenship. They are, therefore, not capable of voting at an election, or of being elected or appointed to any office of public trust or honor. In addition to this, they are also incapable of serving as jurors.—Should an alien come to the United States with the intention of making it his permanent home, he will find in the law an easy means of removing his disabilities, and securing all the rights of citizenship, including that of taking an active share in the administration of the government. The acts of congress regulating and providing for the naturalization of foreigners need not be more than referred to here. A person naturalized under those acts, becomes entitled to all the privileges and immunities of native citizens, except that a residence of seven years is required to enable him to hold a seat in congress, and that no person, save a native born citizen, is eligible to the office of governor in some of the states, or of president of the United States.—The unjust and inhospitable rule by which the most civilized states of antiquity were characterized, prevailed in many parts of Europe, down to the middle of the last century. The law which claimed, for the benefit of the state, the effects of a deceased foreigner who left no native heirs, existed in France as late as the commencement of the French revolution. This rule of the French law was not only founded on the Roman law, but it was also justified by the narrow and singular policy of preventing the wealth of the kingdom from passing into the hands of foreigners. This provision of the *droit d'aubaine* was abolished by the constitution of the first constituent assembly, in 1791, and foreigners were admitted, on very liberal terms, and were declared capable of acquiring and disposing of property in the same manner as native citizens. This doctrine was more or less followed by subsequent legislation, and the treaties of France with other governments.—According to the common law, an alien can not acquire a title to real property by descent, or a title created in any other way by mere operation of law. The law *quæ nihil frustra* never casts the freehold upon an alien heir who can not keep it. It is understood to be the general rule, that even a native subject can not take by representation from an alien, because the latter has no inheritable blood through which a title can be obtained. The statute of 11 and 12 Wm. III., however, was passed to cure this disability, enabling natural born subjects to inherit, under certain restrictions, the estate of their ancestors, notwithstanding that those under whom they claimed or from whom they derived their title,

were aliens. The provisions of this statute have been amplified by those of 33 and 34 Vict., c. 14, by which aliens are enabled to take, acquire, hold and dispose of real and personal property of every description, (except British ships), and to transmit a title to land, in all respects as natural born British subjects.—The former statute is in force in several of the United States, but even where it is not, the courts are very liberal in their construction of the common law, and willing to conform to the enlarged policy of the present day in rather contracting than extending the disabilities attaching to alienage. As to the question touching the distinction of the *ante nati* and *post nati*, at one time the subject of much controversy, the doctrine was finally settled in this country, and persons born in England, or elsewhere out of the United States, before the 4th of July, 1776, and who continued to reside out of the United States after that event, were considered aliens, and incapable of inheriting an estate in lands in the United States.—Again, according to the common law, although an alien may purchase land, or take it by devise, he is still exposed to the danger of having his lands forfeited to the state, upon an inquest of office found, that is, on inquiry as to whether the sovereign is entitled to the possession of the property, real or personal, as against any other claimant. The alien's title is held to be good against every person but the state. If he should die before an inquest is had, the inheritance can not descend, but escheats. If he should undertake to sell to a citizen, the prerogative right of forfeiture is not barred, and the purchaser takes the property subject to the right of the government to seize it. His conveyance is good as against himself, but the title is voidable by the sovereign upon the proper inquiry being had. According to Lord Coke, an alien merchant is the only one who may take a leasehold interest in land; he is, however, restricted to a house, and if he dies before the termination of the lease, the remainder of the term is forfeited to the sovereign. The reason is, that the law gave him the privilege of habitation only, as essential to his trade, and not for the benefit of his representatives.—In many of the states the disabilities of aliens in respect to holding lands are removed by statute, though under certain conditions, such as that the aliens must be residents, or have declared their intention of becoming citizens, or both. As far as personal property is concerned, aliens are capable of acquiring, holding and transmitting it as are citizens, and they can bring suit for the recovery and protection of their property.—According to the authority of jurists such as Grotius, Bynkershoek and Martens, a state has the right, on the breaking out of hostilities with a foreign government, to treat persons as enemies who owe allegiance to that government, and to deal with their property found within the territory of the state as the property of enemies. It has the right to confiscate such property and to detain aliens as prisoners of war. But modern governments, while

modifying and softening this rigorous doctrine by stipulations and treaties, have more or less made special provision in their own legislation, for the security of the persons and property of aliens whose government may be at war with them. Thus it was provided by the great charter—though similar privileges had been granted fifteen years before, in 1200, by special charter¹—that, on the breaking out of war, foreign merchants found in England, and belonging to the country of the enemy, should be attached “without harm of body or goods” until it should be ascertained how English merchants were treated by the enemy; and “if our merchants,” the charter says, “be safe and well treated there, theirs shall be likewise with us.”²—The statutes and judicial decisions which followed this liberal provision of the great charter, tended rather to increase than diminish its privileges. Alien merchants are allowed forty days to depart the realm with their goods; which period is extended for another forty days in case they are prevented from departing on account of accident. The legislation of the United States is dictated by the same wise and humane policy. The act of congress of July 6, 1798, c. 73, authorizes the president, in case of war, to determine the conduct to be observed toward subjects of the hostile government, who, being aliens, may be within the United States, and in what cases and on what security, their residence should be permitted; and it declared in reference to those who were to depart, that they should be allowed such reasonable time as might be consistent with the public safety, and according to the dictates of humanity and national hospitality, “for the recovery, disposal and removal of their goods and effects, and for their departure.” Yet, notwithstanding this, it was held that the strict right of confiscating the property of resident aliens whose government was in hostility to ours, still existed in congress, and that the question as to what should be done with this kind of property, was one rather of policy than of law, and that the exercise of that right rested in the sound discretion of the sovereign body of the nation.—As to the question, whether the state, where an alien may have his domicile, should enforce a judgment rendered against him, either in his native country or in another state, it seems to be the opinion of the continental jurists, that, under their municipal laws, such judgment

can not be enforced; it is simply within its own territorial jurisdiction, and as far as the *imperium* of the state extends, that judgments rendered according to law, can be enforced. Yet, inasmuch as it is the business of the state to embody in its laws and institutions the ideas of justice and right, and as the government is bound to recognize and encourage the same tendency in the laws and institutions of all civilized states, it is held to be the better rule, that the lawful judgments of the courts of one state shall be enforceable in another, provided it be shown that the court had jurisdiction of the cause; that it was decided according to the laws in force within its jurisdiction, and that the judgment does not require the doing of anything which is contrary to the laws of the country in which it is sought to be enforced.—During his domicile, an alien is subject to the police regulations and criminal law of the country where he may sojourn. Whether he can also be tried and sentenced there for offenses he may have committed elsewhere than in his native state, is a question upon which neither the legislation of the different countries of Europe, nor the opinions of jurists seem to agree. On the continent it is considered the better opinion, that, contrary to the rule prevailing in the United States and in England, where aliens are not tried for offenses committed elsewhere, aliens should be tried and punished for such offenses wherever they may be domiciled.³—The power of taxation as regards aliens, can not be exercised by a government to the same extent as regards its own citizens or subjects. Aliens should not be subject to taxation or assessment beyond what is required of them by law; and such tax or assessment should be levied on the property they possess, or should be imposed upon them by reason of the business they may carry on, in the country where they reside.—Aliens can not, and should not, be held liable to military service, or to any impost for military purposes. Aliens have the right to leave the state where they may be domiciled at pleasure; and the government has no authority to prevent their departure, except in cases where they have entered into some obligation which they are bound to discharge in favor of the government, or in favor of its citizens or subjects, or in case the alien has committed some offense for which he is punishable under the laws of such government. As aliens are at liberty to depart from the country where they may be sojourning, or have been domiciled, the government has an equal right to exclude them from its territory, and in that event, an alien has no redress beyond the protection and remonstrance of his native government, in case the foreign government should exercise its right of expatriation without just cause.—The relation of the citizen or subject to his government is not only such as to impose certain duties upon him in case he should reside in a foreign country, but as to secure to him

certain rights. Hence he not only retains all the rights and privileges guaranteed to him by the constitution and laws of his native state, but he may also ask the protection and intervention of his government as against any oppressive or unlawful act on the part of the foreign government. And his native government is bound to use every means pointed out by the law of nations, and the dictates of humanity and justice, for the protection of its citizens or subjects in a foreign country where they may be domiciled or sojourn as aliens.—See I. and II. *Kent's Commentaries*; Poehl in III. MAX. EBERHARDT.

ALLEGIANCE (IN U. S. HISTORY). I 1774-89. Until the opening of the American revolution, native or naturalized British subjects owed allegiance to the British crown, and, for more than a year after the armed forces of the king and his American dominions had met in battle, this obligation of allegiance was still acknowledged. The royal proclamation of Aug. 23, 1775, declaring the American colonists rebels, the act of parliament in December, 1775, authorizing the capture of American vessels, wherever found, the pamphlet of Payne, *Common Sense*, and, still more, the bombardments of Falmouth, (now Portland, Maine), Oct. 18, 1775, and of Norfolk, in Virginia, Jan. 1, 1776, were all arguments which convinced the colonists that allegiance, being dependent on protection, was no longer due to the king. The continental congress, however, which had already, in great measure, come under the control of the state legislatures, did not claim the allegiance of the American people, but resolved June 24, 1776: "That all persons abiding within any of the united colonies, and deriving protection from the laws of the same, owed allegiance to the said laws, and were members of the same; * * * * * and that all persons members of, or owing allegiance to, any of the united colonies, who should levy war against any of the said colonies within the same, or be adherent to the king of Great Britain, or other enemies of the said colonies, or any of them, within the same, giving to him or them aid or comfort, were guilty of treason against such colony." Jan. 25, 1777, Sir William Howe by proclamation offered protection to such citizens of New Jersey as should take the oath of allegiance to the king. Washington at once replied by a counter-proclamation, ordering all persons, who had thus received protection, to surrender their protections and take the oath of allegiance to the United States, or retire within the British lines. The novel idea of allegiance to the United States was the subject of very general and adverse criticism until Washington explained that he had prescribed no form of oath, and had only instructed his subordinates to insist upon an obligation "in no manner to injure the states." In February, 1778, con-

gress prescribed the form of an oath, to be taken by officers of the army, and all others serving *under congress*, which was simply a renunciation of allegiance to the king of Great Britain, an acknowledgment of the independence of the United States, and an obligation to defend and serve them. This non-committal obligation remained the rule throughout the confederation. The state constitutions, adopted during the revolution and confederation, all provided for an oath of allegiance to the state alone, of which the following may serve as an example: "I, A. B., do truly and sincerely acknowledge, profess, testify and declare that the commonwealth of Massachusetts is, and of right ought to be, a free, sovereign and independent state, and I do swear that I will bear true faith and allegiance to the said commonwealth * * * * *"—II. UNDER THE CONSTITUTION.

The constitution (articles III. VI.) introduced two new features into the national government: not only United States senators and representatives, but all members of state legislatures, and all executive and judicial officers of the United States and of the several states, were to be sworn to support the constitution; and the crime of "treason against the United States," which had no existence under the confederation, was stated and defined. The 1st congress at once enforced both these provisions. The act of June 1, 1789, provided for the new oath of allegiance; and the act of April 30, 1790, declared the punishment of treason against the United States (see also **ALIEN AND SEDITION LAWS**). The state constitutions, thereafter adopted, contain the oath of allegiance to the state, but bound up in it is the oath of allegiance to the United States.—The wave of reaction against the establishment of the national will as the basis of national government, (see **UNITED STATES**), which began to be apparent in the south about 1830, and which culminated in the rebellion, was marked by the introduction of a new and subtle doctrine as to allegiance. It defined allegiance as the paramount submission due by the citizen to the constitution and government of the state to which he belongs; and held that the citizen of a state owed to the government of the United States not allegiance, but *obedience*, because his own state, as a party to the confederation, enjoined it. It would follow from this that the citizen was bound as well to refuse obedience to the United States, and to array himself in arms against the national government, whenever ordered to do so by his state. A clear conception of this doctrine, and of its general acceptance by educated men in the south, will show the reason of the astonishingly sudden disappearance of the union party in the south in 1861; and will explain the course of A. H. Stephens, for example, who repeatedly and sincerely urged the maintenance of the union in December, 1860, and ninety days afterward, his state having seceded in the interim, was vice-president of the confederate states, with his own full concurrence.—The result of the rebellion settled the question of the citizen's obli-

tion to "follow his state" against every other possible authority. The state constitutions formed in 1867-8 (see SECESSION, RECONSTRUCTION) contain provisions of which the following extract from that of Alabama is an example: "That this state has no right to sever its relations to the federal union, or to pass any law in derogation of the paramount allegiance of the citizens of this state to the government of the United States."—After the states had been re-admitted to the union under these constitutions, some of them, as Texas and Arkansas, framed new constitutions in which the above provision was omitted. But as the supreme court has decided that the conditions, of which the above was a principal one, under which the state was admitted are binding upon the state, and that the state is estopped to deny their validity, it would seem that this provision, though omitted, is still binding in law. As matter of fact and politics it has been still more emphatically settled by war.—The doctrine of the federal courts has always been that allegiance may be dissolved by the mutual consent of the government and its subjects or citizens, though the few decisions on this point touch only the deposition of allegiance by aliens, and the southern doctrine as to domestic allegiance has never been formally before the federal courts. A single case (cited in 3 *Dall.*, below) lays down the principle that renunciation of allegiance to a state government does not imply or draw after it renunciation of allegiance to the United States. The British government, on the other hand, until the passage of its liberal naturalization act in 1844, refused to recognize the American doctrine (see EMBARGO, II.).—See (I) 2 *Public Journals of Congress*, 216; 4 *Washington's Writings*, 298-319; 4 *Public Journals of Congress*, 49; 1 *Poore's Federal and State Constitutions*; 4 *Cranch*, 209; (II) 1 *Stat. at Large*, 23, 112; *The Book of Allegiance*, (arguments in South Carolina court of appeals, 1834); Thomas Cooper's *Consolidation*; 1 *Tucker's Blackstone App.*, 170-187, and authorities cited under STATE SOVEREIGNTY and SECESSION; 2 *Stephens' War Between the States*, 297; 2 *Appleton's Annual Cyclopædia*, 270 (Debates in Confederate Congress, 1862); 13 *Wall.*, 646; S. ALEXANDER JOHNSTON.

ALLEGIANCE, Oath of. The long civil wars which desolated England had, among other results, that of creating a host of pretenders to the crown, which passed from hand to hand during the War of the Roses. Thus, after the death of queen Mary, there were no less than fifteen competitors for the inheritance of the daughter of Henry VIII. Elisabeth, having had trouble enough in securing her rights, sought for means to strengthen her authority. The first parliament which she convoked therefore proposed to satisfy the wishes of the queen, and, for the first time, prescribed the oath of allegiance. By this oath, which might be exacted from every person twelve

years of age and upward, the queen was recognized as the only and legitimate sovereign; fidelity and obedience were promised her; and she was declared head and supreme defender of the church of England. King James I. had the form of the oath of allegiance modified by parliament in a more monarchical sense than was allowed by the terms employed in the reign of Elisabeth. After the revolution of 1688, the famous convention which formed itself into parliament, voted to retain the oath, but took good care to expunge everything in it which had the odor of passive obedience. The learned English author, Paley, who has commented at length on the terms and motives of the oath in its new form, proved that it justified even armed resistance in case the prince, by infirmity of mind or culpable action, should attack the liberties of the country. No doubt this interpretation, so conformable to the tone of the English mind, is of authority to day in the constitutional interpretation of the oath of allegiance.—In France, under Napoleon III., the first opposition deputies elected after 1852, having refused the political oath, the *senatus-consultum*, of Feb. 17, 1858, prescribed that every candidate for deputy should first put on file the oath of fidelity to the emperor. More than one who had at first refused afterward decided to take the oath. (See OATH.)

MAURICE BLOCK.

ALLIANCE. The nation being but the family enlarged, what is applicable to the one may nearly always be applied to the other, with a few modifications. We shall discover, therefore, in the development of the relations between individuals, the history and origin of the international relations called political alliances.—They have both been subjected to the action of time. They have been modified, transformed, and complicated, keeping pace with the evolution of humanity and the progress of society; but in every epoch we discover, as their essential bases, the constituent principles of the earliest human society. Affinities of blood, the power of passion, community of interests; these are the forces which in all ages have brought individuals, as well as nations, together. We shall adopt these three great divisions in our study of political alliances, keeping always in view the subdivisions which each of them admits of, for they correspond to three great phases in the history of all humanity, and, at the same time, show the permanency and the successive combinations of the constituent principles of which we have just spoken.—Affinity of blood was the formative principle of the first human groups; solidarity of interests has an ever increasing tendency to govern in the making of modern alliances; and yet it is demonstrable that material interests not unfrequently played a part in the most remote antiquity, even where consanguinity and race exercised the most decisive influence, just as certain family alliances have stifled the voice of interest in recent times and in countries in which the principles of political economy have long been

the guiding rules of diplomacy.—There are three chief classes of political alliances: alliances of blood, alliances of ideas or principles, and alliances of interest. There are conditions of existence and duration peculiar to each kind of alliance. Some are temporary, others of indeterminate duration; some have a special object in view, others are universal in their character. There are alliances for common defense, and alliances at once offensive and defensive. The peculiar character of these alliances, the diversities resulting from the governments of different form between which they are contracted, become apparent from the study of the treaties which create these unions, and which constitute the law of nations. Conventions are for nations what contracts are in the case of individuals.—I. ALLIANCES OF BLOOD. There are blood alliances of peoples of common origin, and there are those due to the union of sovereigns. This double species of alliance predominated at the first grouping together of nomad tribes. The patriarchy which preceded royalty introduced family alliances. The laws of agglomeration are everywhere identical. Families of a common stock come together and form a tribe; the tribes unite and form the nation; sovereigns, through their alliances, complete and extend the work begun by the heads of families and the members of the tribe. In the vedas, the bible, and the Scandinavian sagas, the illustrations of this are the same, and abound to such a degree that it would be superfluous to cite any. Although the alliance of blood and race becomes less important in international affairs as we advance into historic time, the part it plays is still great in the annals of nations. It was the ties of consanguinity that grouped the princes of Asia around the ravisher of Helen; it was the solidarity of race which gave avengers to the outraged Menelaus. We find in the immortal epic of Homer, on the narrow boundary between fable and primitive history, an example of the alliance of blood and race as it was developed during centuries of barbarism and ignorance.—During the period of the great migrations of peoples, and the wars of conquest and religion, alliances of blood played a less important part. They governed, however, in the formation of those numberless hordes which rolled westward like so many avalanches, from the lofty plains of Asia and the icy fastnesses of northern Europe. When men thought to stem the torrent it was through alliances of blood that resistance to it was organized. Such alliances it was that brought order out of chaos, light out of darkness, and did away with violence, and established peace. Such alliances it was that gave Clothilda to Clovis and Helen to Constantine. After the fruitless efforts of Charlemagne and his emulators to revive the empire of the west, the sovereignty of the world was divided among several. The age of feudalism was an age of violence, but it was also an age of grace and beauty. The souvenirs of chivalry show clearly enough what the influence of woman was during all that period. Her influence found expression

and strength in marriage contracts. Through marriage all the great houses and lasting fortunes of modern times were founded. The fortune of war is variable. Defeat takes away what victory gave; but much is handed down which survives the reverses of war. The ties of blood resist the trials of adversity. While conquerors disappear like brilliant meteors, fortunes which last for centuries attest the force and vitality of family alliances. It was by these latter that the French monarchy was established. The fruits of the greater part of French conquests have been taken away from France. The dowries of French queens have remained. The house of Bourbon, whose destiny has been so closely allied to that of France, owed its greatness to the skill with which its alliances were formed more than to anything else. These verses inspired by the matrimonial successes of the house of Austria are well known: *Bella gerant alii, tu felix Austria, nube.*—We might say the same of the house of Savoy, which owes six or seven centuries of constant aggrandizement to its continued formation of useful alliances. We have said enough to describe the classes of alliances with which we are here concerned. To show what was their influence in peace and war would be to rewrite all history. We will, therefore, add but two examples to those already cited. The union of the house of France with that of Spain, ending in the war of succession under Louis XIV., and which gave rise to English mistrust under Louis Philippe, is one of those historical episodes in which the inconveniences and advantages of family alliances are strikingly shown. Formerly, in the organization of the "Holy Roman Empire of the German nation," of the Germanic Confederation, and latterly of the German Empire, we find a no less striking instance of race alliances.—The motive cause of family alliances is almost always the ambition of sovereigns, the instinct of conquest, or the desire of political preponderance. They are, therefore, most frequently aggressive. Alliances of race, on the contrary, are generally defensive. They are formed for the protection of interests, which would be imperiled by isolation from other interests. The menaces of Persia gave rise to the amphictyonic league. The gigantic development of the Russian empire, and the formation of France into a powerful unit, gave birth to the diet of Frankfort, which led to the complete unification of Germany.—II. ALLIANCES OF IDEAS OR PRINCIPLES. We do not wish to conceal the vagueness and insufficiency of this caption, yet we have been unable to find a title more applicable to an alliance which is neither an alliance of race, of family, nor of interest.—Hatred, vengeance, gratitude, friendship, ambition, faith, are feelings, passions, *ideas*, which have more than once determined peoples and sovereigns to contract alliances. It often happens that an idea is complicated with interests or with affinities of blood. We must not hope for strict unity in a subject which by its nature is complex and indeterminate.—One of the

most evident results of civilization is the substitution of interest for passion, in the management of human affairs. We must go far back in history to find an example of a people forming an alliance for objects of vengeance or hatred. Ambition itself scarcely ever avows its object now, and princes most greedy of glory disguise their passion under the mask of the general good. This was not always the case: The profound impression made by the invasions of the barbarians and the memory of the violence which prevailed under the territorial and political constitution of the world at the fall of the Roman empire, long sanctioned, among princes and nations, conventions regulating the most criminal projects, without scruple and without disguise. Antiquity had nothing similar to offer. Was not piracy the professed object of the alliance between the Barbary States? And when the Norman barons made a league with William to invade England, did they not stipulate beforehand the conditions of their assistance and the amount of booty they would demand in case of success? The hatreds and violence of the middle ages went as far as the formation of sacrilegious alliances. We can scarcely imagine the magnitude of the scandal, caused by the cross and the crescent fighting in the waters of Lepanto on the same side and for the same object. We are constrained to call attention to this scandal because it was an exceptional fact in flagrant contradiction with the customs and passions of the age. Faith, the religious sentiment, was really the ruling passion in politics until men's material interests began to rule supreme. From the schism of Arius to the peace of Utrecht, and the treaty of Westphalia, the question of religion occupies so large a place in all intervening conventions that diplomacy was saturated so to speak with theology.—In the name of the Holy Trinity, and under the inspiration of the Holy Ghost international acts were drawn up. We need not add that it became necessary for religious formulæ to cover interests of another nature. However, there is an event among the most important of history in which alliances of religion appeared in all their purity, the event of the crusades. The crusades were followed by consequences unforeseen by their promoters, but faith was in the majority of cases the sincere and only motive of the crusaders. Side by side with this great fact are others of less importance which ought to be ranged in the same category; the alliance against the Albigenses and that of the leaguers with Spain; but, in both cases, the religious principle in which the alliance had its origin was combined with political elements which did not permit complete assimilation.—The alliance of the United Provinces with the house of Orange, and the alliance of the Protestants of Germany with Gustavus Adolphus were essentially religious. They bore within them no doubt, the germs of political changes, which they were destined to bring about in Europe, but this can not detract from the purity of their origin.

Religious sentiment will, perhaps, never again tower above material and political interests to such a degree.—Political principles have not been without influence on alliances. We may cite among others those which were based upon the ultra conservative principles of the Holy Alliance to which we devote a special article. Unity of liberal ideas has drawn France and England together, and, in conformity to a law, the effects of which are frequently visible in nature, that contraries attract, we have seen the Russia of Nicholas I. manifest a weakness for the American republic. Alliances based upon political ideas are not more numerous because men have less inclination to argument or reasoning than to sentiments or interest.—III. ALLIANCES OF INTEREST. The policy of interest prevails everywhere. If, therefore, we were to take up at random the alliances concluded since the beginning of this century, we should find that they are all connected either with a material or a political interest; but we have a more serious object in view. The present must be explained by the past. So long as nations were under the tutelage of princes, that is in their minority, so to speak, the will of the sovereign decided the fate of the nation. The country had no policy but that of the prince's ambition, it had no interests but those of his dignity and his dynasty. We must go rather far back in the annals of monarchy to find treaties of commerce and international conventions in which the least thought is given to the economical principles which rule the modern world. Commercial enterprises and industrial undertakings were then so many monopolies. Some princes might be named to whom agriculture, commerce, and industry are indebted for valuable encouragement, but the distance is great between this and an alliance of interest, such as we understand by the term to-day. We must not, therefore, look for alliances based on commercial interests, except in a few small states in which the commerce of the ancient world had become centralized, until we reach modern times. We are not yet cured of the prejudice which causes us to put the glory of arms and military greatness above all other. We should not be astonished, therefore, at the small account which has been made of industrial nations for so long a time by warlike peoples. Fidelity to engagements entered into with them was not considered necessary. Such nations were held in regard only in so far as they were feared by or useful to others. Industrial states were among nations what the Jew is yet in certain countries. Therefore, guided by their instinct and enlightened by experience they substituted the foundation of colonies for foreign alliances which could offer them no guarantee of reciprocity. Before the discovery of the route around the Cape the great highway of the world's commerce was the one which the steam engine has reopened and which has now been so much shortened by the cutting of the Isthmus of Suez. The products of India and the East arrived at the

African coast and there awaited buyers from Europe. Hence along the coasts, the establishment of the flourishing emporiums of Tyre, Carthage, and of so many others. Between these states there was the closest of alliances, identity of origin and a permanent community of interests. On the opposite shore of the great lake, a similar work had been accomplished by the Phœnicians and the Phœceans. The merchant marine had there its stations, and commerce had its centres from the Greek archipelago to Bayonne. Heavy interests and formidable powers sprang up there with which the proudest monarchies of Europe had to reckon, the Sultan as well as other Asiatic potentates. The alliances concluded by Venice and Genoa are those in which commercial interests were most strikingly represented. The commercial and industrial development of Flanders, Holland and Great Britain succeeded Mediterranean prosperity. Commerce had changed its route. It had increased. Up to this time the world had been indebted to it for great cities, it was now to form great nations.—It is from this epoch that economic questions really take a place in the public law of Europe. In the treaties of Charles V. there are stipulations in favor of the good cities of Bruges and Ghent. Industrial states have greater need of independence and security than any others. Alliances of interest reached their full importance only when these interests themselves were admitted and represented in international conventions on a footing of equality.—Our own generation will witness the solution of the problem. Navigation, protection, exchanges, so long forgotten or merely implied, are prominently mentioned now at the head of every treaty. And not only have material interests become the main foundation of all alliances, but no other alliances are possible. There is an explanation of this phenomenon which leads us to hope that it will be an enduring one. The preponderance of material interests keeps pace everywhere with liberty and the progress of civilization. It substitutes loyalty and truth for violence and cunning; what all want takes the place of a single will. Liberty displaces servitude and democracy enters into the possession of its rights.—To believe in this upward course of humanity is to believe in the system of alliances born and destined to develop with it. We have seen by what a logical chain of events this system came to be substituted for the systems which preceded it, but its superiority over them consists in its satisfying man's multifarious wants. It results from this that alliances of interest take part in all the complications of modern life, and that they are never more important than when they compromise with the prejudices of race or with religious sentiment. This new law of international conventions destroys nothing; it transforms the past, it assimilates and absorbs it. It will be the lasting honor of Switzerland to have pointed out by its example, before all other peoples, the solution of the question. No matter how noble or how lofty

the problem, it was interest that united together the old cantons, and this same interest has been so broadly understood, so wisely nursed that through the most violent European crises, in the midst of perils of every kind, it has held together to our day in a close and prosperous union three races, three languages and religions which were everywhere else at war—Another nation which may be cited as the most marvelous example of prosperity due to an alliance of interest is the American Union. If the alliance of the northern and southern states was imperiled by the war of secession, it was because the republic had inherited from the past a legacy irreconcilable with the economic laws and morals of the future—slavery. There is a lesson to be learned from the fearful crisis through which the Union passed. It is this that the sanction of justice and morality is needed in alliances of interest more than in any other.—IV. LAW OF NATIONS Like all international relations alliances are governed by the law of nations. Accepting the definition of authors, who see in states *moral persons*, we may compare treaties between states to contracts between individuals.—The acknowledged necessity of waging war under certain circumstances has established a two-fold relation among nations: 1st. A relation to the power with which they form an alliance. 2nd. Toward the power against which they employ their forces. Alliances bind the contracting parties to make war in common against third powers, or to furnish aid as auxiliaries to one of the principal belligerents. They are offensive or defensive according to the circumstances which determine them. In most cases offensive alliances are temporary and special, for they have a special and determinate aim. This attained they cease to have any *raison d'être*. Two nations may, however, unite their destinies for a purpose so complex and lasting that their alliance would lose the ordinary character of an offensive alliance. France and Spain afford us an example of these exceptions in the treaties of 1761 and 1796.—Defensive alliances have a character of permanence and generality in keeping with the object they have in view. Side by side with the full and complete alliance we may mention the simple subsidy treaty by which a state enters into no other obligation than to loan a body of its troops to another power which is to pay them. Besides the many examples furnished by antiquity and the middle ages we know how frequently during the wars of the empire, England bound herself by subsidy treaties with the continental powers; and we may add here, that this species of contract has often served as a pretext for more general and intimate alliances.—Treaties of alliance provide for the cases in which the aid of the contracting parties is to be invoked and the measure of their participation. When the contingencies provided for have happened, it has first of all to be decided whether the *casus fœderis* exists, that is to say whether the parties to the treaty are in the position contemplated by it. It often hap-

pens that when the time has come to carry out the terms of the treaty, one of the powers recedes from the fulfillment of its obligations. We do not wish to recount the almost infinite number of pretexts which bad faith has been able to suggest under such circumstances. It has sometimes happened that a treaty of alliance left unexecuted has become a cause of war. The difficulties are still more numerous in carrying out the conditions of certain treaties, in regulating the sacrifices made or the advantages gained. Here, again, we find in Heffter a confirmation of the position we have taken. He says, paragraph 116: "In such cases the rule of partnership has to be followed, in accordance with which the profits and losses fall to each party in proportion to the amount he has invested in the business. Have we not here the laws of common morality, and the rules of private business? We find the same doctrine on this matter in Wheaton's *Elements of International Law*, vol. I., p. 259, etc. Although it is considered almost impossible to specify all the cases in which the refusal of aid may be proper before the commencement of war, and to foresee all the disputes which may follow the conclusion of peace, Martens has noted four cases in which an alliance may be broken, even during the course of a common war: 1st. Cases of necessity. 2nd. Cases in which an ally was the first to break faith with his ally. 3rd. When the object of the alliance can no longer be attained. 4th. When the ally refuses peace offered on proper terms. We are very far from wishing to approve the opinion of Martens. As to conventions concerning subsidies and auxiliaries we shall limit ourselves to a few essential generalities. Most frequently after fixing the number and conditions of the first contingent they provide for the additions which may become necessary. They reserve the civil rights in their own country of the men who go to serve on a foreign soil and under a foreign flag. They stipulate for the reward as compensation which shall follow success or defeat. They establish the differences existing between the ally and the auxiliary, between the auxiliary and the power which simply furnishes a subsidy. These differences impose restrictions on the rights of war. An anterior treaty may engage a nation to assist another in an anticipated war, without the nation which fulfills this engagement being considered in a state of hostility with the power against which it bears arms involuntarily and accidentally.

L. LEGAULT.

ALLIANCE, the Holy. Among the alliances of modern times, the holy alliance, which was entered into at Paris, Sept. 14-26, 1815, by the emperor of Russia, Alexander I., the emperor of Austria, Francis I., and the king of Prussia, William III., has a special claim to our consideration, because it is one of the most remarkable attempts to announce a principle of government the adoption and carrying out of which was expected to secure, forever thereafter, the peace of

Europe, and justice and prosperity to the nations of Europe. The struggles carried on for a number of years, first against the French revolution and the principles of government which, originating in France, had spread throughout Europe, then against Napoleon's universal supremacy, had awakened a desire in the minds even of European sovereigns—who, leading in the uprising of Europe, had finally entered the gates of Paris as victors—for a principle which might successfully resist and overcome the principles of revolution. This revolution was the work of *men*. The eastern monarchs, therefore, appealed to God as their only helper. The human laws by which the state was governed, were to be invigorated and purified by the moral precepts of a divine rule, and the rights of man were to be superseded by the authority of Christ.—The emperor of Russia was the author of this scheme, and the moving spirit of this alliance. It is strange that this declaration of principles, touching a system of government essentially Christian in its nature, was substantially the work of Russian statecraft, and that the German sovereigns had hardly a greater share in it than that of approving and signing it. France, which was the first to embrace the ideas of the new era, was also first to announce her new polity. Russia, which was the most backward in its political ideas, attempted to renew, in opposition to the polity announced by the French, the polity of a by-gone age. Germany alone, placed between the two, did not yet dare to publish its own views to the world. The Germans took the matter under consideration, siding now with the one, and then with the other of these principles, but always with the reservation, that, if they should succeed in their intellectual endeavors, they would break the silence they had hitherto observed.—All the states of Europe were invited to join the holy alliance. Although the alliance was expressly based on the Christian religion, and although its originators represented three different creeds—the Greek, Catholic, and Protestant—the pope, whose political power was more than any other, based on the authority of Christianity, was, strangely enough, left out. They probably understood, though not very clearly, that the principle underlying the alliance, would, if the pope was to join in it, assign the *first* place to him, and would, followed out to its ultimate consequences, establish the supremacy of the church over Christian governments. But this was not what they wanted. They, rather than submit to this danger, by inviting the pope to join them, were willing, by failing to invite him, to betray the weak side of this principle which they were ready to proclaim to the world as a new gospel. It was less strange that they failed to invite the Ottoman court, for it was not to be expected that the head of Islam should acknowledge Christianity as the only principle of his policy. Still, Russia, by excluding Turkey from the pale of European peace, had secured her freedom of action, so far as her schemes of

conquest in the south were concerned, and might point to the Christian principle, which formed the basis of the holy alliance, while encouraging and protecting the Christian population of Turkey in their efforts to rid themselves of the yoke imposed on them by the Mohammedan government. All the governments which had been invited, joined the holy alliance. The Bourbon kings of France, and even the republic of Switzerland, joined it, the latter, however, giving her assent rather vaguely, in response to the invitation extended to her. England alone, whose political education was of a superior kind, refused to join it, but without proposing any new idea, or even stating that she was opposed to the principle of the holy alliance, in whose favor all European dynasties had declared themselves, and which the king of England personally approved. The objections England urged were simply of a technical nature. In the compact, the following principles were either expressly set forth, or were contained in it by necessary implication: 1. The unity of European Christendom as one family of nations. The allied sovereigns declare, (art. II.), that they consider themselves and their subjects "as members of the same Christian nation" and their several governments "as three branches of one and the same family." This principle itself was not new. In the middle ages it was more universally recognized, and had become embodied in the two closely related institutions—the papacy and the empire. What was new in this declaration was the effort to revive this principle in the shape of a family alliance as distinguished from the system of the Roman empire of the middle ages, which shortly before had had a passing revival in the universal empire of Napoleon. And this effort was made after, and in spite of the lines which divided Christianity into opposing creeds, and in the face of the national animosities which, for centuries, had broken up the whole fabric of European government, and which had destroyed all thought of a community of interests calculated to sustain it. That thought was indeed alike productive of good results and in keeping with the requirements of the age. The unity of Europe and the essentially Christian character of European civilization are verities of the greatest importance, in their bearing alike on the organization and peace of all European governments and the development of mankind. 2. Then again, the fact that the alliance rose, in point of principle, above the denominational and political differences which divided the nations of European Christendom, was evidence of a noble spirit. The Christian European commonwealth was the principle which embraced all those differences with a spirit of conciliation. If we bear in mind how little in our days even this principle is realized, and the efforts that had been made since its first announcement, and are still made, to have the different Christian creeds recognized, and the diversity of political opinions tolerated, we shall have no difficulty in understanding, that the holy alliance

seemed to the sovereigns who had entered into it, and, at the beginning, to nations, to possess, in point of principle, a surpassing wealth of wholesome truths, whose light was to break upon and spread throughout Europe. This was a truly modern principle. It was, not in a religious, but in a political sense, that the middle ages had shown this liberal spirit. The middle ages had tolerated the greatest diversity in the forms of government, while they had persecuted all departure from the orthodox faith as a heresy, and had interdicted communion of any kind with those of a different faith. Now these three sovereigns announced, in principle, *freedom of conscience* and a *community of creed* throughout Christendom. And it was the emperor of Russia, whose people, more than any other European nation, had been held captive by their creed, who took the lead in the announcement of so liberal a principle. Yet, the practical workings of the holy alliance did not at all correspond with its principle in the end. The subjection, in the several countries, of all those whose faith differed from the recognized creed, did not cease; and least of all in Russia, whose emperor had been principally instrumental in effecting the alliance. The Græco-Russian church never ceased to oppress other creeds, and tried to spread its dominion by both crafty and forcible measures. 3. The Christian religion was proclaimed as the moral principle which was to govern in the international conduct and comity of the several states, and the relation of the government to its subjects. The allied sovereigns declare, in the introduction to their manifesto, "their ardent conviction of the necessity requiring the reciprocal relation of the several powers to be based on the sublime truths which the holy religion of the Lord and Redeemer," (in the original: *l'éternelle religion du Dieu sauveur*), and they evince "in the most solemn manner, before all the world, their firm purpose to adopt both in the government of their states, and in their political relations with every other government, the precepts of this eternal creed as their sole guide—that is, the precepts of justice, of Christian love, and of peace, which are not simply applicable to private conduct, which should exercise a direct influence on the intentions of sovereign rulers and their conduct, because they are the only means of firmly establishing human institutions, and of removing their imperfections." Who doubts that a candid observance of the moral commandments of the Christian religion by both sovereigns and their people, as well as by individuals, would have a very wholesome effect; that, by this observance, an absolutely new era of ideal wealth and material prosperity would be inaugurated, the like of which the most vivid imagination and anticipation poets and prophets did not dare to attribute to Paradise Lost or the millennium. The announcement, by the most powerful sovereigns, of intentions and tendencies like these, was calculated to again awaken and strengthen the despairing or slumbering hopes of the people

for an improvement in their public affairs. This announcement was in itself—for we believe that it was made in good faith—a deed of great moment. Yet even on this point these hopes were not realized, and politics in their actual state were carried on, in spite of that declaration of principles, in the old way. Their actions differed in so many instances and so strikingly from the intentions of these rulers, that the people could not help losing faith in their honesty of purpose. 4. The Christian religion, moreover, was proclaimed as the political principle which was to regulate and govern the whole system of public law. Just here the grave mistake in point of principle, in the policy of this confederation, one which subsequently provoked the distrust and hate of the people against the holy alliance and caused its final dissolution, was made. We can not, of course, censure the Russian emperor for having mixed up the principles of religion with those of politics, and mistaking the one for the other; for state and church were, in the Russian empire, not separated as distinctly as in the empires of civilized Europe. But the fact is still remarkable, that at that time the German and Romanic sovereigns alike overlooked a distinction which not alone the positive teachings of Christ, but also the primitive political and ecclesiastical institutions of their people had pointed out most emphatically. The greatest danger, however, lay in the manner in which the Christian religion was made the principle which was to govern the system of public law. Christ himself purposely and in opposition to other founders of creeds, never made any public declaration of principles touching the state or the forms of government or its laws. In spite of this, Christian rulers now undertook to base their polity on the positive authority of Christ. They openly declared Jesus Christ as the sole "sovereign of all Christendom to which they and their people belong, who was the only source of power,"—and they announced themselves as "representing his divine authority" as being his viceroys on earth, as it were, commissioned to "govern in the different parts of the Christian world." If we consider, in addition, that this statement does not draw any distinction between God and Christ, it becomes quite evident that this principle of government is none other than that of theocracy, and that it is at the same time, that of absolutism, because God is, as he must be, conceived as the absolute ruler, and because, according to the above statement, His power is simply delegated to His viceroys for them to execute. Indeed, it was but the polity of Russia as it had come from the east. It might agree

with the character of the *slàve*, but it was impossible for the Teutonic people or the Romanic nations to submit to it. In the middle ages even, the Teutonic and Romanic nations alike were no longer held captive by the theocratic polity of the eastern nations. They were saved from it by the separation of church and state. The spirit of modern times above all had developed an opposition to theocracy as a form of government. The tendency of the age was too outspoken in favor of the principle that the state was a government of man, and that it was for the human mind to comprehend and determine its nature and proper functions. The absolute power of the kings in the seventeenth century, and in a large measure in the eighteenth century, had, moreover, been a favored system of government. Rulers clothed with absolute power, destroyed the feudal powers of the "small lords"—they removed the checks and obstacles placed during the middle ages in the way of progress—they concentrated the power of government, and paved, by the destruction of the institutions of the middle ages, the way for the advent of a new era. But no sooner had this work been accomplished than the people became opposed to the exercise of absolute power. The most formidable revolution the world ever saw, followed as a reaction against the spirit of absolutism which had prevailed until then. What reason had men to hope after all these violent agitations and changes characterizing a new era, that the standard bearing the principle of absolute government of a by-gone age, which had shown its weak sides in all these agitations and changes, might be raised again, and that the nations would gather around it in true loyalty? The unbiassed could not help but see in this the spirit of reaction as opposed to the revolution. How was it possible to discover in this manner a principle on which the advancement and progressive growth of government and its institutions might be based in future? The extreme ardor of certain parties might be lavish in praise, whereas the instincts of the masses and the minds of the intelligent saw the dangers rather than the benefits which this spirit seemed to prophesy. 5. The promise of mutual aid in all cases, which the allied sovereigns held out to one another,² was not calculated to remove the apprehensions caused by the manner in which the polity they intended to pursue was announced. On the contrary, the mutual guarantee of absolute sovereignty soon came to be considered the most practical feature and the very nature of the alliance. This being the case, the fears soon bore down all hopes, and the alliance grew more and more unpopular. The European nations had, in the wars of liberation, taken up arms against the absolute power of Napoleon, the greatest political genius of the age. Was it to be expected that they would now permanently and blindly submit to the absolute power of their

¹ Art. 2. "*les trois princes alliés ne s'engageant eux-mêmes que comme délégués par la Providence pour gouverner trois branches d'une même famille; savoir l'Autriche, la Prusse et la Russie; confessant ainsi que la nation chrétienne, dont eux et leurs peuples sont partie, n'a réellement d'autre souverain que celui à qui seul appartient en propriété la puissance parce qu'en lui seul se trouvent tous les trésors de l'amour, de la science et de la sagesse infinie, c'est à dire Dieu, notre divin sauveur Jésus Christ, le verbe du Tr. s-Haut, la parole de vie.*"

² Art. 1. "*les trois monarques contractans demeureront unis par les liens d'une fraternité véritable et indissoluble, et se considérant comme compatriotes, ils se prêteront en toute occasion et en tout lieu assistance, aide et secours.*"

rulers, without any guarantee, that the latter were willing to recognize the wants of the age, and to exercise their absolute power for the benefit of the people generally? And in case the people did not submit—in case they exercised their traditional or newly acquired privileges in checking the spirit of monarchical absolutism—in case they demanded some guarantee of good government, such as their generation might ask for—should every sort of tendency toward political freedom be checked or kept down by the force of arms to suit their absolute rulers? Questions of this sort were raised at once; and the events of the following fifteen years strengthened the belief that the alliance was bearing down with a heavy load on every tendency toward a more liberal development of European states. 6. In order to allay these fears somewhat, another principle was announced—the patriarchal—that the sovereigns considered themselves, in relation to their subjects and armies, *fathers* of a family, (Art. 1, “*se regardant envers leurs sujets et armées comme pères de famille.*”) The allusion to the family relation and to paternal sentiments was to soften down whatever was offensive in the assertion of the principles of the absolute and divine power of kings. Not as slaves to their master, but as children to their father, should subjects look up to their rulers—another Russian idea. The Russian emperor is both revered like a god and loved like a father by his people. But while the patriarchal idea of government in Russia and China and among the eastern nations generally, is still, in a measure, a legitimate factor, the manly European nations have, for centuries past, outgrown its discipline. The educated and thoughtful European is no longer willing to look upon his relation to his ruler as being that of a minor, and can no longer expect his ruler to have the feelings of a father toward him. The European state has long since outgrown the artless views peculiar to family life, and the limitations which characterize the family, and is governed by the broad principles of public law. To the European mind, therefore, that declaration must have seemed like a going back to a primitive age. And likely as it was to respect and be gratified by the benevolence displayed in the paternal sentiments of the sovereign, it was still opposed to a principle which, as was evident, was but a *fiction*. I have reviewed the principles of the holy alliance critically and somewhat in detail, because it has, in point of principle, still some effect on the present political state of Europe, and because it has an important bearing on the history of political ideas regarding the constitution of the state. Yet, the confederation itself was broken up by the spirit of the age, which it was expected to govern and control. The opposing tendencies, in point of principle, among the sovereign powers themselves, were first in making themselves felt, both at and after the congress of Troppau, in 1820, and subsequently in a more marked manner in the Greek question, in 1827. The July revolution of 1830 caused a wide breach

between the parties to the alliance. In its opposition to the French revolution, and even to the Belgian uprising, the alliance showed its utter weakness. It did not dare, in all cases, to furnish the mutual aid and assistance it had promised and to defend its views by force of arms. The formation of the Prussian diet in 1847, the European uprising in 1848, the re-establishment of the Napoleonic dynasty in 1850, the war, finally, of Russia with Turkey and the eastern powers in 1854–6, gave the finishing stroke to the complete dissolution of a confederation whose chief significance lay in its principles, and whose political ideas were not likely to minister successfully to the political wants of the age.

MAX. EBERHARDT, 77. J. C. BLUNTSCHLI.

ALLOYAGE. Gold and silver coins are never made of absolutely pure metal. Precious metals, when extracted from the earth, are nearly always found mixed to a greater or lesser extent with other metals, from which it is often difficult or too expensive to separate them entirely, yet it has been deemed necessary always to add to gold and silver a certain proportion of some commoner metal, such as copper, in order to increase their hardness and better fit them to stand wear and tear. This is called *alloyage*.—Alloyage should be in a fixed proportion, for instance, one-ninth part. But the same proportion is not adopted everywhere, although all nations are tending more and more to the adoption of the same proportion.

CH. C.

ALMANACH DE GOTHA. This publication has acquired a position apart, in the political world. On this account the following data will not be without interest. The first idea of this almanach is due to Wilhelm von Rotberg (died in 1795, minister of state). He had printed under the title: “*Almanach, necessary for 1763*,” a volume on the model of the *étrénnes*, (Christmas presents), then published in Paris. Beginning with the following year, the almanach grew under the hands of its new editor, Em. Ch. Klüpfel, who had lived at Paris from 1747 to 1750, and who died in 1776, vice-president of the superior consistory of Gotha. Klüpfel was the first to insert the names of European sovereigns, much more numerous then than in our day. He also included, though at first only in extracts, the genealogical tables which have been so often consulted. The Almanach of Gotha therefore dates from the year 1764. The centennial anniversary of its first publication was, however, celebrated in 1863. The German edition, *Gothaischer Hof Kalendar*, did not appear until 1765. In this year the names of all the living members of princely families were given for the first time. Instructive or simply amusing notices on the most varied subjects were inserted in it. Toward the end of the last century events took such a serious turn that the amusing part of the almanach was dropped and the place that it occupied given to historical and statistical infor-

mation. In 1794, Frederick Schlichtegroll, who died in 1822, director of the academy of sciences, (Munich,) added the *chronik*. In 1802 the names of ambassadors or envoys were added; in 1824 the personnel of ministries and higher departments, and, soon after, the consuls and other functionaries.—Under Napoleon I. the Almanach of Gotha had to suffer on account of the tenacity with which it adhered to the ancient order of things. Its publication even suffered a temporary suspension.—The two editions, French and German, are almost identical. The plan followed in the first two parts dates from 1815, that of the third from 1824. In 1768 engravings were added to the text. There was a great variety of them at first, but since the end of the last century only portraits are given.—Although the Almanach de Gotha is the property of an individual house, (Justus Perthes at Gotha since 1816), it is almost considered as the official almanach of reigning princes and the higher nobility. It enjoys also the reputation of an authority for statistical data. These are always drawn from official or authentic sources. The number and extent of these data so increased from year to year that an enlargement of the volume was found necessary in 1870. M. BLOCK.

ALSACE-LORRAINE. A country separated from France by the war of 1870–71 and made a part of the German confederation, or more correctly of the German empire. It is not our purpose to write a history of this country or to relate by what combination of circumstances it ceased to be French. Neither is it our design to risk conjecture as to its future fortune. Our task is simply to detail actual facts. Alsace-Lorraine was not demanded by the German government as a territory formerly taken away from Germany, nor as a province containing a German population, but “as the key of the house, *la clef de la maison*.” It was as a bulwark against wars of revenge or reconquest that Alsace-Lorraine was annexed to the German empire, such at least is the pretense made.—The country was ceded, in virtue of the preliminaries of peace Feb. 26, 1871, confirmed by the treaty of peace signed at Frankfort May 10, 1871, ratified by the law of May 18, following. *Bulletin des Lois*, 1871, 1, p. 117.—Article 2 of this treaty is thus drawn up: “French subjects born in the ceded territories, and now actually domiciled there, who may wish to preserve their French nationality shall have, by virtue of a preliminary declaration to that effect made to the competent authority, the power until Oct. 1, 1872, of transferring their domicile to France, and fixing it there and this right shall not be done away with, by the laws relating to military service; in which case their quality of French citizens will be maintained.—They shall be at liberty to retain their real estate in the territory ceded to Germany.”—It is not the declaration of his choice which determines the nationality to which the Alsatian or the native of Lorraine henceforth belongs, but his place of domicile. It was given to be understood

that the person who should elect in favor of France but who should be found domiciled in Alsace-Lorraine after Oct. 1, 1872, should be considered a German, notwithstanding his declaration of choice which should be considered as null and void.—For natives of Alsace-Lorraine outside of Europe the period of choice was extended to Oct. 1, 1873, by the additional convention of Dec. 2, 1871.—The present position of Alsace-Lorraine in the German empire was fixed by a law passed by the *reichsrath*, June 3, 1871. The following is the text:—Art. 1. “The territory of Alsace and Lorraine ceded by France, according to the terms of article 1, of the preliminaries of peace, is united forever to the German empire.—Art. 2. “The constitution of the German empire shall go into force in Alsace-Lorraine on Jan. 1, 1873. Some parts of the constitution may be put in force before that date, by decree of the emperor with the consent of the federal council. The modifications and additions to the constitution must be approved by the *reichstag*.—[Art. 3, of the constitution comes into force from the present date, (this article 3 confers German nationality on the inhabitants of the newly annexed territories).]—Art. 3. “Executive power in Alsace-Lorraine belongs to the emperor. Until the constitution goes into force, the emperor must have the assent of the federal council in legislative matters, and when it shall be a question of making loans or furnishing guarantees involving the empire, that of the *reichstag*. Annual reports on the administration of the provinces shall be presented to the *reichstag*. After the constitution goes into force, this assembly will equally take cognizance of matters, which in the confederated states are not within its jurisdiction.—Art. 4. “The decrees and ordinances of the emperor shall be countersigned by the chancellor, who shall thus assume responsibility for them.”—Thus the countries detached from France have not been distributed among the different German states. They form a unity, a special state, a member of the German confederation. The reasons for this action were stated by Prince Bismarck, before the *reichstag*, June 3, 1871, in the following words: “One question alone has been seriously put: ‘Shall Alsace-Lorraine be annexed to Prussia, or shall it become a part of the empire directly?’ From the beginning, I have favored the latter alternative, first of all in order not to mix questions of dynasty with political questions; and besides because I see that the inhabitants of Alsace will adopt more readily the German than the Prussian name. During the two centuries that the Alsacians have belonged to France, they, like true Germans, have preserved a good share of particularism, and it is on this, to my thinking, we ought to build, doing the opposite of what was done in analogous circumstances in North Germany. Our mission is first of all to strengthen this particularism.—The more the inhabitants of Alsace shall feel themselves to be Alsacians, the more they will differ from the French. As soon as they feel

they are Alsacians they are too logical not to feel that they are also Germans. In consequence of artifices, I might indeed say intrigues, of the French government, the name of Prussian is detested in France, much more than that of German. —It is an old tradition in the country, not to recognize the Prussians as Germans, to flatter the Germans as such, and to represent them as under the protection of France, vis-à-vis of Prussia. In this way it has come to pass that the Prussian name has a hateful sound in French ears, and whenever it is desired to say anything evil of us it is said of the Prussian government or the Prussians, while they speak of the Germans whenever they wish to say anything good. It is not to be doubted that this policy of bringing suspicion on Prussia, which has been continued by France for a whole generation has left its traces in Alsace. Besides, as I have already said, it is easier for the Alsacians to find a new position as Germans than to adopt the Prussian name. This reason alone would be sufficient for me. As to what must be done later in the interest of the empire and of Alsace I think it will be necessary first of all to hear what the people of Alsace and Lorraine have to say for themselves * * *." —Alsace-Lorraine has representatives in the *bundesrath* and in the *reichstag* since 1873, but it has not yet been announced when this country shall have a special constitution. In the meanwhile the public powers of the empire, the emperor, and the *reichstag* and *bundesrath* will manage, for Alsace-Lorraine, not only the affairs which these powers manage for the whole empire, but also those which remain within the competency of the government of each German state. In other words, Alsace-Lorraine is provisionally without a government of its own: the functions which would devolve on a special government to perform are exercised by that of the empire.¹ —The administration of the country was organized by the law of December, 1871. It is placed under the direction of an upper president, a title given in Prussia to the governors of such provinces as embrace several departments. The upper president who is assisted by the imperial council of Alsace-Lorraine, (council of state), resides at Strassburg as does also one of the three prefects (or rather presidents of departments) the prefect of lower Alsace. The prefect of upper Alsace is at Colmar, the prefect of German Lorraine at Metz. The prefects are assisted by administrative councils, composed of the higher functionaries. The departments are divided into circuits answering in some sort to the former *arrondissements*, but with different and smaller boundaries. At the head of each circuit, there is a director who has provisionally the powers of a sub-prefect. Contrary to French usage, these

circuits can have their budgets. They are recognized civil entities. Civil tribunals of first resort are established at Metz, Sarreguemines, Strassburg, Saverne, Colmar, Mülhouse. The court of appeal sits at Colmar. In commercial suits appeal may be made to the federal supreme court (third resort) at Leipsig. The German commercial and penal codes are in force side by side with the civil code of France. Many provisions of previous administrative law are retained. All laws which have not been expressly repealed are still in force, *i. e.*, no law is implicitly repealed by the change of sovereignty, the financial system has been scarcely touched. Direct taxes are collected as before, but the monopoly of tobacco is suppressed. The reasons for the law of June 3, 1871, shows that this suppression is equal to a reduction of taxes amounting to almost 5 fr. (50c.) per head. Primary instruction, and military service have been introduced. Both are obligatory. —Alsace Lorraine has an area of 5,580 English square miles, and a population December, 1875, of 1,531,804. If we are to believe the *Almanach of Gotha*, which does not cite its authority, there were, in 1872, 254,000 Frenchmen and 1,345,000 Germans in the country, but we can not discover that these figures are confirmed. —The area and population according to the census of Dec. 1, 1875, were as follows: Upper Alsace, 1,353 square miles; population, 453,374. Lower Alsace, 1,844 square miles; population, 598,180. Lorraine, 2,383 square miles; population, 480,250. Total square miles, 5,580; total population, 1,531,804. (See LORRAINE AND ALSACE.) —BIBLIOGRAPHY: Schöpflin, *Alsatia Illustrata*, 2 vols., Colmar, 1751–61; *Alsatia diplomatica*, by the same author, 2 vols., Munich, 1772–5; Colbéry and Schweighäuser, *Antiquités de l'Alsace*, Paris, 1828; Strobel, *Vaterländische Geschichte des Elsass*, 6 vols., Strassburg, 1840–48; Lorenz and Scherer, *Geschichte des Elsass von den ältesten Zeiten bis auf die Gegenwart*, 2nd ed., Berlin, 1872; Spach, *Moderne Culturzustände im Elsass*, 3 vols., Strassburg, 1873–4; Glückler, *Das Elsass*; Freiburg in Br. 1876.

AMBASSADOR. The article "Diplomatic Agent" in this work may be supplemented by a few striking passages which we here quote, from a speech of Prince Bismarck at Berlin Nov. 16, 1871, in the German *reichstag*. —"An ambassador does not deserve a higher salary by reason of his title, for ambassador is only a title. If you put a colonel or a general at the head of a brigade, he becomes a brigadier and must always be ready to do a brigadier's duty. If you maintain your ambassador at a great court in a shabby manner, his expenses will not, perhaps, necessarily exceed those of a minister plenipotentiary by more than from one thousand to three thousand thalers. This sum will suffice to cover the outlay imposed on him by the custom prevalent in most countries in accordance with which sovereigns accept, on certain occasions, the invitations of ambassadors; and

¹ Since January 1, 1874, the constitution of the German empire has been in force in Alsace-Lorraine, and the empire legislates for the country. But it is contemplated in future that laws may have force in Alsace-Lorraine when approved by the *landesausschuss* (committee of the country) and the *bundesrath*, even without the co-operation of the *reichstag*. —Ed.

it is this custom of giving great entertainments that causes the increased outlay of which I have spoken. The honor which the visit of the sovereign confers on the house he enters has this effect: it makes the position of the representative in the eyes of the sovereign's subjects correspond with the dignity of the state he represents. But there is no question of that in the increase of salary which you have proposed.—Why then, we may be asked, confer the title of ambassador at all? I answer, because of the hierarchy of political agents. A difference is made between the members of the diplomatic corps, an unjust one, no doubt, but one which is nevertheless generally admitted. Thus if a minister of foreign affairs be in conference with a minister plenipotentiary, at the moment that an ambassador is announced, he thinks it his duty to break off the conference at once and receive the ambassador. A minister plenipotentiary may have waited an hour perhaps in the antechamber of the minister of foreign affairs. At the moment he is about to enter an ambassador arrives, and the usage of most courts, so far as I know, is to receive the latter; the minister will have to wait a long time more, and perchance he may not be received at all that day. The result is mortification and collisions which may be avoided by a mere change of title. A minister plenipotentiary conscious of his own dignity will not endure such treatment, and, for my part, I found myself in a situation to resent it successfully but not without bringing on a coolness out of all proportion with the importance of the matter. Moreover, such resistance can not be made without placing persons in a position which almost touches the limits of what is allowed to the representative official of a great nation. The object can be obtained by conferring on the agent the title of ambassador, which thus becomes, through the marks of honor which it brings him, a bit of economy rather than a cause of expense. The prerogatives belonging to the title of ambassador may be considered as a full equivalent for a few thousand thalers.—I have read occasionally in the public papers (and the preceding speaker has alluded to the point) that some persons recognize the danger of the privilege belonging to ambassadors of conferring directly with the sovereign. This is founded on error. An ambassador has no more access to a sovereign than any other minister plenipotentiary, and he can in no way pretend to have the right to treat with a monarch directly and without the intervention of the monarch's ministers.”

M. BLOCK.

AMBITION, Political. Vanity (in the sense here used) is the desire of honor and distinction; ambition is the desire of power. The two are essentially political passions. The second plays a most important part in society. If men were completely devoid of egotism, the love of justice and the public good would suffice to give life to the body politic; but, as a matter of fact, power is sought for and held on to, because men love it.

Ambition is the motor, secret or avowed, of the great majority of those who govern states. It is useful, because it calls forth men; it is necessary, because it lends force to those who govern and consequently to governments; it may be even glorious, if noble in its aims, pure in its means, and seconded by great intellectual power. It is more in place in free than in absolute states. Richelieu and Colbert, under the ancient monarchy of France, were useful, if ambitious men. They might have been dangerous and even pernicious citizens, if they had not risen to the highest rank. It is in free states alone that ambition can have a definite, specific aim, test its powers, and adapt itself to circumstances and to men. It is the chief motive power in free states, as vanity, under the name of honor, is in absolute monarchies.—In speaking of political ambition, we need not always have a Marius, a Sylla, or a Julius Cæsar in view. These names fill the minds of men as they do, because they are very great names; but the most absolute monarchies have their ambitious men as they have their civil wars. It was not liberty that made the overthrow of the Roman republic easy; it was the weakening of authority. It is sometimes thought that liberty and authority are antagonistic, and that the one increases only to the detriment of the other. There could be no greater mistake. An authority powerfully constituted but restrained within just limits and a generous liberty may co-exist in the same state. This is the indispensable condition of order and stability. There is no liberty without a powerful authority to secure its continuance, nor can there be a firm, lasting and beneficent authority without liberty. These conditions are required by the nature of man, which has equal need of freedom and limitation. Liberty permits ambition to act for good, and authority prevents its passing the limits set to guard the common weal. An ambitious man subject to a master has but two roads to success, revolt and flattery. An ambitious man in a free state may reach his end by the éclat of his talents or his virtues. He journeys under a clear sky, and the more lofty his soul the greater are his chances of success.—It was a saying of the Fourier school, that everything is good in its place. This is particularly true of ambition, but it needs to be directed by a right conscience, and an honest and firm mind. Ambition is almost always given to excess, and consequently to violence. The vehemence of its desires deceives it as to the legitimacy of its objects and its means. It then becomes immoral through blindness and passion; and, as it is attended with pride, far from confessing its errors it invents a false morality to justify and exalt them. The author of the *First Alcibiades*, who perhaps was Plato, treats this subject with much force and truth. He shows that it is a vulgar ambition to desire power when one is not sure of exercising it in the interest of humanity, and a criminal ambition to acquire dominion through injustice. Morality enlightened by history, pronounces this judgment on ambition and

ambitious men: No legitimate ambition can justify or excuse the use of illegitimate means. No ambition is legitimate which has not sufficient force at its command. It is not success that justifies ambition; it is the service rendered by it. The common herd who always approve and applaud force are slaves of success heart and soul. They are the devoted and patient servants of every ambitious person who succeeds. Success has in itself no moral grandeur. It is a force, but it is not, as has been said, an evidence of force. It may attend corruption and weakness. The true criterion of a lofty and noble ambition is this: the employment of honorable means and of none other, the promotion of justice and the furtherance of the interests of the whole community, while furthering one's own. JULES SIMON.

AMENDMENTS TO THE CONSTITUTION. (See CONSTITUTION.)

AMERICA. It is with the fall of the eastern empire, that is, with the capture of Constantinople by the Turks, that, according to most historians, the modern era opens.—While acknowledging the share taken by the Byzantine emigration in the onward movement accomplished then in Europe, we think it is pre-eminently with the discovery of America (1492) that the modern era should be made to begin. By opening a broad career to the spirit of enterprise and adventure, by rousing old Europe to come and share the boundless wealth of a new continent, by opening new markets for commerce, by substituting, at least in part, the conquests of colonization for the barren conflicts of the past, the discovery of America could not but force Europe out of the bonds imposed upon it by the middle ages. It is in this that the explorations of Columbus and his successors are superior in civilizing influence to the crusades. From the struggle caused by the crusades, although these were born of a moral idea, civilization reaped little benefit, and the result of them is that a religious antagonism has been generated between the east and the west, the violence of which eight centuries have not been able to temper. America serves old Europe in a different way. She enriches and reinvigorates her. Every nation that sets foot on American soil doubles its power and influence. Without mentioning Spain, which owed to America its domination at one time in Europe, what would the annals of Portugal have been without the new continent? Shall we yet see this impulse in the line of progress which the old world received from America return whence it came; in other words, is Europe destined to sink into decadence and see the new world the torch-bearer of civilization? This thesis has been maintained, and without accepting its conclusion, we may admit that a grand future is reserved to the magnificent continent where generous nature seconds the efforts of the American states, north and south, a great number of which are distinguished for the energy and intelligence of their in-

habitants.—From a purely geographical point of view, the new world is naturally divided into North and South America, connected by the isthmus of Panama. Of the innumerable islands which belong to the new continent, two groups should be mentioned when speaking of the great geographical divisions of America. These are the arctic lands or the islands which extend north of the new continent, and the Antilles, which usage improperly designates the West Indies.—According to the calculations of Humboldt, the surface of this part of the world, including the islands we have mentioned, reaches 38,233,594 square kilometres.—America exhibits the peculiarity of having fewer inhabitants to the square mile than any part of the globe, and of having, at the same time, a greater number of different kinds of people than there are in any of the divisions of the old world. According to the ethnographical atlas of the globe, 438 languages are spoken there and more than 2,000 dialects.—The people of the new world form two great divisions, the aborigines, and people of foreign origin. The latter comprise at present the great mass of the population of America and compose the dominant nations of the new world.—The Spaniards, the English and their descendants, the people of African origin, the Portuguese, the Irish, peoples of foreign blood. After them in respect to numbers come the Germans and the French. The Dutch and Danes are still fewer in number. The Swedes must also be mentioned. They preponderate in the island of St. Bartholomew, and several millions of Basques and Italians who are settled principally in Uruguay and some of the eastern states of the Argentine Confederation. It is proper to state that North America belongs more particularly to the Saxon or Germanic race, and South America to the Latin race.—The decrease of the aborigines is a fact shown by every day experience. They recede before Europeans, and the fragments of their race are found only where settlers have not yet penetrated or where they are few in number.—Christianity extends its influence over the whole of the new world, from the arctic regions to Patagonia, and presents the following subdivisions: The Catholic church prevails in the empire of Brazil and all America which was formerly Spanish; the Episcopal or Anglican, the Presbyterian or reformed, and the Lutheran churches, with the Methodists, Quakers, and Baptists, to mention only the most numerous, are dominant in the United States and British America. The orthodox Greek church is established in the late Russian possessions. The Mosaic law is observed by a small number of persons living principally in the United States, the English, Dutch, and French Antilles; and, in the Guianas, fetichism, in various forms, is found among the savage tribes.—When the Spaniards discovered America, it presented every variety of government from the paternal despotism of the Incas to the absolute independence enjoyed by the members of the tribes still existing. It has been observed that government in almost all the indigenous nations of

America appears under a mild form, which contrasts strangely with the despotism prevalent in Asia and Africa, even among nations the most polished. While the flourishing empire of Peru was governed by a theocratic despotism, and while we find a pontiff and an absolute king among the Muyscas, the government of the Natchez was theocratic, and that of the powerful Mexican empire resembled one of the feudal monarchies of the middle ages more than it did the despotic empires of Asia. Tlascala, Cholula and Huetxocingo, as well as that group of little states established on the eastern and northern coasts of Brazil, were republics.—At present most of the indigenous nations of the new world are democratic republics, governed by a chief, sometimes elective and sometimes hereditary. Some of them banded together formed or still form confederations, such as the famous confederation of the five nations, the Sioux, the Arrapahoes, etc. The government of the Osages, the Kansas, the Pawnees, the Missouri, the Mohawks, and several other nations, is a species of republican oligarchy. That of the Araucanians presents a mixture of aristocracy and democracy. That of the Cherokees is an imitation of the internal administration of the United States, while that of the Otomakos and the Yaruros in the territory of Venezuela lead, so to speak, a family life with property in common. The American colonies, English, French, Spanish, Dutch, Danish and Swedish have retained, with certain modifications, the administrative forms of their mother countries.—The United States form a great federal state, in which each separate state governs itself, except that it has confided to a central authority, the federal government, the management of everything touching the common defense, foreign politics, customs and postal service, etc. (See UNITED STATES.)—The republican constitution of the American Union has served as a model to a host of states built on the ruins of the Spanish colonies. The constitutional monarchy of Brazil forms the only exception to this rule.—From a political point of view, America may be divided into two great sections: independent and colonial America.—Independent America comprises the United States, founded originally by English colonists; Mexico, a state formed in 1810 from nearly the whole vice-royalty of Mexico and a fraction of the captain generalship of Guatemala; the central American republics, made up of the captain generalship of Guatemala, less certain fractions of its territory, and divided since 1839 into five republics, Guatemala, San Salvador, Honduras, Nicaragua and Costa Rica, (see these countries); the Colombian republic, formed of New Granada, Ecuador and Venezuela; the first two have arisen from the dismemberment of the vice-royalty of Santa-Fé, the last from the captain generalship of Caracas; the Peruvian republics, comprising the republic of Peru and that of Bolivia, both formed of the vice-royalty of Peru; Chili, formerly the captain generalship of Chili; the Argentine republic or confederation, formed

by the greater part of the vice-royalty of LaPlata; Uruguay, formed of the eastern portion of the vice-royalty of LaPlata; Paraguay, having the same origin as the preceding, and whose founder was the celebrated Doctor Francia; the empire of Brazil, the republics of Hayti and San Domingo, which divide the island of San Domingo. Add to this enumeration the independent nationalities of the Araucanians, the Creeks, the Apaches, the Algonquins, the Esquimaux, which are the most important nations.—Colonial America comprises British America, composed of the Dominion of Canada in North America, of Jamaica, the Barbadoes, Saint Christopher, Antigua in the Antilles, a part of Guiana; Demerara and some possessions of minor importance; Spanish America, composed of Cuba and Porto Rico; French America, comprising a part of Guiana, the islands of Martinique, Guadaloupe, St. Marie Galande, St. Pierre, and Miquelon; Dutch America, composed of a part of Guiana, the isles of St. Eustache, Saba, Curaçao, etc.; Danish America, formed of the Greenland group, the isles of Santa Cruz, St. Thomas, and St. John in the Antilles; Russian America, Kodjak, Sitka, and the Aleutian islands; Swedish America, confined to the island of St. Bartholomew in the Antilles.—A special article has been devoted to each American state and territory.—BIBLIOGRAPHY. AMERICAN MERCHANT MARINE; Its Growth, Decadence, and Causes of Decay.

The building and use of ships were employments to which the founders of the North American colonies and their descendants subsequently, until within a very recent period, may be said to have taken to naturally; and from the middle of the seventeenth until the middle of the nineteenth century—a period of 200 years—they were the two industries whose competition England, with good cause, especially dreaded. In fact, within little more than twenty-five years after the settlement of New England, or in 1650, the English parliament, in full accord with the then spirit of the age, felt it necessary to enact a statute for the avowed purpose of protecting English shipping

against the competition of the English plantations in America, which statute was reenacted or amended in the direction of further restriction in 1661, and again in 1663. By the statute of 1650 the export and import trade of the English colonies was restricted to English or colony built ships; but by the statute of 1663 nothing was allowed to be imported into a British plantation except in an English-built ship "whereof the master and three-fourths of the crew are English."—But, notwithstanding these restrictions, the business of ship-building and ship-using in the American colonies was one that would not stay restricted, but continued to grow in spite of all efforts of the mother country to the contrary. At the time of the breaking out of the American revolution and for long afterward there were more people in the northern part of New England—Maine and New Hampshire—engaged in ship-building and in navigation than there were in agriculture, and Massachusetts at the same time was estimated to have owned one vessel for every one hundred of its inhabitants. The enactment of arbitrary laws on the part of Great Britain to prevent her American colonists from freely participating in the carrying trade and commerce of the ocean was, however, a sore grievance, and ultimately, as is well known, constituted one of the prime causes of the American revolution. They were, furthermore, from the very first either openly or secretly resisted and evaded, and under their influence the colonists became a nation of law-breakers. Nine-tenths of their merchants were smugglers. One-quarter of all the signers of the declaration of independence were bred to commerce, to the command of ships and to contraband trade. Hancock, Trumbull, (Brother Jonathan), and Hamilton, were all known to be cognizant of contraband transactions, and approved of them. Hancock was the prince of contraband traders, and, with John Adams as his counsel, was appointed for trial before the admiralty court in Boston, at the exact hour of the shedding of blood at Lexington, in a suit for \$500,000 penalties alleged to have been incurred by him as a smuggler. The pertinency of the introduction of these historical facts in this connection is to be found in the evidence they embody of the opinions entertained by the founders of the republic respecting the justice or expedience of laws arbitrarily enacted for the restriction of commerce and the freedom of trade. Men like Hancock, Trumbull and Hamilton, who were merchants before they became statesmen, had, as the result of personal experience, been led to feel that the government of Great Britain, in endeavoring through such laws to restrain the colonists from engaging freely in a department of otherwise lawful industry and from enjoying the fruits of their labors, contravened their natural rights, reaffirmed the principle of slavery and became their enemy. Every evasion of such statutes was, therefore, in their view, a blow in favor of liberty. Hence also the origin of that count in the indictment against the king of Great Britain embodied in the

declaration of independence "of cutting off our trade with all parts of the world." It is interesting also to note, how, subsequent to the revolution, a determined effort was made by American statesmen, to incorporate the idea of free commerce and unrestricted trade with all nations as a part of the fundamental and permanent policy of the new republic. Thus, up to that time, treaties of commerce between nations had been little other than agreements to secure special and exclusive privileges to the contracting parties, and to antagonize as far as possible the commercial interests of all other countries. But in the treaty of commerce entered into between France and the United States, in 1778, the commissioners of the two nations—Franklin, Deane, Lee and Gerard—evidently determined to attempt to inaugurate a more generous policy and establish a precedent for freer and better commercial relations between different countries than had hitherto prevailed. It was accordingly agreed in the treaty in question to avoid "all those burdensome prejudices which are usually sources of debate, embarrassment and discontent," and to take as the "basis of their agreement the most perfect equality and reciprocity." And they further stated the principle which they had adopted as a guide in their negotiations to be that of "founding the advantages of commerce solely upon reciprocal utility and the just rules of free intercourse." The traditions and customs of Europe were, however, too strong to be at once broken down; and in the end the United States abandoned its efforts in behalf of a new commercial policy, and within a comparatively few years afterward enacted a commercial code as illiberal and narrow in many respects as any that had preceded it.—Let us next briefly trace the experience of American shipping subsequent to the revolution. At the time of the formation of the constitution in 1789 the registered tonnage of the United States, by which is to be understood the tonnage engaged in foreign trade, was 123,893 tons. During the next succeeding eight years, or from 1789 to 1797, it increased 384 per cent., but this remarkable increase was exceptional, and was due to the almost universal state of war in Europe, which threw the carrying trade of the world in an equal degree into our hands. Between 1797 and 1807 the increase was 42 per cent., or from 507,777 tons to 848,307 tons. Between 1807 and 1837 there was no increase, but periods of decrease (as between 1811–14 and 1818–25), and again of partial recovery, so that in 1837 the amount of American registered tonnage was only 810,000 tons, or about 38,000 tons less than it was thirty years previously, or in 1807. Subsequent to 1837, the increase was again rapid; rising from 810,000 in that year to 1,241,000 in 1847, to 2,268,000 in 1857, and culminating with 2,496,000 tons in 1861, or at the period of the outbreak of the war. The maximum tonnage of the United States at any one time registered and enrolled, (or engaged in foreign and domestic trade), and in the fisheries was

in 1861, namely, 5,539,813 tons. The tonnage of the world at that time, divided among the different nationalities, was also approximately as follows:

	Tons.
Belonging to the United States.....	5,539,813
Belonging to Great Britain and her dependencies.....	5,895,369
Belonging to all other nations.....	5,800,767

The tonnage belonging to the United States in 1861 was therefore but a little smaller than that of Great Britain, and nearly as large as the entire tonnage of all maritime nations combined, with the exception of Great Britain. In respect to the international carrying trade of the world, the United States had more tonnage engaged than all other nations combined, exclusive of Great Britain.—Another point of great importance in this connection is, that from 1855 to 1860, the period when the American shipping interest attained its greatest prosperity, the tonnage of the United States engaged in foreign trade was more than 50 per cent. in excess of what would have been requisite to carry all the exports and the imports of the country; or, in other words, if American vessels had exclusively moved all our exports and all our imports from 1855 to 1860 there would have remained some 1,300,000 tons of American shipping to be otherwise accounted for in respect to business. But as the American vessels did not at that time exclusively carry all our imports and exports, and as fully 25 per cent. of the foreign trade of the United States was then done by foreign vessels, it follows that the tonnage of the United States in 1855–60, which was in excess of the immediate trade requirements of the country, was much more than 1,300,000 tons. This surplus was in the employment of foreigners and engaged in a trade with which the United States had no connection except as a carrier; and in this business, the ships employed, not unfrequently, did not return for years to their home ports. At the same time, the amount of American tonnage transferred by sale to foreigners was very considerable, and, for the year 1855, amounted to 65,000 tons.—Attention should also be here called to the circumstance that the remarkable results as above detailed were achieved at a time when the differences in the wages of seamen, and the cost of stores, rigging, etc., on American vessels in favor of their foreign competitors, was very marked, if not fully as great as at present. The explanation of this anomaly is that the crews of American vessels, although paid higher wages than the seamen of any other nationalities, were more efficient, consequently fewer men were needed, which reduced the cost and risk of navigation, and this last in turn reduced the cost of insurance, as compared with English ships, even in English companies. The Americans also very early introduced labor-saving machines and mechanism, as for managing the top-sails, handling and lifting the anchor, loading and unloading freights, which also largely dispensed with the necessity of manual labor. Vessels of the United States at the time under consideration were better

modeled than vessels of foreign construction, and, being better modeled and better handled, they sailed faster, and as a general rule could make four voyages while the Englishman, under similar circumstances and with similar vessels, could make but three. American ship-owners, consequently, obtained more freight and often better prices—a sixteenth of a penny more per pound, for example, in cotton—and in English ports, other things being equal, English merchants preferred to ship in American rather than in British bottoms. In 1857, when the rebellion in India broke out and the British government found it necessary to dispatch troops and stores with the greatest promptitude, the vessels that were first chartered, at the highest prices, which were most relied upon and did the best service, were the magnificent American-built clippers at that time largely engaged in the India and China trade.—The statistics of American shipping thus far presented have not discriminated between sailing vessels and steamers. But there is a point just here of no little importance as throwing light on what subsequently happened. It is this: British foreign steam shipping practically dates from 1838, when the *Sirius* and *Great Western*, the two pioneer vessels, crossed the Atlantic to New York. The increase in this department was at first very slow, and thirteen years later, or in 1851, the total British steam tonnage engaged in foreign trade was only 65,921 tons. The foreign steam shipping of the United States may be said to date from 1848, when it amounted to about 16,000 tons. For a number of years next subsequent its increase was so rapid that in 1851 the foreign steam tonnage of the United States and Great Britain were almost equal; that of the former being 62,392 tons, and that of the latter 65,920 tons. The prospect, therefore, at one time was that the United States, although late in the start in this new department of foreign shipping, must soon equal, if not overtake, her great commercial competitor, Great Britain. And after the year 1851 the American growth steadily continued down to the year 1855, when our aggregate steam tonnage engaged in foreign trade amounted to 115,000 tons. But from that time onward there was no more progress, but a retrograde movement; so that in 1862 the aggregate foreign steam commerce of the United States was less by 1,600 tons than it was in 1855. But even before the outbreak of the war “there were no ocean mail steamers, away from our own coasts, anywhere on the globe under the American flag, except, perhaps, on the route between New York and Havre, where two steamships may then have been in commission, which, however, were soon afterwards withdrawn. The two or three steamship companies which had been in existence in New York had either failed or abandoned the business; and the entire mail passenger and freight traffic between Great Britain and the United States, so far as this was carried on by steam, was controlled then (as it mainly is now) by British companies.”—The year

1856 further marks a great natural division in the history of the entire foreign mercantile marine and ship-building industry of the United States. The record thus far has been substantially a record of a most remarkable progress and prosperity. The record hereafter is to be a record of decadence and disaster, which, considering the magnitude of the capital and interests involved, is almost without a parallel in the history of modern civilization.—The decline in American ship-building and in the American carrying trade upon the ocean did not, as is popularly supposed, commence with the war, and was not occasioned by the depredations of the confederate cruisers. These agencies simply helped on a decadence that had previously commenced, and which probably would have progressed just as far as it now has had no war intervened. The first symptoms of this decadence appeared in 1856 in the falling off in the sales of American tonnage to foreigners; the reduction being from 65,000, in 1855, to 42,000 in 1856; to 26,000 in 1858, and to 17,000 in 1860. During the war, however, the transfers of American tonnage to foreign flags again increased very largely; and for the years 1862 to 1865 inclusive, amounted to the large aggregate of 824,652 tons, or to more than one-fourth of all the registered tonnage (the tonnage engaged in foreign trade) of the United States in 1860. But these transfers it is well understood were not in the nature of ordinary business, but for the sake of obtaining a more complete immunity from destruction upon the high seas than the United States at that time was able to afford. The year 1856 also marks the time when the growth of our foreign steam-shippping was arrested and a retrograde movement inaugurated, so that, as before stated, our aggregate tonnage in this department was 1,000 tons less in 1862 than it was in 1855. The total tonnage of every description built in the United States also declined from 582,450 tons, in 1855, (the largest amount ever built in any one year) to 212,892 tons in 1860, a reduction of over 60 per cent. in five years. The year 1855-6 was also the period when American vessels carried the maximum percentage (75.2 per cent.) of the exports and imports of the United States. After 1856 this business steadily declined from 75.2 per cent. in 1856 to 73.7 per cent. in 1858; 66.5 per cent. in 1859, and 65.2 in 1861, the year of the outbreak of the war. Notwithstanding this, the records of the United States treasury department show that the aggregate of American tonnage engaged in foreign trade and the total aggregate of the entire mercantile marine of the United States were both greater in 1861 than at any former period. Whether it was at this latter date all profitably employed, as it certainly was at an earlier period, can not now be affirmed.—What happened in the twenty years that elapsed between 1860-61 and 1880 is shown by the treasury statistical statement. Our aggregate tonnage of every description, registered and enrolled, sail and steam, employed upon the ocean, upon

the lakes, upon our rivers and harbors, has declined from 5,539,813 tons in 1861 to 4,008,034 in 1880—a reduction of over 26 per cent.—Our tonnage engaged in foreign trade has declined during the same period from 2,496,894 tons to 1,314,402 tons—a reduction of 47 per cent.—The aggregate of tonnage of every description built in the United States in 1855 was 583,450; in 1861, 233,193 tons, and in 1880, 157,409 tons—a reduction of annual increment since 1855 of 73 per cent., and since 1861 of 32 per cent. How rapidly furthermore this former great branch of American industry is decaying may be also illustrated by the statement that the American tonnage built in 1880 was 35,622 less than 1879, and 78,095 tons less than in 1878. There was a falling off in the shipbuilding of the New England States during 1880 of 9,500 tons as compared with 1879, 44,012 tons as compared with 1878, and 105,123 as compared with 1875; while for our entire seaboard—Atlantic, Gulf and Pacific—the tonnage built in 1880 was 142,755 tons less than the product of 1875.—But the changes which have taken place within the last twenty-five years in the ocean carrying trade of the United States constitute by far the most striking illustrations of the tremendous decadence and wreck which our foreign maritime commerce and commercial marine within that period experienced. During the whole period between 1855 and 1860 there was, as before noticed, at least a million and a half of American tonnage exclusively in foreign employ, “carrying cargoes from foreign ports to foreign ports for foreigners, to be used by foreigners, and in which business Americans had no direct interest but to receive in cash their freight money, to be sent home and added to the productive capital of the country.” Of this great and profitable business a small proportion (in 1881) probably yet remains, but how much it is difficult to state with accuracy.—Again, in 1856, out of the total value of all the exports from and of all the imports into the United States the American commercial marine transported 75.2 per cent. The record of the experience of the twenty-five years next succeeding is exhibited in the following table:

Percentage of the exports and imports of the United States carried in American vessels from 1856 to 1880 inclusive:

Years.	Per cent.	Years.	Per cent.
1856.....	75.2	1870.....	35.6
1857.....	70.5	1872.....	28.5
1859.....	69.9	1874.....	26.7
1861.....	65.2	1876.....	25.9
1863.....	41.4	1878.....	22.6
1865.....	27.7	1880.....	17.4
1867.....	33.9		

Or to sum up in a few words, of the goods, wares and merchandise exported and imported into the United States during the fiscal year 1880, American vessels transported only 17.4 per cent. and foreign vessels 82.6 per cent.—Startling, however, as are these statistics, they nevertheless fail to convey the exact truth of the situation at the present time of writing. For it must be borne in mind, that while the business of American shippping engaged in foreign trade has been rapidly

disappearing, the opportunities for business have at the same time been increasing in a far more rapid ratio: or, to put the case differently, while there never was so much business calling for the employment of merchant vessels in the history of the world as at the present time, the extent to which the capital and industry of the United States participate in this business is annually growing less and less. Thus, taking merely the trade of the United States as an example, we find that out of a total value of exports and imports in 1860 of \$762,000,000, the value transported in American vessels was \$507,000,000, or 66.5 per cent.; but in 1880, out of a total value of exports and imports of \$1,589,000,000, American vessels transported a value of only \$28,000,000, or 17.6 per cent., a little more than half of what was done twenty years ago, or in 1860. Of this enormous increase every maritime nation of any note, with the exception of the United States, has taken a share. American tonnage alone exhibits a decrease. Thus comparing 1880 with 1856, the foreign tonnage entering the sea-ports of the United States increased nearly 11,000,000 tons; whereas the American tonnage entered during the same period exhibits a decrease of over 65,000 tons. British tonnage increased its proportion from 935,000 tons in 1856 to 7,903,000 in 1880; Germany, during the same time, from 166,000 to 1,089,000; Sweden and Norway from 20,662 to 1,234,000; Austria from 1,477 to 206,000; Spain from 63,813 to 227,496; while Russia, whose vessels participated in our trade in 1856 to the extent of only 40 tons in 1880, reported 104,049 tons.—The tonnage of iron vessels, sail and steam, built in the United States from 1876 to 1880 inclusive, amounted to only 101,823 tons, and this trifling amount was almost entirely for our coastwise or home trade, in which no foreign competition whatever is allowed under the provisions of our navigation laws. No iron sailing vessels were built in the United States between 1871 and 1880; but during the latter year 44 tons were reported by the treasury department as having been constructed. *Per contra* the increase of iron ship-building in Great Britain during the corresponding period amounted to 1,800,193 tons.—From these exhibits it is easy to comprehend the tremendous change that took place between 1856 and 1880 in the great department of domestic industry under consideration as measured in ship-building and in the business for which ships are constructed and used. Let us next endeavor to gauge the amount of this loss as measured in money.—In 1855 the amount expended in the United States in the construction of new vessels was estimated at about \$25,000,000 per annum; and a sum considerably in excess of this for the repair and rebuilding of old vessels; or a total for this branch of domestic industry of from \$55,000,000 to \$60,000,000 per annum. The bulk of this large expenditure was very largely for the labor of construction. A present (1881) annual expenditure in the United States of

\$25,000,000 for similar purposes would probably be an over rather than an under estimate. We start off in the money account, therefore, with a loss to the industry and business of the country in the two items of ship building and ship repairing of from \$30,000,000 to \$35,000,000 per annum.—Again, the business of transporting merchandise or passengers by land or by sea is as much a productive industry as the raising of wheat, the spinning of fibres or the smelting or forging of iron. It adds to human comfort, it supplies wants, creates values, increases abundance.—In foreign commerce, the freights paid on the things transported are as much exports or imports as the merchandise which is exported or imported. Thus, if 2,000 tons of coal of the value of \$10,000 are sent in a vessel of the United States to China, and the freight on the same is \$6,000, this freight is as much of an export of the results of American industry as the coal, and if paid and returned to the United States in the form of coin or tea or silk, may, and under ordinary circumstances will, add as much proportionally to the general wealth of the country as the proceeds of the sale of the coal upon which the freight was earned. On the other hand, if the coal is transported in a foreign vessel, the freight earned does not increase the capital or benefit the labor of the United States, but of the country to which the vessel belongs. The amount paid for the transport of the imports and exports of the United States for the calendar year 1879, has been estimated by the best authorities, (Henry Hall, of the U. S. census and Dr. E. H. Walker, late statistician of the New York produce exchange), at \$88,000,000 as a minimum for exports and about \$45,000,000 on imports, or an annual total of \$133,000,000. For the fiscal year ending June 30, 1880, Mr. Hall also reports 18,000,000 of gross tons of the produce and manufactures of the United States as exported, and 3,900,000 tons of the produce and manufactures of foreign countries as imported into the United States, the exports—grain, provisions, cotton, petroleum, etc.—representing a large bulk in comparison with value, and the imports—textiles, drugs, manufactures of metals, etc.—large value in proportion to bulk.—Of the above estimated aggregate of freights paid on the exports and imports of the United States, probably not more than one-fifth, or \$26,000,000 as a maximum, was carried under the American flag. If the proportions of the carrying trade which were controlled by the United States in 1860 had been simply maintained, without any increase, the present (1880) worth of the business which has been lost to the country in this department of domestic industry must be estimated at \$86,000,000—\$26,000,000, or \$60,000,000 per annum.—Adding to these estimates the loss of business consequent on the decline of ship building and ship repairing, and also the nearly total loss of the great business of ocean passenger and immigrant carriage—to be estimated for the year 1880 at not less than \$15,000,000—and we have the sum of one hundred millions of dollars

as the smallest measure in money of the annual worth, in 1880, of the business which the United States has lost in consequence of the decay of her commercial marine. If we assume, however, only seventy-five millions as the loss which the business and national wealth of the country at present annually sustains by reason of the decay of our industries of ship building, ship repairing and ship using in foreign commerce, then this loss would be equivalent to the almost complete wiping-out of the business of pig-iron smelting as it existed in the United States in 1870; to forty-five per cent. of our manufacture of cotton goods at the same period, and nearly the same proportion of the value of our woolen and worsted industries.—As illustrating, furthermore, the extent to which the ocean carrying business is capable of development as a national industry, attention is asked to the fact that the gross amount of freight—exclusive of that on bullion—earned by British vessels on the transport of the exports and imports of the united kingdom for the year 1875-6 was estimated by the best authorities as £56,000,000, or \$280,000,000.—But the direct losses occasioned by the decay of our ocean commercial marine are insignificant in comparison with the indirect losses due to the loss of trade from an inability to make exchanges promptly, regularly and cheaply with foreign countries. No matter how well stocked the store may be with good, cheap and desirable goods, if would-be customers find great inconveniences in the way of getting to the store and in transporting to it their products for barter or exchange, they will not come, but trade elsewhere.—Having inquired into and acquainted ourselves with the present condition of our foreign commercial marine, and having traced the gradual changes which have taken place in our ship-building industry and foreign carrying trade within the last quarter of a century, embraced between the years 1855 and 1880, we are now prepared to enter upon a discussion and analysis of the causes which have produced the existing most remarkable, and at the same time nationally discreditable condition of American ocean commerce.—The facts already presented fully demonstrate that the war of the rebellion was not the cause, and did not mark the commencement of the decadence of American shipping, although the contrary is often and perhaps generally assumed by those who have undertaken to discuss this subject. The war simply hastened a decay which had already commenced, and under the same influences and conditions as have otherwise prevailed the same results would undoubtedly have been reached, even if no war had intervened. Neither can the paralysis with which the great branches of domestic industry under consideration have been smitten and have been threatened with extinction, be referred to such agencies as fluctuations of supply and demand, foreign wars, or financial revulsions at home or abroad, for all these influences have operated in the past, but have produced no such results, either

in this country or elsewhere, as those we are considering. During the latter years of the period we are now treating—1878-80—the general prosperity of the country, measured by the volume of business transacted, and the amount of resulting profits, has been greater than ever before, and yet there has been not only no resuscitation of the American commercial marine, but rather a marked and further decline. It has been also a popular idea, that the continued decadence of American shipping since the close of the war in 1865, was in part due to the system of vicious irredeemable currency which the war engendered; but the currency of the country was restored to a specie basis in January, 1879, and foreign nations have no longer any advantage in this respect over the United States; and yet there were not half as many vessels built during the prosperous specie-paying year of 1880, as during the height of the inflation period of 1868. To what then is the deplorable result, which no one denies has happened, to be attributed? The answer first is, not to one, but to several causes. The primary cause was, what may be termed a natural one, the result of the progress of the age and a higher degree of civilization—namely, the substitution of steam in the place of wind as an agent for ship propulsion, and the substitution of iron in the place of wood as a material for ship construction; and for nations or individuals to have attempted to permanently counteract the influence of these substitutions by legislation or any specific commercial policy, was as useless, as our own experience proves, as to have sought to arrest the stars in their courses. So long as wood was the article mainly used in the construction of vessels the United States had an advantage over foreign nations in the cost of the material, in the skill which we had acquired in working the same, and in the positive genius for the management of wooden sailing ships which natural faculty and more than two centuries of experience may be claimed to have nationally engendered. When, however, the steam engine was substituted for the sail, and iron for wood, then these advantages were in a great degree neutralized or wholly swept away.—Foreign steam shipping and the successful application of iron to the construction of vessels designed for ocean navigation were accomplished facts in Great Britain as early as 1840. As is generally the case with all new inventions and discoveries, these startling innovations on an old established order of things were in the outset regarded doubtfully and, indeed, did not command the full confidence of the commercial public in both respects until a considerably later period. The application of steam to ocean navigation was the first to be accepted as an absolute necessity, and therefore as inevitable. The Americans waited until English experience had proved the fact to their full satisfaction, and then embraced the idea so eagerly and turned it to practical account so rapidly that the foreign steam tonnage of the United States, which really commenced to

exist in 1848, nearly equaled in 1851 (as before shown) the entire steam tonnage of Great Britain of longer growth, and continued to regularly and largely increase until 1856. But during the period between 1848 and 1855 the commercial public had become pretty generally satisfied in respect to certain other matters. They had been taught by further experience that iron in the construction of vessels was much more durable than wood, and that whatever difference, therefore, there might be in the first cost, the iron vessel in the long run is cheaper than the wooden one. They had learned that iron vessels are more rigid than wooden vessels, and that the former are therefore better adapted to withstand the strain of heavy steam machinery, and also that from lack of the necessary strength and rigidity the application of the most economical method of propulsion—namely, the screw—is impracticable in the case of wooden vessels of large capacity. They had also learned that iron ships are superior to wooden ships in buoyancy, and hence draw less water with a given tonnage, carry a greater weight of cargo, and have a greater stowage capacity. In short, they had come to know that for the most practical purposes wooden ships in competition with iron ships were nowhere. American ship owners, merchants and navigators, or at least the more enterprising of their number, were not more backward in learning and understanding the significance of these facts than their English competitors; and the conditions of the hour for the continued prosperity of the American merchant marine were fully set forth in various commercial journals of the United States.—Had matters been allowed to take their natural course; had Americans been allowed to simply take the advantage of the world's progress which was taken by their competitors, it is reasonable to infer that there would have been no material decline in the American shipping interest, and no such condition of things to bewail as exists at present. To assume to the contrary is to assume that Americans would have made an exception of this one department of their domestic industry, and have failed to bring to it that sagacity and skill that before and since have characterized all their other business operations. But matters were not allowed to take their natural course. The means and appliances for the construction of iron vessels did not then exist in the United States; while Great Britain, commencing in 1839, (when John Laird constructed his iron steamers for the British navy which afterward took part in the Chinese war), and with seventeen years of experience, had become equipped in 1855 for the prosecution of this great industry. The facilities for the construction of steam machinery adapted to the most economical propulsion of ocean vessels, furthermore, were also inferior in the United States to those existing in Great Britain, and by reason of statute provisions (see NAVIGATION LAWS OF THE UNITED STATES), citizens of the United States interested in ocean commerce were absolutely prevented and forbid-

den from availing themselves of the results of British skill and superiority in the construction of vessels when such a policy was the only expedient which could have enabled them at the time to hold their position in the ocean carrying trade in competition with their foreign rivals. Now, there is very little sentimentality in the representatives of trade and commerce, whatever may be their nationality. They simply ask, "Who will serve us best and at the cheapest rate?" And the inability of the ships of the United States to do the work which trade and commerce required that they should do as well and cheaply as the ships of other nations being established, the decadence of American shipping commenced and was inevitable from the very hour when this fact was first recognized, which was about the year 1856. Here, then, we have the primary cause of the decay of the business of ship building in the United States and of our commercial marine. Other causes—hereafter noted—have since come in and helped the decay and are powerfully operative to prevent recovery; but so long as the conditions, which in the outset were the source of the trouble, continue to prevail, decay will continue to go on and there can be no recovery. Attention should here be called to the circumstance that the relation of the United States to Great Britain in this matter of ship construction and employment has been no different from the very outset of the new era in navigation from that of all other maritime nations, with the single exception that, as the interest of the United States in the new conditions was greater than that of all these others combined, it was incumbent on the former to act with the greatest wisdom and discretion, and not allow prejudice and ancient conservatism to prevent the removal of obstacles which stood in the way of national growth and development. But none of these nations, with the possible exception of old Spain, acted as did the United States. Taking a practical, common-sense view of the situation and setting sentiment aside, they concluded that it would be the height of folly to permit a great and profitable department of their industries to be impaired or destroyed rather than allow certain improvements in the management of its details, because suggested and carried out by a foreign nation, to be purchased and adopted. And they, therefore, virtually said to their own people: "If England can build better and cheaper ships for ocean commerce than you can yourselves, and will furnish them to you on terms as favorable in every respect as is granted to her own citizens, and if your own private judgment and feeling of self-interest prompts you to buy and use such ships, the state will interpose no obstacles to your so doing. As between a business and the instrumentalities for doing business the interests of the first are to be first considered, for if the business fails, the instrumentalities employed in it, be they good or bad, will retain but little of value; whereas, on the other hand, if the business can be kept profitable there need be no apprehension

as to a deficiency or imperfection of the instrumentalities." And the merchants and capitalists of these maritime states, adopting the course which seemed best to them under the circumstances, went to England and supplied themselves with ships and steamers of the most approved patterns, and sharing with the English the monopoly of owning and using the same, have always derived great profit therefrom. And the several states, furthermore which permitted their citizens to act without restraint in accordance with their own best judgment in this matter, have never had any such results as the United States has experienced, but, on the contrary, have seen their commercial tonnage and carrying trade upon the high seas largely increase, and if their shipping interests have since experienced any vicissitudes, they have not in any one instance been referred to influences even remotely connected with the liberal policy that was adopted. On the other hand, the policy of the United States under the same circumstances has been very much as if at the outset of the development of the railway system as an improved method of transporting goods and passengers, some one state of the Union—say Ohio, for example—had said, "We have no manufactories of locomotives or cars, or mills for rolling railway bars, within our territory; state pride and a desire to be wholly independent will not allow us to purchase these articles of Pennsylvania; therefore we will continue to use horses and wagons, which heretofore answered our purposes of transportation, and not use railroads until we can manufacture all railroad equipments ourselves." People in other states would have been prompted to characterize the action of the people of Ohio as irrational, and as in opposition to their material interests, and yet the boundary line which separates the United States from Great Britain is just as much a matter of artificial ordination as that which separates Ohio from Pennsylvania. But be this as it may, the result in the hypothetical case would have been exactly the same as is the result in the real case. Ohio would not have got her railroads nor the wealth and development that would have flowed from their construction. The United States has not got the ships, or the wealth and business that have been attendant upon their possession and skillful employment in other countries.—But, although the navigation laws of the United States have been undoubtedly the prime agency in originally occasioning this decadence, and subsequently preventing the resuscitation of American shipping engaged in foreign commerce, other influences have also powerfully contributed to the same results. Among these, the influence of the high protective tariff system of the United States which has been in operation since 1861, must be regarded as most prejudicial; *first*, by enhancing the price of nearly all articles entering into the domestic construction and equipment of vessels, and for which the allowance of a drawback on the importation of similar articles

of foreign production has afforded but a partial relief; and *secondly*, by preventing that reciprocity of trade between the United States and various foreign countries, which is essential to the full and profitable employment of vessels. Ships are the children and not the parents, the effect and not the cause of commerce; and so long as the commercial policy of the United States restricts the producers of this country from freely exchanging the products of their labor with the products of the labor of the producers of other countries, foreign commerce will not develop or a national commercial marine find a basis for growth or even existence.—Another serious obstacle in the way of the profitable employment of American vessels in foreign commerce, is the system of state or local taxation generally adopted by the several states of the federal union, under which ships are taxed as personal property, to their owners; a practice which does not prevail in any other of the leading maritime nations. The manner in which such taxes work to the disadvantage of American shipping may be thus illustrated: Let us suppose the projection of a new line of steamships to run between the United States and Europe in competition with existing lines, now controlled by foreign capitalists and registered under a foreign flag. If the nationality of the company is to be American and its location any one of our leading Atlantic cities—except Philadelphia—the taxation on the whole accessible capital or property of the company—ships, wharfs, machine shops, offices—and floating capital, will be from 1.50 to 2.50, or even greater per cent., on a pretty full valuation. In the State of New York the tax is to a great extent evaded. In many of the other states it is, however, rigidly enforced. [Since this article was written (1880), New York and Massachusetts have exempted ships engaged in foreign commerce from local taxation.] On the other hand, Pennsylvania, when she some years ago incorporated a local transatlantic steamship company having its *situs* in Philadelphia, judiciously exempted all ships engaged in foreign trade, as well as all other property—stocks, bonds, etc.—of the company in question, from all state taxation. Furthermore, until recently, the national government would have preferred an average tax under the tariff of about 40 per cent. on all articles of foreign production entering into the construction of vessels, and as a consequence it advanced the price of similar articles of domestic production to an equal or nearly corresponding extent. By the act of June, 1872, however, articles of foreign growth or production "necessary for the construction and equipment of vessels built in the United States for the purpose of being engaged in foreign trade" may be imported in bond free of duty; but vessels receiving the benefit of this provision are not allowed to engage in the coastwise trade of the United States for more than two months in any one year. As one consequence of this restriction, a New York ship owner stated at the recent meet-

ing of the national board of trade (December, 1880,) that, having occasion to send a vessel built for foreign trade from New York to New Orleans for temporary employment, he was obliged before he could do it to pay \$400 for duties on the suit of metal which had been previously placed on the ship's bottom. For some years after the war, also, when the shipping interests of the United States engaged in foreign trade had suffered exceptionally from the inability of the government to protect it from confederate cruisers, and when it, therefore, needed the kindest and most fostering care, income taxes were imposed on the incomes of ship-owners (if they perchance happened to have any) and in addition heavy taxes on the gross receipts of their entire business and upon every passenger ticket by them sold. When the largest possible damage had been effected these national taxes were repealed. But the practice of Great Britain and other nations of allowing vessels employed in foreign commerce to take stores for voyage consumption out of bond free of duty has not as yet been thought worthy of imitation, and as a consequence the cost of ship supplies in the United States was reported by a committee of congress a few years ago to be about 20 per cent. in the aggregate in excess of the cost of supplies to vessels of Great Britain. If now, on the other hand, the *situs* of the prospective new steamship company is made foreign and its location fixed at Liverpool, the whole amount of local taxation to which the company would be subjected would be merely an assessment to the extent of from 10 to 25 per cent. on the rental—not capital—value of the premises occupied either as offices, storehouses or machine shops. Beyond this the British government would levy an income tax on the profits (if any) of the shareholders or owners, as individuals, which tax is at present about 2 per cent., but in 1875 and 1876 was less than 1 per cent.; and, omitting all other forms of direct taxation, would allow all articles subject to taxation either under the excise or tariff, such as distilled spirits, teas, sugars, coffee, wines and tobacco, which may be required for use on board the steamer in question, to be taken from bond free of duty. The difference in the return on the investment, therefore, growing out of the difference merely in the fiscal systems recognized in the different locations specified, would be of itself sufficient to afford to the foreign capitalist a dividend on his stock equal to at least one-half of the ordinary rate of European interest on the capital employed, while to the American investor the disadvantage would have an expression at least twofold greater through an increase of expenses and a diminution of profit which can be traced directly to a system of taxation which has enhanced the price of everything that has entered into the steamer, from the laying of her keel to the coal that feeds her engines. In Great Britain and other countries it is furthermore to be noted that the ownership of a ship that is idle and not earning, or employed and not

earning, does not entail any burden of taxation, but in the United States it makes no difference whether the ship be at work or idle, profitably or unprofitably employed, she pays taxes all the same. —With competition with foreign nations on terms of equality being, therefore, from the very outset, not less by state than by federal laws, rendered impossible, is it to be wondered at that the American ocean marine has declined almost to extinction, or that there are so few mechanical establishments in the United States capable of building or repairing first-class steamships?—Tonnage taxes on shipping are not levied by Great Britain, nor, it is believed, by any other of the maritime states of Europe, except Spain. Prior to the war also there were no tonnage taxes in the United States, and their enactment in 1862 was due simply and exclusively to the urgent necessities of the government for revenue occasioned by the war. Those necessities having long since passed there is no good or sufficient reason for the continuance of such taxes. The rates imposed on American and foreign vessels being substantially the same, American vessels would not seem to be relatively at a disadvantage with foreign vessels on account of these taxes. But really they are; inasmuch as in the one case the effect of the tax is generally to reduce realized profits, while in the other it constitutes, under existing circumstances, an obstacle, as will be presently shown, in the way of realizing any profits at all.—According to British maritime rules the tonnage capacity of vessels is reckoned on only such space as is available for cargo, and in the measurement of vessels for the ascertainment of their capacity allowance is made for the space occupied for the accommodation of the officers and crew and also by the machinery. In the United States the space occupied by the water closets and galley are alone exempt from admeasurement; and as a consequence American vessels are at a disadvantage as compared with British shipping in respect to tonnage and harbor dues and light money in ports where such taxes are levied. Again, a sailing vessel which enters an American port once a year is obliged to pay as much tonnage tax as a steamer that enters the same port every month; and if in a given line a steamer which has paid her tonnage taxes for a year becomes disabled and is withdrawn during the first month of the year the substitute steamer must pay tonnage all the same for another full year.—The charges of our consular system are claimed, and undoubtedly with truth, to be another weighty burden on American shipping engaged in foreign trade. These fees are all fixed by congress, and paid into the United States treasury, and have evidently been arranged with the idea of not only rendering the United States consular system self-sustaining but of also making it a source of revenue to the government. For the fiscal year ending June 30, 1880, the amount of consular fees paid into the United States treasury was \$592,161, and the amount disbursed for consular salaries \$465,641. For contingencies

pertaining to the consulates there was also disbursed the additional sum of \$164,000. Compulsory pilotage, the three months' extra pay to crews discharged in foreign lands—the great mass of sailors being now of foreign nationality and as much at home in one port as another—and the obligatory employment of government officials for the shipment of sailors in American ports, are also further obstacles in the way of the prosperity of the American commercial marine from which its foreign competitors are either wholly or in a great degree exempt. By a system of compulsory dues on incoming and outgoing vessels, (from which only the coasting service is exempt), the Sandy Hook pilot service of the port of New York, which consists of 133 New York and 58 New Jersey pilots, derives a yearly income from the commerce of the port of \$800,000 to \$1,000,000. The specific amounts charged are said to be two and a half times in excess what is paid in Liverpool for similar service; and at the shipping convention at Boston in October, 1880, Mr. James E. Ward, of New York, stated that his firm "paid as large an amount for pilotage into New York harbor as they did to the captain of his steamship for sailing the vessel all the way to Cuba and back, facing all the dangers of the seas and the risk of contagion in Cuba." These compulsory pilot charges contribute to make New York one of the most expensive ports for shipping in the world.—From this history of the rise and fall of the American merchant marine it must be evident that no one measure will arrest the decay of American shipping now in progress, bring back prosperity to the ocean carrying trade, or revive the ship-building interests of the United States; but that the field of reform to be entered upon is very large and the number of details to be attended to very numerous. Reform and prosperity are, however, both possible and practicable if the people of the United States desire and will it.—To complete this history, a further special reference is needed to the American merchant marine engaged in "coastwise" or domestic commerce as contradistinguished from that engaged in "foreign" commerce. American vessels engaged in foreign trade, in order to be qualified by law for so doing, are required to be registered "by the collector of that collection district which includes the port to which such vessel shall belong at the time of her registry; which shall be deemed to be that at or nearest to which the owner, or managing owner, of such vessel usually resides" (U. S. Revised Statutes, section 4141.) Registered vessels are subject to the payment of tonnage taxes and various regulations from which vessels engaged exclusively in foreign trade are exempt. (See Revised Statutes of the United States, titles XLVIII and XLIX, sections 4131 to 4310 inclusive.) Vessels designed for the coastwise or domestic commerce, if of less than twenty tons burden, are required to be licensed, and if in excess of twenty tons are required to be both licensed and enrolled in the collection district where owned; are not

subject to the payment of tonnage taxes, and are not permitted to engage in foreign trade, without changing their enrollment for a register. Vessels of foreign construction, or owned in part, or commanded by foreigners, are not permitted to engage in the coastwise or domestic commerce of the United States. Vessels licensed for the carrying on of fisheries can, before sailing, obtain special permits for touching or trading at foreign ports; but any such vessel found within three leagues of the coast with merchandise of foreign growth or production on board, exceeding five hundred dollars in value, without special permit for the carriage of the same, is made subject to confiscation, with cargo. For further details of regulations respecting the coastwise commerce of the United States, see Revised Statutes of the United States, title L, sections 4311–4390.—The tonnage of vessels of the United States, owned by American citizens and sailing under the American flag, on the 30th of June, 1880, was as follows:

VESSELS.	Number.	Tonnage.
Sailing vessels.....	16,830	2,366,258.03
Steam vessels.....	4,717	1,211,554.35
Canal boats.....	1,235	106,589.57
Barges.....	1,930	383,628.61
Total.....	24,712	4,068,034.56

The employment of tonnage on the 30th of June, 1880, was reported by the register of the United States treasury to have been as follows:

In the foreign trade.....	1,352,810.31
In the coastwise trade.....	2,649,352.84
In the cod and mackerel fisheries.....	77,538.73
In the whale fishery.....	38,408.12

The tonnage of sailing vessels—including canal boats and barges—and of steam vessels, comprising the merchant marine of the United States from 1860 to 1880 inclusive, is thus reported by the U. S. treasury department:

YEAR ENDED JUNE 30.	Sail. Tons.	Steam. Tons.	Total. Tons.
1860.....	4,485,931	847,937	5,353,868
1861.....	4,662,609	877,204	5,539,813
1862.....	4,401,701	710,463	5,112,164
1863.....	4,579,537	575,519	5,155,356
1864.....	4,008,440	977,980	4,986,400
1865*.....	1,212,805	367,189	1,579,994

DAVID A. WELLS.

AMERICAN PARTY, The (IN U. S. HISTORY).

Opposition to aliens has at intervals been a feature in American politics from the foundation of the government. During the period 1790-1812 the question whether war should be declared against Great Britain or against France was almost always a critical one, the democrats (see DEMOCRATIC-REPUBLICAN PARTY) preferring, of the two, war against Great Britain, and the federalists (see FEDERAL PARTY) war against France, though both were professedly anxious for neutrality. During this period most of the immigrants were really banished men, driven from England, Scotland or Ireland for too free use of the printing press, for hostility to the British government, or for affection to that of France. Naturally these immigrants took the democratic view of the great debatable question, in all its ramifications; as naturally the federalists became an anti-alien party; and as naturally the aliens sought refuge in a permanent alliance with the democrats which has been kept up by their successors. —The first naturalization act (March 26, 1790,) made two years residence necessary, and this was prolonged by act of Jan. 29, 1795, to five years, as at present; but the federalists, in 1798, having taken advantage of the war fever against France and their own almost absolute power, raised the period to fourteen years (see ALIEN AND SEDITION LAWS). Jefferson's election and the democratic triumph in 1800 brought the period back to five years in 1802, and insured fresh reinforcements of aliens to the dominant party. The British minister, Foster, soon after his return, in 1812, from America, where he had honestly and vainly striven to avert war, stated in the house of commons that, among those who voted in congress for the declaration of war, were at least six late members of the society of united Irishmen. The increasing feeling of the federalists produced an anti-alien clause in the amendments proposed by the Hartford convention, (see CONVENTION, HARTFORD), but with returning peace the nativist feel-

ing died away. When the congressional caucus, in 1824, nominated Crawford and Albert Gallatin, (a Swiss by birth), the latter withdrew because of the strong objection made to his nomination, which, indeed, was improper (see CONSTITUTION, AMENDMENT XII. ¶3). —The first revival of nativism was naturally in New York city, where a foreign population early began to form. In 1835-7 an attempt at a native organization was made, but it had ended in failure before the election for mayor in April, 1837. The close vote of the whigs and democrats, and their alternate successes, had given bitterness to their contests in the city, and when the democrats at the election for mayor in April, 1843, carried the city, (Morris, democrat, 25,398; Smith, whig, 19,517), they proceeded to parcel out the local offices, giving the lion's share to foreign born citizens. The result was seen at the election for state senator in November, 1843: Jones, democrat, 14,325; Franklin, whig, 14,291; Quackenboss, American republican, 8,549; the latter's vote being evidently mainly democratic. In April, 1844, the vote stood: Harper, native American, 24,510; Coddington, democrat, 20,538; Franklin, whig, 5,297; and the city passed under native control. By this time the native movement had spread to New Jersey and Philadelphia, and in the latter place several lives were lost and much property (including two Catholic churches) destroyed in riots between natives and Irish citizens. The whigs had generally voted with the democratic natives in order to secure their vote for Henry Clay, but when, in November, 1844, New York city and Philadelphia gave native majorities, and at the same time majorities for the democratic presidential electors, the whigs drew off. In April, 1845, the vote in New York city stood: Havemeyer, democrat, 24,307; Harper, native American, 17,485; Selden, whig, 7,032; and, in 1847, the new party had disappeared in New York city. As a result of the election of 1844, the 29th congress, in December, 1845, had 6 native representatives, 4 from New York (2nd, 3rd, 5th and 6th districts), and 2 from Pennsylvania (1st and 3rd districts). In the 30th congress there was but one, (Pennsylvania, 1st dist.). Thereafter for some years, with the exception of very small votes occasionally cast in New York, New Jersey and Pennsylvania, nativism disappeared. —About 1852, when the rapidly growing sectional contest as to the extension of slavery to the territories had begun to sap the old allegiance of members of both parties, and when the whigs might almost be described as maddened by the steady stream of reinforcement which their democratic opponents were receiving from immigration, nativism again appeared in the form, new to American politics, of a secret, oath-bound fraternity, whose name is said to have been *The Sons of '76*, or *The Order of the Star Spangled Banner*. Its real name and objects were not revealed even to its members until they had reached the higher degrees, and their constant answer when questioned on these subjects—"I don't know"—be-

came almost a shibboleth of the order and gave it the popular name by which it is still known—know-nothings. Its ostensible moving causes were the increasing power and designs of the Roman Catholic church in America, the sudden influx of immigrants after the failure of the European revolutionary movements in 1848–50, and the greed and incapacity of naturalized citizens for public office; its cardinal principle was that “Americans must rule America”; and its favorite countersign was a mythical order of Washington on a critical occasion, “Put none but Americans on guard to-night.” Its nominations were made by secret conventions of delegates from the various lodges, and were voted for by all members under penalty of expulsion. At first these nominations were merely selections of the best men from the rival whig and democratic tickets. No public notice of such indorsement was ever given, but its effects were visible in the counting of the votes and threw political calculations into chaos. So long as this plan was followed, though the order's name did not appear in politics, it was really the arbiter of elections.—In 1854 the Kansas-Nebraska bill was passed, and resulted in the permanent division of the northern whigs. Those who were not sufficiently opposed to slavery to enter the new republican party, and who despaired of further national success under their old party name, saw no refuge from the democratic party and its reinforcements from increasing immigration except in the know-nothing order, which now, tacitly accepting the name of the American party, struck out a separate existence in politics. The race between the republican and American parties was at first fairly even. In the state elections of 1854 the latter party carried Massachusetts and Delaware, and in New York polled the respectable vote of 122,282. But it was still a middle state party and had no opening in the west, where the republican party was steadily conquering a place as the only opponent of the democratic party. In the state elections of 1855 the American party, though it gained little in the west, made a great stride in advance southward, spreading its organization among the former whigs in that section. So late as 1881 the proportion of foreign born population in the south, except in Florida, Louisiana and Texas, was under two per cent., or practically nothing. In 1855 this absence of foreign born population was universal in the south, and the nativist feeling among the whigs of that section made it easy to transfer them to the American party, which thus secured in both sections, the governors and legislatures of New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, California and Kentucky, the controller and legislature of Maryland, and the land commissioner of Texas, and in Virginia, Georgia, Alabama, Mississippi, Louisiana and Texas, was beaten only by majorities ranging from 2,000 to 11,000. It seemed for the moment that three parties would exist in future, a republican party in the west, and an

American party in the southern and middle states, struggling for supremacy in the northeast, while the democratic organization remained intact in all the sections. Even in the hour of the American party's first successes, however, Greeley, of New York, shrewdly observed that it seemed to have “about as many of the elements of persistence as an anti-cholera or anti-potato-rot party would have.”—Encouraged by its brilliant initiation into state politics, the order began preparations for a campaign as a national party in 1856, hoping for support from all who were tired of agitation either for or against slavery. Instead of this it aimed to introduce opposition to aliens and Catholicism as a national question. Leading Catholics were brought to bay in public controversies, the persecutions in all countries by the Catholic church were recounted, special denunciations were leveled at Bedini, the “pope's nuncio,” and Americans were warned that the inquisition would “kindle the fires of the holy *auto da fe* on the high places of our republic, and deluge our blooming plains with American blood.” The hollowness of this effort to escape the inevitable conflict, ostrich-fashion, became evident in the party's first and only national convention, into which the dreaded slavery question at once forced its entrance. Feb. 19, 1856, a secret grand council of delegates met at Philadelphia and after a stormy session of three days adopted, Feb. 21, a platform in sixteen propositions, the principal being as follows: (3) “Americans must rule America: and to this end native born citizens should be selected for all state, federal and municipal offices. (9) A change in the laws of naturalization, making a continued residence of twenty-one years necessary for future citizenship. (12) The enforcement of ‘all laws’ until repealed or decided unconstitutional. (13) Opposition to Pierce's administration for its expulsion of ‘Americans’ from office, and its reopening sectional strife by repealing the Missouri compromise. (15) That state councils should abolish their degrees, and substitute a pledge of honor to applicants for admission.”—The party, thus dropping a part of its secret machinery, hoped to gain votes in the north by denouncing the administration, and the Kansas-Nebraska bill, in the south by upholding the fugitive slave law, and in both sections by substituting nativism for slavery agitation. The open nominating convention met the following day, Feb. 22, with 227 delegates, Maine, Vermont, Georgia and South Carolina, being unrepresented. About 50 delegates were “north” Americans, of republican, or anti-Nebraska, sympathies, and these offered a resolution denying the power of the secret grand council to bind the convention by a platform. This was negatived, 141 to 59, and by 151 to 51, a ballot for candidates was ordered. Many of the “north” Americans then withdrew. After one informal ballot, Millard Fillmore was nominated, on the first formal ballot, as follows: M. Fillmore, 179; George Law, 24; Kenneth Rayner, 14; John McLean, 13; Garret Davis, 10; Sam.

Houston, 3. Necessary to a choice, 122.—By a vote of 181 to 24 for all others, Andrew Jackson Donelson, of Tennessee, was nominated for vice president, and the convention adjourned. Its nominations were adopted, "without adopting or referring to the peculiar doctrines of" the American party, by a whig national convention at Baltimore, Sept. 17.—The preliminary state elections of 1856 were by no means discouraging for the American party. In New Hampshire and Rhode Island its governors were renominated and elected in the spring, so that eight of the thirty-two states now had American governors. The presidential election in November, however, showed that in national matters the party had indeed none of the "elements of persistence." In New Hampshire, in March, 1856, the vote had been 32,119 American, 32,031 democratic, 2,360 whig; in November of the same year it was 38,345 republican, 32,789 democratic, 422 American. The first wave of the republican tide from the west had washed nativism almost out of New England. The American (popular) vote was 874,534 in a total of 4,053,967; and its total electoral vote was 8 out of 296, the vote of Maryland.—In the state elections of 1857 the American party carried Rhode Island and Maryland, and in the 35th congress, which met in December, 1857, it had from 15 to 20 representatives and 5 senators. When the 36th congress met in 1859 it had become almost entirely a border state or "south" American party, having 2 senators, one each from Kentucky and Maryland, and 23 representatives; as follows: Kentucky 5, Tennessee 7, Maryland 3, Virginia 1, North Carolina 4, Georgia 2, and Louisiana 1, (see BORDER STATES). In 1860 (see CONSTITUTIONAL UNION PARTY) it made another desperate effort to save the country by ignoring slavery agitation, and, having failed to carry the south, disappeared finally from politics.—The existence of a secret and oath bound party was always an anachronism in an age and country where free political discussion is allowed. But the short lived organization introduced many young men to politics, who would have found no opportunity in the other parties, and served to delay in some degree the inevitable conflict until the adverse elements had fully come to a head. (See WHIG PARTY; ANTI-MASONIC PARTY, II.; UNITED STATES.)—See *Sons of the Sires* (anon.); 2 *Wilson's Slave Power*, 419-434; *Principles and Objects of the American Party* (anon.); *Wise's Seven Decades*; O. A. Brownson's *Essays and Reviews* (art. *Native Americanism*); Godwin's *Political Essays*; 2 von Holst's *United States*, 523; 3 Seward's *Works*, 386-389; Bromwell's *Immigration*, 157; Knapp's *Immigration*, 228-30; *Tribune Almanac*, 1844-6, 1855-7; Clay's *Private Correspondence*, 497-520; Carroll's *Great American Battle*; Lee's *Origin and Progress of the American Party*; Whitney's *Defense of the American Policy*; Warner's *Liberties of America*; Denig's *Know-Nothing Manual*; and later authorities under WHIG PARTY. The acts of March 26, 1790, Jan. 29, 1795, and June 18, 1798, (see ALIEN AND SE-

DITION LAWS), are in 1 *Stat. at Large*, 103, 414, 566; the act of April 14, 1802, is in 2 *Stat. at Large*, 153. Slight amendments have been made to the last named act but without essentially changing it. By the act of March 3, 1813, (2 *Stat. at Large*, 811), five years' residence was required before admission; but this was repealed by act of June 26, 1848, (9 *Stat. at Large*, 240).

ALEXANDER JOHNSTON.

AMERICAN WHIGS (IN U. S. HISTORY), the first American political party. Of the two English parties during the years 1763-75, the tories upheld the principle of passive obedience to the crown, while the whigs aimed to "fight up against the king and against the people." Neither pretended to uphold "the people" as a political force. When George II., abandoning the direct assertion of royal prerogative, but still aiming to exert it indirectly through a purchased parliament as his instrument, attempted to ignore or subvert the legislative bodies in America, those Americans who had the political wisdom to see that they were contending against the king under the mask of parliament naturally preferred the name of American whigs. Its first appearance seems to have been in New York city in 1768. When the king declared his American subjects out of his allegiance, and they consequently declared their independence of him, the name whig became synonymous with that of patriot, while that of tory was given to the American supporters of the crown. After the peace the whigs, having banished the most prominent tories, and confiscated their estates, remained the only party in America until the question of a closer union divided Americans into federalists and anti-federalists. (See DECLARATION OF INDEPENDENCE, ANTI-FEDERAL PARTY.)—See 6 Bancroft's *United States*, 141. A. J.

AMES, Fisher, was born in Dedham, Mass., April 9, 1758, and died there July 4, 1808. He was graduated at Harvard in 1774, was admitted to the bar in 1781, and was a member of the house of representatives 1789-97. In politics he was a federalist, and his ability made him one of the leaders of his party. In eloquence he seems to have held the first rank in the first four congresses. As an instance, it is said that, at the conclusion of his speech in favor of the execution of Jay's treaty, in 1796, the opponents of the treaty secured an adjournment in order to neutralize if possible its influence on the wavering. Failing health removed him from politics, in 1797. (See JAY'S TREATY, FEDERAL PARTY.) His works have been collected in two volumes.—See Ames' *Works of Fisher Ames*; 1 Benton's *Debates of Congress*. A. J.

AMISTAD CASE, The (IN U. S. HISTORY). June 27, 1839, the schooner *L'Amistad* left Havana for Puerto Principe, with a cargo of slaves, fresh from Africa. The slaves, at the first oppor-

tunity, rose in revolt and killed the whites except two, whom they reserved to navigate the vessel to Africa. The two white men gradually altered the ship's course so that, in August, she was off Long Island, New York, where she was seized by a United States war vessel, and sent into New London. Mr. Calderon, the Spanish minister, in the absence of an extradition treaty, asked the surrender of the ship and cargo as an act of international comity, and president Van Buren, supported by the advice of the attorney general, was determined to grant the request on the ground that the slaves were "property rescued from pirates," which Spain and the United States, by the treaty of Oct. 27, 1795, had agreed to mutually restore. Counsel for the slaves contended that even by the Spanish law, they were free men, having been illegally carried into slavery from Africa. The case first came on in the district court, and the administration was so confident of the result that a vessel was ordered to New Haven to convey the blacks to Cuba. But the abolitionists, throughout the country, took an intense interest in the case, secured counsel, and gained a verdict in the district court. The district attorney then appealed to the circuit court, and thence to the supreme court, which gave final judgment, March 9, 1841, that the blacks, having been kidnaped from a foreign country, were not bound by treaties with Spain, but were free men. The case in the supreme court was distinguished by the argument of John Quincy Adams in favor of the blacks.—The case is in 15 *Peters*, 518, (14 *Curtis*, 156); 3 *Opinions of the Attorneys General*, 484; 10 *Adams' Memoirs of John Quincy Adams*, 398; 2 *von Holst's United States*, 321. The treaty of 1795 is in 8 *Stat. at Large*, 138; art. 9, p. 142, is the one specially referred to. See Barber's *History of the Amistad Captives*. A. J.

AMNESTY. Amnesty is the reproduction of a Greek word, *ἀμνηστία*, the literal meaning of which is forgetfulness. This is also the true meaning of the English word. To grant an amnesty is not to forgive or pardon; it is to forget. Amnesty preserves a character of generality, and of absolute remission which no other form of clemency implies. Thus the right of amnesty is the broadest privilege of victory and power. Amnesty has frequently to deal more with the treachery of fortune than with the faults of men. Thrasylbulus, after having driven out the thirty tyrants of Athens, had a law passed by the people, called the law of forgetfulness, *ἀμνηστία*, which forbade the troubling of any citizen on account of past acts. This example sustains our definition and marks clearly the sense and bearing of the word. After a struggle or conflict and especially after civil convulsion, when victory has pronounced in favor of a person or a party, when the vanquished have laid down their arms and hatred has left the battle-field to take refuge in the breasts of men, clemency is sometimes called on to finish the work begun by proscription, and

the scaffold; and that which was obtained neither from the rigor of persecution nor the terror of torture is obtained by an amnesty which appeases minds, cicatrizes wounds, and lulls vengeance to sleep.—Amnesty, emanating always from the will of man or of a political body, has no fixed rules. It varies according to the character or interest of the grantor, or the circumstances inspiring it. It is general or particular, absolute or conditional. It is general when it comprises a whole class of offenses, and makes no exception of persons. It is particular when it excludes a whole class of individuals judged unworthy of it. It is conditional when it subjects the people it has in view to the performance of certain conditions. It is absolute when it imposes no conditions. We will cite a few cases of the different kinds of amnesty which we have just named. One of the most celebrated amnesties is that mentioned in the treaty of Passau. Not only was it general and absolute, but it seems that after having amnestied the combatants it was desired to amnesty the war itself. It called the brilliant campaigns of Maurice de Saxe, simply "military exercises." The thirty years war brought to a close by the treaty of Münster was also followed by an amnesty called full and entire, but the execution of which met with many difficulties.—When Charles II. re-ascended the throne, he declared a general amnesty without restriction, but parliament interfered, and the majority, more royalist than the king, excepted the judges who had condemned Charles I. This regrettable exception, as is known, was made a pretext for fearful reprisals. But there is a still bloodier page in the history of amnesty. Sincere in appearance, but serving in reality to cover the most abominable designs, the amnesty granted to the Huguenots, in 1570, was an odious snare and paved the way for the massacre of St. Bartholomew.—A few facts more: In 1413 a truce was made between the Armagnacs and the Bourguignons under the name of *letters of abolition*. It was an amnesty intended to efface the whole of a bloody past. A century later, at Bordeaux, an amnesty followed the repression of seditious movements which had taken place in the city. In 1536, 1560, and 1572, in consequence of various episodes in religious wars, amnesties were accorded, guaranteeing to the conquered heretics life and possession of their property.—In 1749 an insurrection broke out at Lyons. The question was about a regulation of the council of wardens. The acclamation of the working class was answered by musket shots. The whole population rose up, sustained and excited, even by the women. The armed force was driven from the city. The conquerors executed justice on the unlucky regiment, the original cause of the trouble. The case was a grave one; the precedent perilous. Yet clemency prevailed, and to proportion it to the importance of the occasion the form of a general amnesty was given it.—It is not by facts alone that the distinctive characteristics of an amnesty are revealed. They are indicated and

commented upon in the writings of the lawyers of the time. "The king," says Rousseaud de Lacombe, "accords sometimes *letters of abolition* to a city, a province, a community, for deeds or crimes committed against the interests, the order, or the will of the king, or against the royal authority; this pardon is called an amnesty," and he adds: "It is necessary to follow blindly whatever is ordained by the letters and decisions containing the amnesty or *abolition*."—Almost all the governments which have succeeded each other in France since the revolution of 1789 have had recourse to amnesty with a view to peace and concord; but the crises were so near each other, hatred so pertinacious, passions so hot, that the conqueror almost always sacrificed some victim to his safety or his rancor. There are exceptions to almost all amnesties. In 1814 the restoration recoiled even before this measure. It was replaced by article 11 of the constitutional charter, declaring that no man could be prosecuted for his political opinions. Napoleon was bolder on his return from the island of Elba. After declaring all who had assisted in overturning the imperial throne state criminals, he granted them a full and complete amnesty, from which were excepted only 13 of the most guilty. This example of partial and restrictive amnesty was imitated at the second restoration. Published only on Jan. 12, 1816, this new amnesty did not include a certain number of prominent persons, among whom it will suffice to mention Ney, Labédoyère and Lavalette. The men who had voted the death of Louis XVI. were proscribed, and the power was reserved of banishing from the kingdom in the space of two months, certain suspected persons, among the number Soult, Bassano, Vandamme, Carnot, Hulin, Merlin and others. This was mingling many an irritating souvenir with a measure the real meaning of which is forgetfulness (amnesty).—To whom belongs the right of granting amnesty; and how may different political constitutions, modify the exercise of that right? These questions we shall examine now.—It is of the essence of this right to belong to the sovereign. Simple as this rule is when the sovereignty is one and absolute, its interpretation may vary greatly if the sovereignty is limited or divided. Under the ancient monarchy of France, for instance, when the king desired to grant an amnesty, he sent the *letters of abolition* to be registered, and we do not think that any parliament would have allowed itself to remonstrate on this subject. Even the quotation from Rousseaud de Lacombe made above, shows how free this law was from restriction.—It has been the same wherever the same form of government has existed.—In republics this right has passed to the sovereign assembly which retains and defends it against the claims of the executive, which sees with good reason in this power the index and the means of preponderant powers. France has witnessed the spectacle of this struggle on two memorable occasions which we need to recall because

the distinction between pardon and amnesty was clearly established on both occasions. According to article 16 of the senatus-consultum of the 15th thermidor, year X., the first consul had only the right to pardon. The power of granting amnesty had not been given him. Napoleon wished that this anomaly should disappear.—Article 57 of the law of April 22, 1815, an addition to the constitution of the empire, was thus worded: The emperor has the right of pardon even in correctional matters, *and of granting amnesties*. In 1848, at the time of discussing the articles of the constitution, the project drawn up by the commission was worded thus: Amnesty can be accorded only by a law. M. Ayllies proposed an amendment, that the words, "On the propositions of the president of the republic" be added. This amendment was opposed in the name of the commission by M. Dupin. He maintained that the power left the president of anticipating the assembly in proposing an amnesty was enough of a prerogative. The constitutional assembly rejected the amendment. The wording of the commission was retained. Article I., of the senatus-consultum of Dec. 25, 1852, is thus worded: The emperor has the right to pardon and grant amnesties. The charter of 1814 was silent on the question of amnesty, and we have seen that article 11 had in view the effacement of the political past of all citizens. Under the régime established in 1871, the right of amnesty in France, is reserved to the national assembly. Certain political casuists have asked, not without some puerility, what are the signs by which the claims of a new power to the right of amnesty are to be recognized, and who is to be the judge if the terms of the act are not sufficiently clear? This double question will remain long unanswered if it is to be examined aside from accomplished facts. A. HÉBRARD.

AMNESTY (IN U. S. HISTORY). I. Dec. 8, 1863, president Lincoln issued his first proclamation of amnesty. It was based upon the president's constitutional power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment. Congress had authorized such a proclamation by act of July 17, 1862. The proclamation offered a full pardon and restoration of property rights, except in slaves and in cases where rights had accrued to third parties, to all, with the exceptions hereafter given, who would take and keep the following oath: "I ———, do solemnly swear, in presence of almighty God, that I will henceforth faithfully support, protect and defend the constitution of the United States, and the union of the states thereunder; and that I will, in like manner, abide by and faithfully support all acts of congress passed during the present rebellion with reference to slaves, so long and so far as not repealed, modified, or held void by congress, or by decision of the supreme court; and that I will, in like manner, abide by, and faithfully support all proclamations of the president, made during the existing rebellion,

having reference to slaves, so long and so far as not modified or declared void by decision of the supreme court. So help me God."—The following classes of persons were excepted: civil or diplomatic officers, army officers above the rank of colonel, and naval officers above the rank of lieutenant, in the confederate service, all who had left judicial stations or seats in congress, or had resigned commissions under the United States, to aid the rebellion, and all who had treated federal colored soldiers or their officers otherwise than lawfully as prisoners of war. March 26, 1864, a supplementary proclamation explained that the first proclamation was not intended to embrace prisoners of war.—II. May 29, 1865, president Johnson issued a proclamation offering amnesty, as in president Lincoln's first proclamation, to those who would take and keep the following oath: "I, ———, do solemnly swear, or affirm, in presence of almighty God, that I will henceforth faithfully support and defend the constitution of the United States and the union of the states thereunder, and that I will, in like manner, abide by and faithfully support all laws and proclamations which have been made during the existing rebellion with reference to the emancipation of slaves. So help me God."—In addition to the classes named in the proclamation of Dec. 8, 1863, the following classes were excepted: all foreign agents of the confederate states, graduates of West Point or Annapolis in the rebel army, governors of states in rebellion, deserters, privateersmen, Canada raiders, prisoners of war, persons worth over \$20,000, and persons who had already taken and broken the oath required. Persons in the excepted classes were to make special application for pardons. A bill to repeal the act of July 17, 1862, above mentioned, was passed by the house Dec. 3, 1866, and by the senate Jan. 7, 1867, and became a law through the president's failure to sign or veto it. He preferred to treat the original act and the repealer as nullities, trenching on the president's constitutional pardoning power.—III. Sept. 7, 1867, president Johnson issued another proclamation of amnesty. It recited the substance of former proclamations, including that of April 2, 1866, declaring the rebellion at an end, offered full amnesty to all who would take and keep the oath, above given, substituting "late" for "existing" in describing the rebellion, and excepted the following classes, "and no others": the president, vice-president, and heads of departments of the confederate government, its foreign agents, military officers above the grade of brigadier general, naval officers above the grade of captain, governors of states, all who had unlawfully treated prisoners of war, all legally held in confinement, and all parties to the assassination of president Lincoln.—IV. July 4, 1868, by proclamation, president Johnson offered full pardon and amnesty for treason, with restoration of property rights, except as to slaves and confiscated property, to all except those who might be under indictment or presentment in any federal court. No form of

oath was prescribed.—V. Dec. 25, 1868, by proclamation, president Johnson, by virtue of the power and authority in him vested by the constitution, proclaimed and declared unconditionally and without reservation, a full pardon and amnesty for treason to all who directly or indirectly participated in the rebellion, without the formality of any oath (see RECONSTRUCTION).—VI. By the 3rd section of the 14th amendment, which was declared in force July 28, 1868, disability to hold office was imposed on those who in higher positions had engaged in rebellion, with permission to congress to remove such disability. After the disability of many persons had been removed by acts of congress applicable only to individual cases, the act of May 22, 1872, removed the political disability of all persons except those who had engaged in rebellion, having been members of the 36th or 37th congresses, officers in the judicial, military or naval service of the United States, or heads of departments or foreign ministers of the United States. An attempt in 1873 to make the removal universal failed.—See Appleton's *Annual Cyclopædia* (1861-73), McPherson's *Political History of the Rebellion and History of the Reconstruction*. For the successive proclamations above referred to, see (I.) Dec. 8, 1863, and March 26, 1864, 13 *Stat. at Large* (38th cong.), appendix 1, vii, xi; (II.) May 29, 1865, McPherson's *History of the Reconstruction*, 9; (III.-V.) Sept. 7, 1867: July 4, and Dec. 25, 1868, 15 *Stat. at Large*, 699, 702, 711. The act of July 17, 1862, is in 12 *Stat. at Large*, 589 (§13); the act of May 22, 1872, is in 17 *Stat. at Large*, 142. ALEXANDER JOHNSTON.

ANAM, Empire of. (See COCHIN CHINA.)

ANARCHY. According to the etymology of the word, anarchy would mean absence of all government, of all political authority; but in evil as well as in good, the mind may conceive an extreme limit which can scarcely be ever attained in reality. Therefore history does not present, perhaps, a single complete example of anarchy, in which each individual was found in full and entire independence of all external authority.—Since sociableness is one of the essential characteristics of man, we find in every movement tending to disintegrate society, elements of one or more new associations; and from the moment that through one cause or another a government is overthrown, if it is not replaced by a new one, the citizens group themselves in fractions more or less numerous around an authority which springs up because of the situation. Instability of public power is the peculiar mark of anarchy, whether governments embracing the whole of the country but representing different ideas rapidly succeed one another, or whether the nation is divided into several fragments hostile to one another. This state of things may appear all at once and sometimes when it is least expected, but the causes of the evil are almost always of remote origin, and should be carefully distinguished from the accidents which de-

termine the outbreak.—The existence of a political society implies a common object, and as soon as the members of such a society have ceased to agree on the object or the means of attaining it, we may say that the germ or commencement of anarchy is present. Anarchy, then, exists long in the minds of men before it reveals itself in facts, and it may be referred to two principal causes: disagreement in beliefs or opinions and antagonism of interests.—These two causes operate almost simultaneously; but even when it is the principal motive of the fomenters of anarchy, interest, if not altogether concealed, is generally relegated to an inferior place, for men when acting collectively make it a point to rise, at least in appearance, above the level of vulgar interests, for which they are willing to sacrifice so much individually, and to connect the cause for which they are struggling with some great principle in politics, morality, or religion.—In republics, the ambition of citizens who wish to get possession of supreme power, and in monarchies the ambition of princes who can come to the throne only through change in the regular order of succession, have more than once been the apparent cause of anarchy; but if a close examination is made, it will be seen that these ambitious persons merely profited by the disagreements of people, or by an antagonism of interests, and that there was in the condition of the country a greater cause of anarchy, the effects of which were merely rendered more speedy and intense by the personal action of these ambitious men. It is the same, to a certain extent, with the weaknesses inherent in every political constitution; they do not become stumbling blocks until men cease to understand each other.—Nevertheless there are some of these weaknesses which may be considered as a sure cause of anarchy, for the reason that, at a given moment, they are certain to lead to serious differences among the citizens of a state. Very large states contain in themselves the germs of anarchy, on account of the almost absolute impossibility of keeping so many diverse interests in harmony for any great length of time, and of establishing between the inhabitants of countries long strangers to one another the community of ideas necessary to preserve a sufficient force of cohesion between all the different parts of such an empire.—In case anarchy arises from the abnormal territorial extension of a state, it is often the prelude to a social dissolution, but there are other cases in which it comes solely from a too rapid transformation of the conditions of existence of a political society. Then instead of coming peacefully, progress is made amid profound convulsions caused by the struggle between old and new ideas.—No matter what the conditions of its appearance, anarchy is always a great evil. Not only does it decrease the security of person and property, if it does not annihilate them altogether, it also destroys confidence, dries up the sources of labor; and the misery it produces renders men the victims of evil passions and more accessible to the influences of faction; but the many sufferings it causes in-

dividuals and the trouble which it introduces into the economy of society, are generally of less significance than the disturbances which it produces in the moral order. Men are thus subjected to trials from which they rarely come forth with any advantage to themselves. In times of anarchy we witness some rare examples of political virtue, of civil courage and moral force, but at the same time a multitude of facts calculated to injure the public conscience. In the fever which seizes on all minds, notions of good and evil, of the just and the unjust, become obscured. Everything is judged and decided with the blindness and rage of passion. Lassitude and disgust are certain to follow this state of violence, and the necessity of calm, order and repose becomes so imperative that it almost always leads to revolutions fatal to public liberty. Happy the people whose liberties do not totally perish in these fatal crises, and who look for safety to a power intelligent enough to know how properly to limit the dictatorial authority with which general confidence has invested it.—The means of preventing or putting an end to anarchy necessarily vary according to an infinity of circumstances, and it is the great art of the statesman to discern those best adapted to the time and to the character of the nation; but in many cases it is with anarchy as with acute diseases, where nature and time do more to cure the patient than the skill of the physician.—May not anarchy which is a very great evil, become a very great good? Such is the question raised by a celebrated writer, M. Proudhon, and he did not hesitate to answer it in the affirmative. If we understand him aright, the *an-archy* of M. Proudhon is nothing but self-government carried to its extreme limits, and the last step in the progress of human reason. According to him, men will at last acknowledge that, instead of disputing and fighting over questions of which, in the majority of cases, they know nothing, and instead of seeking to enslave each other, they would do better to accept the law of labor frankly and join hands to triumph over the numerous obstacles which nature opposes to their well-being. In this new order of things, nations would be nothing more than groups of producers bound together by close ties of common interest. Politics, as hitherto understood, would have no further *raison d'être*, and *an-archy*, that is to say, the disappearance of all political authority, would be the result of this transformation of human society in which all questions to be solved would have a purely economic character. Long ago J. B. Say advanced the opinion that the functions of the state should be reduced to the performance of police duties. If so reduced there would be but one step needed to reach the *an-archy* of M. Proudhon—suppression of the police power.

L. FOUBERT.

ANCIEN RÉGIME. The *ancien régime*, the old régime, might be defined feudalism in its decrepitude. So long as feudalism was a living-

reality, so long as it constituted a form of government, the people who were oppressed by it more or less, endured it as a necessary evil. They thought, perhaps, that the social order in which they were living, was the condition natural to man. But when gun-powder, the printing press, the discovery of America, and a thousand other inventions and discoveries, had raised the intellectual level of a great number of men and formed a class of citizens well-to-do and enlightened; when the concentration of political power in the hands of a sovereign had lowered his vassals to the rank of subjects, undistinguished from the masses except by a vain title, sometimes humiliating and sometimes detrimental to others, sentence of condemnation was passed on feudalism. The object of the revolution of 1789, was to wipe it out entirely.—It was because the ancient political and social condition of things was destroyed at a single blow, and because the change was brusque, that the term *ancien régime* came into use. If, in France, as elsewhere, the abuses had disappeared one by one, in an almost imperceptible manner, the contrast between the past and the present would have been less striking, and there would scarcely have been occasion to say anything about it. The middle ages had been replaced in other countries than France by the modern era, but in them the transition was made without conflict. The result was that hatred between the representatives of the *ancien régime* and the modern order of things is less profound in those countries or, at least, has not had time to manifest itself in violence.—The idea entertained at present, by the masses of the *ancien régime* is vague enough. It appears to them as a mist filled with nobles and privileged priests, tithes, duties and services, and with a number of other disagreeable things. The *ancien régime* is at present a scarecrow made use of in France, by parties, to influence ignorant minds. Enlightened men know that it is forever dead, and that it was but a corpse when the revolution buried it for all time. Humanity never retraces its steps.

MAURICE BLOCK.

ANDORRA, Republic of. A small independent state situated on the southern slope of the Pyrenees between the French department of Ariège and the Spanish province of Lerida, having an area of 450 to 460 square kilometres, with a population of about 12,000. The republic of Andorra (Val d'Andorre) is under the protection of France which divides the suzerainty with the bishop of Urgel, in Spain, who exercises episcopal jurisdiction, assigns priests to the parishes, names one of the provosts and receives 450 francs yearly. France appoints the other provost and (alternately with the bishop of Urgel) the civil judge. A tribute of 960 francs is paid to France, but in return the republic enjoys certain customs-privileges.—The government of the republic is carried on by the sovereign council, the 24 members of which are elected for life by the

citizens. The council is presided over by a syndic, elected also for life by its members. The syndic is charged with executive power; the provosts and the civil judge with the administration of justice. The provost named by France must belong to the department of Ariège. The term of office is not fixed. The term of office of the provost appointed by the bishop of Urgel lasts only three years. He must be a citizen of Andorra.—The revenues of the republic are derived from rents from the communal pasturages, from personal and land taxes. As all officers are unsalaried these revenues are intended to discharge the tributes to France and the bishop of Urgel.—All citizens are obliged to bear arms and to come together at the summons of the provost to maintain order and public tranquillity.—See Dalmaude, Baquer, *Historia de la republica de la Barcelona*, 1849.

MAURICE BLOCK.

ANHALT. The duchies, formerly principalities of Anhalt, were 4 in number during several centuries. In 1793 the extinction of the line of Zerbst took place, in 1847 that of Köthen, and in 1863 that of Bernburg; so that now the line of Dessau has reunited all the country of Anhalt. The duchy of Anhalt forms a part of the German empire. (See GERMAN EMPIRE). It has an area of 869 English square miles with a population of above 213,565 according to the census of Dec. 1, 1875, mostly protestants. The duchies of Anhalt had even in the time of the Holy Roman empire a common diet, and their princes had formed a family compact stipulating for reciprocal rights of succession, and according precedence to the eldest among them. In 1848, these bonds became relaxed, each duchy constituted itself apart from the others, and provided itself with legislative chambers, on a democratic basis. But since 1850 certain democratic provisions were repealed and, on Nov. 4, 1851, an order of the duke of Anhalt Dessau, annulled the constitutional act of 1848. The old state of things changed somewhat by the orders of July 18, and Aug. 31, 1859, has been reestablished, and these orders combined with the family pact of 1635, make up the constitution of the duchy.—The duke who enjoys the title of highness (*hoheit*) possesses all political power, but he enacts laws only with the concurrence of the estates whom he consults also in other important affairs.—The assembled diet is composed of 36 members. Of these 12 represent the nobility and great land-holders, 12 the towns and 12 the rural population. The representatives of the nobility are elected for life by their peers. The 12 deputies from the towns are the mayors of the 4 chief towns, and 8 common councilmen, elected for 6 years from among all the municipal bodies. The country members are chosen also for 6 years by the village mayors (*schulze*), either from their own body or among the rural proprietors.—To be eligible a person must be at least 30 years old, profess the Christian religion, have civil and political rights, and have lived in the country at

least 3 years. The diet assembles at least once in 3 years. Its sessions are not public. During the intervals between the sessions, business is done by a permanent committee of 9 persons elected by the diet. This committee is assisted by 2 jurists.—Municipal administration (law of March 1, 1852,) accords to the communes the right of self-government under the supervision of the state. The communes are represented by a municipal body, composed in the towns of a burgomaster, and in the villages of a mayor (*schulze*), assisted by a common council and, in important affairs, by an assembly of communal delegates. The burgomaster and the common councilmen of towns are elected for 12 years. The delegates of communes, the mayors and the common councilmen of villages for 6 years. The local police is generally under the burgomaster or the *schulze*, but in the neighborhood of the great estate of a nobleman, or a public domain, the proprietor of that estate or the farmer of the domain, may be charged with it.—The internal finances of the duchies of Anhalt, both in income and outgo are about 2,213,000 thalers.—The debt of the duchy in 1879 amounted to 7,445,417 marks.—The army of Anhalt is assimilated to that of Prussia. The contingent is one man out of a hundred, not including the landwehr.—Agriculture, the raising of cattle, the forests and mines (iron, silver, lead, coal) are the chief sources of wealth.—A number of hands are employed in woolen and linen industries. Commerce is relatively important, the transportation of merchandise is facilitated by the navigation of the Elbe and the Saale and by about 85 kilometres of railroad. The bank of Dessau has a capital of 4,000,000 thalers. The central bank of Germany 50,000,000, the institution of credit for industry and commerce, at Dessau, a capital of 8,000,000. These establishments are a proof of great commercial activity.

M. BLOCK.

ANNEXATION (IN GENERAL). If this word has any political meaning, it can only be applied to acquisition of territory without armed conflict. Annexation differs, therefore, from conquest, but it is not always agreed to expressly, by the country annexed. In 1845 Texas requested to be annexed to the United States. In 1859 and the following years, certain Italian provinces consented to their annexation to the kingdom of Piedmont. In Germany, after the war of 1866, states were annexed to Prussia without any consultation with their inhabitants, and notwithstanding the minatory tendencies of Germany. The autonomy of these states was extinguished against the will of a part of their inhabitants. The war of 1870-71 seems to have had the effect of hastening assimilation.—The fate of annexed countries is merged in that of the state of which they form a part. Sometimes they are allowed to retain their legislation and previous structure, (Prussia); at other times, means are taken to hasten their fusion with the state to which they are annexed, into a

homogeneous whole, (Italy). Annexations do not seem to raise now, as they once did, questions of a grave international character. We might almost believe that nations had now become less jealous of each other. But in such matters there is no general rule. Each case admits of circumstances and therefore of consequences, and a solution peculiar to itself.

M. BLOCK.

ANNEXATIONS (IN U. S. HISTORY). By the treaty of 1783 "His Britannic Majesty acknowledges the said United States, viz, New Hampshire, Massachusetts-Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina and Georgia, to be free, sovereign, and independent states; that he treats with them as such; and for himself, his heirs and successors, relinquishes all claim to the government, propriety, and territorial rights of the same, and every part thereof." The nominal boundaries of many of the states, as constituted by their charters, extended to the Pacific ocean; but in practice they ceased at the Mississippi. Beyond that river the sovereignty, by discovery, settlement and active exercise, was vested in the king of Spain. Before the end of the eighteenth century all the territory west of the present boundary of the states above named had been ceded by them to the United States, (see TERRITORIES), and the Union consisted of the thirteen original states, with Vermont, Kentucky, and Tennessee, afterward admitted, and the territory (see ORDINANCE OF 1787) comprised within the limits of the Atlantic ocean, British America, the Mississippi river, Louisiana, the gulf of Mexico, and Florida. For these states and this territory the Union had been made. The objections to the extension of the Union, without the unanimous consent of the "original partners," are elsewhere given (see SECESSION, I.; UNITED STATES); only the successive processes by which the extension was accomplished will be considered at present.—I. LOUISIANA. One of the earliest physical problems with which American statesmen were called to deal was found in the position and necessities of the emigrants who had crossed the Alleghanies and were beginning to fill the valley of Mississippi. If they were to be permanently retained in the Union it was essential that some easier communication should be formed between them and the older states, and that they should not be annoyed by Spanish restrictions upon the free navigation of the Mississippi and its affluents. All through the closing hours of the revolution, Washington's attention was drawn to this question, and, in 1784, a tour to Pittsburgh and a personal examination of the Alleghanies convinced him that, by deepening the Potomac and the James on one side, and the head waters of the Ohio on the other, canal communication between the east and the west was possible. This scheme, which would have offered engineering difficulties then almost insurmountable, had gone so far as incor-

poration by Virginia and Maryland, when Washington reluctantly allowed himself to be withdrawn from it by the voice of the whole country to the presidency of the convention of 1787, and afterward of the United States.—It had long been the fixed policy of Spain to exclude all foreign commerce from the Mississippi. She had refused, in 1780–2, to make a treaty with the United States, the main reason for her refusal being Minister Jay's demand for the free navigation of the Mississippi. She had then even designed, as appears from one of Dr. Franklin's letters to congress, to confine the United States to the territory east of the Alleghanies, on the ground of a proclamation by the king of Great Britain in 1763, forbidding his North American governors to grant lands westward of the sources of the rivers falling into the Atlantic ocean. In July, 1785, when Don Diego Guardoqui, a *chargé d'affaires*, arrived at Philadelphia, the claims of Spain had been finally modified to the Floridas, all the west bank of the Mississippi, the east bank to a point considerably north of the present southerly boundary of the state of Mississippi, and an exclusive navigation thence to the mouth of the river. The commercial states of the north were anxious for a treaty of commerce with Spain even at the price of the abandonment of the interests of the western settlers, and Guardoqui refused a treaty on any other terms. Aug. 29, 1786, by a vote of seven northern to five southern states, the congress of the confederacy withdrew its demand for free navigation of the Mississippi, and before Oct. 6, their secretary of foreign affairs, Jay, had agreed upon an article by which the claim was suspended for twenty-five years, though not formally relinquished. But, while congress had been deliberating, a nation had been forming in the Mississippi valley; and the remonstrances, public and private, of its inhabitants were so emphatic, and in some instances so violent, that in September, 1788, congress in desperation relegated the whole subject to the new federal government, which was to assemble in March, 1789. Negotiations with Spain were dropped until February, 1793, when Messrs. Carmichael and Short again attempted, but in vain, to make a treaty. The year 1795 was more auspicious. Spain was exhausted by war with the French republic; her virtual ruler, Manuel Godoy, prince of the peace, was aware that hostile expeditions against New Orleans, under Genet's directions, had, in 1793, with difficulty been suppressed by the federal government, (see GENET, CITIZEN), and, Oct. 27, 1795, Thomas Pinkney, envoy extraordinary, succeeded in negotiating a treaty of friendship, boundaries, and navigation. Its important features, in this connection, are in the fourth and twenty-second articles:—Art. 4. * * * * * “And his Catholic majesty has likewise agreed that the navigation of the said river (Mississippi), in its whole breadth, from its source to the ocean, shall be free only to his subjects and the citizens of the United States, unless he should extend this privilege to the subjects of other

powers by special convention.—Art. 22. And, in consequence of the stipulations contained in the fourth article, his Catholic majesty will permit the citizens of the United States, for the space of three years from this time, to deposit their merchandises and effects in the port of New Orleans, and to export them from thence without paying any other duty than a fair price for the hire of the stores; and his majesty promises, either to continue this permission, if he finds during that time that it is not prejudicial to the interests of Spain or, if he should not agree to continue it there, he will assign to them, on another part of the banks of the Mississippi, an equivalent establishment.”—With this article, when it was some three years later, honorably executed, the people of the west were fairly satisfied.—By the third article of the secret treaty of St. Ildefonso, Oct. 1, 1800, in return for the erection of the kingdom of Etruria for the prince of Parma, the king of Spain's son-in-law, Spain “retroceded” to France the vast province of Louisiana, stretching from the source to the mouth of the Mississippi, and thence west to the Pacific (but see OREGON). It had belonged to France until the peace of 1763, when it was ceded to Spain in compensation for her losses during the war. By its retrocession the United States were now to be hemmed in between the two professional belligerents of Europe; and a great fleet and army, which sailed toward the end of the year 1801, ostensibly against St. Domingo, but ultimately intended to take possession of New Orleans, showed Bonaparte's design to revive there the colonial glories of the former French monarchy. April 18, 1802, president Jefferson wrote to Robert R. Livingston, minister to France, as follows: “The cession of Louisiana and the Floridas by Spain to France works most sorely on the United States. It completely reverses all the political relations of the United States, and will form a new epoch in our political course. There is on the globe one single spot the possessor of which is our natural and habitual enemy. It is New Orleans, through which the produce of three-eighths of our territory must pass to market. France, placing herself in that door, assumes to us the attitude of defiance, * * * * * (and) seals the union of two nations who, in conjunction, can maintain exclusive possession of the ocean. From that moment we must marry ourselves to the British fleet and nation, and make the first cannon which shall be fired in Europe the signal for tearing up any settlement she (France) may have made.”—The ferment in the west, caused by the retrocession of Louisiana, was increased by the orders of the Spanish *intendant*, Morales, issued Oct. 2, 1802, abrogating the right of deposit, without substituting any other place for New Orleans, as the treaty of 1795, above given, required. In congress James Ross, senator from Pennsylvania, introduced resolutions authorizing the president to call out 50,000 militia and take possession of New Orleans. Instead of this, congress appropriated \$2,000,000 for the pur-

chase of New Orleans, and the president, Jan. 10, 1803, sent James Monroe as minister extraordinary, with discretionary powers, to co-operate with Livingston in the proposed purchase.—Monroe found his work done to his hand. A new war between England and France was on the point of breaking out, and in such an event England's omnipotent navy would make Louisiana a worse than useless possession to France. April 11, 1803, Livingston, who had already begun a hesitating negotiation for the purchase of New Orleans alone, was suddenly invited by Napoleon to make an offer for the whole of Louisiana. On the following day Monroe arrived in Paris, and the two ministers decided to offer \$10,000,000. The price was finally fixed at \$15,000,000, one-fourth of it to consist in the assumption by the United States of \$3,750,000 worth of claims of American citizens against France. The treaty was in three *conventions*, all signed the same day, April 30, 1803, by Livingston and Monroe on one part, and Barbé-Marbois for France on the other. The first convention was to secure the cession, the second to ascertain the price, and the third to stipulate for the assumption by the United States of the claims above named. Its important articles in this connection are the first and third of the first convention, as follows: ART. 1. "*Whereas*, by article the third of the treaty concluded at St. Ildefonso, the 9th Vendémiaire, an. 9 (Oct. 1, 1800), between the first consul of the French republic and his Catholic majesty it was agreed as follows: His Catholic majesty promises and engages on his part, to retrocede to the French republic, six months after the full and entire execution of the conditions and stipulations herein relative to his royal highness the duke of Parma, the colony or province of Louisiana, with the same extent that it now has in the hands of Spain, and that it had when France possessed it; and such as it should be after the treaties subsequently entered into between Spain and other states; and *whereas*, in pursuance of the treaty, and particularly of the third article, the French republic has an incontestable title to the domain and to the possession of the said territory: The first consul of the French republic, desiring to give to the United States a strong proof of his friendship, doth hereby cede to the said United States, in the name of the French republic, forever and in full sovereignty, the said territory, with all its rights and appurtenances, as fully and in the same manner as they have been acquired by the French republic in virtue of the above mentioned treaty, concluded with his Catholic majesty. ART. 3. The inhabitants of the ceded territory shall be incorporated in the union of the United States, and admitted as soon as possible, according to the principles of the federal constitution, to the enjoyment of all the rights, advantages and immunities of citizens of the United States; and in the meantime they shall be maintained and protected in the free enjoyment of their liberty, property, and the religion which they profess."—The annexation of

Louisiana was the source of unbounded exultation to the president and his party. Its constitutionality was at once angrily attacked by the federalists, and never defended by Jefferson. He says, in a private letter: "The constitution has made no provision for our holding foreign territory, still less for incorporating foreign nations into our union. The executive, in seizing the fugitive occurrence which so much advances the good of their country, have done an act beyond the constitution. The legislature, in casting behind them metaphysical subtleties, and risking themselves like faithful servants, must ratify and pay for it, and throw themselves on their country for doing for them, unauthorized, what we know they would have done for themselves had they been in a situation to do it. It is the case of a guardian, investing the money of his ward in purchasing an important adjacent territory, and saying to him when of age, 'I did this for your good; I pretend to no right to bind you; you may disavow me and I must get out of the scrape as I can; I thought it my duty to risk myself for you.'" (For the amendment, which was to cover the case, see CONSTITUTION, IV.)—"The news of the transfer of Louisiana was like a thunder-stroke for the cabinet of Madrid, who then perceived the enormous fault it had committed in sacrificing the safety of Mexico. Florida, inclosed on both sides by the United States, was separated in the middle from the Spanish dominions, and would fall on the first occasion into the hands of its neighbors." It is supposed that, in addition to the non-fulfillment by Napoleon of essential points of the treaty of St. Ildefonso, that treaty had annexed a secret condition that France should not alienate Louisiana, and that Bonaparte had, as he frequently did in other cases, contemptuously disregarded it. It is certain that Spain refused with indignation to believe the first news of its alienation, filed a formal protest against it, and only consented to it at last after a course of unfriendly conduct, which, according to a report of a house committee in January, 1806, fully justified a declaration of war against her.—Ratifications were to be exchanged within six months from the date of the treaty, that is, before Oct. 30, 1803. The president therefore called an early session of congress for Oct. 17, and in two days the treaty was confirmed by the senate. In the house, Oct. 25, the resolution to carry the treaty into effect was passed, by a vote of 90 to 25, over the opposition of the federalists, who maintained the unconstitutionality of the annexation on the grounds assigned by Jefferson himself above. (See SECESSION, LOUISIANA.) The province of Louisiana added 1,171,931 square miles to the area of the United States, comprising Alabama and Mississippi south of parallel 31°; all Louisiana, Arkansas, Missouri, Iowa, Nebraska and Oregon; the entire territories of Dakota, Washington, Idaho and Montana; the state of Minnesota west of the Mississippi, and Kansas except the southwest part south of the Arkansas; Colorado and

the territory of Wyoming east of the Rocky mountains, and Indian territory.—II. FLORIDA. Until 1763 the eastern boundary of Louisiana was the river Perdido. When Great Britain in that year became the owner of that part of Louisiana east of the Mississippi she at once united it to Florida, and created two territories, east and west Florida, separated by the Appalachicola. By the fifth article of the treaty of 1783, "his Britannic majesty ceded and guaranteed to his Catholic majesty eastern and western Florida." Spain therefore claimed, and not without considerable appearance of reason, that she could not retrocede to France what France had not ceded to her in 1763; that Louisiana east of the Mississippi had disappeared from the map in 1763 and become a part of Florida, and that, when she retroceded "Louisiana" to France in 1800, she had no intention of ceding with it the separate territory of west Florida, acquired by her after 1763, from Great Britain. She had therefore retained Mobile, the key to the rivers of Alabama, and in its custom house levied heavy duties on goods to or from the upper country. The United States, however, claimed that, as Spain's retrocession and France's cession were, of "Louisiana, with the same extent that it had when France possessed it" (see treaty above) Louisiana's eastern boundary was now again the Perdido. To avoid war with Spain the claim was not forcibly asserted until 1810, when, the king of Spain being dethroned, and the cortes having been driven to the isle of Leon and dissolved, the hereditary government had to all appearances disappeared, and a large part of the people of west Florida, having met in convention at Baton Rouge, declared themselves independent and assumed the lone star as a symbol for their flag. Against the protests of the Spanish governor and of the British *chargé d'affaires*, governor Claiborne, of the territory of Orleans, was sent by the president to take possession of west Florida, and accomplished it, with the exception of the city of Mobile, late in 1810. In 1812 the Pearl river was made the eastern boundary of the state of Louisiana, and the rest of west Florida was annexed to Mississippi territory. In 1813 possession of the fort and city of Mobile, and of the whole of west Florida, was at last secured by general Wilkinson.—Through all this period the determination of the southern states to gain east Florida also had been rapidly growing. Acts of congress of Jan. 15, and March 3, 1811, passed in secret, and first published in 1816, had authorized the president to take "temporary possession" of east Florida. The commissioners appointed under these acts, Matthews, and his successor, Mitchell, both of Georgia, had stirred up an insurrection in the coveted territory, and, when the president refused to sustain the commissioners, the state of Georgia declared Florida necessary to its peace and welfare, and practically declared war on its own private account. Its expedition, however, resulted in nothing. In 1814

general Andrew Jackson, then in command at Mobile, having, by a raid into Pensacola, driven out a British force which had settled there, restored the place to the Spanish authorities and retired. In 1818, during the Seminole war, being annoyed by Spanish assistance afforded to the Indians, Jackson again raided east Florida, captured St. Marks and Pensacola, hung Arbuthnot and Ambrister, two British subjects who had given aid and comfort to the Seminoles, as "outlaws and pirates," and again demonstrated the fact that Florida was completely at the mercy of the United States. The Spanish minister at Washington therefore signed a treaty, Feb. 22, 1819, by which Spain ceded Florida, 59,288 square miles, to the United States, in return for the payment by the latter country of claims of American citizens against Spain, amounting to \$5,000,000. The ratification of Spain was only obtained in 1821, after an unsuccessful effort on her part to secure, as the price of it, the refusal of the United States to recognize the independence of the revolted Spanish-American colonies. By this treaty the western boundary of Louisiana was fixed as follows: "Beginning at the mouth of the Sabine in the gulf of Mexico; up the west bank of the Sabine to the 32nd degree of north latitude; thence north to the Red river; along the south bank of the Red river to the 100th degree of longitude east from Greenwich; thence north to the Arkansas; thence along the south bank of the Arkansas to its source; thence south or north, as the case might be, to the 42nd degree of north latitude, and along that parallel to the Pacific." As the price of Florida, therefore, the United States gave up the claim to Texas and the Rio Grande as its western boundary.—III. TEXAS. The inevitable result of the two previous annexations was the annexation of Texas. It had been persistently claimed before 1763 by Spain; and France, though claiming it as part of Louisiana, had made only a few futile attempts to colonize it. It had been one of the ultimate objects of the Burr conspiracy. During Wilkinson's hasty preparations to defend New Orleans against Burr in October, 1806, he had agreed with the Spanish commander upon the Sabine as a provisional boundary between the Spanish and American territory, and upon the consequent suspension of the American claim to Texas as part of Louisiana; and the treaty of 1819 above mentioned made this boundary permanent. Considerable opposition, of which resolutions offered by Henry Clay were an expression, was manifested against the "alienation" by treaty of soil to which the United States had a claim, but the annexation of Florida covered all dissatisfaction in the south, and when Mexico's revolt was successful, by the treaty of Cordova, Feb. 24, 1821, "Texas and Coahuila" became one of the states of the Mexican republic.—The Missouri struggle, (see COMPROMISES, IV.), had shown that the union of the two sections in the United States was as yet only factitious; that the operation of economic laws would inevitably drive immigra-

tion away from slave soil and toward the free territory of the northwest; and that, consequently, in the sectional race for the manufacture of new states and the control of the senate, the south was doomed to defeat if the Sabine remained as the boundary. Therefore, so early as 1821, the adventurous and lawless population of the southwest, under the direction or with the silent sympathy of far-seeing southern leaders, began systematic efforts to pierce the barrier of Mexican exclusiveness and effect an entrance into Texas. Under the guise of persecuted American Roman Catholics, enterprising men obtained land grants from Mexico and filled them with settlers who had at least as much reverence for Catholicism as for any other form of religion. Offers were made in 1827 and 1829 by Clay and Van Buren, successively secretaries of state, of \$1,000,000 and \$5,000,000 for Texas, but without effect. In 1835 Texas had grown so far in population that it disdained to be longer a part of Coahuila, and by convention, April 1, formed a Mexican state constitution of its own. In 1835 the Mexican congress abolished all the state constitutions, and created a dictator; and, March 2, 1836, Texas put into practice the doctrine of secession by declaring its independence of Mexico. After a brief war, marked by the inhuman Mexican massacres of Goliad and the Alamo, Houston, the Texan commander, with 700 men, met Santa Anna, the Mexican president, with 5,000 men, at the San Jacinto, April 10, and totally defeated him. Santa Anna, a captive and in mortal fear, was glad to obtain his freedom by signing a treaty which acknowledged the independence of the republic of Texas, but which Mexico naturally refused to ratify. In March, 1837, the United States, and, soon after, England, France and Belgium, recognized the new republic, which may thereafter be fairly considered independent, though never acknowledged as such by Mexico.—The finances of Texas early fell into extreme disorder. Her government had borrowed and expended so recklessly that borrowing would no longer avail, and its operations had almost come to a stand-still for sheer want of money. Under these circumstances annexation was as desirable to Texas as to the south, and in August, 1837, by her minister at Washington, Texas made application to the executive for membership in the United States. A proposition to that effect was introduced in the senate, by Preston, of South Carolina, and tabled by a vote of 24 to 14. The matter then rested for some years, and Texas, undisturbed by Mexico's continued refusal to recognize her, proceeded in the prodigal sale and distribution throughout the south and southwest of a vast mass of land warrants, whose owners were at once converted into advocacy of Texas and annexation. Jan. 10, 1843, Gilmer, member of congress from Virginia, in a letter to a Baltimore newspaper, eloquently appealed to the people to annex Texas in order to forestall Great Britain in so doing; and his appeal was seconded by the legislatures of various south-

ern states. From this time Texas annexation became a game, skillfully played in partnership by the southern politicians, who wished to increase the number of southern states, and the Texas land and scrip speculators, who wished to make their worthless ventures profitable. A letter was obtained from ex-president Jackson, March 12, 1843, warmly counseling immediate annexation. The democratic national convention was put off from December, 1843, until May, 1844, and in the interval Van Buren, the chosen candidate of the northern democracy, was formally questioned by letter as to his position on annexation. April 20, 1844, Van Buren declared against it, as also did Clay, the leading whig candidate, April 17. May 17, the democratic convention met at Baltimore, and as a preliminary adopted the rule of the conventions of 1832 and 1835, which has since been the rule in all democratic conventions, that a nomination should only be by a two-thirds vote. This made Van Buren's nomination impossible, and insured to the southern minority the ultimate choice of an annexation candidate. On the 8th ballot Van Buren was withdrawn, having fallen from 146 to 104 out of 266 votes, and on the next ballot Polk was nominated. Not only was the candidate strongly in favor of immediate annexation; the platform also warmly demanded the re-occupation of Oregon, and the re-annexation of Texas.—In the meantime, an annexation treaty had actually been concluded with Texas, April 12, 1844, by Calhoun, whom Tyler, in the course of his drift back toward the democratic party, had called into his cabinet (see ADMINISTRATIONS), as secretary of state, and who had declared his only object in the cabinet to be the annexation of Texas; but it was rejected by the senate by a vote of 16 ayes to 35 nays. This treaty fixed the western boundary of Texas, as Texas herself had done in 1836, at the Rio Grande, thus taking in the country between the Nueces and the Rio Grande, which had been settled by Spaniards since 1694 as the province of Coahuila, and had been peaceably in Spanish and Mexican possession ever since, though Texas had attempted some formal exercises of jurisdiction over it. In this disputed territory lay the germs of the Mexican war.—In the presidential election of 1844 votes were gained for Polk in the north by the demand for the re-occupation of Oregon, and by the cry of "Polk, Dallas and the tariff of 1842," (see TARIFF); but in the south the whole question turned on Texas, and "Texas or disunion" became a common toast. Polk's election was accomplished in part by the vote which the liberty party, (see ABOLITION, II.), threw away on Birney, which would have given New York and Michigan to Clay, and in part by indubitable fraudulent voting in Plaquemines parish, in Louisiana, which gave the vote of that state to Polk. Nevertheless, his success was taken as a popular indorsement of Texas annexation, and in the next session of congress the doubtful members hurried to join the popular side. Jan. 25, 1845,

a joint resolution was passed by the house, by a vote of 120 to 97, that "Congress doth consent that the territory properly included within, and rightfully belonging to, the republic of Texas, may be erected into a new state, to be called 'the state of Texas,' the consent being given on three conditions, 1st, that evidence of the formation of the new state should be sent to congress for final action on or before Jan. 1, 1846; 2nd, that the public property of the republic should be transferred to the United States; and 3rd, and most important, (see DRED SCOTT CASE, KANSAS-NEBRASKA BILL, COMPROMISES, V.), as follows: "Third: New states of convenient size, not exceeding four in number, in addition to the said state of Texas, and having sufficient population, may hereafter, by the consent of said state, be formed out of the territory thereof, which shall be entitled to admission under the provisions of the federal constitution; and such states as may be formed out of that portion of said territory lying south of thirty-six degrees thirty minutes north latitude, commonly known as the Missouri compromise line, shall be admitted into the union with or without slavery, as the people of each state asking admission may desire. And in such state or states as shall be formed out of said territory north of said Missouri compromise line, slavery or involuntary servitude, (except for crime), shall be prohibited." To some of the senators this formation of a new state out of territory which had never been formally annexed seemed utterly unconstitutional, and an amendment, prepared by senator Walker, of Wisconsin, was added, authorizing the president, if he should deem it advisable, to first make a treaty of annexation with Texas. The whole was then passed by a vote of 27 to 25, and agreed to by the house. No such treaty was ever made. Tyler leaped at the chance of ending his presidency with *éclat*, and on the last day of his term sent a special messenger who secured the unanimous assent, June 18, of the Texas congress, to annexation, which action was ratified, July 4, by a popular convention. A joint resolution was passed in the house, Dec. 16, 1845, by 141 to 56, and in the senate, Dec. 22, by 31 to 13, for the admission of Texas as a state, and its annexation was complete without the formality of a treaty. The power of annexation by treaty, which had been doubted, but exercised, in 1803, had thus been carried, in 1845, to annexation even without treaty, and both by the strict constructionist party. (For the further results see WILMOT PROVISIO, COMPROMISES, V.). The annexation of Texas added 376,133 square miles to the United States. — IV. NEW MEXICO, AND UPPER CALIFORNIA. These two pieces of territory had been conquered during the Mexican war, the former, (including Utah, Nevada, and a large part of Arizona, New Mexico and Colorado), by Kearney, and the latter by the navy under commodore Stockton and a small land force under Fremont, and both were held as conquered territory until the end of the war. From the

opening of hostilities, the acquisition, by force or purchase, of a liberal tract of Mexican territory as "indemnity for the past and security for the future," had been a principal object of the war, and at its close, by the treaty known as the treaty of Guadalupe Hidalgo, signed Feb. 2, 1848, by Mr. Nicholas P. Trist and three Mexican commissioners, and ratified by the senate March 10, the territory above named was added to the United States, the price being fixed at \$15,000,000, besides the assumption by the United States of \$3,250,000 in claims of American citizens against Mexico. The territory thus annexed, including that part of New Mexico east of the Rio Grande, which was claimed by Texas, and for which Texas was afterwards paid \$10,000,000 by the United States, added to the area of the United States 545,783 square miles. — V. GADSDEN PURCHASE. During the next five years disputes arose as to the present southern part of Arizona, the Mesilla valley, from the Gila river to Chihuahua. A Mexican army was marched into it by Santa Anna and preparations were begun for a renewal of war. By the Gadsden treaty, Dec. 30, 1853, so called from its negotiator, the United States, at the price of \$10,000,000, obtained the disputed territory, as well as a right of transit for troops, mails, and merchandise over the isthmus of Tehuantepec. By this annexation, 45,535 square miles were added to the United States. — VI. ALASKA. This territory, distant about 400 miles from the United States, and valuable only for its fur-bearing animals, was first claimed by Russia by right of discovery; and by right of possession of opposite shores, Siberia and Alaska, (or Aliaska), Russia also claimed the northern Pacific as a sort of inland water. By treaty of March 30, 1867, ratified by the senate in special session June 20, 1867, Russia ceded the whole of this territory, 577,390 square miles, to the United States for \$7,200,000. — Summary:

	Square Miles.
United States in 1783.....	827,844
Louisiana (1803).....	1,171,131
Florida (1819).....	59,268
Texas (1845).....	376,133
Mexican cession (1848).....	545,783
Gadsden purchase (1853).....	45,535
Alaska (1867).....	577,390
Total.....	3,603,884

The boundaries of the United States were established by art. 2 of the provisional treaty of Nov. 30, 1782, (8 *Stat. at Large*, 54), and by art. 2 of the definitive treaty of Sept. 3, 1783, (8 *Stat. at Large*, 80). — I. ANTI-FEDERAL PARTY (IN U. S. HISTORY). At the close of the revolution there was but one party in the United States, the American whigs. They had no organization and needed none, their former opponents, the loyalists or tories, having been banished, killed, or converted. The state legislatures had taken the opportunity offered by the confusion of the revolution to seize, by the articles of confederation, upon the powers which the king had abandoned, and which the national popular will was not yet sufficiently educated to assume (see CONFEDERATION, ARTICLES OF). In this interregnum and in this seizure all America had acquiesced, with the exception of a few advanced thinkers like Hamilton; and the mass of the population was entirely agricultural, democratic, particularist, devoted to the worship of their separate commonwealths, and disposed to look upon the central or federal government very much as they had but recently looked upon the king. The war practically ended in 1780, but a space of seven years is marked by great development in the United States. Before 1787, in spite of lawlessness and bad government, commerce and the commercial class had already reached respectable proportions, a distinct creditor class had been formed with capital to lend, and in the south property owners had learned their weakness and their needs. These three classes, uniting for the control of the convention of 1787, had really split off into a new party (see FEDERAL PARTY), leaving the mass of the people to their particularist prejudices.—As the old government had been strictly federal, or league, in its nature, it would seem natural at first sight that those who favored

its retention or modification should take the name of federalist, and Gerry, of Massachusetts, and a few others, made some efforts to secure this party title, and give their opponents that of anti-federalists or nationalists. But all parties were quick to perceive that the essence of the constitution was its creation of a strong federal government; and all who were opposed to this new and portentous appearance in American politics, all who considered the constitution fantastic, theoretical, and experimental, and a distant attempt to ape European monarchy, all the local magnates who feared to be overshadowed by the new central power, all the small farmers who dreaded the addition of federal to state taxes, at once accepted the name of anti-federalists and opposed the ratification of the constitution, in and out of the conventions.—In Rhode Island and North Carolina the opposition was successful, (see CONSTITUTION III.), but in the other states it was overcome. In Pennsylvania the anti-federalists protested that they had been unfairly treated. In the legislature, which was slightly federalist, the resolution for a state convention gave but ten days for the choice of delegates, thus cutting off the anti-federalists of western Pennsylvania from all chance to participate. To secure a longer interval of time, the opposition absented themselves, and left the house without a quorum, but two of their number were seized, carried into the house, and held in their seats while the quorum thus secured passed the resolution. In consequence, so the protest alleged, but 13,000 of the 70,000 voters in the convention, September 5, a separate anti-federalist convention at Harrisburgh demanded a second federal convention to revise the constitution.—Had the anti-federalists followed the concerted plan of ratifying the constitution *on condition* of its revision by a second federal convention, their general success could hardly have been prevented. But they saw fit to oppose ratification altogether, and, as the federalists were wise enough to yield to ratification on the "Massachusetts plan" of recommending amendments, stiff-necked opposition to the plan indorsed by Washington and Franklin resulted only in general failure and utter demoralization, for the time, of the anti-federal party. When the 1st congress met, the active, energetic and skillful federalist leaders secured control of almost every department of the new government, yielding to their opponents only the speakership of the house, the attorney generalship, and the state department.—But it must not be supposed that all who were classed as federalists in 1787-8 were really wedded to federalist doctrines as afterward developed by Hamilton. Every convention contained many delegates who, like Madison, Edmund Randolph, and R. R. Livingston, while opposed by nature to a strong federal government, were equally opposed by education and experience to the rickety rump which then figured as a congress, and to the articles of confederation which had stamped upon it its peculiar character. It

was natural that such delegates should urge ratification as an escape from present and pressing evils; Jefferson himself, who had at first pronounced against any constitution without a bill of rights, soon came to say—"It has my hearty prayers." But it was natural also that these men, when the constitution had been adopted, should aim at a construction of its terms which should not give the new government extensive power. The consequent divergence between real and temporary federalists became evident about 1791-3, when the latter again coalesced with the former anti-federalists under a new name (see **FEDERAL PARTY**). In 1793 Madison and Hamilton, who had made common cause in 1787-8, were already attacking one another in the newspapers, each significantly quoting his former associate's language in *The Federalist*.—Throughout the 1st congress the anti-federalists made but two essays at party contest. Their opposition to Hamilton's plan for settling the public debt (see **FEDERAL PARTY**) was defeated by Hamilton, assisted by Jefferson, (see **CAPITAL, NATIONAL**), and their opposition to his scheme of a national bank (see **BANK CONTROVERSIES**) was equally unsuccessful. They also very generally opposed the imposition of any higher duties on imports for the benefit of manufactures, but their opposition was without concert and without success. The first session of the 2nd congress has many symptoms of the revival of the anti-federalists as a popular and strict construction party. Their opposition to bounties to the cod-fisheries, and to the senate's proposition to put the head of the president for the time being upon the coins, took a fairly organized form, and by the end of the session the tone of discussion had so risen that allusions were made to the existence of a "corrupt faction" in congress. In the second session party organization took on unmistakable form. The debates on the increase of the army show that the anti-federalists had come to regard Hamilton as the arch-priest of broad construction, and themselves as his appointed adversaries. Toward the end of the session they attempted without success to censure his management of the treasury and his language to the house. Their former party name was no longer entirely applicable, for they were not now opposed to the federal government or to the constitution which had created it. On the contrary, by a process which was very natural, however odd at first sight, they, who had at first absolutely opposed the constitution through their fear of a strong and tyrannical federal government, had now become, through the same fear, the most pronounced champions of the exact and literal language of the constitution, and opponents of all attempts to extend its meaning by ingenious interpretations of its terms. In other words, they were now a strict construction, conservative party (see **CONSTRUCTION, I.**).—Jefferson had returned from France in 1789 wholly engrossed by the opening scenes of the French revolution, and personally triumphant in the prospect of the coming success of the principles which he had formulated in

the declaration of independence. Very soon after his return he seems to have become fixed in the belief that the conflict between government *by* the people and government *of* the people was to be transferred to America also, and that the Hamilton school, under the guise of broad construction, was aiming at monarchy. He soon impressed his belief upon others, and before the summer of 1793 he was able to refer in vague terms to the opposition to Hamilton as a "republican" party, in contrast to the "monarchical" federalists. He was emphatic, at first, in excluding the anti-federalists from the "republican" party, acknowledging them only as allies; but Washington's neutrality proclamation in 1793 brought all the former anti-federalists so prominently forward as friends of the French republic that Jefferson perforce accepted as political facts the death of the anti-federal party and the existence, for the future, of but two parties, the federal party and the republican, or, as it was soon enlarged, the democratic-republican party.—See Pitkin's *Statistical View of American Commerce*; Randall's *Life of Jefferson*; Jefferson's *Ana* (in *Works*); Austin's *Life of Gerry*; 1 Gibbs' *Administration of Washington and Adams*; 3, 4 Hildreth's *United States*; 1 Benton's *Debates of Congress*; and earlier authorities under **DEMOCRATIC-REPUBLICAN PARTY**.

ALEXANDER JOHNSTON.

ANTI-MASONRY (IN U. S. HISTORY). **I. ANTI-MASONIC PARTY.** The society of free masons was established in the United States during the last century, and before 1820 had enrolled among its members very many of the political leaders of the country. In 1826 William Morgan, of Batavia, Genesee county, New York, having prepared a book for publication which purported to expose the secrets of the fraternity, was arrested, and a judgment obtained against him for debt. Upon his release, Sept. 12, he was seized and conveyed in a close carriage to Niagara. No further trace of the missing man was ever found, in spite of liberal rewards offered for him or his abductors. The affair caused intense excitement throughout western New York. Charges were made that the conspiracy to abduct embraced all the leading free-masons of that section of the State; that these had systematically thwarted all investigation; that members of the society placed their secret obligations above those of citizenship or official duty; and that they were necessarily unfit and unfaithful public servants. In town and county elections candidates who refused to resign their membership in the society soon found a strong, though unorganized, anti-masonic vote against them, and in August, 1828, the national republican party in New York, carefully nominated state candidates who were not free-masons. But an anti-masonic state convention, at Utica, a few days later, nominated candidates pledged against free-masonry, and polled 33,345 votes out of a total of 276,583. In 1830 they entirely displaced the national republicans in New York, as

the opponents of the democrats, and, as Jackson, the democratic leader, was a free-mason, steps were taken by his opponents to extend the anti-masonic organization to other states, in hopes of thus gaining the small percentage of votes necessary to defeat the democrats in the national election. The attempt was a failure, in one sense, since the number of national republican free-masons who were alienated to the democracy more than counterbalanced the anti-masonic accession; but it resulted in the establishment of the anti-masons as the controlling anti-democratic organization in Pennsylvania and Vermont, and as a strong local party in Massachusetts and Ohio. In the state of New York, William H. Seward, Millard Fillmore, and Thurlow Weed, first appeared in politics as anti-masonic leaders.—In February, 1830, a state convention at Albany, had decided in favor of a national anti-masonic nominating convention, and this decision was confirmed by a national convention, in September, 1830. John Quincy Adams had already lost control of the national republicans, and Clay had begun to develop some of that popularity with the party which afterward made the whigs almost a distinctive Clay party. In the hope of forcing Clay, who was a free-mason, out of the field, the anti-masons held their convention first of the parties, at Baltimore, in September, 1831, and nominated William Wirt, of Maryland, and Amos Ellmaker, of Pennsylvania, as presidential candidates. The national republicans, however, persisted in nominating Clay, and Wirt and Ellmaker received the electoral vote of Vermont alone. The anti-masons made no further effort to act as a distinct national party, and the rise of the whig party soon after absorbed their organization, except in Pennsylvania, where they retained existence in alliance with the whigs until about 1840, and in 1835, through democratic dissensions, succeeded in electing their candidate for governor, Joseph Ritner. But while acting as a part of the whig party, the anti-masonic element was sufficiently strong and distinct to force the nomination of Harrison, in 1835 and 1839, instead of Clay. (See WHIG PARTY.) The anti-masons and the American party have been the only instances in our political history of an attempt to form a national political party not based on some controlling theory as to the proper construction of the constitution.—II. AMERICAN PARTY. In 1868 a national convention, at Pittsburgh, formed the national Christian association, which has held annual meetings since, and now has branches in 14 states. In 1875 this body began political action as the American party. It is opposed to free-masonry as false religion and as false politics, and demands the recognition of God as the author of civil government, and the prohibition of oath-bound secret lodges as acknowledging supreme allegiance to another government than that of the United States. The vote of the party was in 1876 and 1880 included in the few thousand votes classed as "scattering." Its newspaper organ is *The Christian Cynosure*,

published in Chicago, Ill., and its practical leader is president J. Blanchard, of Wheaton College, Illinois.—See (I.) Creigh's *Masonry and Anti-Masonry*; 2 Hammond's *Political History of New York*, 369, 403; H. Brown's *Anti-Masonic Excitement*, in 1826-9; Ward's *Anti-Masonic Review* (1828-30); 1 Seward's *Writings*; *Proceedings of the U. S. Anti-Masonic Convention*, in Philadelphia, Sept. 11, 1830; Stone's *Letters on Anti-Masonry*; and earlier authorities under WHIG PARTY; (II.) *Christian Cynosure*, 1880; Greene's *Broken Seal*; Gasset's *Catalogue of Anti-Masonic Books in Public Libraries*. ALEXANDER JOHNSTON.

ANTI-NEBRASKA MEN (IN U. S. HISTORY), a name at first assumed by northern whigs who had broken with the southern whigs on the support of the Kansas-Nebraska bill. They drew reinforcements from democrats opposed to the extension of slavery to the territories, and thus, without any party organization, succeeded in gaining control of the house, and electing the speaker in the 34th congress, (1855-6). At the next session they had developed into the republican party. A. J.

ANTI-RENTERS, The (IN U. S. HISTORY). Large portions of Columbia, Rensselaer, Greene, Delaware, and Albany counties, in the state of New York, belonged to manors, the original grants of which were made to "patroons" by the Dutch company, and renewed by James II., the principal being Rensselaerswyck and Livingston manor. The tenants had deeds for their farms, but paid annual rental in kind, instead of a principal sum. This arrangement caused growing dissatisfaction among the tenants after 1790. When Stephen Van Rensselaer, who had allowed much of the rent to remain in arrears, died in 1839, the tenants, who longed to become real land owners, made common cause against his successor, refused to pay rent, disguised themselves as "Injuns," and began a reign of terror, which for ten years, practically suspended the operations of law and the payment of rent throughout the district. An attempt to serve process by militia aid, known as the "Helderberg war," was unsuccessful. In 1847 and 1849 the anti-renters "adopted" a part of each party state ticket, and thus showed a voting strength of about 5,000. This was not to be disregarded in a closely divided state, and in 1850 the legislature directed the attorney general to bring suit against Harmon Livingston, to try title. The suit was decided in Livingston's favor, in November, 1850, but both parties were then ready to compromise, the owners by selling the farms at fair rates, and the tenants by paying for them. Most of Rensselaerswyck was sold, and of the Livingston manor, which at one time contained 162,000 acres of choice farming land, very little now remains in the possession of the family.—See Jay Gould's *History of Delaware County N. Y.*, and authorities under NEW YORK; Mrs. Willard's *Last Leaves*

of *American History*, 16-18; *Jenkins' Life of Silas Wright*, 179-226; *Cooper's Littlepage Tales*.
ALEXANDER JOHNSTON.

ANTI-SLAVERY. (See ABOLITION.)

APPORTIONMENT. The term apportionment was applied in the federal constitution to the distribution of representatives in the lower chamber of the federal congress between the several states and to the allotment of direct taxes upon the basis of population. The rare intervals at which direct taxes have been levied by the federal government, and the recurrence in the state and federal systems of regular apportionments of representatives, have led to the general restriction of this term to the distribution of representation, and it is here used in this sense alone. State constitutions employ the word in both senses, but more frequently with reference to representation. The regular annual apportionment in many of the states, New York, Illinois, and others, of a school fund raised from the several counties by valuation and distributed by population (New York) or by population of a school age (Illinois) has continued the use of the word apportionment in fiscal allotments. The word has also a legal signification. As the division of a territory into districts is usually intimately connected with the apportionment of representation to its population, the words "districting" and "re-districting" have come to be used in American politics as nearly synonymous with apportionment.—The principle of representation once established and its basis determined, the apportionment of representative power in arbitrary or proportional parts becomes the next problem in any government based on representative institutions. This apportionment may rest either on status, or the representation of certain estates by members qualified, not by election, but by position; on the organic divisions of the state; or on numbers, reference being had either to population or wealth. Bentham proposed an apportionment based in part on population and in part on territory, and such a principle was adopted in France in the constitution drawn by the constituent assembly in 1791. It has been secured elsewhere in practice by combining a representation based on population with one based on the integral divisions of the state. Historically the apportionment of representation has been first by status, next by the recognition, generally on an equality, of the organic or administrative divisions of the state, and lastly by number; a method of apportionment now recognized in the fundamental law of all constitutional nations except Great Britain, and at intervals recognized even there. In general where apportionment is based on status it is arbitrary; when derived from the administrative or other divisions of a state or confederacy it is equal; and, when guided by population, it is proportional. The allotment of representation among the towns of Aragon in the first recorded instance of representation assigned other

than by status, in 1162, was equal, and the same rule was followed in Castile in 1169. Frederick II. in Sicily, 1232, assigned each place two representatives. When the cities appeared by deputies in the German diet, they enjoyed equal representation, and the same was true of the municipalities represented in the states general of France. A like principle was followed in the union of Utrecht in the Netherlands, as it had been in the Swiss confederation. It reappeared in the continental congress and is preserved in the United States senate. An upper chamber swayed by this principle, even where, as in Germany and the Dominion of Canada, complete equality is not given the smaller states, and a lower chamber based on population, often with certain classes excluded—as aliens in many American states, and slaves in Cuba under the Spanish constitution—is now the rule in most representative constitutions.—In allotting representatives by population among the divisions of a state, whether a definite number of representatives or a fixed ratio is applied to the population of each division, fractions always remain. Provision is generally made for treating these fractions as full ratios if over one-half; but in the United States the tendency of apportionments during the past generation has been toward a recognition of any fraction in all cases where greater proportional equality of representation is secured by doing so. Regular intervals at which an apportionment shall be made are generally prescribed in the fundamental law and the apportionment itself is generally, but not always, performed by the legislature. In the division of representation, the entire number assigned to each subdivision may be elected as a whole. French *scrutin de liste*, or districts, may be laid out, as in the German empire and in most states of the union, in apportioning state representation, by the body making the original apportionment, or the work of districting may be done by a second body as congressional districts, after the apportionments of representatives by congress, are laid out by the state legislatures, and in New York, Massachusetts, Michigan, and Missouri state legislative districts within the counties are laid out by county authorities, independently of the legislature. Where the election of representatives is by single districts the effort is, not unfrequently, made to lay out these subdivisions so as to give the party in power a majority. This is ordinarily done by massing the voters of the opposite party in a few districts and distributing those voting with the party in power in a larger number. In American politics this is known as "gerrymandering;" having been conspicuously practiced in the act of Feb. 11, 1812, laying out Massachusetts into senate districts, passed during the temporary ascendancy of the democratic party in the legislature of that state under Gov. Elbridge Gerry. Another instance of the same practice which has given a term to politics is the sixth congressional district in Mississippi, as laid out in 1874, which, as it lies along the Mississippi river and almost the entire

length of the state, is known as the "shoe-string" district. The districts laid out in France under the second empire by the electoral decree of 1838 furnished equally remarkable cases of "gerrymandering."—As the British colonies in North America, while enjoying mutual political equality, differed greatly in size and population, the problem of an equitable apportionment of representation presented itself in the earliest inter-colonial assemblies. In the confederation made by the New England colonies in 1643, known as the "united colonies of New England," each of the four colonies was equally represented in its council by two delegates, although the burdens of taxation and military service were allotted by population. At a later date, 1648, Massachusetts demanded an additional member or an equalization between the privilege of representation and the burdens of taxation. This was denied in the reorganization of the confederacy, and to its close the share of each colony in its deliberations remained equal. The first step in American history toward an apportionment of representation upon some other basis than the equal voice of each division in the nascent nation was presented in the "plan of union," submitted by Benjamin Franklin to the commissioners from seven states, who met at Albany in June, 1765. This plan proposed a "general council" with "legislative powers," apportioned every three years among the colonies by the "proportion of money arising out of each colony to the general treasury." A provisional apportionment proposed by Franklin for the first meeting of this council is the earliest aliquot division of representation among the colonies ever offered. The same problem confronted the continental congress at its first session in Philadelphia, Sept. 5, 1774, when James Duane, of New York, proposed a committee to prepare regulations "particularly on the method of voting, whether by colonies, by poll, or by interests." Patrick Henry, declaring that he sat "not as a Virginian but an American," urged a "national" system of representation based upon free citizens, excluding slaves; but the congress, as John Adams reminded it, had accurate information neither as to the wealth nor the population of the colonies, and it was at length voted "that in determining questions in this congress each colony or province shall have one vote, the congress not being possessed of or at present able to procure materials for ascertaining the importance of each colony." There was here the distinct admission, and apparently by a unanimous vote, that the colonies were entitled not to an individual but to a proportional vote; but the precedent established of necessity was accepted in practice and became the rule of procedure in the continental congress, first by consent and later by the articles of confederation. Apportionment in the acts and proceedings of the congress of the revolution is uniformly applied to the assessment of pecuniary burdens and the distribution of calls for military service. Proportional representation was urged by Virginia,

but steadily voted down by the smaller states. "Our great question," wrote John Adams, when a member of the committee drafting the articles of confederation in 1776, "is whether each colony shall count one, or whether each shall have a weight in proportion to its number or wealth or exports and imports or a compound ratio of all." The subject came up for discussion in the long and desultory debate to which these articles were subjected in congress through fifteen months, and Oct. 5, 1777, three plans of apportionment were proposed in succession; first, that Rhode Island, Delaware, and Georgia should have one vote and the other states one for every 50,000 white inhabitants, with a provision that the representation of the three smaller states should increase with every additional 50,000 to their inhabitants and the ratio of representation be itself changed when it threatened to make congress too numerous; second, that every state should send a delegate for every 30,000 of its inhabitants, each delegate to have one vote, and third, that representation should be "computed by numbers proportioned" to the taxes levied on the states and paid by them into the public treasury. All three propositions were voted down, Pennsylvania and Virginia standing alone in their support, and by a vote of ten colonies to one, each was given one vote and the privilege of sending not less than two nor more than seven delegates.—Repeated review and discussion have made familiar the steps by which a compromise was reached in the convention of 1787, at Philadelphia, on the distribution and apportionment of representation; the only question which provoked the menace of withdrawal from one of the states and threatened at a later date the dissolution of the convention. As at last adopted, an equal representation was given the organic divisions of the new government in the upper chamber. In the lower, number was followed as far as the free population of the country was concerned, and status in determining the share, "other persons" should play in increasing the representation of states with a slave population. The verbiage of the clause in the federal constitution, basing representation on the total free population, "three-fifths of all other persons, and excluding Indians not taxed," first appeared as an amendment to the articles of confederation in the continental congress April 18, 1783, proposing a new basis for raising revenue. It was urged and accepted in the convention as an equitable compromise and in the constitution was accompanied by a clause which provided that the federal house of representatives should never have less than a member to each state and never have more than one to every 30,000 inhabitants in the states, computed upon the constitutional rule. The constitution contained also a provisional apportionment of representation to the states, at best little more than a guess. Mr. Gorham, of Massachusetts, a member of the committee of five which first sketched this apportionment, informed the convention that without observing fractions, the com-

mittee had been guided by the "number of blacks and whites with some regard to supposed wealth," and at a later date Mr. Gerry, of the same state, told the Massachusetts convention that, in the share given Georgia, allowance was made for expected growth from pending immigration. The only grave criticism made on the provisions respecting apportionment in the federal constitution came from Virginia and Massachusetts, who urged that the ratio should not be altered till the number of representatives reached 200. A constitutional amendment to this purport was passed by the 1st congress, but it was never ratified by the states. The constitutional rule remained unchanged and governed apportionments through 70 years, a longer span than has fallen in history to any other provision controlling the distribution of representation by changes in population.—The first of the 10 decennial apportionments, including 1880, which have come up under the federal constitution, raised, in 1792, all the questions in regard to the representation of fractions and was marked by the same struggle between the north and the south, as its successors. In this and in 4 succeeding apportionments the recognition of fractions was treated as unconstitutional. Since 1830 a contrary practice has obtained and is now firmly established. The census of 1790 placed the representative population of the country at 3,636,921. Dividing this by 30,000 as a ratio, the house (2nd congress, 1st session) apportioned 113 members on a plan favoring the southern states. The senate raised the ratio to 33,000, transferring the unrepresented fractions from the east to the south. The house refused to yield and the senate insisting upon its amendment, by the casting vote of vice-president Adams, the bill lapsed, and the house passed another, with the same apportionment, but providing for a new census in 1795, to be followed by another apportionment. The senate struck out this provision, added 7 members for each large fraction, which in Delaware was 29,000, and sent the bill back to the house. There, after a hot debate, in which both sections predicted a dissolution of the union if an apportionment favoring it was not adopted, the bill passed 31 to 29; the Delaware member, the only representative from the south voting for it. A week later the bill encountered the first veto message in the history of the government. Hamilton and Knox, the two northern members of the cabinet, advised its signature; Jefferson and Randolph, the two southern members, its veto. President Washington, with some misgiving, lest he should seem to "be taking sides with a southern party;" sent to congress a brief veto, in which, without accepting or rejecting the principle first advanced by James Madison, that the representation of fractions was unconstitutional, he based his objections upon the fact that the apportionment was on a different ratio in different states and in some fell below 30,000, the constitutional limit. The first was the inevitable result of representing fractions at all; the second of assign-

ing members to fractions after taking the smallest ratio known to the constitution. Congress yielded, and in the house 34 to 30, in the senate by a heavy majority, passed a bill placing the ratio at 33,000, and apportioning 105 members among the states, without regard to fractions. The real principle underlying this and succeeding struggles, was whether in an apportionment the nation should be considered as a whole or be dealt with by states.—Following the same ratio and the same principle as in the 1st apportionment, congress, in January, 1802, (6th congress, 2nd sess.) distributed 141 members among 15 states. Senator White, of Delaware, endeavored in the senate, to secure an additional member for an unrepresented fraction of 28,811 in his state, but his proposition was voted down, 10 to 15 as unconstitutional.—Two unsuccessful attempts were made before the census of 1810, to determine the apportionment in advance, by adopting a ratio before the results of the census were known; but the house (11th congress, 2nd and 3rd sess.) laid on the table bills proposing 40,000 and 45,000 as the ratios. After the census was published, the house, (12th cong., 1st sess.), 102 to 18, placed the ratio at 37,000, distributing 180 members. The senate, on motion of senator Bayard, 22 to 12, reduced the ratio to 35,000, giving Delaware a member, with 181 as a total, and the house, 72 to 62, agreed.—For the first time since the 1st apportionment, an effort was made, after the census of 1820, (17th cong., 1st sess.), to abandon an equal ratio for all the states and adopt a number which should make the average to each member within each state equal. Under the vehement opposition of Mr. John Randolph, this was voted down, 43 to 125, and, 100 to 58, the house passed the apportionment bill, as reported by its committee, with a ratio of 40,000 and a house of 212 members. The senate, 25 to 21, accepted this, but added an amendment providing that the apportionment could be changed in the case of Alabama, when its census was completed, and, while denounced as unconstitutional in the house, for prolonging the apportionment, it passed 98 to 47.—Mr. James K. Polk, in 1832 reported to the house (20th cong., 1st sess.) an apportionment bill based on the 5th census, in which the ratio was 48,000, and the membership of the house 240, a ratio favorable to Tennessee and highly unfavorable to New England. The house after prolonged debate, in which several other ratios were adopted, at last, 119 to 75, reduced the ratio to 47,300, which cut down the apparent size of the fractions without changing the distribution of members, and sent the bill to the senate. There it was attacked by Mr. Webster, in an elaborate report, urging the representation of fractions over one-half; the representation of fractions less than a moiety being pronounced unconstitutional. This amendment was once lost, 23 to 24, but its principle was at length adopted, 23 to 20, the whigs generally voting with Mr. Webster. The house, 134 to 57, refused to agree, and the senate yielded.

Mr. Polk presented the democratic view in a report in which he declared that the states "must be regarded as separate, distinct communities or masses of population and not as parts of the consolidated population of the union, melted down into one mass or community;" a doctrine now abandoned in federal apportionments.—Debate chiefly centered, in the apportionment on the census of 1840, (27th cong., 2d sess.), on a provision requiring the states to elect by districts, moved by Mr. William Halstead, of New Jersey. Supported by the whigs and opposed by the democrats, this was passed, 101 to 99, in the house, and 29 to 19 in the senate. This measure was principally intended to divide the delegations from New York and Pennsylvania, then elected on a general ticket. It was opposed as unconstitutional, because it directed the state legislatures to lay out districts, and deprived any citizen from voting for the entire congressional representation of his state. In the struggle over this provision, fractional representation was adopted with little debate. The house, 125 to 75, placed the ratio at 50,179 and the members at 217. The senate, 28 to 18, added 6 members for fractions over one-half, and the house, after once refusing, yielded to this, 111 to 102.—The census of 1850 was preceded by a measure determining the method and principle of the apportionment based upon it. To the bill providing for taking the census, sections were added, on motion of Mr. S. F. Vinton, of Ohio, (31st cong., 1st sess.) placing the number of the house at 200, and requiring the secretary of the interior, as a ministerial act, to divide the representative population of the entire country by 200, and the population of each state by the quotient thus obtained as a ratio; assigning to each state representatives for each full ratio its population contained, and 1 for each fraction till the entire number, 200, was exhausted. The principle of these sections, since known as the "Vinton bill," has guided all subsequent apportionments. The house, 93 to 78, increased the number of members to 233, and the senate supported this, 27 to 17. An apportionment was made pursuant to this measure by the secretary of the interior, (32nd cong., 1st sess., ex. doc. 129) and subsequently altered under a supplementary act, (approved July 30, 1852), giving California an additional member.—In apportioning representatives after the census of 1860, congress followed the principle of Vinton's bill, but abandoned its method. The house, 86 to 7, passed without debate, (37th cong., 1st sess.), a bill which, taking 233 as the basis for apportioning 233 members on Vinton's plan, then added 6 more members to represent large fractions in Vermont, Rhode Island, Ohio, Kentucky and Iowa. In the senate, Mr. Collamer, going a step farther in the support of fractional representation than had been proposed at any previous apportionment, urged that the average of population to each member should be kept equal by giving the small states an overplus. The senate, still basing its

ratios on 233 members, added 8 for fractions in Pennsylvania, Ohio, Kentucky, Illinois, Iowa, Minnesota, Vermont and Rhode Island, making 241. Supplementary legislation gave California an additional member and permitted Illinois to elect a member at large.—Before the census of 1870, the 8th, had been taken, these amendments had altered the constitutional rule of apportionment. The 13th amendment left no "other persons" for the three-fifths rule to operate upon, and the 15th amendment, by imposing manhood suffrage upon the states, accomplished the purpose intended by the 2nd section of the 14th amendment. Drawn as a compromise, after the failure of a proposed amendment directly expressing its purpose, the 14th amendment, in its 2nd section, imposed a new rule of apportionment by requiring the population of each state, as a basis of representation, to be diminished in the proportion between the whole number of its male citizens, 21 years of age and upward, and those whose right to vote at any state or federal election the state denied or in "any way abridged," except for crime or a share in the rebellion. This amendment was intended solely to discourage exclusions from suffrage on account of race; but senator Sumner objected to the explicit assertion of this purpose, and proposed language so broad as to include, in its literal meaning, all the abridgments of the grant of suffrage to adult citizens, based on residence, illiteracy, idiocy, insanity, non-payment of a poll-tax, or a property qualification. This interpretation was never suggested in the debates upon the amendment. It had its first recognition in two bills for taking the 9th census, drawn by Mr. James A. Garfield, and passed by the house, (41st cong., 2nd sess.), but lost in the senate. In the absence of legislation the secretary of the interior added to the schedules of the 9th census, inquiries in regard to the abridgment of suffrage to citizens; but the data obtained deserved, as Mr. Francis A. Walker, superintendent of the census said, "little credit." No provision for obtaining this information was embodied in the law for taking the 10th census, and two precedents now exist for disregarding this inquiry in census legislation. When an apportionment based on the 9th census was reached in the house (42nd cong., 2nd sess.) Mr. Garfield and Mr. S. S. Cox insisted that the meagre returns reported by the secretary of the interior should be employed, such as they were. Mr. James Maynard and Mr. M. C. Kerr united in advancing the interpretation that the 14th amendment regarded only abridgments of the suffrage based "on race, color, nationality, or any other quality which inheres in the person and constitutes part of the individuality of the voter," and the house, 77 to 70, supported this commentary. In the debate in the house (46th cong., 3d sess.) on the apportionment after the 10th census, substantially the same view was adopted, Mr. Cox urging that the rule in the 14th amendment could not be practically applied. This may now be considered as the accepted doctrine, and

future apportionments will probably rest upon number alone.—Prior to the census of 1870 the house, (41st cong., 2nd sess.), passed, 86 to 84, a bill drawn after Vinton's measure and placing the apportionment of 275 members in the hands of the secretary of the interior. The senate, 30 to 21, increased this number to 300, and the bill was lost in the house, 96 to 94. Two years later, the house, (42nd cong., 2nd sess.), adopted, 93 to 89, a law, apportioning 283 members upon a new plan. Four of the states, Delaware, Nebraska, Nevada and Oregon, had a population less than the ratio obtained by dividing the entire population of the United States by 283. Assigning these states 4 members, their population was subtracted and the remainder of the population divided by 279 for a new ratio; upon which the remaining apportionment was made, 17 members being assigned for fractions. The senate accepted this bill; but at a later date a supplementary bill passed both chambers adding a member each to New Hampshire, Vermont, New York, Pennsylvania, Indiana, Tennessee, Louisiana and Florida, 9 in all, making the total 292. Upon its face a supplement to the other bill, this was in fact, as an accompanying report explains, to be taken with that as a new apportionment with 131,425 as a ratio, obtained by dividing the population by 290; 2 more members being given for large fractions in Florida and New Hampshire.—After the census of 1880, the house, (46th cong., 3rd sess.), 136 to 123, passed a bill apportioning 319 members, on Vinton's plan, but the measure was lost in the senate.—All the states of the American Union, except Delaware, provide in their constitutions for a periodical apportionment of representation, and a re-distribution of the members in one or both branches of the legislature has been made with some regularity during the last half-century in all the other states except Connecticut. This allotment of representation is usually guided exclusively by numbers in apportioning the lower branch and by population controlled by county or town lines in the upper, so that the former generally reflects changes in population more closely than the latter. The chief exception to this rule is in Vermont where representation in the lower branch has, since 1793,¹ been equally distributed among the towns while the members of the senate, since 1836, have been divided among the counties by population.—The duty of apportionment is committed to the legislative authority of the state; except in Ohio, where the governor, auditor and secretary of state or any two of them have allotted representation in both branches under the constitution of 1851; in Maryland, where the governor performs the same duty by the constitution of 1867; while in Missouri, 1867, the governor, secretary of state and attorney general are empowered to lay out senate districts if the lower chamber, at its final session after any enumeration, fails to pass a bill re-districting the

senate. In Massachusetts, under amendments adopted in 1836 and in 1840, the apportionment of the state was placed in the hands of the governor and council, until 1857, when it was restored to the legislature. In Illinois, by the constitution of 1870, the first apportionment under minority representation was committed to the governor and secretary of state. Both Massachusetts, 1780, and New Hampshire, in 1784, in their early constitutions left the apportionment of representatives in a measure to the people of each town by selecting a small number of ratable polls as the ratio and permitting each town to send 1 for such ratio; the large towns, as Boston, rarely sending all the members to which they were entitled to the general court. This right, the judge of the state held (Mass. Elec. Cases, 120,) was enjoyed by the town in its corporate capacity and could not be interfered with by the legislature.—The following table gives the ratio and the number of representatives at each apportionment:

STATES.	Constitution, 1781. Ratio, 1 to 30,000.		Act of apportionment April 14, 1792. Census of 1790. Ratio, 1 to 33,000.		Act of apportionment January 14, 1802. Census of 1800. Ratio, 1 to 33,000.		Act of apportionment December 21, 1811. Census of 1810. Ratio, 1 to 35,000.		Act of apportionment March 7, 1832. Census of 1820. Ratio, 1 to 40,000.		Act of apportionment May 22, 1832. Census of 1830. Ratio, 1 to 47,000.		Act of apportionment June 25, 1842. Census of 1840. Ratio, 1 to 70,000.		Act of apportionment May 23, 1850. Census of 1850. Ratio, 1 to 93,420.		Acts of apportionment May 23, 1860 and March 4, '62. Census of 60. Ratio, 1 to 126,840.		Acts of apportionment February 2 and May 30, 1872. Census of 1870. Ratio, 1 to 131,400.

¹ Here and elsewhere dates refer to the adoption of the organic law quoted

The basis of apportionment, where dependent on the civil divisions of the state, is, in New England, the town; in the middle, western and southern states the county; in Louisiana the parish; in South Carolina, until 1868, election districts: while in New York until 1821, in Virginia, from 1850 to 1864, the state was divided into 4 districts, made up of counties, within which senators were apportioned. In Virginia 8 such districts were provided at the same time for the lower branch. Ohio, 1851, has 33 fixed senate districts within whose limits senators are apportioned, districts being united from time to time when they fall below the ratio obtained by dividing the state population by 35. Under an opinion given by attorney general Nash, in 1881, districts so united can not be separated in a subsequent apportionment until the population of each equals the state ratio for senator. Another unit in apportionment was recognized in Maryland by the division of the state, adopted in 1776 abolished in 1836, into an "eastern" and "western" shore in allotting the senate. Massachusetts was also divided up to 1851 into senate districts, made "permanent" in 1840, among which senators were apportioned. These various divisions of a state to which representation is assigned or within which it is divided must be distinguished from the ordinary district whose erection is a customary incident of apportionment where the number of representatives is greater or less than the number of counties or towns. Apportionments within the states, based upon number, rest either upon the entire population, (Alabama, 1867; Connecticut, 1828; Illinois, 1870; Louisiana, 1852, 1879; Massachusetts, 1840; Minnesota, 1857; Missouri, 1875; Nebraska, 1867; Nevada, 1864; New Hampshire, 1877; New Jersey, 1844; Ohio, 1851; Pennsylvania, 1873; Rhode Island, 1842; South Carolina, 1868; Texas, 1836, 1876; Vermont, 1836; West Virginia, 1872; Wisconsin, 1848; all the western states mentioned excluding Indians not taxed), upon the total population less aliens, (Maine, 1820; Maryland, 1867), upon the total population, less aliens and Indians not taxed. (New York, 1821; North Carolina, 1868), upon the total population less aliens ineligible to naturalization, Chinese, (California, 1879) or upon voters (Arkansas, 1874; Florida, 1868; Georgia, 1877; Indiana, 1851; Kentucky, 1850; Mississippi, 1868; Tennessee, 1834). In three states, the old limitation to a white population still remains (Iowa, 1857; Michigan, 1850; Oregon, 1857), but in none of these would the recognition of a colored population affect an apportionment. In Michigan, "civilized persons of Indian descent" are included in the representative population and tax paying Indians were by the New York legislature in the last, 1879, apportionment of the state. The constitutions of Colorado, 1876, Kansas, 1859, and of Virginia, 1870, omit to designate specifically the basis of apportionment, which is presumably the entire population. In nearly all the states, limitations upon the application of the rule of

numbers exist with reference to one chamber or the other; usually by requiring county lines to be observed. In New Hampshire, the upper chamber is still apportioned by direct taxation. An apportionment of this character existed till 1821 in New York, 1836 in Massachusetts, 1868 in South Carolina and from 1835 to 1868 in North Carolina. In all these states, except South Carolina, this allotment was applied to the upper branch; there one-half the lower branch was apportioned by taxation and one-half by population under a provision adopted in 1808 and continuing till 1868. Georgia and Pennsylvania both had apportionments based on freeholders in their first constitutions and ratable tax-payers were the basis for apportioning the lower branch in New Hampshire till 1877 and in Massachusetts till 1840. Before the civil war, Georgia, 1798; Maryland, 1851; North Carolina, 1835; Virginia, 1850, adopted the "federal" rule of population and in all the other slave states, the free white population was the only basis employed as to population. A like limitation occurs in most of the early constitutions in the states formed out of the north-west territory.—The decennial census taken under the federal constitution has led all the states except Kentucky, which still retains an octennial period, to adopt an apportionment once in 10 years, even where, as in New York and Massachusetts, the state apportionment takes place after an intercalary state census. In 10 states (California, Indiana, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, Oregon and Wisconsin) provision is made for a new distribution of representation after every state as well as after every federal census, giving an apportionment every five years. Apportionments every 4 years, (Arkansas, 1836; Iowa, 1846; Louisiana, 1812; Kentucky, 1792; Missouri, 1820; Ohio, 1802,) every 6 years, (Alabama, 1819; Indiana, 1851,) every 7 years, (Georgia, 1798; New York, 1777; Pennsylvania, 1776, 1840; Tennessee, 1796; Vermont, 1786), and every 8 years, (Kentucky, 1850; Texas, 1845) have been required by different constitutions; but of these only Kentucky survives. It is an open question in state, as in federal, constitutional practice whether the requirement of a recurrent apportionment is mandatory or directory, whether it can be discharged only by the legislature sitting next after the enumeration or by any other, and whether once accomplished, it can be revised by a succeeding legislature. The constitution of Louisiana, adopted in 1868, prohibited the legislature from passing any act at the first session after a census before a reapportionment bill had become a law, but this restriction was dropped in the constitution of 1875. The constitutions of 6 states (Arkansas, 1874; Alabama, 1867; Connecticut, 1828; Nebraska, 1875; New York, 1846; New Jersey, 1844), require an apportionment once made to remain unchanged till the next census, and the constitutions of all the other states enjoin an apportionment "immediately" or at the "first session

after" an enumeration. Mandatory language is generally used in these injunctions, but the practice of state legislatures has repeatedly construed it as directory. The constitution of Connecticut, 1828, requires a decennial apportionment of the senate, but after making an apportionment on the census of 1830 none was made till 1880 by the legislature. In New York state after the census of 1855 an apportionment was not made till 1857, and after the census of 1875 till 1879, and there have been other cases of delay. The attorney general of New York state held in an opinion (58 N. Y. A. Gen. Decisions 21) that no apportionment could be made except by the legislature meeting immediately after the enumeration, and while the law does not seem settled (19 N. Y. 41; 20 N. Y. 447, 19 Barber 81) the later decisions favor the view that an apportionment can be made only after an enumeration (3 Keyes 111). This is the accepted doctrine in Maine (Opinions of Justices, 33: 587, and 18: 458), but an exception is made if the apportionment "appear to have been unconstitutional." In Massachusetts the decennial distribution is held to be "fixed and unalterable" (6 Cushing 575; 2 Gray 84), as it is in Ohio (1 Ohio, 437). In the state last named frequent changes in apportionments had been, as the court was moved to say, a "most humiliating experience." A like practice, more or less frequent, has established in most states the precedent that an apportionment can be made by any legislature and in some cases, when an apportionment has already been made, (Indiana state apportionment 1880, Ohio 1878 and 1880, in re-districting congressional districts, and Louisiana 1879), a second and third distribution of representation has been made by successive legislatures.—In apportioning representation, the state authority discharging this duty is generally limited in three particulars, in the number of members to be distributed, in their distribution among the civil divisions of the state and in the representation to be given to fractions. But three state constitutions (Alabama, 1819; Georgia, 1789; North Carolina, 1776) have left the legislature complete discretion in determining its numbers at an apportionment. The usual practice has been to specify a major and minor number within which the legislature is required to act. This is now the case in all the states except 14 (Delaware, 1776; California, 1870; Colorado, 1876; Georgia, 1868; Illinois, 1870; Iowa, 1857; Massachusetts, 1857; Nebraska, 1867; New York, 1846; North Carolina, 1868; Ohio, 1851; South Carolina, 1868; Vermont, 1836 and West Virginia, 1877). In several of the earlier constitutions, instead of specifying the limits by the number of senators and representatives, a ratio is named by the constitution to be used in apportionment. This is still the case in Florida, where 1,000 registered voters is the ratio in the lower branch, in Minnesota, 2,000 population for representatives and 5,000 for senators, in New Hampshire, 1,200 population for the house, in Rhode Island 1,530, and a like practice has been followed in other

states; 7,000 and 3,000, 12,000 and 4,000 being the ratios for senator and representative in 1836 and 1841 respectively in Illinois. In distributing representation the county is usually assumed as the unit, the town as well as the county being used in New England. In nearly all the states which have been admitted into the Union since its organization and in several of the original states, the legislature is at liberty to group counties whose population falls below the representative ratio; but in 7 states (Florida, 1868; Georgia, 1868; Kansas, 1859; Louisiana, 1879; Michigan, 1850; New Jersey, 1844; New York, 1846), each county, and in Rhode Island, 1842, each town is guaranteed 1 member of the lower branch, and in Connecticut, 1828, each county is secured 2 senators and in New Jersey 1. Provisions prohibiting the legislature from dividing counties in laying out districts for the upper chamber and requiring such districts to be of contiguous territory, exist in many constitutions, but the inconvenience of a contrary practice has led it to be abandoned, even when no restriction exists. In Maine, the judges have held (Opinions of Justices, 18: 458) that a small county can be attached to a portion of a large county, where the latter is divided into more than one district. In New York state such an apportionment has been proposed, but never practiced. It has been held in the same state that after districts have been laid out new counties could be erected a part in each, leaving the right of suffrage unchanged (19 Barber 81); but this is doubtful and has been denied in an opinion by attorney general Talcott (Assembly Journal, 1822, p. 78), a view which is sustained in 20 N. Y., 447. A limitation upon the number of members which can be assigned any one county exists in the constitutions of most of the states having a large city, designed to prevent the concentration of too large a representation at a single point. A provision of this character was strongly urged by Chancellor Kent in the New York constitutional convention in 1821, but was voted down. Pennsylvania, in the year 1873, Rhode Island, in 1842, South Carolina, in 1868, Maine, 1820, and Florida, in 1868, have such limitations in regard to one chamber or the other, and down to a recent date they existed in Louisiana. In Maryland, 1851, Missouri, 1875, and New Hampshire, 1877, the same result is reached by largely increasing the ratio of representation when a number of members are apportioned to one county. It is the uniform practice in all the states to recognize the representation of fractions whether a constitutional provision is made for this or not. In Tennessee a county, losing by unrepresented fractions in apportioning one branch, is to have special representation in apportioning the other; in Kentucky allowance is to be made for such loss in successive apportionments; in Texas fractions can be united by giving two counties having fractions equal to a ratio an additional member, but in general the legislature is left to its own discretion. In Massachu-

setts, under the amendments adopted in 1836 and 1840, fractions were given a proportional representation during a part of each decennial period, a plan followed in the Ohio constitution of 1851. Each fraction left in apportioning senators and representatives among districts and counties is multiplied by five, and if the product equals a full ratio, the district receives an additional member for the fifth of the five terms into which each ten year period is divided, if the product equals two ratios for the fourth and fifth terms, and so on. These additional members are known in Ohio politics as "floaters."—The initial apportionment of representation prior to the existence of a written constitution in the original states was in general made by the revolutionary committee in organizing a new government after the disappearance of the colonial administration. In the admitted states and the organization of territories, an apportionment is usually provided in the enabling act. In distributing representation in the various conventions and state "congresses" called in 1775–6–7–8, an equal allotment among the recognized divisions of each colony was the rule, as it had been in the colonial legislatures. In New Hampshire, a census was taken in 1775, the earliest on record with this end in view, for the purpose of "apportioning fairly" the delegates to a convention which met Dec. 21, 1775. An unequal distribution of representation was made in South Carolina in calling a congress in 1776; but it does not appear to have been guided by population. In Pennsylvania each county and Philadelphia were given 8 members in the convention of 1776. Equal county representation was followed in New Jersey and Delaware. Massachusetts, Connecticut, Maryland, Virginia, and North Carolina adopted the apportionment already existing. The first step toward an apportionment based on number was not taken in Rhode Island till the irregular call issued by a committee appointed by the "friends of the suffrage" convention, July 20, 1841, which assigned each town a delegate to every 1,000 inhabitants, and 3 to each ward in Providence. Vermont, on organizing a central government in 1777, gave each town an equal voice. The first apportionment in Kentucky, to the convention meeting at Danville, was on the basis of a delegate to every company of militia in the Kentucky district, a unique instance in American history of representation resting on the old Teutonic foundation, an arms-bearing people. The ordinance of 1787, in providing for the government of the territory northwest of the Ohio, apportioned the membership of the lower branch of the territorial legislature by allowing, "for every 500 free male inhabitants, 1 representative, and so on progressively," until the number of representatives amounted to 25, when further apportionment was left to the legislature of the territory. In succeeding enabling acts constituting territories, the first apportionment and districting is vested in the governor and succeeding allotments committed to the legislature. Where, as

in Alabama, 1817, a territory is erected from counties already part of another, the existing apportionment is accepted. Usually, in providing for a convention to draft a state constitution, the distribution of representatives is left to the territorial legislature, sometimes with a limit on the number of the convention, (Louisiana, 1811) and in other instances the enabling act makes the apportionment, (Missouri, 1820); a circumstance probably due to the fact that the proposed state was smaller in area than the existing territory. In the last three states admitted, Nevada, Nebraska, and Colorado, the act providing for a state convention authorizes the governor of the territory to lay out districts, and constitutes the governor, the federal district attorney, and the chief justice a board of apportionment to distribute the members, whose number is usually fixed by the governor, among these districts. Where the first step toward a convention is taken by the people an existing apportionment has been adopted, in West Virginia, 1861, the old representative districts of the last Virginia apportionment, in Kansas, 1857–9, and in Michigan, 1834, the lower branch of the territorial legislature, but in Tennessee, 1796, the first call was for 5 from each county. In California the constitutional convention of 1849 revised its own apportionment; an act without precedent. The convention met pursuant to a call issued by brigadier general Riley, U. S. A.,—in his capacity as civil governor of the conquered territory—dividing the state into 10 districts and apportioning delegates among them with general reference to the last Mexican apportionment, with a proviso that any district could elect more members whose admission would be decided by the convention. After three days' debate, the convention, guided principally by the votes cast, increased its number from 37 to 73.—In the period succeeding the civil war, an apportionment of representation in state party conventions based on the votes cast at a recent election for the candidates of the party has come into use. It obtains in both parties in Massachusetts, New Jersey and Ohio, in the republican party in New York, in city conventions in Cincinnati and Chicago, and elsewhere. Where such a division is not employed, representation in a party convention is generally based on some legislative apportionment.—The methodical distribution of representation upon an accepted basis is recent in all European governments. No principle was followed in allotting representation in the ancient German diet. The constitutions of 1815, which organized the federal diet of the German empire, divided representation with general reference to population in the plenum or general assembly, but contained no provision for an apportionment. The short-lived Frankfort assembly of 1848 was based on a representative ratio of 50,000 inhabitants. An apportionment according to population was a prominent feature of the Prussian plan for reorganizing Germany in 1866. The projects proposed by Austria at Frankfort, Sept. 1, 1863,

and by Saxony, Oct. 15, 1861, both divided representation more closely in accordance with population than in the federal diet, but they adopted no uniform rule of distribution. This was provided during the organization of the North German confederation in 1866 through the adoption in September by the Prussian legislature of a law for the election of the first German parliament, under which a deputy was to be apportioned to the states in the constituent diet of the new confederacy for every 100,000 inhabitants, a surplus of 50,000 to be treated as a whole number; elective departments and districts to be settled by the government. This apportionment was extended without changing its character when the new German empire was organized in 1871, and adopted for the *reichstag* in article 20 of the constitution. The limits placed upon future apportionments are the stipulations that each state shall have at least one representative and the guarantee of 48 members to Bavaria, 17 to Württemberg, 14 to Baden, and 6 to Hesse. The apportionment of representation to the states in the *bundesrath*, or federal council, as fixed by article 6, is not subject to revision, but gives each of the larger states a representation approximately proportioned to population, and the smaller states 1 vote each. In the Prussian kingdom an apportionment based on population was first provided by the electoral law passed by the united diet in 1845, which took the census of 1846 as a basis in distributing representation in the lower chamber, assigning 1 member to each civil division, 2 to those having 60,000 inhabitants, and for every 40,000 more inhabitants an additional member. The Prussian constitution of 1850 altered this apportionment by distributing the election of 350 members among administrative "circles" of 10,000 inhabitants each. The present Prussian lower chamber is apportioned upon much the same principle. Representation in the provincial diets of Austria is not subject to any systematic apportionment, and while the membership in the Austrian *reichsrath* and the Hungarian house of representatives follows the population of the crown lands represented approximately in each case, the average ratio of representation (1 to 34,000 in Hungary and 1 to 97,000 in Austria in 1869) is extremely unlike in the two bodies. The imperial patent of Feb. 26, 1861, under which the first Austrian parliament was summoned, apportioned 343 deputies among the crown lands with a general adherence to population in the share given each. The earlier Austrian constitution of 1849 provided no apportionment whatever.—The states general of the old French monarchy was a body in which the distribution of representation in the two upper branches rested on status and in the third on the ancient divisions and municipalities of the kingdom. The national assembly organized under the constitution of the year III, 1791, consisted of 745 members; 247 apportioned on the basis of territory, each department having 3 members and Paris 1, 249 on population and

249 on the direct contributions of each department to the government. Under the directory, the first empire, the restoration and the monarchy of July mediate elections by groups of taxables organized upon various systems took the place of any systematic apportionment. In 1848 the provisional government, in its decree of March 5, announced population as the basis of representation and, selecting 40,000 as the ratio, apportioned 900 members among the departments in France and the colonies abroad; a principle followed by the constitution of 1848 in the apportionment it provided, carried into effect by the electoral law of 1849. The constitution proclaimed under the second empire, Jan. 14, 1852, adopted 35,000 as a representative ratio (article 34) and empowered the executive to divide the departments into districts (*circonscriptions*) on this basis, allowing an extra member for fractions over 25,000. These districts were not required to be of contiguous territory, often were not, and were revised under the constitution every five years. Under the republic, the constituent electoral law of Feb. 25, 1875, regulates the apportionment of members to the lower branch of the national assembly. It provides that each administrative *arrondissement* shall name 1 deputy, (*scrutin d'arrondissement*), and those with a population over 100,000, 1 for every fraction of this number. As the French *arrondissements* are of nearly equal size and intended to contain about 100,000 inhabitants, this is practically a general apportionment upon a ratio of 100,000, and a representation is also given the colonies. The districts electing members, it is provided by the same enactment, must be defined by law, and can be changed only by law. At the passage of the electoral law defining the apportionment of the chamber of deputies, the national assembly also distributed among the departments in nearly equal shares, not dependent on population, the senators to be chosen by each.—An equal division of representation continued to be the rule in the allotment of representation among the Spanish municipalities summoned to send members to the cortes down to the final suppression of their legislative powers in the 16th century; although during the 14th century the larger cities obtained a greater proportional representation. In 1808 the central junta, in providing for the re-assembling of the cortes, assigned an equal representation to those cities last represented and to the provincial juntas, and 1 deputy besides to every 50,000 souls in the kingdom; the Spanish-American colonies, most of which were then in insurrection, being included in the apportionment. The constitution of Cadiz, adopted four years later, abolished by the decree of May 4, 1814, but subsequently revived at frequent intervals by the "constitutionalists," provided an apportionment based on population, taking 70,000 as a representative ratio. The census of 1797 was assumed as a basis of the apportionment made by the constitution, but it is difficult to reconcile its allotment of representation with the

returns of population; Valencia and Granada, with a nearly equal population, having respectively 19 and 2 deputies. An apportionment based on representation was demanded at every rising for the next half century by Spanish liberals, and in 1868 the electoral law, promulgated by the provisional government, declared an apportionment by provinces for every 45,000 inhabitants, a fraction over 22,500 to count as a full ratio; 350 deputies being distributed on this basis. The constitution of June 6, 1869, changed this ratio to 40,000, and that of June 30, 1876, to 50,000—in Cuba, 40,000 free persons. Representation in the present Spanish upper chamber, 1881, is distributed partly by status and in part to state corporations.—In Switzerland, an equal representation of the cantons was the rule till 1848. This was embraced in the act of mediation, 1803, and in the constitution imposed by the allied powers in 1815. In 1848 the method since enacted in the constitution of 1864 was adopted. In the state council, each canton has 1 vote; in the national council, a delegate is assigned to every 20,000 inhabitants, fractions over 10,000 to count for 1. Each canton and each half of a divided canton is guaranteed 1 vote. The election is by districts. The Danish great charter, drawn in 1848, and revised in 1866, gives a member in the lower branch, *landsting*, for every 16,000 inhabitants. In Belgium the chamber of representatives is based upon a ratio of 1 to 40,000, and the provincial councils are also apportioned by population, varying from 1 to 11,500 in Brabant and Hainault to 1 to 5,000 in Limbourg and Luxembourg. The members of the lower chamber in Holland, by the constitution of 1815, revised in 1848, are apportioned 1 to 45,000 of population among the provincial states. The first Mexican constitution, 1824, apportioned the house of representatives on the ratio of 1 member to every 40,000 inhabitants.—As the English house of commons is, in its origin, a body made up of the consolidated representation of the shires and boroughs into which the kingdom was divided for local administration and the collection of taxes, the only apportionment known in English constitutional practice is based on the organic divisions of the state; a fact mirrored in the nearly equal representation awarded to the counties and boroughs returning members to parliament before the reform bill of 1832. The changes in representation made by this and succeeding measures have been simply a redistribution of the right of returning members of parliament among civil corporations in the United Kingdom; often with a general reference to population, but with no apportionment based upon it. Sir Thomas E. May states that “the principle of population, although rudely carried into effect, formed the basis of representation in early times,” but it is difficult to reconcile this statement with the actual distribution of members. The representation given Scotland by the act of union, 1707, was intended to represent the relative importance of

the two kingdoms in wealth and population; but the allotment was only approximate. Even this was not attempted at the union with Ireland in 1801. In organizing representative government in the colonies, parliament has uniformly recognized population as a basis for the apportionment of representation. Pitt’s constitutional act of 1791 for the government of Canada empowered the governor of the colony to decide the number of members to be returned to the lower chamber in the colonial legislatures of Upper and Lower Canada, and to lay out districts containing an equal male population for the election of these members. Future apportionments were committed to the local authorities. The same general plan was followed in the act of Aug. 5, 1850, organizing the Australian colonies, an initial apportionment by the governor and future distribution by the colonial legislatures. The act of 1841, uniting the two Canadas, accepted the old districts and made a new apportionment in the bill. By the act of union in 1866, organizing the dominion of Canada, no apportionment is provided for the senate, a fixed number being assigned each province. For the house of commons, the legislature is authorized to make a decennial apportionment of 181 members among the different provinces; dividing the population of Quebec by 65 to obtain a representative ratio, in accordance with which members are to be distributed; fractions over one-half to be reckoned as whole numbers and those less than a moiety to be omitted. At any assignment, no province is to lose in representation unless its decrease of population is over one-twentieth. Talcott Williams.

APPROPRIATION. Appropriation is the reduction to private property of an object which belonged or might belong to all. Thus, arable land which, as we may suppose, was primarily the property of the whole human race, was appropriated when it was first divided into parts, each one of which had its distinct owner.—The word appropriation can hardly be applied to things other than those given by nature; for, as to those which are the fruit of the labor of man, they so naturally and necessarily belong to him who has produced them that they are, so to speak, incorporated in him, until he disposes of them by exchange, or voluntarily destroys them. But the word appropriation does not apply equally to all natural objects. It can hardly be properly applied to the simple consumable products which the earth or the sea may furnish man with. It is rather applied to productive original *stock*, that is, to the natural instruments of production, such as arable land, mines, water-courses, etc., in a word to all the natural elements which constantly assist us in our labors.—Among the natural instruments of production, some are susceptible of appropriation, others are not. For instance, arable land and mines have been almost entirely converted into private property in all civilized countries; but the sea which, like the earth, is

productive, since it produces fish, mollusks, coral, pearls, salt, etc., has not been appropriated and scarcely can be, except some very limited portion of it near the shore.—All economists admit that the appropriation of arable land has singularly increased its fecundity, and made it truly a benefit not only to the actual possessors of the soil, but also to those who believe they have been unjustly deprived of it. “We have examples,” says J. B. Say, “of what happens where there are no landed proprietors. Where there are no such proprietors, people are in the condition of the Hurons and Iroquois. Among them the soil belongs to nobody; and the only product that their agricultural industry, which is the chase, procures from this soil, consists of the furs which they sometimes secure at the cost of untold fatigue, though at times their labor goes unrewarded. The produce of the chase does not always crown their efforts, and they and their families are exposed to most frightful privations.”—In countries where the land does not belong to anybody, nobody cultivates it, and men obtain from it only the meagre fruits which it produces spontaneously.—In all countries, even the most civilized, there still are lands which are not absolutely appropriated, in the sense that the state or communes have reserved their possession to themselves. This is always a beginning of appropriation, and it can not be said in this case that nobody is interested in improving the natural resources of such land; but as the proprietor is a collective person, his interest is not sufficiently direct and urgent to induce him to endeavor to draw from the land all that it can be made to yield. Hence it is that in all the countries of the world, the lands belonging to the state and municipalities are by far the worst managed and least productive.—Mines and quarries may be *appropriated* just as arable land may be, and, it is evident, may gain fully as much by it. Their appropriation is, however, rarely as complete and absolute as that of land. In many countries, the state makes certain reservations in this respect. In some of them the government retains the mines in its own possession, and works them itself. This is the case in Germany for instance, with the iron and salt mines, and in some other parts of Europe and America, with gold and silver mines. In France, the government while granting to private individuals the right to work mines, reserves to itself the ownership of them in principle; so that, leaving out the consideration, the labor, the expenses, and the losses to which it subjects its grantees, it constantly holds over them the threat of a withdrawal of their grant. There is a sort of conditional and precarious appropriation, which does not offer the advantages of an absolute and irrevocable appropriation. (See AGENTS, NATURAL; LAND, MINES, OCCUPATION, PROPERTY.)

APPROPRIATIONS. (See PARLIAMENTARY LAW.)

ARBITRAGE. In banking and commercial matters, arbitrage or arbitration of exchange is resorted to in order to discover, by comparison and calculation, the profit which may result from the negotiation of bills of exchange on different places—This process is either simple or complex. The simple process is of more general application, because there is little speculation in money changes which extend to more than three places.—Simple arbitrage is a comparison of the course of exchange between two places, relatively to the course established between these two places and a third; that is to say, the rate of exchange between two places being known, arbitrage consists in comparing this rate with that prevailing at the third place, in order to ascertain to which of the three it is most advantageous to make the remittances to be made.—A complex arbitrage consists in comparing the course of exchange of more than three places, with a view to ascertain what a remittance shall cost in the last which has passed through all the others. In fact, a complex arbitrage is the repetition of several simple arbitrages, and can be solved only through a series of operations in the rule of three.—Arbitrage in the case of goods takes place especially when the price of a certain commodity at a certain place being known, it is sought to ascertain what price the commodity will bring in another market; and consequently what price should be asked for it there, so as to realize a profit. In this case, there are charges made for handling and transferring the goods to be taken into account. The merchant who is not in a position himself to reckon these expenses, particularly when his business relations extend to markets far distant from his place of residence, usually has these expenses estimated by his correspondents.—Arbitrages are very useful, as they tend more and more to keep in balance the rate of values between different countries.

CHARLES COQUELIN.

ARBITRARY ARRESTS. (See HABEAS CORPUS.)

ARBITRARY POWER. In the common acceptance of the term arbitrary power is an act of the will not guided nor restricted by any law. It is characteristic of all absolute governments to become arbitrary, but in theory we can well conceive of a power without external limits, which would impose limits to itself and respect the limits thus self-imposed. Should such a government exist, we can readily comprehend that it would have warm adherents. Nevertheless, we believe, that in an enlightened nation, public sentiment will never be favorable to arbitrary power.—Such power destroys morality, security, and patriotism itself; and this the more, the further it is carried. But it would be an error to look for arbitrary power only in despotic states. Frequent examples of its exercise are found under constitutional governments and even in republics, in countries governed by law and ranged by the Germans under the denomination of *Rechtsstaat*.

These cases of arbitrary power should be charged to the account of the discretionary power which the laws are obliged to leave to a considerable number of officials, or rather to the account of citizens who submit to the abuse of power without making use of the legal defense at their command. If the functionary knew that every act of his, not justifiable by the necessities of the case, would be brought before the higher authority of the courts, or merely before the tribunal of public opinion, by way of the press, he would think twice before assuming the responsibility of it. If no one would consent to endure arbitrary power, no one would be arbitrary.—The word arbitrary has in addition a philosophic meaning, which must not be confounded with its vulgar sense. We shall endeavor to define this in a few words and indicate the application it finds in governmental affairs.—The actions of men are sometimes determined by natural laws, physical or moral. Sometimes again they are not affected by any insurmountable restriction. A man can not remain suspended in the air without support; here is a physical impossibility. A man can not be grateful for evil done him; this is a moral impossibility. But he is free to grant a month's delay and, if he wishes, two or three months' to a debtor; in a word, he can accept or grant a thousand different conditions in every one of the thousand circumstances of life. This is arbitrariness, for in strictness everything not materially or morally necessary, forced, or inevitable, is arbitrary. One arbitrates, chooses, among several solutions or methods of action, that which seems preferable for some reason. Now in a large number of cases the law should have settled the question. To cite but a single example: how long an interval should be allowed a criminal between judgment and appeal? A limit is necessary; it is not established by the nature of things; it is therefore necessary to fix it by legislation. The time adopted is chosen arbitrarily, though by no means capriciously or without reflection, but it would have been possible either to lengthen or shorten it. Once a law is enacted the tribunal which enforces it exercises no arbitrary power. We have laid stress on this acceptation of the word only with the intent of bringing home to the legislator the fact that when he is obliged to fix arbitrary limits he ought before making decision, to examine everything, to hear and weigh what may be said pro and con. Laws of this category cause most harm when they have not been made with that maturity of deliberation which should never be absent in an act so important. (See ABSOLUTISM, BUREAUCRACY.)

MAURICE BLOCK.

ARBITRATION. (See INDUSTRIAL ARBITRATION.)

ARCHONS. The archons were the principal magistrates of Athens. Their institution goes back to the eleventh century before Christ. After the death of Codrus (1045) the Athenian aristoc-

racy, the *eupatrides*, like the *patres* in Rome at a later period, abolished royalty and replaced a hereditary king by an elective magistrate, the archon, elected for life, invested with the royal authority but responsible to his electors and chosen from a limited number of families. So long as the Doric and aristocratic elements were preponderant in Attica, the archonship retained its original character. But it was modified according as the constitution inclined to democracy, and the different reorganizations which it underwent are a faithful picture of the revolutions, more and more democratic in character, of the Athenian people. After 714 (or 752) the archonship, instead of being a sort of royalty for life, was limited to ten years. Thenceforth open to all noble families, it ceased to be the exclusive appanage of an oligarchy. In 683 it received its almost final organization. Executive and judicial power, concentrated until then in a single hand, was divided among nine archons, elected for a year. Each of these had his special powers. The first, the archon *eponymous*, gave his name to the year, represented the state, maintained the social hierarchy, was judge of questions of civil status, and acted as the official representative of widows and orphans. The second, the *king* archon, inherited the religious functions of ancient royalty. He looked after the ceremonies of religion, presided at the Areopagus, and had jurisdiction in criminal cases as well as in cases of sacrilege. The third, the archon *polemarch*, organized and commanded the army and decided disputes between citizens and strangers. All other judicial affairs were reserved to the last six archons, named *thesmothete*.—The reforms of Solon while respecting this organization did away with its sovereignty. While the archonship was rendered accessible to all citizens of the first four classes established in the state by Solon according to their fortunes, its judicial power ceased to be absolute. The archons were obliged on leaving office to render an account of their administration before the general assembly of the people, to which, from that time the real sovereignty belonged. The archon *eponymous* had within his jurisdiction only questions of status and inheritance. The creation of ten *stratiges* elected annually took from the archon *polemarch* nearly all his military authority, and by the extension of power given the *heliasts*, the six archons *thesmothete* were transformed into simple examining magistrates. Aristides by a law opened the archonship to all classes of citizens. Shortly after, Pericles and Ephialtes substituted drawing by lot for election. The candidates were not admitted until after an examination, and a decision by the assembly of the people. Once in office, they continued under the supervision of the *nomophylactes*, new magistrates charged with maintaining the law, and who might veto every act of their administration. To sum up, their judicial power was limited to the repression of the simplest misdemeanors punishable with a

small fine.—Thus deprived of all their authority in favor of the people, the archons, like the consuls at Rome, survived all the governments which followed one another in Greece and their name is found in an edict of Galien in the third century of the Christian era. M. BLOCK.

AREOPAGUS. The origin of the Areopagus is of such remote antiquity that the ancients themselves did not know the precise period of its establishment. When Solon, in 595, undertook to give Athens a new constitution, he found in the Areopagus, a court of justice, whose jurisdiction he extended and modified, leaving it the right which it seems to have always possessed of trying the crimes of murder, mayhem, and treason. He made it in addition a kind of conservative senate and a court of appeal. Specially commissioned to oversee the city, the education of children, and the private life of citizens, to moderate luxury, to keep up the obligation to labor, the Areopagus became by degrees a tribunal of judgment on morals, whose power rested chiefly on public opinion. It would be difficult to define nicely what its authority was. Before the assembly of the people it demanded, and often obtained, the revision or repeal of laws, of judgments and even of simple decrees; but it would seem that this was done not by virtue of any recognized right. The creation of ten tribunals of *heliasts*, withdrew from its jurisdiction the cognizance of the greater part of ordinary crimes, and it is permissible to suppose that the repression of sacrilege and crimes against the state was at last its only prerogative. Like all the Athenian magistracies, the Areopagus was abolished by the democratic reforms of Clisthenes, Ephialtes, and Pericles. Beginning with 459, the censorship of morals which was its principal source of power was taken away from it by Ephialtes, in spite of the protests of the aristocracy. Thenceforth the Areopagus existed as an institution venerated by all but playing no active or useful part in the state.—The members of the Areopagus (their number was not limited) were chosen from among the ex-archons. They were appointed for life, after a solemn examination. Presided over by the second archon they passed judgment in the night with ceremonies intended to impress the imagination. Their decisions were originally without appeal, but by virtue of a privilege which we find to have existed in Rome also, the accused could escape the sentence hanging over him by voluntary exile. M. BLOCK.

ARGENTINE CONFEDERATION. The Argentine Republic, in South America, is bounded, on the north and the east by Bolivia, Brazil, Uruguay, Paraguay and Montevideo; on the southwest by the Atlantic ocean, on the south by Patagonia, and on the west by Chili. Its area inclusive of the disputed portion of the Gran Chaco is 841,000 square miles. According to the census published by the government of Buenos Ayres, in 1872, the Argentine Republic had

1,877,490 inhabitants, including the population of the national dependencies of Chaco, Misiones Pampa and Patagonia. In the republic proper, there are 1,748,355 inhabitants, of whom 897,780 are males and 845,572 females. These figures represent the civilized population. The number of savages or half breeds is about 100,000; but other authorities make it 300,000. The capitals of the fourteen provinces into which the confederation is divided contain in the aggregate 300,000 inhabitants, or about one-fourth of the whole population of the country. In the province of Buenos Ayres, one-half of the population of cities is composed of foreigners. In the fourteen provinces there are 610,432 inhabitants of cities, 1,114,160 inhabitants of rural districts, and 12,330 inhabitants of river islands.—The mixture of races is not so great in the Argentine Confederation as in other parts of Spanish America. But the difference in habits and intellectual culture between inhabitants of cities and those of the rural districts, has created between the two classes an antagonism which, on account of the crimes and acts of violence it has caused, is second to none of the most lamentable race-antipathies recorded in history.—During the war for independence, from 1810 to 1819, all the provinces composing the vice-royalty of La Plata were, in a measure, united. While hostilities lasted, they recognized willingly enough the supremacy of Buenos Ayres which, proud of its wealth, the intellectual superiority and the high standard of culture of its inhabitants, assumed the title of the Athens of the south. Buenos Ayres conducted the war for independence, furnished arms, money, soldiers and generals to Chili and Peru, and opposed a barrier to the invasions of Brazil, by the establishment of the state of Uruguay. The whole political drama of the Argentine Republic which, at first, seems to present, during the last fifty years, only a personal conflict, turns mainly upon the antagonism between Buenos Ayres and the provinces. Commerce and industry, and intercourse with Europe, are monopolized by Buenos Ayres; the other states of the confederation are purely agricultural countries where the primitive mode of living of the early colonists, and even the Indian life of the *Guachos* shepherds or nomads still exist. The alternate success of the two factions accounts for the changes in its political constitutions. Buenos Ayres imposes on the other states a uniform constitution, European codes, a regular government, civilization and its accessories, all of which do not appear equally reasonable to the rural population accustomed, as they are, to an almost savage independence. The latter naturally find allies among the lower classes in Buenos Ayres and other cities; while the notabilities and the educated, who govern Buenos Ayres according to European ideas, are supported by the rich, country land owners. It is therefore the difference between Europe and America, cosmopolitan civilization and local independence, which excites the conflict between the *Blancos*

and the *Colorados*, between the moderates and the progressionists, the unionists and the federalists. Federalism is among Latin nations, and more especially among the Latinized states of South America, the form taken by the tendency called, according to circumstances, anarchy or liberty, and which, in times of triumph, leads to sanguinary dictatorships, as was that of Rosas.—This general observation which sums up the history of fifty years of apparent political confusion, relieves us of the necessity of entering into details of the revolutions of La Plata. It is sufficient for us here to point out the unifying or federal character of the four constitutions which there succeeded one another.—Independence having been proclaimed, a federal constitution, modeled on that of the United States, was tried. Subsequently, between 1820 and 1827, an effort was made to effect a union of the several states. The union party, between 1820 and 1830, surrounded by an almost barbarous population, endeavored to realize all the political liberty, social reforms, and economic progress, which now constitute the programme of the most enlightened portion of the liberal European party. But the constitution of 1826, was opposed by the military chiefs, whom that instrument was intended to reduce to subordination; by the clergy, who thought their property and influence were endangered by it; and also by the inhabitants of the rural districts, the *Guachos*, who feared interference with their old way of living.—The conventions which intervened in 1829, 1830, and 1831, after the overthrow of the unionist constitution of Dec. 24, 1826, reorganized the Argentine Republic on the basis of a federation which conceded to the provinces complete political independence in their internal affairs, and left them at liberty to manage their own financial affairs. The provinces guaranteed to one another full liberty in commerce and navigation. The conduct of foreign affairs was delegated to the captain general of Buenos Ayres. He was also intrusted with the conduct of the military affairs of the provinces. Rosas was clothed with these powers from 1829 to 1852.—Rosas maintained himself in authority twenty-four years, by causing the whole national power to be vested in him by a legislature which granted everything he desired. A popular organization, *La Mazorca*, assisted the dictator by ridding him of his adversaries. His endless quarrels with France and England, and his struggle with Montevideo are well known.—The constitution, adopted in 1852 after the fall of Rosas, gave a wide range to the executive power, but it also gave the country a true share in the management of its affairs. Nothing of essential importance was changed in the internal organization of the provinces. The congress, composed of a chamber of fifty representatives, and of a senate of twenty-eight members appointed by the provincial chambers of representatives, was invested with the right to take a part in the making of all laws relative to the finances, and, if need be, to take the initiative in the making

of such laws. The congress was also authorized to ratify diplomatic treaties and conventions.—From a purely political point of view, the provisions of the constitution of 1852 met with little practical opposition; but, from a financial and economical point of view the case was very different. The provinces would have been very glad to have a share in the customs duties at Buenos Ayres. On the other hand, Buenos Ayres which, under Rosas, defrayed its expenses with customs duties, was opposed to this. The utmost that Buenos Ayres would do, was after having taken from the proceeds of the customs what it needed, to relinquish the surplus to the confederation. In 1853, a conflict of interests separated Buenos Ayres from the thirteen other provinces, a separation which was continued throughout the presidency of the statesman who had placed himself at the head of the movement against Rosas. During all this time the two divisions of the Argentine Republic kept up a war of customs duties, which inured to the benefit of Rosario, a port situated on the river La Plata. Finally, in 1859, after a short struggle the two parts of the confederation concluded a peace at San José de Florez, on June 10, and Jan. 6, 1860, they signed an act of union.—In the same year, the constitution was revised. The executive power is vested in a president elected for six years by the legislature. There is a vice-president who presides over the senate. The president, with the consent of the senate, appoints the cabinet ministers. The members of the chamber of representatives are required to comply with certain conditions as to age, residence, and property. Each province in the confederation has its own legislature and governor, who bears the title of captain general. Political rights are everywhere made to depend on property qualifications or the exercise of a profession. Foreigners may become naturalized after a residence of two years in the country.—The federal capital is really Buenos Ayres; but from time to time its right to be the seat of government is contested. A law passed on Oct. 8, 1862, by the federal congress with the concurrence of the local government of Buenos Ayres, authorized the federal office-holders to reside at Buenos Ayres for five years. This limitation having expired on Oct. 8, 1862, a motion was made in the senate to have the seat of government remain in Buenos Ayres, which was to become federal property. The autonomists proposed, in imitation of the United States, to convert some unimportant territory into a federal district, and to make Rosario the capital. This last proposition was favorably received by the chamber of representatives, but rejected by the senate, but it was not decided to retain the capital at Buenos Ayres. A middle course was adopted. The federal minister of the interior restored to the governor of the province of Buenos Ayres the exercise of local jurisdiction with which the central power had been vested for five years only. In this way the national government is satisfied with the right of

simple residence at Buenos Ayres. The proposal to transfer the capital to Rosario was renewed, without success, in 1872.—The civil law is the same as in Spain. In commercial matters, the Bilbao ordinance still governs. The legal interests of the poor are committed to special advocates.—Before the constitution of 1860, the Catholic religion was the state religion, but it is now only the dominant religion. All foreigners are free to worship according to the dictates of their own conscience. Public education is committed to the care of a superior commission. Primary instruction, exclusively in the hands of the clergy, is in a very low state. Higher instruction is given in two colleges which are subsidized by the state. The degrees necessary to practice the professions of medicine, of law, and of the ministry, are conferred after an examination by a board of physicians, a commission composed of magistrates, and a committee of canons appointed by the bishops.—In civil and criminal matters, there are two degrees of jurisdiction and a supreme court.—The army is composed of 6,861 men, of whom 2,090 belong to the infantry, 2,861 to the cavalry, and 712 to the artillery, the national guard of cities not included. The staff of this small army is not so numerous as in the other Spanish republics. The navy is composed of a few small vessels, one of which mounts twelve guns.¹—The resources of the state are derived mainly from customs duties. Other duties, such

as stamp duties, taxes on residences and professions, do not amount to one-tenth of the receipts. The revenue receipts seem to vary between 18,000,000 and 20,000,000 dollars. The expenditure exceeds 25,000,000 dollars, and the deficit is made up by a national loan.—The national debt is rather large: it is divided into the home debt, foreign debt and the deferred debt. The total debt of the state of Buenos Ayres proper is about 10,653,000 dollars, and of the Argentine Confederation 12,000,000 dollars. The interest on this debt varies from four to nine per cent. There is, besides, a paper money debt of nearly 400,000,000 dollars. Twenty-five of these dollars or *piasters* in paper are equivalent to one *piaster* or *peso* in coin.—In 1871 the national debt was thus divided: the British loan of 1824 at six per cent. amounted to 20,764,000 francs; the British loan at three per cent. was 25,000,000; the foreign debt, 5,000,000 francs; another British loan, 56,000,000 francs; the sum due to Brazil, 6,600,000 francs; and a loan negotiated in London in 1871, at six per cent., with a sinking fund of two per cent., amounting to 150,000,000 francs. The foreign debt, therefore, amounted to 269,850,000 francs, the old home debt reached 183,500,000 francs, while the home debt, contracted since 1871, amounted to 30,000,000 francs.—A large part of the Argentine Confederation is yet uninhabited. This country is furrowed by a magnificent system of rivers, navigable for a long distance, which renders travel

¹ The following statistics relative to the Argentine Confederation are from the Statesman's Manual for 1881. The estimated sources of revenue and branches of expenditure for the year 1879 were as follows:

Sources of Revenue.		Branches of Expenditure.	
	Pesos fuerte.		Pesos fuerte.
Import duties.....	11,000,000	Interior.....	2,014,793
Export duties.....	2,500,000	Foreign affairs.....	105,480
Warehouse duties.....	350,000	Finance.....	912,943
Stamps.....	750,000	Public debt.....	7,979,612
Telegraphs.....	50,000	Army.....	4,493,065
Post-office.....	300,000	Navy.....	616,972
Audine railway.....	70,000	Justice.....	1,188,748
Tucuman railway.....	70,000	Total expenditure.....	17,311,613
Gusaguay railway.....	10,000		£3,462,322
Miscellaneous receipts.....	1,789,120		
Total revenue.....	16,889,120		
	£3,377,824		

The budget for 1880 estimated the revenue at 18,762,061 pesos, or £3,752,412, and the expenditure at 18,381,718 pesos, or £3,676,343. The interest on the public debt was calculated at 8,429,057 pesos, or £1,685,811, being 450,000 pesos, or £90,000 more than in 1879. The other principal items in the expenditure were estimated as follows: Internal administration, 3,452,000 pesos; department of justice, 1,326,000 pesos; war, 4,416,000 pesos; marine, 650,000 pesos. The customs duties on imports and exports were expected to yield, the first 13,000,000 pesos, and the latter 2,500,000 pesos. The probable railway receipts were set down at 650,000 pesos, and the receipts from the postal and telegraphic services at 450,000 pesos, in the budget for the year 1880.—More than one-half of the total expenditure of the confederation is for the interest of the public debt, home and foreign. The internal liabilities were stated to amount to 64,855,000

pesos, or £12,971,000, at the end of 1873. The foreign debt, at the same date, amounted to £8,497,200; it was entirely raised in England. The foreign debt consists of three loans, negotiated in 1824, in 1868 and in 1871. Of the first there was outstanding, in 1879, the amount of £1,501,300, of the second £1,853,600, and of the third £5,142,300.—The greater part of the foreign loan of 1868, to the amount of £1,950,000, was issued by Messrs Baring Brothers, London, at the price of 72 for 100. It is to be repaid in twenty-one years. The most important of these foreign loans, that of 1871, amounting originally to £6,122,400, was granted by congress for the construction of railways and other public works. It was issued in London at the price of 88½, under promise to be redeemed by a sinking fund of 2½ per cent. before the end of 1892.—Besides the liabilities here enumerated, there was a floating debt in treasury bills, and comprising also loans made to the national government by the provincial bank, to the amount of 13,240,000 pesos, or £2,640,000, at the end of 1877.—The above statement of the revenue, expenditure and debt of the Argentine Confederation refers to the national or general government, called upon to defray the expenses of the army and navy, of the foreign department, and to meet other obligations imposed upon it by the constitution. Each of the fourteen provinces, or states, of the confederation has a revenue of its own which is derived by the imposition of local taxes. Buenos Ayres, the most important state of the confederation, requires annually above £1,000,000 to meet the expenses of its government, law courts, chambers, militia, country schools, and other public institutions. The liabilities of all the states are internal, with the exception of Buenos Ayres, which contracted a foreign loan of £1,034,700 in June, 1870, in England. The loan, issued at 88, with interest of 6 per cent., was to be redeemed at par in 33 years.—ARMY AND NAVY. The army of the confederation, now in course of reorganization, consisted, at the end of 1876, of 6,183 men, comprising 2,612 infantry, 3,189 cavalry, and 409 artillery. There were besides a militia and national guard, numbering 19,867 men. The army was commanded at the same date by 8 generals, 138 colonels, 140 majors, and 674 other officers, being a total of 955 commissioned officers, or one to every 7

and intercourse very easy. Its animal, vegetable, and mineral wealth is immense. The present government has done much to favor immigration, but the condition of its finances does not allow it to keep all its promises. However, although the immigrants can count, as in all other countries, only upon their own resources, the tide of immigration continues unabated. According to the last census there are in the Argentine Confederation 211,994 foreigners, of whom 151,241 are in the province of Buenos Ayres; of the latter 43,663 are Americans from the United States, 71,442 are Italians, 34,060 Spaniards, 32,383 French, 10,709 English, 5,860 Swiss, 4,997 Germans, 1,966 Portuguese, 832 Austrians, and 5,860 natives of other countries. In the city of Buenos Ayres there are 88,126 foreigners, of whom 41,957

are Italians, 13,998 Spaniards, 13,402 French, 12,139 Germans, 542 Austrians, and 603 Americans.—The confederation being wholly an agricultural country, it imports from Europe nearly all the wrought and manufactured goods consumed in the republic. The English have established an important bank in Buenos Ayres. Their exports to the Argentine Confederation amounted in value, in 1863, to 33,300,000 francs, and in 1870 to 57,000,000 francs. The existing lines of railways are also in their hands. In 1864 a new company was formed with a capital of 1,600,000 pounds sterling, to open a railroad between Rosario and Cordova, the capital of the province of the same name. Besides the grant of the line, the company, with a view to colonization, also secured a grant on both sides of their line of 900,000 English acres

men, rank and file.—The navy of the confederation consisted, at the end of the year 1876, of 26 steamers, as follows:

STEAMERS.	Number.	Guns.	Horse-power.	Tonnage.
Ironclads.....	2	12	1,500	3,400
Gunboats.....	6	16	1,950	2,400
Torpedoes.....	3	440	700
Brigs.....	12	50	3,020	1,700
Transports.....	3	600	300
Total.....	26	78	7,510	18,500

The navy was commanded, at the end of 1876, by two admirals, and 74 other officers, and manned by 2,900 sailors and marines.—The increase of population in recent years has been due chiefly to immigration. In each of the six years from 1871 to 1876 the immigration and emigration were as follows:

YEARS.	Immigrants.	Emigrants.
1871.....	20,928	10,686
1872.....	37,037	9,153
1873.....	76,332	18,236
1874.....	68,277	21,340
1875.....	42,066	21,518
1876.....	30,965	13,487

The immigrants of 1877 numbered 23,708, and those of 1878 numbered 35,876. The great majority of the immigrants are natives of Italy and Spain.—TRADE AND INDUSTRY. The imports into the confederation consist chiefly of manufactured cotton and woolen goods, machinery, coal and iron, while the exports are made up to the amount of more than one-half by wool and tallow. The foreign trade is chiefly with Great Britain.—The commercial intercourse between the Argentine Confederation and the United Kingdom is shown in the subjoined tabular statement, which gives the total value of the exports of the confederation to Great Britain and Ireland, and of the imports of British and Irish produce and manufactures into the confederation in each of the five years from 1875 to 1879:

YEARS.	Exports from the Argentine Confederation to Great Britain.	Imports of British home produce into the Argentine Confederation.
1875.....	£1,359,783	£2,386,002
1876.....	1,664,029	1,543,532
1877.....	1,639,376	2,092,100
1878.....	1,099,838	2,317,638
1879.....	823,365	2,063,254

The three staple articles of Argentine exports to the United Kingdom are skins, tallow and untanned hides. The value of the skins, mainly sheep, amounted to £145,245, of the

tallow £110,042, and of the hides to £88,476, in 1879. The imports of British produce into the Argentine Confederation consist chiefly of cotton and woolen manufactures, and of iron. The value of the British cotton manufactures imported in the year 1879 was £770,020, that of woollens £298,890, and that of iron, wrought and unwrought, £232,480. A network of railways, constructed in part at the expense of the state, has been in progress for several years. The following statement gives the length, in English miles, together with the proprietorship, of the various lines open for traffic, at the end of 1878:

RAILWAYS.	Proprietors.	Length, Eng. miles.
Western Railway: Buenos Ayres to Chivilcoy and Bragado.....	Provincial Gov'm't of Buenos Ayres..	187
Northern Railway: Buenos Ayres to Tigre..	English company...	18
Buenos Ayres and Ensenada Railway: Buenos Ayres to Ensenada, with branch to Great Southern Railway.....	English company...	37
Central Argentine Railway: Rosario to Cordova.....	English company...	246
Great Southern Railway: Buenos Ayres to Las Flores and Azul.....	English company...	270
Primer Entre Riano Railway: Guaqueguay to Puerto Ruiz.....	National governm't.	6
Andine Railway: Villa Maria to Rio Cuaito.....	National governm't.	158
Tucuman Railway: Cordova to Tucuman ..	National governm't.	341
East Argentine Railway: Concordia to Monte Caseros.....	English company...	96
Buenos Ayres to Campana.....	English company...	50
Total.....	1,409

There were besides, at the end of 1878, railways of a total length of 1,568 miles sanctioned by the government, including an international line from Buenos Ayres to Chili, 894 miles in length.—The total cost of construction of the lines open for traffic at the end of 1878, was £10,874,633, being an average cost of £7,700 per mile.—At the end of June, 1879, there were 4,829 miles of telegraph lines in operation, 3,346 miles belonging to the state, and 1,474 miles to private companies. The total length of telegraph wires at the same date was 9,830 miles. The number of telegraphic dispatches was 214,714 in the year 1878.—The postoffice, in the year 1878, carried 2,166,078 parcels and packets, and 5,045,573 letters.

of land.—France likewise carries on a pretty extensive trade with the country. Its imports into the states crossed by the Rio de la Plata amounted to 26,000,000 francs in 1863 and in 1870, and its exports from these states reached the figure of 31,000,000 francs in 1863, and 61,000,000 in 1870. These exports consisted almost entirely of skins, peltries, wool, and other animal products.—In 1871 there were 985 kilometres of railway in operation, 453 kilometres in process of construction, and 3,625 kilometres granted or projected. There were 2,379 miles of telegraph lines, besides 3,895 in process of construction. — BIBLIOGRAPHY: Núñez, *An Account Historical, Political and Statistical of the Provinces of La Plata*, London, 1825; Woodbin-Parish, *Buenos Ayres and the Province of the Rio de la Plata*, London, 1839; King, *Twenty-four Years in the Argentine Republic*, London, 1846; Mackinnon, *Steam Warfare in the Paraná*, 2 vols., London, 1848; Mansfield, *Paraguay, Brazil, and the Plate*, Camb. 1856; Page, *Report on the Exploration and Survey of the River La Plata and Tributaries*, Washington, 1856; Andree, *Buenos Ayres und die Argentin Provinzen*, Leipsig, 1856; Balcarce, *Buenos Ayres*, Par., 1857; Mannequin, *Les Provinces Argentines et Buenos Ayres*, Paris, 1856; de Moussy, *Description géographique et statistique de la Confédération Argentine*, vols. 1-3 Paris, 1861-4; Burmeister, *Reise durch die La Plata Staaten*, 2 vols., Halle, 1861; Dominquez, *Historia Argentina*, Buenos Ayres, 1861; Beck-Bernard, *La République Argentine*, Lausanne, 1867; Martin de Moussy, *Rapport sur quelques produits Argentins*, Paris, 1867; *Tschudi Reisen burch Südamerika*, 5 vols., Liepsig, 1869.

LOUIS GOTTARD.

ARISTOCRACY. I. THE ORIGIN AND GROWTH OF ARISTOCRACY. The word aristocracy, taken in its etymological sense, means *government by the best*. Taken in this sense, all would agree that aristocracy ought to govern. If ignorance and passion did not cloud the judgment of men, they would call the most capable and most virtuous to rule in nations. This is no doubt the reason why writers of antiquity saw in aristocracy the most perfect of governments.—At present, the word aristocracy has a far more varied meaning. It is now applied to every kind of superiority, and particularly to that of birth. It is necessary, therefore, to extricate from it the different ideas which are bound up in this one word and to see how aristocracy originates and grows. It is the duty of modern publicists to distinguish natural aristocracy from that born of convention and of law.—To say that there is a natural aristocracy, is merely to affirm that there are inequalities resulting from nature itself. Not all the members of a savage tribe have the same degree of physical strength, adroitness, courage or intelligence. There are some who show a marked superiority in warlike leadership and government. Besides these innate gifts, age and experience count for much. The old men form what may be called

the council of the tribe. Time consecrates these distinctions as is shown by the word senate (*seniores*), which attests the respect and importance accorded by civilized nations to men who have had a long and distinguished career. In personal merit and experience we have an aristocracy ready formed against which no theoretical objection of any value can be raised. Men have always and will always agree to grant an exceptional share of influence to the talent which serves and the wisdom which instructs and guides them, by visible marks of consideration, such as rewards and honors.—Parallel with the source of original inequalities which is connected with the organization of each one of us, and with the use which we make of our will, there is another inequality which civilization should not abolish; we mean property, and particularly inherited property. Property even if not transmissible, would still create great differences in the relations of man to man. Just as there are educated and ignorant men, there are rich and poor men, in every nation acquainted with the division of labor and the exchange of wealth. Accordingly, those who can tolerate no species of aristocracy are forced to dream of an equal partition of property among all. But how much the hereditary transmission of landed and personal property adds to this inequality! The wealth accumulated by the father during an entire life of labor and success goes to his children to whom it is frequently but a beginning, and the means of new acquisitions. On this account, we find a purely personal aristocracy by the side of an aristocracy of family.—Is this all? Is property the only institution developed by society? It is not. There is another, growing from day to day—the state. Political society passed through two inevitable phases, before the state was definitely constituted, although government was never entirely absent, even in nascent societies. The first phase continued while the shock and conflict of opposing and more or less anarchic wills was going on. The second witnessed the distribution of power among a certain number of chiefs. This condition approximated to feudalism. It was only later that power was concentrated, and that the state rose in its majesty and force above the divergent wills of individuals who had to be subjected to the empire of law. The aristocratic principle did not perish through this new development of the state. It now became finally fully established, and borrowed from the law the authority which it before asked only from the power of custom. The state finding an aristocracy already in existence approved and organized it, and undertook to add new elements to it. It united great families together, it called them to its councils from all parts of the territory over which its empire extended, it secured to them by wise provisions the possession of their property and titles. It can not be said that aristocracy is in this case artificial.—When an individual has rendered eminent service to his country, the state is merely the organ of public grati-

tude in the granting to him of certain advantages. In the same way, it is but the interpreter and instrument of a natural and general sentiment in the extending of a part or all of these advantages to his family. Although we may discuss the justice, we can not the value of recognizing in the son the merits of the father. Let us remember, moreover, that this sentiment has its origin in the family itself. Is not a family proud of the merits and fame of its head, or of one of its own members who sheds lustre on its name? Are not children proud of their father as the father is of his children? This sentiment is so natural that it extends to shame as well as to glory. A single guilty person possesses the lamentable possibility of dishonoring a whole family. Thus honor becomes a treasure; whosoever increases it is exalted to the skies; whosoever brings a taint upon it robs the family of its respectability and is execrated accordingly. This pride of family which exists in all ranks of society, where it becomes the main-spring of a host of virtues and the most powerful preventive of shameful acts, is greatest in prominent families. It is the support of honor and may extend to the most absolute abnegation or the sublime; but it may also assume the character of barbarism. In these spontaneous feelings, we must recognize that selfish personality is not everything; we must see in them a solidarity which, commencing with the family, extends to the whole nation, when it assumes the character of patriotism. It is in the name of this feeling of solidarity that men have come to believe in privileged races in which are transmitted the most brilliant mental and spiritual gifts, and even a physical organization, which is considered finer and stronger than others. We can foresee the abuses and the exaggerations to which this prejudice may lead. Is the solidarity on which it rests less natural, less fundamental for that? Is it not a fact physiological, moral and social, that human qualities are hereditary? Every religion has sought and given an explanation of this fact. Solidarity in the fall and redemption of man, the community of merit, and prayer, taught by Christianity, would not receive so ready an adhesion if they did not have a basis somewhere in nature. —Among the historical sources of aristocracy there is one which occupies an important place in the destinies of the race—conquest. There are few countries which have not presented the spectacle of at least two races, one superimposed on the other, such in antiquity as the Spartans on the Lacedemonians, not to mention the Indians and Egyptians, or the races of the other portions of the ancient east which was traversed by so many invading armies, and overthrown by so many successive revolutions. Such also were the Franks, the successors of the Romans in a portion of Gaul. Such were the Normans who imposed their yoke on the Anglo-Saxons. Conquest extends and strengthens the aristocracy already existing among the victors: the seizure and partition of conquered lands which become hereditary

in the principal families give it permanency. Its numbers are increased by the accession of those who have played a brilliant part in the war of conquest and by whose services the country was won. It is very easy to see that an aristocracy thus founded on violence, will not hesitate to perpetuate itself by claiming unjust privileges. It is natural that force should be guilty of abuse, and these abuses are far reaching when there is no counterpoise to them. This conquering and warlike aristocracy is able to render service to a country, but it is evident that this service is dearly paid for. What would such an aristocracy not do to secure a monopoly of wealth and honor? It will to reach this end employ the laws the making of which it reserves exclusively to itself, not less than arbitrary power and force. It will establish a jealous line of demarcation between itself and the rest of the population. Hence the struggles between the aristocracy and the people. In Rome while the patricians were in possession of the priesthood, the religious rites, the auguries, the offices and most of the public property, they impoverished the people by violence, fraud and usury. To issue from this condition and free themselves from servitude, the plebeians demanded admission into the religious community and participation in its sacred rites. It is well known how lively and stubborn the resistance of the patricians was, but they were forced to yield. There remained for the plebeians the acquisition of citizenship, liberty, and the guarantee of liberty, that is, the right of property. The Romans were above all an agricultural people; their law did two things: it ordained the partition of the conquered lands and fixed limits to the extent of possession; but it was violated or eluded. History may be consulted for the recital of the long and energetic struggle which the plebeians maintained in order to shake off this crushing yoke. The office of tribune afforded them the means of regular political action. Little by little, they won admission to the highest grades of military command, to all the magistracies and finally to that of pontiff. This struggle may serve in a certain degree as a type. But there have been analogous cases. The aristocracy of France, even when scarcely more than a nobility, renewed a part of this exclusiveness toward the masses. It would agree to pay no other tax to the country than that of blood, which the people also paid while they had at the same time to defray all the expenses of the state. These are a specimen of the abuses brought about by an aristocracy, and especially by one having its origin in conquest —Let us sum up what we have to say on the origin of aristocracy. Considered in its principle, it is natural. It arises from individual differences and social circumstances. When it thus arises, it can not be considered altogether artificial, for the social state is the natural condition of man. Property and inequality of condition are necessities of the social state recognized by the law. Aristocracy is a result of these necessities, since it manifests itself as soon as

superiority makes itself felt. Not only does it exist in countries governed aristocratically, but no people can get on without it. It has as a guarantee of its continuance, the respect which will always attend every kind of superiority, and the power of family spirit. We shall not attempt to justify in detail this aristocratic element which is recognized by nations most imbued with the principles of equality. To dispute its legitimacy, we should have to descend to an absolute equality of condition which yet would not prevent nature from distributing its gifts very unequally. The doctrine of an absolute equality of condition needs no refutation. This leveling equality such as the communists conceive it, is unjust in itself. It puts industry and idleness, foresight and thoughtlessness, virtue and vice, on the same footing; and leads to the most complete stagnation, by taking from individual effort all prospect of advancement, from capital the concentration which makes it fruitful of benefits, from men all possible leisure and all refined culture. But man is so constructed that there is but a step from use to abuse, and from evil to good. There is no institution which does not take advantage of its necessity to society to become exclusive and tyrannical.—Such vice and suffering result from aristocracy that many persons not knowing the providential and salutary principle of its corruption and excess, have condemned the principle of aristocracy itself. The iniquities of an artificial and violent aristocracy have made men hostile to a just and natural aristocracy. To acquaint these levelers of the necessity of the aristocratic element, we have offered the preceding reflections on its source. It is to them, and to the too exclusive partisans of the political preponderance of aristocracies that we offer the following considerations, deeply convinced as we are of the principle, that no political society and no government can thrive except through a mingling of the various elements, any one of which would become fatally oppressive through exclusive domination.—II. THE OBJECT OF ARISTOCRACY, ITS MERITS AND ITS FAULTS. Every political society has a twofold object, its own preservation and development. Its institutions answer to this end and accomplish it each in its own way. Aristocracy, therefore, represents in society more especially solidarity and tradition, while democracy represents essentially personal merit and the spirit of innovation. Even when aristocracy plays a conservative part, it is impossible to refuse it due homage. Nations do not live from hand to mouth, and the present has need of enlightenment from all the glorious reflexes of the past. Pascal compared humanity to a single man learning continually. Aristocracy is the ballast of a ship, the play of the winds and waves. It represents perpetuity in government. Without it, the hereditary rights of families possessed neither of great fame nor wealth would soon be unprotected, for that which in the possession of the rich and powerful would be destroyed would not be suffered

in the feebler and poorer. Ancient families, both in home and foreign affairs, are like the imposing figure of national power and glory. A writer of the sixteenth century, Jean Bodin, in his *République*, paints them in this energetic manner: "The condition of the republic is more firm and stable being fixed upon good houses, upon great immovable pillars as it were, which could not support the weight of a great structure if small and slender unless they were greater in number." But, we may ask, is this conservative part the only one which the aristocracy has to play? It is not. And here we have one of the most essential elements of the question, one which it is as dangerous as it is frequent to ignore. Under pain of abdication, it is necessary that the aristocracy become an instrument of progress, and above all that it oppose no insuperable obstacles to progress. At Rome, where the aristocracy yielded only foot by foot before more than legitimate plebeian demands, it was able to live only by concessions which did not save it from finally falling under the crushing weight of the Cæsars. In England where it is so favorable to social progress, it appears with considerable éclat; it remains popular and full of life. It is in this sense and on these conditions that an aristocracy which understands its duties may be considered as an indispensable agent in civilization. It aids in every improvement. It is not merely the personification of the feeling of patriotism, but it represents it with a delicate and courageous pride. It encourages arts and letters. Without haughtiness toward inferiors, it bestows a patronage on all who labor and wish to elevate themselves, which does not humiliate. To this it adds care for the suffering. Haughty only toward the power which is ready to trample morality, justice and law under foot, it shows itself, with respect to the masses of men, more penetrated with the feeling of duty than with pride of privilege.—This is the ideal. We need not add that no aristocracy has ever come up to it and many are scandalously remote from it. Those whose memory has been preserved to us by history present generally a mixture of the virtues and vices which the aristocratic spirit engenders successively or at once in varied proportions, according as the aristocracies in question performed their task well or ill.—This is approximately a fair picture of their qualities and defects, when aristocracies play a preponderant or at least a prominent part in the state. We can not deny to aristocracies not altogether degenerated, a masculine energy, at times sombre and harsh, as at Rome and in the republic of Venice. They afford the best examples of the dignity and independence to be expected from individuals who, subjected to the rude trials of public life, have nothing to ask of any one.—They commend themselves no less in times of advanced civilization, by their habits of elegance and taste than by military courage. The most striking traits of an aristocracy, in a political sense, are sequence and depth of design. The Roman senate, the

governments of Venice and England furnish evident proofs of this. Aristocracy creates a political class devoted by occupation from youth to the study and the art of government. It is this which made it possible for a man like Pitt to be prime minister at the age of twenty-three. Many faults of an aristocracy border closely upon its good qualities; others are the opposite and mark the decay of the body itself, such as the spirit of servility under absolute monarchs. The principal faults which history finds in it are the pride of a narrow caste, the disdain of all labor except that of war, contempt for humanity which it treats as the plaything of its pleasures or as the tool of its ambition. What history is there which does not tell of, what theatre which does not show us the insolence and debauchery of the heir of a great house, and the impertinent frivolity of courtiers? Even in the bosom of aristocratic families, harshness toward woman, despotism toward children, the systematic sacrifice of the younger members of the family to the idea of primogeniture, are traits frequently noted and to which attention has been often called. The action of customs and laws, the influence of a religion which favors sentiments of humility and charity, must tend without doubt to diminish among individuals those faults of the aristocratic spirit. But they reappear very soon again when aristocracy is left without a counterpoise. It is, therefore, indispensable to confine it within proper limits, and this applies with equal justice to all other political elements. Left to its inclinations, it is more exempt from excess than an absolute monarchy or a pure democracy. As has been shown by Aristotle and after him by Montesquieu, it tends to become an oligarchy. Under this form, it hesitates at no abuse of power and gives government a basis more and more narrow and egotistical.—One of the most important problems of modern times will be to reconcile that part of aristocracy which is found in all society with the inevitable and just progress of democracy, which will not, even in the interest of its own continuance, descend to absolute leveling. We must see how aristocracy can adapt itself to this situation. Let us follow it then under the different forms of government and see its action under a monarchy, an exclusive aristocracy and a democracy.—III. ARISTOCRACY UNDER A MONARCH, IN A PURELY ARISTOCRATIC GOVERNMENT, AND IN A DEMOCRACY—PROBABLE FUTURE OF ARISTOCRACY IN PURELY DEMOCRATIC STATES. There is no form of royalty, unless it be a despotism pure and simple subjecting everything to the crushing level of a uniform tyranny, which does not like to surround itself with great families. There are two reasons for this. The first is that it is natural for royalty to seek counsel and support from those whose rank brings them nearest the throne. The second consists in a certain sameness of origin and nature of royalty and aristocracy. What is a dynasty ordinarily but an aristocratic family which has reached supreme

power, either by the success of arms or by rich and powerful marriage alliances, which have extended its domains and established its authority over that of its former peers? Who can fail to see also that the idea of royalty and aristocracy are the same? Both rest on the idea of inheritance. It matters little that among publicists there are some who recognize in this principle of inheritance a veritable divine right, while others see in it a purely social institution, formed less in the interest of those who enjoy it than in the interest of all. The hereditary principle which retains the same families around the same throne, becomes no less the permanent trait of royalty than of nobility. Aristocracy appears therefore in so-called limited monarchies as an intermediate and moderating body between the king and the people. When monarchy is absolute or tends to become so, it has nothing more at heart than the abasement of the aristocracy. This the monarchy did in France. It was not satisfied there with lowering the aristocracy (and let us note this well) as a feudal power; it ruined it politically by the systematic nurture of excessive centralization which crushed out all opposition and left nothing but functionaries in existence. Thus the political power of the aristocracy grew weaker and weaker until nothing remained but a haughty and brilliant nobility, vain of their titles, frivolous and brave, still occupying a number of high offices, devoted to the prince but devoid of all influence on the course of public affairs and powerless among the people. This is a picture of the French nobility under Louis XIV. and Louis XV. We know what a bitter complaint was wrung from Saint Simon by this debasement and what helpless plans were made to regenerate this fallen aristocracy which had ceased to have any point of contact with the nation. Not content with waiting in the antechambers of a minister or a courtesan, it put itself, in the person of its most illustrious representatives, at the feet of the banker Law. It is, therefore, for the general interest that aristocracy should maintain an important political position in monarchies. Otherwise royalty would fail of support, and the people be without a guide. The tendency of monarchy would be to arbitrary power, and of the people to agitation. There would be a wide field for revolution and a narrow one for liberty.—A purely aristocratic government puts an aristocracy to the difficult test of all political powers which have no checks or balances outside themselves. Moreover aristocratic government does not necessarily always appear under the same form. It exists in England side by side on the one hand with monarchy whose object seems to be to preside over its destiny while occupying the lofty place which individual ambition would struggle to attain if it could, and on the other with the popular element which it governs, but which in our day hotly contests the mastery with it. If we suppose the aristocracy standing alone, a republic is the natural form of the aristocracy. Rome exiled its kings and became an aristocratic

republic. Many of the Italian republics of the middle ages assumed the same form. Is it not too evident that if the republic had been maintained in England, it would not have been to the advantage of democracy? How can we help saying as much of the league in France, notwithstanding the support it met with among the people? Could the triumph of the Guises as well as that of the Protestant leaders, have had any other result than the success of a pure aristocracy? Would that pure aristocracy have proclaimed a republic? Would it have come to terms with royalty reduced to a subordinate position? That is the secret of history, one of the enigmas the solution of which we know not. The author of the "Spirit of Laws" has laid down the rules of aristocratic government. He has given to monarchy honor as its principle, to democracy virtue, and to aristocracy moderation. The somewhat subtle reasons which he assigns for this may be reduced to the following: that the nobles must be self-repressive and not turn against the people the laws of which they are the depositories and the organ. Montesquieu draws the pictures of a kind of ideal aristocratic government, which has been realized only in very few cases and at rare periods. He insists greatly on absence of pride and splendor, and on the modesty and simplicity which nobles ought to exhibit. The two principal sources of disorder should be banished from government. "extreme inequality between the governing and the governed, and the same inequality among those who govern" Montesquieu therefore blames the nobles for exempting themselves from taxes and imposing burdens upon the people. He approves taxing the principal personages of the state as well as others and even more. He fears extreme wealth among the aristocracy not less than extreme poverty. Everything which tends to equality in the aristocratic class seems good to him. "The law," he says, "ought to deprive the nobles of the right of primogeniture so that by the continual partition of property fortunes may ever tend to equality. None of the means employed to perpetuate the greatness of families should be permitted." In giving utterance to these ideas he seems to have had in mind the government of Venice which carried out these principles. He accorded extensive and even exorbitant privileges to the aristocracy in a monarchy, privileges which he refused it in a purely aristocratic state. This is not inconsistency but precaution. In a monarchic government the aristocracy is limited, in an aristocratic one it is not, and should submit itself to rules calculated to maintain its power without rendering it odious. This is why Montesquieu approves, in principle, institutions like those of the ephors at Lacedemonia and state inquisitors in Venice. "The best aristocracy," he says, "is that in which the part of the people who have no share in power is so small and poor that the party in power has no interest in oppressing it. Thus when Antipater established a rule in Athens that

those who had not property to the amount of 2,000 drachmas should be excluded from the right of suffrage, he formed the best possible aristocracy, because this property qualification was so small that it excluded but very few people and none who had any consideration in the city. Aristocratic families ought therefore to be as far as possible of the people. The nearer an aristocracy approaches democracy, the more perfect it is, and it is less perfect as it approximates to monarchy. The most imperfect of all is where the part of the people which obeys is in civil slavery to those who command, as the aristocracy of Poland where the peasants are slaves of the nobles."—It seems indeed, although he does not mention it, that Montesquieu had the English aristocracy in view when he spoke of those who do not lose connection with the great body of the people. It is not that it realizes the ideal of the simplicity and equality dreamt of by the author of the "Spirit of Laws," who recalls the lessons of philosophers and the political writers of antiquity. In England, fortunes are immense and the right of primogeniture is established. The privileges accorded the aristocracy have caused it to strike root in the clergy, the army, the navy and the colonies. But it has never separated its interests from those of the nation. By its attachment to country life it fulfills its duty as the patron of the agricultural population. It has thus avoided the sad example of the French nobility who desert their landed estates to lead an idle life in the cities. It has not thought commerce beneath it. It has taken the lead in the economic progress of the country. When we seek for the causes of the success of this great aristocracy which has thriven in presence of the ruins heaped up by revolutions in other countries, we can, I think, reduce them to the following: In the first place, local habits (that of the mingling in every-day life of great and small, rich and poor for instance) have established among the people bonds of respect and gratitude which unite them to the aristocracy. The result is to make the interests of all one. In the second place, the fortunate circumstance which has divided the British aristocracy into two camps saves them from stagnation and corruption, by introducing among them the necessary principle of competition. If there had been only whigs, the aristocracy would have been inclined to excess, to innovation which runs the risk of degenerating into revolution. If there had been only tories, their conservative tendencies would have subjected them to the no smaller inconvenience of maintaining an aristocracy in a state of stagnation and resistance. England has had the singular fortune of possessing parties more impassioned than any other but with a profound respect for the fundamental principles of the constitution. Consequently no political body since the great revolution which has settled its destinies once and forever, has been less exposed to the alternations of languor and violent crises which elsewhere have injured the political constitution of the country.

In the third place, and the circumstance is decisive, this aristocracy has continued ready to earn the fortunes to be won in manufacturing industry and commerce, as well as the rewards of scientific and literary labor. The father of Sir Robert Peel was a cotton spinner. Macaulay, the great historian, who received the title of lord, is an instance of this intelligent liberality which brings into the ranks of the aristocracy all the social forces capable of adding to its strength and brilliancy. It has been remarked that the English aristocracy which does not hide the plebeian origin of some of its members and knows how to recruit its thinned ranks from labor as well as from the army, places birth so little in the front rank of the advantages it seeks, that the English language has no equivalent for the French words *mésalliance* and *parvenu*. This explains how a man like Fox, of a more aristocratic origin than Pitt, should have been able to remain all his life the chief representative of popular interests. This explains, too, how the Tories have finished by showing themselves almost as progressive as the Whigs by the sacrifice of the rotten boroughs and of the protectionist corn laws. It is certainly proper to condemn the too frequent Machiavellian policy of the aristocratic government of England with regard to foreign nations. And it must be acknowledged also that this aristocratic government has more than once shown itself harsh and corrupt at home, intolerant and oppressive to minorities. But how can we refuse our admiration to an aristocracy which has known how to correct abuses and which corrects them every day; which has conferred political equality on Ireland, emancipated the Catholics; which has given civil and political rights to the Jews, sacrificed the prohibitive system, broadened the electoral basis, proclaimed parliamentary reform, and which we doubt not will raise up against its younger sons the formidable competition of the commoners? To give the example of every kind of agricultural progress and to favor it among others by all the means of publicity and association, to watch over the material and moral wants of the laboring classes, to be occupied in remedying the unhealthiness of workmen's dwellings, to establish schools for the indigent, to tax itself heavily for the poor; to have a part in everything done for the advancement of science and the development of credit, is a noble rôle, a grand spectacle—a spectacle the more imposing and a rôle the more splendid in that the aristocracy is not seconded by the state and that it accomplishes by unceasing individual efforts more and better things than are accomplished by governmental mechanism elsewhere. We can not be astonished after this that since the fifteenth century we do not find in the history of England anything like a serious revolt of the lower against the upper classes. The aristocracy accomplished in silence the revolution which in France was so noisily accomplished on the night of the 21st of August, 1789. It gave up the tributes, the humiliating services and the privileged jurisdiction of

the feudal system. To-day it has no surer ally than the agricultural classes.—Is the democracy, which in many countries is becoming more and more important, to exclude the aristocratic element, such as we have defined it, from society and a share in public affairs? To put such a question is to answer it. If democracy condemns privileges securing the monopoly of government to a certain class unjustly favored by the laws, it can not, without injury to itself, reject the natural aristocracy born of enlightenment, services performed, and all kinds of superiority recognized and sanctioned by society. How can the political utility of the aristocratic element in a democracy be denied? Has democracy no need of tradition or restraint? The division of legislative power into two chambers even in the most democratic nations is destined in a great measure to contribute to this element. Men specially distinguished by experience and age are sent to one of these—men who have rendered brilliant services to the state, men of large possessions and known family. For if it is neither indispensable nor desirable that birth should be an absolute title to respect, it necessarily attracts the attention of men. This has been witnessed even under the recent democratic republic in France. To be the son or brother of a celebrated member of the convention became a species of republican nobility. The title of count was not bestowed on him, but the man was made a deputy or a counselor of state simply because of his name.—Let us not rebel against these facts; they are rooted in human nature. It is no more indifferent to the public that a person is of such or such a family, than it is to foreigners that a man is born in such or such a country.—That which is condemned and without appeal by modern thought is the proud pretension that there are certain races created to govern, while the rest must forever obey. The prejudice of race exists neither in presence of the Christian religion, which sees in all men brothers, nor in that of philosophy and the progress of thought. The pretense of the aristocratic element to become exclusive would meet with an invincible obstacle in this sentiment of equality which has descended down among the masses, and a formidable rival in the accumulations of industry and wealth. Aristocracy may go into mourning for its ancient privileges. It is scarcely to be believed that duchies will be created again for the purpose of making dukes or marquises for marquises. The *éclat* of these titles which formerly rested on solid realities will disappear with the illustrious families of another age which still serve as decorations to the present; but if the top of the tree is to be severed from it, let us hope that it will not be entirely beaten down. The wighty causes which form in every society, in proportion as it is more developed, an aristocratic element, exist in democracy with this additional circumstance, that where all unjust inequality and illegal oppression have disappeared, it is necessary that superiority of every kind

should assert itself. A democracy which does not take account of any kind of superiority, or even which does not take into account all kinds, can not escape continual and wretched agitation. It will consume itself and surely fall a victim to chance and transient despotisms, with intervals of anarchy.

HENRI BAUDRILLART.

ARISTOCRATIC AND DEMOCRATIC IDEAS. The politics of democracy considers the equality of men the fundamental law of nature, the supreme law of the state. The politics of aristocracy, on the contrary, finds the basis of all political order in the natural differences between men. An equality of rights is, therefore, the fundamental principle of democracy; a preference for the nobler, that of aristocracy. Democracy hates this preference as a most damnable privilege, and aristocracy despises that equality as low vulgarity. The democrat says: "Equal rights to all citizens; to all citizens an equal share in the government; no privileges." The aristocrat says: "To the better citizen higher rights; not to the common crowd, but to the more select, belongs the preference in government."—There is evidently a fraction of truth in both these views, but in neither the whole truth. They both fall into error, because they keep constantly striving in blind one-sidedness after their acknowledged half-truth, and do not see the other owing to their precipitateness. Equality of rights, of course, finds a very good foundation in the common nature of men. But if this alone is kept in view, and no regard paid to the equally evident differences between men, then the state is an impossibility, inasmuch as it is unthinkable without some visible distinction made between the rulers and the ruled. When no difference is admitted there can be no political order, for to order means first to discriminate or distinguish. The reproaches so often brought against democrats, that they drag what is noble down into the dust, and through their leveling processes finally place power in the hands of the lowest mob, are justified to a certain extent, because of this exaggeration of a principle correct in itself. —Conversely, the aristocratic view can justly appeal to human history, since history emphasizes the differences between men. History, too, shows plainly the differences which move, separate, unite and distinguish them from one another. Logic can not raise any objection to the principle: the better deserve the preference in public life.—But since aristocrats follow this fragment of truth blindly, they forget the universal, human principle which naturally binds the nobler to the common. They do not reflect that the state is, to begin with, the community of all, and not a society of the better. They thus disengage themselves from human, popular connection; and while they look down with contempt upon the low crowd which they alienate from themselves, they do not perceive that they are losing the ground from under their feet, and that their superiority, in consequence,

becomes an empty privilege and fiction. Their vain and haughty overestimate of self leads to an ignominious fall, while the ridicule of the offended and despised multitude pursues them in that fall. Just as the error of both views lies in the one-sidedness with which each, clinging to its fragment of truth, severs it from the other indispensable fragment, so the whole truth lies in the union of both these fragments. We have to connect the natural equality with the historical inequality of rights, and while leaving to both ideas, as far as they are true, what belongs to them, we must avoid the errors and exaggerations into which narrow-minded democrats and aristocrats fall.—II. Democracy says that the second law, a consequence of equality of rights, is this: "The will of the majority of citizens is the will of the people. The minority must submit to the majority." Aristocracy asserts in turn: "The better minority is not to be governed by the worse majority. Not numbers, but morality is decisive. In a well ordered state it is not a question of quantity, but of quality."—Here again the danger lies in one-sidedness. The majority of the people is, under any circumstances, a power in the state worthy of careful consideration. The masses are the natural basis of the whole state; they constitute the greatest physical power and generally the greatest intellectual power in the state. He is no statesman who regards the masses as mere matter placed in his hands for him to play with at his pleasure. This error is dangerous, especially in our time, when even the lower masses have awakened to the consciousness that they are men, and that at least in this respect they are the equals of their rulers. But neither is he fit to rule who listens only to the wishes of the masses and serves the will of the majority, even when the majority desire for themselves what is bad and destructive, or when they, in slothful calm and heedlessness, oppose necessary reforms.—Numbers, that is to say, the majority, are really decisive only on the supposition of equality. When the majority and minority are on an equal footing, and the latter possesses no evident superiority over the former, then only the visible superiority, that of the greater number on the side of the majority, is calculated to incline the scales in its favor. It is, therefore, a quite natural law, which, from time immemorial, has been acknowledged by all nations which have understood the meaning of law, that every assembly formed by several persons of the same position, such as a council, a chamber, a municipal body, a corporation, expresses, as a rule, its collective will through the will of the majority of its members present. —But numbers, in other words this majority, are not decisive where a dissimilarity in the factors is presupposed. When a minority occupies a higher position in public life than the majority, then the former and not the latter should turn the balance. The different successive grades in public and judicial administration are an application of this rule. The

higher courts are everywhere in a minority compared with the more numerous lower ones; and still the higher courts decide (of course by a majority within their own body, because the members stand all on the same level) and not the opinion of all the lower courts, even when unanimous.—III. The contrast re-appears again in the *valuation* of the majority. The principle of a majority, as such, demands that *that* only be recognized as the majority, and consequently as the collective will, for which more than half the voting members have declared themselves. The absent can not by right come into consideration because they do not vote. This form of voting meets with an internal difficulty only when the number of votes is even and divides into two equal parts. The scales are therefore in equilibrium. If out of 100 votes there are 50 ayes and 50 nays, no party has the preponderance. Where this can not be remedied by the supposition that there being no majority, there is consequently no decision at all, then the president's vote is estimated at a higher value, so that the 50 votes with that of the president will weigh more than the other 50. The inconvenience of a tie is also avoided by granting the president no vote unless there is a tie, when he has the casting vote. In both cases the vote of the president is valued differently from that of a simple member; and the unequal value of a vote prevents the mathematical balance in voting. With the last method, however, it can happen that the vote of the president may be of less value than that of an ordinary member. In elections, the casting of lots is also resorted to in case of a tie, and the decision made by blind chance. Deciding by a relative majority is so opposed to principle that it may be used, at most, only in the case of indifferent questions, for the sake of expedition; for the relative majority is in reality often the minority, and there is no reason for giving among equal members the preference to a few over the majority. The same favoritism of the minority results from the admission of a larger than a simple majority, as for instance two-thirds, or three-fourths, because if seven out of twelve votes do not form a majority the five in opposition decide. This departure from the rule can be approved only when important interests of the minority give them increased weight, as for instance when their interest is such as to warrant their having a certain number of votes.—IV. It is further a democratic idea that "public offices and dignities should be open to all." The aristocratic idea, on the contrary, is: "The rude and ignorant man is to be kept far from office, and access to the same is to be given only to distinguished men." The utmost consequences of the first one-sided principle are visible in the ancient democracy of Athens, where most offices were given by lot, which, although a blind method, presupposed an equal ability in all citizens, and discriminating election was rejected on principle as an aristocratic institution. The extreme application of the second method tends to

the exclusion of all the lower classes of the people from office, and makes office a privilege limited to the noble classes as the only ones capable of governing. Hereditary offices are the aristocratic counterpart to the offices by lot of the democracy. Modern law endeavors by uniting these opposite principles to deprive them of their one-sidedness, and has adopted the fruitful truth: "The road to office is open to all, but only the man who distinguishes himself above others reaches the goal." Equality is the basis, distinction is the development.—V. Frequent change of persons intrusted with public power is a democratic, permanence in place and office an aristocratic principle. Change favors the equal participation of all in public affairs, and hinders the creation of an authority placed above the people. On the other hand, permanence in office strengthens the authority of those in power and secures a hierarchy in the official aristocracy. For this reason we find short terms of office and frequent elections in all democratic states. It is clear that the exaggeration of this tendency weakens official authority which is essential in every state, and afflicts the people with a periodical election fever. But where aristocracy has a thorough, although one-sided training, all change ceases, and offices are conferred for long periods or for life, as in many aristocratic states of the middle ages, or even according to hereditary principles, on certain aristocratic families, as in the German empire. The modern states, especially monarchies, seek to unite impartially the advantages of the two opposing principles, and to avoid their defects. Where it is a question of the representation of popular interests and opinions, as in the constitution of the legislative body, the system of election at certain intervals is followed. But where it becomes a matter of filling positions of power, measures are taken to insure the firm authority of these, and also to secure the position of the official against changing opinions, without, however, having recourse to the extreme of hereditary office.—VI. Respect for evident authority is peculiarly natural to the aristocratic mind. Long established authority is all the less doubted and all the more willingly obeyed, when people are accustomed to it from youth. On this account the aristocracy pays special respect to tradition, and seeks to preserve it from generation to generation. It has a preference for noble races and inherited distinction, clings to the right of inheritance whenever practicable. It is right in all this and perverts the right only through exaggeration, by opposing with stubborn enmity newly budding life, and claiming for the vanquished and dead, rights which belong only to the living. In contrast with this, democrats lay especial emphasis on popular liberty, and demand free movement for the masses. Not tradition but the national will of the time is the lauded fountain of right at which they drink. They do not deny the power of tradition, but they will not be hindered by it in their path toward the desired end. Wherever

tradition stands as a barrier in their way, they break through it without hesitation. Democratic opinion is easily deceived by taking the reasonable will of the people and the capricious or passionate whim of the crowd as the same thing, and to judge as right what is pleasing to the latter without considering that before all, right *is*, exists, and has not to be made; that it must be recognized and respected, not established at will. It also confounds freedom of the people with the domination of the people, and thinks the first is secured and realized most easily by adopting and exercising the latter. But in a healthy civil and political organism, authority and freedom, repose and movement, right of inheritance and progress, tradition and law, exist not isolated from, but connected with, each other.—VII. The splendor of authority and the dignity of its formal appearance are also characteristic traits of aristocracy; democratic opinion sets little value on this, and even almost fears that the equality of citizens will be put in jeopardy by the choice robes of their dignitaries; and universal freedom endangered by the solemn pomp of public authority. Used in moderation (and the immoderate ceases to be beautiful) a noble form of outward appearance serves to show forth the dignity of the state and increase respect for it. The difference in the two theories is well illustrated in public buildings. The public utility of such buildings which is the thing first, and sometimes exclusively considered by the democracy, is of course not to be lightly thought of, and is in every case, practically, the chief consideration. But beauty and ornament, which are generally the work of an aristocracy—as artistic gifts and distinction are by nature aristocratic—lend public buildings also an ideal value and have an elevating and ennobling influence on the minds of the people generally. In this respect the Athenians, in other regards extravagantly democratic, were highly aristocratic. As aristocratic natures have a fine understanding for dignity of form in general, so also they have a lively sense of personal honor. The rising of aristocrats from the masses has always been accompanied by an increase in their feeling of honor. A nobility can better afford to surrender power than honor. When this feeling of honor, however, degenerates into an insolent overestimate of self and a contempt of the lower classes, it goes beyond its bounds; but in a healthy state the feeling of honor is a great moral power. The democratic mind places all value in the general human and national honor, and disregards or even hates any higher degree of honor. This general feeling of honor is indeed the most important, and a people in whom the feeling of human dignity is active, has reached, indeed, a high degree of civilization. It is also the natural foundation of all higher honor which springs forth like a blossom from the stem. The democratic envy which strives to pull down everything which struggles upward deserves to be punished with contempt. But the democratic desire for a

recognition of the honor of man, is well founded in the divine order of things. If man is created in the image of God, then man as such has a just claim to the recognition and protection of his honor. Here, too, the popular democratic doctrine of honor appears as the foundation; but the special growth of higher honor, as an aristocratic development. J. C. BLUNTSCHLI.

ARITHMETIC, Political. Three different meanings are attached to this word, which was more used during the last century, than in our day, and which is rarely found in contemporary political economy. Some use it in a rather vague way, applying it to reflections upon social economy in general, or more especially to researches on population, agriculture, etc.; others employ it as a synonym for the science of statistics, calling to its aid political economy, to explain the causes and significance of the facts established by figures; to others still, it means simply the calculations and processes, arithmetical or algebraic, by the aid of which, from these facts, inductions and conclusions are formed which have not been directly established, but which are admitted by way of analogy, proportionality or probability.—Arthur Young published under this title a work in which there are scarcely any figures, and which treats of the causes which, in his time, had made agriculture flourish in Great Britain, and of the causes which stood in the way of the advance of that great industry in other lands. His French translator, Freville, compiled from a work of Arbuthnot, also translated from the English, a volume, under the same title, upon the utility of large farms, and another volume without the name of the author, likewise translated from the English, treating of the condition of agriculture in the British Islands. The term political arithmetic was therefore used by Young and his translator in the first sense.—It is in the last sense, however, that it is used by J. B. Say, who has devoted a chapter to it in his *Cours*, (part 9, chap. 3.) It is in this last sense that it should be used in order to avoid confusion in the terminology of economical science.—M. Moreau de Jonnés in his *Eléments de statistique*, made political arithmetic, understood in the sense of J. B. Say, one of the two methods of statistics. He terms it the method of induction in contradistinction to the method of exposition which he recommends by way of preference, and which consists in registering all the numerical data, that constitute the elements of a given subject, in grouping, combining and even reducing them, or, to speak more correctly, in co-ordinating without altering them.—When Vauban, at the commencement of the 18th century, estimated the agricultural products and the revenue of France, upon the basis of the investigations which he had made in a small number of localities; when Lavoisier, in 1790, calculated from the number of plows the extent of land under cultivation, and the amount of production and consumption in France; when Lagrange esti-

estimated the consumption of food by the whole population on the basis of that of a soldier, by supposing that one-fifth of the inhabitants were under ten years of age, and that two children and one woman consumed only as much as one man; when Necker, not venturing to undertake a general census, in 1784, calculated the number of inhabitants from the number of births, by adopting the ratio of one birth to every 25 inhabitants; when Chaptal, in 1818, gave the extent of arable lands, of vineyards, meadows and forests of the whole of France, at a seventh of the surveyed territory, and starting from the hypothesis that the other six-sevenths were identical in extent, with the first, as well in natural quality as in the uses made of them. Vauban, Lavoisier, Lagrange, Necker and Chaptal were workers in political arithmetic. When Arthur Young hit upon the idea of cutting up the map of France, estimating the parts and drawing conclusions from the notes he had been able to make upon certain localities, he pushed this method to the limits of possibility. "When one studies," says M. Moreau de Jonnès "the results which Vauban and Lavoisier have obtained by these strange processes, we are astonished to find in them all the characteristics of truth, and we are tempted to believe that there are men of genius who are endowed with the prescience of numbers and whose penetrating minds reach their object even following a vicious method. We can not refuse this preëminence to Necker, who was guided by the example of two distinguished statisticians, Messance and Montyon, and who surrounded himself with all the data necessary to eliminate error."—We can easily see to what errors these calculations applied to the facts established by statistics might lead, and understand by the use to which they have sometimes been put, the discredit into which the works of certain statisticians, quite unworthy of the name, have fallen. It would be very wrong to confound with such men those who collect facts with intelligence, perseverance and honesty; who correct one method by the other; who use the processes of induction and the rule of three only with the greatest circumspection; and reason solely upon facts or figures drawn from a good source; who draw conclusions only from the particular to the general, taking local or even accidental facts and applying them to a whole country or an entire epoch.—A writer who respects himself should have nothing to do with political arithmetic, unless he has no other means of calculation, and in this case itself, it is his duty to be sure of the solidity and exactness of the bases upon which he grounds his reasoning. This, several writers or publicists, of our day, who have discussed facts relative to poverty or other delicate questions of social economy, seem to have forgotten.—There is a branch of arithmetic which has been remarkably developed, and which to-day constitutes a science apart. We mean the calculus of probabilities, that is to say the application of calculation to questions of insurance, of life annuities. JOSEPH GARNIER.

ARIZONA, a territory of the United States, originally part of the territory of New Mexico, was organized by act of Feb. 24, 1863. Its present territory consists of parts of the Mexican cession and the Gadsden purchase (see ANNEXATIONS, IV., V.). The southeastern part of its former territory, below the parallel of 37°, now belongs to Nevada. (See TERRITORIES.) A. J.

ARKANSAS, a state of the American Union, formed from the Louisiana purchase (see ANNEXATIONS, I.; LOUISIANA). It was separated from Missouri as Arkansas territory by act of March 2, 1819. No enabling act was passed, but a popular convention, Jan. 4, 1836, claiming "the right of admission into the Union, consistent with the federal constitution, and by virtue of the treaty of cession by France," formed a state constitution (see TERRITORIES), and under this Arkansas, after much opposition, was admitted by act of June 15, 1836. The boundaries of the state were fixed by the constitution as follows: "Beginning in the middle of the Mississippi river at the parallel of 36° 30' north latitude; thence west to the St. Francis river; thence up the St. Francis river to the parallel of 36° north latitude; thence west with the Missouri boundary line, and south with the Indian territory boundary, the Red river, and the Mexican (Texas) boundary to Louisiana; thence with the Louisiana boundary to the Mississippi and up the Mississippi to the place of beginning."—The constitution fixed the capital at Little Rock. The governor was to hold office for four years. The powers of the legislature as to slavery were similar to those of Alabama. The state was made suable in its own courts, but this privilege was abolished by amendment, Feb. 12, 1859.—In politics the state was steadily democratic in both presidential and state elections until the close of the rebellion. A whig opposition was maintained until 1856. In 1849, in a scarcely contested election, the vote for governor was 3,290 democratic, and 3,228 whig; but in all other years the whig vote was generally about thirty per cent. of the total vote. After 1856 the American party, or know-nothings, and the constitutional union party, took the place of the whigs with about the same proportion of the total vote.—In 1861 the state at first showed no disposition to secede, preferring "co-operation" (see BORDER STATES, SECESSION). In state convention, March 18, a conditional ordinance of secession, to be submitted to popular vote, was defeated by a vote of 39 to 35. Instead of it an ordinance was unanimously passed submitting to the people, at an election to be held on the first Monday of August, a choice between secession and co-operation. The convention was to be re-convened and its action governed by the result of the election. The proclamation of president Lincoln, April 15, (see REBELLION) and a demand for a quota of troops from Arkansas to enforce it, caused the re-assembling of the convention, which passed an ordinance of secession, May 6, by a vote of 69 to 1. It purported to re-

peal, abrogate, and set aside all laws and ordinances whereby the state had become a member of the Union, to dissolve the union existing between Arkansas and the other states, to resume to Arkansas the powers delegated to the federal government, to absolve her citizens from all allegiance to the United States, and to reinstate Arkansas in the rights and sovereignty of a free and independent state. May 18, the state was admitted as one of the confederate states.—The people of the section of the state north of the Arkansas river seem to have been unionists from the beginning, for arrests of suspected persons by the confederate and state authorities in that part of the state became general toward the end of 1861. In September, 1863, Little Rock was captured by the federal army, and steps were immediately taken to reorganize the state government. By special orders from president Lincoln an election was called for March 28, 1864, but in the meantime a state convention had formed a new constitution which abolished slavery and repudiated the right of secession and the rebel debt, but restricted the right of suffrage to white male citizens. The constitution was ratified and state officers chosen, March 14. In September the confederate forces regained about two-thirds of the state and reorganized their legislature, but within a month they had again lost the state, this time forever. The "loyal" state government retained control of the state until its functions were suspended by the act of March 2, 1867 (see RECONSTRUCTION). Under the provisions of this act a state convention met Jan. 7, 1868, and adopted a new constitution which acknowledged paramount allegiance to be due to the United States, denied the right of secession, made suffrage universal (excepting persons under disabilities by the 14th amendment), and repudiated the rebel debt. This constitution was ratified March 13, 1868, and the state was re-admitted June 22. The state passed at once under republican control, and the disfranchised classes kept up an intermittent disturbance of the public peace for some years. In 1870 a section of the dominant party, commonly known as "brindletails," became dissatisfied with the republican administration and joined the democrats in assailing it and impeaching the governor for bribery and corruption. In 1872 the republican governor ordered the registration law of 1871 to be disregarded and the law of 1868 to be followed, thus again disfranchising the persons whose disabilities had been removed since 1868. The legislature, in January, 1873, canvassed the votes thus cast and declared Baxter, the regular republican candidate, elected by 3,111 majority; but the democrats claimed a majority of 1,598 for Joseph Brooks, the brindetail candidate, indorsed by the democrats. Brooks, after several suits in different courts, obtained judgment of *ouster* against Baxter in a circuit court, and seized the public buildings by an armed force, April 15, 1874. Civil war followed until the legislature met, May 13, and called for federal inter-

position. This was at once given, and the Brooks forces were disbanded. The principal result of the disturbance was the calling of a state convention for July 14, 1874. It formed a new constitution, which was ratified by popular vote. In addition to the provisions above given of the previous constitution, it took away all patronage from the governor and reduced his term of office to two years; prohibited him from suspending the privilege of the writ of *habeas corpus*, and from proclaiming martial law; and abolished all registration laws. The state has since been democratic.—The name of the state is taken from that of its principal river, an Indian word which has no known meaning, but has no connection with the name of Kansas. Its pronunciation was declared to be *Arkansaw* by a resolution of the state senate in 1881. The state is popularly known as *The Bear State*, from the supporters of its coat of arms.—GOVERNORS: Jas. S. Conway (1836–40), Archibald Yell (1840–44), Thos. S. Drew (1844–8), John S. Roane (1848–52), Elias S. Conway (1852–60), Henry M. Rector (1860–64), Isaac Murphy (1864–8), C. H. Smith (military governor under general Ord, March, 1867–July, 1868), Powell Clayton (July, 1868–January, 1873), Elisha Baxter (1873–7; superseded by new constitution, November, 1874), A. H. Garland (1875–7), William R. Miller (1877–83)—See Poore's *Federal and State Constitutions*; *Tribune Almanac*, 1838–81; Appleton's *Annual Cyclopædia*, 1861–80; and authorities cited under SECESSION and REBELLION. No history of Arkansas has been published. On the question of its admission as a state, see TERRITORIES; 1 Benton's *Thirty Years' View*, 627; 12, 13 Benton's *Debates of Congress*. The act of March 2, 1819, is in 3 *Stat. at Large*, 493; the act of June 15, 1836, 5 *Stat. at Large*, 50.

ALEXANDER JOHNSTON.

ARMISTICE. In the course of a war, it frequently happens that hostilities are suspended for a time. At the close of an engagement it is agreed, between the belligerent parties, to stop operations, for a short period, in order to bury the dead. The commanders of contending armies may wish to hold a conference, to have a parley, or to enter into an arrangement for the surrender of a besieged place. There may also be other reasons for a suspension of hostilities, at a given time or place. These suspensions are ordinarily of short duration, and, therefore, are called simply suspensions of arms, especially when they are only temporary, and hostilities may be resumed without any previous notice. But there are circumstances in which suspensions of arms are prolonged, as, for instance, when both parties feel that an effort should be made for the restoration of peace. A protracted cessation of hostilities, mutually agreed on by the belligerents, is called an armistice.—The term truce which seems to have fallen out of use in diplomatic language, can properly be applied only to a general armistice of long duration.—When the hope of restor-

ing peace makes it advisable that an armistice should be sought for, and the belligerents wish to enter into negotiations to that end, it is customary to begin with an agreement that hostilities shall be suspended at all points, sometimes without previous stipulation as to what shall be the duration of the armistice.—Although an armistice is only a military convention, it is obligatory, not merely on armies but on nations themselves, in the same way as international treaties are binding. Hence, the breaking of an armistice has always been considered one of the gravest violations of the law of nations. A suspension of arms should, therefore, be concluded in the name of the sovereign, and by persons having power to bind the country. It is generally assumed that the commander-in-chief of an army receives with his commission, the power to make any agreement of a military character. He is authorized to appoint, from among his officers, the commissioners and plenipotentiaries charged with the duty of concluding a military contract, reserving to himself the right to ratify it. This authority is not even restricted to the person of the commander-in-chief. The commander of a detached or an isolated corps, who is not in direct or immediate communication with his superior officers, may properly agree to a particular armistice, so far as it concerns the corps or the detachment under his command. When there is question of a general armistice, it is usually understood that such an armistice is a convention more political than military in its nature; and even a commander-in-chief should not agree to the terms of such a convention, if he be not specially authorized to do so by his government, and if there be not a previous understanding to that effect between the rulers of the belligerent nations.—There are instances of armistices having been concluded directly between one government and another, through the medium of their representatives or ministers; but in most cases, even when the suspension is general, of long duration, and agreed upon by the governments of the belligerent parties, the military authority is charged with the drawing up of the terms of the armistice, and with the care of its execution.—The duration of an armistice must be agreed upon in the terms of the armistice itself, and this must be done with the utmost precision, that a renewal of hostilities may not be feared while one party is under the impression that the armistice has not expired. Even when the duration of an armistice is long or uncertain, it is customary not to resume military operations until after due notice has been given, declaring the armistice at an end. On the occasion of a memorable armistice concluded in 1813, at Plesswitz, in Silesia, between the French army on the one side, and the Russian and Prussian armies on the other, the following provision was inserted in the text of the agreement: "The armistice shall last until July 20th, inclusive, and six days more, during which to give notice of its termination. Hence, hostilities shall not be re-

newed until six days after the armistice shall have been declared at an end, at the headquarters of the respective armies." Subsequently the armistice having been prolonged, the following clause was added: "The armistice shall be prolonged until the 10th of August. Neither of the contending parties shall declare the armistice at an end before that time. If, at the expiration of that time, the armistice shall be declared at an end by either of the interested parties, then six days' notice thereof, shall be given. Therefore, hostilities shall not be renewed until six days after the armistice shall have been declared at an end."—The declaration of the expiration of an armistice is all the more indispensable when the duration of the armistice has not been previously fixed.—An armistice is binding from the day it is concluded; but military commanders, charged with its execution, are responsible for its observance only from the day they are notified of the armistice. Hence, an armistice should be promulgated, and governments are responsible for the damage caused by too tardy a notification of the fact of its existence.—During an armistice, armies ordinarily maintain their respective positions, and can not rightfully commit any hostile act. Hence, besiegers can not prosecute their offensive operations, nor the besieged throw up new works of defense, repair their breaches, etc. But there is nothing to prevent each of the belligerent parties from availing itself of the suspension of arms, to do, within its own borders, anything to improve its position, such as to levy troops, provide supplies, etc. Neither party is bound to maintain a strict *statu quo*, save within the limits embraced in the armistice, and as to matters relating to the armistice.—It depends on the terms of the armistice whether the citizens of hostile states may freely trade with one another, whether passports are necessary, and who may issue them. Many other things depend upon the terms of the armistice. Thus, the re-victualing of a fortress during an armistice may be sometimes allowed, for instance when the position is of little importance, or its capture is certain within a short time: but the re-victualing of a fortress should be denied when its capture might decide the fate of the war. It is evident that it is better to decline an armistice than grant an advantage for which there could be no equivalent.—The whole law of armistices may be reduced to one principle: provide for as many contingencies as possible. ROYER COLLARD.

ARMIES, Standing. The first half of the 19th century will be forever memorable in the history of mankind as the most productive period in industrial wonders. The results which we have succeeded in obtaining from steam, from atmospheric pressure, from electricity, and other natural forces are, in certain respects, so wonderful, that had they been predicted a century ago, such a prediction would have been regarded as an extravagant illusion.—Who, for instance, in 1750, could have believed that we should find in

the expansive force of steam a power of such utility as compared with which all human and animal strength would scarcely admit of comparison; and that this force when applied to great ships would impel them against the most rapid currents, and across the whole width of the Atlantic in eight days; that when applied to our railroads, we would be able to travel at the rate of from 45 to 60 miles an hour; that our cities and dwellings would be brilliantly illuminated with a gas extracted from coal; that an engineer would search in the bowels of the earth, at a depth of 1,700 feet beneath the soil of Paris for an inexhaustible fountain of pure water, which he would cause to spout to a height of 60 feet above that same soil; that an artist would be able to compel rays of light to work for him, that is to say, to fix permanently the image of objects, with an exactness and faithfulness that neither the pencil nor the brush will ever be able to equal; that we would succeed, at last, by means of the electric telegraph, in subduing an invisible, intangible agent, of a nature entirely unknown to us, to such an extent as to compel it at will to transmit words at the distance of hundreds and thousands of miles? Assuredly, if these wonders and many others could have been predicted a hundred years ago, their prediction would have been overwhelmed with ridicule—Nevertheless, whatever power these unlooked-for evidences of progress may have added to our productive agents, to our comfort and civilization, our social existence remains imperfect, or improves but very slowly; politics, so far from following in the wake of industrial progress, actually seems to retrograde; the conditions of its amelioration appear so uncertain, or are so generally ignored, that after decades of commotion and of revolution, France, for instance, is still in search of a form of government which will be able, without the imposition of too heavy taxes, to fairly guarantee its freedom and protection.—It is here that human intelligence has to contend not only against forces which bend to its service from the moment their secrets are discovered, but against passion, against old prejudices propped up by vanity, against interests founded on ignorance and injustice. These obstacles, however, are not insurmountable; and although they may be able to retard the progress of political or economic order, they can not stop that progress, for the truths of this order, as they become better known, derive very great support from all interests suffering unjustly, while time inevitably weakens everything founded on error or iniquity.—The political reform of the greatest consequence and the one most earnestly demanded by the requirements of the age will consist, if not entirely doing away with, at least in greatly lessening the standing armies maintained by the nations of Europe. We venture to assert that this reform will take effect in the near future, however opposed by the ambition of certain classes, and the pusillanimity of others. It seems to us im-

possible that Europe, industrious and civilized Europe, can for any length of time persist in that strange policy, which, spite of the evident wishes of its citizens to avoid all international warfare, and notwithstanding the effective peace of thirty years which preceded the revolutionary crisis of 1848, has compelled them to maintain both land and sea armaments more extensive and more ruinous than they had ever been before.—It is now some time since enlightened men of the United States, of England, of Germany, and of France exerted themselves to give practical effect to the idea of extirpating this cause of ruin and misery which, everywhere diametrically opposed to industrial pursuits, renders almost null the most brilliant and most fruitful discoveries for the bettering the condition of the masses. The idea of the Abbé de Saint Pierre, considered chimerical by many, that of substituting arbitration for brute force in great international questions, obtained in England such a number of supporters as to induce Mr. Cobden, the famous leader of the free trade party, to believe it possible to successfully bring the subject before the house of commons. In a session of parliament he made a motion tending to commit the English government to the policy advocated by the Abbé de St. Pierre; and this motion, notwithstanding its somewhat unusual and eccentric nature, was supported by seventy-nine votes. If one reflects upon the determination that the English have ever evinced in the matter of reforms, of which they have once felt the propriety or usefulness; if we will but call to mind what obstacles, apparently insurmountable, have been overcome by the agitators of the abolition of slavery, the changes effected in the system of promotion, in the old laws of navigation, etc., we can not but hope that a new idea which in its very incipency obtained 79 adherents in the national parliament, is destined to triumph in a future not far off; and if the English government some day joins sides and co-operates with the advocates of this measure, and furthers their salutary wishes with that immense influence which it exerts in Europe and the world over, the system of great standing armies will indeed be near its dissolution.—It will most probably be in France that this great reform will meet with the greatest opposition. The French people are as a class imbued with what is called "the military spirit," which is nothing else than a spirit of silly vanity, with a touch of aversion for useful labor. It appears as if the French were to make good the prediction of Montesquieu: "The military of France will be its ruin." However, the French working classes begin to understand that this military spirit is one of the causes which have most impeded the amelioration of their condition. They are still, indeed, imbued with a large amount of national vanity. The words: "preëminence, supremacy of France," still sway their minds a great deal too much, and they are only too easily governed by the notion that it becomes

them to dictate the destinies of other nations; but they no longer admit the right of maintaining at their expense, in times of peace, of from 400,000 to 500,000 men. This agency of ruin now finds its only supports in those directly interested in its continued existence, and in the exaggerated fears of an influential but relatively small portion of the population. Even in France then we may look for the growth and spread of the principle which seeks to deliver the nations of Europe from the greatest part of the burden imposed upon them by their standing armies. Now one of the most efficacious methods of accelerating the progress of this principle, is to keep constantly before the public eye a statement of the enormous sacrifices required for the maintenance of large armies. —Among the number of economists who have busied themselves with the nature and formation of forces necessary for purposes of national defense and to the maintenance of state government, Adam Smith is, as far as we know, the only one who considered a standing army preferable to a national militia force. According to him the civilization of a country could not be perpetuated or preserved long without a standing army. This opinion he dwells upon at length in the first chapter of the 5th book of his "Wealth of Nations," but his statements indicate that he based his opinions on a social condition of affairs which has long ceased to prevail among the states of Europe. We can judge of this from the following extract: "When a civilized nation depends for its defense upon a militia, it is at all times exposed to be conquered by any barbarous nation which happens to be in its neighborhood. The frequent conquests of all the civilized countries in Asia by the Tartars, sufficiently demonstrates the natural superiority which the militia of a barbarous has over that of a civilized nation. A well regulated standing army is superior to every militia. Such an army, as it can best be maintained by an opulent and civilized nation, can alone defend such a nation against the invasion of a poor and barbarous neighbor. It is only by means of a standing army, therefore, that the civilization of any country can be perpetuated, or even preserved for any considerable time." —J. B. Say thinks, that far from protecting national independence, a great military establishment is that which compromises it the most, by reason of the aggressive tendencies which it incites among those who have the control of it. "England," he says, "would not have interfered with the intrigues of all Europe, if she had not been possessed of great fleets which she could send out in all directions; and Napoleon, if he had not had at his command the bravest and the best drilled troops of the world, would have directed his ambition toward ameliorating the affairs of France." In this way, the very existence of large armaments incite to war; and war always brings about, in the end, cruel retaliation on those who provoked it. "The ambassadors of Louis XIV.,"

adds J. B. Say, "at the congress of Gertruydenberg were obliged to be silent spectators at the deliberations concerning their master's fate." England, in its war with America, was compelled to surrender its sovereignty over the colonies, and, later on, it was her insular position alone that saved her from threatened invasion. Bonaparte, with a better army than that of any other nation, suffered a more signal defeat than all others. Everywhere the more formidable the army, the more inevitably has it been the cause of war and all its attendant evils. There is not one that has ever saved its country from invasion. J. B. Say further considers whether, in the present condition of Europe, militia forces would be sufficient to preserve the independence of the individual states, and relying upon the opinion of experienced military men, such as Guibert, Lieutenant General Tarayre and others, he decides the question in the affirmative; only, he thinks that for the military corps which require an intricate course of instruction, as the engineers, the artillery and the cavalry, which could not be formed at a moment's notice, permanent provision must be made, but only to such an extent as a purely defensive system may demand. He shows how the maintenance of large naval forces, usually justified on the grounds of protecting and extending commerce, is ruinous to nations, and how little, in reality, they contribute to the extension of commerce. The fact of England's great commerce proves nothing in favor of the excessive increase of its marine service, for its commerce would be quite as great without this appendage. "Is it with sword in hand," asks Say, "that business is successfully transacted? The reason that England can sell her wares as well in the Archipelago, as in the East, and in America, both north and south, is because she understands how to manufacture those things which the consumers of those various countries require, and can make them cheap. Her cannon has nothing to do with it." (J. B. Say, *Cours Complet*, vol. ii. pp. 280-297.) The maritime commerce of the United States is next to that of England the most extensive, and will probably soon equal and even surpass it, and yet the naval power of that great republic is one of the least important. As regards the naval service of France, we can not do better than quote from the excellent remarks on the subject by Mons. Bastiat: "Is a powerful naval service not necessary, it is asked, in order to open up to our commerce new foreign markets? Truly the measures of government in respect to commerce are singular! It begins by flattering it, impeding it, restraining it, and that at enormous expense; then, if any small portion of it has escaped its vigilance, at once government is seized with a tender solicitude for the petty articles which have successfully eluded the meshes of the custom house. We wish to protect our merchants, it is said, and for that reason we exact another 150 millions from the people, in

order to cover the seas with armed vessels. But, in the first place, ninety-nine hundredths of the commerce of France is with countries where our flag-ships have never yet, and never will be seen. Have we naval stations in England, or in the United States, in Belgium, in Spain, in the Zollverein, or in Russia? And so we are taxed more in France than we will ever possibly gain in centimes from the trade of those places.—Moreover, what is it that establishes new channels of commerce? One thing alone, viz.: cheapness. Send where you will goods which cost five or six cents more than like goods of English or Scotch manufacture, neither your ships nor your cannon will effect a sale of them for you. Send thither products five or six cents cheaper, and you will have no need of either cannon or ships to enable you to dispose of them. Is it not a fact, that Switzerland, with not even a brigantine, unless it be on its lakes, has driven from Gibraltar itself certain qualities of English goods, and this spite of the guard ever at its gates? If then cheapness be the sure protector of commerce, in what manner is it that our government sets about to take advantage of it? In the first place, it raises, by its tariff, the price of raw material, of all the instruments of labor, of all articles of consumption; and in the next place, under the pretext of sending out vessels in search of new channels of commerce, it overburdens us with taxes. It is stupidity, the grossest stupidity; and the time is not far off when it will be said of us: The French people of the 19th century had strange systems of commerce, but they ought at least to have refrained from believing themselves to have already reached the epoch of universal knowledge. A very able German author, Mr. Rotteck, published, in 1816, an important work entitled, "Standing Armies and National Militia." He proves, from the history of all wars, from those of the most ancient peoples down to the termination of the wars of 1815, that standing armies, or paid troops, under the sole control of their officers, and knowing no duty but toward them, have never served except to destroy the liberty of nations, and that the liberty and independence of subject peoples has been regained only by its citizen soldiery. "When France had to defend its liberty against the allied sovereigns," he says, "it was the citizen soldiery, mere raw recruits, who effected the triumph of the revolution, and later it was the militia of the Germans, that restored the independence of their fatherland." Mr. Rotteck in that work lays special stress on the mischievous influence of a standing army upon the morals of a people, particularly as it weakens among all classes of citizens the feeling of responsibility, by habituating them to rely upon others for the defense of their dearest interests, and tends but to relax those bonds of solidarity which would otherwise exist.—"A nation," says Mr. Rotteck, "which surrenders the defense of its liberties to any special class, becomes cowardly and incapable of op-

posing the most unjust aggression."—The same thought has been elaborated by an eminent French author. "What innumerable pretexts for war do you not cultivate by the creation of an army of which each member has a career to work out, and in which war is the primary, the only means of success! And the existence of an army of this nature is rendered the more serious, as it is almost impossible to change its tendency, inasmuch as it is not to be expected that men will willingly remain stationary in a profession once embraced as the business of life. * * * Let us add that if such an army by its natural bent is ever ready to compromise our safety, it compromises that safety still more by the extreme weakness to which it reduces us. While it increases our dangers, it at the same time paralyzes the greatest part of our national strength. It dwarfs the nation; it reduces it, in a certain sense, to the size of the army. France, in relation to her enemies, is no longer a people of 30 millions; she is a power of three hundred thousand men. All her strength is inventoried in the roll call of her troops. Beyond this, one sees but a sparse population, inactive, feeble in proportion as the army is strong; and, as they believe themselves, exempt from the necessity of self-defense. * * * Is such an army the best guarantee of our liberties? In order to determine this question, it is sufficient to consider what there is in common between the interests of liberty and the interests of the army as established by the law of enlistment. That law, as we have said, makes a profession of the military service. Are the interests of that profession compatible with those of liberty? Is it possible that the army should prosper, and at the same time that liberty should flourish? The profession of arms flourishes in times of war, liberty in times of peace. The army flourishes by the tribute it exacts, and liberty by labor. The greatest interest of liberty is to curtail power, while to extend it is of the greatest importance to the army. One of the chief interests of the army is to yield nothing to the spirit of reform, because, were this desire for reformation to prevail, it might extend even to the army itself. * * * It is evident that as regards liberty and the profession of arms there exists no conditions of mutual welfare, that the very reverse is the case, and that members of the army, professional soldiers, as such, far from having the interests of liberty to defend, have but the interests of despotism to maintain. It might be true, undoubtedly, that an army such as ours would not lend itself to the maintenance of despotism; but this is rather a disposition we could wish it to have, than one we can do it the honor of attributing to its nature"—It has been frequently urged that militia or a national guard would never acquire that disposition and those habits of discipline which constitute the strength of standing armies; but this assertion, which has some foundation, perhaps, in the case of the militia of those states which have

for a long time past maintained great standing armies, and the militia of which, consequently, is almost reduced to a service of parade, is not at all applicable to the militia which constitute the sole defensive force of their country. The militia of Switzerland have often enough proved that they could sustain the fight against the best troops, and as much can be said of those of the United States. There is nothing that appears to us more instructive and more fit to shake the prejudices prevailing on the subject with which we are engaged than the testimony which we are about to adduce. It is taken from the message addressed to the congress of the Union in December, 1848, by president Polk:—"One of the most important results of the war into which we were recently forced with a neighboring nation, is the demonstration it has afforded of the military strength of our country. Before the late war with Mexico, European and other foreign powers entertained imperfect and erroneous views of our physical strength as a nation, and of our ability to prosecute war, and especially a war waged out of our own country. They saw that our standing army on the peace establishment did not exceed 10,000 men. Accustomed themselves to maintain in peace large standing armies for the protection of thrones against their own subjects, as well as against foreign enemies, they had not conceived that it was possible for a nation without such an army, well disciplined and of long service, to wage war successfully. They held in low repute our militia, and were far from regarding them as an effective force, unless it might be for temporary defensive operations when invaded on our own soil. The events of the late war with Mexico have not only undeceived them, but have removed erroneous impressions which prevailed to some extent even among a portion of our own countrymen. That war has demonstrated, that upon the breaking out of hostilities not anticipated, and for which no previous preparation had been made, a volunteer army of citizen-soldiers equal to veteran troops, and in numbers equal to any emergency, can in a short period be brought into the field. Unlike what would have occurred in any other country, we were under no necessity of resorting to drafts or conscriptions. On the contrary, such was the number of volunteers who patriotically tendered their services, that the chief difficulty was in making selections and determining who should be disappointed and compelled to remain at home. Our citizen-soldiers are unlike those drawn from the population of any other country. They are composed indiscriminately of all professions and pursuits: of farmers, lawyers, physicians, merchants, manufacturers, mechanics, and laborers; and this, not only among the officers but the private soldiers in the ranks. Our citizen-soldiers are unlike those of any other country in other respects. They are armed, and have been accustomed from their youth up to handle and use fire-arms; and a large proportion of them, especially in the western and more new-

ly-settled states, are expert marksmen. They are men who have a reputation to maintain at home by their good conduct in the field. They are intelligent, and there is an individuality of character which is found in the ranks of no other army. In battle, each private man, as well as every officer, fights not only for his country, but for glory and distinction among his fellow-citizens, when he shall return to civil life."

AMBROISE CLÉMENT.

ARMY. The word army denotes the entire body of armed men put on foot and supported by a nation for the defense of its interests or the furtherance of its ambition, greed, or other passion. The term is also applied to any portion of the entire body mustered for special service. Politically considered, the army is a safeguard and should be animated with patriotism, from a military standpoint, it is a machine, and should be so constructed in all its cogs and wheels as to execute efficiently the various military manœuvres; to accomplish which it needs strength, agility, and mobility in all its parts. Whether taken in the sense of a corps manœuvring before the enemy, or in the meaning of the entire military forces of the country, the army comprises all species of arms, as well those of a particular branch, as the infantry, horses, besides combatants such as cavalry; or men, horses and material, as in the case of the artillery and of the engineer corps. It draws after it as a consequence, and as essential to its existence, the creation of great and costly establishments, and also, from a moral point of view, the isolation of a portion of the nation, whose life is subjected to an exceptional regimen.—**I. HISTORY.** Who does not recall the immense armies of Sesostris and Xerxes, and does not wonder how they were composed and supported? The former question is the more easily answered.—The armies of Sesostris, the most famous of which numbered 600,000 foot soldiers and 27,000 chariots, and which overran and conquered Asia, had not the character of permanency. As soon as a war was ended, they were at once disbanded. But the recruiting of these armies was easy, warriors constituting a privileged caste in Egypt. It is said that punishment in the armies of ancient Egypt was inflicted rather on the personal honor and reputation than on the body of the delinquent, a proof of generous ideas among the people and of a wise military organization.—As much can not be said of the Persians under Xerxes. They were at that time degenerated as compared to what they had been during the reign of Cyrus; and yet the Persians were conquered by the Greeks, owing rather to their bad equipment and to the blunders of several of their chiefs, than to any lack of courage.—Although at the outset the king of Persia commanded 1,000,000 men, he did not give battle with very many soldiers. At Platea, he confronted his united enemies with only 350,000 men, and with still fewer on other fields of battle. This is an instance of the fate of large armies.

Far from their native land, they melt away by thousands and thousands. The history of all times shows this.—The use of chariots of war, of which Sesostus had so many, and which were to be found among the Persians, shows the nature of the country in which these people fought. It was essentially a flat country. From Asia westward, the use of chariots gradually diminished. They were seldom seen among the Greeks and never among the Romans.—Greece, divided up among small tribes, never put large armies on foot. In their intestine struggles, these tribes fought with handfuls of men. In their greatest battle, that of Leuctra, they numbered but 14,500 soldiers on one side, and 26,000 on the other. In their foreign wars, the same numerical weakness is observed. Against Syracuse Athens sent 6,300 men. Agesilaus accomplished his Asiatic expedition with 8,300 men, and Alexander the Great, when in command of the whole Grecian force, led against Darius only 35,000 men. The Greeks had but little cavalry. Their infantry consisted of a solid phalanx. The phalanx consisted of hoplites or heavy-armed men, in columns sixteen deep; four columns constituted a tetrarchy, or company of sixty-four men, the essential basis of this tactical formation. The tetrarchies and higher fractions of the army were ranged side by side, almost without any space between them, rendering the phalanx a heavy, compact and unwieldy body. This serious disadvantage was made up for by the individual quality of the Grecian soldiers, for the Greek foot soldiers, heavily or lightly armed (these latter employed in skirmishing about the phalanx), were robust, valiant, and enthusiastically patriotic.—The Roman armies acquired an importance different in more than one respect from that of the Greek armies. The Roman empire, as established by them, was both vaster and more durable than the improvised empire of Alexander.—In Rome every citizen owed military service, and at the beginning of a war the fittest for battle were chosen, just as in Greece; only instead of being subject to draft from twenty to sixty years of age, as at Athens and Sparta, it was only from seventeen to forty-six that a person was liable to be drafted, and between these limits sixteen years were to be spent in actual service, if a foot soldier, ten years only if a mounted one. One of the principles of the military constitution of Rome, was that the cavalry of the state should be recruited solely from the patrician class, who ranked inferior only to the senators. As long as this custom prevailed, the cavalry of the Roman armies were only mediocre, and it was necessary, from the beginning of the Punic wars, to have recourse to auxiliary foreign cavalry; to that cavalry, of which the Numidians, the Iberians and the Gauls furnished the best recruits.—The Roman legion possessed an offensive power which tallied wonderfully well with the ambition of the people from which it sprung. Instead of being ranged in one deep line, like the phalanx, it was formed into three spaced lines. On this chess-board the occu-

pied squares were equal to the empty ones, so that in bringing the second line on a line with the first, there was obtained, when needed, what is known as a full formation, meanwhile preserving as its normal formation detached and movable lines, each ten files deep. These three lines comprised the legionaries, properly so called, which consisted of the *hastati* in the front line; *principes* in the middle, and *triarii* in the rear. These latter (*triarii*) constituted a reserve, and did not number more than 600, half the number of each of the two other lines. Besides the soldiers of the rank, there was, as in Greece, a body of light armed men who opened the battle as skirmishers. These latter were equal in numbers to the *hastati*, that is to say, 1,200 strong. This made 4,200 foot soldiers to the legion, the mean strength of this corps at different periods of its organization. A distinctive feature of Roman army organization is that the cavalry constituted an integral part of the legion, and varying from a tenth to a twentieth of its whole strength.—The consuls commanded the armies. A consular army consisted of two Roman legions, supported by two allied legions, and the fact that there were two consuls tells what was the ordinary composition of a levy: four national legions and four foreign legions. Thus each consul had under his command 16,800 foot soldiers and 1,800 cavalry. Even still later, at the time of the proconsuls, a Roman army seldom exceeded 25,000 men. One of the largest Roman armies was that which fought at Cannæ, one which numbered 80,000 men, and yet was vanquished by Hannibal.—As the consuls were elected for only one year, the command of the Roman armies was frequently changed. Notwithstanding this disadvantage, the Roman armies were eminently successful, except when confronted with genius, as they sometimes were. This fact is owing particularly to the personal valor of the Roman soldier, hardened by exercise from his youth, inured to hardship, battle and privation. The member of a legion carried, in addition to his arms, a sack containing two weeks' rations of wheat, and a stake for the purpose of strengthening the camp inclosure. Even thus burdened, he was able to make long marches.—Let us add, that, in spite of the inflexibility of Roman policy, the legion which had so well served it underwent a transformation, a reaction from one of the revolutions which agitated the forum. Marius, the head of the popular party, admitted as soldiers of the rank, or legionaries, even the proletarians; while up to his time, the possession of a certain income was a condition precedent to the enjoyment of that privilege. The consequence of this admission was to put an end to the hierarchy which existed in the legion. The *hastati*, *principes* and *triarii* were thus fused into one, and armed in the same way. Then the legions were divided into ten cohorts ranged in three lines. The light cavalry while it lost some part of its mobility, continued to have two principal lines, and a third line as a reserve. No better disposition could have been made of these

lines when ranged in order of battle. Cæsar's legion was the cohort legion, and it achieved as great results as the primitive legion.—Even under Cæsar, and to a greater extent under the empire, the conquered provinces contributed to recruit the legions, while the ranks of the army, as well as the offices of the Roman government, were invaded by the conquered. But this is not the main cause of the deterioration in the imperial armies; this deterioration was caused rather by the effeminacy which affected all classes of society. The old weapons were found too heavy, the well-known straight sword was abandoned; the soldier no longer carried his stake and luggage. Light arms, such as the bow and arrow, were preferred; and instead of coming into close contact when fighting, the habit was formed of fighting at a distance, and with machines which increased beyond measure, rather than with soldiers. Thus the way was paved for the triumph of those rude barbarians who invaded the country.—The cohort of this period gradually changed; it sometimes fought entirely apart, and became a mixed corps of infantry and cavalry. The last legion, that mentioned by Vegetius, with its 6,100 foot soldiers formed into two lines only, comprised all descriptions of foot; in the front rank, heavy armed; in the second, mailed archers; then two ranks of light armed foot soldiers; one rank of cross-bowmen, around a machine for throwing projectiles, and last the *triarii*. It soon became necessary to abandon this confused arrangement, and to return to the system of isolated cohorts. The discipline, as well as the organization of the army declined. It suffices to recall the exactions and the mutinies of the prætorian cohorts, in order to get an idea of the disorder which prevailed in the Roman armies, removing the last prop of the empire.—The armies of the barbarians, if the name of army may be applied to the crowd of combatants, accompanied by their wives and children, who invaded the Roman empire, was composed almost exclusively of infantry. Once settled in the countries which they had conquered or which had been ceded to them, these barbarians adopted the military customs of the former owners of the land, that is of the Romans, as did the Visigoths; or else, like the Franks, they preserved the principles of their own barbarian organization, modified by the necessity of holding the conquered people in check. The Franks, before the enemy, retained the deep rank, as may be inferred from the account of the chronicler writing of the victory of Tours, won by Charles Martel, over the Saracens,—that his success was owing to his heavy battalions. They thus massed when on the offensive, and scattered when acting on the defensive, occupying isolated, but important positions.—In the feudal army, the lords themselves came at the summons of the king to fight by his side. Their vassals accompanied them and took part in the battle as a second line. Beside these two lines of horsemen, the one of lords, the other of their vassals, the armies of this period com-

prised infantry, also, but no one was disposed to assume its command, or to have anything to do with it, since for the rich and the powerful the mounted service had many more attractions. This state of affairs was aggravated by reason of the vanity which bred, in the lords, a thorough contempt for the foot soldier, whose powerlessness and want of skill at the moment of danger, were, later, the occasion of so much regret to them. The infantry, consigned to the rear rank, consisted, in feudal times, of only poorly armed peasants, fit only to commence the battle, as skirmishers, and at its close to be employed as pillagers of the enemy's camp. While the infantry was thus dwindling, the cavalry acquired an exaggerated prominence. It constituted a disproportionately large part of the army, and it alone bore the weight of the war; it was the besieging force, attacked posts and intrenchments, to accomplish which it had to dismount. If it had been light cavalry, it would not have been so bad; but it was heavy cavalry, weighed down with iron mail, for the noble cavalry would not fight in any other way; the right of wearing armor being one of the privileges of their rank. Hence, when dismounted, even after throwing off some of their military accessories, they experienced great difficulty in going over a small piece of ground, and were obliged to divide themselves into several bodies. This cavalry of nobles soon formed a corporation of honor, the order of knighthood, to which admission could be had only by proving nobility of birth, courage and good reputation. Among the cavaliers, the most powerful carried *banners*, and the effective strength of armies was reckoned only by *banners*, that is to say by groups of about 30 cavaliers, a fact which shows how little was thought of infantry. The 30 cavaliers belonging to a banner were divided into 5 parts, each part consisting of a knight and his suite.—In this way was brought about the strange anomaly of effecting all the operations of war, even those requiring active and unimpeded motion, with men weighed down with iron armor, necessarily slow and heavy in their movements.—The crusades, in which chivalry played so important a part, changed to some extent, this condition of affairs. Far from the mother country, the recruiting of armies became difficult, and the leaders, to insure the safety of their cause, were obliged to turn their attention to the foot soldiers who followed them, to equip them better and to direct them. From this time the foot soldier showed the importance and lasting character of his part. While the infantry was thus reviving in the east, another circumstance was bringing it into prominence in France. The kings of France entered into covenants with the cities, granting them by degrees municipal government. Each commune levied for its own defense a corps composed nearly always of infantry, and it was not long before this *communal militia*, always on foot, and subject to the same leader, excelled the feudal militia. The use of gunpowder doing away with

the use of mail armor, was a circumstance equally favorable to the development of the infantry.— Besides this *communal militia*, at the disposal of the king in case of war, there were at this time bands of mercenaries, who, recruited principally from Brabant and from Germany, fought at the sole expense of the sovereign, a scourge alike to friend and foe. The *grandes compagnies* of which Du Guesclin had the merit of ridding France, were these very adventurers, whose existence lasted until the 17th century.—The disadvantages incident to the employment of mercenary troops, induced Charles V., and after him Charles VII., of France to attempt the creation of a national and standing army. Taxation, reduced to a permanent system, crowned this effort with success under the latter of these monarchs, the creator of the *frances archers*, (1448). These new foot soldiers, were recruited at the expense of the parishes, and except when mustered for the purpose of drill, each one of them remained in the parish that had equipped him and held itself responsible for him. This isolation effectually prevented the development of any military ardor among these foot soldiers, and as a consequence the *frances archers* had a short existence. Quite otherwise was it with those companies of cavalry, each composed of 100 *lances fournies* (500 men), for these companies, first organized in 1445, continued to exist down to the French revolution. These organizations of Charles VII., were copied by the other powers. Louis XI. did away with the *frances archers*, replacing them by 10,000 adventurers and 6,000 Swiss. These recent conquerors of Charles the Bold, who, armed with pikes, fought in large, square battalions, enjoyed a great reputation, and all the other powers endeavored to imitate their infantry. At the camp of Pont-de-l'Arche (1480) they were the instructors of the French soldiers, whom they taught to manoeuvre with precision and in silence.—Charles VIII. introduced German infantry into France, *lands-knechte*, of whom his father had already had several companies in his service. When Charles set out on his expedition to Naples, he took with him 30,000 men and 140 cannon; of these 18,000 were infantry, nearly all Swiss or *lands-knechte*. Louis XII. organized a few companies of light horse, afterward amalgamated with the cavalry companies of *lances fournies*, and, when about to march against Genoa, recruited 2,000 Greek horsemen, called *stradiots*. The necessity of thus enrolling foreign troops, shows that the French infantry was still backward, while, on the other hand, the French cavalry had gained and continued to enjoy the best of reputations. Louis XII., with the view of improving the French infantry, induced several distinguished chevaliers to assume the command. The most famous of these, Bayard, was not willing to place himself at the head of more than 500 men, a proof at once both of his modesty and of the necessity he recognized of giving to this service very particular attention. Francis I. endeavored to devise the

means to establish in France a good and solid infantry. In 1534, he organized 7 legions of 6,400 men each, and each legion was composed of men of the same province. Had this institution lasted, the French would have had a standing army of 45,000 infantry, no inconsiderable force for those times. The system of legions having been abandoned, the French armies now only numbered a few small and detached companies of infantry, called *bandes* or *bands*. These *bandes*, of from 500 to 600 men each, commanded by a captain, fought generally, ranged in squares, the pikemen in the centre, the *arquebusiers* on the outside. Thus the soldiers equipped with fire-arms, served as light armed soldiers. It was the tendency of the times to render fire-arms, those arms which place the weak upon an equality with the strong, more easily handled and of more general use; a tendency which proved that these arms were destined to prevail in the future. In this respect, the artillery had already made great progress, evidenced by Charles VIII. being able to carry 140 pieces of cannon with him in his Neapolitan expedition, and evidenced also by the effects of the French guns at Marignan.—Fire-arms thus became lighter, and greatly increased in number. For the culverin of the Swiss, was substituted the arquebuse; and the musket, the precursor of the gun, was on the eve of introduction. The adoption of portable fire-arms increased in the ratio of about one-fifth under Francis I., to two-thirds at the close of the wars of religion, and to four-fifths under Louis XIII. At that time armies were not large. The duke of Anjou, at Moncontour, had only 16,000 infantry, 8,000 cavalry, and 15 cannon, the largest force of that period, excepting only the army of 26,000 men with which the duke of Alba, in the name and to the advantage of Philip II. invaded and conquered Portugal. The *bandes* acquired importance in proportion as the infantry superseded the cavalry, and as fire-arms increased. It was not long before several of these *bandes* were united under one chief, for the purpose of simplifying their government, and of giving a united impulse to their action. Three or four of these *bandes* constituted a regiment; the commander of a regiment taking the title of colonel. The use of these two terms is found beyond dispute, under Charles IX. about 1561.—The companies of light cavalry were not united into regiments until 74 years later. What characterizes the cavalry from the time of Francis I. is that the cavalry of noblemen diminished in number, disappeared little by little, and that men at arms, who succeeded the knights, soon found that their followers attained to the same level as themselves. From this time the formation in line was abandoned, and squadrons, of at least eight ranks deep, were formed. This reform originated with the Germans, and was copied from the armies of Charles V. by Francis I. These new squadrons, called squadrons of *reitres*, from the German word *reiter*, meaning a knight or rider, fought in successive ranks, the rank

which charged and fired retreating to the rear. The awkwardness of a cavalry too many deep, was soon perceived, and the number of ranks was immediately reduced from 8 to 6, and even to 5. In order to reduce their ranks, the infantry, too, abandoned the square formation. This was inevitable, as artillery would produce the greatest destruction on compact bodies.—Under Henry IV., and Maurice of Nassau, army organization improved. The latter introduced regularity, discipline, encampments, and compulsory agricultural work on the part of the soldier. The former won his crown by his exploits, exhibited skill in tactics, and to the courage of a valiant knight added the prudence of a commander. He was one of the first to show modern nations all the advantage to be drawn from a reserve corps. In command of but an insignificant army during the civil wars, he mustered for the execution of his designs against the house of Austria (1610), which his death alone prevented, an army of 32,000 infantry, 5,000 cavalry, and 33 cannon, a formidable army, augmented by his numerous allies to the number of 65,000 foot and 25,000 horse; and during this expedition he still left a reserve of 60,000 soldiers in France; for his economical administration had enabled him to endow his country with a total army of 100,000 men. At that time these numbers were regarded as extraordinary, but the size of armies has constantly increased since then. Louis XIII. had five armies on foot at one time, amounting in all to 100,000 men. Louis XIV., on a peace footing, never had less than 125,000, and during war mustered as many as 400,000 soldiers.—These formidable armaments led to the abandonment of the pike and the adoption of the gun with sword bayonet, to the organization of special troops of artillery, to the establishment of an honest and strict command, of which the state gradually assumed a more complete direction and control, and led also to the introduction of a national system of recruiting by drafting from the militia. Although the *grand roi* had in his service foreign troops, yet these were always the exception. As much can not be averred of Gustavus Adolphus, king of Sweden. This monarch reigning over a nation of 3,000,000 souls, and of warlike instincts too, was obliged to enroll in his armies a large number of foreigners. From every country he took into his armies fugitive prisoners. He directed officers to levy regiments, according them at the same time the command of those regiments in advance. His armies were noted for sobriety, obedience and discipline, to such an extent, that the German peasants did not seek to molest any isolated Swedish soldiers. His armies at no time exceeded 70,000 men, assisted by only 30,000 allies. Gustavus Adolphus was one of the first to make use of artillery for purposes of offensive warfare, to divide his infantry into small bodies in a manner at once more rational and more convenient for firing, to require his cavalry to fight when trotting, and only to fire when at close quarters.

Frederick II., of Prussia, continued and completed these progressive measures. The infantry performed its manœuvres and fired with a precision that has not since been surpassed; the cavalry charged galloping and with side arms; mounted artillery was introduced, and these three arms of the service manœuvred as one body, forming a new combination on which are based the military tactics of to-day. The Prussian army, with 70,000 men at first, soon developed into an army of 120,000 and even of 200,000 soldiers, a prodigious number for a country of 6,000,000 people. It contained a large number of foreigners whom the severity of the discipline retained willingly or by compulsion in its service. Desertion, nevertheless, kept undermining it, and it is astonishing that Prussia, even while entertaining the desire of remaining faithful to the traditions of the great Frederick, should have preserved even up to the time of the disasters of 1806, the mixture of national and foreign soldiers.—With the commencement of the French revolution the aspect of French armies changed. The fusion of the national guard with the army, the *levies en masse* of 1793—the draft extending indiscriminately to all citizens between the ages of 20 and 25 years—supplied France with a million of soldiers, divided up into fourteen armies. These improvised soldiers lacked instruction and could not manœuvre as the recruits of Frederick. In the first battles, at Jemmapes and at Valmy, they were deployed in great bands as skirmishers, and their daring, making amends for their want of experience, enabled them to gain a victory. In forced marches they did not encamp, but bivouacked; then they marched upon the enemy, and attacked it wherever they found it, without having recourse to temporary works of fortification. The other powers were compelled to follow the example of France and to muster large armies likewise. In regulating and consolidating the military organizations of the revolution, Napoleon I. established those immense armaments on a permanent basis. The armies became so large that it was found indispensable to divide them up into army corps, many of which numbered as many men as the entire armies of Turenne. The *grande armée* which accomplished the brilliant campaign of Austerlitz, comprised seven army corps: its total effective strength amounted to 186,000 men, of whom 38,000 were cavalry; and 340 pieces of artillery accompanied it. Napoleon set out in 1812 with 625,000 men, of whom more than 16,000 were officers. In 1814, the allied powers placed in the field against France an army of 900,000 men. From that time until 1870, Europe never saw such prodigious armies. The system of large standing armies having prevailed, the greater part of the nations of Europe were unwillingly compelled to maintain more soldiers than they otherwise would have done; a condition of affairs which still cripples many of those nations, and may even eventually drag them into bankruptcy. These costly armies have, however, often rendered as

effective service in the maintenance of civil order, as when engaged in foreign wars.—II. GENERAL PRINCIPLES OF ORGANIZATION. The army of a nation should be so organized at home as easily to prepare for any war that may occur. Its numerical strength also should be proportioned to the population of the country. The proportion that prevailed formerly, on the principle of *si vis pacem, para bellum*, was, one soldier to every one hundred inhabitants. This was, in fact, about the proportion, on a peace footing, in the armies of France, of the Germanic confederation, and of some other nations, a mean between that of England, with a very small army, and that of other powers in the north, with their larger armies. Preparation for possible wars requires that a fraction of the army be available for mustering either in camps for instruction or in places of rendezvous, other than their usual garrisons. This fraction should amount to at least one-tenth of the entire effective force. To satisfy these two conditions would not be enough. An army organized at home, in the manner just described, becomes too feeble from the moment that war breaks out; for if there are one or two-tenths under instruction and preparing for war who can immediately enter the field, the remaining eight-tenths are indispensable, or almost so, for the maintenance of order. Hence the necessity of being able rapidly to increase the effective strength of the army: this is what is called passing from a peace footing to a war footing. This transition should be managed skillfully in order that it may be effected without violence, and this condition is all the more important since it is necessary to at least double the effective force. This object is attained by the maintenance of what the French call *cadres*, a permanent and legal organization of superior and inferior officers, corporals, and privates, among whom it is sufficient to place young soldiers, in order that these latter may readily acquire the military spirit and skill. This possibility of rapid increase facilitates the putting on foot of entire armies and leading them into the country of the enemy.—All armies are divided into combatants and non-combatants. And first of the combatants.—All combatants can not be united into a single group. They are too numerous, and too different in nature to permit this. By reason of their stature, or on account of aptitude or choice, some will fight on foot, others on horseback, and still others with the machines of war. Thus the first division of an army is the following: infantry, cavalry, and artillery. To provide quarters for these three, and to enable them to overcome the difficulties in their way, a fourth class, an engineer corps, is necessary. This fourth arm serves on foot and manœuvres like the infantry, but it is divided up into small fractions. Napoleon I., as it is stated in his memoirs, required the following proportions between the several arms: the infantry being represented by 1, the cavalry to be 1.5, the artillery 1.8, the engineer corps 1.40, and the train 1.30. Except as regards the cavalry, the

diminishing importance of which seems to have been presaged by certain wars, these proportions are still retained. How should an army be constructed? It should be divided into manœuvring units and tactic units, that is, into divisions and battalions or squadrons. It is by divisions that manœuvring is performed in camps. It is by battalions and squadrons that drilling and fighting in detail are done. The battalion or squadron, commanded directly by an officer without bearers of orders, should not, when drawn up in line of battle, extend beyond the range of the human voice, for it is indispensable that the officer in command, stationed at one wing, may be heard at the other wing. There should be also administrative units: the regiment, comprising several battalions or squadrons, and the company, which is a fraction of the battalion. The company should be such that its head, the captain, may be able to follow carefully the character, the instruction, and the service of every man in it, that is to say, it should have from 100 to 150 men. These administrative units are intended to centralize expenses, and to facilitate both purchases and the auditing of accounts. The existence of these units, and the graded division which results therefrom, would not be sufficient, unless among the heads of these units and below them, there was a properly organized hierarchy.—The division is divided into brigades, which comprise two or three regiments; below the general of division, there are, therefore, brigade generals, and colonels of regiments. A regiment may include from three to five battalions or squadrons; a colonel has, therefore, under him the several officers of the battalions or squadrons. The battalion which should not exceed 800 men, 1,000 at most, comprises from six to eight companies, and the chief of a battalion commands from six to eight captains. The captain requires assistance, for he must lead in battle and administer his company: he has a lieutenant and a second lieutenant, two under paymasters, and four sergeants, each having the command of one of the four sections of the company; two corporals, assist each sergeant of a section. From corporal to general of division, there are ten grades; and one of the fundamental principles of army organization is that these grades be within the reach of all, that a volunteer private may rise to the rank of general. Notwithstanding this principle, such success will always remain very rare; and, in any case, the man who finally reaches the topmost round of the ladder especially in times of peace, will be pretty well advanced in years. It is important that the army should have colonels and generals in the vigor of life, under fifty years of age.—The army should be distributed over a country in proportion to the resources of the different portions of that country. But are the troops to remain stationary at a point, or should they be moved from time to time, to be succeeded in their former quarters by other troops? To continue them in one place is to weld them into one body,

and to familiarize them with their chiefs who are well fitted to lead them to war. To move them about, is to isolate them more from the other troops and from the same officers, and to prevent them from acquiring fixed habits. They are thus maintained better in that condition of semi-unconcern favorable to the development of soldierly qualities.—**NON-COMBATANTS.** These are as indispensable to an army as are supporting forces to the artillery, or as servants to a numerous family. Those who place their lives in jeopardy for their country, should do so cheerfully, certain of accomplishing a duty, of performing an honored act, and of obtaining, in case of death, proper burial for themselves, and assistance for their families; should be certain of medical care, if they return wounded or sick, and of rest and food, if they return to the camp with nothing more than fatigue. To permit these non-combatants, surgeons, nurses, bakers, to remain without organization, would be a grievous error. They should therefore be organized in a military way. They will thus be subjected to the same discipline as combatants. Under a military organization they are susceptible of a greater degree of mobility, and in spite of the inconveniences occasioned by the presence of wagons, they are better able to follow the troops and participate in the events of war, each within his sphere. The accessories comprise not only the belongings of each arm, such as the train of artillery, and of engineers, military wagons, pontoon bridges, ambulances, etc., but also what may be called the personal and speaking material of the army, *e. g.* interpreters, printing presses, lithographic, photographic and telegraphic apparatus. In a word, all the wants which advanced civilization has called into existence or can satisfy, should be felt and satisfied in the army, that miniature of the nation, whenever those wants become military wants.—**III. USUAL MODES OF RECRUITING.** By recruiting is understood the aggregate of the means, or the system by which young men are led to leave their homes to serve their country in the field.—Recruiting is to an army what food is to the human body: if the food is not healthy, the body decays; if the system of recruiting is bad, the efficiency of the army is impaired.—Enrollment in the ranks of the army, in the case of natives, may be either voluntary or compulsory. Voluntary enlistment is the result of love of country, or made in consideration of the advantages, immediate or remote, which the military service offers. Voluntary enlistment may be made with or without bounty.—Voluntary enlistment with bounty attached thereto, prevailed during the thirty years' war during the reigns of Louis XIV., Louis XV. and Louis XVI, that is to say, from the time of Gustavus Adolphus to the French revolution, and was, indeed, about the only means used for obtaining recruits. Applied in a great country where the condition of the people is generally prosperous, this system of recruiting degenerates into one of force or fraud,

and brings into the service only the dregs of the population. Carried on without good faith, it alienates the enlisted, who never become free again, notwithstanding their contract, and produces desertion.—Voluntary enlistment without bounty is scarcely seen except in free countries. It reveals generally a decided vocation for military life, although trouble or spite, or even the mere desire of wearing a brilliant uniform, is sometimes powerful enough to induce a young man to enlist.—At all events, voluntary enlistment has always been an inadequate means of recruiting large armies. Louis XIV., by this mode of recruiting, did not obtain annually more than 20,000 men, and were it not for his garrison regiments, his attempts at a militia, and his foreign regiments, it would have been impossible for him to have completed his army. The famous voluntary enlistments in Paris in 1792, about which so much has been said, produced a total of 5,000 soldiers. The restoration which, forced to promise the abolition of conscription, had, at least provisionally, to resort to voluntary enlistment as the principal source of recruiting its armies, was obliged to give up the attempt. In fact from 1815 to 1848 this mode of recruiting never supplied France with more than 10,000 soldiers in ordinary years, and with not more than 28,000 in those years when war was imminent, as in 1831.—And yet writers, statesmen, even those of our own day, have extolled the exclusive employment of volunteers in the formation of standing armies. In our opinion this is a utopian idea. The army of a large country can never be fed in this way, unless its numbers greatly decrease. To be thus fed, there would have to be more of the military spirit prevalent in the country than ever existed, and more of the patriotic instinct than our modern industrial society seems capable of possessing.—As to compulsory recruiting, it is easy to conceive how its forms may vary. Let us examine the forms which have most frequently obtained.—There is, in the first place, recruiting from a particular caste. In countries where there was a military caste, the requisite number of soldiers was supplied from this source. This was effected by compulsory enlistment from the body of that caste; and when the country was threatened, all the males of the caste, of an age and in a condition to bear arms, were obliged to take the field. Ancient Egypt offers an illustration of this state of affairs. In that country the military caste hierarchically followed the priestly caste, possessed a third of the territorial wealth, and, besides, received pay during the continuance of the war. India, also, had its military caste. The Roman knights, too, at least during the first years of the republic, constituted a sort of military caste, and in the middle ages the obligation of service in war was imposed in exchange for a fief, an obligation which became at once hereditary and brought about a like state of things. To-day, especially since the modification of the military boundaries of Austria, scarcely any ves-

ages of this mode of recruiting are to be found in the countries of Europe.—In the second place, we must mention recruiting by arbitrary selection, as, for example, from among the young men between the ages of eighteen and twenty-five. In this case parents see their children at the mercy of the magistrate, who represents the state; and if this magistrate is a man lacking in honesty, or of a whimsical disposition, he will be the instrument of great abuse and acts of injustice. It would be impossible in these days to revive this mode of recruiting, so essentially opposed to the principles of civil equality. It existed among the Romans, the tribunes choosing for their legions the citizens who appeared the most robust, but then the enlistment was only for a time, and the legion was disbanded at the close of the war which had called it into service. It existed in Prussia, where, under Frederick the Great, military service was for life, each regiment having a district assigned to it from which, under the arbitrary control of a superior officer detailed for the express purpose, and with instructions to select the strongest and the largest men, it was recruited. The system existed for a short time in France, under Napoleon I., in 1813, for the formation of regiments to serve as guards of honor, of which each horseman of good family was appointed by the prefect of his department, by virtue of his office. In Russia the system survived till about 1870.—Recruiting by arbitrary selection, instead of being applied to individuals, as we have just represented it, may take place in a collective manner; as, for instance, when a battalion or a regiment of militia, or of national guards, after having served at home, as it usually does, is afterward sent abroad, either in whole or in part, to swell the ranks of an army in the field.—In exceptional cases, recourse may be had to what is called the *levy en masse*. If an entire nation is summoned to arms, every one capable of handling a pike or a gun should come forward. Only when a nation's independence is at stake, should this method be resorted to, since it exhausts the population of the country. And even in cases of most imminent danger, government should defer as long as possible resort to such an extreme measure. France had recourse to this mode once, in 1793, and the convention did not hesitate to decree the *permanent levy* (so long as the enemy should continue to desecrate its soil) of all Frenchmen unmarried, or widowers without children, *no matter what their age*. We may imagine the disturbance of all the relations of life of the French people, produced by this much too radical measure, especially after the requisition of 300,000 men, from 18 to 40 years of age, which took place in the month of February of the same year. Germany, in 1813, and France again in 1870, had recourse to the *levy en masse*.—Another mode that requires mentioning, is the system of general, gradual recruiting. We understand by this a system of recruiting which makes every citizen, as long as adult and able-bodied, subject

to military duty; but in different categories which remove him farther and farther from a chance of being obliged to take the field as he advances in years. The advantage of this system is, that it requires every one, without distinction of birth or fortune, to undergo military service equally and to fulfill his duties to his country. The disadvantage of the system is that it retains a citizen for too long a time, if not as a member of the regular army, at least of the *landwehr*, and in this way, to a certain extent, interferes with individual liberty and the spirit of industry which it produces.—Partial recruiting by lot has been, up to the present, the most general mode of recruiting. This mode is least detrimental in its effects on the population of the country, since it takes from it only a limited number of young men, and leaves at liberty those on whom the lot has not fallen. These are two real advantages. Drafting by lot, besides, if well conducted, establishes a rule of justice, very conducive to the maintenance of harmony among families, especially in the country, where the people are averse to give their children to the state as to give it their money.—Recruiting by military pupils supplies but a small contingent to the armies in the countries in which it is in use. Pupils maintained at government expense, may be educated with a view to a military career, and willingly or by compulsion made to enter the service, as is the case in Russia, where sons of soldiers are brought up as soldiers by the state. The famous corps of janissaries, organized in Turkey toward the close of the fifteenth century, and which lasted until 1826, was constantly recruited in this way. The children brought up to become janissaries were not even of Turkish origin; they were young Christian captives instructed in the Mussulman faith, and thus naturalized. The sultan, who established this corps, thought that their origin would make the members of this body most devoted to the sovereign, but all he obtained was men devoted to themselves, capricious, exacting, making and unmaking emperors, and by their dissensions bringing Turkey to the verge of ruin.—From 1781 to 1789 *national schools*, intended to bring up children from the provinces, in such a way as to give them a taste for the military career, were established in France; but when the pupils left them they were allowed some time before entering the army. To utilize the pupils of these national schools during the time of their education, they were employed in the maintenance of the public highways.—Thus far, whether treating of volunteer or compulsory recruiting, we have considered only the employment of native soldiers. It is in like manner possible to levy and to muster foreign soldiers. Two systems of recruiting foreign soldiers may be considered under this head. First, by purchase. Buying slaves and making soldiers of them is a simple enough means of recruiting. This mode of recruiting could be employed only in exceptional circumstances, or in countries still in a barbarous state.

After the battle of Cannæ, Rome bought and equipped 8,000 slaves. The famous mamelukes of Egypt were originally slaves bought of the Mongols by certain Egyptian sultans. To-day the *black guard* of the emperor of Morocco is recruited, partially, at least, in this manner, for the sovereign claims, for this purpose and, as entry duty, several of the negroes whom each caravan brings from the Soudan. Troops thus recruited may be devoted to their sovereign, but it requires tact to prevent them from acting like the janissaries. The second may be called the *hiring system*. Instead of buying a man, his services are hired for a fixed time. This is the old system of employing mercenaries, so much in vogue at the beginning of the modern era, during the thirty years' war, and the seven years' war, and which lasted until the commencement of the nineteenth century. It is a system which, happily, has become obsolete. If, instead of hiring the services of men individually, they are engaged as a body collectively, it is then said to be recruiting by *capitulation*, a species of contract for troops. The contracts of *capitulation* of the Swiss with France are well known. The consideration of the contract of *capitulation* for troops, consisted of a bounty, fixed wages, and certain privileges and guarantees. At present, contracts of *capitulation* for troops are prohibited by Swiss law.—IV. GENERAL CONSIDERATIONS. The army should set an example of honor and devotion to the country. It is by maintaining a sentiment of honor, pure and unsullied in the service, that the army furnishes the best proof of its patriotism; for through the army this sentiment will be kept up among the people, and will contribute to the greatness of the nation. Devotion to one's country is not practically so powerful an incentive as a sense of honor; it is frequently apparently absent, and yet it should be ever present, in peace as in war, in defeat as in success, in adversity as well as in prosperity. The devotion which springs from duty and is a source of self-denial, often exposes the soldier to severe trials, and it is no doubt with the view of mitigating the severity of these trials, of disguising them as it were, that the higher officers of the army, as a general rule, manifest so much kindness and indulgent friendship toward young officers. In order to uphold the sentiment of honor and of self-devotion, to obtain a military spirit useful in every great nation and in keeping with its political, literary, commercial and industrial spirit, it is essential that military service should be required of all, and that all should be placed on an equal footing in rendering military service, as they are placed on an equal footing in the matter of taxation.—As civilization advances, military laws become less severe. The proof of this is found in the code of military law promulgated in France in 1857, and in the German military code of 1872; but indulgence should not be carried any further. These codes no longer permit the punishment of a deserter with the ball and

chain, or irons. They allow extenuating circumstances to be pleaded in behalf of soldiers under accusation. If repressive measures in the case of the soldier have become less severe, the treatment of the enemy has become less rude. Thus, during the Prussian war, the French returned wounded prisoners, and about 1870 an agreement between several of the powers *neutralized* their hospitals and ambulances in time of war. War, while keeping pace with the humanitarian progress of civilization, and allowing the army to exist under better conditions, should be carried on with rapidity and decision; and from the moment the voice of the country has declared war, it should break forth vigorously, and submit the enemy to the will which he, in the first instance, refused to submit to. It is by shortening war that its horrors are mitigated.—Army policy should be looked at from two standpoints, that of the government toward the army, and that of the army toward the government and the country.—From the former standpoint it has been often said that the army constituting almost exclusively an instrument of governmental authority, absolute government had greater need of relying upon it, and for this reason caressed it and overwhelmed it with favors. This opinion seems exaggerated, since republics too have granted favors to the army. What may be reasonably asserted is that a wise government should treat the army well, as constituting an essential and vital part of the nation, and as an indispensable agent for the maintenance of public order. Government ought, in an especial manner, to be moved to kind and just treatment of it, as some equivalent for blood spilt, fatigues undergone, and that exceptional system of discipline to which the army is at all times necessarily subjected.—The exceptional system of army discipline consists in this, that the individuals who compose the army do not enjoy, so long as they belong to it, the plenitude of rights conferred by the fundamental law of their country on its citizens. These rights include, besides equality in civil matters and in the matter of taxation, the full liberty of every man so far as his person, his time, his opinions and the right to give expression to them are concerned.—In the army in which the orders of a superior must be obeyed and executed instantly and in the best way possible, complete equality, and especially personal freedom of action can not possibly exist; were it otherwise, instead of striking and striking like one man, because governed by a single will, that of the general-in-chief, the army would scatter its strength and operate in a disjointed manner. It suffices to point out these disadvantages in order to show that the exercise of the right of individuality would, from a military point of view, be detrimental to the continued existence of that social machine called an army. Hence, the exceptional army discipline, the preservation of which discipline interests society in the aggregate, and the necessity of which has been in all

ages universally recognized. As a consequence of this discipline, the army does not generally possess political rights; it can neither petition, hold deliberative meetings, nor meet without order; it has its own peculiar laws, more expeditious and severe than those of the common law courts, to take cognizance of crimes and misdemeanors. Individuals composing the army are cut off from all family pleasures, or at least can not marry without permission. On the other hand, the government provides for the health of the soldier by allowing him the conveniences compatible with his condition in life, by paying him wages in proportion to his wants, allowing him a chance for advancement; by guaranteeing to the officer the continued possession of the grade he has reached; by assuring to all soldiers a retreat for their old age, which, without luxury, at least guarantees them from want; and lastly, by honoring the service of its members, and by a jealous care that the death of the soldier on the field of battle shall be for his family a glorious souvenir, and not an occasion of spoliation.—The army can neither meet for deliberative purposes, nor meet without an order. Submission, obedience, self-denial, result from that moral obligation inherent in its essence. Hence the army has no political part to play. But does one abdicate his citizenship when under arms? He does not; his rights of citizenship are only suspended. Hence the limits are rather difficult to fix, especially in times of revolution. The army should have an interest in the affairs of the country, but no part in the direction of them unless consulted. Far from anticipating or embarrassing the general opinion of the country, the army should ever show deference toward, and confidence in, public sentiment, when manifested legally and calmly. It should consider itself the right arm of the country, and assume as its special missions those in which there are dangers to be incurred or relief to be brought. (For U. S. army, see UNITED STATES.) DE LA BARRE DUPARCO.

ARTHUR, Chester A., president of the United States 1881–5, was born in Franklin county, Vt., Oct. 5, 1830, was graduated at Union in 1849, was admitted to the bar in 1851 in New York city, was quartermaster general of the state of New York during the rebellion, and was collector of the port of New York 1871–8, when he was removed by president Hayes. In 1880 he was nominated for the vice-presidency by the republican party and was elected. Sept. 20, 1881, he became president after the death of president Garfield. (See GARFIELD, JAMES A.) A. J.

ARTISANS. An artisan is a tradesman who works at one of the mechanical arts, as a carpenter, a locksmith, or a shoemaker. The artisan is sometimes confounded with the workingman, because both labor with their hands. They differ however in this, that the artisan works on his own account and solely at his own risk, while

the workingman works for another for a fixed amount of wages. In this respect the artisan more resembles the capitalist: he is a small capitalist.—In ordinary thought and language, we may make of artisans a separate class, midway, in a certain sense, between the laboring class and the capitalist-employers. But from a politico-economical point of view, this distinction is of little use, the more so because it is so difficult to establish the line of demarcation. In their quality of capitalists, artisans are subject, just as the manufacturer or the capitalist in general, to the laws which regulate the profits of capital. We should remark, however, that their profit generally is, or appears to be, larger in proportion to their capital, because they add to it the product of their personal labor, without clearly distinguishing these two sources of revenue. They combine, so to speak, the profit of the employer and the wages of the workman. CHARLES COQUELIN.

ARYAN RACES. Among the nations which have possessed the earth, the Aryan races occupy the first rank. They were, in earlier times, comprehended under the name of the Indo-Germanic; sometimes under that of the Iranian races, while, still earlier, they were called the Japhetic. The name Indo Germanic, however, is inappropriate, partly because it designates a particular country because it designates in part a particular nation; because it has been adopted partly from geographical, partly from ethnographical considerations, and hence, denotes, in either case, not all that is to be comprehended under it, but only a part. Again, the name Iranian has only a narrow geographical meaning. Aryan, however, is the name by which, in ancient times, these races called themselves. It serves, at the same time, to designate their character. We find it among the old Hindoos whose three highest castes were called *arya*. Only the lowest, darkest caste, the Sudras, did not belong to the Aryan tribe. The highest castes were *venerable* in comparison to the latter; and this is the meaning of the word in Sanskrit. The highest caste of the Brahmins were Aryans of the highest type, (*ârja*, not simply *ârja* as the Vaisyas were called). The ancient Medes were, in like manner, called Aryans, and we have it on the authority of Herodotus, that the Persians were called Artaians, a word derived from the former. The noblest among the Hellenes were known as having preserved the traces of their Aryan origin, *οἱ ἄριστοι*. Tacitus mentions a tribe as belonging to the Germanic people, who retained the same name—the Aarii; and in like manner too in that of the Arimanni, whose meaning is said to be “free men,” we again find traces of the same word. *Venerable*, in the east, and *free* in Europe: such are the Aryans. Wherever we meet, in the Aryan language, the root of this word, it signifies the noble and the free.—The philological researches of the present century have demonstrated the close affinity and close relationship alike of the

Sanskrit, Zend, Parsee, of the Greek, Latin, the Germanic, and Lithuanic languages. They have thus again disclosed the affinity, long forgotten, of nations which have spoken, and still speak, these languages. The Scandinavians of the north and the Hindoos along the Ganges, who through thousands of years, have lived a great distance from one another, are now recognized as brethren and cousins. Language furnishes, at the same time, incontrovertible proof of the superior intelligence of these peoples. The Aryan languages are the most flexible in form and the richest in thought of all languages spoken by man. Their literatures are superior, in science and art, to those of all other races.—We find, in the history of the world, but one family of nations, which, to a certain extent, can stand comparison with the Aryan race, the Semitic. All the rest are far inferior to it. The Aryan and Semitic languages are separated by a broad distinction. The difference between Aryans and Shemites is certainly much greater than the difference noticeable among the Aryans themselves. Yet, there is a tradition, among these two peoples, of their common origin. They belong, in a certain sense, together, like two stems having a common root, like two families, which, though separated, trace their origin to a common ancestor. They both consider themselves not the sons of the earth, but the offspring of the heavens, the sun, and the light (the sons of God). They are thus distinguished from the inferior races who, according to their own, though obscure and false ideas, have sprung from the earth, or from the animal kingdom. It is not impossible that the beginnings of the belief in both the affinity and the differences found among these races are traceable in the account given of the origin of man in the cosmology of Moses. If the idea of the origin of the superior race (the sons of God) seems to be personified in Adam, it is not improbable that in his two sons, Cain and Abel, we may find the first typical illustration of the origin of the two races which, in after times, separated in hostility. Cain is described as the first born, the man, the lord, the tiller of the soil, as the proud, daring warrior; while Abel, as the second born, is characterized as a pious, mild, and devout herdsman. It is impossible to make the distinction between the primitive, pure-minded disposition of the Aryans and of the Shemites clearer in a few words. In like manner, the other races such as the Hellenes and Germans have represented the ancestors of their different tribes as the sons of their common progenitor. If this idea be true, the fratricide which Cain committed in killing Abel is placed in a new light. It is very likely that the Shemites justly reproached the more violent Aryans who were their superiors, with being the first people who were the cause of warfare among the sons of God, a warfare the result of religious dissension. For this reason the Shemites called down upon the Aryans the curse of war, *i. e.* fratricide—which was to follow them on their onward

march through ages. But, however this may be, we do not propose to force this idea upon any one; and besides it might, though unjustly, be used to disparage the character of the Aryan races. It is a fact that, from a very early day, the fortunes of the Aryans and the Shemites, as well as their ideas and languages, took a different turn. They both are conscious of being the creatures of God. But the Aryans are characterized by greater self-assertion, and by their placing greater reliance in the resources of the human mind. The Shemites show greater trust in, as well as a more absolute dependence on, God. This distinction is clearly manifest in the history of the world. All higher scientific achievements are the work of Aryan minds. The Aryans are religious by nature, but their creative power is shown in philosophy, rather than in religion. On the other hand, the most important religious revelations have come through Semitic races. Moses, Mahomet, and the mother of Christ were Shemites. It was from them that the ruling nations of the earth received their religion; but these nations themselves belong to the Aryan stock, and are the authors of science and of the legal and practical institutions of the world. The older religious systems of the Aryan races are all the results of profound meditation on the nature of God and the world; while the religion of the Hebrews, and in a still greater degree the creed of Islam, are manifestations of the religious sentiment. Christianity even, as the religion of love, did not take rise as a dogmatic system. Brahmanism, Buddhism and the creed of Zoroaster, on the other hand, are philosophical theories. On the religious belief of the Greeks and Romans, and of the Germanic nations, speculative views of nature and the mind, and the imaginative faculties at work among the sages and prophets of these peoples, exerted a very great and controlling influence. And even, when the Hellenic people and the Romans had embraced Christianity as it came from Palestine, that philosophical tendency of the Aryan mind again became manifest in this, that it transformed the religion of love into dogmatic tenets, and developed it into a system of thought. The strong sense of individuality which distinguishes the Aryans sometimes turns into defiance and haughtiness; and it is a very remarkable fact and one which re-appears among the Hindoos, the Hellenes and the Germanic nations, that their great heroes even dared to battle with the gods. The victory over one of the gods, that is, over a personal manifestation, in time, of the divine principle which was no longer spited to the age, was, among the Hindoos, considered the highest proof of true heroism which man could give, and as establishing his claim to kingship. Homer has, in a series of pictures, represented the struggles between the heroes of his people and the gods. The Germanic heroes among the warriors of their race, who are killed in battle, enter Valhalla, and there prepare themselves for the world's battle (the last of all)

when they, together with the shining gods of heaven, are engaged in fierce contest with the dark spirits of nature. What Gobineau so justly remarks, while pointing out this distinguishing feature in the character of the Aryan race: that the inferior races should look up to the Aryan heroes, as though they were the gods themselves, and willingly submit to them, is a fact which is not surprising, when we observe that the latter, in their character as warriors, considered themselves the equals of the gods. Yet, more important than these characteristics of a daring and heroic leader in war, is another intellectual peculiarity of the Aryan race. It is, above all, a peculiarity of this race, that their intellectual heroes dare to struggle with the gods, and to push forward in this contest, to the ultimate cause of things. These people have, from the beginning, dared to search, with a greater freedom, for the ideals of human thought, the relation of man to nature and the divine. They were, from the beginning, happy as they gloried in the thought of struggling with the highest problems which present themselves to the human mind for solution. The blind submission to traditional authority on questions of science is, as is shown by the history of the world, an entirely un-Aryan characteristic. I do not mean the childish and blind hatred of all authority, though rightful; a sentiment which resists the authority of parents, the wise, of those in office, of the government, history and divine revelation. From this irrational dread of all authority, the truly Aryan is entirely free. People of a different stock, when, having suffered too long from an oppressive authority, they are suddenly relieved from it, are more liable to fall an easy victim to this erroneous sentiment. Liberated slaves, not men born and reared in a state of freedom, are hurled into this moral abyss. Whoever has learned to cope with the formidable difficulties peculiar to every sort of scientific research which is bent on going to the very depth of a problem; whoever is an adept in pure thought and knows how to conform to its irrefragable logic, is not easily led into such extremes. Indeed, the authority whose supremacy we all have to acknowledge whenever a conflict arises, is, to the man of scientific training, in all things peculiar to his calling, the power of logic; and in his search after knowledge he does not allow even the faith to hamper him, to which, in feeling, he may be devotedly attached. And this free spirit of inquiry is certainly a characteristic peculiar to the Aryan race. It is an established fact in the history of the world, that it was above all the Aryan races who labored for the advancement of science. With their scientific achievements, those of other races bear no comparison, not even those of their primitive kinsmen, the Semitic people who resemble them more closely. It is a very remarkable fact that the ancient Hindoos (forming part of the Aryan race) had classified mankind according to scientific principles. The attempt of the Chinese to imitate

this classification, shows, by the manner in which they substituted mere erudition for methodical science, the marked contrast between the two races. According to the ideas of the Hindoos, the Brahmins form the highest class (the promoters of science and religion alike), the religious philosophers. According to the Hindoo law, only the Aryans are permitted to read the sacred books (the Vedas) because they are the only ones who were supposed to enjoy the dignity of free men, while the darker Sudras, who were supposed not to understand these books, are denied that privilege. When we consider the intellectual heroism, and the incessant search after truth which distinguish the Aryan races, and among them the Germans in particular; and when we further consider that it was, in the first instance, not the Aryan race, superior in intellectual endowments and individuality (but the Semitic, so much inferior in all respects) to whom God revealed himself, the question arises: What is the cause? What does it mean? Short-sighted and timid people have often since contented themselves with the answer, that God was better pleased with the constitution of the Semitic than of the Aryan mind. How often have these people condemned the efforts of bold scientific thinkers as arrogant and futile, and attempted to fasten the shackles, which the authority of the Church provided for it, more firmly upon the spirit of inquiry, throughout the world! This intellectual malady was not without its evil influence on the state. How many an effort to oppress the intellect of nations and how many an instance in which men of liberal mind were persecuted, were, in the light of this sentiment, held to be entirely rational and justifiable! By these means, the development of mankind was, for a long time, retarded in a great many countries; the best tendencies toward human progress were weakened; and the course of science was, on account of the spirit of opposition and contradiction, by which human nature is controlled, forced into dangerous by-ways and marked by the spirit of destruction and negation. And yet, how little satisfaction do we find in the curious answer above referred to! If it were true that God loved the Aryans less than the Semites, why is it then that he has endowed them with superior intelligence, with reasoning powers more acute? That this is a fact, the language and literature of the Aryan races demonstrate most conclusively. And if He should place the Semitic above the first born Aryan races, because the former looked upon Him as their Lord and Master with greater trust, how comes it that He has given the supreme power on earth to the Aryan rather than to the Semitic races? One of the greatest and most liberal thinkers among the Germans (Lessing) has tried to give in his essay, "The Education of Mankind," an answer to this question, which is more luminous and significant, and which we are tempted to repeat here, though slightly changed in form. A father has two sons.

The first born is the superior both in intellect and daring. He is more violent and self-reliant than his younger brother who is milder and more attached to his father and his family. The former no sooner becomes aware of his powers than he rushes out into the world, while the latter stays at home. Now can it be said to be unkind in the father, if he is interested and directly engages in the education of the younger son first, while he is confident that the older one will make his way through life, and be less likely to find his way back to his father; and for this reason, contents himself with having the mind of the latter educated partly by the traditions of his home, partly by the experience and fortunes of life. He knows him and his ability thoroughly, and the powers of nature and the world, which are likely to put a check to too much daring, and guard against the extravagance and the extremes of the actions of men. Is it, then, absolutely inconceivable that, in the history of the world, we should find similar cases? that God should, in the first place, manifest himself, by divine revelation, to the Semitic races, the Jews and Arabians in particular, suiting these revelations to their character and degree of development, and should thus enable them materially to influence the intellectual and moral growth of the other races, while He should impose upon the Aryan races the task of building up the methodical knowledge of science, and be confident of their ability to work out this higher problem, in the ripeness of their powers? Yet, should this be one of the grand designs of God as manifested in the history of the world (which so clear a thinker as Lessing believed it to be, and which the events of history so far seem to prove it to be) how foolish and atrocious are the attempts, both of clerical and political parties, to check this search and struggle for the attainment of ultimate truth, on the part of the noblest and wisest of human intellects!—The affinity of the several Aryan races is shown, not only by their speech but by their ideas of law and government as well. The science of jurisprudence is indeed still far behind philological science, in the knowledge of this connection. It was the science of philology that led the way in the discovery of this truth, and encouraged jurisprudence to follow in its wake. The difference in the laws of the Aryan races, great as it may seem to us, is no greater than that of their speech. But, as one common primitive language has been successfully traced in all the great variety of our modern languages, it is possible, in like manner, to discover, in the variety of laws of the Aryan races, the original unity which embraced the primitive ideas of these races on jurisprudence and the policy of the state. This original unity seems to have been stamped upon these races by the Creator; while the great diversity in the development of the primitive ideas common to all, and the difference in their general development, are the work of human history.—The whole Aryan race has at all times shown a strong

sense of the honor and dignity of human nature, and this is the source of the after-development of their various laws. The sense of honor attaching to the human person was the primary idea (which is also shared by the Semitic races), the principle of *liberty* peculiar to the Aryans only, is the development of that idea as worked out by the latter; and it became an object of human thought and aspiration, for the first time, in Europe. In the east "Aryas" still means the *venerable*, and among the Germans the "Arimans" are the *free men*.—In war the standard of honor is raised, and it is this superior sense of honor which characterizes the noble knighthood whom we find among all the Aryan nations. The knights of the Hindoos are not inferior, in their high sense of honor, to the Germanic and Romanic knights of the middle ages. In the laws of Manu, viii. 89, it is said: "The princes who, anxious for the victories of war, do battle against one another with the greatest fortitude, without turning backward, go straight to heaven. 90: A warrior is never allowed, in battle, to use treacherous weapons on his enemy; no arrows with barbs, nor such as are poisonous. 91: He shall not beat an enemy who is on foot, while he is mounted on the wagon; nor a man effeminated; nor him who begs for mercy; nor him whose horse is slain; nor him who is sitting; nor him who is taken a prisoner. 92: Nor him whose weapons are broken; nor him who is oppressed with sorrow; nor him who is seriously wounded; nor the coward and the fugitive."—A people with ideas such as these, certainly had a delicate sense of honor, and we readily perceive how closely related to it the sentiment of personal liberty is, which took its rise chiefly among European peoples of Aryan blood. How different is the character of the negro! The negro bows in the dust before his master, covers his head with ashes, and even puts his master's foot upon it. Such base feeling was at all times detestable to the Aryan people. But in other nations, too, superior to the negroes, as for instance those of the Mongolian race, the Aryan sense of honor seems to be entirely wanting. They submit willingly to those in power, but, treacherous by nature, they never fail to take revenge whenever an opportunity offers. This distinction in the character of the different races is also noticeable in Europe. It was for a long time a matter of doubt whether the Slavonic people were part of the Aryan race. But it finally became quite evident that in these people also (especially among the higher classes) an Aryan element is to be found, though strongly mixed with un-Aryan blood, which preponderates in the lower classes. The ordinary Russian, therefore, has little sense of personal honor, and in the higher classes even, this sense is wanting more frequently than among the Germanic or Latin races. Among the Poles, however, this Aryan trait seems to be (especially among the nobility) much stronger.—Bright as this side of the character of the Aryan races, their sense of honor, of human dignity,

and of liberty, may be, the dark side is not wanting: and it stands in bold contrast with the other. The Aryans have, in the course of history, frequently shown themselves arrogant and selfish, the natural effect of this sentiment running to an extreme. In this manner, they have been very often tempted to consider themselves better than the rest of mankind, to treat them with contempt, and, as far as lay in their power, to reduce them to subjection. In the ancient castes of the Hindoos, this dark side of the character of the Aryan races is shown in a conspicuous way. But we find it also in European history, and we again discover it in America in the treatment of the negroes by the whites.—However, the true mission of the Aryan nations is quite different: it consists in educating the nations and those classes morally and intellectually inferior to them, up to the *standard of humanity and honor*. And of this we find in history many a noble example. The Hellenes and Romans have, on the whole, thus influenced the nations of the world who came within the range of their superior intelligence, by civilizing and ennobling them. Another illustrious example we find in the history of the French people. The Celtic people, and among them the upper classes in particular, may, like the Slaves, share in the blood of the Aryans, but they undoubtedly have, in a very great degree, that of inferior races as well. For this reason they, as Celts, have never succeeded in establishing a permanent and independent form of government. Caesar, who knew the Celtic people well, describes the masses of them as being in a very low condition, despised and plundered by both the priesthood and the knightly nobility. In the middle ages, too, the large rural classes (*villains*) were characterized by the contempt in which they were held by others. And yet it will certainly be admitted now, that a very strong sense of honor and love of glory controls the whole French nation, from the highest to the very lowest class. The lowest Frenchman even is very sensitive on all matters touching the honor of his nation, and acts manfully when his feelings on this subject are aroused. This high standard of a whole nation is due to an educating process, which, as an essential factor of history, runs through centuries. The Romanic and Germanic elements in the population of France, together with Romanic and Germanic ideas, have gradually supplied what was wanting in the primitive character of the Celts; and both great rulers and great thinkers have, by action and thought, awakened and preserved among all classes a new and higher sense of nationality. This is but an instance of what the Aryan nations have to do throughout the world and for all mankind.—Woman also, among the Aryans, enjoys the benefit of this superior standard of human dignity and honor. Indeed, the position of woman among the Aryan nations (especially in the east) was in many respects characterized by oppression. Yet, all the nations of Aryan stock cherish (as is shown by their legen-

dary lore and their songs) an ideal of female honor which is far above the low, sensuous feeling with which so many non-Aryan nations look upon her sex. In Sanskrit a woman is called *patni*, the associate of the governing father, the mistress of the house. One of the consequences of this is, that the nations of Aryan stock were at all times in favor of monogamy. "One husband and one wife," is a principle thoroughly Aryan. Indeed, an honorable position for woman is inconceivable in a general state of polygamy. It is true, certain Aryan nations allowed, under certain circumstances and occasionally under certain conditions, individuals to have two and even more wives. We find this to be the case among the Hindoos, who let a man in case his first wife bore him no children, take another; and also among the Germanic people, who, from political reasons, suffered their princes to connect themselves with several families by way of marriage. Yet, among these nations, as among the Hellenic and Roman, monogamy is still the rule while polygamy forms the exception. The fact that a few Aryan tribes disregarded this primitive rule, is largely due to the influence of people who were members of a different stock. The Semitic race even held less refined sentiments on this point, while the people of the Mongolian and African races were still less scrupulous.—The matrimonial relation is based on the family. A noble view of the former naturally leads to a noble view of the latter. For this reason, the Aryan races showed, from the beginning, a great interest in, and a true conception of, all family relations. It is remarkable that the words father, mother, son, daughter, brother and sister are traceable in all Aryan languages: a certain proof that the ideas which they suggest of the organic relation of the different members of the family were the common property of this body of nations. Everywhere the father is respected as the head of the family and the lord of the household. In him we find the power of the family concentrated, and it is he who directs and shapes its economy. But this power is far from being absolute; it is never like that of the master over his slave; on the contrary, it is always associated with certain duties, and those which are due to the members of the family are not forgotten. Yet, one objection may easily be raised here, in view of the provisions of the Roman law, which is substantially of Aryan origin. It is true, the Roman law considers the husband's power over his wife (*manus*) and the power of the father over his children (*patria potestas*) as absolute; and its legal effect was similar to that resulting from the power of the master over his slaves. But this objection loses its force when two things are considered: first, that the customs and social life of Rome were, in point of fact, better than the law and the theories of the jurists; secondly, that throughout the whole range of the Roman law, there was, besides the Aryan elements which constituted its principal feature, a Semitic element unmistakably embodying the principle of divine absolutism, and which we again find

cropping out in the forms of the Roman law.—The Aryan races, considering the family as an organic whole, clearly recognized in it a principle of continuity, connecting one generation with another, and, as a natural consequence, certain family rights and privileges. This is one of the most essential conditions of civilization. If we surrender the laws of inheritance, we are given over to barbarism. The knowledge of the fact that not only the blood of the ancestor, but also the results of his labor and provident care are to be transmitted to future generations, is one of the strongest spurs to his activity and providence. If man does not provide beyond the present day, his life is of but little value; and all human progress would surely be impeded, if all should (in all things which go to sustain life and add to its pleasures) have to commence with sunrise and stop at sunset, only to commence over again the next day in the same manner. It is this very character of the law establishing a rule of inheritance, which promotes the development of civilization, by transmitting all achievements which are lasting in their effects, as a priceless heritage from one generation to another.—The case is not different as regards the idea of property, and land ownership in particular. A sort of ownership in chattels is indeed to be found almost universally, though among certain nations the forms in which it appears are not very well defined, and lack the positive sanction of law. But as regards the right of property in land, it was very difficult for mankind to conceive it and to introduce it as a legal institution. The Semitic race attributed all ownership in land, not to man, but to God. The first attempt to recognize this right in man was made by the Aryans, but not for the first time in Europe, but in Asia, as is shown by the primitive laws of the Hindoos. It was they who first attempted to assert an ownership in the soil and to parcel it out, and who by this means tried to secure for man and his family a permanent home. On this fact, however, all improvements in the way of agriculture, all the higher forms of civilization, and the permanent condition of all legal institutions depend.—When we pass from private law to public law, the peculiar character and the superior position of the Aryan races are even more conspicuous. It may well be said. The Aryan nations are in a special manner the political nations. All higher forms of human government and polity originated with the Aryans; and it is for this reason that they secured the vast political power by means of which they have become the rulers of almost the entire globe.—A glance at the map (Berghaus has endeavored to give us an idea of this in his ethnographical atlas) will make manifest the universal sway of the Aryan races, which in some parts has already taken the shape of undisputed supremacy, while in others this supremacy is fast becoming a fact. Europe, the foremost of the great divisions of our globe, is throughout occupied by Aryan states. It is true, we can find nowhere a purely Aryan na-

tion. Throughout Europe, the forces of history have removed the ancient landmarks which divided the different peoples and in a great degree produced an admixture of their elements. Different inferior races had inhabited Europe, before the Hellenic people entered into history, and before Rome was known among the nations. Subsequently the Celts and Slaves spread among these people, and still later among these the Germans, like a higher ethnological stratum over an inferior one. But, after all, the ruling element in all Romanic and Germanic states is of Aryan origin. The English (Norman, Saxon) race formed by an intermixture of these two nations (the Romanic and Germanic) which has taken the lead in spreading the rule of the Aryan race throughout the world, shows, at the present day, traces of its Aryan origin. Although the Slaves may have less of Aryan blood, than the rest of the European peoples, they still belong to that family of nations, and are under the educating influence of the more civilized Germanic and Romanic peoples. In Europe, both the Finnish and Basque elements, however, though they may be complete strangers to the Aryan stock (which certainly can not be said of the Magyars who, in the course of history, have taken in a good deal of the Aryan character) occupy no independent station and are of no special importance.—That great division of our globe, moreover, which seems to be destined to succeed Europe, whenever she may be tired of rule in the supremacy of the world, and to regenerate mankind, America, is, of course, not yet settled as completely by the Aryan race; but it is at the present time completely controlled and governed by it. All the lands on the seacoast are occupied by Aryan colonists, by Romanic and Germanic people; the aborigines are ever falling back before the advance of the superior white race and are continually being diminished in number; or they submit wholly to the rule of the whites. And as far as the African race is concerned, it may be said, that, as a whole, they never seem to rise above a state of voluntary servitude.—The ancient country of Asia, however, the primitive seat of all the nations of Aryan stock, has lost its supremacy, and is gradually coming under the government and control of both Europe and America. In the south, the English and the Dutch have established their dominion; in the north we find the Russians; in the west the French; while in the east, the Americans have made their first attempt to assert their influence. But there is still an ancient Asiatic branch of the Aryan stock in that country, which has again sought a more intimate relation with the European Aryans. This relation is continually gaining in strength, and is certainly calculated to help the spread of the Aryan supremacy in Asia too. To this branch of the Aryan stock belong the Hindoos in India, the Parsees in Persia, the Afghans, Kurds, Armenians, the Circassians, etc.—Among all the rest, Africa (the most inferior and backward in civilization) is the only country to which the Aryans

have yet paid little attention. The important northern coasts of Africa are, at the present day, more under the influence of the Semitic than of the Aryan race. It is a fact, however, that they were early exposed to the influences of the culture which started from European Rome; and France has again made a recent effort to transmit to that part of the globe the fruits of Aryan civilization. And besides this, some of the most important points along the coasts of Africa (to the north, south and east) are settled by Europeans; and by this means a firm basis is secured for the extensive spread of Aryan civilization, whose tendency is to encompass the whole world.—This universal supremacy of the Aryan nations will be fully secured in the end by their undoubted superiority on the seas.—The whole of Polynesia is in their possession. All coasts, the sea, all rivers, all harbors are dependent on them. All means of transportation are in their hands.—This supremacy is but evidence of the superior political intelligence and capacity of the Aryan nations. We indeed find political institutions among inferior nations too. But the government of these nations is vastly inferior as compared with the political institutions and governments of the Aryan races. And wherever they show traces of a higher character, we can, in the majority of cases, show these to have been due to the influence of men of Aryan blood. The Semitic race, primitively related to the Aryans, seems to be the one race which wrought out and followed a principle of polity of its own. But, in point of fact, there is a distinct difference between the Semitic and the Aryan idea of government and its polity; and no doubt the idea of the Aryans on this point is the wider in its range and the nobler in form, as shown by its outward development and realization among mankind. The Semitic races are thoroughly *theocratic* in sentiment. And theocracy has continued to be their ideal even when they, by the force of circumstances and the ruling powers, were compelled to submit to a different form of government. In Europe even, where the theocratic system was at no time looked upon with favor, we find a small number of ingenious men—representatives of the Semitic race—who, when they assume the character of political leaders, very frequently show themselves the advocates of a government under the immediate and absolute direction of divine authority. The political ideal of the Aryans, on the other hand, is evidently that system of government which is organized in accordance with the true and permanent instincts of human nature, and is controlled by the powers of reason in man.—The distinction we have traced here in the political ideals of the different races receives additional support by a further fact of history. It was not until the Aryans succeeded in the attempt, that the essential distinction between a clerical body (the church) and the body politic (the state) between religion and politics, was clearly apprehended, and the separation of the state and church was effected; on which more

than on all else the more refined and civilized sentiments of humanity depend. This is the best proof that the Aryan nations have a clear conception of the true nature and organization of the state.—Proceeding from these general considerations to details, we succeed in tracing out the primitive ideas controlling the public laws of the Aryans. Among all the people of Aryan stock, in their earlier days, we find a body of freemen as the basis of their polity, and forming the principal part of the nation. It is, in a certain sense, the general rule regulating the primitive and elementary forms of human life. It participates in the making and administering of the public laws, and in the public affairs of the nation. In this body of free men the honor and the liberties of the people have their origin and support. What we, in our days, term the rights of citizenship, is but the modern expression of what, in ancient times, was embraced in the honor and liberties of this race. How different is the fact with the people belonging to an inferior race, who have not the slightest conception of this idea, and among whom the masses are either oppressed like slaves, or live in a wild state of nature! With them a slavish submission, or a continual warfare of all against all, is the rule.—However, the Aryan races do not stop short of this idea of popular freedom, which, as sanctioned by the state, is political in its nature. As they have a particular regard for the honor and dignity of man, it is quite natural that they should measure and value men by this standard, and, in consequence of this, be apt to perceive and establish distinctions among men. The principle of absolute equality among men, is a non-Aryan idea; the Aryan people hold to and consider certain distinctions, because given to closer examination. We consequently find among all the Aryan nations certain strong distinctions among the population which are fully recognized by these nations. Among the Hindoos these distinctions have become fixed with great rigor in the form of an immutable system of castes. Among other Aryan nations, especially among the European, these distinctions have retained their fluctuating character. They have entered into the moving process of history, and change with the change of the times. The mummy-like castes of the Hindoos have, in Europe, taken the shape of estates, as wrought out by the traditions of history; and European history is essentially determined by the history of these estates. Whoever has not learned to regard these distinctions in the population and the mutations to which they have been subject, in course of time, will never gain a clear insight into the history of European states.—The divisions of the people into estates is shown in the oldest myths of the Aryans, while we may discover, at the same time, a clear distinction, on this point, between the religious views and the political views of the people. The religious views lay the greatest stress on the relation of man to God, and hence on the equality of men before God. They hold, in the first place,

all men to be the children of the one Lord (brethren) and as such to be equal one to another. This point of view is certainly, as far as religion and its revelations are concerned, the most important and essential. But the state can not absolutely base itself on this principle of equality. As it is the business of the state to regulate human relations and conditions, it must pay due regard also to the differences between men, which exist side by side with that equality. To order or regulate, after all, means nothing but to perceive and protect the true relations of all differences. As the state is the regulating principle and power among men, it naturally presupposes distinctions among them.—This remarkable contrast between religious and political views is shown even in the most ancient legends concerning the origin of man. While the Semitic people, in their legend of the creation of Adam, forcibly point out the unity and equality of the human race (being entirely under the influence of the religious sentiment) the Hindoos and the Germanic people (the two extremes in the series of Aryan nations) indicate, in their versions of the creation, the distinction which obtains among the different races and classes.—It is true, that, according to the Hindoo view, the divine principle (Brahma) generated all men, but in different grades, after the manner in which in the creation of the higher class the superior forces of nature were at work, while in the lower classes inferior agencies were engaged. Thus Brahma, according to the ancient myth of the Hindoos, generated the men of a higher grade by causing them to issue from his mouth. They are the living word of God. Then he causes the tribe of warriors to spring from his arm. They represent the strength and power of God. After the warriors came the Aryans proper (the Vaisyas) the offspring of the loins; in which process we may perceive an attempt to imitate the natural process of generation. Last of all, came the caste of the serfs (the Sudras) from the feet of God. In like manner, though reversed in order, the process of man's creation is represented in the Germanic legend of the Edda, in which the Creator begins with the serfs and ascending to the free men generates, as the highest class, the nobility. The idea represented in all these legends is substantially this: that human laws and systems of government are all based on this distinction establishing the different classes. And, indeed, change as these distinctions may in detail, it always remains true that no high system of government is conceivable without paying some regard to certain differences within the vast extent of a populous state.—The Aryan nations are consequently distinguished, from the very first, by their organizing ability in which we are bound to recognize the chief power at work in the building up of governments and states. The most important factor in this work is the principle of leadership. All the nations we know of, had, in one form or another, in the beginnings of their history, chiefs whom the rest of their tribe obeyed.

But, while some nations worshiped their leaders as gods or demi-gods, and others believed that their chiefs acted mainly under divine inspiration; while others, again, without thinking of God, trembled before the despotic power of their masters, and some submitted, for the time being, to the greater prowess of their leaders, the Aryans recognized in their leaders *human beings*, and the relation of the people to their chiefs as a moral one. Originally, all Aryan nations, in all probability, started out with the idea of the family as an organic institution. This was quite natural for humanity still in its childhood. As the father is the head of the family and the household, the oldest (patriarch) is, in like manner, the head of the gentes and the tribe; and the head of greater bodies which embrace several families, is, in the same way, considered the father of his community and the country they occupy. In language we have the evidence of this primitive Aryan idea of the state. The Hindoos called their chiefs *vic-pati* (*vici pater*) the *father* of the community; and we find the same word in Europe in the Lithuanic, *wies-pati*, which signifies a gentleman, a ruler of the country. In the same manner we find in the Teutonic word *kuning*—king—(from *kun*, clan), a reference to the primitive rule of the gentes. This, however, signifies a great deal. The entire power of the government is thus defined by conceptions which are the natural offspring of the human mind; it is subject to their subtle influence, and a certain sense of piety gives color to the relation between the powers that govern and those who are governed. The paternal chieftain has indeed great privileges and superior authority, but not without also having certain duties toward the members of the same family; he is united with them in the one organic body, a family on a larger scale.—Yet this is simply the first germ, the beginning of development. When a people have become conscious of the wide range of their tribal connections, then the ideas of the family and the state part company. The growing state breaks through the close form of the family, and rises, in its superior character, above the family. The Mongolian people, though widespread and large in numbers, and inhabiting kingdoms whose territory is immense, are still content with the idea of a patriarchal government. But the Aryan races have all discarded this idea. Their thoughts of the state have gone beyond the childlike notions they may have had in the beginning, and their institutions have assumed more imposing proportions, a wider range. When history with her mighty and opposing forces lights upon the vast range of human relations, then the narrow principle of paternal rule will lose its former hold, and the states which are now trembling with political commotion will be beyond the control of the pious influences which a patriarchal system may set to work.—And now, the terms, too, which designate the head of the people (the ruling power) are fraught with a higher meaning. They embody new ideas. In

the Aryan languages, there are chiefly two words, in addition to that mentioned, corresponding to *king*, both of which well characterize the idea which the people had formed of kingship. The old kingly name of the Hindoos is *rag*, the same word which we find again in Europe—among the Romans as *rex*, among the Gael as *righ*, among the Goths as *reiks*, to which also the German word, *richter*, is closely related. The root, *rag*, means a pure, brilliant light, but also the right; and hence we may say that light and right suggested to them the ideas of government; that they considered their kings as the propagators of light and the defenders of right: an idea which, therefore, was not projected (as the advocates of darkness and absolute power claim) from the crater of the French revolution, to spread its burning flames throughout the world, but forms part of the primitive stock of ideas which have been handed down to us through the ages by the undying agencies of tradition. The king of the Aryan people, first in his royal station, is a lover of light, as he is the fountainhead and defender of right—he is a king within the law. He recognizes the rights of others and protects those rights, while possessed of and exercising the highest prerogative.—There is still another word which is taken from military life. *Kshatra* in the Zend means king, and, in the Hindoo vedas, *Xatra* signifies power, strength; *xatrija* the warrior. With these words the Greek *πάτρις*, *ῥατρίων*, and the designation of the different forms of government, democracy and aristocracy agree. And related in sense are also the Roman *imperium* and *imperator*. These serve to designate the kingly power essential in, as well as increased by, war. Might and right are alike essential to the kingship. Judgeship and military rule are the two principal functions of the ancient kings. In this they are superior to the ancient *vishpati*.—With these Aryan ideas, the history of the Aryan people is in perfect harmony. It is true, that in certain periods of their history, and under the influence of foreign elements, they, too, were subjected to the rule of absolute power, but they did not remain under it permanently. They have, at all times, either directly or indirectly, established a government controlled by law whereby the prerogatives of kingship, too, were defined and essentially qualified. It is not the system of absolute government, but that of a constitutional government which is in keeping with the character of the Aryan people. And for this reason the Aryan people are so much superior to the large body of people who are ruled by a despotic power; and their kings (the civilized leaders of free nations) are far above those miserable despots who simply look down upon their subjects as upon a wretched body of uncivilized slaves.—Not only the head of the body politic, but also the rest of its constituent elements are regulated by the Aryans according to human experience and reason. They less expect, than the Semitic race, the principle of governmental polity and organization to

be conveyed to them by divine inspiration, a sentiment which naturally leads to an absolute or modified rule of the priesthood; but they devote their best thought and reasoning powers to the apprehending of the true nature and province of the state, and by this means try to discover the rules which should govern their common conduct as a people. In an inferior stage, when the human mind is yet unable to comprehend the principle of organic growth, the idea of number appears to it the systematizing principle which it employs in perfecting an organization.—When we read, in the laws of Manu, (vii. 115, 121), that ten towns constitute a district, ten districts a province, ten provinces a state, we are at once reminded of the fact that, in Europe, the Germanic nations follow out the same idea in their primitive constitutions which we find among their Aryan cousins in India.—Another Aryan trait is the tendency of these peoples toward perfection. We may trace this tendency throughout the whole history of the Aryan race, and it is the motive principle of their politics. For this very reason they are *the* political people. The famous saying of Aristotle, that man is a political animal, appears in its true light only when applied to the character of the Aryan people. While other bodies of people place the highest value on the quiet enjoyment of the fruits of life, and dread first of all the idea of being disturbed in their quiet, it is the tendency of the man of Aryan stock to improve and refine the conditions of human society. He favors the progress of civilization. His efforts are directed toward developing and exalting the state. There is no danger great enough to drive him back, there is no sacrifice so dear that he is not willing to make it for the accomplishment of his object. It is to this struggling and onward spirit of the Aryan race (trying to overcome the opposing forces of nature and history) that all the higher civilization of mankind is, in great part, due. Religious ideas and sentiments alone have not been able to bring about the results of civilization; it is only because aided by political ideas and sentiments that mankind was able to make those splendid achievements which, through the long ages of history, have enriched and ennobled humanity. If we take away this political tendency from the history of nations, Europe would again relapse into that dull state of implicit faith which, for ages, has been the lot of the people of Asia.—Of course, this political tendency has been chiefly active in the minds of the European Aryans, and has, for the first time, developed its full energy among them. But, that the Hindoos and Persians have also been largely endowed with this faculty is a fact amply proven by their labors in science and their attempts at political organization. The Hindoo system of castes would be impossible, were it not for the fact that it secured the possibility of an advance from a lower to a higher rank (which is indeed denied during this life to those who are

associated in one caste) in the regenerated life of the hereafter; and that it gives promise of this advance in the life hereafter, as the reward for the willing discharge of all duties on earth. The dread of losing, for thousands of years to come, the chance of improving their condition, keeps the Hindoos of the lower castes tied down to a strict observance of the dividing lines between the different castes and of their religious ceremonial.—Finally, it is quite evident that, if the Aryans are, by way of preference, to be considered the political nations, and if all political civilization has proceeded from them, the science of the state is a tree of Aryan knowledge. And such is indeed the fact. With the political literature of the Hellenic people, and that of the Romans, as well as that of the Romanic and Germanic people, the literature of no other nation can be compared. And as the Romanic and Germanic nations are, in the present system of the world, taking the lead in the political life of nations, they are likewise taking the lead in the advancement of political science.—To express, in a few words, what we have considered on a larger scale, in the foregoing pages, we may say: The Aryan mind, more richly endowed from the very beginning, and destined to develop its independent individuality in the highest degree, is also destined to enlighten mankind with its ideas and principles of government and law. It is to assume and hold the rule of the world which is already in the hands of the Aryan people, with a spirit friendly to all that is true and noble in humanity; and to do this, it is charged with the duty of spreading the refining influence of its superior civilization among the rest of mankind. History has imposed this task upon the people of the Aryan race, and the duty being theirs, they have also the right to fulfill it.

MAX. EBERHARDT, Tr.

J. C. BLUNTCHLI.

ASIA. Asia is reputed to be the cradle of the human race. Certain it is, that it is the region whose history goes farthest back into the past; and this is true whether we make history begin with the traditions of the Bible or accept the millions of years of which the Chinese annals boast.—Asia is, after America, the largest of the five divisions of the globe. This immense region includes such countries as Siberia and Kamtschatka, where the cold of winter reaches the greatest intensity, as well as countries in which spices, cocoa-nuts, tea, and all the products of the torrid zone flourish. But it is not our task to give the geography of Asia. Let us rather glance at the political organization of the states within its boundaries.—Asia has always been considered *par excellence* the home of despotism: but if a despot be an absolute master who enjoys and abuses an authority without limit or control, we scarcely find such despots anywhere in the advanced states of Asia. Religion, manners, ancient customs, prejudices, put obstacles in the way of despotism which are often more of a check to it than written provisions. From the

former, tyranny can not free itself except by exposing itself to destruction through its own violence. The monarchs of Asia have been taken for tyrants before whom everything bends or breaks. It is usual to approach them in a very suppliant manner. A rajah of India, however, has power neither to levy taxes on a Brahmin, even if dying of hunger himself, nor to make a merchant of a laborer, nor to infringe in the least on a code which passes for revelation, and which governs in civil and religious matters. The emperor of China, a sovereign reputed omnipotent, can not choose a lieutenant governor of a province outside the list of candidates trained by the learned men of the empire. If he neglects to fast on the day of an eclipse, and recognize publicly the faults of his ministry, a hundred thousand pamphlets will recall him to the observance of ancient usage. Let any one read the too little known journal of van Braam Houckeest, and he will see what a net-work of moral bonds involves the existence of him whom his subjects call the son of heaven.—There are many nations in Asia whose governments might be compared to those of the feudal empires of the middle ages; such, for example, are the Afghans, the Beloochees, the Mongols, the Calmucks, the Mantchoos, many Turkish peoples, and several nations of the Caucasus; but especially Japan, whose *daimios* are true feudatories of the emperor, or were, at least, before the reforms effected about 1870.—The Bedouin Arabs, the Kurds, and several small peoples of the Caucasus region and of Syria, are entirely free. Small nomad nations and several Arab tribes have a pastoral or patriarchal government, hereditary for the most part in certain families. Others are governed by a council of old men, and form a kind of republic, such as the town and territory of Antsoug, in the region of the Caucasus.—The empire of the Wahabites afforded quite recently an instance of a singular mixture of monarchy, aristocracy and democracy. Thibet, Bootan, and a part of Arabia, are governed theocratically, this last by the imams of Sana, of Muscat, and by the sherif of Mecca, a dependent of the porte whom he almost never obeys; Thibet and Bootan by absolute but elective pontiffs, who have the titles of *Dalai-Lama*, *Boghdol-Lama* and *Dharma-Lama*, and are considered as an emanation of the divinity itself.—In general, it may be said that Asia presents almost every form of government from a republic to a theocracy, in which the sovereignty is attributed to God himself or, more correctly, to a person considered as a real incarnation of the divinity.—Asia may be divided into nine great regions. Ottoman Asia, which comprises Asia Minor, Armenia and Kurdistan, Mesopotamia, Irak-Araby, Syria, and a part of Arabia; Arabia, subdivided into several states, of which Yemen and Muscat are now the most important; the Persian region, subdivided into three kingdoms: Persia, properly speaking Kabyli and Herat, and comprising also the confederation of the Beloochees; Turkestan,

comprising Bokhara, Khiva, Khokan, and the Kirghiz countries; India, subdivided into several states, of which the Anglo-Indian empire, the kingdom of Scindia, Nepaul and Lahore are the principal, (to this region belong small territories possessed by France and Portugal); India beyond the Ganges, of which the principal states are Burmah, with the kingdoms of Siam and Anam; the Chinese empire, which embraces China, Thibet, Bootan, Corea, Mongolia, Eastern Turkestan (Little Bokhara), and the country of the Mantchoos; Japan, which is divided into Japan proper, and that portion of territory called by geographers the *Government of Matsmai*; Asiatic Russia, which comprises Siberia, and the southern slope of the Caucasus

MAURICE BLOCK.

ASSEMBLY (IN U. S. HISTORY), the name generally given to the legislative department of the governments of the different states. It is now in all the states composed of two bodies, which act as a check upon each other; in Pennsylvania, 1776-90, and in Vermont, 1777-1836, there was but one house, called the house of representatives. In all the states, the upper house is called the senate, and in most of them the lower is called the house of representatives; in Maryland, Virginia and West Virginia, the lower house is called the house of delegates; in a few states (see below) it is called the assembly, and in North Carolina, until 1868, it was called the house of commons. The two bodies, the senate and the house of representatives (or delegates), are together called the legislative assembly in Oregon; the general court in Massachusetts and New Hampshire; the legislature in Kansas, Maine, Michigan, Minnesota, Nebraska and Texas; and the general assembly in Alabama, Arkansas, Colorado, Connecticut, Delaware, Georgia, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, and West Virginia. The lower house is itself called the assembly in California, Florida, Nevada, New York, and Wisconsin, and the general assembly in New Jersey; and in these states the two bodies are together called the legislature. The states have usually held steadily to the original names given to their legislative bodies, except that in New Jersey the name of the upper house was changed from legislative council to senate in 1844 (see COUNCIL), and that Mississippi in 1832, and Florida in 1868, changed the collective name from general assembly to legislature. As a collective title (in 1831), therefore, general assembly is used in twenty-three states; legislature by twelve states; general court by two states, and legislative assembly by one state; but, in all the states, legislature is very often used as equivalent to the official title.—The legislative functions of the American assemblies are exercised upon such subjects as pertain exclusively to the interests of their particular states, but are checked and con-

trolled, 1, by the limitations which the people at large have imposed in the constitution of the United States; 2, by the limitations which the people of each state have imposed in the state constitutions (see CONSTITUTIONS, STATE); 3, by the veto of the governor (see VETO); and 4, by a very few general principles, such as the invalidity of irrevocable legislation, and the right of property to protection, which the courts have established. In other respects the various assemblies have complete legislative powers, and are very tenacious of their rights and privileges; but all the latter state constitutions show a strong disposition on the part of the people to increase the limitations upon the legislative power by prohibiting special legislation, the grant of special privileges to corporations, or money to sectarian institutions, etc., (see CALIFORNIA, ILLINOIS, NEW JERSEY; CONSTITUTIONS, STATE). Their political importance, however, has been fully maintained by their right to choose United States senators (see CONGRESS), by their right to pass upon amendments to the constitution, and by their power, which is often and unjustifiably exercised in all the states and by all parties, so to district the state as to affect seriously the state's representation in the lower house of congress (see GERRYMANDER). In addition to this, the opponents of the growth of federal power have unsuccessfully endeavored to establish the right of a state legislature to declare void an act of congress (see NULLIFICATION, KENTUCKY RESOLUTIONS), and to instruct the United States senators of the state how to vote upon bills pending in congress (see INSTRUCTION, RIGHT OF).—In all the assemblies the machinery of legislation is very much the same, following closely the provisions of Jefferson's "Manual." Each house has its own officers, rules and *esprit de corps*, and as the two houses generally differ in the times of election of the members, or in the extent of their constituencies, they are often under control of opposite parties and commonly furnish a fairly efficient check upon improvident or evil legislation. Where this check fails, the veto power of the governor, or, in the last resort, the power of the people, exerted in the election of new members or by amending the state constitution, has usually been sufficient. (For the direct action of the federal upon the state governments, see INSURRECTION, II.)—See Poore's *Federal and State Constitutions*; Cooley's *Constitutional Limitations*; Story's *Commentaries*, § 1252; Jefferson's *Manual*, and authorities cited under articles above referred to.

ALEXANDER JOHNSTON.

ASSESSMENTS, Political. This is a general term used to designate the pecuniary contributions levied by congressional, state and municipal political committees, upon the office-holders and candidates belonging to their several parties, for the stated purpose of defraying the expenses of the political canvass conducted by them respectively. The assessment embraces in each

case the office-holders and candidates within the field of such canvass. With office-holders it usually takes the form of a request for a specific sum, amounting to a certain percentage of the salary of the contributor. In the case of candidates the practice is not yet systematized except in the larger cities, and not completely except in New York. There it becomes a contribution, the amount of which varies with the closeness of the election, the salary of the prospective office, and the circumstances of the candidate. The amount of this assessment, however, is not fixed by the candidate as if it were a purely voluntary contribution, but is determined by a political committee, to which the candidate is often compelled to give security for its payment, as a prerequisite to obtaining the nomination. An action has been brought against a judge in New York, to recover a portion of the assessment thus levied upon him as a candidate, and it is a matter of common belief that, in the autumn of 1880, a judicial candidate mortgaged his prospective salary to secure the payment of an assessment of \$17,000.—The beginning and growth of political assessments are involved in great obscurity, the only data for the history of the practice being preserved in the memory of men who have levied assessments, or who have paid them. Obviously, however, it is an outgrowth of the "spoils" system, which conceives political office to be a species of valuable property, belonging with its profits to the party in power, and out of which has grown the later conception, that as an occupant of an office holds it not in trust, but in fee of his party, he may have in it a right of individual property, and consequently, a tenure of office which is irrespective of his efficiency or his behavior. The first specific instance of an assessment which has been found, is in the testimony taken in the Swartwout investigation to be found in the report of a house committee of the twenty-fifth congress. During that investigation a former deputy collector of New York testified as follows. "I have frequently been called on to contribute to political objects while I was deputy collector, as an officer of the custom house. The amount was from \$20 to \$100. The tax was *pro rata* according to salary. It bore a proportion of from one to six per cent. I believe nearly all the officers of the custom house in doors and out, and the clerks were similarly taxed, and generally paid what they were assessed. It was assessed by the general committee of the Tammany hall party, and for the support of the Tammany hall party. If the individual did not pay the amount he was taxed with, the collector would remark, 'You will be reported to the general committee,' and everybody well understood proscription would follow. The collector of the general committee has an alphabetical book containing the names of persons taxed, and the amount each individual is requested to pay."—The next instance was in 1842 or 43, and was levied from Washington upon the employés of the New York postoffice. Ten dollars were demanded from

each clerk, and twenty dollars from each carrier, both classes being also required to subscribe for the *Madisonian*, the organ of president Tyler, and for a copy of his portrait. From that time until the present, despite the occasional endeavors of far-seeing officers to check it, (Gen. Dix, for instance, while postmaster in New York, ordered the collectors out of the postoffice) the practice of political assessments seems to have developed without serious interruption. From information obtained from the older men in the great public offices, it appears that since then, pecuniary "contributions" have been solicited in every presidential campaign. It appeared from the Covode investigation that the democratic party of that day collected its campaign funds from office-holders and contractors, and an abortive endeavor was made in the interior department, at about the same time, to compel the patent solicitors to contribute to the funds of that party and to render to it political allegiance.—In 1866 the republican party established its congressional committee for the special purpose of watching its interests in congressional elections, and the present practice of addressing to all persons whose names appear in the official register of the United States a request for the "voluntary contribution" of a sum which is specified, appears to have originated with this committee, although the present practice may have reached its completed form gradually. The existing system will be best described by a statement of what was done in 1880. On April 19, the republican congressional committee addressed to all persons (except the heads of executive offices) drawing a salary from the national government, a letter containing these words: "Under the circumstances in which the country finds itself placed, the committee believes that you will esteem it both a privilege and a pleasure to make to its fund a contribution, which, it is hoped, may not be less than —. The committee is authorized to state that such voluntary contribution from persons employed in the service of the United States will not be objected to in any official quarter." The blank was filled by writing in a sum which was equal to two per cent. of the salary of the person thus solicited for a "voluntary contribution." On Oct. 14th, the committee addressed to the same persons a second appeal: "to promptly contribute to its funds an additional one per cent. of your salary." There are no means of ascertaining what number of persons thus addressed actually contributed, nor what was the total amount received, and probably not more than one or two persons know the precise sum realized; but there is the highest authority for stating that it was at least \$100,000. In addition to this assessment, the federal office-holders were further assessed by the republican state committees in their respective states. This assessment varied in different states, but it was larger and more rigidly collected in Pennsylvania and New York than elsewhere. In New York it amounted to a second three per cent. of the

office-holder's salary, and no effort was spared to extort the whole amount. Repeated letters were sent to delinquents requesting more or less imperatively the payment of the contribution, and finally a list of such delinquents in each office or department with the amounts "due" from each, was sent to its chief, with a request to attend to the matter. Of three of these letters the following are copies:

STATE OF NEW YORK,
REPUBLICAN STATE COMMITTEE,
FIFTH AVENUE HOTEL.
NEW YORK, Sept. 13, 1880.

SIR: Under instructions from this committee on the 26th of August last a circular was mailed to you with the expectation that you would respond before Sept. 3rd. —The republican state committee respectfully invite your immediate attention to this matter, and hope to hear from you without further delay. Very respectfully, T. C. PLATT,
Chairman of Executive Committee.

STATE OF NEW YORK,
REPUBLICAN STATE COMMITTEE,
FIFTH AVENUE HOTEL.
NEW YORK, Sept. 28, 1880.

SIR: This committee instruct me to call your attention to the circular sent you Aug. 27th, asking you to contribute \$15 (in two monthly payments, the first one before Sept. 3rd) toward the necessary expenses of the presidential campaign in New York State, and to say that, as you have not yet paid the first installment, it is important that the whole sum asked be paid before Oct. 3rd, in one payment. —Checks or postal orders should be made payable to the order of

Yours, very respectfully,
JOHN N. KNAPP,
Treasurer.

FIFTH AVENUE HOTEL,
NEW YORK, Oct. 27, 1880

MY DEAR SIR: Below you will find a schedule of your subordinates who have several times been asked to contribute the sums set opposite their respective names toward the expenses of the campaign in this state. —You will find opposite each name the amount yet due. The total unpaid at this date and due from the employes of your office, therefore appears to be \$—-. Your immediate attention to this matter is very important. By order of the executive committee. HENRY A. GLIDDEN, Secretary.

No one employed by the national government in New York seems to have been omitted from the lists of this committee. Three per cent. of a weekly stipend of \$2 was requested from an office boy in a rural postoffice, and one of the most insolent letters was received by a custom house messenger whose salary is \$500 per annum. As in the case of the congressional committee, the exact amount raised can not be computed, but it is best estimated at between \$90,000 and \$125,000. No accounts are kept or rendered; the receipts and expenditures are in the hands of a small executive committee, whose accounts are presumed to be audited by the character of its members. —The system of political assessments in the city of New York, as the end toward which the practice elsewhere is tending, deserves special notice. In that city in 1880 the members of the police force were assessed, and the proceeds divided between the parties; the firemen and even the school teachers have been requested for "voluntary contributions" and in all the other departments, without exception, the salaried employes of the city

government are called upon to assist in keeping the party, under which they hold, in power, by means of "voluntary contributions." The assessment of candidates is so complete as to amount to a fixed price upon a nomination for every elective office. A judgeship costs about \$15,000; the district attorneyship the same; a nomination for coroner, \$2,000; for a nomination to congress the price is about \$4,000, though this is more variable than any of the other assessments; an aldermanic nomination is worth \$1,500, and that for the assembly from \$600 to \$1,500. While these prices fluctuate, they represent the average cost of the nominations named. The amount realized from these assessments, as in the previous cases, can not be exactly estimated, but the amount raised by Tammany hall, which is the most complete political organization, may be fixed very nearly at \$125,000. As in the previous cases also, this amount is collected and expended by a small executive committee, who keep no accounts and who are responsible only to each other. A certain amount of corruption in the handling of the funds would, under such circumstances, seem to be inevitable, and the fact that a considerable number of persons, without property and without occupation, find a means of livelihood in the pursuit of "politics," demonstrates the truth of that supposition. —The main motive for the payment of assessments is the fear of losing office and means of livelihood through the success of the opposite party. But it is also true, that many office-holders contribute because they fear that their refusal will be punished by removal by their own party. Great stress is laid by most politicians upon the statement that the contributions of office-holders are all "voluntary." A United States senator of the largest experience in levying assessments, has assured this writer that he never knew an office-holder to be dismissed or to lose his place in consequence of refusal to pay his assessment. It is probably, nevertheless, the fact that many persons have been so punished, and the slightest intercourse with the holders of minor offices shows that the fear of this punishment is the sole inducement for many contributions; numbers of cases might be cited to show that the payment of this assessment has been made only at a sacrifice and that it has worked actual hardship. The terms in which the request for "voluntary contributions" are made, as in the letters above, are certainly calculated to convey the impression that refusal will be punished, and it is unquestionable that many office-holders suppose themselves to have no other volition in the matter than that of choosing between paying and losing their places. —The effect of the practice of political assessments has already been, in New York, as it must ultimately be elsewhere, to directly increase the salaries of the persons subjected to them. Mr. John Kelly, of Tammany hall, for instance, defended the payment of exorbitant salaries to the city aldermen before a legislative committee in 1880, on the ground that it was

necessary to enable them to meet the large political demands that were made upon them. The remote effect of the practice, by causing the sum of the salaries of public servants to be regarded as a fund to which there is easy and secret access, is to increase the unnecessary expenses of elections and to encourage the corrupt use of money in influencing their results, and, by seeming to provide that the expenses of one party shall be paid out of the public treasury, and that the means of support of government employes shall depend upon the issue of an election, to introduce into contests between parties an exasperation and rancor which is properly foreign to them.—Many of those by whom the practice is carried on regret it, and very few defend it, except on the ground that it is necessary. It is not said to be wise or to be just, but simply a necessity which can be obviated only through a compact between parties. There have been two other remedies proposed: first, the absolute prohibition of assessments; second, reform of the existing systems of civil service. The first of these remedies was attempted in an executive order made by president Hayes at the beginning of his administration, which prohibited the participation of office-holders in politics and forbade political assessments, but this order was soon allowed to become a dead letter. Bills have also been introduced into congress with the same object; most of them make the levying of assessments a misdemeanor; but, with the exception of a bill introduced in 1881, and entitled “a bill to prevent extortion from persons in the public service, and bribery and coercion by such persons,” all of them by proposing to prohibit all contributions, repeat the mistake made by president Hayes in his order, in seeming to restrict the individual liberty of the office-holder. The radical remedy for political assessments is a reformed system of civil service, which by substituting fitness, ascertained by competitive examinations for political services, as the basis for appointments, shall secure to all citizens an equal right to be admitted to the public service; and which by providing that all persons shall be appointed to the business positions in the service, not for four years or for any other definite period, but for such time as they shall be found by their superiors to be efficient and well behaved, shall secure the same permanency of tenure in the public services of the United States which exist in private business and in the civil service of other civilized countries. Under a system so reformed there will be no special sense of obligation to any political organization for procuring appointments, and no consequent readiness to discharge it by pecuniary contributions or by political services. Under such a system also, the office-holder will feel as in private life, that his income depends upon his efficiency and his conduct, not on the results of an election; he will have no stronger motive for making political contributions to one party or the other than any good citizen; and if he does make it, it will be on

the footing of his other expenditures, and in fact voluntary, and not under actual or fancied duress. Until such a reform is made, all government employes will be compelled to consider the members of the political party opposed to that under which they hold, as persons who are engaged in an endeavor to deprive them of their means of subsistence, and they will pay political assessments to an amount and with an eagerness which has convinced thoughtful men of both parties, even in the present dimensions of the practice, that it is, together with the “spoils” system, out of which it has grown, a mighty and unpaliated evil.

FREDERICK W. WHITRIDGE.

ASSIGNATS. Every one knows what the assignats were during the French revolution. We shall limit ourselves here to a brief review of the historical facts relating to them. As to the economical questions connected with this subject, they will be amply treated of under the term. **PAPER MONEY.** When the French revolution broke out in 1789, the state succumbed under the weight of its debts. The total, which would seem light enough to-day, surpassed, by far, all the resources the state then possessed. The reforms effected by the constituent assembly, reforms salutary in themselves, far from decreasing the burthen immediately, tended rather to increase it. Such was especially the effect of the laws, which, while abolishing the sale of offices, accorded indemnities to former incumbents. The ordinary resources were, therefore, far from meeting the demands upon them. It was necessary to have resort to extraordinary means to provide for them.—It was then thought to make use of the immense estates formerly possessed by the clergy, and which a recent decree had added to the public domain. The sale of these estates was ordered, and the communes were intrusted with the task of selling them in their respective districts. But the sales could not be effected quickly, because of the scarcity of capital; and the fear of a counter-revolution, which might restore their property to the clergy, considerably diminished the number of purchasers. And as the need was pressing, it was decreed to issue immediately paper money, representing the value of this property, which the communes were to be obliged to receive as payment in all the sales which they might make. By reason of this last provision the bills issued were first called *municipal paper*, but this name was soon changed to that of *assignats*, which they afterward retained.—The first issue, decreed April 1, 1790, was for 400,000,000 francs.—It is evident that at first the assignats were nothing but an assignment of national property which served as security for them. They were apparently intended to be received only in payment for these estates from those who had acquired them. On this basis, they would have preserved a pretty stable value, in spite of the depreciation of the security, but they would have had but a small circulation; they would have found no

other purchasers than those who had the real intention of buying some of the land offered for sale. The greatness and urgency of the need, probably also the scarcity of coin, an ordinary result of political agitation, caused a decree to be made that the assignats should circulate as money, and they consequently had compulsory circulation. From this time these bills assumed the character of paper money and partook of its variations in value.—The issues were successively increased afterward in proportion to the increase of the wants of the state. In September, 1792, they were 2,700,000,000 francs, a year later they went as high as 5,000,000,000. The convention tried, for a certain time, to reduce their amount, and a forced loan to which it had recourse, having procured it extraordinary resources, it called into the treasury and burned 840,000,000 francs. But this system of reduction was not long-lived. The issues of assignats soon began again, and they were larger in proportion as the assignats became more and more depreciated in value. At the commencement of 1794, the issue again exceeded 5,000,000,000. Another 1,000,000,000 was issued in the month of June following. The issues became then so rapid, that in March, 1795, they attained 8,000,000,000, and reached the sum of more than 20,000,000,000 in the same year. At the commencement of 1796, when the assignats were finally abandoned and replaced partly by territorial *mandats*, the sum total put in circulation up to that period was not less than 45,000,000,000 francs. Therefore, in the month of February of that same year, the engraved plates were broken by order of the government.—We can well understand that the state had not really received more than a small part of the sum represented by this enormous amount of paper. The assignats which had never been received in public for their face value, depreciated from day to day, in proportion as the institution was abused. As early as the month of August, 1793, they were accepted for only a sixth part of their value. Vainly did the convention try to keep them in circulation by violent and despotic means, such as the proscription of coin, fixing a maximum price of goods, and imposing, under severe penalties, the obligation on all private citizens, to take the assignats at a fixed rate. All these measures and others, more violent still, were powerless to arrest the depreciation which kept on increasing. For a moment their value rose, when, in 1793 a part of the bills were called in, but it fell again soon after to such an extent that in March, 1795, they represented only the ninth part of their nominal value, and this was not the limit of their depreciation.—More than once the government, although it struggled with all its strength against this depreciation, was obliged to recognize and sanction it. The most significant fact in this connection was that which happened in 1795. In the new forced loan to which it had recourse in that year, the assignats were received only for a hundredth part of their nominal value. At this point

it would seem that the use of paper, thus degraded even by those who issued it, would have been abandoned; and yet at this very juncture, there were issues still more numerous than those which preceded. Thus the assignats fell to a half a hundredth part of their value, and soon after became entirely worthless.—The history of the assignats is as significant as it is sad; but it is necessary to treat it in conjunction with other facts of the same nature, in order to draw the legitimate consequences which flow from it, with proper force. (See BANKS; BANKRUPTCY, NATIONAL, PAPER MONEY.) CHARLES COQUELIN.

ASSOCIATION AND ASSOCIATIONS. Association, in the politico-economical sense, consists either in a union of efforts tending to the same end, or in a community of goods, interests, or of consumption. Its determining causes are found either in the sentiments of affection or benevolence, or merely in personal interest.—The questions pertaining to association have been considered in the works of the principal economists from a rather narrow point of view; most of them have confined themselves to pointing out the advantages it affords for the execution of great works of public utility; they have given but little attention to the examination of the numerous cases in which it has already been applied, nor have they endeavored to discover under what conditions it can be used to advantage.—On the other hand, other classes of publicists, and especially those belonging to the different socialistic schools, have discovered in association the dominant question of our time; it seemed to them that all social misery could be remedied by association and all social difficulties solved by it. They seem convinced that there are yet undiscovered new forms, new modes of association destined to change completely the organization of modern society, and the progress of mankind.—I. Among nations advanced in civilization, association has a multitude of various applications and appears under different forms which we shall briefly enumerate.—1. *The Family*. Dictated by the most powerful instincts of our nature, the intimate association of father, mother and children is as old as humanity itself; its conditions may be modified in certain respects according to the belief, morals and institutions of each people; but we find it everywhere manifesting the most invariable example of unity of effort and community of interest.—2. *The Commune*. The simple fact of a greater or less number of families residing in one place, renders it necessary for them to put together a part of their means to satisfy their wants. All can understand that if they acted separately they could not construct nor maintain properly objects intended for use by all, such as roads, churches, bridges, etc.; that they could not themselves prove with the requisite authenticity births, marriages and deaths, nor effectually provide protection against all attacks upon person and property. They must therefore

inevitably intrust these different services to town-councils or corporations, invested with the authority and supplied with the material means necessary to accomplish them. These are the causes which led to the establishment of municipalities. — In proportion as population increases, as industry and civilization develop, as wealth increases and as learning is diffused, communes become more important. cities are formed and grow, collective wants increase in number and urgency, and municipalities are led to extend the circle of their powers accordingly. They provide for religious service, interments, public feasts and ceremonies, and for the paving, cleaning and lighting of the streets, they see to it that the buildings or works of individuals do not interfere with traffic and are not injurious to health and safety. They draw up and enforce regulations as well for this latter purpose as for the maintenance of good order and tranquillity in the city. They provide and distribute the water necessary for drinking and domestic uses; they found, or concur in founding or in supporting hospitals and other charitable institutions, colleges, schools, libraries, museums, theatres, parks, etc.; lastly, they determine and collect the local contributions necessary to defray the expense of all these services. Thus we see that the *commune*, as its very name implies, associates and unites a multitude of interests and consumptions, and this *de facto* *communism*, as has already been remarked by the renowned administrator, Horace Say, becomes more inevitable, more exacting, and more extended in proportion as the density of population increases. — 3. Other collective interests, of the same nature as the preceding, associate together the *communes* of the same district, or the same province; in France, for instance, the *communes* of each department are associated together for the building and maintenance of highways, departmental routes, and certain prisons; for the care of foundlings and the indigent insane; for the necessary expenses of certain judicial or public services, etc. — 4. The powers with which the government of each nation is invested also establish between provinces, communes and families, associations of force and communities of interest for a great many important objects: first, for the defense of person and property, whether against the aggression of foreign nations, or against the violence or fraud to which they might be exposed at home; also, for the foundation, support, or enjoyment of national property, such as forests, streams, rivers, highways, canals, light-houses, harbors, etc.; and also for certain services, for the performance of which sufficient guarantees could not be given, without the concurrence or control of public authority, such as the carrying of the mail, the coining of money, the general management of forests and streams, the regulation of weights and measures; finally, for other services, of which the administration of some states assumes the direction, such as those of religious worship and education. — 5. *Religious*

Associations. Among Catholics there are a great many associations founded on religious belief; they generally practice community of labor and of consumption, and frequently, community of goods. — 6. *Private Charitable Associations.* In addition to the public charitable institutions, that is, those founded or controlled by local administration and governments, there is a multitude of others founded and governed by voluntary associations of individuals which put into a common fund to be used for charitable purposes the money contributed or collected by their members, whose personal services they also make use of in different ways — 7. There are numerous other philanthropic associations formed for the advancement or propagation of science, for the progress of the arts and of industry, for reforming habitual drunkards, etc., the members of which mutually contribute, besides their personal services, material resources. — 8. *Insurance Societies.* The aim and result of these associations is to lighten the losses occasioned by certain specified accidents, such as fires, shipwrecks, etc., by sharing them in common. When the number of associates is very large, the assessment levied upon each is hardly felt, and nevertheless it suffices to save the one insured, upon whom the calamity falls, from the ruin or reduction of fortune which it would otherwise cause. At the same time, insurance gives to all the benefit of security against the accidents in question. — 9. *Savings Associations.* This class comprises the *tontine* or life insurance, and societies for mutual aid among workmen. The money accumulated by these establishments is intended for use in time of sickness or other misfortunes, and, like the insurances of which we have just spoken, serves to lighten the consequences of the misfortune to the individuals or families stricken by it, and to increase the security of the other associates — 10. *Agricultural, Manufacturing and Commercial Associations.* After the associations just enumerated, these associations are the most important because of their number, and of the aggregate of interests which they put in common. All those who concur in the same productive operation, by furnishing either land, capital or labor, by this concurrence alone unite their productive services and their interests, no matter how the share of remuneration belonging to each of them is determined. From this point of view, association would embrace almost all kinds of labor. However, those only are ordinarily regarded as *associates*, in the sense of *partners*, in industrial enterprises, who are expressly entitled by previous agreement to share in the chances of the profit or loss which these enterprises may offer; but even reckoning among the number of these industrial associations only those based upon this sharing of profit and loss, they nevertheless control a very large proportion of the entire production. In agriculture, they embrace all farms cultivated on the metayer system, in the cultivation of which the owner and the farmer share the risk. In manufacturing indus-

tries, there are few enterprises of any importance that have not a certain number of associates. In great enterprises such as mines, iron works, railroads, canals, banks, navigation, etc., whose capital is usually divided into shares, the associates are counted by hundreds and thousands.

—II. Our intention in briefly enumerating, as we have just done, the nature and object of the different existing associations, has not been to explain each of them, and to point out its respective advantages and inconveniences, or to discover the modifications which it might profitably receive. Our desire here has been to give a general idea of the different kinds of associations that may be formed, and the extent of their operations. Surely, never before have associations embraced such a diversity of labor and interests; and we do not think it would be any exaggeration to affirm that in England and France, for instance, the number of persons who combine their efforts and their capital for a common end, the community of interests and consumption and the importance of the resources of all kinds devoted to the various species of associations, are to-day at least ten times greater than they were a century ago.—But this prodigious increase of common interests, although we have but to open our eyes to see it, seems to have escaped general attention, for in our own days more than at any other time declamation has everywhere been loud on the alleged increase of the isolation of interests and of individualism, and on the necessity of substituting for this state of things *association*, that is, apparently, associations new and entirely different from those with which we are acquainted. Some socialistic reformers have, in fact, ventured to formulate new modes of association; but their formulas have exhibited such false judgments of men and things, such folly and extravagance, that the most prudent socialists, without ceasing to recommend *association* as the panacea for all our ills, now abstain from specifying precisely the use they would wish to make of it.—These vague tendencies toward new forms of association, in which, by some unaccountable illusion of the imagination, they hope to find an inexhaustible source of abundance and prosperity, are, however, of late years directed to an appreciable object, to the method of remunerating workmen in industrial enterprises. The socialists seem to believe that if workmen, instead of receiving wages, determined beforehand and independent of the final results of the enterprise, had a share in these results, their condition would be improved.—They say that wages fall below what is requisite to supply the workman's wants, only because the system of wage-hire puts the workingman at the mercy of the contractor or the capitalist; that it is absurd to suppose that the workingman is at liberty to argue about the price of his labor, when hunger forces him to accept whatever is offered. They say too, that association in the profits of enterprises would interest the workman in its success,

and would stimulate the development of his useful faculties, would hasten the perfecting of the processes of labor, and would put an end to the antagonism between employers and workmen, which causes strikes, suspensions of work, collisions, etc. In a word, they think the interest of the working classes requires all those who desire to improve the condition of these classes to labor for the realization of the principle: *the suppression of wages, by association*.—These ideas had at one time sufficient power in France to cause the national assembly to assist in founding certain associations of workmen and employers, or of workmen alone, by devoting to that object, under the title of a loan, sums amounting to three million francs. In spite of the ill success of the experiments made, with the assistance of this *loan*, the opinions which led to them are still widespread, and as they tend, in our opinion, to urge men into evil ways, and to turn their attention from useful and practical reforms, to make them follow after a chimera, we do not believe we can do anything better than endeavor to lay bare the error and delusion of these opinions.—The various services necessary in all productive operations are united together by the care of the capitalist-employer. When he disposes of the productive resources of others, he usually agrees with them beforehand upon the price he is to pay for their use; he pays rent to the land owner or house-owner, interest to those who loan him capital, and wages to the workmen whom he employs. When public authority does not interfere in regulating these transactions, these three kinds of remuneration, rent, interest and wages, are all freely discussed and agreed to on both sides, and it is not true that the urgency of his wants leaves the workman less liberty in this respect than the man who employs him; the employer's need of the workman's services is at least as urgent as the continued payment of the workman's wages to him; the employer who is without workmen loses not only the price of his personal services, but also the interest on all the capital engaged in his business; he loses, besides, his patronage and his market, which last fact alone would suffice to render his need of the workman's labor, perhaps, more imperiously urgent than the wants of the workman himself. This is proved by strikes; for, although these suspensions of labor, continued sometimes for several months by the will of the workmen, are prejudicial to all and never beneficial to any, yet the injury recoils upon employers and not unfrequently causes their ruin. It is certain, therefore, that the urgency of the want on both sides is at least equal, and that the liberty of the workman, in fixing the wages for which he will work, is no more constrained by his position than that of his employer.—But this is not all; in order that the capitalist-employer should be disposed to take advantage of the position of the workman, to compel him to accept insufficient wages, he must have an interest in doing it, and to have an interest in doing it, he must be able to

appropriate to himself the amount of the reduction in the workman's wages; but this is not the case. If we except monopolies, in all branches of labor in which there is competition, the capitalist-employer can no more profit by the lowering of workmen's wages than he can sell his products, if of the same quality as those of his competitors, at a higher price than they: with perfectly free competition, it is impossible for a reduction to occur in the *cost price* of products, and consequently in wages, without its being followed by a corresponding reduction in the selling price of these same products; this is a universal fact so constant, and so plainly evident to all, that nothing can give rise to a doubt concerning it. It can not be supposed that the capitalist-employers enjoy the benefit of a lowering of wages; it is clear that they have no share in this benefit, which goes entirely to the consumers.—There can be but two causes of a permanent lowering of wages; it must be occasioned either by an inopportune increase in the number of workmen, or a decrease in the demand for labor. Now these two causes which depend upon the general movement of the population, revenue, and consumption, are absolutely independent of the will of the capitalist-employer. When the supply of labor is *less* than the demand, he is forced by competition to raise the wages of his workmen, and when, on the contrary, the supply is *greater* than the demand, competition compels him to lower these wages; for if he were to keep them up, as the cost price of his products would be higher than that of his competitors, he could not sell his products, and would speedily fail.—So true is it that capitalist-employers are not benefited by the lowering of wages, that we invariably find that their business is most prosperous when wages are high; nor is this difficult to explain, for the wages paid in any branch of industry never increase but when the demand for its products increases, and the capitalist-employer naturally profits by this increase as well as his workmen; if there is, on the contrary, a falling off in the demand sufficient to cause a noticeable reduction in labor and wages, the capitalist-employer inevitably suffers a corresponding reduction, in the returns he receives for his capital and personal industry.—Finally, it is so radically impossible to raise wages above the rate determined by the relation of the supply and demand of labor, that it could not be done, even if all the capitalist-employers should combine to attempt it. In fact, to raise wages would be to decrease consumption, for all consumers combined have together but a certain amount of resources, and to make them pay more for products, would evidently be equivalent to reducing the amount of products which these resources could buy; this would be to diminish production, or the amount of labor; so that the wages of some can not be arbitrarily raised without taking away the wages of others, by depriving them of their share of labor.—These are mathematical truths against which it would be vain to contend. It

will indeed be said that they are severe and inexorable, that economists in stating them, prove their insensibility, and—as they have been reproached with doing—that they substitute a *figure for the heart*. This puerile kind of declamation can work no change in the nature of things, nor alter the fact that there is a more profound, more manly and more real feeling of humanity and benevolence toward the suffering classes in the laborious researches of science which seek to ascertain the only real means of improving their lot, than in all the cheap affectation of zeal in the cause of those classes, an affectation which has to this day done nothing but encourage among them illusions always followed by disappointment.—But, is it true that the position of the laboring classes would be improved by their general association in the enterprises in which they are employed, by changing the mode of remuneration and substituting, in the place of wages, a share in the final profits of the business? We do not think so.—Many are apt to exaggerate the magnitude of the profits which capitalist-employers may realize, because they direct their attention principally to enterprises unjustly favored by regulations restricting competition, or by legal monopolies, or enterprises which are placed in exceptional circumstances. The truth is, that, in most branches of industry, competition does not allow the profits to exceed what is strictly necessary to pay for the use of the capital engaged and the personal industry of the capitalist-employers. If we will but notice within the sphere of our own observation, the position of the farmers, manufacturers, mechanics, and merchants, we will readily perceive that for one head of an industrial enterprise that succeeds and makes a fortune, there are ten who scarcely do more than realize the amount of profit indispensable to the continuance and to the maintenance of their business, and at least one who fails and is ruined. This condition of things, which has long been that of most of the agricultural, manufacturing and commercial enterprises of France, is hardly calculated to justify the opinion which sees in the sharing of workmen in the chances of industrial enterprises a means of considerably increasing their remuneration.—We must ever bear in mind that the services of heads of industrial enterprises suppose knowledge, talent and special qualities and faculties more or less indispensable to the successful management of an enterprise, and which by no means fall to the common lot of all men. Under the present system, those who possess these faculties and employ them in establishing or conducting a business, generally receive in the shape of profits only a remuneration proportioned to the importance of their services, and in keeping with the state of supply and demand relatively to this kind of service: would it be otherwise if workmen shared the profits of the business? Certainly not. If these associations were optional, (and to render them obligatory would be going farther than even Louis Blanc),

the men possessed of the qualities of a good capitalist-employer would remain only as long as the advantages they received were equal to those they could obtain outside the association, and as long as this equality was assured to them, either by the amount of their share in the value produced, or in some other way; all that could be expected of them would be that, in consideration of the participation of the workmen in the chances of loss, they would exact for their services not quite so large a share of the profits, and this concession would be exactly compensated for by the risks which the associated workmen would assume. These associated workmen would therefore be obliged to give from the profits of their common labor, for the services of the agents who would supply the place of the capitalist-employer, a share proportioned to the value of these services, that is to say, equivalent to what they now generally receive; thus there would remain for the workmen to divide only a sum equal to the amount of their actual wages. If they should attempt, on the contrary, to reduce the remuneration to be paid to the agent or manager whom they employ below its proper rate, they could not obtain the services of a capable manager, their association would be unable to sustain the competition of the well-conducted enterprises which would continue to employ workmen for wages, and they would, of their own accord, soon give up association to return to their former manner of working.—In every productive industry, success depends entirely upon the action of the man who superintends the work, buys the raw material, sells the products; in a word, who fills the post of capitalist-employer. When all the chances of loss and gain fall upon this agent alone, all his useful, available faculties are actively stimulated and strive for success with all the energy which they can command; and we may rest assured that, under these conditions, his management will be as efficient as possible. But this efficiency can not but become more uncertain in proportion as the interest of the manager is lessened, and as he is less exclusively responsible for the results of the business, and in proportion as others are called to share the risks with him. It is, therefore, very likely that, if it were possible to associate workmen in the chances of industrial enterprises by making them sharers in their losses or gains, and thus lessening the interest of capitalist-employers or managers, this association would lessen the chances of success, and render losses more frequent. The increased interest which the workmen would have in the success of the business could not compensate for the interest which would be lacking in the action of the manager, for they could not interfere in the management of the business without renouncing unity of management, the loss of which would surely precipitate the ruin of the enterprise; their zeal could therefore only be applied to matters of detail, and it is doubtful whether, even in these, it would advantageously

replace the active surveillance of a capitalist-employer under the present system.—We feel authorized to conclude from what precedes that, if workmen, instead of being paid a certain predetermined remuneration, were associated in the chances of industrial enterprises, the total amount of the remuneration they would thus receive would not net them a greater income than they now receive in the form of wages. Under like conditions, the revenue of the workmen would only be more variable and more uncertain, and they would need more foresight than they ordinarily exhibit, to save the surplus of prosperous years to make up for the deficit of unsuccessful ones. Is it not evident that the present system, by procuring them at least the same amount of income, and distributing it to them in a surer and more equal manner, is more advantageous to them?—Another truth, moreover, which controls all these considerations, is that with freedom of labor and of business dealings, the remuneration of workmen and of their employers is just what it should be, whatever the manner of determining it. Whether this remuneration come to the former in the shape of wages determined beforehand, and to the latter in the form of resulting profit, or whether it is based for all upon the resulting profits, their general and permanent relations will suffer no change; the capitalist-employers or managers will always deduct, under one form or the other, the share which the state of the supply and demand of their services allows them, and the workmen will never receive more than the share similarly determined by the supply and demand of their labor. Under a free government, these natural laws alone determine the just value of each kind of service, and any new combination of free associations would be as powerless permanently to modify this value as to change the level of the ocean.—We are, therefore, firmly convinced that all researches looking to the discovery of new processes of voluntary association, capable of improving the condition of the laboring classes, are absolutely vain, and that to be successful, the efforts of those who are interested in the cause of the workingmen must take another course. In France, for instance, these efforts might be usefully applied to influencing public opinion in favor of a simpler and cheaper system of administration, and one less calculated to excite covetousness and ambition, less compromising to public security than the one to which that country has been subjected for many years. They might be effectually employed also in inclining public opinion to suppression of all opposing legal obstacles in promoting the prosperity of certain particular interests, and the freedom of labor and business. The reforms which a change of public opinion could obtain would serve to render productive forces more fruitful, and to increase the demand for labor and for workmen.—III. To complete the task which we have undertaken, we have still to assign the limits or general conditions beyond which association can not be

practiced for the greater benefit of all.—Association, notwithstanding the grandeur of its results, can never obtain the marvelous power which some have attributed to it. Men have made use of this means of increasing their prosperity ever since the world began, and it is undoubtedly true that its most effectual combinations have already been discovered and put in practice: they are the family, the commune, the state, the great enterprises of public works, etc.; and if there still remain any methods of association which have not been discovered or applied, which during forty or fifty centuries have escaped the incessant search of personal interest, we may be sure that they would not offer any very certain or very important advantages. Be this as it may, we would approve of granting entire liberty to the attempts of new associations, so long as they result in no disorder or prejudice to general interests; but we could wish, at the same time, that there were less inclination to indulge in dreams of this kind than generally exists to-day.—The advantages and saving to be realized from living in common, from *community of consumption*, in particular, have been greatly exaggerated. It is true that if a limited number of individuals, twenty or thirty for instance, agree to combine their resources and share in common their expenses for food, lodging, clothing, furniture, fuel, washing, etc., they will be able to economize very largely in these expenses; but, because this economy is practicable for a limited number of persons, on condition of a more or less rigorous discipline, of a similarity of habits more or less irksome to each, and of a regulated management, we must not conclude that the saving would be still greater as the community became more numerous; for this conclusion would be contradicted by facts. We will furnish the reader the means of judging of this for himself, by citing two conclusive examples.—Standing armies afford occasion for the greatest *community of consumption* to be found anywhere, and if it be true that the economy which results from this community is greater, in proportion as there are more persons combined to share in it, the individual expense for each soldier taken separately should furnish the strongest proof of this truth. Now, according to the French budget of 1849, the cost of supplying 320,000 soldiers (not including officers) with food, fuel, clothing, bedding, etc., is estimated at 136,000,000 francs, or 424 francs per man; and still this expense does not include the cost of administration and surveillance, which are always indispensable and necessarily very considerable in every large community of this kind. We should, therefore, add to the amount stated, the pay of the officers, and the cost of military administration; this, according to the same budget, would increase the amount to 262,000,000 francs for a force of 338,000 men, including officers, which makes the expense for each man 775 francs. It is evident that the economy obtained by this community of consumption is not very wonderful; assuredly, the greater part

of these soldiers, especially those from the country districts, did not spend at home for the objects of consumption we have mentioned, more than 775 francs, nor even more than 424 francs each; for the average consumption in France, according to the largest valuation made of the total annual products, would not exceed from 300 to 350 francs for each individual.—We will take as our second example the consumption of the individuals received into and cared for by the hospitals and *hospices* of Paris.—The ordinary expense of these establishments shows the average cost of one bed occupied throughout the year to be.

For the hospitals taken together.....	656 fr. 37 c.
For the <i>hospices</i> and <i>maisons de retraite</i>	416 fr. 21 c.
For endowed <i>hospices</i>	528 fr. 35 c.

And we must note that these figures do not include one single centime for interest on the very large amount of capital employed in the establishments in question, so that, we would come very near the truth if we were to place the real expense of each individual entertained in these establishments, at from 800 to 1,000 francs.—So, for the soldiers and the indigent received into hospitals, (two classes of persons whose wants surely are not more expensive or better supplied, on an average, than those of the individuals of all other classes taken together), community of consumption has no other result than to increase this consumption in the one case to double and in the other to treble that of the average individual consumption of the entire population.—This shows what the *magical* power of association amounts to in this regard.—These results, which so ill conform to the exaggerated notions of the advantages of community of consumption, can, however, be very readily explained. In proportion as these communities increase, their administration becomes complicated, intermediary agencies are multiplied, the necessities of surveillance and control require personal services more and more numerous, the cost of which is necessarily added to the cost of consumption proper. On the other hand, the chiefs and employes of the administration act as public officers generally do, that is to say, the special points of interest to them about their mission are almost without exception, the position and personal advantages which it confers upon them; so that we can hardly expect of them, so far as good management and economy are concerned, anything more than is strictly necessary to relieve them of responsibility. Now, when the object of their management interests the general public, or a considerable portion of the population, this responsibility is not of a kind to require any great effort at improvement, when we consider that the general control of the administration can be exercised only by delegates, who have no direct or very special interest in discovering its defects, and that this interest is, besides, weakened by the thought that the ill consequence of these defects or abuses is hardly felt by each one separately, on account of the great number interested. The very complicated nature of the

administration itself offers, moreover, almost insurmountable obstacles to the exercise of an effectual control. By increasing the means of surveillance and auditing, and, in consequence, the expense, theft, waste, and the more evident abuses can be restrained; but that incessantly watchful attention, with its care for every moment and application to every detail, which are necessary in the management of every business in order to discover the simplest and most efficacious means of practicing all possible economy, can be prompted by personal interest alone; a government can never obtain them. This is one of the chief causes which will always prevent community of consumption from being as great a source of economy in large bodies as when practiced in families.—Small communities, administered by their own members and under the eyes of all the associates, may, nevertheless, save considerably by this system, because by it the same dwelling, the same fire, the same light serves, at the same time, for a great many persons, because by purchasing their supplies of all kinds in larger quantities and of the same quality, they obtain them on better terms. But these advantages have long been known, and still (except in religious associations, which are determined by motives other than temporal interests) people seem little disposed to make use of them. We hardly ever see several families uniting to live in common; the reason is, that in order to obtain the advantages of this system, it is indispensably necessary for the members to submit to uniform rules, to subordinate to them their wills, their individual tastes and their personal convenience, and because each one prefers the preservation of his liberty to the economy thus realized. Now, this obstacle to community of consumption will last as long as men prefer liberty to constraint; it is not probable, therefore, that this method of association will ever be very extensively adopted, unless men are involuntarily compelled to submit to it.—We have yet to assign the conditions, without which association when applied to labor ceases to work for the general good.—There is in political economy no better established truth than that of freedom of labor which asserts *competition* to be the indispensable condition of the improvement of industry, of the increase of wealth, of goods, and of its equitable division. Still, competition has many enemies among publicists; but it is likely that many of them are merely misled by a prejudice against the word *competition*, for most of them would not want to be regarded as enemies of freedom of labor. Besides, when under another form, liberty or competition seems to be generally approved, for no one undertakes openly before the public the defense of *monopoly*, which, ostensibly at least, is condemned by all, and finds defenders only on condition that it conceal its name. Now we can not reject monopoly without admitting liberty, and consequently competition.—In any case, all who think free labor preferable to monopoly will probably admit the following propo-

sition without hesitation:—*Association ceases to be advantageous, when, applied to works capable of being surrendered to competition, it renders, or tends to render, competition impossible.*—This proposition supposes that the suppression of competition, and consequently the establishment of monopoly, may result from association, and it remains for us to prove that this is really possible. We will first briefly recall the reasons why competition is preferable to monopoly.—By the freedom of labor, all capabilities of individuals, which are infinite in variety, receive the application most advantageous for all, inasmuch as each one, prompted by personal interest, endeavors to make the best use of his faculties; and, under a system of liberty, this best use is precisely that which renders the most service to all, since in the general exchange of services no one obtains more than the equivalent of what he has given. The effect of this system, therefore, generally is not only to apply each particular faculty to the labor for which it is best suited, and in which it can work most successfully, but also to maintain in all pursuits an active emulation, and a constant disposition to make improvements and inventions calculated to render labor more fruitful. Competition does not allow any capitalist-employer to remain behind in this movement, for if he allows himself to be passed by his rivals, his services will be dispensed with at once. The general result of these energetic and incessant efforts is *a rapid increase in the number and importance of the services which we mutually render one another*, that is to say, in our general well-being.—Monopoly deprives the majority of men of the choice of the kind of labor in which they shall engage; and those for whom the employments which it offers are reserved, can not change the task assigned them by managers. Individual initiative is thus in great part suppressed, on the other hand, the tendency toward progress is null or nearly so, because the efforts for improvement have no longer the stimulant of competition, nor even that of personal interest, monopoly having done away with these efforts, in order to secure the disposal of its products. Under this system, therefore, there are no longer any innovations, improvements or inventions, but those conceived or approved of by the managers of monopolies; and experience has superabundantly proven that monopoly is as sterile in this respect as liberty is fruitful. Under the system of liberty, each one's remuneration is the equivalent of the services which he has rendered to others; it is therefore proportioned to the service rendered; and this is perfectly just. Under the monopoly system, the profit is proportioned to the extent and urgency of the wants which the monopoly supplies, and to the obstacles which it puts in the way of people seeking to supply their wants elsewhere; monopoly profits are proportioned, therefore, to the degree of oppression which the monopoly exercises. In short, the general results of monopoly are *to retard or suppress*

progress, to reduce the number and importance of our means of prosperity, to secure an iniquitous division of these means, and to paralyze or enfeeble the useful faculties.—We may now say, there is no doubt but that association may lead, and in fact does lead to monopolies more or less absolute. All great concentration of industrial enterprises is a step toward this result, the realization of which is more or less probable according to the nature of the work which they suppose. In France, for example, those working in mines and foundries are more likely than those in most other branches of production to lend themselves to the founding of monopolies by way of association; the reason of this is that the heavy-bearing veins of mineral are thinly scattered through that country, and too far apart for the products of the miners' work to come into competition; so that the miners working in each mine, who are never very numerous, could by associating themselves together easily suppress all competition, if not at all the points which their products can reach, at least throughout the whole extent of the market wherein most of the sales are effected.—We conclude, therefore, that association can contribute to the bettering of man's condition only to a certain extent, and that when it passes beyond the limit we have assigned it, when it amounts to monopoly, its results, far from being beneficial, are injurious.

AMBROISE CLÉMENT.

ASYLUM, Right of. By the word asylum we here mean the place where a man has taken refuge from his enemies, or where he, when pursued by the legal authority of his government, or by justice, finds absolute inviolability.—Among the ancients, there were places of refuge consecrated as such by religion, but they were not always respected as such. Pausanias was immured in the temple of Minerva, and Antipater sent his troops to tear Demosthenes away from the statue of Neptune. In the middle ages, the church opened many places of refuge in the dependencies in which it exercised an absolute jurisdiction, and in which violation was less frequent than in pagan temples. It is not of this kind of asylum we wish here to treat, but of the protection sought by refugees on foreign soil, and which is based on the inviolability of sovereign nations.—The history of ancient nations, and even that of modern Europe, does not suffice to give us the elementary principles of the doctrine of the right of asylum which general use has confirmed. No doubt, men pursued at home have in all ages succeeded in sheltering themselves abroad; but the world has only too often witnessed the employment of force to constrain weak states to deliver up the refugees who sought an asylum in them, and sometimes even force follows these unfortunates to their place of asylum.—It is not less true that these acts of violence have always been severely censured by public opinion, and held to be in every respect contrary to the true principles of justice and

morality. In proportion, therefore, as civilization has advanced, and international intercourse become more regular, the principles of national independence have been better understood and consequently better followed. A number of rules has been established, and these rules are, it may be said, never violated.—Every state may deny to strangers generally, permission to enter its territory, and especially to fugitives from justice. Nevertheless, from considerations of humanity, they admit fugitives readily enough, and especially political refugees, who are permitted to come into the country and remain in it, on certain conditions. The revolutions of states often drive men from home, and it would be cruel not to receive them. If they endure their exile with dignity and composure, and do not seek by conspiracy to regain their lost cause, they receive hospitality and even help from foreign nations when they need it. But measures are sometimes taken against them. They are deprived of arms if they have any. They have assigned to them certain quarters, the limits of which they are not allowed to quit; they are retained forcibly where they are, or they are expelled when they abuse the protection of the government and compromise its international relations.—When asylum is sought by a person pursued for offenses punishable by law, it is rarely that it is accorded him when he has been guilty of crimes revolting to general morality and affecting person or property. If men pursued or condemned for crime take refuge on foreign soil, it is the usage to deliver them up to the country claiming them, to be dealt with according to law. There is a great number of treaties between European nations on this subject (see EXTRADITION). Strictly speaking and saving a very few exceptions, it is only political refugees who find an asylum on foreign territory, where they are looked upon as inviolable and only submitted to the precautionary measures mentioned above. Although he grants them a generous hospitality, the sovereign who accords protection to political refugees has duties of his own to perform toward the nations which proscribe them, and although he protects the refugees, he can not and should not leave them the means and the possibility of acting against the government of a people to which he is friendly. In this regard, France, among European nations, has distinguished herself for wise conduct and good laws. She has generously received all the refugees whom revolution in different parts of Europe has thrown within her limits. Spaniards, Italians, Poles, and many others, have found an asylum in France and received assistance from the public treasury, which even natives themselves could not hope for; but they have been subjected to police regulations of an exceptional nature.—France, on the other hand, has made foreign nations see to it that French refugees be deprived of the power of injuring their own country. We need scarcely recall the celebrated note addressed by the duke

of Montebello to the Helvetic federal council in 1836, and the blockade of Switzerland by the armies of France. The Swiss government submitted, the secret societies were dissolved, and a large number of refugees from all nations were expelled the country. The conduct of other European nations, except in a very small number of cases, has been regulated by the same principles. The right of asylum is, therefore, to-day, a public right sanctioned by general custom.—It is well to add here that asylum is often claimed by refugees, not only on the territory itself of a foreign power but on board the vessels belonging to that power, and even on merchant ships bearing its flag. In these cases, rules, with a few distinctions similar to those already mentioned, are followed. Whenever refuge is sought on board a vessel of the navy, the commander, who is the legal representative of his government, may refuse or grant the asylum according to circumstances. He will refuse to receive actual criminals, but will receive political refugees or men pursued on account of their religion. The same course is recommended to captains of merchant vessels. The commanders, both of navy and merchant ships, may expel either those who have come on board without their permission, or those who compromise the tranquillity of the ship by their conduct. If the getting on board of a refugee has taken place on the high seas, commanders are responsible only to their own government. As to the government of the country to which the refugee belongs, it can make a requisition for him only through the proper diplomatic channel.—The case is not altogether the same when the embarkation is made in a port or in the maritime territory subject to the country from which the refugee has escaped. When the commander of a naval vessel has granted asylum to a refugee, it is likewise only through diplomatic channels that requisition for him can be made, for the reason that the ships of the state enjoy complete extraterritoriality. But merchant ships are not thus privileged. The local authorities have the right to go on board such ships, search for and arrest a refugee. Generally this is done in a courteous manner, by a previous announcement of the visit, and by giving notice to the consul of the nation to which the vessel belongs in such way as to permit his intervention.—In history there are cases of persons taking refuge in the residence of ambassadors or foreign ministers. These cases have given rise to serious discussions among nations. In our time, embassies, legations or consulates are scarcely anything more than a place where the fellow-countrymen of the diplomatic agent may take refuge in time of war or insurrection. In this way they make known their nationality, and take, literally, shelter under the flag of their country. (See EXTRADITION.) ROYER COLLARD.

ATELIERS NATIONAUX. An *atelier* means in French, a place where workmen or artists, such

as masons, carpenters, painters, sculptors, etc., work under a common direction. The same term is applied sometimes to a collection of workmen. An *atelier* can be established in the open air; nevertheless the place of labor for ship-carpenters, stone-cutters, for instance, whose work is almost always performed in the open air, is more generally called in French a *chantier*, that is, a yard.—We have nothing to say here of *ateliers* or French workshops in general, in so far as they are subject to the ordinary law. Since the law of March 17, 1791, which abolished the old régime of corporations in France, there have been no special regulations in that country for private workshops. The regulations which limit the hours of labor for children in factories, do not concern us now. We have here some observations to make on certain public *ateliers*, organized by the French government with a view of aiding unemployed workmen, and which have been designated by the name of *ateliers nationaux*.—This last expression recalls nothing to-day but the organized movement of workmen which took place after the revolution of 1848, and which became so threatening to the public peace. Nevertheless it was not the first attempt of this kind made. In ancient times *ateliers* of charity, so called, had been established in France, with the object now of furnishing employment to unoccupied workmen especially during dull seasons, and now to put an end to mendicancy, by employing the indigent in various kinds of labor appropriate to their age and sex.—The establishment of *ateliers* of charity in France goes back to rather a remote period. An edict of 1545 ordered the employment of able-bodied mendicants in public works. Ordinances of the 13th of April, 1685, of the 10th of February, 1699, and of Aug. 6, 1709, regulated the conduct of these *ateliers*. Louis XVI. extended this mode of assistance to the whole kingdom; he caused public works to be opened in every province during the dull season, and encouraged them by immunities and exemptions.—In 1790, the beginning of the public troubles having caused a great number of private establishments to be closed, and left many laborers without work, vast public *ateliers* in the environs of the capital were opened. Besides, a capital of 30,000 francs was placed at the disposal of each of the departments, to give employment to the people everywhere according to the plan adopted for Paris. It was a very small amount in view of the object proposed, and apparently this sum of 30,000 francs was merely a sort of premium offered to encourage the departmental authorities who should enter on the path indicated by the legislature of the country. The law of July 12–22, 1791, regulated, by precise directions and strict orders, work in the public *ateliers* as well as the wages of the workmen. In addition, the organization of *ateliers* of charity was brought into the vast plan proposed to the constituent assembly for the suppression of mendicancy.—It does not appear that these plans, executed in an imperfect manner, it is true,

attained their object at that time. In spite of the opening of public *ateliers*, the misery of the poor and the enforced idleness of the workmen went on increasing. Still the convention did not hesitate to adopt the same method of public aid which fitted but too well into its general plan. It had often promised to come to the relief of every form of human misery, and the organization of public *ateliers* was one of the principal means which it proposed to adopt to make good its promises. But it was with these measures as with so many others announced by this stormy assembly; the time of putting them into execution did not come.—Later, the law of the 24th Vendémiaire, year XII., gave a more regular and constant organization to *ateliers* of charity. The question was then, as it had been formerly, how to succeed in remedying enforced idleness and how to suppress mendicancy. Without entering into the details of this law, which was precise and foreseeing enough in its provisions, it suffices us to say that it did not attain the object which it proposed to itself any better than those which preceded it. Perhaps it might have been concluded, from this experience, that this method of public assistance is not so rational or efficacious as was supposed; but it appears so natural to want to obtain labor for those who need it, and compel those to labor who refuse to labor through misconduct or idleness, and so natural for men to flatter themselves that they can realize at small cost this double advantage, that they could not renounce the employment of the same means again.—Recourse was had to it again in 1830, as in all critical periods; but the greatest as well as the most unsuccessful trial made in this direction was that which took place in 1848, in the establishment of the *ateliers nationaux*.—The disturbance produced by the revolution of February having curtailed credit, diminished the demand for labor and thrown a large number of laborers into the street, the thought immediately occurred to men, as it had before, to organize public workshops in order to give employment to workmen during the stoppage of private establishments; and, in organizing these *ateliers* on a vaster scale, a more ambitious name was given them. At this period the ideas of certain socialist schools were spread generally among the people, who received them favorably. Various systems were current, having in view to substitute in a general way, for private establishments, public *ateliers* organized under the control of the state, and to which the name of *ateliers nationaux* was given in advance. Then, in order to aid laborers without work, it was resolved to employ them temporarily at the expense of the state. The *ateliers* which were established with this intent, naturally received in advance the name of *ateliers nationaux*. People seemed to consider them as a first attempt at applying the socialistic systems then in favor. And it is thus that real *ateliers* of assistance, very similar in substance to those that had been organized in 1790, 1830, and at so many previous periods, received

a designation altogether new, which general usage in France has sanctioned.—Not that in the minds of those who established the *ateliers nationaux* in 1848, there was really an attempt at realizing socialistic utopias. Those who took part in that work have defended themselves against having had such a thought, and we have no right to ascribe it to them in spite of themselves. It is certain, however, that the ideas which were current at that time, and even the ambitious name adopted, gave to the *ateliers* of assistance established in 1848 a special character and a new importance, very much greater than they had at any previous time. The organization of these *ateliers* produced most lamentable results, well fitted to disgust men forever with any attempt of the kind. They became a place of refuge not only for workmen reduced to involuntary idleness, but also for those who refused to labor of their own accord, through a spirit of turbulence or of idleness, and who found it convenient to obtain, at the expense of the state, a harmful leisure, too often devoted to fomenting civil commotion. It is thus that while completing the disorganization of private *ateliers*, they contributed, in no small degree, to extend the evils of enforced idleness, which they seemed destined to cure. At the same time they became a standing menace to the public peace.—It is proper to add that, in 1848, less discretion and reserve were used than at other times in the admission of men to employment on account of the state. None of the precautions recommended, for example, by the law of the 24th Vendémiaire, year XII., were then observed. All who presented themselves were admitted, almost without distinction and without choice, especially in the first period; and it was only when the number admitted had attained colossal proportions that this course had to be abandoned. It was a corollary to this idea, almost officially admitted at that time, that the state owed labor to all who needed it. Moreover, either through negligence, want of care, or the real difficulty of the circumstances, poor provision, we might say none at all, was made for the effective employment of the men whom the state was supposed to put to labor for its own advantage. Both tools and work were wanting. During several months an enormous number of workmen were seen, estimated by some at 110,000 or 120,000 men, and whose number has never been exactly known now occupied in simply stirring the earth without any object, but more frequently in doing nothing at all, or in devising ways among themselves to direct tumultuous movements on the public square. This whole mass of humanity was seen hovering over the boundaries of Paris like a cloud, threatening general destruction. This was perhaps the most cruel and terrible of the embarrassments of this unsettled time.—We shall leave to others the task of treating the questions of principle involved in this important subject. It is enough for us to have presented a short resumé of the facts. However we can not conclude without remarking how

dangerous in itself is the method of assistance which consists in establishing public works to give employment to unoccupied workmen, and with what difficulty it answers the object proposed. It is not so easy as some think for a government to create at once extraordinary works in time of crisis and dearth of employment. A commercial crisis which influences in so unfortunate a manner the credit of private men, and which often forces them to restrict or suspend their work, influences in a manner no less disastrous public credit and the finances.—It is besides in the very nature of things, that works improvised in this manner, especially in times of agitation and trouble, should be always badly organized and badly conducted. Therefore, even when unfortunately, critical times appear, when honest workmen are forced to stop work, if the government is in a condition to dispose of any extraordinary funds to aid them, perhaps it is better to devote it to a wise distribution of assistance to them at their homes than in works ill conceived, the least inconvenience of which is always to devour in useless outlay a good part of the means in hand.

ATTAINDER, Bill of. (See BILL OF RIGHTS.)

ATTORNEYS GENERAL. (See ADMINISTRATION.)

AUSTRALIA. (See OCEANICA.)

AUSTRIA-HUNGARY. The point of departure or germ of this empire was the margraviate of *Marchia Austriaca*, founded in 779 by Charlemagne, for the defense of Germany against the attacks of the Hungarians. The territory increased, and this fief was elevated to the rank of a duchy in 1156. On this occasion the name of Austria appeared for the first time in an official document.—It was only in 1282 that this country was acquired by the house of Hapsburg, which, as it occupied for five or six centuries the throne of the "Roman emperors of the Germanic race," had the opportunity to annex to its dominions, one after another, a large number of fiefs, and even states, both German and other. This is not the place for a history of these annexations, but it will not be useless to give at least the dates of a few of them.—Styria was acquired at the same time with the duchy; later (1453), the archduchy of Austria. Carinthia was united to the crown in 1335; Tyrol, in 1363; Trieste, in 1382. In 1438 duke Albert V., of lower Austria, succeeded his father-in-law as king of Hungary and Bohemia, which comprised at that time Croatia, Moravia, Silesia and Lusatia. It is true that after the extinction of this branch of the house of Hapsburg, Bohemia and Hungary were separated temporarily from Austria, but from 1525 the archduke Ferdinand I. became, partly by inheritance and partly by election, king of Hungary and Bohemia.—We may pass over some acquisitions which

the house of Hapsburg has not retained, as for example, Spain and Belgium, and recall that in 1740, at the extinction of the male line, the territory of the states of the crown was in extent not far from what it is to-day. The line of Hapsburg-Lorraine likewise extended the limits of the empire. With the exception of some countries of minor importance, such as Bukowina, it was Italy and Poland that furnished the elements of this later aggrandizement. Thus, in 1804, when Francis II. laid down the crown of the Roman or Germanic emperors, to assume the title of emperor of Austria, his states embraced a territory of 689,869 square kilometres.—We shall not enumerate the vicissitudes through which Austria passed since this epoch, which is memorable on so many accounts, nor recall events of not less importance this generation has witnessed. We shall limit ourselves to the statement that, since 1867, the Austro-Hungarian empire is made up of two portions divided in part, at least, by the little river Leitha, which falls into the Danube. One part of the empire is often called Cisleithania and the other Transleithania.—The following table gives the area and population of 1870, or rather of Dec. 31, 1869, for Cisleithania:

COUNTRIES OF THE CROWN.	Population in 1870.	Square Kilometres
Lower Austria.....	1,954,251	19,287
Upper Austria.....	731,579	11,998
Salzburg.....	151,410	7,166
Styria.....	1,131,309	22,457
Carinthia.....	336,400	10,375
Caroliola.....	463,273	9,989
Maritime Territory ..	582,079	7,9 9
Tyrol.....	8,8,907	29,331
Bohemia.....	5,106,069	59,963
Moravia.....	1,997,897	22,233
Silesia.....	511,581	5,148
Galicia.....	5,418,016	78,508
Bukowina.....	511,964	10,453
Dalmatia.....	442,796	12,795
Total.....	20,217,531	340,232
Comprising the army.....	20,394,980	

—For Transleithania, or the lands of the crown of St. Stephen, the population at the date last named, and the area in square kilometres, respectively, were as follows:

COUNTRIES OF THE CROWN.	Population in 1870.	Square Kilometres.
Hungary.....	11,117,623	214,543
Transylvania.....	2,101,727	54,955
Military Borders.....	1,200,371	29,848
Croatia and Slavonia.....	897,606	22,982
Total.....	15,417,327	322,328
Comprising the army.....	15,509,455	
Total of Austria-Hungary.....	35,043,858	622,560

—The previous census returns give for 1818, 29,813,580; 1830, 34,503,824; 1846, 37,443,035; 1851, 36,393,620; 1857, 37,754,856 inhabitants. These figures embrace the Lombardo-Venetian populations (a little more than 2,000,000). There was no census between 1857 and 1870. The census of 1870 gives the following data regarding

the various bodies of Christians and non-Christians in Austria and Hungary:

SECTS.	Austrian.	Hungarian.
Roman Catholic.....	16,395,675	7,558,558
Greek.....	2,342,168	1,599,928
Armenian.....	3,146	5,138
Protestant Lutherans.....	252,271	1,113,508
Protestant Reformed.....	111,935	2,031,243
Unitarians.....	248	54,822
Other Christians.....	4,112	2,734
Jews.....	822,220	553,641
Non-Christians.....	370	223

—NATIONALITIES. One of the peculiar characteristics of the Austro-Hungarian monarchy is the diversity of races and tribes by which the country is peopled. The countries now composing the Austro-Hungarian empire were sometimes acquired through violence; but the greater part of them came of their own accord, seeking protection. The people inhabiting them were impelled by necessity. Moreover, what is now called the "spirit of nationality" was not yet awakened, or it existed only under the barbarous form of hatred of the stranger; and all who were not born on the same spot were looked upon as strangers. Hatred of the stranger was overcome by fear of the Turk. More recently the sentiment of nationality has sprung up. Every little tribe now holds itself obliged to preserve and transmit its own peculiar dialect, which no stranger ever thinks it worth while to learn. It must be said that in all this there is much that is artificial, but since the sentiment exists, it must be taken into account; and for this reason we give the following figures of the year 1857, with proper additions to bring them up to the total of 1870.—The population of Cisleithania, leaving out the army, is made up of the following nationalities: Germans, 7,230,000; northern Slaves, 9,822,000; southern Slaves, 1,734,000; Italians, Roumanians, etc., 815,600; Magyars, 18,000; others, 742,400; total, 20,362,000.—In Transleithania there are of Germans, 1,810,000; northern Slaves, 2,220,000; southern Slaves, 2,441,000; Roumanians, etc., 2,649,900; Magyars, 5,413,000; others, 612,000; total, 15,148,000. The 9,180,000 Germans (army included) are not subdivided. The northern Slaves are made up of 6,730,000 Czechs (Bohemians) Moravians and Slovaks, 2,380,000 Poles and 3,104,000 Ruthenians. The southern Slaves are 1,260,000, Slovenes 1,424,000, Croats 1,520,000, and 26,000 Bulgarians. To sum up, it is well to state that in Bohemia, there are 2,000,000 Germans to 3,200,000 Bohemians; in Moravia, 530,000 Germans and 1,480,000 Bohemians; in Styria, 707,000 Germans and 410,000 Slovenians; in Carinthia, 240,000 Germans and 109,000 Slaves; in Carniola, 32,000 Germans and 450,000 Slaves. It is worthy of note that the influence of the different nationalities is generally upheld by the feudalists and ultramontanes. The parties of the past always vote together.—POLITICAL CONSTITUTION. Austria has passed through many vicissitudes since 1804, and it is to be feared that the compromise of 1867 will not be

the final political system of the Danubian empire. Up to 1848 the government was constitutional in Hungary, and absolute in the other domains of the crown. This last phrase describes the hereditary lands of the imperial family, in contradistinction to the German states, where previous to 1804 it merely exercised the rights of suzerainty, which at last became only nominal. Each of the crown lands had a diet of its own, but the provincial assemblies had only a consultative voice in their own local affairs. Bohemia formed no exception to this rule. Since 1627 its diet had lost the right of initiative, and the king had reserved to himself and his heirs the right of law-making, the *jus legis ferendæ*. Hungary, alone, preserved its autonomy. Before 1848 the Hungarian diet was divided into two chambers.—The chamber of magnates was composed of the 11 barons of the kingdom, who occupied the chief offices of state, of the Catholic and Greek bishops, the *obergespans* (chiefs) of counties, of one representative of Croatia and all the Hungarian princes, counts and barons. The second chamber comprised county deputies, those from Croatia, from the royal towns, from chapters, certain priors and provosts of monasteries, mandatories of absent magnates, and of magnate's widows.—The chamber of magnates was presided over by the chief justice (*jude curiæ*), and the popular assembly, by a delegate of the emperor or the vice-palatine. The deputies were elected for 3 years. The initiative in law-making belonged to the sovereign as well as the lower house, and not to the chamber of magnates, who might, however, reject bills that originated in the other house. The diet voted the taxes and the military contingent.—In this way Hungary enjoyed rights unknown to the other territories of the crown. It is not to be wondered at that the court of Vienna was restive under this state of things. But, instead of raising the other countries to the level of Hungary, it preferred for a long time to diminish the influence of the Hungarian diet. Support in this struggle, sometimes masked and sometimes open, was found in the antipathy of the races, oppressed by the Magyars.—It was in self-defense against the central government, and in the case of some chiefs, perhaps, from their own ambitious aims, that in 1847, a separate Hungarian ministry was demanded, in order to have nothing in common with Austria but the person of the sovereign, an arrangement called *personal union*. The events of 1848 obtained for them the adhesion of the emperor, Ferdinand I. (Ferdinand V. as king of Hungary); and nine ministers under the presidency of count Batthyany, (Kossuth was minister of finances), were charged with the direction of affairs.—Under the impulse of this first success and influenced by the moral pressure of the revolution of 1848, the diet adopted a series of liberal measures. The non-noble classes were made electors, and liberty of the press was proclaimed; but it was so regulated that dangerous discontent was the result. The following is an analysis of the

electoral law of 1848, which was amended in 1872 in a conservative sense, by the extension, for instance, of the term of members of the diet from 3 to 5 years, and the addition of a property qualification.—Those who formerly had the right to vote, retained it. That right is besides granted to all male inhabitants twenty years of age, not adjudged guilty of crime, and satisfying the following conditions: ownership of a house in the towns, or of land worth 300 florins, and in the country a certain small amount of property: being the head of a work-shop, factory, or other industrial or commercial establishment; or having a sure income of at least 100 florins. It is also granted to doctors, lawyers, professors, engineers, artists, members of the Hungarian academy, druggists, clergymen, and teachers, no matter what the amount of their income; finally, to all citizens of towns, even if they do not satisfy the above conditions.—Every voter aged 24 and knowing how to speak the Hungarian language, is eligible to the diet. The lower house of the diet is composed of 337 deputies, of which 60 are from the communes or cities, 17 from Croatia, 15 from the military frontier. Transylvania was declared incorporated with Hungary. The insurrection in Hungary was seconded by revolts in other parts of Austria, and which reached as far as Vienna itself. The emperor, Ferdinand, was obliged at first to yield to the storm. But he abdicated Dec. 2, 1848. His brother did not accept the crown, which passed directly to his nephew, Francis Joseph, the present emperor. The government did not wish to yield to a state of things imposed on it by violence. This is not a matter of surprise. A signature to a document obtained from even a private person by force, would be cancelled by any court; and can it be asked that consent given when the revolt was at its height, should be considered valid by those who gave it? The new emperor did not ratify the concessions made by his uncle. The war, therefore, was violent, and Hungary profiting by its momentary victory, declared the house of Hapsburg deposed, April 14, 1849. This was a mistake. While showing that the emperor was not wrong in attributing dissimulation to Kossuth, then president of the republic of Hungary, all the acts of 1848 were annulled, and after victory, the emperor was able to avail himself of a new right, that of conquest.—And this right of conquest, a right unfortunately recognized by the international law of Europe, was appealed to. It was appealed to not only as against Hungary, but in some regards also as against all the other states of the crown. In 1848 the government had been obliged to confer important privileges and real power on the diets of these states; but as soon as the Austrian armies had put down the revolution a reaction set in, and not only were the diets reduced to their former position in 1850, but the ancient privileges of Hungary were done away with, and the country was united to the rest of Austria. It was prince Schwarzenberg who undertook to fuse into one

these naturally antipathetic countries. If the work had been begun three or four centuries ago, we might, perhaps, have found the measures initiated by Austria under Schwarzenberg and Bach great and admirable. Centralization might have accomplished real good; the country might have been pacified; unity of language, manners and of nationality might have been established. The magnitude of the result would have caused the methods employed to be overlooked.—But times have changed, national feelings have grown more intense and vivid. Passive resistance on the part of Hungary was sufficient to force the government to yield. It is proper to add that Hungary was sustained in her resistance by liberal opinion in other states of the crown, and notably by the Germans. For this period of unification or centralization came to an end in the following manner. The government being in want of money convoked the consulting parliament of the time, but although composed of men chosen with care and mainly Germans, that parliament was hostile to it. After ten years of absolutism a constitutional régime was inaugurated anew in 1860.—The essential parts of the document establishing that régime are as follows: "Wishing to reconcile the differences hitherto existing in our kingdoms and the countries composing them, and to bring about the regular co-operation of our subjects in legislative and administrative acts, we have thought proper, on the basis of the pragmatic sanction, and in virtue of our sovereignty, to decree and ordain the following fundamental law of the state, perpetual and irrevocable, during our own rule as well as that of our legal heirs.—I. The right of changing or rescinding laws will be exercised by us and our successors only in concert with the diets legally assembled, and especially of the council of the empire, to which the diets will send the number of deputies fixed by us.—II. All subjects of legislation which concern the rights, obligations and interests common to all our kingdoms and lands, notably legislation on the finances and public credit, the customs and commercial affairs, as well banks of issue, postal, telegraphic and railroad regulations and the organization of military service, will be discussed in future in and by a council of the empire and decided with its constitutional concurrence.—And so the introduction of new imposts and charges, the increase of those now existing, notably the rise in the price of salt, the conclusion of new loans in conformity with our resolution of July 17, 1860, the conversion of actual debts of the state, the change of use and management of state property, can not be decreed except with consent of the council of the empire.—Finally the examination and fixing of the budget of future expenses as well as the examination of the financial accounts and the annual result of the administration of the finances, must be with the assistance of the council of the empire.—III. All other subjects of legislation not mentioned in the preceding article, shall be decided constitutionally in and with the

respective diets, to wit in our kingdoms and countries belonging to the crown of Hungary, in the spirit of their previous constitutions, and in our other lands in the spirit of their provincial constitutions and conformably to them.—Since for a great number of years there has existed for other countries except Hungary a common legislation and administration on subjects not exclusively within the jurisdiction of the council of the empire, we reserve for ourselves the regulation of these subjects with the constitutional concurrence of the council of the empire, and by calling to our aid councillors belonging to said countries.—This document, emanating from the Goluchowski ministry, was far from satisfying public opinion. It was opposed by the Hungarians because its tendency was too much toward centralization, and by the Germans for not being liberal enough. The Slaves would have accepted it willingly because it had strong federal tendencies, and federalism is the only system which can transfer power into their hands. The ministry of Schmerling was formed Dec. 13, 1860, and Feb. 26, 1861, the government issued a new legal document which developed that of October in a liberal sense. The constitution established by the February document (*diploma*) and its additions was this: The Austrian parliament (*Reichsrath*) shall be composed of two houses, a house of lords or peers, and a house of representatives or deputies. The house of lords shall be composed of three classes of persons having seats: 1st, by right of birth, princes of the imperial house and heads of great families on whom the emperor has conferred the dignity of hereditary peerage; 2nd, by virtue of their offices, archbishops and bishops having the rank of princes; 3rd, in consequence of appointment for life, persons who by their merits or services have a claim on the gratitude of the state. The house of representatives shall be composed of 343 members, of whom 203 are from the different German and Slavic provinces, 85 from Hungary, 9 from Croatia, 26 from Transylvania, 20 from Venetia. The representatives were elected by the provincial diets from among their own members.—The council of the empire was to act as a council restricted or special to the German, Slave and Italian provinces, when the representatives of these provinces deliberated on their own special interests. But when there were questions of the general interests of the monarchy, the council of the empire was to be completed by the addition of representatives from Hungary and the other countries beyond the Leitha. The questions for the deliberation of the council of the empire thus completed were general laws, and especially those touching military service, the budget of the empire, general imports, the public debt and public credit, banks, customs, commerce, postal arrangements, railroads, and telegraphs. The public debt was placed under the direct control of the council of the empire.—The right of initiative in legislation still belongs as well to the government as to the two houses. The laws

had to be passed by both houses and approved by the emperor. The sessions were annual, convoked, adjourned and dissolved by imperial decree. The emperor appointed presidents and vice-presidents from among the members of each house. The sessions were public, and could be secret only on motion of the president or ten members, approved by the house. Decisions were made by an absolute majority of the members present. A change, however, in the fundamental laws, required a two-thirds majority.—The *diploma* or fundamental law of February was accepted by Cisleithania only. Hungary held aloof in the name of its historic rights. More than one publicist supposed that the Hungarians had themselves broken the continuity of this right in 1848-9, but in practical politics less attention is paid to the subtleties of jurists than to possibilities. Surrounded as she was with difficulties, in 1866, it was of the first importance for Austria to come to terms with Hungary. Since Schmerling was not inclined to radical concessions, Belcredi was intrusted with the direction of affairs in July, 1865. The constitution was *suspended* Sept. 20, of the same year, with the formal declaration on the part of the emperor that he would submit, before arriving at a decision, the result of the deliberations of the said oriental countries (Hungary) to the legal representatives of the other kingdoms and countries, in order to learn and weigh their opinions, which are not of less importance.—The Belcredi ministry did not succeed. We need not recount the details of his negotiations with the parties interested. It was Count von Beust, prime minister from Feb. 7, 1867, until November, 1871, who succeeded in effecting the compromise, (*Ausgleich*). It was signed by the emperor Feb. 17, and confirmed in the course of a year by parliament. The Austro-Hungarian constitution, therefore, of which we are now to give an account, dates from 1867.—Each half of the empire has full and complete autonomy in all matters not expressly declared common to both. The following are declared common: Foreign affairs and the army, as well as the financial management pertaining to both branches of the service. The common ministry is composed of three ministers, one of whom, the minister of finance, disposes only of the direct receipt of the customs, which is common revenue; the rest of the expenses is covered by the quota of Hungary on one part, which contributes 30 per cent., and Austria on the other, which contributes 70. This arrangement to be valid for ten years, was concluded Sept. 25, 1867, by the delegates of both countries.—The details settling the relations between Austria and Hungary, are found in the organic laws voted by the Hungarian diet on the one part, and the Austrian parliament on the other. It is needless to add that the provisions of both laws are identical. That passed at Vienna bears the date of Dec. 21, 1867 (*Reichsgesetzblatt*, Dec. 22, 1867, No. 146). We here make mention only of the most salient

points. Common affairs are (§ 1): *a.* Foreign affairs embracing diplomatic and consular representation, and provisions regulating the same. Treaties must be approved by the parliament and the Hungarian diet. *b.* The army and navy, exclusive of recruitment, the army contingent, the duration of military service, the disposition of troops in the country (places of garrison), the maintenance and civil rights of the military. *c.* The budget of common expenses shall be regulated (by the territorial parliament) on common principles, (§ 2): 1st, commercial affairs and the customs; 2nd, indirect taxes affecting certain industrial products; 3rd, monetary affairs; 4th, railroads in which both countries are interested; 5th, military organization. (The laws are first agreed upon, then passed and promulgated separately in each half of the empire).—Common expenses are regulated by a convention between the two parts of the empire, sanctioned by the emperor. If the two delegations do not agree on the amount, the emperor has the right to fix it, but not for longer than one year, (§ 3).—The common ministry is responsible. No minister can at the same time be a member of the common and of a territorial ministry, (§ 5).—Common affairs are regulated by parliamentary *delegations*, (§§ 6 and 13). Each parliament chooses 60 members every year, 20 of whom are from the upper house, (§ 7). The 40 members of the second chamber are to be selected in such manner that each kingdom or country shall be represented as follows: Number of members: Bohemia, 10; Galicia, 7; upper Austria, 3; lower Austria, 2; Salzburg, 1; Styria, 2; Carinthia, 1; Carniola, 1; Bukovina, 1; Moravia, 4; Silesia, 1; Tyrol, 2; Vorarlberg, 1; Istria, 1; Gorizia, 1; Trieste, 1, (§§ 8 and 10). The propositions of the government are presented separately to each delegation by the common ministry. Each delegation has the right of initiative, (§ 14). The delegations deliberate separately; they communicate with each other in writing, and when necessary, meet in equal numbers to vote in common, but not to deliberate, (§§ 15, 30, 31). The common ministers have a right to seats and to a hearing, (§ 28). They may be impeached, (§§ 16, 18).—What especially distinguishes the Austro-Hungarian compromise is, that it was not concluded between the emperor and the Hungarian diet only. The Cisleithanian parliament took part in the treaty at the express demand of Hungary. All the details of its execution were arranged by the delegations which sat in July, August and September, 1867; and it was after deliberating with the parliament of Cisleithania, that the new constitution was established (that of 1861 had been granted). This constitution of 1867 is composed of several laws of Dec. 21, two laws of Dec. 24, and one law on ministerial responsibility of July 25, 1867.—The first law of Dec. 21, 1867, modifies "with the consent of both houses of parliament," the *fundamental law* (constitution) of Feb. 26, 1861. The composition of the upper house is unchanged.

The house of representatives must be made up of 203 members, thus distributed among the different kingdoms and countries: Bohemia, 54; Dalmatia, 5; Galicia and Cracow, 38; upper Austria (Linz), 10; lower Austria (Vienna), 18; Salzburg, 3; Styria, 13; Carinthia, 5; Carniola, 6; Bukovina, 5; Moravia, 22; Silesia, 6; Tyrol, 10; Vorarlberg, 2; Istria, 2; Gorizia and Gradiska, 2; Trieste and environs, 2 (§ 6). The diets choose from among their own members representatives to parliament, being careful to apportion them among the districts, towns, corporations (universities, chambers of commerce) according to the special laws of each country. No change in the distribution or grouping of members can take place except by virtue of law *passed by the reichstag* at the instance of the diet wishing the change. Should a diet refuse to send, or be prevented from sending representatives to the *reichstag* the emperor may order direct elections by the districts, towns and corporations as was done in Bohemia in 1871.—Officials elected to parliament do not need leave of absence from their posts, (§ 8).—The emperor appoints the president and vice-president of the upper house each year. The house of representatives elects presiding officers from among its own members, (§ 9). Parliament is convoked every year by the emperor, as far as possible in winter (§ 10). The powers of parliament extend over the following matters: 1, The examination and approval of treaties of commerce or those which impose a charge or effect a change in territorial divisions; 2, recruitment and the military service; 3, budgets, imposts and kindred matters; 4, monetary questions, the issue of paper, customs, postoffices, railroads, navigation and other means of communication; 5, credit, banks, industrial privileges, weights and measures, property in trade marks and models; 6, medical matters, epidemics and epizootics; 7, laws on naturalization, aliens, passports and the census; 8, religion, rights of reunion and association, the press, literary property; 9, the organization of schools; 10, civil, penal and commercial laws, in so far as the drafting of them has not been specially reserved to the diets; 11, general principles for the organization of the judiciary; 12, organic laws; 13, laws concerning the relations of the different countries of Austria to one another; 14, laws on matters common to both parts of the empire, (§ 11).—All legislative matters not specially enumerated here are reserved to the diets, (§ 12). All laws are proposed by the government, (§ 13); therefore, individual initiative in the proposing of laws does not exist. The consent of both houses and the imperial sanction are requisite to give a law force, (§ 13). When the two houses are unable to agree on the amount of a sum of money in the discussion of a financial question, or the number of men to be levied on the occasion of the discussion of the military contingent, the smaller figure is to be taken as the sum or the number agreed on, (§ 13). A quorum consists of 40 members in the upper and 100 in the lower house. A change in organic or consti-

tutional laws can be effected only by two-thirds of the members present, (§ 15). It is needless to reproduce here the regulations to be found in all constitutions concerning the liberty of members of both houses and analogous matters.—A second fundamental law of Dec. 21, relates "to the general rights of citizens." It defines civil and political rights, assures to each citizen equality before the law, liberty of the person, safety of property, freedom of worship in all recognized religions, (art. 15). Article 16 ingeniously enough permits believers in an unrecognized religion to hold worship in their houses "provided it be not contrary to law or morals." Education is free. All races have the same right to the protection of the state, (art. 19). It is the same with language.—A third law, of Dec. 21, institutes a court with jurisdiction in cases of conflict between different countries or administrations. A fourth law of the same date regulates the administration of justice. The judges are named for life by the emperor, (art. 5). "It is not for tribunals to pass on the validity of laws regularly promulgated, but they may discuss the legality of an administrative regulation," (art. 7). Publicity, (art. 16). Jury, (art. 11). A fifth law of the same date relates to the executive power. The person of the emperor is sacred; the ministers are responsible, but the emperor appoints them. He commands the armies, concludes treaties, coins money, and takes an oath "to observe faithfully the fundamental laws of the kingdoms and lands represented in the *reichstag* and to govern according to law."—The provincial diets in the German and Slave countries are composed of archbishops, bishops, rectors of the universities, representatives of the great landed proprietors, (in Tyrol of noble land owners, in Dalmatia of the heaviest tax payers), the delegates of towns and burghs of chambers of commerce and manufacturing industries, and country deputies. In Trieste the municipal body takes the place of the diet.—The country members alone are chosen indirectly (by electors each one of whom is selected by 500 inhabitants); other members are chosen directly by the voters. Voters must be Austrian citizens of age and in possession of all civil rights. A candidate to be eligible must be thirty years of age, at least. In addition, both voters and candidates must have property qualifications varying as follows in different countries: In Bohemia, Moravia and Silesia the great landed proprietors must pay 250 florins direct taxes, in lower Austria 200 florins, in Tyrol 50 florins, elsewhere (even in Dalmatia) 100 florins.—In the towns and rural districts all citizens enjoying the rights of municipal election are voters; and in towns of such size that the voters in them may be divided into three bodies, classing them as tax payers according to the amount they pay, into three classes (1, the most heavily taxed; 2, the less heavily taxed; 3, little taxed) members of the first two bodies, and of the third who pay at least 10 florins direct taxes (at Vienna and Brünn 20 florins, at Gratz 15 florins). The

presidents of diets who have in Bohemia the title of *Oberstlandmarschall*, in Galicia and lower Austria that of *Landmarschall*, in other places that of *Landeshauptmann*, as well as the vice-presidents, are named for six years by the emperor. The representatives are elected for six years also. The diets meet at the summons of the emperor and generally once a year. In the intervals between sessions there is an acting committee (*Landesausschuss*) composed of a president and from four to eight members elected by the diet.—In Hungary the diet is composed of two houses, that of the magnates and that of the representatives. The first is made up of the archbishops, bishops, barons of the empire, the guardians of the crown, the *Obergespans* (chiefs of counties) and the other princes, counts and barons who assist there personally; their number is not limited. The house of representatives comprises the deputies of the chapters, monasteries and convents, the delegates of prelates and absent magnates, (that is, of those who are not sitting in the upper house), and 333 deputies of counties, free districts and towns. With the members from Croatia and Transylvania, which with Hungary form the "crown of St. Stephen," there are 446 in all.—To vote in Hungary, it is necessary to be at least 20 years old; to be eligible, to be at least 24 and to know the Hungarian language. Besides, it is requisite to own real estate worth 300 florins, an industrial establishment, or to have some kind of revenue amounting to 100 florins at least. Doctors, lawyers, engineers, professors, teachers, members of the academy, clergymen (*les capacités*) are exempt from the property qualifications. Deputies are elected for three years. The diet meets usually once a year at Buda-Pesth. The president and vice-president of the upper house are appointed by the emperor; those of the lower house are elected by the members of the chamber.—Croatia and Slavonia on one hand and Transylvania on the other, have diets organized in a similar manner, but slightly different from that of Hungary. The Croatian diet is presided over by the *Ban* (governor).—The diets of the different states of the crown deliberate upon all legislative and other affairs special to the countries in which they are held. Their sessions are public and the deputies are paid.—These diets have powers similar to those of the *reichsrath*, but these powers are limited on the one hand by extent of territory and on the other by rights reserved exclusively to the *reichsrath*. But below the diets there are still consultative bodies whose action is restricted to a subdivision of one of the states of the crown. These councils are also elective bodies; only if the diets are called on to complete the work of the *reichsrath*, the district assemblies are only intended to aid the administrative authorities.—In Hungary, however, the powers of the district assemblies are more extended, and correspond in powers and composition to the diet at Pesth. They have members by hereditary right, members ex-officio, and elected members. These

assemblies are represented during a part of the year by a committee presided over by a count or *Obergespann*, and it is by these bodies, which are not merely consultative, that the country is administered.—The political organization of Austria-Hungary of which we have been able to give here but the principal traits, is described in a general manner by the word *dualism*. In this way there are more intimate relations between the two countries than if there had been simply what is called a *personal union*. The party of the extreme left in the Hungarian diet demand, whenever an opportunity offers, that the two countries shall be connected only by the person of the sovereign; but the great majority of the Hungarian nation understand that they have too many interests in common with Austria not to desire to draw closer the ancient ties which bind Hungary to the Austrian empire. *Dualism* presents difficulties enough to be overcome. There is no need of increasing them.—Moreover difficulties abound in the interior of Cisleithania. The Slaves are not inclined to recognize the constitution of 1867. They would like to replace *dualism* by a federation of states, which would weaken the Austrian empire still more. These tendencies are all the more surprising because, if realized in practice, the Slaves, aided by the ultramontanes and the feudalists, would always have the majority in parliament. Foreign publicists friendly to Austria and wishing to see her strong and prosperous do not sympathize with federalist tendencies. They do not see any advantage to humanity in the preservation of the autonomy and language of small nationalities, especially when these small nationalities have neither a history nor literature.—However, one of the most remarkable of these nationalities and one which has a history closely bound up, it is true, with that of Austria, the Bohemians or Czechs, sulk and refuse to send representatives to the *reichsrath*. They demand a position similar to that of Hungary. They made a solemn declaration of this in 1868 and renewed it in 1871, when the ministry of Hohenwarth had gone far in their favor. Their claims at the time were about to be granted, when count von Beust with count Andrassy, prime minister of Hungary, succeeded in defeating them. If the successors of Hohenwarth are not federalists they are none the less disposed to make every concession to the different nationalities compatible with the unity of the empire.—We would consider as an evil the introduction of federalism in Austria, when Galatia, Croatia and other countries equally demand autonomy. Up to the present time there is no example of a confederation which has not been stained by blood in civil war. Greece did not escape it, and if we speak only of modern times neither Switzerland, the United States, nor the German confederation has escaped this fate. Why should such a fate be made to await Austria where the horrors of war would be increased in violence by the hatred of race?—ADMINISTRATION. The provincial administration of Cisleithania, or the western part of

the empire, differs from that of the countries of the Hungarian crown. The largest countries (Bohemia, upper and lower Austria, Moravia, Styria, Dalmatia) are lieutenantancies (*Statthaltereien*). The smaller states (Salzburg, Carinthia, Carniola, Silesia, Bukowina) are governed by *provincial authorities*, (*Landesbehörden*). In Galicia there is a governor general, to whom the provincial authorities of Lemberg and Cracow are subordinate.—The authority of the lieutenants or provincial authorities was fixed by the laws of Sept. 14, 1852, and Jan. 10, 1853, as well as by various subsequent legal decisions. They are analogous to those conferred on prefects in France, with some differences the natural result of the different circumstances of the two countries. Thus the chiefs of provincial administrations represent the government within their respective jurisdictions. They render decisions in cases which the emperor has not reserved to himself, nor assigned to his ministers; they carry on the administration of affairs in conformity with the laws; they are representatives of the province in certain defined cases. They are also chiefs of the police department.—The provinces or countries of the crown are subdivided either into districts or into departments composed of several districts. There are, therefore, countries where two intermediaries stand between the commune and the minister, and others where there are three.—The communal organization was regulated in the German-Slave countries by the law of March 17, 1849, and in ten of the greater cities by special municipal statutes. In each commune, a distinction is made between the members by right (*Gemeindebürger*) and members in fact (*Gemeindeangehörige*) on the one hand, and foreigners on the other. The commune is represented by a municipal council elected for three years. The members by right are voters, and among the members in fact are clergymen, public functionaries, officers, doctors of Austrian schools, professors and public teachers. All voters thirty years of age are eligible to office except members of the active army and communal officials.—In populous communes voters are divided into three bodies according to the amount of taxes they pay. In small communes they form a single body.—The municipal council (*Gemeinderath*) elects from its own members a directory committee, which has to be confirmed by the government. In many of the towns, this committee forms a municipal authority known as the *magistracy*. The burgomaster is president of the municipal council and chief of the directory committee. He represents the commune, carries out the decisions of the council, governs the police, and exercises, at the same time, the administrative functions in the interests of the state which have been confided to him by the laws.—These provisions of the law of 1849 were confirmed and partly modified by the law of March 5, 1862, which established the general principles of communal legislation for the German-Slave countries, by intrusting each diet with the execution of the laws, and with

adding to them such supplementary provisions as it should consider necessary. The following are a few articles of the law of 1862: The whole territory except the imperial palaces must be divided among the different communal *circumscriptions*. Certain great estates may, by permission, be constituted apart by assuming all the burthens and fulfilling all the duties of a commune. Every citizen must belong to some municipal community. The communal authority may grant or refuse the right of citizenship, but the right of sojourn belongs without authorization to every person of good moral character having means of support either through his fortune or his labor.—The commune has powers or rights which belong to it and others which were delegated to it. The powers proper to the communes are those which by their nature pertain to the municipal domain, such as the administration of municipal property, the security of persons and property, the establishment and maintenance of highways, the freedom of passage over roads and waterways, the adulteration of food, fairs and markets, and particularly to weights and measures, sanitary, industrial and moral police, public charity, primary and special education, the arbitration of cases, and the supervision of auctions of personal property.—Delegated powers are determined by the various laws which established them; they confer on the municipal authorities the administrative powers necessary for the transaction of municipal affairs. In Austria as elsewhere it is these authorities who act between the administration and the commune.—To be a municipal voter it is necessary to have the right of citizenship in a commune, not to have lost one's civil rights, not to have been condemned for crime or certain misdemeanors, and to be twenty-four years old. Property qualifications may be established in a certain measure by particular diets.—The sessions of the municipal body are public. The chief of the executive committee (the burgomaster) or a number of members may demand the closing of the doors in certain cases, but never while the budget or municipal accounts are under discussion. The treasurer's accounts must be exhibited to all who ask for them.—When the communal expenses exceed the communal income, the deficit may be covered by a proportionate addition to the direct or indirect taxes or by the imposition of some other tax according to the will of the commune. Such additional taxes must be authorized by law. The government, however, has the right to oversee the action of the communes. It may dissolve municipal bodies through provincial authority, but on condition of ordering new elections within six weeks.—The district and department councils may be charged with seeing that the communes preserve their property and institutions intact, with confirming certain important decisions of the communes in financial matters, with authorizing the increase of taxation within the limits of the law; finally, with taking cognizance of municipal affairs or with annulling such decisions as may be

referred to them. Large towns with a special charter are exempt from this species of tutelage. The councils of the district or department are formed from the following elements: large proprietors, manufacturers, or merchants most heavily taxed, of the city and rural population. They are placed under the authority of the diets whose confirmation of certain of their important acts is necessary to the validity of such acts.—Hungary is divided into 46 counties (*comitatus*) subdivided into districts, besides which there are five free districts.—It has been said that the chiefs of counties (*Obergespans*), are named by the emperor. The archbishops of Gran and Erlau, however, hold this position *de jure*. The heads of certain families of magnates have the same position by hereditary right. These functionaries are assisted by two vice-*gespans* and several other officials elected for three years by the county council. Their powers are analogous to those of other intermediary administrations in other parts of the empire with somewhat more of the right of initiative. In the districts a judge and deputy judge represent administrative authority. The free towns are administered by their magistrates and are directly subject to the lieutenant.—Croatia is a lieutenantancy presided over by the *Ban* and is divided into seven counties.—In Transylvania the chief administrative authority which still directs the administration of justice is called the *Gubernium*. The country is divided into counties where the Hungarian population predominates, and into seats (*stuhle*) where the Germans (called Saxons) are in the majority. The *obergespans* are appointed by the sovereign at the recommendation of the *Gubernium*; and the vice-*gespans* and judges are elected for two years and confirmed by the government. The titles of the local authorities in this region, as well as in most others which form a part of Austria, are almost as varied as the languages of the people who inhabit it.—ADMINISTRATION OF JUSTICE. The administration of justice is differently organized in different parts of Austria. For the German-Slave group, there is a supreme court of third resort at Vienna. It has jurisdiction in all civil and criminal cases, and decides controversies between subordinate courts and tribunals and the administrative authority. The courts of second resort are the court of appeal at Vienna, Graz, Trieste, Innsbruck, Prague, Brünn, Lemberg, Cracow and Zara. The courts of first resort are those composed of several judges and of tribunals having but one judge. The jurisdiction of these tribunals with but one judge is not so extensive as that of the courts with several judges. The courts have a double jurisdiction. They are judges in the first place of all civil and criminal matters not specially assigned by the laws to another jurisdiction, and then they, in one or two tribunals, likewise take cognizance of all affairs beyond the jurisdiction of the tribunals with but one judge. They are not, therefore, courts of appeal. The most important judicial affairs of the district have been reserved to them.

Thus, in criminal matters, the tribunals with but one judge are scarcely more than police justices, while crimes and misdemeanors are tried by the courts. Political crimes and misdemeanors, however, can only be judged by a court sitting in the chief town where the lieutenant or governor resides.—The procedure is oral and public, even in civil affairs, since the law relating to judicial power of Dec. 21, 1867. The organization of the public ministry and the bar bears a great resemblance to that of France; it is regulated by the laws or decrees of Jan. 20, 1852, Aug. 16, 1849, and May 31, 1855.—In Hungary the supreme court is formed of the chamber of septemvirs who with the royal council form the royal *curia* presided over by the *judez curia* (minister of justice). The council of septemvirs is the highest court in all civil and criminal matters. The royal council is the court of appeal in the case of all decisions of inferior tribunals brought before it, and it acts as a court of first resort in the construction of laws or in determining what the law is; also in criminal cases in which capital punishment or a punishment involving infamy may be inflicted.—The inferior tribunals are, on the one hand, those of the counties, and under them the tribunals of district judges, and, on the other, the tribunals of the towns and the free districts, each one of these districts having a judge from whose decision an appeal may be made to the district court.—An analogous judicial organization obtains in Croatia, Slavonia and Transylvania. Besides the courts above described Austria has special courts, such as the court of the grand marshal (*Obersthofmarschallamt*), where matters are adjudged which concern members of the imperial family, princes and foreign envoys with their personnel; the military, naval and mercantile courts, the courts of experts who settle the disputes of fairs and markets, and of arbiters in commercial affairs; bank, industrial and other similar tribunals.—FINANCES. The finances of Austria seem to be pursued by a malignant fate. It very frequently happens that she is asked for means to carry on gigantic wars against superior forces. This brings the country to the verge of ruin, and when after an interval of repose, her condition improves, some unexpected event comes to destroy the fruits of her statesmen's efforts, and throw the country anew into financial difficulties for another period of indefinite duration.—The treasury has thus far been sustained by enlarged revenues due partly to the increase of taxes but still more to increase in wealth. However, circumstances have not yet permitted Austria to make up its deficit, and its financial troubles seem so inveterate that their cure may almost be despaired of. Certain it is that the financial compromise of 1867 does not seem to have acted as a sovereign remedy.—The space at our command does not permit us to give exhaustive information on the finances of Austria at previous epochs. The figures given below are from entirely reliable sources. We take them from official documents, and would remark that

previous to 1860, the florin was worth 12 centimes more, the new coins having been slightly reduced in consequence of the treaty of the 24th of January, 1857, in order to bring them nearer in accord with the different monetary systems which Germany then had. The actual silver florin is worth two-thirds of a thaler, (two marks of the German currency introduced in 1871). The following figures give only the net revenue: In 1781 the receipts of the state were 69,100,000 florins, its expenses 68,300,000. During the last years of the eighteenth century the revenue varied between 65,000,000 and 80,000,000, but the necessities of the war against the French republic carried the expenses beyond 118,000,000, 121,000,000 and even 157,000,000. The greatest deficit of this epoch was that of 1796 when it went beyond 96,000,000.—But the time of trial was not come to an end with the century. A new and more formidable athlete appeared upon the scene,—Napoleon. In the struggle against the emperor of the French a revenue of 142,000,000 to 147,000,000 was obtained by extraordinary efforts, but the expenses of the country increased in a still greater proportion. They reached the sum of 368,000,000 in 1810, causing a deficit of 226,500,000 in a single year.—At length the great captain who had held all Europe so long in check, was conquered. It was again possible to take breath and wait for better times. The proverbial prosperity of Austria reappeared anew, and, from 1820 to 1832, the income rose from 126,000,000 to 140,000,000. Twelve years later 150,000,000 was reached, but the equilibrium of the budget was not yet attained, because the expenses followed the same law of progression.—1848 and 1849 were disastrous years. The revenues were only 106,000,000, while the expenses reached 109,000,000 in 1848 and 268,000,000 in 1849. It was necessary to readjust the finances, to impose new taxes and raise the rate of taxation generally. By degrees the receipts were brought up to 333,000,000 florins in 1857, but war broke out and 388,000,000 were spent. In 1860 the net receipts were 318,000,000, and the gross expenses 523,000,000.—Dating from 1861 great efforts were made to decrease the deficit, but the net revenue of the whole empire did not exceed 253,000,000 in 1861, 285,000,000 in 1862, 292,000,000 in 1863, 290,000,000 in 1864, 286,000,000 in 1865, with deficits in the corresponding years, of 127,000,000, 86,000,000, 84,000,000, 85,000,000 and 104,000,000. We shall say nothing about 1866, whose financial showing was influenced by the war. In 1867 the budget was ordered (the constitution being still suspended) by imperial decree of Dec. 26, 1866. It amounted for the whole empire to 407,297,000 receipts, and 433,896,000 expenses. The régime created by the compromise of 1867 established three distinct budgets which have been in use since 1868: 1, the common budget; 2, the budget of Cisleithania; 3, the budget of Transleithania.—The common budget destined to meet common expenses is very simple, having but one common source

of income, the net product of the customs. The remainder has to be made up in two distinct parts, one of 70 per cent. from the Cisleithanian, the other of 30 per cent. from the Transleithanian budget. The following is the budget of 1872:

ORDINARY AND EXTRAORDINARY EXPENSES.

Ministry of foreign affairs.....	2,329,100
Ministry of war, the army.....	95,165,007
Ministry of war, the navy.....	11,254,690
Ministry of finance.....	1,794,606
Court of accounts.....	104,095
	110,647,498
Receipts (of which 12,000,000 customs are net).....	17,208,583
Balance to be distributed.....	93,438,615

Of this the 70 per cent. furnished from Cisleithania amounts to 65,407,315, and the 30 per cent. from Transleithania, 28,031,300 florins. The Germans complain of having been unjustly treated in the compromise. They have two grounds of complaint: 1st, that the estimate of the burdens laid on each part was based on the receipts of the six years from 1860 to 1865 inclusive. Now at Vienna, it is said that the arrears of direct taxes were for the respective years, 7, 7, 7, 6, 8, 11 per cent., while beyond the Leitha they were 28, 40, 19, 32, 38, 30 per cent. 2nd, the Hungarians contribute 30 per cent. and demand as much influence as men who contribute 70 per cent. Rights here are superior to duties, which means a privilege. The common budget is voted by the delegations. All moneys must be used for the purposes for which they were appropriated. The Austrian budget is voted by both houses of the *reichsrath*. The common ministry has nothing to say as to the figures of this budget. The following are the figures:

YEARS.	Total receipts.	Total expenses.
1866.....	281,245,907	320,230,526
1869.....	296,254,176	299,326,671
1870.....	317,065,821	320,674,136
1871.....	333,949,807	345,676,940
1872.....	327,270,000	348,650,000

We do not distinguish here between ordinary and extraordinary receipts or expenses.—Each country of the crown has its *special* budget. The districts and the communes have theirs. In 1868 the total of the *special* budgets of the states of the crown were 17,930,196 florins. The total of district and communal expenses is not known.—Transleithanian budget. In 1869 the total revenue was valued at 172,780,806 florins, and the expenses at 185,508,305; in 1871, revenue 159,136,536, and 197,126,520 expenses. For 1871 the principal receipts were: direct taxes, 57,578,000 florins, of which the land tax formed about 35,000,000; the tax on houses, 6,000,000; taxes on industries, 8,000,000; income tax, 6,500,000; indirect taxes, 69,202,000, of which the tax on spirits formed 6,000,000; on wine, almost 2,000,000; on beer, 1,200,000; on meat, 1,500,000; on sugar, 1,000,000; on salt, 11,500,000;

on tobacco, 23,000,000; on lotteries, 2,750,000; on stamps, 4,000,000; court fees, 7,000,000; public domains, 24,564,000; postal service, 3,500,000; telegraphs, 750,000, and from various sources at least 5,000,000.—Among the expenses we may mention one-half of the civil list, 3,650,000; cabinet of the king, 61,229; civil administration, about 89,000,000 (the expenses of the army and navy are in the common budget); cost of collection, 51,000,000; the public debt, 32,723,200, excluding the interest of the loan of 1871.—Croatia and Slavonia, as well as the counties and communes, have their budgets each.—All religions recognized by the state are protected in the exercise of their worship and in the administration of affairs therewith connected, their schools and their charitable institutions, so far as they transgress no law of the country.—The Catholic bishops are appointed by the pope at the suggestion of the emperor. There are at present in Austria 13 archbishops and 52 bishops of the Latin rite; 2 archbishops and 7 bishops of the Greek rite, and 1 Catholic archbishop of the Armenian rite. In 1861 there were 16,960 parishes and chapels, administered by 32,362 secular priests; in addition to whom there were 9,784 men in 720 monasteries and 5,198 women in 298.—The non-united Greek church has for chief the patriarch of Carlovitz. He has 10 suffragan bishops. The patriarch is elected by the *national congress* composed of bishops and 75 deputies, priests and laymen. This congress can not meet without the authorization of the sovereign. It decides upon all important questions relative to worship and religious instruction. In Hungary, where its powers are more extensive, there are also synodal assemblies in which are elected the seven Hungarian bishops of this rite. The other Greek bishops of Transylvania, Dalmatia and Bukowina are nominated by the emperor, or king, as he is called on the other side of the Leitha. This church has 3,600 parishes, 3,800 priests, and 40 convents with 238 religious inmates.—By an imperial decision of April 8, 1861, the Protestant church was freed from the restrictions which it had to complain of up to that time, and the Lutherans and members of the reformed church have been admitted to all the rights of citizens. These churches have maintained a Presbyterian and synodal organization similar to that of most other countries. These synods, and notably the general synod, one which meets at Vienna, regulate everything concerning religious matters.—The pastors are elected by the faithful of each church, but they have to be confirmed by the superior ecclesiastical council (*oberkirchenrath*). The election of deans and superintendents is confirmed by the emperor. The superior council, composed of pastors and laymen, is nominated by the emperor. In Hungary the organization of Protestant churches, based upon the law of 1791, differs little from that which we have just indicated.—In the whole empire there were, in 1872, 914 Lutheran parishes with 1,210

pastors, and 2,058 reformed parishes (chiefly in Hungary), with 2,278 pastors.—The other churches recognized in Austria are the Unitarians, who live mostly in Transylvania in 107 parishes, and the Jews, whose rabbis are elected by the congregation and by the administrative authorities.—The different religions aided by the state cost it a sum of only 2,000,000 or 3,000,000 of florins in both parts of the empire. It is needless to add that the churches have incomes of their own either from property or the contributions of their members. The property of religious establishments in Cisleithania was estimated at 73,842,456 florins in 1869. Of this, only 8,500,000 were in real estate. The remainder was in different forms of property. Their income amounted to 3,429,372 florins, and the expenses to 4,616,306 florins. Total of their debt, 1,667,241 florins.—**PUBLIC EDUCATION.** Education is primary (elementary), secondary, superior, and professional or special.—The primary schools are subdivided into inferior, superior and city schools (*Bürger-schulen*). The law requires that there should be at least one primary inferior school (*Trivialschule*) in each rural or town district, and that wherever practicable the sexes should be taught separately. The higher primary schools (*Hauptschulen*) carry primary instruction somewhat farther and are situated only in the towns. The city schools are established in the larger cities and the elements of the exact sciences are taught in them.—Education is compulsory for children from six to twelve years of age. As far as the mixture of nationalities permits, the mother tongue of the children is employed in the schools.—Special courses of study are established for the training of teachers in certain higher primary schools. Teachers are appointed and installed by the administration.—The expenses of primary education are borne by the state, the commune, or are provided for by bequests and the tuition fees of children of well-to-do parents.—In 1868 the Cisleithanian countries had 15,054 ordinary and higher primary schools, with 1,691,349 pupils and 13,391 male and female teachers. The Transleithanian countries had, in 1864, 16,164 schools, with 1,161,494 pupils and 28,000 teachers of both sexes. The number of schools is greater in Hungary on account of the mixture of religions and nationalities. Each religion and each nationality voluntarily establishes a separate school. Only four-fifths of the children go to school. In 1855-6 the number of young soldiers able to read and write was, in lower Austria, 83½ per cent.; in Silesia, 69½; in Bohemia, 60½; in Moravia, 45½; in Tyrol, 36½; in Hungary, 25½; in Croatia, 15; in Transylvania, 8½; in Galicia, 4½; in Carniola, 3½; in Dalmatia, 1½.—The intermediate schools (*Mittelschulen*) are divided into gymnasia and schools of the exact science (*Realschulen*). In the gymnasia, which are almost entirely supported and supervised by the state, there are eight classes. The ancient languages are taught in them, and students prepared in them for the universities. There are in

Austria 94 gymnasia, with more than 30,000 students, and 26 scientific schools with 3,500 pupils. This is the total number of schools, excluding the 130 communal colleges (*Unter-Real-schulen*).—Higher instruction is given in the universities, the polytechnic schools and certain special schools.—There are 7 universities in Austria-Hungary. Those of Vienna, Prague, Pesth and Cracow have four faculties, (theology, law, medicine, philosophy). Those of Lemberg, Graz and Innsbruck have not that of medicine. The Austrian universities have more than 600 professors and 9,000 students. Since 1848, they have an organization similar to that of the German universities.—The seven Austrian polytechnic schools (Vienna, Prague, Graz, Brünn, Cracow, Lemberg and Buda), are intended to give technological instruction based on a profound study of mathematics. The Prague school is supported by Bohemia, that of Graz by Styria alone, that of Buda by Hungary, the others by the whole empire. To be admitted to these schools as an ordinary student, it is necessary to have gone successfully through a gymnasium or scientific school. Students may elect their course of study themselves. They may ask to be examined on subjects which they have studied and require a certificate showing the result of the examination. These schools have more than 225 professors and 3,000 students.—The special or professional schools reckoned among the higher institutions of learning are the two faculties of theology (outside the university) and the 120 seminaries supported by the bishops or religious houses (3,500 students), and some similar institutions for ministers of other creeds.—In addition to this there are 5 administration academies, 7 schools of surgery, 16 secondary schools of agriculture (500 students), 3 schools of forestry (100 students), an agricultural institute (147 students), one academy of forestry, several schools of mines, veterinary schools, 60 industrial and commercial schools (3,500 students), the mercantile academies of Vienna, Prague and Pesth (private institutions), 70 art schools, military and naval schools and others.—**PUBLIC CHARITY.** Public charity is within the authority of the commune, and the state steps in only when local resources are insufficient. The dispensation of public charity is confided to the poor board (*Armeninstitut*) created in the last century and established in almost all the provinces. The poor board is composed in each parish of the pastor presiding over a number of "fathers of the poor" (*Armenväter*) and one responsible agent named by the pastor in accord with the municipality.—The principal sources of income for these institutions are the voluntary offerings of the people, bequests, gifts and legacies, a certain part of the tax on sales, and fines. The assistance given is either temporary or permanent (*Pfünde*). There is a large number of refuges or houses of retreat, of hospitals, civil (330) and military (159), of insane asylums (49), of lying-in hospitals (40), of foundling hospitals (33):

these last were founded by the emperor Joseph II. Physicians, surgeons and midwives are paid from the local treasury for treating the poor.—The whole number of physicians in Austria-Hungary is about 6,000; of surgeons, 5,400; of druggists, 2,300.—The system of public charity in Austria comprises, in addition, work houses, divided into two classes: voluntary, in which the labor of able-bodied persons, wishing to earn their living but unable to find employment, is lightly paid for; involuntary, where vagabonds and tramps seeking to avoid work, are confined; these institutions are supported by the provinces.—There is in Austria a great number of savings banks, regulated by the decree of Sept. 26, 1846, and established by the communes or by companies. The statistics of Cisleithania furnish the following figures: Number of depositors Jan. 1, 1866, 694,421, on Dec. 31, 824,830; total of deposits at both periods, 196,800,000 and 247,700,000 florins.—**AGRICULTURE, INDUSTRY AND COMMERCE.** Austria-Hungary may be considered more particularly an agricultural country. More than two-thirds of the population are employed in tilling the soil; it is only in Bohemia that the number of agriculturists falls below one-half. In lower Austria and Moravia the proportion is a little more than 50 per cent. The value of immovable property is estimated at 10,500 millions of florins and that of its product at more than 2 milliards of florins.—The productive land is nearly 87 per cent. (86.9) of the whole area of the empire. Of this, 36 per cent. is arable and 33 per cent. under forests. Cereals are among the chief products of the country and reach in wheat 50,000,000 *metzen* (a German measure equal to 1.6775 of a bushel); wheat and rye mixed, 15,000,000; rye, 65,000,000; barley, 50,000,000; oats, 100,000,000; Indian corn, 44,000,000; buckwheat and millet, 10,000,000; 500,000 quintals of rice. Hungary, Bohemia, Moravia, Galicia and upper Austria produce sufficient grain to supply the lack of it in other provinces and to export it in considerable quantities.—Among other products of the soil are. potatoes, 120,000,000 *metzen*; beans and pease, 5,000,000 *metzen*; cabbage, 60,000,000 quintals; beets, 20,000,000 quintals; hemp and flax, 3,000,000 quintals; hops (in Bohemia), 40,000 quintals, tobacco, 1,000,000 quintals; olive oil, 100,000 quintals. Wine deserves separate mention, for, next to France, Austria produces it in the greatest quantity. The vintage is estimated according to the year at from 330,000,000 to 440,000,000 *eimers* (1 *eimer* about 15 gallons). The forests, which yield annually 30,000,000 *klafter* of wood, are an important element of prosperity, especially in a country so rich in minerals.—Cattle thrive well on the broad meadows and vast pasture lands of the Eastern empire (*Oesterreich*). According to the census of Dec. 31, 1869, there were in Cisleithania 1,389,623 horses, 43,070 asses and mules, 7,425,212 horned cattle, 5,026,398 sheep, 979,104 goats, 2,551,473 hogs. In Hungary there were 2,095,000 horses, 5,026,398 horned

cattle, 11,288,000 sheep, 431,000 goats, 4,505,000 hogs.—Mining is a rich source of wealth to Austria, and employs directly and indirectly more than 120,000 workmen. The quantities of metal produced are in round numbers:

METAL	Austria	Hungary
	Livres of 500 grammes	
Gold.....	53	3,200
Silver.....	30,000	52,350
Mercury.....	4,000	806
Cast iron.....	4,000,000	2,100,000
Copper.....	10,000	40,000
Lead.....	100,000	40,005
Nickel and Cobalt.....	100	-----
Tin.....	500	-----
Zinc.....	85,000	4,000
Antimony.....	1,500	850
Arsenic.....	4,000	-----
Sulphur.....	36,000	200
Graphite.....	150,000	-----
Salt.....	4,500,000	2,000,000
Coal.....	90,000,000	12,500,000

—The manufacturing industries embrace all branches of labor. They are sufficiently advanced not to fear foreign competition, and in certain districts they are able to compete successfully with their rivals in the international markets. Manufacturers employ a large number of persons of both sexes, who, with children and other members of the family, amount to about 8,000,000 souls. The value of manufactured articles exceeds 1,600 millions of florins. Bohemia occupies the first rank among the manufacturing portions of the Austrian empire. Next comes lower Austria, with Vienna as its capital; Moravia, Silesia, and others follow.—Among the metallurgic industries that of iron is the most important. It supports 350,000 persons (workmen with their families), and produces a value of 80,000,000 florins. Its principal seats are in Styria, Carinthia, Carniola, upper Austria, Bohemia and Moravia.—There are the following ceramic establishments: 4,300 tile factories, 45 crockery ware and 15 porcelain factories, producing a value of 20,000,000 florins. The glass works, of which those of Bohemia are so famous, produce a value of 18,000,000 florins. Chemical products amount to 20,000,000 florins. The distilleries, of which there are 103,000, produce 60,000,000 gallons. The breweries, 3,300 in number, produce 12,600,000 gallons. The tanneries employ 150,000 workmen who prepare an amount of leather worth 80,000,000 of francs, not enough for home demand.—The products of Austrian textile industries have been noticed favorably at the recent exhibitions, and continue to improve. While in 1831 113,000 quintals of cotton were equal to the demand of the mills, 586,000 were needed in 1850, 880,000 in 1861, and above 900,000 in 1870. At present there are 158 spinning mills with 1,700,000 spindles. Cotton weaving is established everywhere in Bohemia, in the north of Moravia, in lower Austria and Silesia. The cotton industries give employment to 400,000 persons, who produce a value of 100,000,000 florins, which is sufficient to supply

the demand of the country, and to leave a surplus for exportation.—Hemp, linen and wool have been woven in Austria from time immemorial. In the eastern provinces this work is done yet mainly by hand. In the west flax is spun in 33 establishments with 200,000 spindles; besides, 600,000 spindles are used for carded flax, and 30,000 for combed flax. The total value of the linen industry is estimated at 150,000,000 florins and the woolen at 130,000,000.—Silk employs 100,000 persons, the value of the produce is 25,000,000 florins, leaving a small surplus for exportation.—The progress of Austrian industry can not but be stimulated by the freedom of labor (the suppression of corporations) decreed Dec. 20, 1859. At present every person who is of age may engage in almost any industry. But a few remain, for the exercise of which training or a special permission (a concession) is necessary. Such are the following: Printing, reading rooms, common carriers, house building, the making and sale of arms and ammunition, manufacture of fire works, inn keeping, bawking and slaughtering of animals. Although the previous restrictions connected with the system of guilds have been suppressed, a certain organization for benevolent objects is retained among members of the same profession. The best proof of the advance of Austrian industry is found in the increased number of stationary steam engines. Cisleithania had of these in 1852, 584, with 7,110 horse-power, in 1863, 2325, with 35,837 horse-power. Transleithania had in 1852, 79 engines with 1,175 horse-power, and 480 engines with 8,134 in 1863.—The commerce of Austria is of considerable importance and constantly increasing.—There are no restrictions on internal commerce.—The coasting trade is reserved to the Austrian flag. About 66,000 arrivals and departures are noted yearly. The mean capacity of vessels employed is 32 tons.—The empire is divided into two tariff-districts with reference to foreign commerce. One is the whole empire except Dalmatia, the other is Dalmatia. Since 1851 Austria has abandoned the prohibitive for the protectionist system. Duties on imports are graduated according to the degree of protection which it is thought should be granted to different industries. The export duties are few, and are levied exclusively on raw materials.—The merchant marine of Austria numbered, in 1871, 7,843 ships with 375,000 tons capacity and manned by 28,000 sailors. Transportation in the interior is facilitated by 7,055 kilometres of navigable rivers, and 112,500 kilometres of highways, and (1870) 6,553 kilometres of railroads in Cisleithania, and 3,628 in Hungary. Since 1850 Austria has formed a part of the German postal and telegraphic union. The mail carried, in 1830, 18,600,000 letters; in 1860, 105,600,000; in 1870, 144,000,000 in Cisleithania and 32,000,000 in Transleithania; 76,000,000 newspapers, besides 4,000,000 and 7,000,000 letters with samples, 111,000,000 stamped packages, 29,000,000 administrative letters.—The length of

telegraphic lines in 1861 in the empire was 12,215 kilometres, and 586,500 dispatches were sent. In 1871, 2,690,000 dispatches were sent in Cisleithania, where the length of the lines was 17,256 kilometres, (527 stations), and 1,356,000 in Transleithania, where the lines are 10,156 kilometres in length (487 stations).¹ MAURICE BLOCK.

¹ The budget estimates for the "common affairs of the empire," were as follows for the year 1880:

Sources of Direct Revenue.	Florins.
Ministry of foreign affairs.....	4,159,490
Ministry of war { Army.....	123,653,080
Navy.....	8,709,780
Ministry of finance.....	889,550
Board of control.....	125,500
Total.....	137,537,380
Branches of Expenditure.	Florins.
Ministry of foreign affairs.....	4,159,490
Ministry of war { Army.....	129,312,420
Marine.....	
Ministry of finance.....	1,889,557
Board of control.....	125,570
Total.....	135,486,960

—The principal sources of revenue were given as follows in the financial estimates for the year 1880:

	Florins.
Direct taxes.....	91,880,000
Customs duties.....	28,232,500
Salt monopoly.....	19,396,000
Tobacco monopoly.....	59,070,000
Stamps.....	17,300,000
Judicial fees.....	31,900,000
State lottery.....	20,200,000
Excise (Verzehrungsteuer).....	59,937,000
State domains and railways.....	5,642,941
Post and telegraph.....	3,263,000
Miscellaneous receipts.....	45,967,503
Total.....	382,768,944

—The principal branches of expenditure were given as follows in the budget estimates for the year 1880:

	Florins.
Imperial household.....	4,650,000
Imperial cabinet chancery.....	69,492
Reichsrath.....	725,165
Council of ministers.....	880,620
Ministry of the interior.....	16,924,469
Ministry of national defense.....	8,368,087
Ministry of public education and worship.....	16,010,583
Ministry of agr culture.....	10,291,480
Ministry of finance.....	84,780,698
Ministry of justice.....	20,392,971
Ministry of commerce.....	23,630,746
Board of control.....	153,000
Interest on public debt.....	112,935,074
Pensions and grants.....	38,880,888
Cisleithanian portion of the common expenditure of the empire, including war and foreign affairs.....	73,130,642
Total.....	411,823,914

—The following table gives the total amount of the public debt of Austria, including the debt of the whole empire, but exclusive of the special debt of Hungary on the 1st of July, 1879:

	Florins.
Consolidated debt, bearing interest.....	2,781,668,095
Consolidated debt, without interest.....	122,569,953
Floating debt.....	82,167,342
Annuities.....	905,238
Total.....	2,987,310,628

The following table gives the area and total number of

AUTHORITY. Wherever society exists there is a struggle between authority and liberty. The fundamental laws of a body are nothing but treaties of peace between these two principles or forces. In political society such laws are called a constitution. In religious societies they are called a creed. Authority seems so necessary to all society, and liberty so necessary to human nature, that we find the reflex of authority even in philosophy where it would seem there ought to be unbounded freedom, and a demand for liberty even in the family, which is the narrowest kind of society and the only one in which absolute power would seem legitimate.—The history of human society, from whatever point of view considered, is the history of authority and liberty. These two principles being intended to limit each other, but unequally according to the degree of civilization, there is always a boundary line between them varying with social conditions, which neither of them should pass; and political events are nothing but the wanderings of liberty or authority beyond this necessary limit. When authority steps beyond this line, humanity is oppressed and suffers: when liberty, society is endangered. It is natural that, in the first case, public spirit should reassert liberty with emphasis, and in the second, re-establish authority on a firm basis. The constant reaction of opinion against success, which is more or less immediate and rapid, is the cause of the mobility of society. This law of the development of humanity has been observed and accepted only very lately. And it was only when it was observed and accepted that men, understanding the impossibility of preventing revolutions, tried to replace violent by pacific or legal revolutions, through the revision of constitutions. Ancient nations which had tradition as a foundation and immobility as their rule, believed in an absolute limit between au-

thority and liberty. Authority according to this doctrine derived its force and its rights from itself. It was essentially the right, and if it made concessions to liberty, these concessions were mere acts of grace and consequently revocable. Modern nations, on the contrary, are their own masters, that is, social interests being now the source of the right, no member of society can have rights as against society. Authority is simply a trust from the nation, limited in duration and extent by the interests of the nation. Now society which is always in need of direction, has all the more need of it the less enlightened it is. In proportion as it becomes enlightened and civilized it receives all the liberty it can enjoy without danger to itself. Authority then retreats step by step, not as a master who yields to force, or who makes a gift from pure kindness, but as a delegate who resigns his office, hands in his account and confines himself within the limits of his new powers. In one word, the source of political right or sovereignty which amounts to the same thing, is changed. It resided in authority, now it resides in the people. Authority is now only a power delegated by the governed. The sovereignty of the ancient régime, inherent in the person of the monarch, and possessed by virtue of divine right, continued legitimate with all the plenitude of its powers, even in opposition to the unanimous will of the people. Modern sovereignty, essentially power delegated, is legitimate only within the limits of the grant.—It is very clear that, from the moment sovereignty belongs to the people, who delegate only its exercise, the extent of the trust, as well as the trust itself, depends on the popular will. But it is asked what the people ought to wish in their own interests, which in this instance is their only rule. Should they desire to confer an absolute trust, a large trust or a very limited one? The doctrine of absolute trust has its partisans. This is like a piece of metaphysical jugglery which first makes a pompous award of sovereignty to the people, and immediately deprives them of it under pretext of a trust, which they have created, thus leaving themselves more bare and naked than before. Royalty by divine right, even the most absolute in character, being founded on tradition, is bound, through respect for its own principle, to uphold all other tradition. In this way royalty is both based upon and limited by tradition. Thus it was that under the ancient régime, the kings of France were unable to shake the Catholic religion, to abolish the nobility, or to do without their parliaments in the passage of laws and the administration of justice. They could not alter the form of the states general, and had no resource against them except not to convoke them. A dictator, on the contrary, representing popular omnipotence can be restrained in the exercise of his sovereignty neither by law nor by tradition. Such a representative of absolute omnipotence can meet with limitation neither in the history, manners, nor laws of a people. It is clear that authority

inhabitants of the various provinces of the empire, according to the official estimates for Dec. 31, 1876:

PROVINCES OF THE EMPIRE	Square miles.	Population.
Lower Austria.....	7,654	2,143,928
Upper Austria.....	4,831	745,097

understood in this way absorbs and destroys liberty. Between such a delegation of power and monarchy by divine right, there is scarcely more than a formal difference; but if there is a difference of degree, it is in favor of monarchy by divine right.—The essence of delegated authority then is in limitation and revocability, for it can not be absolute and irrevocable without being false to its own principle. A liberty which exists only in principle, and is delegated in its entirety, is no liberty at all. It is nothing; it is the emptiest and most deceitful of abstractions. In one word, there is no social condition in which authority and liberty do not exist together, and where authority is not a concession made by liberty. The real political problem consists in fixing the boundary between authority and liberty, in the manner most advantageous to liberty rightly understood. Certain minds are naturally inclined to strengthen authority beyond measure, others liberty. Whenever men cease to stand on the basis of divine right, and admit the dogma of popular sovereignty, the drawing of this line of demarcation is no longer a question of right, but of fact, a matter of skill and temperament.—Those who favor an immoderate development of authority adduce three arguments in its behalf: first, that it produces order; second, that it is the parent of progress; third, it does enough for liberty if it governs always in the sense of the majority.—It is true that authority produces order. It is for this very end that it has been established; and it is because authority is necessary to order, and order to liberty that no political society can ever do without authority. But because the proper function of authority is to produce order, it is not to be inferred that, the more authority there is in a state, the more order there is. Order is rather the result of a just equilibrium between authority and liberty; for if a people have not the liberty to which they are entitled, that is to say, the whole sum of liberty which they can enjoy without peril to themselves, they are ill at ease and impatient of the yoke, the result of which is that authority and the foundations of society itself are weakened. All excess is the cause of trouble in politics. Furthermore, authority, in order to be solid, has need not only of material but of moral force. It owes its moral force, in modern states, to the delegation of power by the people. That authority is a delegation of power by the people, is evident to every eye, so long as authority is beneficial in its effects; but authority appears decrepit and an abuse when, by its encroachment, instead of being a cause of order and well-being to the body social, it becomes a danger and a source of suffering. We may conclude that authority produces order only in proportion as it is needed.—The second proposition of the zealous partisans of authority is partly true and partly false. There are kinds of progress which can be realized only through a central authority clothed with the most ample powers. Of the two motives

which determine most of the actions of men, *i. e.*, private and public interest, it is natural that the first should act almost exclusively on the minds of individuals, and the second dominate in the councils of the representatives of the body politic. It is not less natural that individuals should take in only the sphere in which their life moves, and remain strangers or indifferent to whatever has no direct relation to their persons. Even if we, instead of considering individuals, suppose limited corporations of the state, such, for example, as cities, is it not evident that the administration of a city would be concerned only for the interests of its own territory? And is it not evident, on the other hand, that there are national enterprises whose success is more important for the prosperity of each individual city than anything they could do themselves within their own territorial limits? No matter how enlightened local administrators may be, they are like travelers at the bottom of a valley whose horizon is necessarily restricted; but the chiefs of a state, like men stationed on the summit of a mountain, take in a wide sweep of country in their view, and judge points of detail better because they know them both in themselves and in their relations. The superiority of their view arises partly from their position, and partly, perhaps, from an increase of capacity due to the importance of the part they play. Man, like every other created thing, is made up of that which is essential to him, *plus* the modifications for good or ill which are added to his essential being by external circumstances. The history of every human life is the record of what has been produced in the man by virtue of that centre of action called the will, together with all the circumstances that have excited, developed, modified or paralyzed that will, or which have restrained or increased its effects. Save some too poorly gifted natures, whom chance has placed in high position, and who, in a certain fashion, are sometimes perverted by the disproportion of their faculties to their missions, it may be said that the capacity of men increases with their responsibility and authority.—And again, on the other hand, liberty has its own power and efficacy which it is impossible to ignore.—In the first place, liberty is a right. Man has a right to liberty only on condition of being capable of enjoying it. It results from this, that whenever a person does not enjoy the sum even of liberty which he is able to use without injury to the liberty of others, justice is violated in him. This right which is absolute should not be sacrificed to the requirements of progress, even if it could be shown that progress is impossible except through the action of authority; but it must be added that justice is never violated with impunity, and that a force intended by nature to act freely decreases, and produces imperfect effects when it is transformed by social convention, and, from being autonomous, as it should be, becomes dependent and subordinate. It is not the violation of right alone which belittles the man, but baseness of mo-

tive as well. A person under command acts from obedience which generally means that he acts through fear, the independent man is inspired by hope. Which is the more powerful of these motives is doubtful to no one. The man governed by others never moves except from some impulse from without; from which it follows that he neither anticipates the impulse, nor goes beyond the point to which it carries him, and that his power is quiescent whenever it is not called into requisition. The free man seeks action as water does its level; for the tendency to repose would be in him a weakness, and, if chronic, a disease. Not only does he execute better, but he seeks and he finds. Material and intellectual force developed by constant exercise, and the habit of relying on himself, make of him an incomparably superior agent in the rare cases when he needs to subordinate his action to the commands of authority. Two equal forces being given and composed of an equal number of forces, the collective force which is directed by a single will produces the more powerful effect; but the collective force of a people composed of forces which are always directed and obedient, is considerably inferior to what the collective force of the same people would be, if the simple forces composing it were developed under the influence of the strengthening breath of liberty. Now the true wealth of nations is the increase of force and the increase of action. Let us admit that unity is absolutely indispensable to certain deeds, but, in this very case, the forces united to form a collective force, are more powerful in proportion as they have been previously accustomed to liberty. Authority and liberty are consequently both parents of progress. Progress can dispense with neither; but still it is liberty which has the higher place.—The third proposition, that liberty is disinterested when authority has a popular origin and popular agents, or more simply when it is always exercised according to the wishes of the majority, is a sophism. If the cause of liberty could ever be lost, it would be by reason of this sophism that it would perish. The government of the majority thus understood is the government of number, that is, the substitution of might for right. It seems indeed, at first sight that popular government and the government of majorities are identical; because in no case can the will of the people be expressed by the minority. It is this idea which makes so many enemies for the dogma of popular sovereignty. The error consists in considering only the rights of majorities, and forgetting those of minorities completely. These two rights are very different but equally sacred and equally necessary to liberty and order. It is self-evident that all the members of a minority have the same rights individually as the members of the majority; and that these rights may be assured, it is necessary, by virtue of the laws themselves, and the formulæ established, to regulate their application, that every citizen should be dependent on the law and the law only. This point settled, it is the

right of majorities to make the law, and the right of the minorities to form by means of discussion, a new majority to replace a bad law by a good one. If the rights of the minority are respected, the government of majorities ceases to be one of force; for to pretend that the government of majorities is the government of force it would be necessary to maintain that nations are not capable of, and that the human mind was not made for, truth.—We may thus resume the whole discussion: what is authority without any liberty whatever? It is the absolute immobility of the social fabric, an abnormal belittlement of the collective force of society, and the approval of permanent injustice. What is liberty without any authority whatever? It is the absence of society, a state of war, an hypothesis so absurd that it can not present a precise idea to the mind. In all society, therefore, both liberty and authority are needed. Liberty being the right and the interest of the citizens of whom society is composed, it is the object of society. Authority is only its condition. Liberty exists for its own sake. Authority is established in order that liberty may flourish. Since liberty is less dangerous in proportion as the minds of men are enlightened, liberty must advance and authority retreat as enlightenment becomes more general. Authority, in its relations with liberty, is like a wise tutor who never substitutes himself for the will of his pupil; except when that will is powerless or imbecile, who works unceasingly to render his presence unnecessary, and to retire at the precise moment when the child has grown to be a man. There is not and there can not be a fixed limit between liberty and authority; for the true rôle of authority is gradually to prepare the way for liberty.—Authority should always be strong, but it should not be extensive save in countries and among people but slightly civilized. The best proof of the civilization of a people is that they are but little governed, and do not suffer from being so governed. This does not mean being feebly governed, for a feeble power is one which can not fulfill its mission.—Power should not go beyond the limits of its rights, that is, of the necessary; it should also avoid the arbitrary, and always find support in the law.—It is a fundamental error to suppose that the force of authority consists in its extent. On the contrary, it consists in an exact proportion between its extent and its necessity. It may almost be said that authority is the stronger for having, in the highest degree, the faculty of restricting itself at the proper time. Confined within the limits which the civilization of each epoch assigns it, authority is beneficent and necessary. That it should fulfill its mission without fail is of vital importance both to society and liberty. Liberty itself requires that power be strong, for power is its guarantee and hope. It fears only encroachment and arbitrariness.—Arbitrariness to which authority too often aspires is as fatal to it as to liberty, and fatal in the same way. Power as soon as it wanders away from the law, no longer represents the will

of majorities but its abdication. Arbitrariness is in the body politic what the useless would be in the system of the universe. It is looked upon as the height of authority of which it is but the shadow. Between it and authority there is a contradiction, since it is of the nature of authority to produce order. Arbitrariness is the very essence of disorder. Under the appearances of centralization and absolutism, it is in reality but one of the forms of anarchy. It is to authority what privilege is to right, and in the domain of psychology what the liberty of indifference is to true liberty. Everything should be subordinate to law, even force.—The following are a few formulæ in which the whole theory of authority may be expressed.—The conditions of liberty are: 1, the enjoyment of natural rights; 2, the possibility of vindicating the rights of the minority by discussion; 3, the transformation of a majority into a minority whenever the majority on a question have changed views.—Authority then should be: 1, the guardian of natural rights; 2, the guardian of the rights of discussion; 3, the guardian of the rights of transformation.—Consequently it is necessary: 1, that it make everything attainable by legal means, by restricting itself within narrower limits as civilization extends; and 2, that it prevent the employment of illegal means. It should therefore be very strong in so far as it exists.—Conditions of force are: 1, stability; 2, liberty of action within its own sphere; 3, promptness of action; 4, infallibility of action; 5, sure repression, after clear proof before tribunals equally but necessarily independent of opinion and power.

JULES SIMON.

AUTHORS, Rights of. Authors' rights, that is, the right of authors to control the publication of their intellectual or artistic productions, in order to prevent the reproduction of them by others, is of modern growth. The idea that proprietary rights in an original work were to be respected and defended, was not clear to the mind of antiquity. It was only after mechanical methods of multiplying books, etc., had been increased, and especially after the invention of printing, when the danger of unauthorized reproduction became greater, that the need of recognizing these rights was felt.—This protection was first accorded, at the request of interested parties, in the form of privileges, and was originally granted more to benefit publishers than authors, more out of deference to the book trade than out of respect for writers. The earliest known privileges of this kind were granted during the last decade of the fifteenth century to certain Italian and German towns, especially Venice, Milan, Nuremberg, and to the bishop of Bamberg. The emperor Maximilian I. appointed, before the end of the century, a "general superintendent of printing houses in the holy Roman empire," who, with the office of censor of books, combined the authority to grant such privileges. Princes of the empire granted these privileges as well as the emperor.

Frankfort and Leipsig became the most important marts in the German book trade. In the first, an imperial commission was appointed to oversee the trade and protect the rights of publishers; in the second, the government of the elector of Saxony performed the same office.—Until the French revolution, practice held firmly to the privilege theory in France, though men had long since penetrated more profoundly into the universally just character of authors' rights. In most of the German states we find them recognized in the first decades of the present century. The German confederation first opened the way for all Germany to a loftier understanding of this question.—Privileges became, by degrees, universal, and were accorded to every one who asked for them. This implied an acknowledgment that the privilege should not be granted at all. Men became conscious that it merely protected a natural right, but were embarrassed in formulating that right. Authors spoke, it is true, of literary property, but even if the word property can be used in that wider sense, according to which everything pertaining to a man is called property, still it was essentially a different right from that of property proper, that is, the control of a person over a material object; and after a closer examination it was seen that nothing was gained by the expression and nothing explained by it. An intellectual production can not be disposed of by a person, as a thing is by its owner. The author does not wish to keep his work exclusively to himself as the owner of an article does who asserts his property in it to the exclusion of the whole world. He wants to publish it, and the very control over this publication is the main interest of his right. But when he publishes it, the right of society to the work also begins.—Besides, it came to be understood that publishers should be relegated to a secondary rank, and that their rights in a work and in its publication should be derived from the author. It was seen that the author could not be lost sight of, even after the transfer of his right to the publisher; and the continuance of his right was measured by the life of the author. In this way arose the understanding of the author's right as such. The recognition of the author in his work, of the creator in his creation, was acknowledged at length as the very essence of this right.—English jurisprudence was the first to recognize this right, which it called copyright; and understood by the term the exclusive right of the author to the reproduction of his works. A law of queen Anne, in 1710, confirmed this right and at the same time limited it to 21 years. Many English jurists were inclined previously to go further and to declare the author's rights perpetual, like that of property. But they were unable to make this view prevail. From 1837 to 1842, this subject was warmly debated in the English parliament. The result was the introduction of a law which extended the term of copyright to 42 years, or longer if the author lived. But the limit as to time remained.—Modern legislation in different countries

is now becoming more uniform on this subject. All protect the author's right as long as the author lives, and recognize the element of personality in this right in contradistinction to the ownership of material things. All extend the protection a little beyond his death. But as soon as the time expires the work becomes common property according to nearly all recent legislative enactments. This twofold provision, first for the author, second for society, answers completely to the character of an intellectual work. The one-sided and exclusive care for the author and legal representatives came into irreconcilable conflict with the rights and interests of the society of intellect. What had once been given by the author himself to his nation and the world, and made the common property of all mankind, should not be withdrawn nor destroyed by his heirs. How would it fare with culture if the heirs of Shakespeare or Goethe, or the heirs of a thinker like Spinoza or Bacon, through monkish or pietistic narrowness, could prevent a new edition of their works? Just as little to be approved is the opposite one-sidedness, which pays no regard to the merits of the author, and at once declares his work a lawful prize for every one. The reconciliation of the two views is to be found in the recognition and limitation of the author's rights.—In Germany authors' rights belong to the few subjects which the confederate legislation has taken up. The decree of 1837 assured their protection for ten years at least. But in 1845 this protection "for literary productions and works of art" was extended to the death of the author and thirty years after. The Prussian law of June 11, 1837, and that of Bavaria April 15, 1840, had preceded the confederation in this direction.—A peculiar difficulty is connected with the limitation of this right by states. The nature of intellectual productions is such that they can not be confined within territorial limits. Literary and artistic communication spans the earth. Productions of the mind are given to the human race. If the author, therefore, is to find real protection, it is not enough that the state in which he lives and where his work appears should protect him, and prevent its subjects from reprinting the same. The literature of a country has no protection if beyond its borders the robber work of republishing can go on undisturbed. During recent years a series of treaties on this subject have been either the subject of negotiation or have been concluded. France and England are especially active in this direction, and to some extent Prussia and Austria. This is another problem to be solved by international law.¹

J. C. BLUNTSCHLI.

¹ In the United States any citizen of the country, or a resident thereof, being the author of a book, map, chart, etc., may secure a copyright in the same by complying with the requirements of the law. The terms for which the copyright may be obtained is 28 years from the time of recording the title; at the expiration of that period, the author, if living, and his widow, if he be dead, may re-enter for 14 years additional.

AUTOCRAT, one who governs through his own agency. The term is synonymous with sovereign in Russia, and indicates that the chief of the state has a power unlimited and without control, that is, absolute. In the rest of Europe the word autocrat has always had a bad meaning, because opinion has always been liberal enough, even in countries other than constitutional, to be unfavorable to a régime that puts all public power in the hands of one man without imposing on him the least restriction or the slightest control. (See ABSOLUTISM.) M. B.

AUTONOMY. Autonomy is of Greek origin. Literally the word means independent legislation. At one period it was the synonym of sovereignty, but, in time, the sense of the word was restricted. The occasion was the following. Rome had made of Greece a province of the empire. The consul Flaminius, conqueror of the Achaian league, proclaimed the liberty of Greece at the Isthmian games. The Roman senate regulated this simulacrum of liberty by giving autonomy to the Greek cities (*αὐτοῦς*, self, and *νόμος*, law), that is, the right of governing themselves by their own laws and retaining their magistrates, which in reality was nothing but the *municipium*. Citizens of the *municipia* had political rights at Rome, and might fill the military and civil offices of the republic. They belonged, therefore, to two countries, to two cities, a thing altogether contrary to the maxim which Rome applied in the case of her own citizens: *Nunquam duas patrias habebis*, says Cicero (*de legibus* ii. 2). In the internal organization, the *municipia* generally took the great city as their model. They had a senate, comitia, consuls. *Municipal* cities could, of their own will, renounce the benefit of autonomy in favor of the civil law of Rome, and when they had expressed this wish of assimilation, they were purely and simply incorporated into the republic.—In order to define clearly the meaning of the word autonomy which is somewhat vague, it is necessary to distinguish it from sovereignty on the one hand, and self-government on the other.—Sovereignty is absolute independence, which the nation alone can attribute to itself. The nation alone, whatever may be the form of its government, possesses the plenitude of power. It can stand as an individual (or as a collective person) vis-a-vis of foreign powers and it is supreme authority to its own citizens.—Autonomy can belong only to a part of a state, or confederation. The characteristic of all autonomous political communities is, that they do not possess independence in foreign affairs, but enjoy a greater or less degree of independence in home matters. Among those who have the most complete autonomy must be counted the states of the German empire, next, the vassal states of Turkey, the Swiss cantons, the states of the North American Union. Some of these can even have semi-official, but not official representation abroad. In spite of great differences, they have this in common, that they have governments

of their own with some of the attributes of sovereignty.—The position of the two Scandinavian kingdoms united under the sceptre of Bernadotte is that of a *personal union* (see *PERSONAL UNION*). It is the same in the case of Luxemburg and the Netherlands. The two halves of the Austro-Hungarian empire enjoy a large autonomy, almost the same as the German states, but with perceptible differences, not necessary to explain here (see *AUSTRIA-HUNGARY*, *GERMAN EMPIRE*).—The British colonies enjoy an internal autonomy which is almost complete, but abroad they are represented by the mother country.—A narrower autonomy is accorded to Finland in Russia, to the states of the Austro-Hungarian crown, to certain British islands in the channel (Jersey, etc.) and to the Basque provinces in Spain. In former times certain French provinces, Scotland and Ireland enjoyed a very marked autonomy.—It can not be said that there are at present in Europe provinces or communities which

enjoy autonomy, in the proper sense of the word. We can only attribute to them a greater or less degree of self-government. Autonomy presupposes the right, no matter how restricted, of making laws.—This is not the place to examine the question whether autonomy is desirable in itself or not. Abstract theory must answer that question in the affirmative; but in practice the question is very complex; it is essentially one of facts. We shall only say that no autonomy has been *created* outside of the British colonies. When it exists elsewhere, it is an historical growth, or rather it has maintained itself in spite of hostile influences which still continue to act. In the greater number of cases, perhaps in all, our preference would be for the preservation of such autonomy as has been able to resist these influences.

MAURICE BLOCK.

AYES AND NOES. (See *PARLIAMENTARY LAW*.)

B

BADEN, a grand duchy situated in the southwest of Germany along the right bank of the Rhine. It has a superficies of 277 geographical square miles, with a population (December, 1875) of 1,507,179. The population, in 1816, was 1,005,898; in 1839, 1,277,403; in 1861, 1,369,291; in 1871, 1,461,428.—Before 1866 the grand duchy was a member of the German confederation; from 1866 to 1870 it was an independent state; since January, 1871, it is a part of the German empire. It has 3 votes in the federal council, and sends 14 deputies to parliament.—In all affairs not controlled by the laws and institutions of the empire, the country is governed by its own constitution, which dates from Aug. 22, 1818, and by its own laws. The constitution lodges the executive power in the grand duke. The legislative power is divided between him and the representatives of the country or the "estates," divided into two chambers. The grand duke attains his majority at 18 years of age. The succession follows in the male line of the house of Zaehring by right of primogeniture.—The upper chamber is composed of princes of the blood, heads of 10 noble families; the Catholic archbishop, the superintendent of the Protestant church, the proprietors of hereditary landed estates worth 500,000 marks, 2 deputies of universities, and 8 members appointed by the grand duke without regard to rank or birth. The deputies of the universities are elected for 4 years, those of the landed nobility for 8. One-half the seats are vacated every 4 years. The appointments made by the grand duke are for 4 years.—The second chamber is composed of 63 deputies. Elections are indirect. All citizens 25 years of

age are electors of the first degree, and may be chosen electors of the second degree. All citizens 30 years of age are eligible to the office of deputy. Officials can not be elected in the districts where they serve. The term of each deputy is 4 years. One-half of the chamber is renewed every 2 years.—The grand duke convokes, prorogues and dissolves the diet. In case of dissolution the temporary members of the first chamber must be replaced. The president of the upper chamber is appointed by the grand duke; the second elects its own president.—The diet assists in the framing of laws, and in the discussion of the budget. Its consent is necessary to the contracting of a loan, to sell state domains and to levy taxes. The budget is biennial. Every proposition concerning the finances is first presented to the second chamber. The bill which it has voted can be accepted or rejected only as a whole (*en bloc*) by the upper chamber. In case of rejection, the votes of the two chambers are counted together, the ayes and noes are summed up and the majority makes the law (such a case has not yet occurred).—The chambers have the right of initiative in legislation. The second chamber may impeach the ministers. The chambers may receive petitions. Liberty of speech is guaranteed. Sessions of the chambers are public. In the interval between sessions a permanent committee represents the chambers. In case of urgency, its consent gives power to contract a loan. Its powers, however, are not extensive.—At the head of the administration is the ministry of state or the council of ministers. The ministers are responsible.—There are 4 ministerial departments: 1, of justice and foreign affairs; 2,

of the interior; 3, of commerce; 4, of finance.—For purposes of internal administration the country is divided into 54 bailiwicks (up to 1872 the number was 59). In each bailiwick, a district council (*Bezirksrath*), elected by the representatives of the circuit, assists the bailiff.—The country is divided, besides, into 11 circuits, charged with attending to the common affairs of several bailiwicks. The circuit is represented through deputies, chosen by all electors, *i. e.*, by representatives of the important cities, deputies of bailiwicks elected by the representatives of communes, and the principal land owners. This provincial assembly meets once a year, and decides questions relative to roads, schools, hospitals, asylums, orphan establishments and other common interests. It has the right to vote taxes. The administration of common affairs is intrusted to a permanent committee.—Four commissaries general (*Landescommissaire*), sitting at Carlsruhe, Mannheim, Freiburg and Constance, supervise the administration of the bailiwicks and circuits.—The number of communes is 1,584, of which 113 are cities. Communal administration, like that of the circuit, is founded on self-government. The government exercises supervision through the bailiff. Ordinary administration is in the hands of the burgomaster, and the municipal council elected by the inhabitants. The common council (*Bürgerausschuss*), which is also elected by the inhabitants of the commune, has a certain right of control. In important cases all the inhabitants of a commune are called together in a general communal assembly.—In the administration of justice, there is a supreme court (at Mannheim), six courts of appeal, and in each bailiwick a tribunal of the first resort (*Amtsgericht*). Crimes are tried with the assistance of a jury. Slight offenses are passed on by the mayors. There is a special administrative court, (*Verwaltungsgerichtshof*) for questions of public law or disputes relating to the administration.—The civil code of Baden is based on that of France. In criminal and commercial matters the codes of the German empire are in force. Freedom of worship is recognized. Protestant worship is directed by the superior council of the Protestant church. The archbishop of Freiburg is the head of the Catholic church in Baden. The Protestants have 378 parishes; the Catholics, 660. The superior council of the Israelites is charged with the affairs of the Jewish church. In 1875 there were 517,851 Protestants, 958,907 Catholics, and 26,492 Israelites. The rest of the inhabitants belong to less extensive denominations. Public instruction is under the control of the state. The churches give religious instruction. Primary instruction is obligatory. In 1872 the common schools (*Volksschulen*) were 1,826 in number, with about 200,000 pupils. There are many higher primary schools. The secondary or middle schools are 19 in number, 17 of them give classical instruction mainly, the 2, under the name of *real-gymnasium*, pay more attention to the exact sciences.

Eight of the first, which are called lyceums, include all the classes, and have the right of giving certificates of fitness (equivalent to the diploma of bachelor) for the university. The universities are at Heidelberg and at Freiburg: each one has 4 faculties. The theological faculty at Heidelberg is Protestant; at Freiburg, Catholic. The other faculties have not a sectarian character. At Carlsruhe there is a polytechnic school and a school of fine arts. Most of the cities of importance have schools of industry (*Gewerbeschulen*), and each circuit has an agricultural school.—Of the inhabitants (1,461,428) there were, in 1871, 712,763 males and 748,665 females, making 295,709 families. The number of strangers was 54,988, of whom 42,003 belonged to other German states and 12,985 to states not German.—There is an annual excess of births over deaths (in 1870, 58,913 births, against 48,024 deaths). The number of marriages in 1870 was 10,607. Among the births, 52,066 (or 88.4 per cent.) were legitimate, and 6,847 (or 11.6 per cent.) illegitimate. The number of still-born was 1,979.—Emigration, directed mainly to the United States, was very considerable about 1850. It continues yet, but on a decreased scale, and without the country feeling it. The excess of births more than makes up for the loss.—The population is undeniably prosperous. Landed property being greatly subdivided in most parts of the country, few great fortunes are met with, but a most general well-being. There are scarcely any beggars. The communes are obliged to maintain the indigent. They are aided by numerous hospitals and almshouses (131) as well as by other endowed institutions.—About 50 per cent. of the population are engaged in agriculture, 35 per cent. in manufactures, 8 per cent. in commerce, and 7 per cent. is divided among the other professions.—The German language is the only one spoken in the country. Fragments of three German tribes are met with: in the north, the Franconian tribe; in the centre and south, the Allemans, whose name has been given by the French to all Germans; and the Swabians in the southeast.—The soil is generally fertile, especially in the valley of the Rhine. It is only the most elevated points of the Black Forest (in the south), and the Odenwald (in the north), which are stubbornly sterile. One-third of the soil is arable, one-third in forests, and one-tenth meadows; vineyards occupy 1.4 per cent. of the country (21,500 hectares); the rest is taken up with pasture, towns, villages, roads, rivers, etc. Besides the ordinary products of agriculture—cereals, vegetables, etc.—tobacco, hemp, chicory, hops and other plants are cultivated in the lowlands of the Rhine. The vines yield a yearly average of 450,000 hectolitres of wine. There are about 70,000 horses, 600,000 oxen and cows, 170,000 sheep, 350,000 pigs, 60,000 goats, and 90,000 swarms of bees.—The mineral products are inconsiderable, still the country possesses two great salt works which supply its wants, and a multitude of mineral

springs, some of which enjoy a world-wide reputation (Baden-Baden, Rippoldsau, Peterstal).—Manufactures are in a flourishing condition. The number of great industrial establishments is about 400. Textile fabrics of every kind are produced; also paper, machines, tools, leather, chemical products, jewelry, tobacco, etc.; in the valleys of the Black Forest, pendulums, clocks, music-boxes, straw hats, *liqueurs*, (*Kirschwasser*), etc. The clock makers of the Black Forest send the product of their industry abroad. They are found in European countries and even in America.—Commerce is very active. Railroad traffic is very great. Much timber cut in the Black Forest is floated down the rivers. It descends the Rhine to Holland. Navigation on the Rhine is very important as far as Mannheim; it does not go much higher on account of the rapidity of the stream. Mannheim, thus forming the terminus of Rhine navigation, possessing an excellent harbor, becomes an important entrepôt.—The country contains several large banking houses of which the principal are at Mannheim.—The savings banks (to the number of 97) have a capital of 32,000,000 florins. The number of depositors is 107,000.—The postoffice has delivered annually, from 1869 to 1871, about 19,000,000 letters, 12,000,000 newspapers, 3,000,000 packages, and postal orders to the amount of 5,000,000 florins.—The number of telegraphic stations is (1872) 220; the number of dispatches sent is about 800,000 a year.—The greater part of the revenue of the grand duchy of Baden is derived from direct taxes, including in such direct taxes, a land tax, called in the country *Grundsteuer*, and also from an income tax. About one-fourth of the receipts of the grand duchy of Baden comes from the produce of crown lands, forests and mines, and one-sixth from customs and miscellaneous sources. The following is the total of receipts and expenses of the grand duchy of Baden at different times:

YEARS.	Receipts.	Expenses.
	Florins.	Florins.
1830.....	10,730,000	10,650,000
1840.....	16,540,000	15,425,000
1850.....	22,520,000	22,520,000
1860.....	23,715,000	23,920,000

It is proper to remark that the figures for 1850 and 1860 include the special budget of railroads, which amounted in receipts, as well as expenses, to 5,940,000 florins for 1850, and 6,830,000 florins for 1860.—The budget has undergone profound changes through the entrance of the grand duchy into the German empire. The revenues from customs and indirect taxes (salt, beet-root sugar, stamps and drafts), as well as the post and telegraph, figure there no longer, but go directly into the coffers of the empire. As an offset, the expense of administering these departments, as well as that of the army and foreign affairs, has disappeared. (See GERMAN EMPIRE.) The ordi-

nary budget voted by the chambers for the year 1872 presents the following figures:

RECEIPTS.		Florins.
Domains, forests, mines and salt works.....		4,260,000
Direct contribution ¹		5,220,000
Indirect contribution ²		2,980,000
Taxes and fines.....		1,570,000
Contributions of the empire for administration of customs.....		630,000
Different revenues.....		1,490,000
Total.....		16,160,000
Railroads.....		22,720,000
General total.....		38,880,000

EXPENSES.		Florins.
Collection of taxes.....		4,730,000
Civil list.....		840,000
Justice.....		1,940,000
Interior.....		2,950,000
(Of which 1,060,000 are for public education.)		
Commerce.....		2,020,000
(Of which 1,800,000 are for roads and water courses, and specially half a million for the Rhine.)		
Finances.....		1,850,000
(Of which 990,000 are for the debt of the state.)		
Contributions to the empire.....		2,880,000
Various expenses.....		90,000
Total.....		17,300,000
Railroads (of which 16,220,000 are for administration and extension, and 6,000,000 for interest and sinking fund of the railroad debt).....		22,720,000
Grand total.....		40,020,000

The result, a deficit of 1,140,000 florins, was covered by disposable funds.—The extraordinary budget (public works) amounts to 1,400,000 florins a year. For the construction of new railroads and the management of the old, an expense of 24,000,000 florins is estimated for 1872 and 1873. This sum was to be covered by a sinking fund for railroads, and, in case of necessity, by loans.—The receipts for 1877 were 34,188,865 marks, and the expenses about 34,750,123. The land tax and the income tax constitute the greater part of the revenue of the state. Most of the railways belong to the state. Their total receipts in 1877 amounted to 62,022,162 marks, while the outlay reached the sum of 49,383,404 marks.—In 1878 the general debt amounted to 50,881,661 marks, and the railway debt to 277,253,122. A loan of 12,000,000 marks was added to this debt in 1878.—The army of Baden has been united to the Prussian army in consequence of a military convention concluded between the grand duchy and Prussia. Nevertheless, troops recruited in Baden continue to form separate regiments, and are stationed in the grand duchy. They form,

¹ Of this sum, land taxes form 3,240,000 florins; indirect taxes, 1,060,000 florins; tax on capital, on incomes, and on salaries of employés, 650,000 florins.

² The tax on wine is 820,000 florins; on beer, 860,000 florins; alcohol, 94,000 florins; on meat, 800,000 florins; registration, 915,000 florins.—*Remark.* The tax on beer and spirits belongs, according to the constitution, to the empire. But the grand duchy of Baden, like the other states of the south, has reserved the right of taxing these articles and of paying therefor into the treasury of the empire a sum proportioned to the population.

together with two Prussian regiments of infantry and one of cavalry, the fourteenth army corps, the commander of which resides in Carlsruhe.—It is needless to add that all the military institutions are governed by the laws of the empire. According to these laws the grand duchy furnishes, in time of peace, one man per hundred, or 14,350 men; in time of war, 48,000 men, to the army of the empire.—The management of the post and telegraph has passed also into the hands of the empire. There are in Baden two chief postal bureaux, at Carlsruhe and Constance, and one telegraphic bureau at Carlsruhe.—Entry duties are collected on account of the imperial treasury; the customs, however, are collected by Baden functionaries for a consideration paid by the empire.

DR. F. HARDECK.

BALANCE OF POWER. By this term, in public law, is understood an organization intended to effect among nations forming part of one system, such a distribution and an opposition of forces that no state shall be in a position, either alone or united with others, to impose its own will on any other state or interfere with its independence.—One power can not extend its territory, increase its strength, or largely add to its resources, without giving umbrage to neighboring powers. If its growth assumes alarming proportions, the spur of interest suffices to induce other nations to unite, in order to oppose its impending domination over them. This very simple fact, which has appeared at all times and in all places, was the first germ of the theory of the balance of power. The idea which sprang from it is that of an association of several states against the aggrandizement, grown dangerous, of a single state; but only of a temporary association during actual danger, and while the danger lasts. If we suppose the association more extended; that instead of being a league of certain states against one state, it unites a system of states in a common understanding—more lasting and firm in this, that instead of being temporary it assumes a permanent character and tends not only to defend each one of the states thus united into a system, against the ambition of a single state, but to establish and guarantee among all, such a balance of forces as will maintain them in peace—we have a second form of the same idea, much more advanced than the first, one in which the theory of equilibrium or the balance of power is clearly perceptible.—It would not be correct to say, with Sully, (*Economies royales, ou Mémoires de Sully, collection Petitot*, t. vii. p. 94), that this balance consists in rendering all potentates “nearly equal in power, as to kingdoms, wealth, extent and dominion.” That balance tends rather, according to a memoir of count Hauterive, drawn up by the order of the first consul, “to balance the respective rights and duties of a great number of states unequal in power, and in more or less direct relations with each other.” (*De l'état de la France, à la fin de l'an viii.* p. 36.) It is, in fact, in the efficacy

of the common guarantee in that arrangement, which, in case of necessity, balances each force in the system, by the resultant of all the others; in one word, in the rights upon which the association rests, that the balancing of the inequality of facts is to be found.—We may conceive the idea of equilibrium or balance of power applied to different groups of states, united afterward into one great system, in such a way that each partial equilibrium becomes an element in the general equilibrium; thus, the equilibrium between the ancient states of Italy, between the German states, the equilibrium of the north, that of Europe, of America, of the world. This same idea may have as its object the forces of the most varied nature, which constitute the power of states: hence, military equilibrium; commercial, industrial, financial equilibrium; equilibrium of population, of territory, continental or colonial; maritime equilibrium. But it is territory, above all, that is most generally considered in the theories or practical questions of the balance of power. Indeed, territory, one of the principal instruments of the power of nations, is a physical, material element, susceptible of measurement and limitation, while the other forces are more especially connected with moral causes. We have, therefore, to deal with the territorial equilibrium or balance of power here.—The policy of the balance of power presented itself in its first and most simple form, in the resistance to a power which increased in an alarming manner and threatened other powers with its rule. This happened during three very notable periods in European history: 1, in the period of resistance to the house of Austria which had succeeded by inheritance to the throne of Spain and to the German empire, from Charles V. to Philip IV., in the case of the Spanish branch, and from Charles V. to Ferdinand III., in the case of the German; 2, in the resistance to the house of Bourbon, under Louis XIV.; and 3, in the resistance to Napoleon in the time of the republic and the empire.—It was the policy of resistance to the immoderate increase and the aspirations to domination of the house of Hapsburg, that caused the wars of Francis I. against Charles V., and those which followed, notably the thirty years' war. This period was terminated by the peace of Westphalia in 1648.—The antagonism of the house of Bourbon and the house of Austria in Spain and Germany is well known. The duke de Rohan, in his famous work on the *interests of princes*, dedicated to the duke de Richelieu, and written in 1633, during the species of exile to which the king had sentenced him at Venice, sums up the policy of the time as follows: “We must lay it down as a principle that there are two powers in Christendom which are like the two poles, from which the influences of peace and war come to other states, to wit, the houses of France and Spain. Spain's power having suddenly increased, it has not been able to conceal the design it cherished to rule and to cause the sun of a new monarchy to rise in the west. The

house of France forthwith decided to act as a counterweight. The remaining princes joined one or the other side, as their interests dictated." (Preface to the *Intérêts des princes*, Cologne, 1656). At this period very little was said of the people, and much of princes; men wrote of the interests of princes, of the maxims of princes, and spoke not of rights, but interests. "Princes command the people, and interests command princes," wrote the duke de Rohan, at the head of his book. The policy of the balance of power was then openly a policy of interest; it had not been elevated into a legal theory.—The second period was in like manner filled up with efforts of resistance, to an ambition for aggrandizement which had become menacing to the neighboring states. The danger now no longer lay in the house of Austria, but in the house of France; not Charles V. and his successors but Louis XIV. it was who alarmed Europe. "Francis I. had struggled with difficulty against the house of Austria," says Mignet; "Henry IV. had triumphed over its attacks; Richelieu and Mazarin had humiliated it; it only remained to dispossess it. This Louis XIV. did" (*Négociations relatives à la succession d'Espagne*, Introduction, v. 1, p. liii.) And in fact, at this period it was not the house of Austria that occupied simultaneously the throne of Spain and the imperial throne of Germany, but the house of Bourbon which occupied the thrones of France and Spain. The system of the European balance of power was developed despite this, and strengthened as a principle of conventional international law; and the struggle ended in a new and grand practical realization of this system, at the peace of Utrecht (1713). We must pass over a period of nearly 80 years to meet again in European history a coalition of states of the same character, against the danger of a dominant power which was rising up, and advancing, ostensibly, to a general supremacy over all others. It is true that the first coalition against France (that of 1791) was based on the pretense of interfering with the internal forms of the French government. But when the armies of the republic, in retaliation for the aggression, began to take the offensive, the struggle assumed the character of resistance on the part of different powers to a domination threatening to them all.—Such are the three periods, each epitomized in one of the three names: Charles V., Louis XIV., Napoleon I., during which the policy of the balance of power appeared in its simplest and most energetic form: that of common resistance to threatening domination. It is after these wars, and as a consequence of the treaties of peace which put an end to them, that the second form assumed by the theory of the international balance of power, was produced.—This second form, whose distinctive characteristic is one of agreement, a species of general association of the powers to constitute and guarantee in common a certain condition of territorial possession, regulated conventionally, received, in the positive international law of Europe, three great prac-

tical illustrations—the first in the treaties of Westphalia (1648); the second in the treaty of Utrecht (1713); and the last in the treaty of 1815.—But, previous to the first of these practical illustrations we meet with the projects of Henry IV., and of Sully, which have sometimes, too lightly perhaps, been styled utopian. The abasement of the Spanish faction, the close of the wars of religion, the promotion of an association among all the states "who feared or had reason to fear the insatiable avarice of the house of Austria," were a continual source of solicitude to Henry IV.—This solicitude he had entertained ever since 1589. An understanding had been come to at different times by this king with other princes; propositions were agreed upon in 1603, between his delegates and those of the sovereigns of England, Denmark and Sweden; deputies, agents and negotiators, were sent out by him all over Germany from 1608 to 1609, with general instructions. In consequence of steps taken by these agents, a public assembly of 18 or 20 princes, connected by friendship with Henry IV., was convened at Hall, in Swabia. "A confederation of kings, princes and states shall be formed and the confederates agree to call it the most Christian association; the three most numerous creeds in European Christianity shall be chosen and expedients shall be found to enable them to agree and live together in peace; the empire shall be restored to its rights and privileges; the electors shall regain their free suffrage, and two emperors of the same house shall never be elected in immediate succession. Austria shall be restricted, so far as its hereditary dominion in Europe is concerned, to Spain and the neighboring islands; the possessions of which she shall be deprived, shall be distributed according to principles agreed upon, and the limits of the various powers of the Christian association determined by agreement among the confederates." (*Economies royales de Sully*, collection Petiot, t. viii. et ix.) These were the *lofty and magnificent des gns of the king*, as Sully calls them. It is true that this minister to whom Henry IV. confided his projects and intrusted the care of the details of them, as well as the means of executing them, went further than his sovereign in this organization. The projected confederation was to be established universally and perpetually in Europe, under the name of the *Most Christian Republic*. It was to comprise 15 dominions, of which 5 were elective royalities: that of the pope, the emperor and the kings of Poland, Hungary and Bohemia; 6 hereditary royalities: those of France, Spain, England, Denmark, Sweden, and Lombardy, a new kingdom to be established for the duke of Savoy; and finally 4 dominions republican in form. Venice, a second, to be composed of the duchies of Genoa, Florence, Mantua, Parma, Modena, several small sovereign states of Italy, Switzerland considerably increased, and the 17 provinces of Holland. Between these dominions there were to be placed "limits so sure and well adjusted that none of

the 15 could undertake to trespass upon them without bringing on itself an attack from the other 14." Sully saw in this arrangement liberty of individual conscience, understood in the sense of the free and public exercise of three kinds of religions only, the Roman, the Protestant and the Reformed; freedom of trade, freedom of navigation, and freedom of the sea. Finally, independently of a number of particular councils, a general council, "composed of a proportional equality of the 15 dominions," was to be the perpetual sovereign arbiter of common interests and on disputed questions. To the picture of this general republic, the minister of Henry IV. added this last characteristic: "that always at peace with Christians, it should ever be at war with infidels, and maintain a continual struggle against them, in order to recover what they had usurped in Europe, and to go beyond this if fortunate progress should afford the opportunity" (*Œconomies royales*).—The plans of Henry IV. anticipated a theory of political equilibrium under the form of an association of states, with a distribution of territory, agreed upon in common, in a system of counterweights and general interests, and sanctioned by the guarantee of all the powers. Carried to its utmost limits this theory verged upon plans of general and perpetual peace, brought forward later by abbe St. Pierre under the title of the *Project of perpetual peace*, formerly proposed by Henry the Great; afterward by J. J. Rousseau, under the name of a *project of perpetual peace by abbe St. Pierre*; later still by Bentham, and by other writers. It has assumed at present a more expanded form, in the minds of many.—The transition from the projects thus prepared by Henry IV. and by Sully, to the treaty of Westphalia, is not without logical connection. What is found in this treaty is, at bottom, a partial realization of those ideas of Henry IV. which were more closely connected with the general necessities of that time; a compromise and guaranty of equality, in Germany, for the exercise of the three religions which had struggled so long against one another; a more certain determination of the rights of the states of the empire, especially in their relations with the emperor; a diminution of the power of Austria, in the Spanish and in the German houses; a recognition by this last power of the republics of Holland and Switzerland, both long since founded and strengthened by being freed from its domination; certain arrangements, and territorial concessions in Italy, principally in favor of the duke of Savoy; even the idea of henceforth preventing wars and putting an end to future differences by means of amicable compromises. But the ruling fact was a preliminary discussion by the plenipotentiaries of the principal European powers, covering a great number of international questions, the first example of a congress or diplomatic council which had the character of an agreement determining, by precise stipulations, certain bonds of existence and common co-ordi-

nation among the states and Europe; an engagement which made every private question, touching the maintenance of these stipulations, a question for all, and which, in this way, introduced, for the first time, conditions of political equilibrium by means of a conventional system organized by treaties and founded on the principle of a species of permanent association of the states.—Consequently the treaty of Westphalia has been justly considered as the foundation of positive international law in Europe, and this treaty has been taken as the point of departure of this law. It is to be remarked that, from the same epoch are dated regular continuous diplomatic relations, and the use of legations or permanent embassies from one power to another.—Nevertheless this first provision for a certain territorial and political balance had not the extent and character of unity which is essential to such a system. On the one hand, several European powers did not agree to it: Russia had not yet entered the general current of affairs. Prussia was of too little importance at that time to figure in affairs otherwise than in a secondary and passive capacity. England held aloof. The pope protested. The sultan was not included in the Christian group. Besides, the arrangement was not effected by a single and general treaty, but by several separate treaties. the treaty between Spain and Holland entered into Jan. 30, 1648, at Münster, which forms no diplomatic part of what is called the treaty of Westphalia, although it is an important prelude to it; the treaty between Sweden, the emperor, and the states of the empire, Oct. 24, 1648, at Osnabrück, being the first part of the treaty of Westphalia; final y, a treaty between France, the emperor and the states of the empire, Oct. 24, 1648, at Münster, being the second part of the treaty of Westphalia. This peace was not even general. France and Spain continued in a state of war until the peace of the Pyrenees, (Nov. 7, 1659,) which was thus a complement to the treaties of Westphalia. The former brought peace to Germany and the north, the latter to the south.—The second practical illustration of the system of the conventional balance of power was that of the treaties of Utrecht. The course of political events and especially the question of succession to the Spanish throne, made vacant by the extinction of the Spanish-Austrian dynasty, had deranged the equilibrium created by the treaties of Westphalia and necessitated a new arrangement of power and territory. But the emperor Joseph I., having died, (April 17, 1711), and having left as his successor to the empire, his brother, the archduke Charles, the rival of Philip of Anjou, the fear of seeing the power of Charles V. reappear, by the union of the crown of Spain and the possessions of the house of Austria and the empire of Germany, was of much greater importance to Europe than the elevation of a younger branch of the house of Bourbon, at a time when France had just been so considerably weakened. Between these two

dangers the policy of the balance of power had no room for hesitation. It sufficed for it to take precautions to prevent the future union of the crowns of France and Spain, to reduce these two powers, by strengthening, through a distribution of territory taken from them, those states which were especially destined to serve as a counterpoise to them. Such was the meaning of the various provisions contained in the treaties of Utrecht. The dominant idea in men's minds was the establishment of a new balance of the powers. This idea has been developed and consolidated in international practice since the time of the treaties of Westphalia. That this idea was uppermost in the political thought of the time appears clearly from the correspondence of the English minister, lord Bolingbroke, in the preparatory conferences, as well as from the reciprocal acts of renunciation made by the king of Spain and the princes of France, in which they mutually abdicated their eventual rights to the crown of the other country (see Bolingbroke, *Letters and Correspondence*, and *les Renonciations du roi d'Espagne, du duc d'Orléans et du duc de Berry*, in Dumont).—Nevertheless, the peace of Utrecht was not yet presented under the sanction of a general treaty between the powers. It was made up of two series of different treaties: those of Louis XIV. with Great Britain, with the states general of Holland, with Portugal, with Prussia, with Savoy, signed the same day, April 11, 1713, at Utrecht; and those of the king of Spain, Philip V., with the same powers, the conclusion of which only took place later and at different periods. The common bond existed especially in the stipulations of England, who signed the principal treaty of peace with Louis XIV., and with Philip V., and took under her guarantee the particular engagements made with the other powers. The emperor continued the war; he made peace with France by the treaties of Rastadt and Baden, in 1714; and several years later, with the king of Spain. The differences between the treaties of Westphalia and those of Utrecht, both in the personnel of the contracting parties, and in the object of the stipulations, are noteworthy. France and Sweden were at the head of the allied states, at the time of the peace of Westphalia; England stood aloof. At the peace of Utrecht, Sweden figured no longer, it was England that lead in the negotiations, and it was under the preponderant guarantee of this power, now placed on a level with France and Austria in the balance of Europe, that the new equilibrium was established. Louis XIV. recognized in it the hereditary right of the dynasty of Nassau; Frederick, of Prussia, appeared in it with his new title of king; Victor-Amédée, the duke of Savoy, received by it the kingdom of Sicily, which he was obliged 7 years later to exchange for Sardinia, and took the title of king, which Henry IV. had wished to bestow on one of his ancestors. There was no longer a question as to the interests of the three religions (admitted to a footing of

equality by law in Germany) and to those of the states of the German empire in their relations with the emperor. But, under the policy of Louis XIV., France had lost the position of protectress of these two interests; this rôle passed over to Prussia, which, in the future, was destined to hold the house of Austria in check in the affairs of Germany. Finally, Great Britain obtained important colonial possessions, and hastened to conclude, under favor of the influence which she had acquired in the negotiations, treaties of commerce and navigation with several powers. Territorial equilibrium was now the object of concern, and maritime and commercial domination, which was soon to appear, was not perceived.—The last application of equilibrium regulated by common consent between the powers, and at the same time the most absolute, the most general application made of it up to the present day, is that of the treaties of 1814 and 1815. Without entering into an examination of the events which took place from the peace of Utrecht up to that epoch, let us remark, simply, that Russia had had her Peter the Great, as Prussia her Frederick, and that the equilibrium of Europe had to be established between five great powers: France, Great Britain, Austria, Prussia and Russia, with the addition of second rate powers, to which Spain, Sweden and Holland had descended, (Italy at that time was a geographical expression).—The arrangements of 1814 and 1815 result from three series of principal acts: 1. The treaties of Paris, of the 30th of May, 1814, four identical treaties, a consequence of the victory of the allied powers and the first restoration, concluded by separate acts, between the king of France, Louis XVIII., and each one of the four great powers, Austria, Russia, Great Britain and Prussia, stipulating for themselves and for their allies. Article 32, of these treaties, referred the complementary arrangements to a general congress of all the powers, which was to open at Vienna within two months.—2. The final act of the Congress of Vienna of June 9, 1815, whose last resolutions had been precipitated by the news of the return of Napoleon to France, and by the events of the hundred days, with all the treaties, conventions, declarations, rules and other particular acts, were joined as annexes to this final act.—3. The treaty of Paris of Nov. 20, 1815, a result of the new victory of the allied powers and of the second restoration, four identical treaties, more rigorous toward France than the preceding, concluded also between king Louis XVIII. and each one of the allied powers—Great Britain, Austria, Prussia and Russia—which stipulated for themselves and their allies.—Of all these documents that which remains with a leading and constitutive character for the states of Europe is the final act of the congress of Vienna; the treaties of Paris of 1814 had determined its basis; those of Paris of 1815 had modified its dispositions relative to the new reductions of territory imposed on France; but the principal regulation is in the act of the congress. This act is

much more complete than those which had already twice settled the great territorial arrangements of Europe: as to the personnel of the contracting parties, with the exception of the Ottoman empire, all the European powers, even those of the second order, were represented. Nevertheless, the deliberations and the general resolutions were intrusted to a committee composed of the five great powers, and three secondary powers—Spain, Portugal and Sweden. As to the form of the contract, the final act of the congress was a general and common act signed by all the powers, and consequently imposing reciprocal obligations on all of them in regard to all of the others, a great difference as compared with the form of distinct, though analogous or identical treaties signed separately by the different powers, as was done at the peace of Westphalia and Utrecht.—Lastly, as to the extent and nature of its provisions, the final act embraces all Europe: the systems of Westphalia and Utrecht were destroyed. It created a new territorial system, not only for some states, but for all. It is the greatest collection of arrangements relative to the regulation of limits, of boundaries and territories, which has ever been made by treaty. Independently of territorial questions, the final act of the congress of Vienna regulates, for certain countries, questions of organization or internal constitution, the most notable example of which is that of the *Germanic confederation*; and under the title of *general provisions*, it brought into conventional public law certain general principles, regulating the free navigation of rivers, the abolition of the slave trade, and even a regulation concerning the rank of diplomatic agents, a delicate question, which more than once had caused serious difficulties.—But if the treaties of 1814 and 1815 can be justly considered as closing, in these external conflicts, the period of the French revolution, of which they are in this regard the conclusion, they have still left in existence important causes of dissolution in the work of international arrangement which they endeavored to accomplish. More occupied with the equilibrium of material forces and the restoration of dynasties than with the sovereignty of nations, the plenipotentiaries of the congress of Vienna measured the territory of countries and numbered their inhabitants without taking into sufficient account the affinities or the natural repulsions of their peoples; they regulated, even with a view to pacification, internal questions which pertain exclusively to the sovereignty of each people. The triple partition of Poland executed in violation of, and in the name of the principles of the balance of power, though attacked in the congress, was none the less sanctioned in the final distribution of European territory, an injustice which was further increased by the union of the Polish provinces as an integral part of the Russian empire in 1832, and by the absorption of Cracow into the Austrian empire in 1846.—The effects of these vices of organization were not slow in making themselves felt, and modern diplo-

macy, approaching nearer to the sound ideas of international law, had to admit several consequences issuing from these manifestations and accustom itself to accord a larger place to the principle of national sovereignty. Thus, the Bourbons no longer reign in France; events that have taken place in Italy from 1859 to 1870 have removed other families restored in 1815, and overturned the temporal power of the pope; Belgium has separated from Holland; Austria has lost her Italian provinces; and Savoy has been reunited to France; the Swiss cantons have increased their cohesion, by giving more power to the central government; Germany has established its unity and has appropriated to itself, by conquest, Alsace and a part of Lorraine. Other changes destined to react on Europe, are developing in the east, which was not comprised, it is true, in the arrangements of 1815. France possesses Algeria; Greece is freed from Turkey; Egypt, but especially Roumania and Servia, have conquered an independent position.—Still it is not less exact to say that the treaties of Westphalia and Utrecht and the congress of Vienna determine the present territorial condition of Europe. Since the peace of 1648 politics has placed more and more under the protection of the principles of balance of power, its negotiations relative to disputes, the losses and acquisitions of territory; and when, to-day, questions of the same order are raised, they are based on these great international acts; for it is in their stipulations, completed by less important treaties attached to them, that we must look for the principal titles to property or possession of the different powers.—We have just seen how the theory of balance of power was established *de facto* in the positive law of nations. What is to be thought of these principles, if they are separated from the motive of political interest, and judged exclusively from the point of view of the just and the unjust?—In spite of the hesitation and differences on this subject, it may be said that up to the treaties of 1815, juridical writers generally appeared little inclined to erect the theory of balance of power into a law. Grotius, in his treatise on "The Rights of War and Peace," written before the peace of Westphalia, refutes the opinion of those who pretend that, according to the law of nations, it is permitted to take up arms to weaken a prince or a state whose power is increasing day by day, lest if it were allowed to increase too much, it would enable such a state to injure others if an opportunity offered. He admits, however, that this consideration may enter as a determining motive in the resolution to make war, provided there be a just cause for taking up arms. Pufendorf, in his work on "The Law of Nature and of Nations," published before the treaties of Utrecht, also thinks that the fear caused by the aggrandizement of a neighboring state is not a legitimate reason for war, unless there is a moral certainty of evil designs formed against some other power. *Le supplément à l'examen de conscience sur les devoirs de*

la royauté, written by Fénelon for the duke of Bourgoyne, contains a chapter still more explicit, concerning the condition of the balance of power, but whose chief purpose is to illustrate the danger of a universal monarchy. Bynkershoek, in his *Quæstionum juris publici, libri duo*, which he published in 1747, opposes, energetically, the system by which princes divide among themselves the kingdoms and wealth of other sovereigns, basing themselves on reasons of state, which he defines with the poet, *monstrum, horrendum, informe, ingens, cui lumen ademptum*. Vattel, who wrote eleven years later (1758), after having examined the question from the same point of view as his predecessors, Grotius and Pufendorf, solves it in the same sense, and devotes several paragraphs to what he calls "this famous idea of political balance, or the balance of power." He condemns the arrangements which would consist in producing this balance by an almost even distribution of force, it being impossible to effect such a distribution without injustice and violence; but, in his opinion, it is proper to have recourse, according to circumstances, to confederations, amicable interventions, or defensive alliances.—After the treaties of 1814 and 1815, the system of equilibrium having attained the greatest extension it ever had as a practical theory and a conventional right, no publicist of any note could write, after that period, about the whole of international law, without devoting special attention to this system. The most common tendency was to treat the question as one of positive law, and in this regard it is necessary to recognize certain obligatory consequences which the regular clauses of a treaty may produce between the contracting parties. But from the point of view of pure science, most modern writers have maintained the former traditions and refused to see the character of a rational and general right in the political principles of the balance of power. Martens lays down as a principle the right of each state to increase its territory by legitimate means. Nevertheless, he admits that other states have the natural right to watch over the maintenance of an equilibrium among themselves, and to oppose, even by arms, either aggrandizement, or a weakening of power incompatible with this equilibrium. Pinheiro Ferreira, in annotating this passage, attributes the differences of opinion on the question of the balance of power to the circumstance that each writer had in view a different means of aggrandizement. This publicist does not see in the facts which give place to these extensions a question of the balance of power, but a question of justice or of injustice in the means of aggrandizement, a question of the independence and sovereignty of each state.—Schmalz, while declaring himself a partisan of the system of equilibrium, by no means rests on legal reasons.—Klüber considers the system of equilibrium as not founded on the law of nations, unless it is established by public convention, and he wished that this equivocal word should be banished from the language as well of politics as of

international law.—Wheaton sees no limit to the right of a state to aggrandize itself by all innocent and legitimate means, except that of the corresponding and equal right of other states, which flows from the right of self-preservation. When the aggrandizement must cause direct injury to the rights of other states, the limit is certain and precise; but if it is merely a question of fear as to eventual danger, it is a question of equilibrium and intervention which Wheaton considers as belonging rather to political science than to public law. Nevertheless, he inclines to the belief that grave and serious fears may, in rare cases, give birth to this right, while he rejects, in the case of America, the theories of European powers in this matter.—According to Heffter, political equilibrium means that a single nation can not depart from the principles of justice in international law, without exposing itself to the opposition, not only of the threatened states, but also of all the states which form a part of the same political system. From this results a sort of moral equilibrium, engendering a great security in the observance of rules of justice among nations; but a material equilibrium of the relative forces of different nations among themselves, is an impossibility.—These doubts as to the right of maintaining equilibrium, the differences of opinion on this question among statesmen and publicists also, exist because the question is a pre-eminently complex one. It is connected, on one side, with the material necessities of the organization of nations, and on the other, it involves the questions of the just and unjust.—The first essential condition of the existence of nations or states, such at least as they have been conceived up to the present, is the right of external sovereignty or independence, that is to say, the right by virtue of which a state, existing of itself, recognizes no power on earth superior to itself. The exercise of the right of independence of each power can not, therefore, be maintained except by the voluntary carrying out, on its part, of the precepts of justice. But if, in a conflict between two states, they do not put the same estimate on abstract principles, or if they do not fear to sacrifice justice to their interests or their passions, assuming before God all the responsibility of their acts, they are not subject to any other law in the world than that of force, to no other judgment than that resulting from the fate of arms. Such is the inflexible consequence which logic draws from the principle of the independence of states: the abstract sentiment of rational legal right is certainly very much shocked at this, but, to avoid the endless calamities of war, in the absence of any other solution, it must needs be considered as positive law, as a mere procedure, and the result it brings must be given the authority of a judicial settlement.—Another consequence of the right of independence is the obligation of each state to respect the internal sovereignty of other nations, and, consequently, to admit their internal constitution without dispute. Whatever may be the vices of organ-

ization of the public powers in the state, and even if, either by reason of a backward civilization, or for any other cause, these public powers are not really the sincere expression of the internal sovereignty of the state, they must, nevertheless, externally, so long as they are the constituted powers, be considered as representing legitimately the state in its relations with other nations. The sentiment of rational legal right may be wounded by this, but, unless a nation isolates itself from other nations or pretends to exercise over them the right of sovereignty, it is absolutely necessary, in the relations it maintains with these nations, to take them as they are, with their different modes of government. This *de facto* recognition of established governments, (all questions of privilege being reserved), is one of the proper characteristics, and one of the first obligations of diplomacy. It results from this, that owing to the constitutional vices of states, at different times, and also by virtue of the international principle of the independence of these states, positive law has been obliged to admit, as sufficiently justified externally, means of aggrandizement little conformable to rational legal right, such as successions, reversions, testaments, marriages, sales, personal cessions, unions imposed by conventional arrangements, accessions obtained by fraud, etc., means which are summed up in this: violation of the internal sovereignty of the state by the public powers, which alone can be the expression of external sovereignty.—It is easy to conceive that in presence of the necessity of having recourse to war to decide questions of legal right, nations attach the greatest importance to maintaining a balance of forces among the different states, lest the strongest should not always be found the most just. It is this organization, intended to produce a balance of power among nations, with a view to guard the independence of each, that constitutes what is called political equilibrium, or the balance of power.—The interest of all nations that there should be a balance of power, once demonstrated, can a nation be justly restricted in its freedom of extension, in order to reach the realization of this balance? This is the question of right. Let us examine the different cases that may present themselves.—A state becomes more powerful by the development of its faculties and its internal resources, because it believes in enlightenment, in science, in industry and population. Can it be said that other states have the right to set a limit to this internal increase, and oppose, even by force in the name of a balance of power, the passing of this limit? Certainly not. It is for each people to follow this impulse, to profit by the example given, to endeavor to make like progress. The desire of equilibrium may be a cause here of emulation, but it can never be a legitimate cause of hindrance.—Do things change, if it is a question not of development of internal power, but of external growth? Let us suppose that this extension has taken place by means entirely legitimate; for example, by appropriation,

by the colonization of a territory belonging to no one; by a free and regular cession of territory, the right of individuals and the sovereignty of each people having been respected; by a union of two nations, the consequence of their collective will: by what right do other states oppose it? It is possible that their interest, that their feelings of rivalry or jealousy may be offended; but these feelings no more in this than in the preceding case justify the right of opposition. It is for the people who fear lest these legitimate external advances made by other powers should place them in a condition of comparative inferiority of strength, to draw from their desire of equilibrium an impulsion to a similar progress, that will strengthen them in turn. The desire of equilibrium may be here also a cause of emulation, but can not degenerate into a right of hindrance.—If, on the contrary, we deal with the question of external aggrandizement effected by means contrary to the idea of justice, as well as the usage of international law, no doubt that all states have the right to oppose such aggrandizements by force, the moment they judge it proper or useful for them to do so, because they have an undeniable right to take part against a violation of law.—The consideration of equilibrium may furnish them with a determining motive for opposition, while reasons of justice may justify this opposition; the one constitutes the interest, the other legitimacy. Both, instead of being in antagonism, here work to the same end: the repression of international injustice.—Thus, if the extension results from legitimate means, the reason of the law will not permit opposition even in the interests of equilibrium; and if the aggrandizement is produced by unjust means, the right of setting up an obstacle to it exists in an absolute manner, the maintenance of equilibrium not being in this case the foundation of the right, but simply a plausible reason for its exercise.—Still a third more delicate hypothesis may be conceived. Let us suppose an aggrandizement resulting from one of those means, which, admitted by the necessities of positive right, are still not conformable to the rational idea of legal right; for instance, if it is a question of war or conquest. The motive of the war may be legitimate or illegitimate. No state and no nation, if it wishes to remain neutral, has the right to judge whether the demands of the belligerent states are well or ill founded, for this would be to arrogate a right of sovereignty over them. And yet does it follow that these states, because they have remained neutral, are obliged to respect the results of the war, whatever may be the consequences which it brings? We do not think so. War is only an imperfect means of settling disputes, a means contrary to rational justice, accepted as positive justice merely in default of another mode of solution. We are then outside of real law, and the opposition of nations, whose interest in equilibrium is injured by aggrandizements of this kind, may offer obstacles to its disturbance. We can not

say that these aggrandizements are just, according to rational law, and we can not say that they are unjust according to positive law, but this law does not admit them, except in so far as considerations of equilibrium justify them. It would be the same if it were a question of extension in consequence of inheritance, marriages, sales, personal cessions or other means of reunion, in consequence of which the internal sovereignty of nations would have been disregarded. These modes of addition being illegitimate from the point of view of rational law, the nations which would have to fear the consequences of them have the right to oppose them. And although according to time and place they might be received as positive law, this last law in accepting them nevertheless imposes a limit to them: that of political equilibrium. We shall consider then, in these different cases, the law of equilibrium as constituting customary international law, justified by the imperfect condition of public institutions, and intended to limit the modes of aggrandizement or the development of external power which usage admits, although they are not conformable to the abstract truths of rational law. Positive international law, sanctioning the defective means of aggrandizement or of development, sanctions the corrective also.—To sum up, from the political point of view, the realization of a balance between the powers is a chief interest in presence of the principle of the independence of nations; from the point of view of justice, we can not find in this *motive* of utility, the right of maintaining the balance of power by opposing the legitimate, internal or external, progress of other nations. A balance of power may be justly produced: 1, by all the pacific means resulting from internal or external progress; 2, by all the means of constraint employed against the aggrandizement of other nations accomplished by ways contrary to justice and international law; 3, finally, by all means of constraint even against aggrandizements admitted in other cases, by the positive law of nations, if, from the point of view of rational right, they are really unjust.—It remains for us to say something of the binding force of a formal and general convention, concurred in by the states which form one same system, and establishing between these states a certain arrangement intended to produce equilibrium. Certainly the agreement of powers discussing and treating together amicably to solve difficulties that have arisen between them, and decide, in concert, on a territorial arrangement placed under the common guarantee, is an eminently good and useful thing; most certainly, respect for plighted faith, a fulfillment of contracts regularly made, are among the strictest moral necessities in international relations. But we must not forget that between states, as well as individuals, agreements can not accomplish everything. Without entering here into a complete examination of the validity of an international stipulation, we may remark that one of the

consequences of the principle of the inalienable sovereignty of nations, externally as well as internally, is that every engagement attacking the right of sovereignty is radically null and void. It results from this that the convention entered into between a certain number of powers concerning a territorial distribution and a political equilibrium to be established under their common guarantee, can raise no obstacle in rational law, to increase, or additions, to the federative associations, to the union or division of territory or population, to changes of internal government, which may take place later, by the legitimate exercise of the right of national sovereignty, whatever modifications these events may cause in the primitive state of distribution. It is in this way that a certain number of deviations from the arrangements of 1814 and 1815 had to be recognized by the European powers, as we have noted above.—Those great arrangements, concluded ordinarily at the close of general wars, constitute a compromise of existing difficulties; they determine, relatively to all previous cases comprised in the transaction, the actual rights of parties, which are to form a point of departure and are to be respected as such; they embody in the written law the natural right of opposition to illegitimate extension, and put it under the sanction of the respect due to an international engagement; but they can not control future events, prevent the arising of new causes and bind the future to the *statu quo* which they have created. The contracting powers which have guaranteed a constitution, a federated system, a certain condition of property and territorial possessions, are authorized by that fact alone, by the law of nations, to defend the state of things which they have guaranteed, against every attack coming from outside, from third powers; but they can not transform external defense into internal oppression, nor draw from conventions any right to commit violence or hamper the sovereignty of any power in affairs which depend upon the free exercise of this sovereignty.—The principle of the balance of material forces between states necessitated by the circumstance that international conflicts are finally determined by or under the influence of these forces, is a principle useful for maintaining the independence of nations. And it is useful also as a political principle, if it signifies that no state should aspire to dominate others; that all should be moderate in their desire for increase; that they should not make bad use of their good fortune and their victories in war; that the spirit of conciliation, conventional arrangement and peace in common shall be diffused among them. But it may be easily perverted if, by deviating from the limits of right, it serves as a pretext and an instrument of every kind of jealousy and political greed; if it is directed to invasion in common, to partition of foreign territory, agreed upon between several; to the subjection of the weak; to the league of the strong; to opposition to the legitimate acts

of the various national sovereignties; and to repression of the essential rights which belong to each nation.

EUGÈNE ORTOLAN.

BALANCE OF TRADE, in commerce, the term commonly used to express the difference between the value of the exports from, and imports into a country; the balance used to be said to be favorable when the value of the exports exceeded that of the imports, and unfavorable when the value of the imports exceeded that of the exports. And in many countries this was long believed to be the case, and to a late period they were annually congratulated by their finance ministers on the excess of exports over the imports—The attainment of a favorable balance was formerly regarded as an object of the greatest importance. The precious metals, in consequence of their being used as money, were long considered as the only real wealth that could be possessed either by individuals or nations. And as countries without mines could not obtain supplies of these metals except in exchange for exported products, it was concluded, that if the value of the commodities exported exceeded that of those imported, the balance would have to be paid by the importation of an equivalent amount of the precious metals; and conversely. A very large proportion of the restraints imposed on the freedom of commerce during the last three centuries grew out of this notion. The importance of having a favorable balance being universally admitted, every effort was made to attain it; and nothing seemed so effectual for this purpose as the devising of schemes to facilitate exportation, and to hinder the importation of almost all products, except gold and silver, that were not intended for future exportation. But the gradual though slow growth of sounder opinions with respect to the nature and functions of money, showed the futility of a system of policy having such objects in view. It is now conceded on all hands that gold and silver are nothing but commodities; and that it is in no respect necessary to interfere either to encourage their importation or to prevent their exportation. In Great Britain they may be freely exported and imported, whether in the shape of coin or in that of bullion. The truth is, however, that the theory of the balance of trade was not erroneous merely from the false notions which its advocates entertained with respect to money, but proceeded on radically mistaken views as to the nature of commerce. The mode in which the balance was usually estimated was, indeed, completely fallacious. But had it been correctly ascertained, it would have been found, in opposition to the common opinion, that the imports into commercial countries must, speaking generally, exceed the exports; and that a balance, whether on the one side or the other, is but rarely cancelled by a bullion payment.—I. The proper business of the wholesale merchant consists in carrying the various products of the different countries of the world from the places where their value is least to

those where it is greatest, or, which is the same thing, in distributing them according to the effective demand. It is clear, however, that there could be no motive to export any species of produce, unless that which it was intended to import in its stead were of greater value. When an English merchant commissions a quantity of Polish wheat, he calculates on its selling for so much more than its price in Poland, as will be sufficient to pay the expense of freight, insurance, etc., and to yield, besides, the common and ordinary rate of profit on the capital employed. If the wheat did not sell for this much, its importation would obviously be a loss to the importer. It is plain, then, that no merchant ever did or ever will export, but in the view of importing something more valuable in return. And so far from an excess of exports over imports being any criterion of an advantageous commerce, it is directly the reverse; and the truth is, notwithstanding all that has been said and written to the contrary, that unless the value of the imports exceeded that of the exports, foreign trade could not be carried on. Were this not the case—that is, were the value of the exports always greater than the value of the imports—merchants would lose on every transaction with foreigners, and the trade with them would be speedily abandoned.—In England the rates at which all articles of export and import are officially valued were fixed so far back as 1696. But the very great alteration that has since taken place, not only in the value of money, but also in the cost of by far the greater number of the commodities of that and other countries, long ago rendered the official valuation of no use whatever, either as a means of learning the values or the quantities of the exports or imports. In so far, however, as respects the former, this defect was unintentionally remedied in 1798, when the "convoy duty," being an ad valorem tax laid on the exports, furnished the means of ascertaining their amount. And the importance of the information so obtained was such, that, whether articles of export have or have not been charged with duties, exporters have since been made to declare, in every case, the *real* value of the articles which they export.—It has been alleged, and apparently with some probability, that merchants have not unfrequently been in the habit of exaggerating the value of articles entitled to drawbacks on exportation. But the extension and improvement of the warehousing system, and the diminution of the number of drawbacks, have materially lessened whatever fraud or inaccuracy may have arisen from this source. So long, indeed, as the greater number of articles were charged with an ad valorem duty of 10s. per cent. on exportation, it may be presumed that their value was rather under than overrated. But since the repeal of that duty (5 and 6 Vict. c. 47, s. 40), their declared value is believed to come very near the truth; at least, sufficiently so for all practical purposes.—But until very recently no authentic information was obtained in regard to the value of the imports

In 1848, however, the board of customs having approved a plan suggested by Mr. Messenger, inspector general of imports and exports, for ascertaining the value of the former, it was submitted by them to the treasury. And its advantages having been fully appreciated by Mr. James Wilson, M. P., then secretary to their lordships, it was carried into effect in 1854. It is needless to enter into any minute details with respect to the mode of computing the values of the imports. It is sufficient to state that it is effected by ascertaining the current prices of imported articles from price-currents, mercantile circulars, etc., and from these deducing the aggregate value of each. It would be idle to suppose that results derived from a process of this sort should be altogether exact; but the errors it involves are of no great moment, and for statistical purposes it may be reckoned quite correct and most valuable.—We venture to say that, though we have no means of comparing the real values of the imports with those of the exports, we have no doubt that the former very considerably exceed the latter. It can hardly, indeed, be otherwise. The value of an exported commodity is estimated at the moment of its being sent abroad, and *before* its cost is increased by the expense of transporting it to the place of its destination; whereas the value of the commodity imported in its stead is estimated *after* it has arrived at its destination, and, consequently, after its cost has been enhanced by the expense of freight, insurance, importers' profits, etc.

	1863	1864.	1865.	1866.
Value of imports.	£. 248,919,020	£. 274,932,172	£. 271,072,285	£. 295,204,553
Value of exports.	196,902,409	212,619,614	218,831,576	238,805,909
Excess of imports.	52,016,611	62,332,558	52,240,709	56,398,653

—To measure, therefore, the advantage of commerce by the excess of the exports over the imports is a proceeding false alike in fact and principle. The value of the imports, in all but anomalous and extremely rare instances, invariably exceeds that of the exports. And it is plain that this excess, whatever it may be, forms the only fund whence the expenses and profits of the merchants can be derived. The larger, consequently, it becomes, the more will it be for their advantage. —In the United States the value of the imports, as ascertained by the custom-house returns, has usually exceeded the value of the exports. And, although the English politicians were in the habit of considering the excess of the former as a certain proof of a disadvantageous commerce, "it is nevertheless true," says Mr. Pitkin, "that the real gain of the United States has been *nearly in proportion as their imports have exceeded their exports.*" (*Commerce of the United States*, 2nd edit. p. 280.) The excess of American imports has in part been occasioned by the Americans generally exporting their own surplus produce,

and, consequently, receiving from foreigners not only an equivalent for their exports, but also for the cost of conveying them to the foreign market. "In 1811," says the author just quoted, "flour sold in America for *nine dollars and a half* per barrel, and in Spain for *fifteen dollars*. The value of the cargo of a vessel carrying 5,000 barrels of flour would, therefore, be estimated at the period of its exportation at \$47,500; but as this flour would sell, when carried to Spain, for \$75,000, the American merchant would be entitled to draw on his agent in Spain for \$27,500 more than the flour cost in America; or than the sum for which he could have drawn had the flour been exported in a vessel belonging to a Spanish merchant. But the transaction would not end here. The \$75,000 would be vested in some species of Spanish or other European goods fit for the American market; and the freight, insurance, etc., on account of the return cargo, would probably increase its value to \$100,000; so that, in all, the American merchant might have imported goods worth \$52,500 more than the flour originally sent to Spain." It is as impossible to deny that such a transaction as this is advantageous, as it is to deny that its advantage consists entirely in the excess of the value of the goods imported over the value of those exported. And it is equally clear that America might have had the real balance of payments in her favor, though such transactions as the above had been multiplied to any conceivable extent.—II. In the second place, when a balance is due from one country to another, it is but seldom that it is paid by remitting bullion from the debtor to the creditor country. If the sum due by the British merchants to those of Holland be greater than the sum due by the latter to them, the balance of payments will be against Britain; but this balance will not, and indeed can not, be discharged by an exportation of bullion, *unless bullion be, at the time, the cheapest exportable commodity*; or, which is the same thing, *unless it may be more advantageously exported than anything else*. To illustrate this principle, let us suppose that the balance of debt, or the excess of the value of the bills drawn by the merchants of Amsterdam on London, over those drawn by the merchants of London on Amsterdam, amounts to £100,000: it is the business of the London merchants to find out the means of discharging this debt with the least expense; and it is plain, that if they find that any less sum, as £96,000, £97,000, or £99,900 will purchase and send to Holland as much cloth, cotton, hardware, colonial produce, or any other commodity, as will sell in Amsterdam for £100,000, no gold or silver will be exported. The laws which regulate the trade in bullion are not in any degree different from those which regulate the trade in other commodities. It is exported only when its exportation is advantageous, or when it is more valuable abroad than at home. It would, in fact, be quite as reasonable to expect that water should flow from a low to a high level, as it is to expect that bullion should

leave a country where its value is great, to go to one where it is low! It is never sent abroad to destroy, but always to find its level. The balance of payments might be 10 or 100,000,000, against a particular country, without causing the exportation of a single ounce of bullion. Common sense tells us that no merchant will remit £100 worth of bullion to discharge a debt in a foreign country, if it be possible to invest any smaller sum in any species of merchandise which would sell abroad for £100 exclusive of expenses. The merchant who deals in the precious metals is as much under the influence of *self interest* as he who deals in coffee or indigo; and what merchant would attempt to extinguish a debt by exporting coffee which cost £100, if he could effect his object by sending abroad indigo which cost only £99?—The argument about the balance of payments is one of those that contradict and confute themselves. Had the apparent excess of exports over imports, as indicated by the British custom-house books for the hundred years down to 1853, been always paid in bullion, as the supporters of the old theory contend is the case, there should at this moment be some 500,000,000 or 600,000,000 of bullion in the country, instead of 80,000,000 or 100,000,000, which it is supposed at most to amount to! Nor is this all. If the theory of the balance were good for anything—if it had not been a mere idle delusion—it follows, as every country in the world has had its favorable balance, that they must have been paid by an annual importation of bullion from the mines corresponding to their aggregate amount. But it is certain that the entire produce of the mines, great as it is, though it were increased in a *fivefold* proportion, would be insufficient for this purpose! This *reductio ad absurdum* is decisive of the degree of credit that should be attached to conclusions respecting the flourishing state of the commerce of any country drawn from the excess of the exports over the imports!—Not only, therefore, is the theory with respect to the balance of trade erroneous, but the very reverse of that theory is true. In the *first* place, the value of the commodities imported by every country which carries on an advantageous commerce (and no other will be prosecuted for any considerable period) invariably exceeds the value of those which she exports. Unless such were the case, there would plainly be no fund whence the merchants and others engaged in foreign trade could derive either a profit on their capital, or a return for their outlay and trouble; and in the *second* place, whether the balance of debt be for or against a country, that balance will neither be paid nor received in bullion, unless it be at the time the commodity by the exportation or importation of which the account may be most profitably settled. Whatever the partisans of the doctrine as to the balance may say about money being a preferable product, or *merchandise par excellence*, it is certain it will never appear in the list of exports and imports while there is anything else with which to carry on trade, or cancel debts, that will

yield a larger profit, or occasion a less expense to the debtors.—It is difficult to estimate the mischief which the absurd notions relative to the balance of trade have occasioned in almost every commercial country. It is principally to the prevalence of prejudices to which they have given rise, that the restrictions on the trade between Great Britain and France are to be ascribed. The great or rather the only argument insisted upon by those who prevailed on the legislature, in the reign of William and Mary, to declare the trade with France a *nuisance*, was founded on the statement that the value of the imports from that kingdom considerably exceeded the value of the commodities exported to it. The balance was regarded as a *tribute* paid by England to France, and it was sagaciously asked, what had England done, that she should be obliged to pay so much money to her natural enemy? It never occurred to those who so loudly abused the French trade, that no merchant would import any commodity from France, unless it brought a higher price in England than the commodity exported to pay it; and that the profit of the merchant, or the national gain, would be in exact proportion to this excess of price. The very reason assigned by these persons for prohibiting the trade affords the best attainable proof of its having been a lucrative one; nor can there be any doubt that an unrestricted freedom of intercourse between the two countries would be of the greatest service to both.

J. R. McCulloch and HUGH G. REID.

BALLOT, from the Greek *βάλλειν*, to cast or throw, a method of voting designed to secure secrecy, as distinguished from the open or *viva voce* vote. The ballot is as old as the fifth century, B.C., when it was used in Athens, and we know not how much older. The Greek *dicasts*, or judges, voted by ballot in giving their verdicts, using either sea-shells, or beans, or balls of metal, or stone, colored black for condemnation, or white for acquittal. In the Athenian assemblies, the common voting was by show of hands, but in all cases of privilege the voting was secret, and this was practiced even in the senate in cases of ostracism.—In Rome the people in their assemblies (*comitia*) voted at first by open response, but the custom of voting at elections by tablets, with the names of the candidates written on them, came into vogue B.C. 139, by the *lex Gabinia tabellaria*. The votes were thrown into a chest, watched by *rogatores* or inspectors, who collected the tablets and gave them to the *diribitores*, who classified and counted the votes, and then handed them over to the *custodes*, who finally checked them off by points marked on a tablet. In the *comitia tributa*, when the people voted upon laws after discussion, the assembly was called by a *plebiscitum*, and the vote taken by tribes. In elections, if two candidates had the same number of ballots, the decision was made between them by drawing lots.—In Great Britain, which has the honor of originating trial by jury, voting by ballot never

became established at elections until 1872. It was suggested in political tracts two centuries before, and secret voting was actually employed in the parliament of Scotland in cases of ostracism. In corporate bodies, both private and municipal, election by ballot has long prevailed. In deliberative and legislative bodies, the reason for the ballot is not apparent, as it is in popular elections. The voting should be open in parliamentary bodies, to enforce responsibility, and bring the acts of their representatives before each constituency in the clearest manner. In popular elections, on the other hand, where the voter represents no delegated powers but is supposed to vote his own will, the secret ballot is a guarantee of personal independence.—The first prominent agitation of the ballot in England came about in the struggle for parliamentary reform, the purification of elections, and the extension of the suffrage, in the first quarter of the present century. O'Connell brought in a bill for secret voting in 1830, and the first draft of Lord John Russell's reform bill provided for the ballot, though it was left out later. This method of voting was supported in parliament by the historians Grote and Macaulay, and made steady progress, in spite of the ridicule of Sydney Smith and other literary wits, likening the ballot-box to a mouse-trap for catching the votes of Englishmen. Finally, a select committee, with Lord Hartington as chairman, reported in 1870 that corruption, treating and intimidation by priests and landlords, prevailed at elections in England and Ireland, and that voting by ballot would tend to promote peaceful and fair elections, and protect voters from undue influence, provided secrecy were made inviolable by the methods adopted. The ballot was introduced first at Manchester in 1869 as a test, and the voting was found more expeditious than the old *viva voce* system. In 1872 Mr. Foster's ballot act (35 and 36 Vict. c. 33) made the ballot compulsory in all parliamentary and municipal elections, except for the universities. This act requires the names of all the candidates to be printed on white paper, and the voter must fill up with a cross, X, the blank on the right hand opposite the name he votes for. The register of voters shows when an elector has received a ballot from one of the officers of election, and each ballot is marked with a number, corresponding to the counterfoil of the paper, which remains with the officer. This counterfoil is also marked with the voter's number on the register, so that the vote may be identified, if the poll should be scrutinized or challenged. The voter folds the ballot so as to conceal his mark, but to show the stamp to the officer, and it is dropped in a box which is locked and sealed. The elections are held at school-rooms or other public places, and a separate compartment must be provided for every 150 electors. A returning officer counts the ballots, and transmits them, sealed, to the clerk of the crown in chancery; who destroys them at the

end of one year. There have been two general parliamentary elections under the ballot act of 1872, and though it has not put an end to bribery or intimidation, they have been diminished, and the steady effect of the secret ballot is observed to be gradually to get rid of undue influence, and the more disreputable methods of canvassing that prevailed under the *viva voce* system. In Australia, and other British colonies, the ballot generally prevails.—In France, the secret vote used to be employed in deliberative voting in the chamber of deputies, but its use is now confined to elections by the people. The voting is superintended by a returning officer, four supervisors without salary, and a secretary. Every voter must present a card previously obtained at the registry office, to secure his identity. This the returning officer punches, and the vote is recorded by a "bulletin" printed with a candidate's name. The number of votes given is compared with the register, and ballots are rejected which are illegible, blank, containing the name of the voter, or erroneously filled up.—In Germany the secret ballot is in use in all elections for the *reichstag*; registered voters only can vote, and ballots must be on white paper, and folded by the elector, and dropped into a closed box.—In Italy candidates for the chamber of deputies are elected by ballot in public halls, to which only registered or qualified voters are admitted. A stamped piece of blank paper (the official is blue) is issued, on which the voter writes the name of his candidate and hands the folded paper to the presiding officer, who puts it in the box. The same officer oversees the public counting of the votes. It is stated that the ballot has greatly diminished the influence of the clerical power in Italian politics, and canvassing and bribery seldom occur.—Spain, Belgium, Switzerland and Austria have the ballot, and in Hungary it is compulsory in the election of municipal councils, while it was abolished in parliamentary elections in 1874.—In the United States, voting by ballot dates from early colonial times, and was made obligatory by the constitutions of New Jersey, Pennsylvania, North Carolina and other states, adopted in 1776. In New York *viva voce* voting prevailed until 1778, when provision was made for electing a governor and lieutenant governor by ballot, and in 1787 this was extended to the legislature.—The system of open voting which long prevailed in some of the southern states, has given place to the ballot throughout the Union, with the single exception of the state of Kentucky. In this state the constitution provides that the people shall vote *viva voce*, though this is controlled as regards congressional elections by the act of congress (Revised Statutes, section 27), which requires all votes for representatives in congress to be by written or printed ballot.—The constitutions of all the states provide that all elections shall be by ballot, with the above exception. In Alabama, Florida, Indiana, Kansas, Kentucky, Louisiana, Nevada, North Carolina, Pennsylvania, Tennes-

see and Texas, there is a constitutional provision requiring the legislature to vote *viva voce*. In other states it is left to the legislature to regulate its own method of suffrage. Arkansas and Colorado have a constitutional requirement that at every election the ballots shall be numbered in the order in which they are received, and the number recorded by the election officers, on the list of voters opposite the name of the voter who presents the ballot. The election officers are to be sworn not to inquire or disclose how any elector shall have voted. Similar safeguards against "repeating," or fraudulent voting, are provided by law in many states where there is no constitutional provision on the subject. Too many of the states, however, are without efficient registration laws, and a neglect to provide proper legal safeguards for free and honest suffrage is one of the most serious evils which threaten the safety and permanence of republican institutions. All kinds of frauds and deceptions are practiced or attempted with the ballot, such as: 1, counterfeiting the real ballot, and substituting some insidious change of name of an important candidate; 2, heading printed ballots with the name and device of one party, and printing under it the names of the candidates of the opposite party; 3, "stuffing" the ballot box, or voting two or more ballot papers folded so as to appear as one; 4, using "tissue ballots," or votes printed on thin tissue paper so as to conceal a large number of surplus or fraudulent votes, smuggled into the boxes without detection; 5, "repeating," or voting by the same man at several different polls; 6, "personation," or another kind of double voting, by the same man using a different name, at the same poll.—As a safeguard against some of these practices, many ingenious methods have been proposed and experimented upon. A mechanical ballot box, with automatic devices preventing any voter from casting more than one ballot, or at least preventing the count of more than one to each voter, has been invented. This box gives an alarm as each vote is received, secures strict secrecy to the voter, counts and files each ballot on a wire in the box, beyond the reach of any hand, and shows the aggregate vote, with which the official vote must agree. It is claimed to be equally efficient against false counting, tabulating, or returning, as against fraudulent voting.—Ballot boxes have been used of many different materials, from the primitive hat or cigar box, to the voting urn, glass ballot box, and the elaborate mechanical repositories of votes above referred to. Frauds upon the ballot box should be ranked among the worst of crimes against republican government. The secrecy and the sacredness of the ballot should be maintained at whatever cost. The more free the people, the more carefully will the secret ballot be guarded, as the best guarantee of personal independence.

A. R. SPOFFORD.

BANK CONTROVERSIES (IN U. S. HISTORY). The constitution (article 1, section 8) enumerates among the powers of congress: "1. To lay and collect taxes, duties, excises and imposts, to pay the debts and provide for the common defense and general welfare of the United States; * * * * *—18. To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this constitution in the government of the United States, or in any department or officer thereof."—From these two paragraphs broad constructionists have inferred the power of congress to charter a national bank, or any other corporation of national extent, which strict constructionists have denied.—I. 1781–91. Under the confederation, Robert Morris, superintendent of finance, had drawn up the plan of the first national bank, which was chartered by congress, Dec. 31, 1781, for ten years, under the name of *The Bank of North America*, with a capital of \$400,000, afterward increased to \$2,000,000. The general doubt of the power of congress to create a corporation cast a cloud upon the bank's title to existence, and it was chartered by the state of Pennsylvania in 1783. In 1785 a change of parties in the state legislature brought about a repeal of the charter, and in 1787, after another party change, the charter was renewed.—II. 1791–1811. In January, 1791, a bill to incorporate *The Bank of the United States* passed the senate without division, and the house, Feb. 8, by a vote of 39 to 20. Its capital was to be \$10,000,000, of which \$2,000,000 was to be subscribed by the United States; its charter was to continue for twenty years; its bills were made receivable in all payments to the United States; and it had the power to establish branch banks, the headquarters remaining at Philadelphia. Immediately upon the passage of the bill a strong pressure was brought to bear upon president Washington to induce him to veto it, and he therefore called for the written opinions of his cabinet upon the constitutionality of the proposed bank. The opinions submitted by Jefferson and Hamilton are most interesting, as they map out with great exactness the opposite views of the federal government's powers which were to control party conflict for the succeeding three-quarters of a century.—Jefferson's opinion, which was first given, begins with the following text: "I consider the foundation of the constitution as laid on this ground, that 'all powers not delegated to the United States by the constitution, nor prohibited by it to the states, are reserved to the states or to the people,' (XII amendment). To take a single step beyond the boundaries thus specially drawn around the powers of congress, is to take possession of a boundless field of power, no longer susceptible of any definition."—After showing that there was no power to establish a national bank under the special powers to lay taxes, to pay the debt of the United States, to borrow money, and to regulate commerce, he

proceeds to consider "the general phrases, which are the two following. 1. 'To lay taxes to provide for the general welfare of the United States;' that is to say, 'to lay taxes for the purpose of providing for the general welfare.' For the laying of taxes is the *power*, and the general welfare the *purpose* for which the power is to be exercised. Congress are not to lay taxes, *ad libitum*, for any purpose they please; but only to pay the debts, or provide for the welfare of the Union. In like manner, they are not to do anything they please, to provide for the general welfare, but only to lay taxes for that purpose. To consider the latter phrase, not as describing the purpose of the first, but as giving a distinct and independent power to do any act they please which might be for the good of the Union, would render all the preceding and subsequent enumerations of power completely useless. It would reduce the whole instrument to a single phrase; that of instituting a congress with power to do whatever would be for the good of the United States; and as they would be the sole judges of the good or evil, it would be also a power to do whatever evil they pleased. * * * * * Certainly no such universal power was meant to be given them. It was intended to lace them up straitly within the enumerated powers, and those without which, as means, these powers could not be carried into effect. * * * * * 2. The second general phrase is 'to make all laws necessary and proper for carrying into execution the enumerated powers.' But they can all be carried into execution without a bank. A bank, therefore, is not necessary, and, consequently, not authorized by this phrase. It has been much urged that a bank will give great facility or convenience in the collection of taxes. Suppose this were true: yet the constitution allows only the means which are 'necessary,' not those which are merely 'convenient' for effecting the enumerated powers. If such a latitude of construction be allowed to this phrase, as to give any non-enumerated power, it will go to every one; for there is no one which ingenuity may not torture into a convenience in some way or other, to some one of so long a list of enumerated powers. It would swallow up all the delegated powers, and reduce the whole to one phrase, as before observed." (*Italics as in original.*)—Jefferson's opinion that the paying of debts and providing for the general welfare is not a *power* but a *purpose*, is fully argued and accepted by Story as quoted below, and by the supreme court in the *Passenger Cases* (in 7 *Howard*, below); but a colon, which the original has not (see CONSTITUTION), is often, but unjustifiably, inserted between the power and the purpose, so as to give the latter the appearance of a separate power. The second part of his opinion has been ruled against by the supreme court in the case of *McCulloch vs. Maryland* (in 4 *Wheaton*, below). (See also CONGRESS, POWERS OF, II)—Hamilton's opinion, though very much longer, may be clearly given in his own sum-

mary: "1. That the power of the government, as to the objects intrusted to its management, is, in its nature, sovereign. 2. That the right of erecting corporations is one inherent in, and inseparable from, the idea of sovereign power. 3. That the position that the government of the United States can exercise no power but such as is delegated to it by its constitution, does not militate against this principle. 4. That the word *necessary*, in the general clause, can have no *restrictive* operation, derogating from the force of this principle; indeed, that the degree in which a measure is or is not necessary can not be a *test* of constitutional right, but of expediency only. 5. That the power to erect corporations is not to be considered as an independent and substantive power, but as an incidental and auxiliary one; and was, therefore, more properly left to implication than expressly granted. 6. That the principle in question does not extend the power of the government beyond the prescribed limits, because it only affirms a power to incorporate for purposes *within the sphere of the specified powers*. And lastly, that the right to exercise such a power, in certain cases, is unequivocally granted in the most positive and comprehensive terms. To all which it only remains to be added that such a power has actually been exercised in two very eminent instances, namely, in the erection of two governments; one northwest of the river Ohio, and the other southwest; the last independent of any antecedent compact," (see ORDINANCE OF 1787, TERRITORIES).—It will be perceived that the essence of Hamilton's opinion, which is entirely lacking in Jefferson's, but which the courts have since very steadily accepted, is the *sovereignty* of the federal government within its specified bounds—the principle that, when a people have found it necessary to create a sovereignty even for specified purposes, a further and interior limitation upon the sovereignty within its own sphere must be express to be valid (see UNITED STATES).—Hamilton's opinion prevailed with the president, and the bill was signed and became law. The bank, thus chartered, went at once into active and successful operation. It had occasion to bring suits in federal and state courts, and was always recognized as a legally incorporated body. March 23, 1804, an act was passed without a division to allow it to establish branches in the territories, and, having been signed by Jefferson himself, now president, became law; and Feb. 24, 1807, an act to punish forgery of the bank's notes was similarly passed. The charter was to expire in 1811. In 1809 the bank applied for a recharter, and its application was warmly indorsed by Gallatin, secretary of the treasury. In 1810 a bill for a recharter was introduced, met with some opposition on the grounds laid down by Jefferson, and went over to the next session. In the next session the bank's application was renewed and finally defeated, Jan. 24, 1811. In the house the vote to postpone the bill indefinitely was 65 to

64; in the senate a motion to strike out the enacting clause of the bill was only carried by the casting vote of the vice-president, Clinton. The bank then, after an unsuccessful effort to obtain a charter from the state of Pennsylvania, wound up its affairs and went out of existence. The government had previously, in 1802, sold out its 2,200 shares of stock to the Barings, of London, at a premium of 57 per cent. — III. 1816-36. The war of 1812, which almost immediately followed the failure to recharter the bank, was principally supported by loans and the issue of treasury notes. Party spirit was enlisted against the loans, and the federalist newspapers in New England denounced them so warmly that government agents in that section of the country were compelled to advertise that the names of subscribers to the loans would be kept secret. This opposition, together with the downfall of the import trade, the consequent decrease in revenue, the constant drain of specie from the country in payment for smuggled goods, and the want of any convertible currency to take its place, not only increased the public debt from a total of \$45,209,737.90 in 1812, to a total of \$127,334,933.74 in 1816, but decreased the national credit so far that the treasury negotiated the last loans of the war at a discount of 40 per cent. In January, 1814, upon a petition from New York, a project for a new national bank was introduced in the house, but, as the dominant party still held it unconstitutional, it was dropped without action. In October, 1814, the plan was revived, backed this time by the recommendation of the secretary of the treasury, Dallas, and the influence of the administration. Dallas' plan obliged the bank to lend the government \$30,000,000, but gave it power to suspend specie payments. It was met by another plan, introduced by Calhoun, of South Carolina, which neither obliged the bank to loan money to the government, nor allowed it to suspend. The federalists, by favoring Calhoun's plan, defeated Dallas', and then, by combining with the Dallas men, they defeated both plans. The senate, Dec. 9, 1814, then passed a bill for a bank on Dallas' plan, which was defeated in the house by the casting vote of the speaker. A compromise plan then passed both houses, Calhoun's two principles being retained, and was vetoed, Jan. 30, 1815, by the president. The veto message "waived the question of the bill's constitutionality," as having been already passed upon approvingly by the legislative, executive and judiciary, with the general concurrence of the people; but objected to the plan of this bill on the score of convenience, as not being calculated to aid the government or the people in their embarrassments. In February, 1815, after the arrival of the news of peace, the senate again passed a bank bill on Dallas' plan, which was lost in the house by a single vote. April 10, 1816, the act to establish *The Bank of the United States* became law. It followed Hamilton's plan closely. The charter was to run twen-

ty years; the capital was to be \$35,000,000, one-fifth in cash, the rest in United States 6 per cent. stocks; the government was to have the appointment of five of the twenty-five directors; and the bank was to have the custody of the public funds (see DEPOSITS, REMOVAL OF). The stock was at once subscribed; the principal office was opened at Philadelphia; and branches were soon established at Boston, New York, Baltimore, Portsmouth, Providence, Washington, Richmond, Charleston, Savannah, New Orleans, Cincinnati, and other cities. — Within three years, the mismanagement, speculations and frauds of the president and directors of the bank brought the institution to the verge of bankruptcy and helped to derange the whole business of the country. The efforts of a new president were successful in saving the bank, but only by a curtailment and recall of loans to other banks, which aided in bringing on the general stringency of 1818-21, and roused strong feeling against the bank. State legislatures began to arraign it as unconstitutionally chartered. The legislatures of Maryland and Ohio, in 1818, levied taxes upon the branch banks in their states, with the intention of forcing them to close; and, though the supreme court (see *McCulloch vs. Maryland*, in 4 *Wheaton*, below) decided in favor of the bank's constitutionality, and against a state's right to tax it, Ohio took the amount of her tax, \$100,000, from the vaults of the branch bank at Chillicothe by force, in defiance of an injunction from the federal circuit court. The directors at once brought suit in the federal courts against the agents of the levy for trespass, and the state in 1820 withdrew the use of its jails for the custody of prisoners in such suits, at the same time reducing its tax to \$10,000 a year, and refunding the over amount of \$90,000. Returning prosperity changed the current of feeling, and Ohio withdrew from her position. — Until 1829 the bank of the United States seems to have had no connection whatever with national politics. In the presidential elections of 1824 and 1828 we find no allusions to it. It was simply a very successful business enterprise, now numbering twenty-five branches, under the general control of the directors of the parent bank and their president, Nicholas Biddle. In Jackson's letters of March, 1829, there are some traces of an under-current of dislike for the bank and its directors, as "minions of Clay." No symptoms appear, however, of any possibility of collision between the bank and the administration until June, 1829, when the Jackson managers of the state of New Hampshire, Isaac Hill and Levi Woodbury, began to urge president Biddle to remove the president of the branch bank at Portsmouth, N. H., and to appoint a Jackson man in his place. Biddle refused on the ground that the incumbent was a man "of first-rate character and abilities," and not appointed for political reasons; and in October he finally, and so emphatically "as to leave no possibility of misconception,"

declared to the secretary of the treasury that neither the bank nor its branches "acknowledged the slightest responsibility of any description whatsoever to the secretary of the treasury touching the political opinions and conduct of their officers, that being a subject on which they never consult, and have no desire to know, the views of any administration." Here the matter rested until the meeting of congress, when, in his message of Dec. 8, 1829, the president for the first time personally entered the field by making the following reference to the bank "The charter of the Bank of the United States expires in 1836, and its stockholders will most probably apply for a renewal of their privileges. In order to avoid the evils resulting from precipitancy in a measure involving such important principles and such deep pecuniary interests, I feel that I can not, in justice to the parties interested, too soon present it to the deliberate consideration of the legislature and the people. Both the constitutionality and the expediency of the law creating this bank are well questioned by a large portion of our fellow-citizens; and it must be admitted by all that it has failed in the great end of establishing a uniform and sound currency."—The message also suggested the substitution of a bank which should be a part of, and under the direct control of, the treasury. (See INDEPENDENT TREASURY.) In the house this part of the message was referred to the committee of ways and means, which reported strongly in favor of the bank and against the president; and when resolutions against the constitutionality and expediency of the bank, and against rechartering it, were introduced, they were at once laid on the table by a vote of 89 to 66. It was thus evident that the president's party was not ready to support him in assailing the bank, and no further steps were taken against it, with the exception of articles in administration newspapers, until Dec. 7, 1830, when the message with a slight but evident increase of warmth, renewed the suggestions above given. In the senate Benton, of Missouri, in February, 1831, attacked the bank from a point of view outside of its constitutionality, denouncing it as the possessor of needless and expensive privileges for which no return was ever made, and of irresponsible and dangerous power over local banks and the business interests of the country. Even with this attack no open struggle had yet begun, though the bank and its friends everywhere were being rapidly drawn into unofficial newspaper and pamphlet hostilities with the administration. In his message of Dec. 4, 1831, the president hinted broadly that, having several times called the attention of congress to his views about the bank, he now left the matter to the people. The reference was evidently to the presidential election of 1832, for which political arrangements were already making.—Up to this time Jackson seems to have been willing to avoid open war upon the bank until his other enemies should be disposed of, (see JACKSON, ANDREW); but the suggestion conveyed in the message of 1831 was sufficient alone

to drive the bank "into politics." Since the president intended to "appeal to the people," the bank felt compelled to imitate him; and from this time the conflict became flagrant. The national republican convention, Dec. 12, 1831, (see NOMINATING CONVENTIONS), approved the bank as a great and beneficent institution maintaining a sound, ample and healthy state of the currency, summoned the people to defend it in its peril by rejecting Jackson at the ensuing election; and nominated as its own candidates Henry Clay and John Sergeant, both pronounced bank men, and the latter a director in 1834. The legislature of Pennsylvania, a Jackson state, had unanimously resolved in favor of the bank, and the Clay managers seem to have decided to force the fighting, in order, if possible, to deprive Jackson of Pennsylvania's large vote by compelling him to attack Philadelphia's chief institution. Clay's own private correspondence shows his belief that, all the circumstances considered, the bank would "act very unwisely if it did not apply" for a new charter at this session. The application was accordingly made, Jan. 9, 1832, by senator Dallas, of Pennsylvania, on behalf of the bank. The charge was often made that the bank really endeavored to buy its charter; and its loans to congressmen, mostly of the opposition to it, are stated by the report of a senate committee in 1834, as \$322,199 to 59 congressmen in 1831, \$478,069 to 54 congressmen in 1832, and \$374,766 to 58 congressmen in 1833. A majority in both houses was in favor of the charter, but in the house the speaker was against it, and this circumstance controlled the operations of the opposition, guided by Benton. Vague and general charges of corruption were brought against the management of the bank, and the speaker so constituted the committee of investigation that, though the charges were disproved, the majority report brought the bank in guilty. Having thus obtained a basis for an "appeal to the people," the opposition allowed the bill to re-charter the bank to come to a vote, and it passed the senate June 11, 1832, 28 to 20, and the house July 3, 109 to 76. July 10, it was vetoed in a message of great ability, which was mainly devoted to proving the bank, as then constituted, to be an unnecessary, useless, expensive, un-American monopoly, always hostile to the interests of the people and possibly dangerous to the government as well. An attempt to pass the bill over the veto failed.—Time has shown that the application for a recharter at this session was a false step, and that the bank's only course was to wait patiently until a two-thirds majority in congress could be obtained, pass the bill for the charter, if necessary, over the veto, and end the battle by one blow. For the bank only one victory was needed; the charter, once obtained, was secure. By impatience it succeeded only in implicating its quarrel with the presidential election, which resulted not only in the president's triumphant re-election, but also in the choice of a house of representatives, to meet in 1833, which was pledged to support the pres-

dent against all his opponents, even against the bank.—The president now had the move, and he made it. A premonition of his purpose was given in his message of Dec. 4, 1832, in which he announced a belief, which he had warmly taken up, that the bank was insolvent, and advised an investigation into its affairs and the sale of the government stock in it. This congress, however, the same which had recently passed the bill for a bank charter, was still opposed to the president, and the house voted that the deposits might safely be left in the bank. Before the meeting of the new congress, elected in 1832, the president had removed the deposits of public moneys from the bank (see DEPOSITS, REMOVAL OF), and his action was sustained by the new house. In the senate the bank still had a majority which, standing alone, could only enjoy the poor satisfaction of censuring the president (see CENSURES, I.). For want of any other custodian of the public funds (see INDEPENDENT TREASURY) they had been deposited in selected state banks, commonly called "pet banks." April 4, 1834, the house finally voted (1) that the bank ought not to be rechartered, 134 to 82; (2) that the deposits ought not to be restored, 118 to 103; (3) that they should be left in the state banks, 117 to 105; and (4) that the affairs of the bank should be investigated, 175 to 42. The investigation was begun; but the bank objected to its methods as partisan and unfair, and put so many impediments in the way of it that it resulted in nothing. It was very evident, however, that the president was master of the situation, and the bank finally obtained a charter from Pennsylvania. Within two years the senate was opposed to the bank, and thereafter the democratic party was committed against any such institution.—IV. 1837-45. For over twenty years gold and silver, as a currency, had been practically unknown in the United States. Whatever may have been the evils connected with the free grant of the use of the public funds to a private corporation, the bank of the United States had at least provided a currency acceptable everywhere. What was to take its place? Benton's engrossing desire was to bring his party back to its original devotion to "hard money," gold and silver, but to this there was one insuperable obstacle: the state banks which were now the only available receptacle for the public funds, which had thrown the whole weight of their influence for the government and against the bank, and which it was necessary to support, possessed the power of issuing notes to a more unlimited and dangerous extent than the bank of the United States. If the sub-treasury system (see INDEPENDENT TREASURY) could have been introduced in 1835, when congress reduced the ratio of gold and silver to 16:1, there would have been no further need to lean upon the state banks, and the "hard money" system might have been forced through without the dreadful spasm with which the laws of nature compelled its adoption in 1837-9. But for many months the state banks were allowed to engage in a race for

the production of fictitious wealth which deluged the country with paper money, raised the nominal value of all property far beyond the real value, and increased the sales of public lands from \$5,000,000 in 1834 to \$24,800,000 in 1836. July 11, 1836, the secretary of the treasury, by the president's order, and against the known wish of congress, issued the so-called *specie circular*, which directed the land offices to reject paper money and receive only specie in payment for public lands. At the following session congress did indeed pass a bill directing the reception of notes of specie-paying banks, but so late in the session that the president was able to dispose of it by a "pocket veto" (see VETO). The swelling tide of paper money was thus turned back from the west upon the east, and early in May a suspension of specie payments, beginning in New York, began the panic of 1837, which, after a year's general suffering, violently substituted reality in business for fiction.—The democratic party had by this time thoroughly learned the folly of the state bank, or "pet bank," system. The pet banks had gladly received the public revenues, but, when called upon to refund them for distribution among the states (see INTERNAL IMPROVEMENTS, UNITED STATES), they had promptly responded by suspending specie payments. Van Buren, the new president, therefore held manfully to the democratic idea of a "divorce of bank and state," refused to countenance any governmental interference with the panic, and throughout his entire administration pressed vigorously the sub-treasury system, which was finally successful, after two failures, by the law of July 4, 1840 (see INDEPENDENT TREASURY). This was considered by the whigs, and by the government's rejected allies, the state banks, as an attack upon all banks. A subsidiary panic in 1839 lent force to their arguments, and when Harrison was chosen president in 1840, a majority of the congress elected to meet in 1841 was also whig, pledged to revive the past glories of a national bank and abolish the sub-treasury. But the majority was delusive; the whigs had again and again during the campaign denied to the voters that the bank question was at issue, and had declared that the only issue to be decided by the election was the curtailment of the executive power (see WHIG PARTY); Harrison himself had at least once pronounced against a national bank; and Tyler, the vice-president elect, had been unmistakably known to the leaders of the convention, which nominated him, as a confirmed opponent of such an institution.—President Harrison called congress together in extra session for May 31, 1841. His early death (see HARRISON, WM. H.) raised to the presidency a man who was obnoxious to Clay, the whig leader, not more for his unreliability in the whig faith than for his accidental elevation to a rank above his merits, and for his known desire to compass his election in 1844 to the position which Clay regarded as his own by every law of politics. Tyler, though personally averse to any extra ses-

sion of congress, decided to follow out Harrison's action, and congress assembled at the appointed time. In his message the president avowed his belief that congress had the power to charter a national bank, but reserved the right to veto any plan which should contain unconstitutional or unwise provisions. The whig leaders, however, and particularly those under Clay's influence, were more disposed to force Tyler to serve in the ranks than to recognize him as commander-in-chief. At the beginning of the session, on Clay's motion, the secretary of the treasury furnished a plan for a national bank, and a bill drawn up on his recommendations, "to incorporate the subscribers to the fiscal bank of the United States," passed both houses, Aug. 6, by a vote of 26 to 23 in the senate, and 123 to 98 in the house. The word "fiscal" was placed in the title by way of implication that there was some difference between this and the former bank of the United States, though it is difficult to see any great difference; Tyler had even wished that it should be called fiscal institute, or fiscal corporation. Aug. 9, the house passed a senate bill to repeal the sub-treasury law, and the repeal was signed by the president, Aug. 13. The passage of this bill just at the time when the president was considering the bank bill, was very significant and unexpectedly momentous. The debates alone seem to show that it was intended to force the president to sign the bank bill by leaving him without a sub-treasury; its actual result was, by leaving the president master of the treasury, unchecked by the limitations of any law, to enable him to dictate terms to his party. Aug. 16, the president vetoed the bill on the ground that the permission given in it to establish branch banks in the different states was dangerous and unjust to the states; but the veto also contained an intimation, which may be construed as a call upon the whigs to surrender with good quarter, that the president would be willing to sign a bank bill which should not be open to constitutional objections. By this time the distinctive Clay portion of the whig members of congress were in a white heat of exasperation against the president. They justly considered him a mediocre man, shifty in belief and practice, and only settled in a determination to make himself head either of the whig party or of a new third party of his own. They were with difficulty persuaded to restrain public exhibitions of their resentment while a new bill, to avoid the objections of the veto, was prepared and hurried through the house with indecent haste, Aug. 23, and the senate, Sept. 3 but their incautious private expressions, and particularly an angry letter of Botts, of Virginia, gave to Tyler an excuse, of which he availed himself Sept. 9, to veto this bill also. It is impossible to read the full details of Tyler's defeat of this last bill, as given in the authorities cited below, and acquit him of double dealing; the only excuse to be made for him is that his mind was too much beclouded by his presidential aspirations to be able to estimate his own conduct

impartially. His last veto, however, ended the list of attempts to grant to a private corporation the custody and emoluments of the national revenue. (See INDEPENDENT TREASURY, WHIG PARTY.) The present national banking system, begun by act of Feb. 25, 1863, is without this plainly evil feature of the original national banks, is in general terms only an extension of the excellent New York state banking system of 1838 to the country at large, and therefore has nothing to do with the subject of this article. ALEXANDER JOHNSTON.

BANKING (IN THE UNITED STATES) Previous to the revolutionary war paper money was issued to a greater or less extent by each one of the thirteen colonies. The first issue was by Massachusetts in 1690, to aid in fitting out the expedition against Canada. Similar issues had been made by New Hampshire, Rhode Island, Connecticut, New York and New Jersey, previous to the year 1711. South Carolina began to emit bills in 1712, Pennsylvania in 1723, Maryland in 1734, Delaware in 1739, Virginia in 1755, and Georgia in 1760. Originally the issues were authorized to meet the necessities of the colonial treasuries. In Massachusetts, in 1715, as a remedy for the prevailing embarrassment of trade, a land

bank was proposed with the right to issue circulating notes secured by land. John Colman, a merchant of Boston, urgently advocated its establishment. The land bank was forbidden by the province council, unless authorized by the general assembly. There was a large party, however, in favor of paper money in some form. The plan for the land bank was defeated, but the issue of paper money by the treasury was authorized to the extent of £50,000, to be loaned on good mortgages in sums of not more than £500, nor less than £50, to one person. The rate of interest was 5 per cent., payable with one-fifth of the principal, annually. The bills were in form the same as those previously issued for the benefit of the treasury. This round sum or aggregate of £50,000, to be so loaned, was styled a bank, and was the first of the so-called loan banks, which were afterward authorized by nearly, if not quite, all of the colonies. In 1733 an issue of bills to the amount of £110,000 was made by the merchants of Boston, which were to be redeemed at the end of 10 years, in silver, at the rate of 19 shillings per ounce. In 1739, the commercial and financial embarrassment still continuing, another land bank was started in Massachusetts. John Colman was one of the corporators. The stock of the land bank was to be £150,000. No one was permitted to subscribe more than £2,000, nor less than £100. The subscribers were to pay down lawful money at the rate of 40 shillings for every £1,000 subscribed, and for the remainder were to pledge security in lands to the satisfaction of the directors. They were to pay 3 per cent. interest per annum, either in bills of the bank or in produce and manufactures, at prices regulated by the directors. Circulating notes equal to the capital were to be issued, payable in 20 years in produce or manufactures, and 5 per cent. of the capital was to be paid annually in the notes, produce or articles manufactured. The "manufactures, being the produce of this province," were enumerated as follows:¹ "Hemp, flax, cordage, bar iron, cast iron, linens, sheep's wools, copper, tanned leather, flax seed, beeswax, bayberry wax, sail cloth or canvas, nails, tallow, lumber or cord wood, or logwood from New Spain." This scheme was strenuously opposed by Governor Belcher, but in spite of all opposition £49,250 of its notes were struck off, of which the treasurer of the company issued £35,582, and £4,067 were employed by the directors in trade. —A specie bank was also formed in 1739 by Edward Hutchinson and others, which issued bills to the amount of £120,000, redeemable in 15 years in silver, at 20 shillings per ounce, or gold pro rata. The payment of these notes was guaranteed by wealthy and responsible merchants. These notes and those of a similar issue in 1733 were largely hoarded and did not pass generally into circulation. —In 1740 parliament passed a bill to extend the act of 1720, known as the bubble

act, to the American colonies, with the intention of breaking up all companies formed for the purpose of issuing paper money. Under this act both the land bank and the specie bank were forced to liquidate their affairs, though not without some resistance on the part of the former. The governors of Massachusetts rendered themselves very obnoxious to the people by their determined opposition to these banks and to paper money generally,² and governor Belcher was recalled to England on account of misrepresentations of the paper money advocates, but was subsequently appointed governor of New Jersey. —The paper money of the colonies, whether issued by them or by the loan banks, depreciated almost without exception as the amounts in circulation increased. The bills as originally emitted were intended to be equal to coin, but when depreciation advanced to such an extent as to appal the authorities, a new set of bills would be issued, with new assurances that they would be kept equal to coin. In these new bills the old bills would be redeemable at their depreciated value. Sometimes this second set of bills, having also depreciated, was replaced by a third set in the same way. These various sets were designated tenors; the terms old tenor, middle tenor, new tenor, new tenor 1st, new tenor 2nd, being used to distinguish them. To give all the details of the depreciation of this currency in each of the colonies would require much space, but the best authorities agree that it underwent in all cases a constant diminution in value, inflicting loss and misery upon all classes of citizens. Pelatiah Webster says of this paper and the continental currency: "We have suffered more from this cause than from any other cause or calamity. It has killed more men, pervaded and corrupted the choicest interests of our country more, and done more injustice than even the arms and artifices of our enemies." The following table³ gives the price of £100 in coin in the currencies of the several colonies in the year 1748:

New England.....	£1,100
New York.....	£ 190
New Jersey.....	£180 to 190
Pennsylvania.....	£ 180
Maryland.....	£ 200
North Carolina.....	£1,000
South Carolina.....	£ 750
Virginia.....	£120 to 125

—The emission of bills by the colonies and the banks was not regarded with favor by the mother country, and the provincial governors were as a general thing opposed to these issues. They were consequently frequently embroiled with their legislatures. Felt, in his "Massachusetts Currency," gives examples of this controversy. Governor Belcher, in 1740, issued the following proclamation: "Whereas, a scheme for emitting bills

² The History of Massachusetts Bay, by Lieut. Governor Hutchinson, vol. 2, p. 396, Boston, 1767.

³ A Short History of Paper Money and Banking in the United States, by Wm. M. Gouge, Phila., 1833, p. 10.

¹ An Historical Account of Massachusetts Currency, by Joseph B. Felt, Boston, 1839, p. 103.

or notes by John Colman, Esq., and others, was laid before the general court in their session held the 5th of December, 1739, and by a report of a committee appointed by said court, was represented, if carried on, to have a great tendency to endamage his majesty's good subjects as to their properties; and whereas, application has been very lately made to me and his majesty's council, by a great number of men of the most considerable estates and business, praying that some proper method may be taken to prevent the inhabitants of this province being imposed upon by the said scheme; and it being very apparent that these bills or notes promise nothing of any determinate value, and can not have any general, certain or established credit; wherefore, I have thought fit, by and with the advice of his majesty's council, to issue this proclamation, hereby giving notice and warning to all his majesty's good subjects of the danger they are in, and cautioning them against receiving or passing the said notes, as tending to defraud men of their substance and to disturb the peace and good order of the people, and to give great interruption and bring much confusion into their trade and business."—Subsequently, on Nov. 6, of the same year, being assured that part of the military corps encouraged the circulation of the land bank paper, he published the following: "I hereby warn all commissioned officers in the militia from signing or giving any countenance to the passing of the said notes of hand, directly or indirectly. And as I apprehend that if these should obtain a currency, it will reflect great dishonor on his majesty's government here, and be very detrimental to the public interests of this province and people, I do hereby declare my firm resolution, that if after this public notice given, any of the military officers of this province persist in being any way concerned in or giving any encouragement whatsoever to the passing of the said notes of hand, and full proof be made thereof to my satisfaction, I will immediately dismiss them from their said offices." These proclamations had but little effect.—A gentleman writing to a correspondent in London, under date of Feb. 27, 1741, says: "Whole troops, nay almost whole regiments either resigned or told their colonels, who examined them, that they would resign rather than not encourage the bills." Later in the same year governor Belcher writes to Thomas Hutchinson: "You say it would be much better if some other way than by application to parliament could be found to suppress it (land bank). I assure you, the concerned openly declare they defy any act of parliament to be able to do it. They are grown so brassy and hardy as to be now combining in a body to raise a rebellion, and the day set for their coming to this town is at the election, and their treasurer, I am told, is in the bottom of the design, and I doubt it not. I have this day sent the sheriff and his officers to apprehend some of the heads of the conspirators."—These continued disputes, which largely curtailed the use of an expedient which the colonists con-

sidered necessary to their prosperity, together with the action of parliament in restricting the issue of paper money, embittered the minds of the colonists against England, and had undoubtedly much to do with the final outbreak. The bubble act, which laid an interdict on all banking associations having no legal charter within the dominions of the king, was passed by parliament in 1720. In 1740 another enactment was made, extending the provisions of the act of 1720 to the American colonies, where it had been disregarded. Banking in those days consisted merely in the privilege of issuing circulating notes, and this act restricted all private enterprises of this kind. On June 25, 1751, parliament enacted a law forbidding paper money of the colonies to be passed, except for current expenses of the government each year, or in case of invasion by the enemy. It seems also that these exceptional cases where paper money was permitted, were to be under control of the crown, as Mr. Bollen, the agent in London of the province of Massachusetts, writes that he opposed the bill on the ground that it might open the way for the unconstitutional exercise of the king's authority in the colonies in other matters. Legal tender paper money was prohibited by this act of parliament, and in 1763 such issues were declared void; but subsequently, in 1773, they were allowed to be received as legal tender at the treasuries of the several colonies.—The second continental congress was convened in 1775, and, in order to raise funds, having no power to institute taxation, naturally turned toward the expedient of an emission of paper money on the credit of the Union, but in the redemption of which each colony was to bear a part.—The first issue was made in June, 1775. For a year these issues continued equal to gold; in two years they had depreciated to 2 for 1; in three years to 4 for 1; in nine months more their relative value was 10 for 1; in September, 1779, it was 20 for 1. Congress now determined that the total issues should not exceed \$200,000,000, and renewed the declaration that this currency should be redeemed in full, and went to some labor to prove that the states had the ability to do so. In March, 1780, these issues had so depreciated that their value as compared with specie was as 40 to 1. Congress now required the whole to be brought in for redemption at its market value in coin, and also authorized the emission of new notes bearing interest at 5 per cent., and payable 6 years from date in silver and gold. These were to be exchanged in the proportion of 1 dollar of the new for 20 dollars of the old emission. During the year 1780 the notes of the old issue sank first to 75 to 1, then ceased to circulate in the states north of the Potomac. In Virginia and North Carolina they passed for a year longer, and finally depreciated to 1,000 to 1, and then ceased to circulate.—According to Thomas Jefferson but 200 millions of the first emission was issued, which was the amount authorized by resolution of congress; but other authorities state the

amount much higher. Joseph Nourse, register of the treasury in 1828, places it at \$241,552,780. The amount as given in the treasury statement of 1843 was \$242,100,176. The aggregate loss to the people of the country from this currency was estimated by secretary Woodbury at \$196,000,000.—During the war paper money, distinct from the continental currency, was also issued by several of the states. The amount thus issued has been placed at \$209,000,000, which is probably too high. It is, however, difficult to obtain exact information in reference to these emissions.—At the close of the war the minds of all classes were imbued with a wholesome antipathy to paper money, and as a consequence when the federal constitution was under consideration, the power to emit bills which in the original draft was given to the United States was stricken out. Moreover, the original draft having contained a qualified permission to the states to issue paper money, an amendment was inserted which took away from the states all power to coin money, emit bills of credit, or make anything but gold or silver coin a tender in payment of debts. It has been held that the lack of power on the part of a state to coin money, taken in connection with the prohibition of the emission of bills, prevents the issue of paper money by banks chartered by the state, as well as such issue by the state itself. This view was held by Daniel Webster, in his speech on the bank of the United States, on the 25th and 28th of May, 1832, and his arguments are quoted with commendation by Mr. Justice Story, in his commentaries on the constitution, as follows: "It will be hereafter seen that this (the power to coin money) is an exclusive power in congress, the states being expressly prohibited from coining money. And it has been said by an eminent statesman that it is difficult to maintain, on the face of the constitution itself, and independent of long-continued practice, the doctrine that the states, not being at liberty to coin money, can authorize the circulation of bank paper as currency at all. His reasoning deserves grave consideration, and is to the following effect: The states can not coin money. Can they, then, coin that which becomes the actual and almost universal substitute for money? Is not the right of issuing paper intended for circulation in the place and as the representative of metallic currency, derived merely from the power of coining and regulating the metallic currency? Could congress, if it did not possess the power of coining money and regulating the value of foreign coins, create a bank with the power to circulate bills? It would be difficult to make it out. Where, then, do the states, to whom all control over the metallic currency is altogether prohibited, obtain this power? It is true that in other countries private bankers, having no legal authority over the coin, issue notes for circulation. But this they do always with the consent of the government, express or implied; and government restrains and regulates all their operations at its pleasure. It

would be a startling proposition in any other part of the world, that the prerogative of coining money held by the government was liable to be defeated, counteracted or impeded by another prerogative, held in other hands, of authorizing a paper circulation. It is further to be observed that the states can not issue bills of credit; not that they can not make them a legal tender, but that they can not issue them at all. This is a clear indication of the intent of the constitution to restrain the states as well from establishing a paper circulation as from interfering with the metallic circulation. Banks have been created by states with no capital whatever, their notes being put in circulation simply on the credit of the state. What are the issues of such banks but bills of credit issued by the state?" Mr. Justice Story says: "This opinion was not peculiar to Mr. Webster; it was maintained also by Hon. Samuel Dexter, one of the ablest statesmen and lawyers who have adorned the annals of the country."—Nearly 30 years after, chief justice Chase, when secretary of the treasury, in his report to congress, of Dec. 9, 1861, said: "It has well been questioned by the most eminent statesmen, whether a currency of bank notes, issued by local institutions under state laws, is not, in fact, prohibited by the national constitution. Such emissions certainly fall within the spirit, if not within the letter of the constitutional prohibition of the emission of bills of credit by the states, and of the making by them of anything except gold and silver coin, a legal tender in payment of debts."—BANK OF NORTH AMERICA. The bank of North America, the first organized bank in the United States, had its origin in a meeting of citizens of Philadelphia, on June 17, 1780, the purpose being to devise means for furnishing supplies for the army, then in a state of great destitution. It was then resolved to open a "security subscription to the amount of £300,000, Pennsylvania currency, real money," Thomas Paine subscribing \$500 and Robert Morris £200 to the fund. The system of the bank was devised by Robert Morris, then superintendent of finance, early in 1781, and was approved by congress, which, on Dec. 31, following, gave the bank a perpetual charter, with a capital of \$10,000,000. Of this amount, however, but \$85,000 was paid in by individuals. The government subscribed \$250,000, of which but \$50,000 was ever paid. The bank opened for business on Jan. 7, 1782, and within a period of six months thereafter had loaned \$400,000 to the government.—The state of Pennsylvania in 1782 also granted it a perpetual charter, which was subsequently repealed and again renewed, the renewal, however, limiting the term to 14 years, and the capital to \$2,000,000. After successive renewals, it was converted into a national bank on Dec. 3, 1864, with its original title, and with a capital of \$1,000,000.—The Massachusetts bank in the city of Boston, and the bank of New York in the city of New York, which were the only

other banks in operation at the time of the charter of the bank of the United States, were both converted into national banks in 1865, and these 3 banks are now transacting an active and successful business.—**BANK OF THE UNITED STATES.** Alexander Hamilton, secretary of the treasury, in his report to congress on Dec. 13, 1790, recommended the establishment of a bank of the United States, and opposed the issue of paper money by the government. The amount of the bank's stock was fixed at 10 millions, one-fourth of all private and corporate subscriptions to be in coin, and three-fourths in U. S. 6 per cent. stocks. Two millions were to be subscribed by the government, to be returned in 10 annual installments. The board of directors was to consist of 25 persons, all citizens of the United States, who were to serve without compensation; and the circulating notes of the bank were made receivable in payment of all dues to the United States.—The act of incorporation passed the house of representatives by a vote of 39 to 19, those favoring the bill being mainly from northern, and those opposing it from southern states. Among the friends of the bill were Alexander Hamilton, secretary of the treasury, and Henry Knox, secretary of war, while the list of its opponents included James Madison, Thomas Jefferson, secretary of state, and Edmund Randolph, attorney general. The opposition to the bank was based upon the alleged general inutility of banking systems, and the want of power in congress to grant the charter. The bill, however, became a law on Feb. 25, 1791, and the bank at once went into operation, and was immediately successful. Between the years 1796 and 1802 the government disposed of its \$2,000,000 of stock at a profit of \$1,137,152.29, equal to 57 per cent. on the original investment.—The bank was required to make weekly reports to the secretary of the treasury, but the following, for Jan. 24, 1811, is one of the only two balanced statements found of record:¹

RESOURCES.

Loans and discounts.....	\$14,578,294
United States six per cent. stock.....	2,750,000
Other United States indebtedness.....	57,046
Due from other banks.....	894,145
Real estate.....	500,653
Notes of other banks on hand.....	393,341
Specie.....	5,009,567
Total.....	\$24,183,046

LIABILITIES.

Capital stock.....	\$10,000,000
Undivided surplus.....	509,678
Circulating notes outstanding.....	5,037,125
Individual deposits.....	5,904,223
United States deposits.....	1,929,999
Due to other banks.....	634,348
Unpaid drafts outstanding.....	171,473
Total.....	\$24,183,046

—The charter of the bank expired March 4, 1811, but, prior to this, efforts were made for its

renewal, favored by Albert Gallatin, then secretary of the treasury, and by Crawford and Pickering in the senate, and opposed by Mr. Clay. The bill was defeated in the senate on Feb. 20, 1811, by the casting vote of the vice-president, George Clinton, and subsequently failed in the house by a minority of one vote.—During the war with Great Britain which soon followed, the state banks, in whose interests the recharter had been opposed, failed to meet the exigencies of the government, and in September, 1814, nearly all of them south of New England suspended specie payments. Following this their issues expanded rapidly, and floods of unchartered currency were also poured out, of all denominations, from 6 cents upward.² The result was a great depreciation in the value of the currency, ranging from 20 to 25 per cent. at the close of the war, the failure of many of the banks, and corresponding distress among the people. The root of the evil lay in the attempt of the government to carry on a great war through the aid of state corporations, over which it could exercise no control. In 1814 there was nearly 9 millions of dollars of government funds in the suspended banks, and the loans of the government, in 1815, amounted to more than 35 millions; while 6 per cent. stocks issued by the government were sold at rates of discount varying from 5 to 15 per cent.—The effect of this experience was to revolutionize opinions in congress, and on Jan. 20, 1815, in accordance with a previous recommendation of Mr. Dallas, then secretary of the treasury, a bill was passed reorganizing the bank of the United States. The bill was vetoed by president Madison on Jan. 30, following, on the ground that the proposed bank did not appear calculated to accomplish the purposes for which it was designed.—**SECOND BANK OF THE UNITED STATES.** The plan proposed by secretary Dallas was again presented to congress, and, without material change, was approved by president Madison on April 10, 1816. The charter was limited to 20 years, and the capital to 35 millions, 7 millions to be subscribed by the government, payable in coin or in U. S. 5 per cent. stocks. Other subscriptions were payable, one-fourth in coin and the remainder in coin or government stocks. The directors were to be resident citizens of the United States, and to serve without compensation, five of them to be appointed by the president. The bank was to be made a public depository, and to aid the government, free of charge therefor, in negotiating its loans. It was empowered to establish branches, and to issue circulating notes receivable in all payments to the United States. No other bank outside of the District of Columbia was to be established by congress during the continuance of this charter, and in consideration of the grants therein, the bank was to pay to the United States \$1,500,000, in three installments.—The bank commenced doing business on Jan. 7, 1817, at

nearly the worst stage of the monetary troubles resulting from the late war, and at the verge of the financial crisis which culminated in 1819-20. It consequently met with many difficulties and embarrassments, and on Feb. 9, 1819, a resolution was moved in the house, looking to a repeal of its charter, but which failed of adoption. At this period of its existence, by its efforts to restore the soundness of the currency through large importations of specie, the bank was on the brink of failure.—From 1820 to 1835 the country was prosperous, the bank recovered from its embarrassments, and its stock rose steadily in value. Long before 1828 the bank had lived down all opposition; and it was therefore a surprise to all parties when general Jackson, in his first message, in December, 1829, took ground against a renewal of its charter, when it should expire in 1836. The agitation thus awakened grew in intensity, until it culminated, on July 16, 1832, in the veto by president Jackson, of a bill rechartering the bank. The interval of about six years between the commencement of Jackson's warfare upon the bank and the expiration of its charter is memorable for the violence and persistence of the struggle between the administration and its supporters, and the bank and its friends, both in and out of congress.—The most important event of the struggle was the removal of the government deposits from the bank of the United States to various state banks. The order for this removal was issued in 1833, by Mr. Taney, who was made secretary of the treasury for this purpose, his predecessor, Mr. Duane, having declined to issue it. When congress re-assembled in December, 1833, resolutions on the subject were adopted in both houses; those of the senate censuring the president and secretary of the treasury for usurpation of powers, while in the house it was declared that the bank ought not to be rechartered, that the public deposits ought not to be restored to it, that the state banks should be continued as depositories, and that congress should further regulate the subject by law.—Among the early results which followed the removal of the deposits was the expansion of their issues by the state depositories, and the wild and general inflation of the currency by a multitude of other banks, old and new; the aggregate of circulating notes, exclusive of those of the bank of the United States, increasing from 61 millions in 1830 to 149 millions in 1837. In 1830 the currency of the country had been characterized by the finance committee of the senate as being more sound and uniform than that possessed by any other country; and yet within seven years after this all the banks then in operation, including the great bank of the United States, which had then been rechartered by the state of Pennsylvania, went into suspension. The bank, when denied a renewal of its charter by congress, did not close up its affairs, but applied for and obtained a charter from the state of Pennsylvania, Feb. 18, 1836, just 13 days before

the expiration of its charter from the government. This was substantially a renewal for 30 years of the old charter, and under the old corporate name, but with a change as to the amount and terms of the bonus to be paid for it to the state. This bonus, had the bank remained solvent and in existence long enough, would probably not have fallen short of 5 millions of dollars. Col. Benton characterized the Pennsylvania charter of the bank as indicating, by every circumstance of its enactment, corruption and bribery in the members who passed it, and an attempt to bribe the people through the bonus to be distributed among them.¹—The history of the bank subsequent to the crisis of 1837 was a disastrous one. It suspended payments as frequently as other state banks, and finally succumbed to difficulties which prudent management should have enabled it to overcome. It made three several assignments in 1841, to secure various liabilities, the last and final assignment being on Sept. 4, of that year. The 7 millions of stock held by the United States previous to the institution becoming a state bank was paid back in full, and the government realized a very handsome profit upon its investment, as will appear by the following statement, derived from the treasury records:²

Bonus paid by the bank to the United States.	\$ 1,500,000.00
Dividends received from the bank.	7,118,416.29
Proceeds of stock sold, and other moneys received from the bank.	9,424,750.78
Total.	\$18,043,167.07
Subscription to capital stock, paid in U. S. 5 per cent. bonds.	\$7,000,000
Interest paid by United States on same.	4,950,000
	11,950,000.00
Profit on investment.	\$ 6,093,167.07

—Nicholas Biddle was president of the bank from January, 1823, to March, 1839. At the time of his resignation the shares were selling at 111, having in 1837 sold at 137; but in 1843, after the failure of the bank, its shares were quoted at 1½ per cent. The circulating notes of the bank, together with the deposits, were paid in full, principal and interest; but the whole capital of 28 millions was lost to the shareholders.—MASSACHUSETTS. The success of the bank of North America in Pennsylvania, induced the organization of the Massachusetts bank, which received its charter from the state of Massachusetts on Feb. 7, 1784, with a capital of \$300,000. It existed 80 years as a state bank, and became a national bank in 1864. The Union bank was the next one, chartered in 1792, with a capital of \$1,200,000, of which \$400,000 was subscribed by the state. In 1795 the Nantucket and Merrimac banks were established. Up to 1799 but one more bank was chartered. In that year a law was enacted prohibiting the establish-

² Report of the Comptroller of the Currency, 1876, p. 13.

ment of unincorporated associations. In 1808, an act requiring semi-annual returns to be made by the banks to the governor and council was passed, and in 1805 an amendment required these returns to be sworn to. In 1815 16 banks were in operation. From 1805 to 1811 but one bank was chartered. Two more were chartered in 1811. In all the charters granted after 1793, provision was made for a state subscription, and in 1812 the state held about \$1,000,000 out of the \$8,000,000 of stock of the banks of the state. Nearly all the banks were rechartered in 1811. In 1812 the state first imposed a tax on bank capital. In 1813 the system of compelling the redemption at par in Boston of the notes of the New England banks, by assorting and returning the notes to the place of issue, was inaugurated by the New England bank, organized that year. This was the beginning of what was afterward known as the Suffolk bank system, but it was not fully developed until 1825. There was at first some opposition, but the Suffolk system was finally successfully established, and continued down to the establishment of the national system. The Massachusetts banks did not suspend in 1814, owing largely to the fact that a law of the state imposed a penalty of two per cent. a month for non-payment of their notes. The first comprehensive law regulating the banking business was passed in 1829. In 1837 there had been organized 134 chartered banks—of these, 32 failed in the financial panic of that year. The loss was about 30 per cent. of their entire indebtedness. From 1793 to 1836 only 10 banks had failed. A result of the crisis of 1837 was the adoption of a system of official examinations. A free banking act was passed in 1851, similar in its provisions to that of New York state, but only 7 banks were organized under it, the previously existing chartered banks occupying the field. In October, 1865, all but one of the state banks, with the exception of four which discontinued business, had been converted into national banks.—NEW YORK. The first bank in the state of New York commenced business in 1784, under the name of the bank of New York. Its articles of association were drawn by Alexander Hamilton. It was the first bank chartered by the state legislature, and received its charter on March 21, 1791. It was organized with a capital of \$900,000 in shares of \$500 each. The state afterward subscribed for 100 shares, making the capital \$950,000. In 1832 \$50,000 additional was subscribed by the state. May 1, 1852, it was reorganized as a free bank under the general laws of the state, with a capital of \$2,000,000. It became a national bank with a capital of \$3,000,000 on Jan. 6, 1865. Up to June 11, 1812, the date of the declaration of war with Great Britain, 19 banks were chartered by the legislature—7 of these, the bank of New York, Merchants, Mechanics, Union and City bank, of New York city, the New York State of Albany, and the bank of Utica, are now national banks, and

the Manhattan company and bank of America are the leading state banks. Twenty-four more banks were chartered between 1812 and the date of the passage of the safety fund act, in 1829. During the period from 1791 to 1812, political feeling between the federalists and the republicans was bitter, and the obtaining of the charters of the banks organized during this time was, in many cases, the occasion of much party strife and intrigue. Governor Tompkins, in the year 1813, who was subsequently twice elected vice-president of the United States, prorogued the legislature, assigning as one reason for his action the attempt to use corrupt means to secure a bank charter.¹ These charters were in the nature of special privileges, granted to particular persons, and all others were specially restrained by law from participating in the business of banking. The restraining act of 1804 was passed to prevent private banking institutions from continuing their business, for the purpose of leaving a clear field to the chartered corporations. This act prohibited any person, under a penalty of a thousand dollars, from subscribing to or becoming a member of any association for the purpose of receiving deposits, or from doing any business which incorporated banks by their acts of incorporation were permitted to do. This was followed by the more stringent act of 1818, which provided that no person, association of persons, or body corporate, except such bodies corporate as were expressly authorized by law, should keep any office for the purpose of receiving deposits, or discounting notes or bills, or for issuing any evidence of debt to be loaned or put in circulation as money; which statutes were not repealed until 1837, a year before the passage of the free banking act. The safety fund system was authorized on recommendation of governor Van Buren, by act of April 2, 1829. The main feature of this system was the requirement that each bank operating under it, should pay annually to the treasurer of the state a sum equal to $\frac{1}{4}$ of 1 per cent. of its capital stock, the payments to be continued until each bank had paid in 3 per cent. of its capital. This common fund was to be used to pay the notes and other debts of any bank belonging to the system which might become insolvent. In practice the amount required to be contributed was found to be inadequate. Eleven banks belonging to the system failed, and the whole of the fund at that time was but little more than 5 per cent. of their debts. The whole sum contributed down to 1848 was little more than 75 per cent. of the debts of these insolvent institutions. The deficiency was made up by the issue of 6 per cent. stock by the state, the latter to be reimbursed by future payments of the banks. In 1842 the act was amended so that the common fund became responsible for the payment of the circulating notes only of banks fail-

¹ Hildreth's History of the U. S., vol. 5, pp. 548-50.

² Hammond's Political History of New York, vol. 1, p. 309, Buffalo, 1850.

ing thereafter This system was also a monopoly, as it did not provide for new banks These, as before, had to be specially chartered The occasion of it was that the charters of 40 banks previously organized were about to expire, and these 40 banks came in under the new system. Three commissioners were appointed, one by the governor and senate, one by the banks in southern New York, and one by the banks elsewhere in the state, to inspect the banks and report to the legislature. Many abuses consequent on a desire to obtain bank stock arose, and after some changes in the manner of appointing commissioners had been made, the office was abolished in 1843, and the power of examining the banks was conferred on the comptroller of the state.—The free banking system was authorized April 13, 1838. All restrictions confining the privilege of banking to certain classes were swept away. Any number of persons were authorized to form banking associations, upon the terms and conditions and subject to the liabilities of the act. As originally passed, the law provided for the issue of circulation by the state to these associations, upon the deposit of stocks of the state of New York, of the United States, of other states equal to a 5 per cent. stock, or of bonds and mortgages on improved and productive real estate, worth, exclusive of buildings thereon, double the amount secured by the mortgage, and bearing interest at not less than 6 per cent. The amount of circulation issued was to be equal to the amount of the deposit. From 1838 to 1843, 29 of these banks failed, and the securities deposited were sufficient to pay 74 per cent. only of their outstanding circulation. The losses occurred only in the case of those banks which had the stocks of other states than New York. The act was therefore amended so as to exclude all state stocks except those of New York, and they were required to be kept equal to a 5 per cent. stock. An amendment in 1848 required the stocks deposited to bear 6 per cent., and bonds and mortgages 7 per cent., and that the latter should be on productive property, and for an amount not exceeding two-fifths of the value of the land covered by them. In 1849 the law was again amended so as to require one-half of the securities to consist of New York stocks, and not more than half of stocks of the United States, the securities in all instances to be, or to be made, equal to a 6 per cent. stock, to be taken at an amount not above par, and at not more than their market value.—In 1840 a law was passed requiring the banks of the state to redeem their notes at an agency of the bank, either in New York city, Albany, or Troy, at $\frac{1}{2}$ of 1 per cent. discount The discount was reduced, in 1851, to $\frac{1}{4}$ of 1 per cent. The discount was in practice divided between the redemption agent and the bank whose notes were redeemed, and banks which did not provide means to redeem their notes were forced to close. The constitution of the state, of 1846, provided that the

legislature should have no power to grant special charters for banking purposes, but that corporations or associations might be formed under general laws. The constitution also provided that, after 1850, the stockholders of banks issuing circulating notes, should be responsible to the amount of their shares for all debts and liabilities of any kind, and in case of insolvency, bill holders should be preferred to all other creditors.—The banks were under the supervision of a commissioner, appointed under the safety fund act, until 1843. In that year they were required to report to the state comptroller, but in 1851 the present office of bank superintendent was created.

OHIO. The first institution in the state of Ohio, in the nature of a bank, was chartered under the name of the Miami exporting company, in 1803, 5 months after the admission of the state into the Union. It was chartered for 40 years, with a nominal capital of \$500,000, divided into shares of \$100 each, the subscription for the same payable 5 dollars in cash, and remainder in produce or merchandise. Although in form a trading company, it issued bills and redeemed them in notes of other banks. It was finally compelled to close its affairs. The first regular bank was chartered in 1808, with a capital of \$300,000. It was located at Marietta. During the same year another bank was established at Chillicothe, then the capital of the state, with a capital of \$100,000. From 1809 to 1816 4 banks were chartered. In 1816 6 other banks were chartered by one act. This act required, among other provisions, that each new bank and every old bank rechartered should annually set apart out of its profits, for the use of the state, such sum as would, at the expiration of its charter, amount to one twenty-fifth part of its whole capital. In 1825 this provision was amended, so that in lieu thereof the state was to receive 2 per cent. on dividends previously declared, and 4 per cent. on subsequent dividends. The rate of interest to be taken by banks was limited to 6 per cent. Legislation in Ohio relating to banking was evidently shaped with the purpose of enabling the state to participate in whatever profits might accrue from the exercise of the privilege within its borders. From 1816 to 1832 charters were granted to 11 banks, and in 1833 and 1834 2 other banks were chartered. Branches of the bank of the United States, established at Chillicothe and Cincinnati, were subjected to a tax of \$50,000 each if they continued business after September, 1819. Upon an attempt being made by the auditor of the state to collect the tax, the United States supreme court again decided that the state had not the right. In 1845 a state bank with branches was authorized, on the safety fund principle. For creating the fund an amount equal to 10 per cent. of the circulation of each of the branches was to be paid to a board of control, to be invested in stocks of the state or United States, or in bonds and mortgages on unincumbered real estate of at

least twice the value of the amount secured thereby. Each branch was entitled to receive the interest on the stocks and bonds in which its portion of the safety fund was invested. In case of failure of any branch, its own stocks and bonds were first to be used to redeem its circulation before any portion of the safety fund could be so applied. The state was divided into 12 districts, and a portion of the capital of the state bank was allotted to each. Sixty-three branches in all were authorized, with charters continuing to 1866, and 5 other banks, previously chartered, were authorized on certain conditions to avail themselves of the privileges of this act. The issue of circulation was under the supervision of a board of control, consisting of one member from each branch. The act of Feb. 24, 1845, creating the state bank and branches, also authorized an independent bank system, requiring United States or state stocks equal to the full amount of the issues to be deposited with the state treasurer.—In March, 1851, the legislature passed an act authorizing free banking, the circulation to be secured by a pledge of bonds of the United States and state of Ohio. A new constitution was adopted in June, 1851, prohibiting the organization of additional banks, without the approval of the people at the general election succeeding the passage of the law chartering the same. In 1852 a tax law was passed, which, through a forced construction, levied upon banks twice, and in some instances three times, the rate imposed on any other property. Most of the banks organized under the act of 1851 were ultimately forced to go into liquidation by the oppressive taxation. In April, 1856, an act similar in its provisions to that of 1845 was passed, incorporating the state bank of Ohio and other banks, the charters to continue until May, 1877. The act contained a personal liability clause, and prohibited the general assembly from imposing any greater tax on capital employed in banking than is or may be imposed upon the property of individuals. In 1856, 36 of the banks which had been organized in the state had failed, their notes being entirely worthless, while 18 others were in process of liquidation, their notes being quoted at 50 to 75 cents on the dollar. In 1863 there were 56 banks organized upon three different plans, viz., 7 independent banks with a capital of \$350,000, 13 free banks with an aggregate capital of \$1,270,000, and the state bank of Ohio with 36 branches, with an aggregate capital of \$4,054,000 and \$7,246,000 circulation. The total capital of all the banks in the state in that year was \$5,674,000; circulation, \$9,057,837; specie, \$3,023,285.—INDIANA. The state of Indiana was admitted into the Union in 1816, and in 1820 2 banks had been established. In 1834 the state bank of Indiana was incorporated, with 10 branches, the branches being mutually liable for each other's debts. Each share was to be liable to an annual tax of 12½ cents, and when any general system of taxation should be authorized by the

state, the shares were to be liable as other capital. The tax on them was, however, in no event to exceed 1 per cent. The capital was mostly borrowed from abroad, through the credit of the state, which took \$1,000,000 of the stock, and also loaned its credit to individual stockholders to the extent of one-half of their subscriptions, taking real estate at one-half its improved value as security. Although this bank commenced business during the very critical condition of financial affairs which culminated in the panic of 1837, it was the only enterprise started by the state which was successful. The bank paid dividends averaging from 12 to 14 per cent. annually, and in 1854, on the expiration of its charter, when it went into final liquidation, it returned to its stockholders nearly double their original investment. The state realized fully 3½ millions in profits from the 1 million invested. In 1841 the branches were authorized, on payment of 1 per cent., to issue not more than \$5,000,000 in notes of denominations of less than five dollars. The banks of Indiana suspended specie payments in 1838, and resumed in 1841. In November, 1851, a new constitution went into effect in the state, which prohibited the organization of banks except under a general law. In 1852 such general law was passed, providing for the deposit of United States and state stocks with the auditor as security for circulation. In October, 1854, there were 84 of these banks. The oppressive tax laws of Ohio drove much banking capital to Indiana. In 1856, of 94 of the free banks 51 had suspended, and their notes were selling in Cincinnati at from 25 to 75 per cent. discount.—When the charter of the state bank expired in 1854, a new bank with a capital of \$6,000,000 was authorized by the legislature. This bank was carefully and skillfully managed, and did not suspend in the crisis of 1857.—ILLINOIS. The first bank in the state of Illinois was established under its territorial government, in 1813, at Shawneetown, and three years thereafter was incorporated, with a capital of \$300,000, for a term of 20 years. In 1835 its charter was extended to January, 1857, and its capital increased to \$1,400,000, the additional capital being subscribed by the state, which issued its bonds for that purpose. It subsequently failed, having \$46,909 of unavailable funds on deposit belonging to the government. The state bank of Illinois was chartered in 1821, with a capital of \$500,000, the state constitution of 1818 having prohibited any other new organizations. This bank was owned by the state, and its circulating notes were receivable for taxes and for all debts due to the state or the bank, and \$300,000 of circulation was directed to be issued and loaned on mortgages, in sums not exceeding \$1,000 to any one individual, upon notes for one year at 6 per cent. interest. The notes of the bank were soon thereafter quoted at 75 cents on the dollar, then at 50 cents, finally at 25 cents, when they ceased to circulate altogether. In February, 1835, a new bank

was incorporated with a capital of \$500,000, which was subsequently increased to \$2,000,000, owned and controlled by the state. It was soon after compelled to suspend specie payments, and in 1843 acts were passed, placing the state bank and the bank at Shawneetown in liquidation. The stock of these banks subscribed for by individuals was lost, as well as \$900,000 belonging to depositors and bill holders. The state took possession of its bonds amounting to \$3,050,000, and they were canceled and burned in the presence of the legislature in the capitol square at Springfield. — In the year 1843 a general banking law, similar in its provisions to the free banking law of Indiana, was passed. — In 1861 the circulation was \$12,300,000, secured largely by bonds of the state of Missouri, and the bonds of the southern states, which subsequently became much depreciated. — The constitution of 1870 prohibits the creation of a state bank, and requires all acts authorizing corporations with banking powers to be submitted to the people. It also requires that banks in operation shall make under oath, and publish, full and accurate quarterly reports of their affairs, but no law was ever passed carrying into effect this constitutional provision. — Secretary Crawford, Albert Gallatin and others made estimates of the capital, circulation and specie held by the banks in the United States, from 1784 to 1830, and from these estimates the following table has been compiled, showing the amounts of these items at various dates within that period:

YEARS.	Number of Banks.	Capital.	Circulation.	Specie.
		Millions.	Millions.	Millions
1784.....	3	2.1	2.0	10.0
1792.....	16	17.1	11.5	18.0
1794.....	17	18.0	11.6	21.5
1797.....	25	19.2	10.0	16.0
1800.....	28	21.3	10.5	17.5
1804.....	59	39.5	14.0	17.5
1811.....	89	52.7	28.1	15.4
1816.....	246	89.8	68.0	19.0
1820.....	208	137.2	44.9	19.8
1829.....	330	145.2	61.3	22.1

—Banking associations, especially in the southern and western portions of the country, were established under charters granted by state legislatures, the shares of which were held wholly or in part by the states themselves, and in character similar to those in the states already referred to. The banks operating under special charter were in high favor, the amount of currency issued greatly exceeding, in some cases in the proportion of 3 to 1, the amount of their nominal capital. Charters of this class were naturally regarded as of great value, and the parties seeking such concessions from the legislatures were exceedingly numerous. — In 1813 a bill authorizing the establishment of some 25 banks, with a proposed capital amounting in all to 9 millions, passed the legislature

of Pennsylvania, but was annulled by the veto of governor Snyder. The following year, however, a bill of similar character was successfully passed over the repeated veto of the governor of that state, authorizing 41 banks to commence business, with an aggregate nominal capital of 17 millions, while it required only one-fifth of such capital to be paid in. Thirty-seven of these went into operation. The capital of a large number of them was merely nominal, being represented by stockholders' notes for the amount of their respective shares. As might have been expected, the lifetime of such institutions was exceedingly brief; 15 of those in Pennsylvania became insolvent within four years after their establishment. In other cases the banks whose charters had been authorized by the New England and southern states were disposed of to non-residents, who organized such associations with but little real capital, and the currency of these banks was almost certain not to be circulated at home, but among the citizens of remote states, who suffered great loss from such issues. As late as 1854 the circulation of the northwestern states consisted largely of the notes of two or three Georgia banks, which circulated upon the personal credit of western shareholders, and without any regard to the management of the issuing banks. — Observing the results in the state of New York, which had followed the passage of the free banking law, a number of other states, chiefly in the east and west, after the year 1850, adopted similar systems of banking. — The free banking acts of the states of Massachusetts and Louisiana required an ample reserve to be kept on hand, and contained other restrictions, which were subsequently incorporated in the national bank act. — Charters for banks were still granted in most of the states which adopted the free banking system, and the former were more profitable and generally preferred, so that but few organizations comparatively were perfected under the latter system. The free banking acts which were passed by the legislatures of the western and southern states, almost without exception, omitted the most important provisions contained in the laws of the three states already referred to. No provision was made for the redemption of the circulation at any common centre; the security required was not sufficient; the notes were issued in excess of the cash capital, the shareholders were not made personally liable, and a majority of both directors and shareholders were often non-residents. These organizations were frequently associations without capital, located at places not easily accessible, and owned by non-residents who, taking advantage of such laws, converted state bonds into currency and drew the interest on the bonds without transacting much if any business at the place of issue. The governor of Indiana, in his message for 1853, says: "The speculator comes to Indianapolis with a bundle of bank notes in one hand and the stock in the other, in 24 hours he is on his way to some distant point

¹ Report of the Comptroller of the Currency, 1876, pp. 39-42.

of the Union to circulate what he denominates a legal currency, authorized by the legislature of Indiana. He has nominally located his bank in some remote part of the state, difficult of access, where he knows no banking facilities are required, and intends that his notes shall go into the hands of persons who will have no means of demanding their redemption."—The governor of Michigan, in his message for the same year, says: "At present we are giving charters to the issues of banks about which we actually know nothing, in whose management we have no participation, and are thus literally paying a large tribute for what generally in the end proves to be a great curse." Governor Ford, in a message to the legislature of New Jersey, in referring to the same subject, says: "In many cases our banks, although ostensibly located in New Jersey, have their whole business operations conducted by brokers in other states. The facility with which they may be organized and located, without reference to the wants of the community or the business of the place, is destructive to all the legitimate ends of banking."—The adoption of the free banking system under such laws was not favorable to its extension in other states, and only a small portion of the circulation outstanding was issued upon bonds deposited with state officers for the purpose of securing the same. Specie payments were suspended in 1814, in 1837 and in 1857. The notes of the banks, with the exception of those located in the large commercial cities, were during the whole period at a discount for coin. The notes of the New England states, which were redeemed at the Suffolk bank, were worth $\frac{1}{4}$ per cent. less than coin in New York, and many New York state notes, issued previous to the passage of the free bank act, were at a discount of $\frac{1}{4}$ to $\frac{1}{2}$ of 1 per cent., while the notes of the banks in other states which were only redeemed at the counters of the issuing banks, were all at rates of

discount varying from $\frac{1}{4}$ to 5 per cent., and at times at much higher rates. The losses to bill-holders were estimated to be not less than 5 per cent., annually, upon the whole amount of circulation outstanding. The losses upon exchange, between different portions of the country, were still greater than the losses arising from the insolvency of the banks, and the number of counterfeit and worthless bank notes in circulation is estimated to have been more than 6,500.—The sketches given of the banks organized in the states of New York and Massachusetts, and in three of the older western states, exhibit the general outlines of the bank legislation of the country previous to 1863. They present in a favorable light the operations of the charter system, the safety fund, and the free banking system in two of the most prosperous states of the union, while they expose many, but by no means the worst, imperfections of those systems as they existed in some of the other states during the period when circulation was issued by state authorities.—Congress, by a resolution in 1832, directed the secretary of the treasury to procure and publish as full returns as possible of the resources and liabilities of the state banks. In many states no reports were required for banks chartered under their laws; in others, infrequent ones only were required; and in those which made reports there was an entire absence of uniformity as to the dates upon which their condition was stated. No reliable information could, therefore, be given at any given date of the circulation, the specie, the deposits, or of their resources and liabilities generally; and the returns were in many instances based upon statistics which were made from reports that in themselves were unsatisfactory. From these returns the following table has been prepared, giving the principal items contained in the returns of the state banks at the dates named:

YEARS.	No. of Banks.	Capital.	Loans.	Individual Deposits.	Circulation.	Specie.
1835.....	704	\$231,250,337	\$365,163,834	\$ 83,081,365	\$103,692,495	\$43,937,625

All banks organized under state laws, and all private bankers, have been required, for some years past, to make returns to the treasury department of their capital and deposits, for purposes of taxation, and from these returns the following table has been compiled, showing the number of

the state banks and trust companies, of the savings banks with and without capital, and of the private bankers of the whole country, together with their average capital and deposits for the six months ending May 31, 1880:

GEOGRAPHICAL DIVISIONS.	State Banks and Trust Com panies			Private Bankers.			Savings Banks with cap- ital			Savings Banks without capital.

—NATIONAL BANKS. A financial writer in the *Analectic Magazine*, Philadelphia, for 1815, at which time the bank currency was in its worst state proposed that the public funds should serve, in the absence of specie, as the basis, support and limit of a paper currency.¹—Albert Gallatin also, in his celebrated essay in 1831, suggested the issue of circulating notes secured by government bonds. At that date the debt of the government was in process of rapid reduction, and was entirely paid within the next four years. He proposed that existing bank notes be taxed out of existence, and suggested a resort to mortgages on real estate for want of public stock, which plan, however, he found liable to the objection that the accommodations which the banks could, in that case, afford to individuals might be too much curtailed; and he concludes that "if these objections can be removed, the plan proposed would give to the banking system of the United States a solidity, and inspire a confidence, which it can not otherwise possess."—The bank of England was organized in the year 1694, upon a capital of £1,200,000 which had been loaned to the government, and the capital of that bank since that date has not differed materially from the permanent advance to the government; and three-fourths of the stock of the bank of the United States, in 1790, was authorized to be paid in United States stock, bearing 6 per cent interest. In 1844 notes of the value of 14,000,000 pounds sterling were authorized to be issued by the bank of England, on government securities; additional issues to vary with the amount of coin or bullion on deposit.—The free banking system of the state of New York, as has been seen, was authorized six years previous, in 1838, and was the first system of banking which required securities to be deposited for bank issues. Secretary Chase, in his report for December, 1861, recommended the gradual issue of national bank notes, secured by the pledge of United States bonds, similar to the system then in operation in New York, in preference to the issue of United States notes, 50 millions of which had already been issued.—The advantages claimed by the establishment of the banking system were, "A currency of uniform security and value, protection from losses in discounts and exchanges,

increased facilities to the government in obtaining loans, a diminution in the rate of interest or a participation by the people in the profits of circulation, an avoidance of the perils of a great money monopoly, and a distribution of the bonds of the nation to the leading monetary associations of the country, thus identifying their interests with those of the government."—A bill was prepared in accordance with his views during that month, and printed for the use of the committee of ways and means, but it was not reported, and a notice to print extra copies in July was laid on the table; and on the 8th of July following, Mr. Stevens, the chairman of the committee of ways and means, submitted the bill with an adverse report. The immediate necessities of the government compelled the issue of legal tender notes instead of the issue of national bank notes as recommended by the secretary, and the consideration of the bank act was deferred.—A general suspension of specie payments took place on Dec. 28, 1861, and two months thereafter the act of Feb. 25, 1862, was passed, authorizing the issue of 150 millions of legal tender notes, which amount was afterward increased 150 millions by the acts of July 11, 1862, and March 3, 1863, the latter date being but a few days subsequent to the passage of the first national bank act.—On Jan. 30, 1864, when the whole amount of national bank notes outstanding was but \$3,700,000, nearly the whole amount of legal tender notes authorized, \$449,338,902, had been issued, which was the highest amount outstanding at any one time.—In his report for 1862 secretary Chase again earnestly advocated the passage of the national bank bill. He presented at considerable length the arguments for and against the system, and urgently renewed his previous recommendation for its passage. One of the advantages which he said would arise from its passage was "that the United States bonds would be required for banking purposes, a steady market would be established, and their negotiation greatly facilitated, a uniformity of price for the bonds would be maintained at a rate above funds of equal credit, but not available to banking associations. It is not easy to appreciate the full benefits of such conditions to a government obliged to borrow;" it will "reconcile as far as practicable the interests of existing institutions with those of the whole people, and will supply a firm anchor-

¹ Address of Comptroller Knox before the Merchants' Association of Boston; *Banker's Magazine*, vol. 15, p. 545.

age to the union of the states." The bill is said to have had the sanction of every member of the administration. President Lincoln earnestly advocated its passage in his annual message in 1862, and in 1863 he said: "The enactment by congress of a national banking law has proved a valuable support of the public credit, and the general legislation in relation to loans has fully answered the expectations of its favorers. Some amendments may be required to perfect existing laws, but no change in their principles or general scope is believed to be needed."—About 14 months after, the national bank bill was printed for the use of the committee of ways and means; it was introduced into the senate by senator Sherman and referred to the finance committee, from which it was reported by him on Feb. 2, 1863, with amendments. Ten days later it passed that body by a vote of 23 to 21, and on the 20th of the same month it also passed the house of representatives by a vote of 78 to 64.—The bill encountered earnest opposition, and the secretary, in a letter to a friend at about that date, said that "a majority of both the house and senate finance committees were incredulous or hostile."—Senator Collamer, in his speech in the senate, Feb. 11, 1863, said: "It will be found that the people will not break up their present system of banking, interwoven as it is with all their transactions, bound up as their business life is with it, to establish banks under this bill, and they will never buy United States stocks for this purpose." One of his reasons for opposing the bill was that the schools of some of the New England states were supported by the tax fund collected from the existing state banks. Senator Harris of New York, who afterward voted for the bill, proposed an amendment, authorizing the state banks to receive circulation under state charters, and said: "The banks in the state of New York can, I believe, be induced, without surrendering their charters as state banking associations, to take out circulation under the provisions of this bill, but I do not suppose that a single banking institution in the state of New York would ever be induced to surrender the privileges it derives under the state law, and become an association organized under the provisions of this act." Three senators only from the middle states voted in its favor. The two senators from Vermont, one from Connecticut, and seven from the middle states, voted against it. In the passage of the act in the house, some of the most eminent of the representatives from New England and New York, now distinguished members of the senate, voted against it.—The bill was thoroughly revised, discussed, and re-passed a little more than a year afterward, June 3, 1864; all of the senators from New England then voting in its favor, and all of the senators from the middle states who were present, except those from Pennsylvania and Delaware, and all but three from the western states. The vote was 30 in favor and 9 against the bill. In the house it received the votes generally of the republican members. The

vote was 78 to 63. The bill was afterward passed, upon a report of a conference committee of both houses in reference to certain amendments upon which there had been a disagreement.—The constitution of the United States provides that no state shall emit bills of credit, but it was decided by the supreme court in 1836, in *Briscoe vs. The Bank*, when there were 713 state banks in operation, with 281 millions of capital and 140 millions of circulation, 36 of which banks held 41 millions of public deposits and only 16 millions of other deposits, that a private corporation authorized by the state, which was the principal stockholder, could issue circulating notes which the state itself could not issue, and make them receivable for public dues. In 1861 the number of state banks had increased to 1,601, with a capital of 429 millions, and more than 10,000 different kinds of notes were in circulation, issued by the authority of 34 different states, under more than 40 different statutes. The right to issue such notes had obtained a firm foothold, and nothing but a great war could have brought about a revolution in this respect. The circulation of the banks was 202 millions, distributed as follows: ¹

In 6 eastern states	\$45,000,000
In 5 middle states	53,000,000
In 11 southern states.....	74,000,000
In 8 western states.....	30,000,000

There was, as has been seen, determined opposition to the interference with the right of state banks to issue circulating notes. But circumstances favored the substitution of the new issues in place of the old, which had become largely discredited, and which might have been classified as follows:

Stock secured banks.....	\$36,000,000
Chartered	90,000,000
Western banks discredited	22,000,000
Southern banks discredited.....	54,000,000
Total	\$202,000,000

The charters of the state banks of Ohio and Indiana, and of other banks, were about to expire, so that fully one-half of the bank issues of the country were either discredited or depended upon legislation for continuance.—The act of Feb. 25, 1863, and the subsequent act of June 3, 1864, which superseded the former, provided for the establishment of a national bank bureau in the treasury department, the chief officer of which is the comptroller of the currency, and authorized the issue of 300 millions of national bank notes to associations organized in compliance with law, and composed of any number of persons, not less than five. Circulation was authorized to be issued at a rate equal to 90 per cent. of the current market value, but not exceeding 90 per cent. upon the par value of United States bonds deposited. The notes are guaranteed by the government, and if the avails of the bonds deposited as security for circulation

¹ Report of Comptroller of Currency, 1876, p. 92.

are not sufficient for the reimbursement of the government, it is entitled to the first lien upon all the assets of the bank. The law provides that they shall be received by the government in payment of all taxes and other dues, except duties on imports, and payable for all debts or demands owing by the government, except interest on the public debt and in the redemption of national bank notes; and that each bank shall "take and receive at par, for any debt or liability to it, any and all notes or bills issued by any lawfully organized national banking association."—The effect of the passage of the act was to create a demand for the 6 per cent. bonds, which soon thereafter advanced from a discount of 7 per cent to a premium in the market. There was a delay in printing the notes, and no issues were made until Dec. 21, 1863. The act authorized the conversion of state banks; but the new system was not favored by them, and such conversions were not numerous until the passage of the act of March 3, 1865, which provided that every banking association shall pay a tax of 10 per cent. on the notes of any person or state bank used for circulation or paid out by them. The constitutionality of this act was subsequently affirmed by the supreme court. The comptroller, in his report for December, 1865, says that there were 731 conversions during that year, and that of the 1,601 national banks then organized, 922 were conversions from state banks. Nearly all banks in the New England states, and many in other states, became national associations, and during the following year nearly the whole 300 millions of circulation authorized (\$298,588,419) had been issued.—There was at this time more than 1,275 millions of temporary obligations of the government outstanding, 880 millions of which were in treasury notes, bearing interest at 7 30 per cent.¹ The banks soon thereafter held 440 millions of government securities, and the system was of immense service in funding this floating debt during the three years which followed the close of the war. The act of July 12, 1870, increased the authorized issue of national bank notes to 354 millions, and the largest amount outstanding at any one time was on Dec. 1, 1874, when it reached \$352,394,346. The act of June 20, 1874, authorized any national bank desiring to increase its circulation, to deposit lawful money with the treasurer in sums of not less than \$9,000, and to withdraw a proportionate amount of bonds held as security for its circulating notes, and under this act the circulation decreased in volume more than 30 millions during the next three years. The act of Jan. 14, 1875, repealed all previous laws restricting the aggregate amount of circulation, and since that date all banks have had the right to increase and decrease their circulation at their pleasure, subject to the restrictions of the act. The same act required the secretary of the treasury to retire legal tender notes to an amount equal to 80 per cent. of the national bank notes

thereafter issued. This provision was repealed on May 31, 1878, but not until \$35,318,984 of legal tender notes had been cancelled, which reduced the amount of legal tender notes from 382 millions to \$346,681,016, which is the amount now outstanding. The effect of the passage of the act was to reduce the volume, both of the legal tender and bank notes, and until May 20, 1881, the amount outstanding of the latter at any one time, was not equal to the 354 millions authorized by the act of 1870.—One of the most important requirements of the act is that the capital stock of every association shall be fully paid in. The organization of banks without capital, or with stock notes, was one of the great abuses of previous banking systems. At least one-half of the authorized capital stock must be paid in before a national bank can commence business, and the remainder in installments of not less than one-fifth monthly thereafter. The minimum capital of any bank is \$50,000, and such bank may be organized only in places having less than 6,000 inhabitants. In larger places the capital must not be less than \$100,000, and in cities whose population is 50,000, the capital must not be less than \$200,000. The proportion of capital to liabilities is much greater in this country than elsewhere, which is undoubtedly owing to the fact that the national bank act requires that the full amount of authorized capital shall be actually paid in. In England, as a rule, only a part of the capital is paid in; but in the limited banks the stockholders are individually liable for the full amount of their subscriptions, the stockholders of other corporations, not limited, being each liable for all the debts of the corporation.—Tables of the comptroller in his report for 1878, compiled from the London *Economist*, give the capital, surplus and liabilities of 3,417 banks in the United Kingdom, including the bank of England. The ratio of capital to liabilities of the 3,417 banks in the United Kingdom was 16.78 per cent., and the ratio of capital and surplus to liabilities was 23.07 per cent.; while the corresponding ratios of the national banks were 40.88 and 54.73, the ratios of the latter banks being in each instance more than double those of the United Kingdom.—The whole number of shares of national bank stock in 1876 was 6,505,930, and of shareholders 208,486.—It is not probable that the capital stock of any other class of corporations is so widely distributed among people of moderate means. The average amount of stock then held by each shareholder was about \$2,400. In the eastern states it was about \$2,100, and in the western states about \$4,800, and more than half the whole number of shareholders held each but \$1,000 or less of such stock, while 767 persons only held as much as \$50,000 each. It was distributed among residents in every state of the Union, in 11 countries or provinces of this continent, and in 25 countries of Europe, Asia and Africa.—The banks are prohibited from loaning money upon real estate or upon the security of the shares of their own capital stock, or on the

¹ Report of Comptroller of Currency, 1878, p. 33.

security of their own circulating notes or of legal tender notes, and from making accommodation loans to any person, company, corporation or firm, to an amount exceeding one-tenth part of their capital. They are also prohibited from borrowing money upon their own circulating notes, or becoming in any way liable to an amount exceeding their capital stock actually paid in, except on account of their circulating notes, their deposits and bills of exchange drawn against money actually on deposit, and liabilities to stockholders for reserve profits. Thus they are required to be lenders and not borrowers of money. They are restricted in the rate of interest which they may take to the rate allowed by the laws of the state in which they are located, and the penalty for charging a usurious rate of interest, as determined by the supreme court, is a forfeiture of the interest agreed to be paid, or, if actually paid, twice the amount may be recovered back by the person paying it.—The total amount of loans of national banks on Oct. 2, 1879, was \$875,013,107. The number of pieces of paper discounted was 808,269. The number of notes and bills of \$100 each, or less, was 251,345, or nearly one-third of the whole; the number of less than \$500 each was 547,385, or considerably more than two-thirds of the whole, while the number of bills of less than \$1,000 each was 642,765, more than three-fourths of the whole number. The amount of discounts in the New England states was considerably more than those of the western and southern states; but the number of loans in New England was only about one-half the

number in the south and west. The banks in New York city held 2,970 pieces of paper, in Boston 2,258, in Philadelphia 809, and in Chicago 322, of \$10,000 each and over; and the number of loans of this class held by these four cities was more than half of the total number held by all the national banks in the United States. The average amount of each discount was \$1,082.59. The average amount in New York city was \$3,062.13; in Boston, \$3,083; for the 228 banks of the principal cities it was \$2,930.90, and the average for the remaining banks, 1,820 in number, was \$685.85.—If the average time of all the discounted notes was 60 days, and the banks held continuously the same amount, the number of discounts made during the year would be nearly 5 millions, and the total discounts more than 5,000 millions, which would be equal to a discount of \$700 annually for each voter, or \$500 for each family in the country.—The comptroller is authorized to cause an examination of the banks at any time, and such examinations are to be made at least as often as once a year. Reports showing the detailed condition of the banks may also be called for, for any past date, and must be returned not less than five times during each year.—In Jan., 1864, there were 139 banks in operation, with a capital of 14 millions; in 1865, 638 banks, with a capital of 135 millions; in 1867, 1,648 banks, with a capital of 420 millions.—The following table exhibits the number, resources and liabilities of the national banks for eleven years at nearly corresponding dates, and upon May 6, 1881:

RESOURCES AND LIABILITIES.	Oct. 8, 1870.	Oct. 2, 1871.	Oct. 3, 1872.	Sept 12, 1873.	Oct. 2, 1874.	Oct. 1, 1875.	Oct. 2, 1876.	Oct. 1, 1877.	Oct. 1, 1878.	Oct. 2, 1879.	Oct. 1, 1880.	May 6, 1881.

—Banks are required to pay 1 per cent. tax upon their circulation annually, and $\frac{1}{2}$ of 1 per cent. upon their average deposits and upon

capital not invested in United States bonds. The total amount of this tax collected to July 1, 1880, was, on circulation, \$45,941,161; on deposits,

\$47,703,404; on capital, \$6,716,903; making an aggregate of \$100,361,469. Taxes are also imposed by authority of the state within which the

association is located. The table below gives the national and state taxation for the years specified therein:

YEARS.	Capital Stock.	United States Taxes.	State Taxes.	Total	United States.	State.	Total.
					Per ct.	Per ct.	Per ct.
1874	\$493,751,619	\$7,256,082	\$9,620,326	\$16,876,409	1.5	2.0	3.5

—The average amount of taxes paid during the past twelve years has been 16 millions, or considerably more than 4 per cent. upon the amount of circulation issued. The ratio of taxation, state and national, in the New England states, in 1879, was 2.7 per cent.; in the middle states, 3.6; southern states, 2.7; western states, 3.6. The rate of taxation in New York was 5.5; in Boston, 2.6; Philadelphia, 2.8; Baltimore, 2.5; Cincinnati, 4.3, Chicago, 5.8.—The law requires that each association shall, before the declaration of any dividend, carry to its surplus fund one-tenth part of its semi-annual net profits, until the same shall amount to 20 per cent. of its capital stock. It also prohibits associations from withdrawing, either in the form of dividends or otherwise, any portion of their capital, and requires that losses and bad debts shall be deducted from net profits

before any dividend shall be declared. If a bank suffers a loss greater than its accumulated earnings, there are but two courses open to it, so far as dividends are concerned. The first is to pass the dividend, and the other to pay an illegal dividend from the capital stock, which latter course would subject the bank to being declared insolvent and placed in the hands of a receiver. The capital and surplus together form the working fund of the bank, and the banks which make the largest dividends in proportion to their capital are those which have accumulated a large surplus. The amount of the surplus in 1865 was 17 millions; in 1870, 90 millions; in 1875, 131 millions; and on March 11, 1881, it was 122 millions of dollars. The ratio of dividends to capital, and to capital and surplus, for each of the last six years, has been as follows:

GEOGRAPHICAL DIVISIONS.	Dividends to Capital.							Dividends to Capital and Surplus.						
	1875.	1876.	1877.	1878.	1879.	1880.	Av'ge	1875.	1876.	1877.	1878.	1879.	1880.	Av'ge.

During the past five years the average number of banks semi-annually passing dividends on account of losses was 279. The average amount of capital of these banks was \$42,266,244, or nearly one-tenth of the total capital of all the banks. The aggregate losses which were charged off by the national banks in operation during the past five years, before declaring dividends, was more than 100 millions of dollars, about 20 per cent. of which it is estimated has been since recovered.—There are no means of definitely ascertaining the losses sustained through the failures of banks operating under the systems of the several states, prior to the establishment of the national banks. The losses under those systems, both to note holders, to whom there can be no loss from national banks, and to the general creditors and shareholders, is known to be large.—In "Elliot's Funding System" it is stated that in 1841, the total capital of the state banks being then \$317,642,692, and the circula-

tion outstanding \$121,665,198, 55 banks failed, with an aggregate capital of \$67,036,265, and a circulation of \$23,577,752; and in nearly every instance the entire capital of the banks which failed was lost. The comptroller of the currency, in his report for 1879, gives a table by states, showing losses amounting to \$32,616,661 sustained by creditors of 210 state and savings banks and private bankers, during the three years ending Jan. 1, 1879.—Since the establishment of the national banking system, 86 national banks have become insolvent and have been placed in the hands of receivers, who are appointed by the comptroller, and are required to report to him their transactions. The total amount of claims proved by the creditors of these banks is \$25,966,602, of dividends paid thereon, \$18,100,818. The estimated losses to creditors from the failures of national banks, during the 18 years since the passage of the original national banking act of 1863, have not ex-

ceeded \$6,240,000, and the average annual loss has therefore been about \$346,000.—Of the 86 failures of national banks, 6 were those of banks located in New York city, having a capital of \$2,700,000. The amount of claims proved by the creditors of these banks was \$5,585,049. Four of them paid dividends amounting to 100 per cent., and the average dividends of the 6 were 98 per cent. of the claims proved against them. Twenty-one of these insolvent banks have paid their creditors in full, and 40 have paid more than 75 per cent. The average expense of settling the affairs of the banks in the hands of receivers has been about 7 per cent. of the total amount of cash collected.—The individual liability of shareholders of insolvent banks has been enforced in 53 instances, and about \$2,700,000 has been collected from this source. The law provides that the shareholders of every national bank shall be held individually responsible, *equally and ratably, and not one for another*, for all contracts, debts and engagements of the association, to the extent of the amount of their stock therein, at the par value thereof, in addition to the amount invested in such shares.—The supreme court of the United States has decided "that in the process to be pursued to fix the amount of the separate liability of each of the shareholders, it is necessary to ascertain (1) the whole amount of the par value of all the stock held by the shareholders; (2) the amount of the deficit to be paid after exhausting all the assets of the bank; (3) then to apply the rule that each shareholder shall contribute such sum as will bear the same proportion to the whole amount of the deficit as his stock bears to the whole amount of the capital stock of the bank at its par value." The limit of the shareholder's liability is, however, the par value of his stock, and the insolvency of one stockholder does not in any way affect the liability of another.—The percentage of circulating notes unredeemed of 15 national banks which failed previous to 1870 is 0.75 per cent. of the amount issued. The total circulation issued to 23 national banks, which include the 15 banks already mentioned, that failed previous to 1870, was \$3,196,693, and the proportion of notes remaining unredeemed is 1.43 per cent. of the amount issued.—It is estimated that the ultimate loss to the people from the destruction of these notes, or from failure to present them for redemption, will be from 1 to 1½ per cent. This amount of loss will be a gain to the government, and not to the banks, and will, if this estimate is correct, amount to from 3½ millions to about 5 millions during each period of 20 years.—No notes of a less denomination than five dollars have been issued to the banks since the date of resumption of specie payments, as provided by law, and the amount of ones and twos since that date has been reduced \$5,033,185. The increase of legal tender notes of these denominations since that date has been \$3,518,060. The following table gives the amount of each denomination of these notes that were outstanding on April 1, 1881:

DENOMINATIONS.	National Bank Notes.	Legal Tender Notes.	Aggregates.
Ones	\$ 1,811,494	\$22,049,948	\$ 23,861,442
Twos	873,168	21,761,746	22,633,914
Fives	99,434,370	68,596,604	168,030,974
Tens	116,250,470	76,923,673	193,174,303
Twenties	77,521,561	72,515,025	151,036,585
Fifties and over	50,047,625	84,834,860	134,882,485
Totals	\$345,938,557	\$246,681,016	\$592,619,603

—The laws governing the national banks, as has been seen, contain numerous restrictions. They also prescribe many and severe penalties for their violation. The only privilege they have over other banks is the right to issue circulating notes. —The profits of a well conducted bank are not derived mainly from circulation, but from the use of deposits; and national banks at the present time are not organized so much on account of the profits upon circulation, as for the reason that these institutions have established a character which is of value to them in the accumulation of deposits.—The amount of interest received by the national banks from the United States bonds held as security for their circulation, and on which circulation has been actually issued, is much less than is generally supposed. On 10 per cent. of the bonds on deposit with the United States treasurer to secure circulation the banks receive interest, without other privileges, in the same manner as any other holder of United States bonds. Thus while the bonds held to secure circulation by the banks in operation on Aug. 1, 1881, amounted to 358 millions of dollars, the total amount of bank notes issued on these bonds was 321 millions only. On the difference of 37 millions of dollars the banks have no special privilege over any other bondholder.—There are national bank notes outstanding in excess of the 321 millions mentioned, but such notes are those of insolvent banks and of those retiring circulation, and are not secured by bonds, but are provided for by a deposit of an equal amount of legal tender notes, in the United States treasury, where they are redeemed and canceled when presented.—Of the bonds securing the notes of the banks in operation, 92 millions consist of 4 per cents., 32 millions of 4½ per cents., 229 millions of 3½ per cents., converted from 5 and 6 per cents., 3½ millions of Pacific railroad 6s., and the remainder, amounting to 5½ millions of called 5 per cent. bonds, upon which interest will cease on the 1st day of October, 1881. The 4 per cent. bonds are now selling at a premium of about 16 per cent., and at this rate do not net the holders 3½ per cent. It is therefore fair to say that for future years the national banks will not as a rule receive as much as 3½ per cent. in interest upon the United States bonds held as security for their circulating notes outstanding.—The banks are required to pay a tax of 1 per cent. on circulation, to keep on hand with the treasurer an amount of lawful money equal to 5 per cent. of such circulation,

and to pay the expense of redeeming the same as it is presented.—The following table shows the profit on an investment in bonds to secure circu-

lation, when the bonds bear interest at 4, 3½ and 3 per cent., and the rates for bank loans are as specified:

	5 per cent.	6 per cent.	7 per cent.	8 per cent.	9 per cent.	10 per cent.	11 per cent.
4 per cent. bonds at 15 per cent. premium	1.54	1.25	.95	.66	.36	.07	.23
3½ per cent. bonds at 2 per cent. premium	1.69	1.53	1.36	1.20	1.01	.87	.70
3 per cent. bonds	1.29	1.14	1.00	.85	.71	.56	.41

—The profit is greatest when the bank rate of interest is least, for the reason that the bank receives 10 per cent. less in circulation than it deposits in bonds. If a bank has a capital of \$100,000, it receives \$90,000 only in circulating notes. If the bonds are 3½ per cent. and the commercial rate of interest 10 per cent., there is a loss of 6½ per cent. on the margin. If the commercial rate is 6 per cent., then the loss is 2½ per cent., instead of 6½ as in the previous case. —In the computation on which the foregoing table of profits is based, the amount of the 5 per cent. reserve which banks are required to keep on their circulation has been deducted from the loanable circulation. But this reserve on circulation is also allowed to form part of the reserve on deposits. If it is not deducted from the loanable circulation, the profits of the bank from this source are somewhat increased.—The premium on the bonds will disappear if they are held until paid by the United States. The bank holding such bonds until maturity will consequently lose the premium. In the case of the 4 per cent. bonds, the loss of 16 per cent. will be distributed over 26 years, making a loss of a little over ½ of 1

per cent. per annum, to be deducted from the profits in the table. The 3½ per cent. bonds, continued in the place of the 6s, being redeemable at the option of the government, the banks holding them are liable to lose the 1 per cent. premium at any time. If a 3 per cent. bond be issued, a bank taking it at par and holding it till maturity would experience no loss; but if at any time prior to maturity the bank should desire to liquidate its affairs, a loss would arise if the 3 per cent. should then be worth less than par.—The national banks in 16 of the principal cities are required to keep a reserve of 25 per cent. upon deposits, half of which, except in the case of New York city banks, which are required to hold all their reserve in lawful money, may be on deposit with other national banks in the city of New York.—The banks outside of these cities are required to hold a reserve of 15 per cent. upon deposits, three-fifths of which may consist of balances with their correspondents in the reserve cities. The following table exhibits the amount of net deposits, together with the amount and classification of reserve, held by the national banks at the dates mentioned:

DATES.	Number of Banks.	Net Deposits.	Specie.	Other Lawful Money	Reserve Agents.	Redemption Fund.	Ratios.
		Millions.	Millions.	Millions	Millions.	Millions.	Per cent.
October 1, 1875	2,037	734.1	8.1	125.2	85.6	16.2	32.0
October 2, 1876	2,089	706.6	21.3	113.4	87.4	14.6	33.5
October 1, 1877	2,080	669.1	22.8	100.2	73.3	14.5	31.5
October 1, 1878	2,053	678.8	30.7	97.0	85.1	15.3	33.6
October 2, 1879	2,048	768.9	42.2	95.9	107.0	15.8	33.9
October 1, 1880	2,090	983.0	108.2	64.3	134.6	15.9	33.4
May 6, 1881	2,102	1,049.2	121.4	70.6	128.0	15.6	32.0

From this table it will be seen that the amount of reserve held largely exceeded the amount required.—It is estimated by the best authorities that the joint stock banks in England and Scotland do not hold exceeding five per cent. of their liabilities in ready money; the remainder of their reserves being largely invested in English consols, or deposited in the bank of England.—The amount of cash reserves held by the national banks in this country is usually more than 12 per cent. of their liabilities. The banks held on

Oct. 1, 1875, more than 133 millions of lawful money, of which only about 8 millions was in specie, the remaining 117 millions being in legal tender notes; and on Jan. 1, 1879, the date of the resumption of specie payments, the banks held nearly 100 millions of legal tender notes. The average value of the legal tender paper dollar on July 1 of each year from 1864 to 1878, and on Jan. 1, 1879, which was the date of the resumption of specie payments, will be seen in the following table:

1864.	1865.	1866.	1867.	1868.	1869.	1870.	1871.	1872.	1873.	1874.	1875.	1876.	1877.	1878.	1879.
cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.	cts.
38.7	70.4	66.0	71.7	70.1	72.5	85.6	89.0	87.5	86.4	91.0	86.2	89.2	94.5	92.4	100.0

On Oct 1, 1880, the amount of specie, consisting of \$102,851,032 of gold coin and \$6,495,477 of silver coin, was more than 109 millions, and the amount of legal tender notes 64 millions. The amount of specie held on May 6, 1881, was 122 millions, and of legal tender notes 70 millions. This large increase of specie is owing to the gold production of the mines, which, since the date of resumption, is estimated to have been \$72,000,000,

and to the excess of imports of gold over exports, which, in the same period, has been \$150,241,747. The following table exhibits the total amount of paper currency, and the estimated amounts of gold and silver coin in the country on Nov. 1, 1880, together with the amount of each then in the treasury of the United States, in the national banks, in the state banks, and in the hands of the people at that date:

	Gold.	Silver.	Paper.	Total.
In the treasury	\$133,679,349	\$77,977,149	\$ 26,846,826	\$238,503,324
In national banks	102,851,032	6,495,477	86,439,923	195,786,434
In state banks	17,162,130	42,901,474	60,063,604
Elsewhere	200,379,519	73,798,701	584,326,698	808,505,118
Totals ..	\$454,012,030	\$158,271,327	\$690,515,123	\$1,302,798,480

—From the date of resumption to that of the table, the gold in the treasury had increased \$20,976,007, in the banks \$73,976,149, while the paper currency has decreased \$50,768,829, and in the banks \$37,008,585. The increase of gold in the hands of the people had been more than 80 millions, and of paper currency more than 108 millions, since that date.—The amount of silver coin was but 6 millions, which would be largely increased if the number of standard silver dollars to be issued were limited in amount, and the number of small legal tender notes outstanding diminished.—During the next two years the legal limit of the existence of a considerable number of the national banks will expire, and congress will be asked to extend their existence for a second period of 20 years. In the absence of prohibitory legislation by congress, many of these banks will probably go into liquidation, and reorganize again under the same system.—If at any time the national bank system should be discontinued, it is probable that the provision imposing a tax of 10 per cent. upon state bank notes would be repealed. These notes would then again be issued under laws now existing, or under new laws enacted for that purpose. These various

state issues would not all be secured or redeemed at any one point, and the loss and exchange upon such notes would again be a burden to the business interests of the country: the cost of exchange between the various commercial points of the country, at the rate of $\frac{1}{2}$ of 1 per cent., being estimated at not less than 20 millions annually. If the government, as has been proposed, should issue the entire paper currency, now amounting to nearly 700 millions, it should maintain a coin reserve equal to that of the bank of England or the bank of France, which is not less in either case than one-third of its issue. Interest upon this reserve at $3\frac{1}{2}$ per cent. would exceed 8 millions, and if to this is added the expense of the issue and redemption of the notes, the total amount would considerably exceed the profit upon the circulation of the national banks now outstanding. The preference of the people for paper money instead of coin is exhibited in the last table, and there is danger that if the government, under authority of future legislation, should assume the right to the exclusive issue of the circulating notes, it might extend such issues beyond the bounds of prudence, and again involve the country in a new suspension of specie payments.

YEARS.	National Banks.			State Banks, Private Bankers, etc.			Savings Banks with Capital.			Savings Banks without Capital.		Total.		
	No.	Capital.	Deposits	No.	Capital.	Deposits	No.	Capital.	Deposits	No.	Deposits	No.	Capital.	Deposits
1876.....	2,091	500 4	713.5	8,803	214.0	480.0	26	5.0	37.2	691	844.6	6,611	719.4	2,075.3
1877.....	2,078	481.0	768.2	8,799	218.6	470.5	26	4.9	38.2	676	843.2	6,579	704.5	2,120.1
1878.....	2,056	470.4	677.2	8,709	202.2	413.3	23	3.2	26.2	668	803.3	6,456	673.8	1,920.0
1879.....	2,048	455.3	718.4	8,689	197.0	397.0	29	4.2	36.1	644	747.1	6,360	656.5	1,893.5
1880.....	2,076	455.9	900.8	8,798	190.1	501.5	29	4.0	34.6	629	783.0	6,532	650.0	2,219.9

—The above table exhibits for corresponding dates in each of the last five years, the aggregate amount of capital and deposits of national banks, state banks and savings banks of the United States.—Included among the state banks in the total for 1880 there are 2,802 private bankers, employing a capital of \$26,120,000, and having deposits amounting to \$182,670,000.

JOHN JAY KNOX.

BANK NOTES. We do not propose here to examine the part which bank notes play in the circulation of wealth, nor to inquire how far and in what cases they deserve the name of paper money which is sometimes given to them. We purpose only to show what constitutes a bank note, and how it may be recognized.—A bank note is made payable to the bearer, whoever he

may be; it is also payable at sight or on presentation, no time being set when it shall fall due.—Such are the two requisites of a bank note which essentially distinguish it from all other classes of commercial paper. All other paper falls due at a fixed date stated on its face, and can be transferred only by indorsement, so that the actual bearer is always required to show the signature of the transferer. A bank note may pass from one hand to another without indorsement, and is made payable any day.—It has been contended, however, that a bank note should bear on its face something more. Emile Vincens, a distinguished French lawyer, says that a note made payable to the bearer and at sight, requires something else to make it a bank note. It would not, he says, be entitled to this designation, if it were issued by a private house or a simple merchant. There is some truth in this statement.—It is certain that the bank note, viewed in its material conditions, has no other distinctive character than that which we have described; but it is none the less true that the bank note derives part of its power, and consequently part of its virtue, as a circulating medium, from the character of the establishment whence it is issued. If it were issued by a private citizen, it would hardly be accepted by the public; it could not be made to pass for ready money, and it would always be returned to the office whence it was issued, to be converted into specie. It would then but poorly answer the purpose intended by it. The attempt has been made in some countries, especially in Scotland, where the issuance of so-called bank notes is optional with everybody; and it has proved that an operation of this nature is not safe for individuals or private business firms, however wealthy they may be. It is not safe even for corporations organized on a small scale. In England, by virtue of a clause introduced in the charter of the bank of London, in 1708, the issue of bank notes was forbidden to companies composed of more than six partners. The consequence was that small companies which engaged in these operations were exposed to frequent disasters. But this does not affect the character of a bank note the essential requisites of which, that it be payable to the bearer and at sight, always remain the same.—We may inquire whether it is a great advantage to a banking house to possess the exclusive power to issue notes of this kind, and whether this exclusive right is an important privilege of the bank. There can be no doubt about this. No other form of obligation presents the same advantages to the company which issues it. Notes made payable to the bearer and at sight, are the only ones which can circulate everywhere without any drawback or disadvantage, and which, therefore, can remain in circulation for an indefinite time, answering the same purpose as specie. The exclusive right to issue notes payable to the bearer and at sight, is therefore equivalent to the exclusive right to raise a public loan, by substituting notes for coin in the circulation.

CHARLES COQUELIN.

BANKRUPTCY. The constitution of the United States gives power to congress to establish uniform laws on the subject of bankruptcies throughout the United States. When the constitution was adopted, the English law divided the general subject into two parts, insolvency and bankruptcy; which were administered by different courts, and to some extent upon different principles. The insolvent law was applied to persons who were imprisoned for debt, and who asked for a discharge from prison upon a surrender of all their property; the bankrupt law was applied only to traders, and always upon the suit of their creditors against them—never upon the application of the debtors. Not only the person but the debt was discharged. In respect to surrender of property and its division among the creditors, the two systems were alike. It was strenuously insisted in congress, in 1840, that the word “bankruptcies” in the constitution was to be understood in a technical sense, and that the legislature had no power to provide a system of bankruptcy for persons who were not traders, nor to permit debtors to begin the proceedings by their own voluntary petition. This opinion has not prevailed, either in congress or in the courts. It is now fully established that the grant of power is broad enough to permit congress to provide for the settlement of the affairs of all insolvent debtors. At the same time a statute of bankruptcy practically is part of the commercial law, and is hardly needed in purely agricultural communities.—The power of congress over this subject has been exercised but three times, in 1802, 1840 and 1867. The two former acts were short lived, the last was in operation eleven years, and since its repeal many of the merchants of the country have discovered that it was highly useful and they are trying to procure the enactment of a new one.—If we may judge by the practice of commercial nations, a bankrupt law is almost a necessity for them.—The great leading ideas of all such laws are two: to divide the property of an insolvent debtor equally among his creditors, and to discharge the insolvent from his debts. The former of these provisions is universally admitted to be both just and expedient, but there is not a very obvious justice in the latter, and it rests upon expediency alone. To take from a creditor a part of a debt which is his property, without full remuneration, can only be defended upon grounds of a public nature, and upon the theory that if an insolvent debtor is to remain under the load of his obligations, his creditors are likely to obtain little or nothing from him, while, if he is freed, the community will have the benefit of his renewed industry and enterprise. To reconcile, as far as may be, these conflicting interests, it is usually provided that a fraudulent debtor shall not receive his discharge, the renewed industry of such a person not being considered valuable; and also, that the creditors should be consulted, and that a considerable part of them should consent to his discharge. In France the law adds, by way of discouragement

to bankruptcy and the reckless trading which causes it, and of inducement to a subsequent payment when possible, that a discharged bankrupt, however honest he may have been, and however nearly unanimous may have been the consent of his creditors to his release, shall be under certain civil disabilities, implying a sort of disgrace, until he shall have paid all his old debts, with interest. His creditors have no legal claim against him, but the public authorities institute this moral sanction. Something of this kind is now proposed in England in a modified form, and limited to magistrates and members of parliament becoming bankrupt.—If it be granted that a careful and judicious bankrupt law is useful in commercial countries, such a law can be provided only by congress. The courts of the several states give precedence to their own citizens who, as creditors, attach or seize the property of an insolvent debtor, over an assignee or trustee for all creditors equally, including their own citizens, who claim under a decree in bankruptcy made in another state, and this whether the seizure is made before or after the date of the decree. So long as this selfish policy prevails, and there is no reason to expect its speedy disappearance, no state law can effect an equal division to creditors of the property of a bankrupt, if any part of it happens to be found out of the limits of that state.—Again, no state has power, under the constitution of the United States, to discharge a debt due to the citizen of another state or country, unless the creditor chooses to come in and prove his debt in the bankrupt court. For these reasons the states can not pass effectual laws upon the subject of bankruptcies.—That congress will be urged, and at some time persuaded to pass another bankrupt law, is as certain as that the number of undischarged debtors in the several commercial states will increase with the lapse of time. The pressure of this class, many of whom are worthy and estimable persons, broken by misfortune, induced the passage of the statutes which have been passed. But it will be much wiser in congress to frame such a law carefully and deliberately with a view to permanence, before the pressure becomes extreme. Such action has lately been advocated by large and influential bodies of merchants, and a committee of the senate has been appointed to consider the subject. What should be the provisions of such a law?—It has been found that the creditors of a bankrupt can not afford to follow up the proceedings in court, or, at any rate, that they will not. They do not wish, as they say, "to throw good money after bad." If they do not, there is great danger that the assets will be wasted in litigation, in fees, and in various ways. In the latest English law a mode of settlement called liquidation can be used by the creditors, and the estate is supposed to be wound up as they may wish; but it is found that the debtor can obtain proxies and votes with great ease, and virtually control his own winding up. This has led to vast abuses, and will, probably, be very much modified. So under our late stat-

utes, as amended in 1874, the creditors could vote for a composition, and here it was found that the debtor could contrive to obtain votes for almost any composition. A bankrupt law, therefore, should be provided with some machinery which will act without being put in motion by the creditors. In a scheme for a statute lately presented to congress, it is proposed that a salaried officer, like a bank, or insurance commissioner, should be appointed in each circuit, whose sole duty it shall be to provide the supervision over the speedy and economical settlement of bankrupt estates, which the creditors can not be relied upon to furnish.—Another practical difficulty in the working of these laws arises from the selfishness of creditors. In every important bankruptcy, there are some creditors who are determined to attain an advantage over the others, and they will resort to threats and promises and all other means to attain their object. Thus, if the question is of consenting to a composition or to a discharge, these men will insist on being paid for doing what the other creditors are willing to do. In the scheme of a law, above mentioned, a creditor who takes such an advantage is held criminally responsible. This is new; and it is supposed that one or two convictions of creditors, under such a law, would have quite an influence in discouraging this disgraceful practice. The waste and dissipation of assets which was complained of in some quarters, and not without justice, when the act of 1867 was in operation, could best be checked by paying all officers, such as registers in bankruptcy, by salary instead of by fees. The expenses could be reimbursed to the United States by definite payments, as for instance, a fee upon beginning a proceeding and by a specific tax upon the assets.—In the United States the federal courts are not familiar to the great body of lawyers and of clients. Their jurisdiction is limited, and their ways are not fully understood. It is highly important that their administration in bankruptcy should be rendered familiar and easy, and to this end it is proposed that the registers in bankruptcy should have considerable judicial powers, subject to appeal, and should be required to hold frequent sessions, at convenient times and places, for the accommodation of suitors.—The vexed question of the discharge of debtors remains to be considered. Most laws, as I have said, provide for a control of this matter by the creditors. It has, however, been found that certain creditors, the most avaricious and the least scrupulous, will take advantage of any power which may be given them over the debtor's discharge by exacting terms from him, either of present payment or of promises for the future. The English statutes, of late years, have declared all such promises to be void, and it is seriously doubted whether it is expedient to give creditors any arbitrary power in the matter. The latest proposition to congress contained the suggestion that every bankrupt who can not be proved to have committed a fraud or wrong upon his creditors, should have a free discharge,

but the creditors might vote that the assignee, as their representative, rather than the creditors individually, should undertake the duty of opposing the discharge of a fraudulent debtor.—It might be wise to impose some disabilities upon discharged debtors until they should pay their debts, as in France; or to refuse a discharge to those who could be proved to have traded recklessly and wantonly after a knowledge of their insolvency; or to fix a minimum of dividend without the payment of which there should be no discharge. So far as we have been able to gather the opinions of persons interested in the question in this country, it is in favor of a liberal policy in the discharge of debtors who have been honest in their dealings.—The mode of discharge by payment of a composition, accepted by a considerable proportion of creditors, and thereby made binding upon the minority, has been already referred to. It has the great advantages to creditors, of speed and certainty, and to debtors of restoring them, promptly, to the control of their affairs. It is the only mode of discharge practiced in France. It needs, however, to be very carefully guarded, in order that the apathy of some creditors, or the rapacity of others, may not produce great inequality and injustice. It is necessary, therefore, to provide for a thorough examination into the affairs of the bankrupt, in order to see that his offer is large enough, and for a very careful supervision by the court, to see that all creditors are treated alike, and that a composition offered shall be promptly and faithfully carried out. No mere promises of payment should be accepted without full security for their performance.

JOHN LOWELL.

BANKRUPTCY, National. The private individual who borrows money, generally for productive purposes, is not always in a position to discharge his obligations to his creditors. Unforeseen circumstances may have interfered with his business operations; imprudence and bad faith may have diverted the loan from its rightful destination, and prevented the subsequent restoration of the capital he owed to the lender. What wonder is it then, that states which borrow nearly always for unproductive purposes, or even with destructive objects in view, have so often been placed in such a condition that it was impossible for them to meet their liabilities? The state has this poor advantage over the private citizen: no action at law lies against it, especially when its refusal to pay becomes general, and extends to all its obligations. In former times the state had, besides, the privilege of robbing its creditors without seeming to do so. To accomplish this, all it had to do was to debase the coinage. Shortly after the first Punic war, the government of Rome reduced the *as* from twelve ounces of copper, which it contained, to two ounces only. With the sixth part of the sum which the government really owed, it thus paid the debts incurred during the war. This

kind of *legerdemain* has been frequently practiced since the beginning of the Christian era. We can hardly mention a country that has not resorted to this sort of trickery at one time or another. It is still, to this day, a mode of liquidation or redemption which obtains in eastern countries. Sometimes governments made use of artifice in the matter. They debased the coinage, not by the manifest and tangible reduction of its weight, but by misrepresentation on its face. Sometimes, for instance, the government paid in silver crowns with a copper alloy of 40 per cent., a loan which had been contracted on the basis of crowns with an alloy of only 10 per cent. For some time this ruse prevented the inexperienced from detecting the fraud.—The adulteration of the currency had the serious drawback of causing an endless series of dishonest acts by the inhabitants of the country. The adulterated money being used to settle private accounts, the national treasury was not the only defrauder; every creditor was robbed by his debtor. It was almost a step for the better when governments took the resolution to repudiate their debts more openly and heartlessly. They had the lamentable effrontery to carry this resolution into effect in the middle ages, and up to the eighteenth century. They borrowed as much as possible from the Lombards and the Jews, the great bankers and money lenders of that period, and then drove them out of the country as criminals, and confiscated their property. The compulsory conversion of the Jews to Christianity sometimes exempted them from expulsion. Their conversion, of course, saved their souls, but it saved neither the outstanding debts due to them nor their hoarded treasure. When the Lombards and the Jews had made room for native Christians in the financial marts, the national treasury met the claims of its creditors by periodical "blood-lettings," or forced levies on the property of the citizens. The most honest and upright ministers of the French monarchy, such men as Sully and Colbert, were not the least violent in the measures taken by them to reduce or cancel the indebtedness of the government; to pay its creditors in *lettres de cachet* by seizing their property and by sending them to work in the galleys. The regency was inaugurated by the revival of the so-called chamber of justice, whose province it was to cause contractors, purveyors and other persons to disgorge the money they had received or were to receive from the national treasury. The restoration of this tribunal by the duke of Noailles, was preceded by the establishment of the *visa-bureau*, or auditor's office, whose "examination" of accounts reduced the floating debt from 600,000,000 francs to 250,000,000. It had been preceded, likewise, by the pretended monetary reform which debased, by one-fifth, the intrinsic value of the silver coin of the realm. Thus were different kinds of national bankruptcy introduced. Recourse was had to the same measures after the disastrous results of John

Law's enterprise. Subsequently the celebrated abbé Terrai, minister of finance, a man in every respect worthy the reign of Louis XV., proclaimed to the world the necessity and the legitimacy of a nation's going into bankruptcy at least once in every century. Before him, Richelieu had urged the expediency of a decennial re-examination of claims upon the national treasury. These claims, certainly, were not always genuine. Sometimes they were not very authentic, and emanated from suspicious sources; at other times they were burdened with exorbitant usurious interest. But, we may ask, was the lender here more guilty than the borrower? These shameful transactions could produce upon the public credit only one effect, namely, that of raising the premium charged for risk, which the lender then added to the price of money. The states which, like Great Britain and the United Provinces where the principles of liberty and equity prevailed, put an end to these perfidious practices, were the only ones that enjoyed good credit.—But these bankruptcies, under the ancient régime, affected directly only a rather limited number of persons. They affected the contractors, large and small, to whom the treasury was indebted, the parties to whom these contractors had transferred the treasury's promises to pay, and other evidences of national indebtedness, together with the capitalists who had consented to make direct advances to the national treasury. In order that the bankruptcy of the treasury might become a really national calamity, and affect all citizens to a greater or less extent, a wider circulation of government paper was necessary, and it was necessary, above all, to discover a means of borrowing from the people generally without their consent. Paper money furnished this means. Modern history affords us several instances of this kind of public bankruptcy. There is the case of France, Austria, Spain, Mexico, and some of the states of the American Union. That of France and of Austria was the consequence of the events which followed the great French revolution. In both those countries the national bankruptcy affected the fundholders—the direct, voluntary creditors of the government, and also the holders of paper money—the indirect, involuntary creditors of the government.—In France, the nation's bankruptcy grew out of the excessive issue of assignats. When, at last, the law of the 29th Messidor, year IV., did away with the compulsory circulation of the assignats, that is to say, with their circulation itself, since nobody accepted them voluntarily, the amount issued had reached the almost incredible figure of 45,578,810,040 livres—about \$8,432,079,857. We can easily divine what was the value of this mass of waste-paper. The extent to which the assignats had depreciated was officially fixed by the law of the 5th Messidor, year V., proposed by the *Conseil des Anciens* “to devise rules to govern in the case of business transactions entered into while the

depreciation of the currency lasted.” According to the tabulated statement of the value of the assignats, drawn up for that purpose, and which, be it remarked, rather extenuated than exaggerated their falling off in value, it appears that when the assignats were done away with at the beginning of the year 1796, 24 livres in specie brought from 5,000 to 7,000 livres in paper money. The law which authorized the issue of the *mandats*, of which 2,400,000,000 livres were issued between March and September, 1796, fixed their value at 80 times that of the assignats. In other words, 1,000 livres of the *mandats* represented 30,000 livres of the assignats, while the same thousand livres of *mandats*, as soon as they appeared in open market, were worth only from 100 to 120 livres in metallic money! This general bankruptcy was soon followed by another, less extensive in its character, and which involved the holders of government securities. It was called the *Liquidation Ramel*, after the cabinet minister who was the author of the law of the 24th Frimaire, year VI. This law provided that all perpetual and life annuities owed by the state, as well as all other state debts, old and new, should be redeemed to the extent of two-thirds, in vouchers payable to the bearer, with the superscription: *Dette publique mobilisée*. As these vouchers, from the moment they were issued, lost from 70 to 80 per cent. of their value, it soon became impossible to keep them in circulation at all; and hence fundholders, pensioners, contractors and other creditors of the state lost two-thirds of their claims. Nor was the remaining third paid them. It was called the “consolidated debt,” and bore 5 per cent. interest. This last third, known as the consolidated third, was the origin of the national debt of France.—While France, recovered from the violent shocks caused by the revolution, was placing her own finances on a sound basis, the wars of the empire and the immense sacrifices which they entailed on all Europe, produced the greatest disturbance in the financial condition of other states. In England, where the sacrifices had attained fabulous proportions, these losses were borne with comparative ease, thanks to the inexhaustible resources of the country, and to its solid, well-established credit at home and abroad. It was otherwise in Austria, whose national wealth was not so fully developed, and whose finances were in an embarrassed state, even before the outbreak of the wars of the empire. When Joseph II ascended the throne the national debt amounted to 283,000,000 florins, and there were upward of 7,500,000 in *bankcettel*, or bank notes of a low denomination, in circulation. The war with Turkey swelled the debt to 372,000,000 florins, while the paper money circulation (*circulation fiduciaire*) rose to 28,000,000. The enormous expenses and the crushing reverses which attended the wars with Napoleon were Austria's total financial ruin, and obliged the government to have recourse to every possible expedient to raise money. At the begin-

ning of the year 1811 the actual national debt had reached over 700,000,000 florins, and the paper money in circulation was largely in excess of 1,000,000,000 florins. This had so shrunk in value that 1,500 florins in paper were given in exchange for 1 florin in silver. After the peace of Vienna, which deprived the state of its finest provinces, Austria was less than ever in a condition to pay its debts. On Feb. 20, 1811, the imperial decree was issued to legalize, so to speak, *de facto* bankruptcy. The decree reduced the paper money (1,060,000,000 florins) and the baser coin (330,000,000 florins) to one fifth of their nominal value, and also lowered by one-half the interest on the consolidated debt. The paper money was withdrawn from circulation, and new vouchers were issued in its place (at the rate of 1 to 5 florins in *bankozettel*, bank notes,) the issue of which was never to exceed, in the aggregate, one-fifth of the *bankozettel* withdrawn from circulation. But this limit was soon exceeded in consequence of the wars of the years 1812 to 1815. In 1816 the amount issued had risen again to 639,000,000, while the paper money had depreciated to 28 or 29 per cent. of its nominal value. One hundred florins in *bankozettel*, replaced in 1811 by 20 florins in vouchers, were, therefore, worth in 1816 only 5 or 6 florins in specie. Advantage was taken of the creation of the national bank to bring order out of this state of chaos. The bank was authorized gradually to call in the paper money, and to substitute for its own notes, convertible on presentation into specie. It was provided that 250 florins in paper money should be equivalent to 100 florins in specie. The holders of the evidences of the public debt were paid at the same rate.—Is it necessary to call attention to the prodigious losses which such a catastrophe involved, and from which no class, we may say no individual, was exempt? There are writers who have striven to extenuate the gravity of national bankruptcy, and almost to give it the sanction of law. They argue that as the declaration of the fact of insolvency comes only as a consequence of the state's want of credit during a long period of time, and after a gradual depreciation of paper money, the loss in the end is really less heavy than it seems to be. The holder of the government paper at the fatal moment of the national bankruptcy, acquired it at a price quite as low as, perhaps even lower than the rate at which the insolvent treasury now holds it. Partial loss has long since been suffered by those through whose hands this paper has successively passed, while its holders, at the time of the bankruptcy, lose little or nothing. Even admitting this to be a fact, does it in any way extenuate the perfidy of bankruptcy in itself? Take the case of a merchant who fails with liabilities of a million. His financial condition or his bad faith has been suspected for two months, say, by his creditors; and they have sold his paper without indorsement, at a loss, let us suppose, of 50 per cent. Is his bankruptcy to be condemned any the less in law or

morals, because, in this way, the loss of a million of which he has defrauded others is distributed among his original creditors and the buyers of his paper at a discount? The declaration of insolvency on the part of the state is not the only thing to be blamed and regretted; quite as deplorable and blamable is the loss caused by the gradual depreciation which precedes national bankruptcy itself.—Fortunately the terrible evils which we have just mentioned are hardly possible in our day. Revolutions are less frightful and wars less protracted in our generation, than they were during the exceptional period from 1798 to 1816. Now, national resources are, as a rule, better developed, national finances are better managed, taxation and credit are better able to meet even exceptional demands. At the present time public opinion has more power to prevent unwise and ruinous outlays on the part of states. Barefaced national bankruptcy is left to such countries as Peru, Venezuela and Mexico. Still, cases of national bankruptcy, sometimes protracted in duration, occasionally occur in Europe. With the present system of public debts, when the principal is not paid and the interest alone represents to the capitalist the money he has loaned, the failure to pay accrued interest is an act of bankruptcy. When, for example, Spain refuses to pay the interest, or pays only a ridiculously small interest to a part of her creditors; or when Austria discharges in depreciated paper money the debts contracted on a metallic basis, they, in fact, repudiate the whole or a portion of the principal debt. The destruction of the debtor's credit is, and always will be, the first and inevitable consequence of such dishonesty. It is with the state as with the private individual: dishonest management is the costliest management. Hence, open or covert bankruptcy, be it total or only partial, is an abominable piece of speculation, and a wicked act as well. It is so in a higher degree in public affairs than in private transactions. With good laws, one might in some cases give credit even to a dishonest man. The law and the courts of justice will enable him to triumph over the bad faith of the latter. But it is not so in the case of the state. For the very reason that states have the power to be bad creditors, their desire to be honest should be above suspicion. Otherwise there could hardly be any national credit.

J. E. HORN.

BANKS. When through the indefatigable industry of the North American settler, a new town springs up amid the forests of the northwest, a bank is immediately established side by side with the church and the printing office, it may be in a grocer's store, who carries on the business of the banker and his own at the same time. The reason of this is, that the wants which the bank or banker supplies are among the most imperative wherever trade is active or tends to become so, even in a small degree. The bank is, in the circulation of capital, what the railroad is in the circulation of

men and things, and what the newspaper is in the circulation of news and ideas. Like the railway and the newspaper, the bank does not create what it causes to circulate; but it not unfrequently happens that only it can render such circulation possible. It always accelerates and develops the circulation of capital. We might therefore define a bank. An office for the circulation of capital in the form either of accumulated labor (money of all kinds) or of labor yet to be done (credit). This definition embraces the whole series of services which can be reasonably asked of banks, or which have been asked of them at different times. These services are many and varied. They have not been the same in nature and extent at all periods of history. But every country whose industrial and commercial organization did not remain rudimentary has sought and obtained the services of banks. The origin of the banking business is of very remote antiquity.—Recent research, especially that of Mr. Koutorga, has shown the important part played by the *trapezites* (*οἱ τραπεζίται*) in Athens when trade began to develop and personal property to assume some importance. In the fourth century before Christ, their sphere of action was so large that it was thought necessary to divide and specialize their operations. There were money changers who carried on the business of changing the different kinds of local and foreign money, money lenders engaged in the making of advances to borrowers, and bankers properly so called whose operations were much more extensive, of a higher character and approximated more closely to banking operations in modern times. The *trapezites* took the money of individuals either for safe keeping only, to effect payments, or to turn it to account in commercial, industrial or maritime enterprises. They were in constant relation with foreign places, and effected transfers of capital either in specie or by a *clearing* operation. They came to the assistance of the state when it was in financial want. Their trade did not occupy the highest place in public esteem, but it was lucrative. Pasion, the banker, immortalized in one of Demosthenes' orations, was able to lease his banking house in consideration of an annual rent of a talent, or about \$1,200. The bank, however, was not always an individual enterprise. Recourse was had to the association of capital and to the formation of banking companies.—The *argentarii* of the Romans corresponded to the *trapezites* of the Greeks. With the increasing extension of the limits of the empire and its relations with almost all of the then known world, the business of money changing could not but acquire a greater importance than it possessed among the Athenian bankers. But the *trapezites* of the Greeks had predecessors as well as imitators. Banking operations can not have been unknown to the nations which preceded the Greeks in the way of commerce and especially to the Phœnicians. When exchange proper took the place of barter in a country, when the exchange of services was operated only by the intervention

of money, the want of an intermediary to facilitate the indirect exchanges was soon felt; and once the want was felt, institutions were established and men came forward to satisfy it. Money was weighed in ancient times. It was also indispensable that its quality or value should be proven; and what more natural and practical than that recourse should be had to persons who had made a business of weighing and testing it, and who performed both these operations with accuracy and celerity, to establish its weight and value? It is very probable that goldsmiths were in ancient times, as in England in the middle ages, the first bankers.—Let us now suppose that a vender A is in need of a kind of money different from that which the purchaser of his wares has just counted out to him on the goldsmith-banker's table; that, at the same moment, a vender B, accompanied by his buyer, presents himself before the same table and receives the very kind of money which the vender A is in search of, and that B wants the money which A is anxious to get rid of. The exchange of the two kinds of money will be immediately effected by the remunerated intermediation of the banker. But such a meeting of supply and demand can not always be calculated on. The vender A will therefore leave his money with the banker to effect the exchange as soon as the kind of money sought is brought to his table. From this, to the practice of bankers keeping a certain quantity of different kinds of money always on hand to effect changes of money for their clients, in case of need, directly and indirectly, there was but a step. At another time, perhaps the vender A or B having no immediate use for the money just counted out to him at the banker's, leaves it there for the moment, either because he thinks it safer with the banker than in his own house, or because he expects, later, to take in its stead the kind of money he may need, or because he wishes the banker to turn it to account in the meantime. If the money received by A or B is intended to pay a debt due to C, a resident of the locality itself or of some other place, it may still be left in the banker's hands that he may effect the payment; and if the creditor C, in turn, be D's debtor, and D E's and E F's, each of these creditors, who is at the same time a debtor, may instruct the banker to satisfy his own individual creditor, and none of them need touch the money. Thus, thanks to the intervention of the banker, the same sum of money may, without even changing hands, settle a whole series of debts. The banker, seeing that all the payments intended for his clients are made at his counter, does not hesitate to advance to them, in case of need, the amount of a deposit he may receive shortly or only after an indeterminate period. On the other hand, the banker, to profitably employ the sums deposited with him or which he holds in reserve, advances money even to others than his clients, on such security as he considers sufficient.—Thus, the whole series of bank operations—money changing, deposits, clear-

ings, advances, loans, etc.—springs logically and naturally from the modest beginnings of this one man's business, to whom buyer and seller address themselves to have their money weighed and assayed. The mechanism of these operations once known, it was not necessary that every banker should perform them all. One might have a preference for one branch and another for another of the banking business. It is conceivable, too, that at a given time or place one branch might be of much more importance than others. Where, for instance, metallic pieces used as money were subject to frequent alteration, and, therefore, could not be accepted by any one in any quantity until after a minute examination of them, the weighing and assaying of them played a very important part. On the other hand, that part was very unimportant, when confidence in the honesty of the coinage became general and was well founded; for such confidence did away with all the obstacles in the path of monetary circulation. The business of money changing had a wide field in the cities in which great fairs were held, to which great numbers of strangers flocked; but when more perfect instruments and modes of circulation diminished the direct employment of metallic money in large transactions, the business of money changing lost much of its importance. The absence of safety may have been the first motive which determined the capitalist to deposit his money with the banker, who had special means of watching and guarding it not possessed by others; and this making of deposits continued, but for different reasons, after the credit system was more developed. Circumstances sometimes introduced a new branch of the business. Thus knights, going to the crusades, borrowed money by pledging their jewels and silver ware for its repayment. Bankers soon generalized this mode of borrowing, and loaning on pledges occupied a large place in banking operations during the second half of the middle ages.—Italy had a great share in reviving banking operations. Violent measures, and the theological hatred of all trade in money, had almost wiped out even the memory of banking. The modification of lay barbarism and the removal of ecclesiastical pressure, no less than the imperious wants of commerce, restored the banking house to Italy. It was not long before Italy supplied the chief commercial cities and nations with bankers. The Lombards, and their competitors and compatriots the Cahorsians, instructed Europe again in banking from the thirteenth to the fifteenth centuries. They were the money lenders to governments in financial need. The Italian bankers were one day loaded with favors, hunted and robbed the next; and this in England as well as in France, in Germany, and even in Italy. But they found their business a very profitable one; for they were a very serviceable class of men. Not only did they restore the institution of banking to Europe, they assured its growth by assigning an important place to credit which was des-

tined soon to be the preponderating one in banking. Whether it be true or not that the bill of exchange and the bill payable to order were not unknown to antiquity, or that they were invented by the persecuted Jews in the middle ages, certain it is that it was the Lombards who regularized and generalized the employment of these powerful and ingenious instruments of credit.—Simultaneously, an innovation took place which was destined to exercise in the future a very great influence on the progress of banking: it was the creation of public banks. This simultaneousness was not accidental. From the time that the banker ceased to be simply a dealer in money, taking the word in its most material sense; from the time that fiduciary capital (credit) became the principal part of his business, the influence of association could not fail to be felt as a necessity of the situation, and to get the advantage over isolated individuals. Public banks were destined inevitably to take the lead of simple bankers, because the former had greater material resources and more numerous relations, inspired more confidence on account of the joint guarantee of men of good commercial standing, and offered more security because moral persons endowed, so to speak, with immortality. Private bankers, however numerous, rich and powerful they might become, from that time took the second rank; they were satellites revolving around the public banks. Private bankers were supported by, and supported public banks. But public banks differed from private bankers whom they partly superseded, only in the extent of their business and the perfection of their organization; the essential principle of banking operations remained almost the same. This principle, as the reader may have already noticed, is that a banker can be and should be only an *intermediary*. Whether he exchanges for two merchants the money they mutually offer and ask; whether, by loaning to B a deposit made by A, he causes it to yield a profit; whether, by some strokes of the pen (clearings), he settles for his clients a whole series of accounts—whether he discharges C's debt in a distant city, and pays to D the claim, or letter of credit, he has on the same city; whether he advances to the state the funds entrusted to him by private parties: in all these cases a banker only facilitates between two or more persons, transactions the direct realization of which would have cost them trouble, time and money. The usefulness of this intermediary service is manifest; it sums up the whole part played by the banker. It was his business to facilitate the movement of capital, no matter through what channels; this was the mission of both banks and bankers.—It seems certain that Italy, the country in which the institution of bankers was first restored, was also the cradle of public banks. Cibrario, an Italian economist, justly esteemed, speaks of a privilege of banks of exchange, "with the obligation to open eight banks," which the municipality of Genoa granted, in 1150, to Wil-

liam Veto, Oberto Torre and others; but he failed to mention the source of this information which would be valuable if it were less vague, and its authenticity beyond a doubt. The honor of having possessed the first public bank is generally conceded to Venice. Our information as to the date of its creation is contradictory. Some writers place it in the middle of the twelfth century, and others fix it at the beginning of the fifteenth. In any case, this last date can be only that of a re-organization of the original establishment. It seems certain that the bank of Venice was in operation as early as the first half of the fourteenth century. Therefore, it was anterior to the bank which, according to some writers, was founded in 1349, at Barcelona. There are no data concerning this Spanish establishment, the origin of which, it seems, was due to the guild of drapers. A bank of deposits, founded by the commune, was added to the former bank, or superseded it, in 1401. Much more certain is the foundation, in 1407, of the bank of Genoa, the *Casa di San Giorgio*. It ceased to operate only in 1740, when, after having been pillaged by the Austrians, it was forced to go into liquidation. Two centuries after the foundation of the bank of Genoa came the bank of Amsterdam; it was founded in 1609, and replaced, after 1814, by the Netherland bank. Ten years later a public bank was established at Hamburg, on the model of the bank of Amsterdam. It is still in operation, with its modest primitive organism, as a bank of clearings. The city of Nuremberg in 1621, and the city of Rotterdam in 1635, followed the example of the great Hanseatic city. In 1657 Sweden established a bank, which, it is said, was the first to issue notes payable to the bearer and at sight. Other writers attribute the introduction of such notes to the bank of Genoa.—The immediate determining cause of the creation of these banks was not the same everywhere. The two following causes have been more particularly assigned: a national bank is sometimes called into existence by a government in the interest of its financial operations; sometimes commercial interests create it in order to paralyze the effect of certain fiscal manipulations. In the first category may be counted the bank of Venice. It appears to have been organized in consequence of the fusion and consolidation of three debts contracted by the reigning dukes during the twelfth and thirteenth centuries. The debt thus consolidated became the capital stock and assets of the establishment. The government debtors were thus transformed into the creditors or depositaries of the bank. The only cause for the creation also of the bank of Genoa and the bank of Stockholm, was a loan made, or to be made, to the government with its foundation capital. On the other hand, the bank of Amsterdam was created in the interest of commerce to protect it against daily embarrassments and losses consequent upon the alteration of money by the governments of the time. The founders and shareholders of the

bank of Amsterdam deposited in the vaults of the bank a quantity of specie or bullion proportioned to the extent of their business. All their payments were made in money of the bank (invariable), and by means of transfers (clearings) in the books of the establishment. The bank of Hamburg was based on the same principle. Faithful to its origin, by confining itself to operations of deposit and clearing, and carefully abstaining from all dealings with the national administration, it was able to survive the most formidable storms. The bank of Amsterdam, less stable, prepared the way for its own downfall, when it was induced to loan its funds to the East India company.—The severest trials ever experienced by the bank of England, founded in 1694, are likewise due to its accommodations to the government, accommodations sometimes voluntary, sometimes compulsory. The bank of England is the most important financial establishment in the world. It is the first institution in which, from the very beginning, the issue of money with no intrinsic value was a chief element in the mechanism of the bank. Wisely organized, ably administered, functioning successfully, the bank of England has become the model, more or less faithfully imitated, of all the great institutions of credit which have since been established, both in the new world and the old. It is true that its first and grandest imitation on the continent came to a disastrous end; but this disaster had been rendered inevitable by the perversion of the organic principle of institutions of credit, and the exaggeration beyond measure of the application of that principle.—Public and private credit had disappeared in France when the Scotchman, John Law, proposed to the regent the establishment of a public bank. Fifty years of war, and 20 years of defeat, the incapacity of the Chamillards and the Desmarests, the prodigality of the court, and the rapacity of the farmers of the revenue, had reduced the treasury and the country to the most terrible straits. The bank for loans, established by Colbert and restored by his successors, was scarcely able to borrow anything to meet the daily and most imperative wants of the public service, at 8 or 10 per cent. of interest. The sad pictures which the Fénélons, the Vaubans and the Boisguilberts, trembling with suppressed emotion, drew of these times, tell of the misery of the people. Under such circumstances, how could the government refuse to listen to this compatriot of William Patterson, the founder of the bank of England, when he offered to increase public and private fortunes by means of an institution of credit? The concession he asked was granted him (May 2 and May 20, 1716,) for the space of twenty years; Law was director of the bank, the regent consented to be its protector; it began its operations in the month of June, 1716. Its capital was £6,000,000, divided into 1,200 shares of £5,000; the bank was authorized to issue notes payable at sight and to the bearer, to discount

commercial paper, to receive deposits, to make payments and collections, to draw on the directors of the mint in the rural districts, and upon foreign banks; it was forbidden to engage in commercial operations, to make advances, or to engage in insurance or commission; it could not "under any pretext or in any manner" borrow money on interest. All accounts were to be paid in *écus de banque* of five *lièrres*; thus were the unpleasant effects of frequent monetary changes avoided; a rigid and constant surveillance, to be exercised by government commissioners, was intended to assure the public of prudent and honest management.—The success of the bank was slow at first, but afterward brilliant. The public, from scoffing incredulity as to the seductive promises of the Scotchman, which it manifested at first, came gradually to acknowledge the great advantages of bank money, whose fixity enabled them to undertake long term operations, and enter into relations with foreign nations. The rate of discount was reduced to 6 per cent., and soon to even 5 and 4 per cent. per annum, whereas but a short time before $2\frac{1}{2}$ per cent. per month was paid. The jealous care with which the bank held itself ever in readiness to meet its engagements; the favor of the government, which required its tax-collectors to make their returns in bank notes; everything contributed to strengthen the credit of the bank, and to enable it to render signal service to agriculture, industry and commerce. Public credit was benefited by this general improvement of the economic condition of the country; the stockholders, receiving large dividends before they had paid more than a fourth of the subscribed capital, had every reason to congratulate themselves. But this very success was destined to cause the ruin of the bank; it gave John Law courage and power to put into execution the vast projects he had long been revolving in his mind, to attempt the application of hazardous theories hitherto impatiently held in check. The bank became what Law had originally intended it to be, a mere wheel of his *système*. We can here neither give an exposition of, nor pass judgment on, this fantastic conception. Suffice it to say, that the *Compagnie d'Occident*, in which the system was personified, aimed at nothing less than monopolizing the foreign commerce, and the management of the finances of France, and becoming the great dispenser of labor, credit and wealth. An immoderate issue of fiduciary titles, that is, having no intrinsic worth, whose nominal value excessive agiotage endeavored to inflate, was to supply the funds for these vast enterprises, the plans of which were furnished to greedy speculators by the company. The result was one which inevitably follows upon such a course: the structure built upon the sand fell to pieces with a terrible crash, burying in its ruins all the fortunes which had not been saved in time. The bank, which had long abandoned all limitation and restraint, and whose presses had rivaled those of the company in the issue of worthless paper,

was fatally involved in the company's ruin. Four years of honest and intelligent management had established and consolidated the credit of the bank; one year of recklessness sufficed to utterly ruin it. It disappeared, together with its founder, after having put into circulation more than 2,000 million of notes, which could not be invested in any way.—Still, Law's bank merely hastened its ruin in allowing itself to be drawn into the vortex of the *Compagnie d'Occident*. In reality its fate was sealed from the day that it became a royal bank, (Dec. 4, 1718), by passing from the hands of its private founders into the hands of the government; from that date it ceased to be a credit establishment, for which the bank note is one of the instruments of action; it became a veritable paper-money manufactory, approving of every means of casting its products upon the market. This danger is inherent in the issue of money without intrinsic value from the moment it is intrusted to an irresponsible power which, prompted by caprice, may dispense itself from redeeming its bank notes on presentation; the danger was particularly great with the theories professed by John Law. In the opinion of this celebrated Scotchman, the bank note was not an instrument of circulation, it was money, since it performed the service of money. In other words, confounding currency and real money, money and capital, John Law, with that inflexibility of logic which characterizes makers of systems, reached this deceptive sophism. To manufacture bank notes is to manufacture money, that is, to create wealth; only short-sighted routine can not see this. It would impede, through timid and misplaced prudence, operations which would serve to enrich all. Law bowed to the existing prejudice, so long as this condescension was indispensable to the very establishment of his bank. When several years of success had increased his presumption and strengthened the faith of the public in his ability, he cast off this condescension, as the superfluous ballast of the aeronaut, and boldly undertook the flight to which he had so long and ardently aspired. In proportion as he rose in the air, and as the ground disappeared from his sight, Law lost his head more and more; the increasing depreciation of the bank note was for him but the effect of the ill-will of intriguers, seconded by the folly of the vulgar. He grew obstinate and angry, advised bold and desperate measures, proscribed metallic money, flooded the country with bills, he merely succeeded in rendering the inevitable ruin of his work disastrous to the last degree.—More than half a century elapsed before the country, terrified by the disastrous fate of the *système*, dared again think of creating an establishment of credit. A decree of March 24, 1776, granted the privilege of doing it, to Mr. Besnard, who wished "to establish in the capital a discount bank, whose operations shall tend to lower the interest on money." Its charter in fact forbade the bank to go beyond the rate of 4 per cent. discount per annum. Besides discounting it was authorized to deal in gold

and silver, and *se charger en recette et en dépense des deniers, caisses et paiements des particuliers*. All borrowing on interest, the forwarding of merchandise, maritime enterprises, insurance or commerce of any sort whatever, was forbidden it. The capital of the company was fixed at 15 million livres, two-thirds of which were to be converted into an advance to the government; this clause was very strongly disapproved of by the public, and the bank was not finally established until a decree of Sept. 22, 1776, had released it from this dangerous requirement. The government, however, returned to the charge more than once, especially during the war of American independence. The bank had at one time to increase its capital, at another to ask that its notes should be endowed with compulsory circulation. In spite of the embarrassments which these involuntary arrangements with the government caused, the bank succeeded in rendering real service to the business world, and establishing itself strongly enough to withstand the first assaults of the revolutionary tempest; a decree of the convention (Aug. 4, 1793,) finally suppressed it, after a slow and painful agony had already deprived it of its strength. However short and painful its existence, the bank had nevertheless restored the use of credit in France. Scarcely was calm restored when other establishments of credit arose, which led to the foundation of the bank of France. Numerous and important establishments of the same kind were also founded in the other continental countries, for the epoch between the downfall of the system and the great revolution had been almost as barren throughout the whole continent of Europe as in France itself. —In giving a sketch of the history of banks we pointed out the operations included within the circle of their activity. These still form a great part of the operations of banks both public and private. Nevertheless, the direct exchange of different kinds of money which was one of the first and most important operations of the bankers of ancient times and of the middle ages, is no longer practiced by public banks; the private bankers, too, leave this to a small number of houses of the second rank, which make it their specialty to a greater or lesser extent. The reason of this is, that the direct exchange of different kinds of metallic money or of money having no intrinsic value is only required by travelers, and for small shipments of money outside of trade operations. On the other hand, the London merchant who has to make a payment at Vienna in Austrian money, or the merchant of Odessa who wishes to exchange the money he has just received from Paris for money which will pass at Berlin, whither he is going, will not ask the banker for Austrian florins or Prussian thalers, either in coin or paper; it will be infinitely more convenient for the one to purchase bills of exchange on Vienna, and the other letters of credit to his correspondent in Berlin. The importance of this branch of banking operations, which has long been known and practiced, is being continually increased in our times

by the rapid development of international and *interlocal* commerce; we say *interlocal* as well as international, because these payments by means of letters of exchange, and similar instruments of credit, are made between one locality and another in the same country, as well as between two different countries. —This is, moreover, merely a greater extension of the system of clearings which, as we have seen, was practiced by the *trapezites* of Athens, and the Roman *argentarii*. Instead of being effected between the clients of the same bank, or merchants of the same town, clearings are effected between two different localities, or two different nations. The application of this comparison ceases, of course, when the amounts of the debts are unequal. When the merchants of Paris owe 1,000,000 francs in London, and the English merchants owe an equal sum in Paris, the exchange of these debts is easily effected through the Paris and London bankers; the two accounts will be settled simultaneously without the intervention of any money. But if Paris owes 1,200,000 francs in London, and has a credit of only 1,000,000 francs, the difference must be paid in specie. Still the bank may find in the *arbitration of exchange* the means of avoiding this primitive and onerous mode of payment. Suppose Paris has 600,000 francs due it at Brussels, and owes there only 500,000 francs, the difference of 100,000 francs in favor of Paris in Brussels, will be forwarded direct to London there to pay the French indebtedness of an equal sum. The accounts of Paris with London on the one hand, and with Brussels on the other, will thus both be paid without any direct payment, simply by banking operations. It is plain that these transfers or clearings may be effected not only between three, but between any number of places and countries, and afford an opportunity for a number of most varied and complicated combinations. But the ablest combinations can not always obviate the necessity of payments in specie; at one time the total amount of the different credits of a country or city does not equal the amount of its debts; at another time its debts are such as to require more or less immediate payments, (unforeseen purchases of wheat, etc.), while its credits are payable only on long time; or there may be other reasons which render the perfect balancing of its accounts impossible. Commerce in the precious metals, to which recourse must be had to supply the necessary complement in specie, will, therefore, long preserve an important place in banking operations. —The general advantages of this intervention of the banker are manifest. It saves commerce the costly and hazardous transportation of the precious metals; it increases the facility and rapidity of transactions; it allows of an incalculable saving in the employment of specie. The bank finds in this intervention, over and above its commission, an abundant source of profit, especially by combinations of exchange and arbitrage. But whatever may be the extent of operations of this kind, they are nothing when compared to the far

greater importance of operations of credit properly so called. Discount is their most faithful expression; hence it tends to monopolize the activity of public banks. In a business of 6,557 million francs, done by the bank of France in 1861, no less than 5,329 millions were discounts. To discount is to buy credits; they are bought either to sell them again, as is the common custom with private bankers, or to hold them until they mature, as public banks should do. We can scarcely imagine a brisk state of trade in our day without discount; discount alone renders possible that uninterrupted activity of production, circulation and consumption which constitutes the prosperity of our time. We shall now define, in a few words, the nature and end of discount: it is to-day the corner-stone of banking operations.—The cloth manufacturer has just sold 50,000 francs' worth of cloth to a merchant tailor. The making and sale of the clothes to be made from this cloth, will require at least three months; the draper will be able to pay the cost of this cloth after he has disposed of his merchandise; this he binds himself to do in writing. But the manufacturer can not wait; unless he gets the money for his merchandise, he will not be able to procure a fresh supply of raw material, nor pay his workmen; his manufacturing establishment must lie idle for a time. What is he to do? He sells to the banker, with his own guarantee in case of non-payment, the draper's note; the banker pays him the amount of the note less the interest on the money from the time of discounting to the maturing of the note. Sometimes this note will not come to be discounted until it has served to pay several debts; the cloth manufacturer may make use of the draper's note to pay his own indebtedness to the wool-merchant, who may use it to pay the sheep raiser, and so on until it comes into the hands of some indorser who needs to have it cashed. The more a note has been used, that is, the more numerous the indorsements are, the solvency of the indorsers being presumed, the greater security it offers to the discounteer, who gives his money, in the belief that the maker, and in case of need the indorser, of the note will be willing and able to pay it when it matures. The value of the signatures must therefore be examined carefully; the discounteer would run the risk of losing his money, if he were to be too easy, and discounted notes whose maker and indorser have not the will or the means to pay. Thus, public banks, not being in a position to know the solvency and honesty of all the commercial signatures which might be presented at their discount window, require a third signature of a house which they know. This obliges small merchants to have recourse to a private banker to furnish this third signature: he discounts the note, to rediscount it at the bank; in other words, he buys the credit to sell it at a profit, disposing of it at a smaller deduction for interest than he imposed on the party from whom he took the bill. This sever-

ity which renders discounting more difficult and more costly for mediocre and small merchants, is made a subject of complaint by them; but it is hardly possible for the great central banks to act otherwise. The multiplicity of small banks could alone render the advantages of direct discount possible to every solvent and honest man.—Apart from the personal guarantees of the maker and indorser, commercial paper is to a certain extent its own guarantee; it is based on something real. The cloth which the draper bought will be resold in the form of clothes, and the cost of the cloth, advanced by the discounteer, can certainly be paid back. But the note presented for discounting may also be based upon a hazardous transaction, the returns from which are less certain; it may even rest upon no serious transaction at all, and be but an accommodation note made for the purpose of procuring on credit, by means of discounting, a certain amount of money. The making of accommodation notes was carried to its furthest limit previous to 1857, especially in London and northern Germany, and contributed to aggravate the crisis of that year. The bank, which, either through carelessness or a desire to do business at any price, would discount great numbers of these accommodation notes, or notes growing out of venturesome transactions, would expose itself to great risks, without rendering any important service to the general interest. The more it is to be desired that facility of discount should benefit honest and serious transactions, the more should we regret to see the resources of credit turned from their purpose to favor any speculations, or projects whose lack of solidity is not perhaps their greatest defect.—Does this mean, as routine rigorism pretends, that discounting is the only form under which public banks should distribute commercial credit? This is not our opinion. The mechanic or the clerk, who wishes to start in business for himself, may need an advance, just as well as the manufacturer or merchant, who wishes to continue his business, after he has sold on credit a part of his products or merchandise; the advance made to the mechanic or clerk, on nothing but his note, is for them and from the point of view of the general interest, just as fruitful as the advance made to the manufacturer or merchant by way of discount. It may also happen that the cloth manufacturer, after selling 50,000 francs' worth of merchandise, needs 100,000 francs to enlarge his business, or to profit by an excellent opportunity of purchasing raw material. In a word, there are a great many cases in which a credit based upon future operations, and not upon operations already over, render very effectual service to individuals and to the business community. Entire classes of manufacturers and merchants, and certainly not the least important, can, by this means alone, share in the advantages of the credit which the public banks are supposed to distribute to all. And, in fact, to the *cash credit*, so largely granted

by the Scotch banks and their numerous branches, must be accorded a fair share of the benefits which these institutions render their country. The great continental banks do not ordinarily grant *open credits* except to those who make large demands for discount. They give as much *open credit* as they can to those who are rich, and as little as possible to those who are not. But are they free to do otherwise? Open credit, which is entirely personal, can not, in fact, be given but by local banks, which know or can know their clients thoroughly. Such, for instance, are the popular banks, or banks-of-advance (*Volks- or Vorschuss-Banken*) which have recently become very numerous in Germany.—It is also the upper classes—financiers, and those engaged in large commercial operations—who, in the present state of things, profit almost exclusively by the other forms of credit given by the public banks; we refer specially to advances on government securities. These advances, which are ordinarily made for a short time, afford the bank a good investment for capital momentarily idle; the merchant or the manufacturer may, in an unforeseen emergency, avoid, in this way, the losses attendant on hasty and expensive sales. It is none the less true that, as a general thing, these advances are oftener made to aid financial speculation than legitimate commerce. It is perfectly clear, likewise, that, whatever their object may be, they do not properly constitute credit transactions, unless *monts de piété* are also to be reckoned among the establishments of credit, which, for our part, we would hardly allow. Credit and pawning exclude each other, for one implies confidence, the other the very reverse. In making advances on bullion, stocks, or public and other securities, the bank makes of itself a financial pawn shop. We do not deny that this service may be of very great utility; but it does not come within the province of the bank. Another reason which still more strongly dissuades from these advances, or at least counsels their restriction within very narrow limits, is the supreme duty of every bank to have its assets in such a condition that they may be easily and promptly realized on.—By accounts current the bank becomes the cashier of its clients. The greater the number of these clients, the more time and money are saved by the intervention of the bank, especially by its diminishing the amount of money used in consequence of payments made by transfers on its books. This constant influx and efflux of deposits and payments to be made for a large number of houses, always leave considerable sums at the disposal of the bank. With its knowledge of the customs of the place, of the nature and condition of the business of its depositors, the bank will know exactly what class of deposits and what amount of capital must be kept at the immediate disposal of their owners at each moment throughout the year, and what amount of capital it may dispose of for a longer or shorter period of time: this latter amount it

will make use of in discounting and making advances and loans. How signal, therefore, is the service which the system of accounts current renders the business world! It concentrates and fuses together sums more or less important which, scattered in small portions through the country, would remain for the time being, unproductive in the different business houses; the bank, by uniting them, makes of them capital, which will supply the demand of the market, and increase labor, which will, in a word, form one of the principal means of operation in the credit system.—Thus, the tendency of the system of accounts current is to keep even the smallest amount of capital from remaining unemployed for an instant. But banks have also to draw into the channels of trade all capital. Small merchants, farmers or manufacturers realize every year profits to the amount of some hundreds of dollars, for which they have no use in their business; a property owner takes advantage of a good opportunity to sell his house and wishes to await a good chance of re-investing the money realized. In all these cases, and other similar ones, banks attract these amounts to themselves and restore them to circulation.—In Great Britain (in Scotland especially) and in America, the system of deposits has obtained a great development; every one endeavors to keep on hand as little idle money as possible; the smallest sums are deposited in bank, where they together form large sums, and serve to increase business activity. This is the principal reason of the facility with which capital can be obtained in England, and the comparative cheapness of money there. On the continent, and especially in France, the system of deposits is still in its infancy. The amount of capital which is thus kept out of circulation, to the great prejudice of its owners and of the business community, is almost incalculable. Considerations of greater safety or convenience may indeed determine this or that holder of money to deposit it in bank; but these are isolated cases. In order that the bank may act in a general, powerful and continuous manner, in order that it may attract to itself all idle capital, and be able to put it into circulation again, deposits must be rendered as easy and attractive as possible. easy, by putting the bank which receives the deposits within everybody's reach, by a system of local banks; attractive, by the direct advantage which the depositor receives from it, which can consist in nothing else than the inducement of interest. It must be borne in mind that the industrial and commercial movement of great cities leaves but little capital idle; it is in the country that those innumerable small sums of money are to be found, which it would be well to convert into capital.—We have said that the bank is and should be merely the intermediary between the supply and the demand of capital. But it fills this office only partly, so long as it confines itself to acting the rôle of a broker and investor for others, so far as the patent supply, that is, the

direct supply of capital is concerned, of the capital which is offered in the general market as any other merchandise is offered. The bank, in such case, does on a larger scale, it is true, just what the Athenian *trapezite* did. Is this all that the bank should do? Certainly not; the modern bank, in order to enlarge its sphere of action, and the better to fulfill the rôle of intermediary, can and must aim at something higher; it should bring face to face with *demand* not only the real and direct supply, the *soliciting supply*, but also the virtual or latent supply, the possible supply, for instance, of the one thousand francs which the French peasant hides away until the day when he may be able to buy with it a small piece of land. Then the bank should not limit itself to furnishing investments for capital seeking investment (real supply), or which might seek investment (virtual supply); its intermediation should provoke the creation of the supply of capital, by giving life to dead sums of money, by drawing them into circulation, and causing all money to become capital. The system of deposits, when largely developed, is called upon to work these wonders. It undoubtedly has its inconveniences. In attracting money by the inducement of a higher or lower rate of interest, the bank may come to have an *embarras de richesses*, and may have, at times, more capital to supply than there is a demand for. This inconvenience reaches its climax in that strange clause which obliges the state bank of St. Petersburg to receive on interest all deposits brought to it—a clause evidently based on an utter misconception of the very essence of institutions of credit. On the other hand, a bank exposes itself and its patrons to great danger, when, in order to do business and to do a large business, it attracts deposits by the bait of too high a rate of interest. Being obliged to make a profit by obtaining a higher rate than it pays, it will be tempted to invest its deposits in hazardous enterprises, in which the borrower does not stop to consider the price he pays for the use of money. What must be the result? On the happening of the least perturbation in the economic situation, a great many deposits will be demanded, and the bank, unable to call them in promptly enough, will find it impossible to satisfy its creditors. This has happened frequently in the United States, and this imprudence of American banks has contributed, far more than the pretended excess of their issues of bank bills, to the embarrassment which they have so often experienced and caused. These mistakes do not, however, prove anything against the principle of deposits itself. A bank that is wisely administered will always be able, by timely varying the rate of interest which it pays and which it receives, as well as by the choice of its investments, so to arrange it that it will not be embarrassed either by the too great supply or by the withdrawal of deposits. Besides, how can it meet the uninterrupted want of new capital unless it aid in the formation of that capital, and hasten

its entry into circulation?—The banks of issue rather evade than solve this problem by the aid of their notes. Discounting is the ordinary way in which the bank note enters into circulation. To discount is, as we already know, to buy credits. The capitalist A, or the banker B, who has \$50,000 at his disposal, purchases with this money C's credit, because C can not await the maturing of the bill of exchange, signed by his debtor D. If the bank confined itself within the same limits as A or B, it would not be able to discount more than the amount of its own capital and the sums received from accounts current and deposits. In order to do more than this, it does not pay for the credit which it buys; it merely gives its notes. It is as if it transformed into money the title which represents it. Suppose that D, instead of giving C one single draft for \$1,000, had given him five of his own notes for \$100 each, and ten for \$50; or suppose that C substitutes his own personal notes of \$50 and \$100 for D's draft, and that the good credit which C or D. enjoys causes his notes to be accepted throughout the business community, in this case C will use them in making all his purchases, and in paying all his debts; he will have no need of selling the credit. What C was not able to do the bank does, by discounting the draft for \$1,000: it becomes D's creditor in the place of C, but it constitutes itself the debtor, in the place of D (and of C, who indorsed the draft), in relation to those whom C will pay with the product of his sale made to D. Here, again, the bank fills the office of an intermediary: it borrows of the public, who accept its notes, to lend to C (the bank debtor to the public for the amount of its notes); it becomes D's creditor by putting itself in his place, and debtor to those who will accept its notes for D's draft. The money of the bank will be more readily accepted than D's draft, first because its notes of small denomination afford greater facility for circulation and in every-day trade; likewise because being bank notes payable at sight and to the bearer, immediate payment of them *may be demanded*, though, in reality, scarcely one of these notes will be redeemed before the maturing of D's draft, for which they were substituted; finally, and above all, because the solvency of the bank seems surer to every one than that of any private individual, no matter who, because this solvency is based on and guaranteed by the collective solvency of all the debtors whose discounted paper it holds, and of all the creditors who have indorsed this paper.—The confidence a bank deserves and will obtain depends upon its management. When it discounts with discretion and prudence, when it is assured of always being paid by the debtors for whom it has substituted itself in the eyes of the *public*, it will be looked upon as good. Its notes will circulate without trouble: the discounted paper which it holds being sure, the bank notes, which are only money representing that paper, will appear equally sure. If, on the contrary, it be sus-

pected that there is carelessness in the management of the bank, and a willingness to do business at any cost and to buy (to discount) doubtful credits, there will be hesitation to accept its notes; they will flow back to its counters for payment, that is, to be exchanged for specie. This is all elementary. But if credits, which are only doubtful, render the bank a suspected debtor, what credit does it deserve when it places its money in irrecoverable credits, such, for instance, as loans made to a state which will not or can not repay? Transactions of this kind necessarily make the bank the very worst of debtors; its notes, henceforth, deserve no credit at all. It is manifest, in like manner, that to wish to make this credit compulsory, that is to say, to compel the acceptance of its notes, is the most signal violence, based on the grossest misconception of the very nature of the bank note. C can not satisfy his debtors with D's draft, because they are not sufficiently informed or assured of D's solvency; and can they be compelled to accept the notes of a debtor (the bank) recognized and openly proclaimed insolvent? A bill of exchange can not circulate because the time of its maturity is remote, and because every one can not judge of the value of the signature to it; and can you substitute for it, by discounting, paper with no date of maturity and signed by a bankrupt? Better a thousand times, both in law and logic, give compulsory circulation to, or make legal tender of, all bills of exchange up to the time of maturity! —From what we have already said of the nature and primary object of bank notes, it is manifest how little foundation there is for the theory which would make the issue of bank notes a privilege of the state, a right belonging to it alone, and which it might delegate at will. Why should not the bank also be as free as any one else to sign obligations, and give them to any who will accept them? As long as the confidence of people and the good will of those who receive them alone determine the acceptance or non-acceptance of the bank notes, what has the state to do with these transactions between debtors and creditors? It is useless to protect the creditor against the debtor, the public against the bank; suffice it for the state that it do not protect the insolvent debtor, the debtor in bad faith, against his creditor. As long as the bank is bound to honor its obligations just as any other debtor, and redeems its notes in specie upon presentation, the public will be able to determine its solidity, and consequently measure its credit. An excessive issue of notes will cause these notes to flow back into the bank and thus correct itself. Moreover, the history of the bank of England from 1797 to 1821, of the bank of France in 1848, and of the bank of Austria for a series of years, proves clearly enough that a more or less absolute monopoly of the issue of bank notes, and a more or less rigorous surveillance on the part of the state, do not offer the public more effectual guarantees than free banking affords them against the dis-

astrous consequences of a shaking of public confidence. The better to secure the easy circulation of its notes, the bank may, in its charter or in its practice, impose upon itself certain conditions and limitations calculated to strengthen the confidence of the public, by proving to them that the bank is always in a condition to honor its signature; these measures of safety will relate to the proportion to be preserved between the actual capital of the bank and the demands that may be made upon it at any time, to the proportion between the amount of its issues and the amount of specie in its vaults, or it may relate to the limitation of the time of the maturity of the paper which it discounts, or to other points which study or experience may suggest. The law has only to watch over the execution of the contracts made by the bank; in doing this, it will have done all it can do, to give to the circulation of its paper all reasonable facility and security.—It can not, however, be denied that, in practice, a multiplicity of different kinds of bank notes would have more than one inconvenience. These inconveniences must be felt the more, in proportion as the bank note obtains a more extended circulation, that is to say, as it penetrates into places in which there are no means of judging of the solvency of the debtor (the bank), and the degree of confidence its notes deserve. Besides, at a time when men are endeavoring to facilitate exchange by the simplification and unification of coin money, a diversity of kinds of bank notes would perhaps be a step backward. But it is hardly an established fact, that the issue of bank notes is an essential attribute, an indispensable wheel in the mechanism of banks. In proportion as these institutions shall develop the system of accounts current and of deposits, and the use of checks, the want of bank notes must necessarily diminish. Do we not find evident proof of this in the stability maintained by the bank of England for the past forty years, despite the doubling and trebling of the amount of general business; and in the operations of the *London Clearing House*, where, with some odd thousands of pounds, credit transactions amounting to more than a hundred times the amount are transacted every day; as well as in the fact that the Irish and Scotch banks, which were limited as to the amount of their issue by the laws of 1844 and 1845, still remain within that limit? We can to-day look forward to the time when, in countries advanced in civilization and commerce, the bank note will be merely a more convenient mode of exchange than coin money, and will have ceased to be regarded as an instrument of credit, whose distribution is intrusted to the banks, or, rather, in the distribution of which the banks are to serve as intermediaries. Whether the office of supplying this want of circulation be intrusted to one establishment or many, is but a secondary question. If entire liberty be otherwise allowed to the spirit of initiative and of association in banking operations, banks will be

able to render the business community all the benefits which it has a right to expect from them. But this is a goal from which we are yet very far removed.—Let us now examine, from a political standpoint, the relations of governments to banks. We must state, in the first place, that close relations exist in almost all great states between the government and the principal bank or the banks of the country, and we are rather inclined to consider as necessary a fact which steadily repeats itself. But we can not admit that whatever exists is necessary. History tells us that the relations between states and banks were entered into, almost everywhere, in consequence of special events which obliged governments to procure money as soon as possible, and that money was obtained through the agency of the bank. Unfortunately, in such cases, governments did not trouble themselves concerning the ulterior effects of this step. Resulting inconveniences did not fail to appear. They were inevitable. One of these inconveniences was compulsory circulation or the legal tender character of the notes of the bank, and, as a frequent consequence, the issue of paper money, the value of which was so variable (see PAPER MONEY). When the calamity, the cause of the loan, had ceased, it would have been well for them if governments had at least striven to return to a normal condition of the currency, to pay their indebtedness to the bank, and to resume specie payments. But as a return to such a normal condition is difficult, things were generally allowed to take their course. A habit is formed, and the existence of the evil is hardly noticed.—It is not necessary to say that the banks on the one hand, and commerce and industry on the other, suffered in consequence of the relations established between the state and the banks. The history of the banks of Venice, Stockholm, Berlin, Amsterdam, Vienna, Lisbon, and St. Petersburg, and that of England, bears witness to these inconveniences.—Nor do we know whether the other relation between the state and the bank, which consists in charging the latter with the collection of the taxes, is very useful to a country. It is not certain that a reduction of the cost of collection of the taxes is thus obtained; competent men have questioned it. But if there is economy in thus collecting the taxes, should it be purchased at any price? Too close relations between the state and the bank would result in the accumulation, in one single reservoir, of the whole metallic stock of the country, and the least crisis would be felt there more severely than elsewhere. We should not bring together things which should remain separate. In any case care should be taken to avoid entangling political and economic questions, the financial interests of the state and the interests of commerce. This is perhaps one of the strongest reasons in favor of the liberty, and, above all, of the multiplicity of banks.

J. E. HORN.

BANKS, Functions of. In the consideration of the functions of banks and of bankers it will be necessary to assume that the money in use, where the bank is located, is good money and not bad, because all the transactions of banks are stated in terms of money. In the United States the name by which money is designated is *dollar*; in Great Britain, *sovereign*; in France, *franc*; in other countries, other names are used. Each name is the legal definition of a coin containing a certain quantity of gold or silver. It is the metal that gives value; the stamp certifies the weight and purity. Until it is admitted that such coins, and such coins only, are good money, the true function of the bank and of the banker can not be fully comprehended.—The substitution of what is called inconvertible paper money, the "greenback," for instance; that is to say, the substitution of the deferred promise of a thing for the thing itself, under a statute which forces its acceptance as a legal tender, not only works a fraud upon the people of the country in which such a statute is in force, but it also vitiates all reasoning in regard to money and banks, and perverts the moral sense so as to forbid a clear conception of what is right and just.—True money must contain its own value in its own substance, and that metal will constitute the best kind of money which retains its value under the most uniform conditions through long generations. The two precious metals, gold and silver, have met these conditions; sometimes varying in their ratio to each other, but either one constituting a more unvarying standard by which to measure the transactions of men than any other substance that has ever been used to serve the purpose of money.—The great commerce of the world, to which no act of legal tender is or can be applied, is conducted on a gold basis, and the final settlement of the sum due in money on the balance of account is made by a payment of gold coin or its equivalent. This practice would not have become established unless it had been proved by the long experience of the great commercial nations that gold possessed greater stability in its value than silver.—On the other hand, in all transactions with some countries, China for instance, in which country there is no act of legal tender and no paper money, silver passes by weight and best serves the purpose of money.—If there were no acts of legal tender in any country and if all contracts were subject to being enforced by the payment in coins of gold or silver according to the kind designated in the specific contract, the metal which proved to be best fitted to the conditions and circumstances of each country would be adopted by it, while the great commerce of the world would remain upon a gold basis, as it now is.—This statement is made in order to clear the subject of banks and banking from the obscurity that may be caused if the quality of true money is not first defined.—Banks must exist and must perform their work even when the money by which their transactions are measured is false or bad. For instance,

when an inconvertible government note has been made "lawful money" under an act that can only find legal justification as a measure of war, banks must still exist and work under the disadvantage of such a fluctuating and false standard of value.—What, then, is the function of a bank, and how does it work?—In general terms, it may be stated that a bank lends and borrows titles to capital measured in terms of money. If the money be good, that is, unvarying in its value, during the term of the loan, the risk of the bank will be in ratio to the solvency of its creditors only, and the rate of interest will be in ratio to the abundance or scarcity of the capital in the titles to which it deals. If the money be bad, that is, varying in its value according to the caprice of legislators or the decisions of executive officers of the government, another element of risk will enter into every transaction, and the rate of interest on loans will of necessity be higher in order that it may cover this element of hazard.—No borrower wants to borrow money except as an instrument with which to buy the thing he actually needs, and no borrower pays interest upon money. The transaction is stated in terms of money and, in very rare cases, actual money is used, but the thing borrowed is the thing bought and the interest is paid for its service.—What banks deal in are titles, measured and stated in terms of money, to capital of all kinds, such as gold, silver, copper, lead, iron, cotton, corn, potatoes, etc., etc.—1. A bank lends its own capital or a title to a part of its own capital; such capital consisting of the coin that has been paid in by its stockholders.—2. A bank receives from its depositors capital in the form of coined money, or a title to capital in the form of a note, check or draft payable in coin on demand.—3. A bank lends such part of the capital or title to capital deposited with it, as the conditions of business will permit, to the applicants for loans whom its directors consider safe to trust.—In the vast majority of transactions no money passes, no money is lent and no money is borrowed. Only a title passes which may be converted into money, but as a rule the money itself remains in the vault of the bank, or in the place of deposit where the bank has put it for safe keeping.—Let us consider an example of the first class. A bank lends a part of its own capital. In this case it is a national bank, and its managers desire to issue bank notes; such notes serving the general purpose of money more conveniently than the coin itself, being themselves promises to pay coin. The bank subscribes for a certain amount of bonds of the United States and pays for them with a part of its coin, which coin constitutes the capital loaned, saved, subscribed and paid in by its stockholders. Upon this loan the government pays interest. These bonds are then deposited with the government as security for the payment of bank notes that the bank may issue if payment in coin is demanded.—These notes being secured by the bonds and being payable in coin by the bank, for which purpose a bank always keeps a reserve in

coin on hand, are a good and convenient substitute for money, and for that reason borrowers desire to become possessed of them. The borrower has sold a quantity of merchandise on credit for which the buyer has given a note due at a certain future date. This note is a title to, or promise of money, but payment is deferred. It will not serve the purpose of money as it is not divisible, it is not due on demand, and few persons know whether or not it will be paid. Its owner desires bank notes for use in the purchase of other merchandise to add to his stock in trade. He takes this note, or title to money deferred, to the bank, and, after a discount or deduction of interest, the bank exchanges its notes or titles to money payable on demand for this note or title to money deferred. The interest deducted constitutes the profit of the bank. The whole transaction has consisted in an exchange of titles to money, but no money has been used. Each has rendered a service to the other. The borrower has obtained notes that he can spend, and the bank has been paid interest for the use of its credit. This transaction constitutes the function of a bank organized with a department for the issue of circulating notes.—The second class of transactions consists in a bank receiving deposits, either of money or of titles to money, in the form of checks, drafts or bills of exchange payable in money on demand.—A merchant having sold produce for cash, has received, in payment therefor, either bank notes or checks on banks in settlement for the same. These he gathers together and deposits in his own bank. The sum of these deposits, named in dollars, is passed to his credit on the books of the bank, and the bank is hable to have the actual coin demanded, but no money has been used, nothing but a title to money.—As the sum of all these deposits of many merchants and manufacturers is never wanted at one time, the bank is now ready to enter upon transactions of the third class, that is, to lend a title to a part of the capital of its depositors.—Another note, being a deferred title to money promised to be paid at a future date, is presented for discount, and the sum of the net proceeds is passed to the credit of the borrower, to be drawn upon by check as he may wish to use it in his daily transactions. In this, again, the transaction consists in an exchange of titles; one is a title to money deferred, the other a title to money on demand.—Merchandise or commodities on the way from producer to consumer require time for conversion and consumption. During that period of time trust or credit is given by one man to another, and a deferred title to the value of this merchandise takes the form of a note, draft or bill, in which the value of the merchandise is measured in dollars or other coin; that is to say, in true money. These notes, drafts or bills are of limited use, because the credit of the promisors is known to but few. It is the business of bank directors to keep themselves informed and to exchange bank promises to pay money for these deferred promises of persons or firms. Hence it

follows that banks are most potent instrumentalities for enabling merchants or dealers to buy the products of farmers and manufacturers. They are as necessary to the quick movement of commodities as railroads, steamboats, carts or wagons. —The conduct of the business of banks and bankers demands probity, integrity, foresight, and all other qualities that make a true man. All their profits depend upon the services they may render to the community. Hence it ensues that there is no better standard by which to gauge the intelligence and character of the people of any section, state or nation than by their use of banks. The place to choose for the establishment of a branch of industry or business is the one in which banks are numerous and well sustained, and the place to be avoided is the one where banks are subject to jealousy and suspicion. Men who can not trust their banks or bankers are not themselves fit to be trusted by bank or banker. —The function of a bank is, therefore, to borrow and lend titles to property measured in money, and to keep in reserve a sufficient amount of actual money to meet the occasional demand for coin that may be made upon it. Their use is the measure of the trust reposed in, and deserved by, the merchants and tradesmen by whom they are sustained.

EDWARD ATKINSON.

BANKS OF ISSUE are those banks engaged in the transfer of credit by means of the issue of bank notes, *i. e.*, by means of promissory notes of the bank which are payable at sight to the bearer. No questions connected with the money economy of modern times have been more hotly discussed than those in reference to banks of issue. The most extravagant charges have been made against them, and equally extravagant claims made in their behalf. One party sees in them the agency which, above all others, excites and promotes over-speculation, causes commercial crises and aggravates all the ills of our modern industrial economy. Another party regards them as the magicians under whose wands trade and industry are called into life, the healthy growth of credit is favored, palaces and warehouses are made to appear, and national prosperity is created and sustained. Without taking sides with either party, for the present, we propose to introduce our discussion by an investigation into the origin and historical development of banks of issue; for only in this way can we hope to arrive at clear and distinct views of the nature and function of such banks, and to put ourselves in a position to answer satisfactorily the various questions which will come up concerning them. —**I. HISTORICAL DEVELOPMENT OF THE BANKS OF ISSUE.** Modern banks may be divided into two general classes: those which are occupied mainly with dealing in money—money banks, and those which are occupied mainly with dealing in credit—credit banks. The money bank was the original form of a bank, and that from which the credit bank was gradually developed. It is worth

while to trace out this development for it throws a flood of light upon the nature of the bank of issue and its relation to other credit institutions. —We must distinguish between *active* and *passive* accounts in the history of banking. *Active* accounts are those in which the bank is a creditor; *passive*, those in which it is a debtor. During the middle ages, owing to the imperfect coinage, to counterfeiting, to clipping, and to the inability of the public to test the purity of the coins, it was absolutely necessary that there should be some opportunity to exchange the coins and test their value. This opportunity the professional money-changers gave. Their profits consisted in a deduction when they took the coins and a charge when they were taken away. It was a fee or commission for changing money. The business was carried on in the first place with their own capital which for this purpose was invested in coins or the precious metals. This circumstance, and the natural desire of making their capital as lucrative as possible, led them to lend out, on short time, whatever part of their money supply they were not using in their business. Thus arose the first kind of credit transactions as an *active* transaction of the old money bank, *i. e.*, a transaction in which the bank was creditor. These operations, on account of the necessities of their money changing business, had to be conducted according to the same principles which modern banks have had to observe in all their active operations, on account of their rapidly increasing passive transactions. These principles were, security of the loans and constant and immediate control of all advances. These have remained down to the present day a controlling administrative principle of all banks of deposit and of issue. The very first loans of the money changers had to comply with the requisites. The first line of business was pawnbroking, *i. e.*, short loans on pledges of various sorts, such as jewels, coins, precious metals in bars, etc., etc., which persons did not wish to sell. The insecurity of law led to a second branch of business, *dealing in bills*, which from the very first at times took the form of discounting. Pawnbroking and bill-broking were, then, the original forms of the active transactions of all banks. —The course of industry favored simultaneously the gradual decline of the mere money changing business, and the growth of the loan business. For the improvement in coinage, and the adoption of a proper coinage policy, gradually lessened the necessity for the money changer, while the development of productive credit, the growing security of law, the increasing division of labor, rendered more and more necessary the money lender. In this circumstance we find the explanation of the transition from the old money banks to the credit operations of modern banks. —This loan business could and can be carried on with the capital stock of the bank. And yet, with the low rate of interest prevailing in the discount business, a rate of profit equaling that in

other lines of business could hardly be expected. As soon, therefore, as the capital no longer yielded a suitable rate of profit in the money changing business, this very circumstance paved the way for a new development toward which other influences were also working. The bank began to take up money with the intention of loaning it again, *i. e.*, to the active transactions of the bank are now added passive transactions, whose enormous development has made possible the equally enormous development in modern times of the active transactions. The first and simplest passive operations, (*i. e.*, those in which the bank was debtor), arose independently, but were soon connected with the money changing and money loaning business. In the earliest period of this development the term passive transaction could only be applied according to the usage of double entry, in which, by the fiction of a business personality distinct from the head of the house, not only the debts but also the capital stock of the bank, and, further, not only these two but also the property deposited for safekeeping, are entered among the liabilities. The beginning of this passive business was, namely, the acceptance of precious metals in coins or bars as a *real* deposit, (in legal language *depositum*), or in bank language as a deposit for safekeeping. The bank was merely a depositary with the ordinary obligations, not a creditor; it had no right, therefore, to loan out the sum intrusted to it.—In course of time it became customary among these brokers and banks not to allow the deposits to lie dead at the depositories until the depositors withdrew them, but to make the payments of the depositors in the same bank to each other by a simple transfer in the accounts. In this way the actual movement of money was saved in many cases, and a simple, safe and convenient mode of payment found in the transfer of accounts. The profit of the bank (to which in the case of public institutions the term giro-bank, or circulation-bank, was applied, *i. e.*, one in which deposits circulated from account to account,) consisted of commissions, which were charged partly for the safekeeping and partly for making payments for transferring accounts. This profit corresponded exactly to the profit in money changing, and was not interest, as in real credit transactions.—From this time the subsequent development was very different in the case of the money brokers and the giro-banks. The real giro-bank holds fast to the actual deposit and the transfer of the actual deposits, loans no part of the money received, has consequently the total amount of all deposits on hand, and, in addition, generally a capital stock as guarantee. It is, therefore, in a condition, as long as embezzlement or robbery does not occur, to pay out at any time all its deposits at once. This absolute security of the deposits forms in the eyes of the friends of the giro-bank the great advantage of such banks over credit banks, and particularly over the modern bank of deposit and bank of issue. The

giro-bank is the model to which many persons would like to see all banks reduced.—Among the money brokers and goldsmiths, who took deposits for safekeeping and also for transferring accounts, the banking business developed in a different way. Those deposits became "deposits for use," the real deposits (*deposita*) became loans regularly for short, definite periods, sometimes to be repaid on demand. With this step the old money bank became the modern credit bank. When the deposits had once become loans, then the modern banks of deposit, check banks and banks of issue were inevitably evolved from the old banking system. *The change of the deposit to a loan constituted an epoch in the history of banking.* With the justification of this step is granted the justification of the whole modern system of banking. The subsequent phases of the development of the latter, the various influences which have been at work from the earliest period until the present, the ceasing to charge a fee for safekeeping, the payment of the services of the bank by letting it have capital without interest, the ever-increasing participation of the depositors in the profits of the bank, for example in the form of free collections on the part of the bank for its customers, and, later, in the form of interest on deposits; these and other points we need not pursue for our present purpose. These points explain the history of the growth of the banking system, and the peculiar forms which various kinds of banks and various branches of banking business have assumed at various times, and, in this connection, are full of interest. But for the main question as to the justification of the credit banking system, and of the particular form which we have under discussion, *viz.*, the bank of issue, they are not important. The whole question here turns on the justification of that first decisive step, the change of the depositories to debtors. Let us see whether there were any circumstances which justified this change.—The deposits for safekeeping were all expected to be held in reserve at the money changer's or at the giro-bank. Experience soon showed that a balance constantly remained although the depositors could draw out all their deposits at any time. For even if each drew out all his money in the course of the year, as some did many times over, yet all did not do it at once. One drew out while another was just paying in. In the giro business many payments were made between the customers of the bank without affecting the total deposits. The average amount, the movement, the times of drain and influx, the lowest point to which the balance sank, could all be easily ascertained by experience. Now, the part which was never used lay fallow, was unproductive for the individual as well as for the whole. It could, therefore, be dispensed with in the real deposit business, and was consequently available for other purposes. It could, therefore, be loaned out in the same way and for the same reasons as that portion of the capital stock of the money changer which from time to time was not needed

in the broking business. Only, in one case as the other, there had to be an assurance that the sum could be easily and quickly made available in case of unusual demands on the part of depositors. The investment of the superfluous capital in short loans and advances on pledges afforded this security, and thus the change of the deposit to a loan was justified. This transformation could of course take place only under legal forms and with the full consent of both parties. The mutual advantage of both parties and the development of industry produced this understanding in one place at an early period, in another at a later. And thus the money-depository or giro-bank became the modern bank of deposit, and this last is the type of all other modern banks, and particularly of the banks of issue. Any objection against the bank of issue on account of its essential nature (and many such objections have been made even in the last few years), is also an objection to the bank of deposit. —Now, of course, no one can deny the possibility of a temporary suspension of payments on the part of such a bank, inasmuch as the money which may be demanded is not all at once in the coffers of the bank. But it is a sufficient security if the probability of such a necessity can be reduced to a minimum by a proper conduct of the bank business, by a proper investment of the superfluous capital, and by a capital stock large enough to guarantee against ultimate losses. Experience shows that such a security can be assured. Modern banks promise to pay the debt which they incur when they accept a deposit. Experience shows that they can do this and still loan out a large part of their deposits; and thus their business is justified independently of the enormous advantages which accrue to trade and industry from rendering available a large amount of capital, which would otherwise lie dead and useless. But the justification of the deposit business carries with it the justification of the exactly similar business of issuing bank notes. The polemic against the bank note, which is not based dollar for dollar upon a cash reserve, applies just as forcibly to the deposit not so based. —The business of issuing bank notes is nothing but a variety of the modern deposit business, and has been evolved in the same way from the old *depositum*. It makes no difference in the nature of the *depositum* or in the nature of the giro-bank, so far as the last is a place for the safekeeping of deposits, whether for the money deposited a certificate for the whole amount of every individual deposit or for portions of the same in round sums be given. Nor can it change the character of the old deposit banks, even if these certificates, given to individuals, can be further indorsed or furnished with blank indorsement, or even issued to the bearer. The so-called *recepisse* of the Amsterdam giro bank were such deposit certificates. These certificates were the bank notes of the old money banks. And the demand that bank notes shall be secured by a full cash reserve,

dollar for dollar, is nothing else than a demand that the modern bank note shall be reduced to the old deposit certificate. For what is the difference between these two forms of bank notes? Exactly the same as between the modern deposit and the old deposit, *i.e.*, as between a loan and a deposit for safekeeping. The deposit certificates are receipts of the bank for money deposited and kept in its coffers. The bank notes are bonds of the bank in which the bank acknowledges itself debtor for the given sum, and promises to pay it on demand to the presenter of the note. In our present system of bank notes, as little as in the modern deposit business, does the bank promise to keep cash on hand for the amount of its notes, but by a proper conduct of business it is able to keep its promise to redeem on demand. That is sufficient. Why talk in this connection of deception, of fictitious money, of the creation of imaginary capital, as do the opponents of the banks of issue? We might make the same objection to the deposit system of modern times, indeed to every use of credit, and with just as little reason. —The subsequent development of the banks of issue and deposit banks upon the new basis has led to no essential change, but to a mere expansion of their business. The banks gradually began to borrow more and more for the purpose of loaning again, until their principal business consisted in the handling of others' capital, and the capital stock of the bank lost all significance except as a guarantee for the proper conduct of the business of the bank. Wherever the banking system has been allowed by the government to develop itself naturally, the deposit business, as the original and simplest, has been the most important branch; the issuing of notes has been simply a complement of the former. They are but two forms of essentially the same business, that of contracting debts, and the one or the other has been employed according to the varying demands of trade and industry. The conduct of the passive transactions of the bank in both forms must be regulated by essentially the same principles. The oft repeated demand for a separation of these two branches of business is inconsistent with the organic development of the whole credit banking system, and, where complied with, leads to the abandonment of the peculiar advantages which grow out of a proper combination of both systems of operations. —II. THE BANK NOTE AND ITS ECONOMIC FUNCTION. The bank note must be clearly distinguished from both metallic and paper money. Money is a standard of value and a medium of exchange. But the pure bank note is only a medium of exchange, not a standard of value, and does not therefore discharge the money function. Paper money is inconvertible, and a legal tender, bank notes are convertible, and not a legal tender. But aside from the convertibility, bank notes are distinguished from paper money in their mode of issue, and consequently in their mode of reflux. Bank notes are regularly issued as loans, paper

money as payment; the former, therefore, temporarily, the latter, permanently. In place of the bank note there remains a claim, by whose conversion the corresponding debt of the bank can be called in or protected by a cash reserve; in place of the paper money the state has merely a receipt; it can get rid of its money only by special transactions. The notes flow back to the place of issue gradually and regularly in the ordinary course of trade in the payment of the advances made by the bank, provided the bank capital has been properly invested in short loans. The different manner in which notes and paper money get into the channels of trade reveals further advantages for the former and disposes of a whole series of objections which in the case of the latter might seem well founded. An issue of notes is necessarily preceded by a demand for loans, and even if a bank has partly created this demand by carelessly advancing loans upon insufficient security, yet the danger is not great, particularly under a system of free banking. For the notes which exceed the momentary demand for such means of payment immediately flow back to the coffers of the bank for redemption, particularly under a system of competing banks. The excessive issue of bank notes is, therefore, except in certain rare cases, impossible. The banks can not increase their issues at pleasure. The course of bank circulation under a well-developed system of banks of issue depends upon the changing wants of trade, and the latter upon the variations in price of commodities. These variations in price, according to Tooke's detailed investigations, *precede* the corresponding variations in bank circulation, and can not, therefore, have been caused by them. It is, consequently, wrong to attribute to banks of issue the fault of causing over-speculation and commercial crises. With this view of the subject a whole series of objections is effectually disposed of, which grew out of a false identification of paper money and bank notes, and out of attributing to the latter the qualities of the former.—Bank notes are not only not money, but they are essentially like all other substitutes for money which fulfill the function of money as a medium of exchange. The bank note is only one member in the organism of credit institutions together with checks, drafts, notes, book credits, clearing houses, etc., a number whose relative importance with the development of the credit economy grows on the whole less and less, although at certain times, viz., at the turning point in commercial crises, it acquires again a greater importance. The consequence of this conception of the bank note is a correcter view of public legislation in reference to banks of issue. The unfair favoritism toward these banks on the one hand, or the limitation of them on the other, the artificial regulation, so often characterized as a natural necessity, thus appears erroneous and often enough injurious. The whole development of the credit economy suffers under it. So

far are bank notes from being the most important form of credit, that the whole development of the modern credit system shows a constantly increasing tendency to substitute for bank notes some other form of credit. This tendency shows itself either in an absolute decrease in the quantity of bank notes in circulation, or more often by a relatively more rapid increase in the quantity of other substitutes for money.—III. SYSTEM OF SECURING THE NOTES. From the history of the origin and growth of the bank of issue, and from a proper conception of the function of the bank note in industrial economy, may easily be deduced the proper system of securing bank notes. By this last term we understand that regulation of the resources of the bank or that investment of the bank capital (*i.e.*, of both the capital stock and the capital which has been collected by the issue of notes), which will insure the constant and immediate redeemability of the notes in coin. What are the principles, then, which underlie a proper system of security?—Three systems of securing the notes have been proposed and defended: 1, the basing of the note circulation, dollar for dollar, on a cash reserve; 2, the investment of the capital in securities not easily convertible, particularly in real estate or mortgages on the same, and in stocks or bonds; 3, the so-called banking security. Practically a compromise between one or more of these systems has been generally adopted as the basis for legislation, proceeding on the assumption that one portion of the notes might be secured by the second system, while another portion might be based on the third system.—As to the first system, we refer the reader to what has been said above. Such a demand simply means the rejection of all that is peculiar in modern banking. For, if the bank note is to be nothing but that ancient deposit certificate, the deposit which has become a loan (at least the deposits payable on demand, *i.e.*, the great mass of the deposits), must again become *deposita*, that is, real deposits for safe-keeping. Those who demand a complete cash security confuse possibility and actual reality. All the notes can, of course, flow in at once for redemption, but, as a matter of fact, they do not. And under the banking system of security they find their economically proper and practically more important redemption, in their regular reflux, as payment of credit given them in a cash redemption.—Basing the notes on real estate and mortgage security, as in the second system, has been warmly recommended, especially from financial considerations and in the interest of agriculture. But this proposition must be rejected for the same reasons as the similar one of basing the notes on stocks and bonds, viz., that resources in such form are not readily convertible into cash. We must grant, however, that that portion of the notes which, according to one of the compromises mentioned above, need not necessarily be secured by the banking system, might be made available for mortgage loans, if it were not that it is finan-

cial necessity which ordinarily leads to such compromises, and which, therefore, requires that the sum mentioned shall be secured by government bonds. The payment for the monopoly of circulation which occurs here and there (as in Austria) through such a loan to the government, might be better arranged by allowing the state a share in bank profits.—The third system of securing the notes, the banking security, we consider the only rational, scientific and satisfactory one. It consists of a proper combination (changing according to circumstances) of a cash reserve and of securities which are easily and readily convertible into cash. Such securities are found most readily in the discount and lombard business, particularly in the former. The discount business insures, further, the regular reflux of the notes to the bank, and in this way offers an opportunity for the most thorough control of the issue of notes. The discounted bills and the claims on pledges form, therefore, the chief security of the notes, compared with which the cash reserve is of secondary importance. A great heresy in the face of popular sentiment, which is fond of calling all notes "unsecured" which are not based on a cash reserve—an exceedingly materialistic view in the age of that most spiritual of all economical elements, credit.—The cash reserve acquires its importance in view of the irregular reflux of notes to the bank for the purposes of redemption. This reflux can be controlled even in exceptional periods by properly regulating the loans of the banks, provided the banks of issue have developed under normal conditions. Its approximate amount can be told beforehand by observations in the banking business, because the question turns here on periodical movements. For critical times the strength of the reflux may also be estimated, with a little attention, by observing the transactions in the money market, in commerce, and in general production. Of course, such observations must be made by experts, conscientiously undertaken and thoroughly carried out by every banking institution. The relative and absolute amount of the cash reserve must be determined by these observations, and the necessary increase or allowable decrease be effected by the regulation of the discount and lombard business. After what we have said, we need lose no words over the attempt to fix, once for all, in an arithmetical ratio, the relation of the cash reserve to the note circulation. (See VI) —The chief point in the banking security lies in the element of the easy convertibility of all resources of the bank which do not consist of cash on hand. This is demanded by the nature of the notes as obligations payable on demand. In this way the objection of those who demand a full cash reserve for notes payable at sight is met, so far as it corresponds to actual relations. the irregular reflux can assume unusual dimensions, but under these circumstances can not be out of proportion to the time and place. The easy convertibility of the loans forms the real assurance against the dangers

which do undeniably lie in note circulation. —For these reasons, real estate, mortgages, direct claims on the state, great quantities of public securities, on long time, form no proper security for the notes. For even if they afford a safe security, which is often enough questionable, (particularly in the case of the first two in critical periods), yet they are difficult to convert into cash, even individually, not to say in large quantities. Mortgage credit must be taken on long time, owing to the nature of agriculture and of investments in building. In this consideration, and not in an arbitrary monopoly of banking for the advantage of commercial credit, (as the agricultural interests maintain), is to be found the reason of preferring discounts to mortgages on real estate. Other securities, such as running accounts, book credits, ordinary obligations, good bonds, *i. e.*, such as vary but little in value in exchange, preference bonds, etc., may be accepted in limited quantities, but ought to be considered inferior to discounts and lombard claims. Shares in industrial undertakings, and speculations of all sorts on 'change ought to be excluded. (See VI)—IV. FUNCTION OF THE BANK NOTE IN COMMERCIAL CRISES. The discount business is a necessary presupposition of the modern development of trade and industry. A commodity, in the process of its manufacture, must pass through many different hands before it finally reaches the consumer. As the commodity is ultimately paid for by the consumer, the various intermediate agents find difficulty in paying for the commodity as they receive it. Under these circumstance one of two things is necessary. Each of these agents must carry on the business with a greater amount of capital, (in other words, a portion of the capital becomes unproductive), or they must run the risk of letting trade and production come to a standstill at times for want of payment. A help for this condition of affairs is found in the draft of the seller upon the buyer for the selling price and for the time that will probably elapse until payment can be made, and in the acceptance of the draft by the buyer. The seller now has this discounted and thus receives his necessary capital in the form of money or of a substitute for money, such as book credit or bank notes. The modern credit bank has evidently a very important relation to this discount business. Individual merchants could not carry on this business in the regular way and on a large scale necessary for the demands of trade and industry. Particular institutions appear which make it their function to collect the surplus capital in the community and apply it in this discount business. These institutions are called banks of deposit. The whole credit economy has become a highly organized and yet, because constructed on rational principles, a very accurate mechanism. But at times some of the wheels in this mechanism give out. In critical periods we see that, after all, we have not a material mechanism but an organism, whose vital principle is credit, confidence, the spiritual element

par excellence in the credit economy. Let confidence disappear, the soul departs, the organism is dead. At such times the bank note shows its importance as a "primary" means of credit.—The whole credit economy is based on confidence. The confidence of one man conditions that of another. Let mistrust appear, and it spreads rapidly in all directions, destroys the credit of those who deserve confidence, and together with many guilty parties who have abused credit it overthrows many more innocent parties who have only used it. In this lies the danger of all commercial and credit crises. The crisis generally begins, however, in some one branch of industry. The mistrust extends to all the business relations, and particularly to all forms of credit payment usual in that branch. Now, the kind of credit payment which can command most confidence at such a period acquires an unusual importance in the failure of all other ordinary means of credit payment. The bank note commands this confidence because it circulates in other quarters, and because the security of the notes need not be affected even by a great industrial crisis, if the bank has been properly conducted. We may, therefore, designate the bank note as a suitable and important substitute to fill up the temporary chasm made in the credit economy by too great mistrust. Where it is lacking, or confidence is not felt in it, the only resource is specie. Historically the crises have been most severe where the bank note did not exist. Of course, great care must be taken at such a time in issuing notes that credit be given only to solvent houses after the turn in the crisis and not for the sake of keeping up the prices and furthering speculation. At such times the advantages of large banks appear most clearly, as the notes of such banks possess most confidence.—The banks must exercise unusual vigilance in their discounts during crises; for a proper regulation of the discounts affords the best security for the notes. A proper policy in reference to discounts is of most importance in times when the rate of interest is rising, and a scarcity of money begins to be felt; toward the end of speculative periods, when speculation feels the ground giving way beneath it, and uses its short respite for all sorts of extravagances; when exchanges become unfavorable; when specie ceases to come in and begins to be exported; in a word, when all the signs indicate the approaching storm. The discount capital of the banks forms, then, a large part of all the funds in trade and industry available for short loans in mercantile business. The operations with it, therefore, are of wide-reaching influence at the time when the pressure upon the banks for discounts is increasing. In three ways can the bank counteract this pressure and thus favor the necessary reaction in the money market, and revolution in the rate of exchange, while it secures at the same time its own position. It may refuse to make certain loans, to accept certain notes, may limit the maximum credit of certain houses—not a very desir-

able means, and never thoroughly impartial and safe. Or, it may shorten the maturity of all notes and loans, which is more equal in its effects. Or, it may raise the rate of discount, either on all loans, or somewhat differently for notes and lombards, and for the shorter or longer maturity of the notes. The last method deserves the preference; it best secures the bank, affects merchants more equally, and furthers in the most efficient way, the necessary reaction in the money market, in the rate of exchange, in the prices of commodities and the course of securities. This method, which is a logical necessity of the nature of the credit bank, is condemned only by the shortsightedness of practical business men. For the condition of extensive active transactions on the part of the bank is an extensive passive business; but the latter is diminished by the withdrawal of the deposits and the reflux of the notes, or, at least, the bank has such a change in its passive business to fear, and must regulate its active business accordingly, *i. e.*, lessen the loans by making them more difficult.—V. RELATION OF THE STATE TO THE BANK NOTE. In what precedes we have presented the natural development of the system of banks of issue, or rather, the tendency of its natural development; for, as a matter of fact, this tendency has never been fully realized, because the state has interfered with it everywhere. It is probable, that if there had been no interference, and no artificial regulation, the system of banking would have been changed from the old money banks to the modern credit banks, at the same time with the general change in industry and commerce characteristic of modern times, and that the deposits would have remained the chief branch of the banking business, and that the bank note would have come into use as an incidental means of assisting the deposit business. But it would have been wonderful if the banking business, in its early history, had escaped regulation on the part of the government at a time when all other branches of business were subjected to a most minute supervision. And, indeed, we find that the paternal care of the government was extended to banks in general, and banks of issue in particular, to an unusual extent. Every civilized government undertook in some way the direct control of the issue of notes; England, France, Austria, Russia, Prussia, all the small German states, Norway and Sweden, Italy and Switzerland, committed themselves to a distinct policy in reference to banks of issue. After the interference was an actual fact, the attempt was made to justify it on various grounds. On the one hand, the right to control the issue of notes was deduced from the coinage prerogative. On the other, the necessity of controlling such issue was based on the essential difference between bank notes and other credit circulating media.—Let us examine how far theoretical considerations can justify such interference. As we have already said, according to our view, the bank note is not money, not even paper

money, and is not essentially different from other credit circulating media. All the reasons advanced, therefore, in favor of interference on the part of the state, based upon the false identification of bank notes and money, and upon the essential difference between bank notes and other credit means of payment, are of no force. But there are certain inferences from our views of the nature and function of the bank note, which justify a proper positive relation of the state to the bank note and its organs of issue.—In order that the bank note shall remain a bank note, no conjunction of circumstances should be allowed to assimilate it to money or paper money. Everything depends upon this one thing: the acceptance of the bank note must remain completely voluntary. Only under such circumstances is the bank note like other credit means of payment. All the objections which have not been answered by the foregoing discussion are concentrated in this one point. All the peculiarities of the bank note which call for a positive interference of the state, turn upon this one feature. The state, consequently, must see to it that the acceptance of the note is really voluntary, and should limit its interference to the performance of this function.—Now the acceptance of the note may become to a certain degree compulsory, although the note may not be made a legal tender or irredeemable. Thus the bank note may have passed into such widespread circulation that it must be accepted for want of any other circulating medium. Or, it may exist in small denominations which can hardly be refused by the poorer and more uneducated classes, particularly as payment for wages. Or, it may be that the individual can not easily present it for redemption on account of his distance from the place of redemption. Now, under such circumstances the state should hold fast to three points: 1, It must not make the notes a legal tender, or by its own action artificially favor the note circulation; 2, it must forbid the issuing of notes below a certain denomination; 3, it must see to it that the convertibility of the note is a reality, and is not made illusory by certain unfair practices.—Tried by the first principle, the legal tender quality of the bank of England note and of similar notes is to be condemned. Nor will it do to answer this objection by saying that the legal tender quality enables a bank note to perform more easily the peculiar function in commercial crises, which we have ascribed to it above; for English experience before 1844, and continental experience before and after, show clearly, that it is not the legal tender quality that adapts a bank note for that function. And theoretical considerations lead to the same result. Any other possible advantages are outweighed by the inconsistency of the policy with the general principles of banking, or, if this be a too doctrinaire objection, by the very practical consideration that the transition from the legal tender bank note to the legal tender paper money is easier and more alluring.—In other cases the state favors the bank

note as a means of payment by receiving it, for instance, in payment of taxes. This favor is generally accorded to the large centralized banks, and affords what might be called a tax security of the notes. This must also be condemned. For the public, knowing it can pay the notes as taxes, receives them more readily and thus give them a wider circulation, while at the same time neglecting to examine as closely as it otherwise would, the condition of the banks. The banks, relying on the ready acceptance of their notes, and their more irregular reflux for redemption, are less careful of their banking security. The government in critical periods, when it must have the specie, can get it only by endangering the existence of the banks whose condition it has made insecure by its mistaken policy of favoritism; and the state, in case of ultimate failure of the banks, can hardly escape the fair charge of being accessory with the banks to the distress in trade and industry which must ensue. Giving the holders of the notes a priority over the other creditors of the bank has also a tendency to unduly favor the issue of notes. And, negatively, the government must not favor the note circulation by allowing the banks to conceal their condition, but must insist on periodical publications of the exact state of the banks' resources and liabilities.—It is necessary to insist upon the second point mentioned above, because there is a difference not only of kind but of degree between bank notes of large and small denominations. The latter are very similar to paper money in their qualities. They supplant money to a greater degree than large bank notes. They circulate in spheres where other substitutes for money do not come at all. They pass into the hands of laborers and artisans who never have any great amount of money on hand at once. It hardly pays to present them for redemption, and thus they stray away from their place of issue so far that they can not be presented for redemption without sacrificing a large per cent. of their value. The fundamental conditions, then, of their remaining true bank notes are wanting, and they become to all intents and purposes paper money.—By the third point we do not mean that the state is to undertake to insure that every bank shall be constantly in a condition to redeem its notes, but simply to see to it that a bank does not practically escape its obligations of redemption under various pretexts. If a bank is no longer able to redeem its notes, let it pass into bankruptcy at once. But banks often manage to keep from redeeming their notes while they are perfectly solvent. The banking history of the United States affords very good examples of such conduct. The banks often made it so tedious to get money for the notes (as, for instance, by appointing a certain inconvenient hour of the day, by slowly counting out the coins one after another, etc.), that the note holders were deterred from presenting them for redemption. In this connection abuses of four kinds may arise, in reference, namely: to place, time, coins, and

manner of redemption. In a system of local banks, the banks ought to be compelled to redeem their notes wherever they are likely to circulate in large quantities at convenient times and in proper coins, *i. e.*, the coin money of the realm, and in a manner convenient for the note holders. All these points ought to be features of every general banking law, and are not inconsistent with a system of free banking.—VI. RELATION OF THE STATE TO THE CONTROL OF THE BUSINESS OF BANKS OF ISSUE. Our investigations so far lead us to the conclusion that there are no economical reasons why the state should take any different relation toward the establishment of the banks of issue than that which it occupies toward the establishment of other credit banks. The so-called free banking system may prevail in the case of banks of issue as in the case of other banks. From this point of view any regulative interference of the state in the business of the banks is to be condemned. But the case is very different if the state claims the monopoly of issuing notes, or insists that every bank before issuing notes must secure special permission for that purpose. For the logical consequence of such a claim is further interference, leading ultimately to more or less direct control of the banking business. The contrast here lies between a free banking system with a formal bank law not at all inconsistent with such a system, and governmental control of banking with regulative legislation. In the last the system of securing the notes, the amount of circulation, and the amount and mode of investment of the capital stock of the banks, are all prescribed. As typical forms of such laws with manifold but unimportant modifications in detail, we select the German or continental, the English system of Peel's law, and the North American system.—The first system rests upon the principle of the banking security, *i. e.*, the notes are based upon a cash reserve, and loans of various sorts easily convertible, and a capital stock as a guarantee fund. The government has in many cases made further provisions fixing the absolute and relative amount of note circulation in relation to the capital stock, nearly always determining the minimum cash reserve, and often regulating the loan and discount business. These all have the defect of attempting to fix mathematically the ratio between the capital stock and the various active transactions of the bank, which is naturally impossible and frequently very injurious. The bank itself is often led to depend upon the law instead of its own careful conduct of business. The idea that fixing the maximum of note circulation is a wise step depends upon the false view that banks can expand their circulation at pleasure. The provisions requiring that the circulation shall bear a constant relation to the capital stock has but little in its favor, while the fact that it hampers the healthy development of banking constitutes a serious objection. Still more arbitrary is the provision occurring in most laws that the cash reserve shall be equal to one-third the note circulation. The only excuse to be

made for such a provision, is that it is intended to fix the minimum. But even in this sense it may be injurious under some circumstances. In any case there ought to be a similar provision in reference to deposits, or else the banks will make the one-third reserve for the notes serve as reserve for both notes and deposits. The capital stock of the bank, according to most of the laws, must be invested, like the deposits and loans, through notes, in securities which are easily convertible. It is decidedly best that the capital stock be restricted to this banking investment. The bank should not invest its capital in stocks and bonds which are exposed to great variations in value. Still more questionable is the policy of immobilizing the capital, *i. e.*, investing it in a loan to the state on long time, (as in the case of the Austrian bank) or in untransferable bonds (as in the case of the French bank). Of course such an investment need not endanger the convertibility of the notes, as this depends immediately upon the investment of the note capital, *i. e.*, the capital received in return for notes. But in such a case the capital stock loses all significance as a subsidiary means of securing this convertibility, and is of no more assistance for such a purpose than if it did not exist. It is of importance only in the case of ultimate insolvency of the bank. Of course such a provision grew out of the monopoly policy and financial necessity. But it would be better, as has been said above, to have the bank allow the state a portion of its profits and invest its capital in the proper banking method.—The bank of England is historically a realization of the so-called "currency theory" of Lord Overstone. This currency theory rested upon the false views of the nature of the bank note which we have discussed above. It identifies bank notes and money and posits an essential difference between bank notes and other credit substitutes for money, and demands that a bank note circulation shall vary exactly as a specie circulation would in its place. Peel's act does not aim to secure the convertibility of the note, nor even to limit the amount of the note circulation, but to regulate the latter artificially so that it shall increase and decrease in exact keeping with the increase and decrease in the cash reserve of the bank of England. This attempt sprung from false theoretical views, from a complete mistaking of the importance of deposit business and its functions in the influx and efflux of the precious metals, as well as from a misunderstanding of the causes, effects and phenomena accompanying an exportation or importation of specie. Peel's act did not succeed in its attempt, nor was the practical object attained of avoiding commercial crises in the future. On the contrary, the act has repeatedly aggravated the crises, injured the efficiency of the bank, and has been several times suspended by the English ministry.—Its system of securing the notes is as follows: A minimum amount was taken, below which, according to experience, the note circulation of the country had never fallen. Such an

amount of notes, it was assumed, was secure even without a cash reserve, on account of which it was chosen as the maximum amount of unsecured notes. Every further note had to be secured by a full cash reserve, pound for pound.—As a matter of fact, the bank of England holds in general to the banking system of security. The only point is that the provisions as to the cash reserve are different in the case of the English system from those of the continental. And all points of difference are, in our opinion, to the disadvantage of the English system.—The North American system secures the notes by fixing their amount at a high percentage of the capital stock of the bank, immobilizing this capital, and giving the note holders a priority right to it. The security of the notes as such is left to the banks, with the exception of prescribing a minimum cash reserve, and is ordinarily the usual banking security. The state does not aim to secure the instant convertibility of the note, but in case of bankruptcy its ultimate redemption. In this feature, and in the immobility of the capital stock, lie two great defects of the American system. The fiscal tendency of the whole system is apparent in its every feature.—It will thus be seen that the continental system, although hampered by many arbitrary restrictions, is, on the whole, the most natural, because it adheres, in principle, at least, to the banking security. A vigorous bank administration would undoubtedly feel itself cramped in many respects by its provisions. And yet, it keeps in view, on the whole, the points which under a free banking system every bank would have to observe. It adapts itself more easily to the wants of trade than the English or American systems; and experience certainly does not condemn it in comparison with the others. And if we assign to the state the office of controlling the banking business there is no reason why a different basis should be sought than that which underlies the continental system. As a matter of fact, both the English and American systems approach the continental more nearly in practice than in theory, for both maintain in practice the banking security which they reject in theory. The continental system, we must conclude, is best for all kinds of banks of issue, as well for a great monopoly bank like that of England, as for a system of local banks like that of America or Germany.—VII. RELATION OF THE STATE TO THE ESTABLISHMENT OF BANKS OF ISSUE. Although a system of free banking may be demanded on theoretical grounds for banks of issue as well as for others, yet there may be practical considerations which justify an interference on the part of the state, for instance, if one kind of banks of issue possesses advantages for trade and industry over other kinds and needs governmental aid in establishing itself. The question here turns on the respective advantages of a centralized and of a local system of banks of issue. The contest over this point has been as warm and as one-sided as over any other point connected with this

whole subject. The abuse of credit has often been noticed, and then in theory and practice some one kind of credit institution made the scapegoat of all such abuses. But experience has by this time pretty well demonstrated that an abuse of credit is possible everywhere and under every form, that no kind of banks can hinder it, no credit banks and no particular form of banks of issue necessarily favors or prevents it more than any other, and that the respective advantages of the various systems have been greatly over-estimated by their supporters. In fact, the arguments in favor of a centralized system can be nearly all matched by arguments equally as strong in favor of local banks, while all the defects of the latter have their counterparts in the former. The question is pre-eminently a practical one, and can hardly be decided upon theoretical grounds. The objection to local banks, that in competing with each other they will succeed in issuing an excessive quantity of bank notes, has been answered already. The position of a great monopoly bank is connected with some dangers because its great resources enable it to persist in a false policy for a longer period, and thus it may favor the feverish speculation preceding a crisis to too great an extent. But in return for that, after the crisis has come, such a bank can do much more toward alleviating its effect than local banks could.—One great advantage of local banks is, that by these the business of issue is developed in more intimate connection with the other banking business, and can become, as it ought to be, a mere complement of the deposit business. The reflux of the notes is more regular and powerful, and, in so far, the notes are better secured; while, on the other hand, as they must secure both deposits and notes, the latter are ordinarily based on a relatively smaller cash reserve than those of a great central bank.—The comparison between a system of local banks and a great central bank with many branch banks, must end similarly. Each has its advantages and disadvantages, and other influences than banking considerations must finally give the decision. The local banks, besides the advantage mentioned above, can adapt themselves better to local demands. But the central bank with branches can afford a greater extension of the remittance business. If there is less self-dependence in the great bank, there is a more effectual control through the publicity which all its acts possess. If there is greater danger of its becoming involved in the financial difficulties of the government, of its bank notes becoming paper money, there is less danger of the government's going over to a pure paper money system, which is generally far worse. Besides that, American history shows clearly enough that a system of local banks affords no security against abuse for financial purposes. If in the great bank the reflux of notes is weaker, there is a greater cash reserve. If there is occasional partiality in discounting, there is in general greater safety in

the loans, less danger of being ruined by local swindles, etc., etc. One point, however, must be kept in mind, which, in general, will give the decision in favor of free local banks of issue. Modern trade and industry by their own natural development tend to give us all the advantages of these great central banks, without any of the disadvantages which come from monopoly banks. And it is probable that great banks would have appeared in London, Paris, Berlin and Vienna able to confer all the advantages afforded by the state banks in those places, with almost none of their defects.—VIII PRINCIPLES OF LEGISLATION IN REFERENCE TO BANKS OF ISSUE. It follows from the previous considerations that the relation of the state to banks of issue need not consist in a regulative interference. The application of general legal principles to the system of banks of issue, and a general banking law in which there need be only a few particular provisions for banks of issue, are sufficient. We enumerate here some of the principles which should underlie general bank legislation.—1. The establishment of banks of issue may be free as well as that of other credit banks.—2. The provisions as to the capital stock of banks of issue and the amount of liability of the stockholders may be the same as in other banks.—3. A regulative control of the business of the bank ought not to be attempted by the state, as it can never be really carried out. The amount of the capital stock and its investment, the amount of the cash reserve, its yearly increase, the distribution of the profits, the establishment of branches, the extension of the business, the conditions as to the acceptance and amount of deposits, the kinds of bank notes and their total amount, the security of its liabilities, etc., etc., ought to be left entirely to the bank.—4. The care of the state must extend, however, to two, possibly three, points. It must insist on the strictest publicity of the transactions of the bank, so that the public can judge at any time of the bank's solvency; it must fix the lowest denomination of note and provide proper means to force every bank either to convert its notes on demand or go into bankruptcy; and it may exercise a formal control so long as it does not interfere with the principles of free banking.—5. The principle of publicity demands the preparation and publication of regular reports as to the condition of the bank, and the law ought to be framed with the utmost care so that the banks may not be able to evade its provisions.—6. The strictest personal responsibility, on the part of directors, etc., for the full execution of the law, ought to be part of all banking legislation. Provision ought to be made for a compulsory examination of the books by the proper authorities and the publication of the results from time to time.—In a word, the action of the state is in general to limit itself to making possible a strict and immediate control of the banks by public opinion. The state guarantees the publicity of all bank affairs; the public must

really watch the banks and hold them to their duty.—LITERATURE. The literature of the question is simply enormous. All the ordinary text books on political economy discuss the subject in one or more of its phases. The various encyclopædias contain articles of more or less value. Worthy of particular mention in this connection is the article on *Zettelbankwesen*, in Bluntschli and Brater's *Staatswörterbuch*, by Adolph Wagner, of which the present article is essentially an abridgment, and the discussions under various heads in Macleod's dictionary of political economy, and McCulloch's commercial dictionary. The periodical literature of the last 80 years, in French, German and English, is full of the discussion. The various reports of the English and French governments and banks are also full of valuable matter. The writings of Gilbert, Wilson and Lord Overstone, Wolowski and Horn, Schäffle, Rau, Wirth, Wagner, Carey, Walker (Amasa and Francis), Gibbon, and Price, contain many interesting discussions of the topic. Of formal works on the subject we mention the following, in which the reader will find references to all that is valuable on the question in any language: Tooke and Newmarch, *History of Prices*, London, 1838-1857; Fullerton's *Regulation of the Currencies*, London, 1845; Walker's *Money*, New York, 1878; Walker's *Money, Trade, and Industry*, New York, 1879; Macleod's *Theory and Practice of Banking*, London, 1875; Gibbons' *Banks of New York*, New York, 1859; Wolowski's *Quest. des Banques*, Paris, 1864; Horn's *Liberté des Banques*, Paris, 1867; Geyer's *Theorie und Praxis d. Zettelbankwesens*, 1867; Tellkamp's *Princip. d. Geld und Bankwesens*, Berlin, 1867; A. Wagner's *Zettelbankpolitik*, Freiburg, 1873. The last contains a very full account of banks of issue and an exhaustive discussion of all points, theoretical and practical, relating to them.

E. J. JAMES.

BANKS, Advantages of Savings. Saving does not create capital; it collects the small elements and parcels of it, which, when accumulated, gradually swell to values large enough to be employed with fruit.—Savings banks are institutions of credit, founded to inspire, facilitate, favor and encourage savings. The savings bank receives the smallest savings of the poor; it preserves and guarantees them; it shelters them from the temptations of the hour and from disastrous risks; it throws them into circulation; and out of the sterile sums, which they were while they remained at the bottom of a box or drawer, makes of them sums productive of interest which serves, month by month and year by year, to swell the amount of a little account current. Lastly, the bank pays back all or part of the deposit, according to the wish of the person who deposited it, and upon his simple demand.—Savings banks are altogether a modern invention. Inspired by the purest philanthropy, instituted with enthusiasm and generosity by men of the most respectable

character, administered with disinterestedness and rare ability, sustained in their benevolent action by the unanimity of public opinion, aided by the indefatigable co-operation of a host of intelligent propagators, and the ever faithful support of the widest publicity, the savings banks in most parts of Europe have grandly accomplished their mission, such at least as it was conceived by the thought which inspired it, a thought exclusively charitable and moral. Surely after considering all these benefits, the economist will not refuse to recognize the great and noble services which the savings banks have rendered since their first foundation. He takes pleasure in praising them; but he reserves to himself entire liberty in examining and judging in what concerns the legislation, organization and progress of these establishments, whose reach would perhaps have been wider and whose results would have been still happier, if the charity which produced them had been found more intimately united to the science which would have given them liberty as a basis.—Very few raise any objections against the institution of savings banks in itself but there are a few who do. Their objections are so weak and trivial that they do not deserve a serious refutation. Independently of the very worthy sentiment which first produced the savings banks, and which is a good in itself; aside from the very moral habit of saving, a habit which savings banks have largely extended and developed; they have two important economic results, which seem to us henceforth beyond all discussion: one affects the personal and direct interest of the depositor; the other, which is less apparent, is to the general advantage of society.—1. The foresight which, according to the expression of J. B. Say, sacrifices actual satisfactions, in order to insure security in the future, is not only a moral quality; necessity imperatively demands it. Labor, which is possible in strength and health, becomes impossible in old age and sickness, not to speak of crises, times of enforced idleness, and the thousand accidents which trouble and disturb even the most favored lives. A prudent man has strength enough to practice privation when he can, and prefers to a passing satisfaction the permanent satisfaction of assuring himself the means of subsistence during the evil days and fatal period of old age. He moreover increases his productive power by having some capital to rely upon, the revenue from which, whatever it may be, increases his daily earnings. Possessed of greater freedom, he is less anxious to offer his labor to others, and more easily discusses the conditions of its sale.—2. The advantage to society is two-fold. There are fewer unfortunates left to the care of society, in which the proportion of poor people exceeds that of the rich. Then—and it is a great service rendered by the savings banks, which certainly have prompted and favored in many minds the desire to save—these banks utilize a capital, which without their continuous action would remain abso-

lutely unproductive. Very small savings are not invested until they have increased to a certain amount, which varies greatly with individuals, times and places.—Close observation and investigation in many places, and the very nature of things prove to us, besides, the reality of the fact that savings, small, very small, when we consider the amount saved by each individual, assume in the aggregate proportions of enormous importance, as is shown by the official reports of the savings bank. Society is therefore indebted to savings banks for the enjoyment of a considerable amount of capital, which, without them, would be, like the stone which Horace advises avaricious men to substitute for their treasures, hidden in an absurd barrenness. LOUIS LECLERC.

BANKS, History and Management of Savings, institutions established without capital by philanthropists, where the economies of the poorer classes are received and invested, so as to return a profit and be payable on demand or at short notice.—They are managed by trustees without salary, who have no interest in the profits of the business, which are credited or paid to the depositors at stated intervals, and when credited, become new capital which is re-invested and earns interest the same as a fresh deposit, and this operation goes on as often as dividends are declared and are allowed to remain uncollected.—Savings institutions are essentially the banks of the poor, where they can safely place their temporary surplus and feel that their deposits will be returned with whatever additions they can be made to earn consistent with that safety. The proceeds of labor converted into capital by depositors in this way, are made to produce a revenue without impairing the original sum, and go on increasing, while the owner is engaged in the production of other surplus, which he can convert into capital with similar results. Such accumulations earned by individuals tend to distribute property among the masses of the people, to the extinction of pauperism, to produce comfort and happiness, to encourage education, and to the general enlightenment of the individual and the community where they exist; besides, the cares which accompany their possession sharpen the mental faculties, and incline to enlarge the moral perception of the owner. So manifest had this become late in the last and early in the present century, that efforts were then made to encourage habits of economy and thrift among those who had never enjoyed their fruits and knew nothing of the benefits of saving for themselves.—The first publication in England on the subject of savings banks is attributed to Jeremy Bentham, in whose plans for the management of paupers he included a system of "frugality banks."—Among those who first interested themselves, practically, was Mrs. Priscilla Wakefield, the superintendent of a "friendly society for the benefit of women and children," which, in 1801, combined with it a bank for savings for their benefit.—In 1810 the Rev. Henry Duncan

established at Ruthwell, in Scotland, a "parish savings and friendly society," which more nearly resembled a modern savings bank than anything which had been previously established. It was brought to the public attention by a publication of its system, and the details were received with so much favor that in 1817, when the first act of parliament was passed which established the system under government control, 78 private societies, which received and invested the savings of the laboring poor, were in operation in England, Ireland and Wales.—In 1805 savings banks were first opened in Switzerland, at Zurich.—The first institution in France was opened in Paris in 1818. Since then they have extended into nearly every European state.—The philanthropic spirit was displayed in the colonial history of this country, and found expression in efforts to fix by law the price of articles of necessity, and the wages of mechanics and laborers; but experience demonstrated that such regulations were detrimental to the interests of the people they designed to serve; afterward lotteries with charitable designs were legalized, and charitable societies for the protection and support of members who might be in need of assistance, by reason of sickness or accident, and for the relief of destitute widows and orphans of deceased members.—In 1803 a petition was presented to the legislature of the state of New York, praying that sundry persons might be incorporated into a society, with power to build workshops and purchase materials for the employment of the poor.—The present political society of Tammany or Columbian order in the city of New York, was incorporated in 1805, as a charitable institution, for the purpose of affording relief to the indigent and distressed members of the association, their widows and orphans, and *others* who may be found proper objects of its charity.—Many benevolent and charitable societies were incorporated in the New England and middle states in the next decade, some of them fulfilled the designs of their founders to a limited extent, but all failed to accomplish anything for the permanent well being of those they intended to benefit: instead of helping the beneficiaries so that at some time in the future they would take care of themselves, they ministered to present wants only, which were ever recurring and were never fully satisfied; with every succeeding dispensation the receivers became more dependent, finally lost their own self-respect, and were really becoming paupers; the disease had been aggravated by improper remedies. Experience demonstrated that, in most cases, temporary relief resulted in entire dependence, and the number of poor instead of decreasing was stimulated to increase; it was learned, that as soon as it was known in a community that anything could be had without labor, that soup, fuel, clothing or shelter could be had without cost, that moment the moral standard of the neighborhood was lowered, and when the way of supply was made plain by individuals, societies or the state, all further efforts on the part of recip-

ients to earn their own living were abandoned, not only for the part gratuitously offered, but all honest work was given up, and ingenious schemes were resorted to in order to obtain the greatest amount possible; time and labor were wasted, which if they had been directed by honest efforts would, in most cases, have comfortably supported the degraded persons and their families.—Having learned this plain lesson taught by experience, a class of philanthropists resorted to the system to *help others to provide for themselves*, by teaching the poor to acquire habits of thrift in laying aside some part of their earnings in a time of prosperity, to provide for future wants in the days of adversity or old age.—The ideas which inspired the founders of the first savings bank incorporated in the United States, the one at Boston, in 1816, are well expressed in their announcement of intention to apply to the legislature of Massachusetts for an act of incorporation. They say: "It is not by the alms of the wealthy that the good of the lower class can be generally promoted. By such donations encouragement is far oftener given to idleness and hypocrisy than aid to suffering worth. He is the most effective benefactor to the poor, who encourages them in habits of industry, sobriety and frugality."—This, the Boston provident savings institution, was incorporated Dec. 13, 1816, thus giving to the United States the honor of first sanctioning by law these most useful institutions.—The Philadelphia savings fund society had gone into voluntary operation in the same year, but was not incorporated until Feb. 25, 1819. The savings bank of Baltimore was incorporated in December, 1818; the Salem (Mass.) bank in the same year; the bank for savings in New York, March 26, 1819, and in the same year also, the society for savings, Hartford, Conn., savings bank of Newport, R. I., and Providence institution for savings, R. I.—All of these institutions are still in existence, and the latest annual reports show them to be in a flourishing and prosperous condition, the results of honesty and common sense in their management which have characterized them from the beginning.—The method of operating savings banks is not the same in all the states where they exist. In some they take the form of a society, with power to add to their membership, and with perpetual succession, a certain number of members are yearly chosen by ballot to act as managers, these managers elect their own officers, make rules and by-laws, and alter or rescind them at pleasure.—In others the corporators are a limited number, and are themselves trustees with power to fill vacancies, and are responsible for the management to state authority, to which they report at regular intervals, which reports are published. In some they do business under special charters, in others under general laws to which every institution in the state conforms; this last system is growing in favor as supervision is simplified, so that superintendents or commissioners familiar with the one law, can easily determine if investments have

been made in prohibited securities or generally in too great amounts on permissible ones.—The laws in the six New England states in relation to savings banks are very similar, although in some banks the managers are more conservative in their practice than in others. All invest to some extent in United States bonds, in bonds and mortgages on real estate, in national or state bank stocks, state, county, city, town or village bonds, loans on personal security, in railroad bonds, and some in railroad stocks.—Most of the banks are operated under special charters, but in some of the states general laws have been enacted, to which savings banks may conform if they so elect.—The general law of Massachusetts is similar in many of its wisest provisions to that of New York, but as the old chartered institutions of the former state are not required to conform to it, its full benefits are not realized. All banks pay a tax on the average amount of their deposits to the treasurer of the state in which they are located. In Massachusetts this tax is $\frac{1}{4}$ of 1 per cent. per annum, payable semi-annually.—Banks in all these states loan on bond and mortgage on property located in nearly every state in the Union. They may invest in, or loan on, one-quarter of the capital stock of any one bank (state or national), provided the sum is not more than 10 per cent. of their deposits, nor more than \$100,000, but they may deposit in addition on call in such bank, 20 per cent. of the amount deposited in the savings bank, so that in case of the failure of the state or national bank the savings bank would become liable as a stockholder for its debts over and above the amount of capital stock owned by it, and would be obliged also to take its chances with all other creditors in recovering the amount on deposit in the failed bank. To illustrate the effect on a savings bank of the failure of a national bank in Massachusetts, let us take a savings bank having \$1,000,000 due its depositors, which has invested and deposited the sums permitted by law, viz.:

Say 10 per cent. of deposits invested in stock.....	\$100,000
" liability equal thereto.....	100,000
" 20 per cent. of its deposits placed with the bank.....	200,000
Would make the amount involved.....	\$400,000

Or 40 per cent of its assets. This seems a dangerous section in the law, and the risk is not diminished, if, as is often the fact, any number of trustees in a savings bank are at the same time directors and stockholders in the national bank.—The amount of savings bank deposits at present invested in, and loaned on bank stocks, and on deposit in national and state banks, is 14 per cent. in the New England states.—Town and village bonds are not usually desirable securities, for the reason that they are required under state laws to be issued in a prescribed manner, and if all the forms have not been complied with, and the burdens bear too heavily on the issuing towns or villages, the interest usually ceases, and the

principal remains unpaid at maturity.—In the case of a village in Maine, which issued its bonds in aid of a railroad, (the usual reason for such issues), when the burden on the taxpayers became heavy, the selectmen concluded to leave their creditors in the lurch, and arranged the property in the town so that it would be valueless for even a combination of their creditors to take it. They then repudiated the interest on their bonds, and when the holders offered to take 50 per cent. of their dues, they still declined to pay, thinking to settle for less if they kept them waiting long enough.—The effect is, that nearly every city and town bond in the state sells at a reduced price, most of them below par, and savings banks are the largest sufferers by the decline.—The court of appeals in the state of New York, the court of last resort there, has just decided in the case of *Cagwin vs. The Town of Hancock*, that the town was not liable on certain bonds and coupons, issued in aid of the New York & Oswego Midland R. R. Co., because the tax-payers of the town, representing more than half of the property, had not consented to their issue, and that they were null and void in whatever hands they might be found, although the plaintiff insisted, which was not contested, that he was a *bona fide* holder for value, and that the affidavit of the assessors that a majority of taxpayers, representing the major part of the property, had consented, which was conclusive evidence that the requisite consent had been obtained, and that such affidavit attached to the consent was recorded in the county clerk's office, and was a decision in the nature of a judgment. The court held that the affidavit of the assessors was not conclusive evidence and might be disproved, as it was. Under this decision no savings bank can safely hold town bonds in that state, unless it attends the town meeting at the time the vote is taken, knows every voter by name and the assessed value of his property, and can produce evidence that a full majority voted in favor of bonding. Even with this knowledge, it should also know that the meeting was properly called and due notice given according to law.—Loans on personal security to the extent of one-third the amount held by savings banks may be made in the New England states with two sureties, *i. e.*, they may discount indorsed notes, not, according to the custom of banks of discount, those having two or three months to run, but they may loan on notes running one year. It is only necessary to mention this form of investment, comment is needless; the practice is unsound and should be discarded. Loans on bond and mortgage have always been thought the best kind of security for trustees and executors. We have inherited this notion from our old world ancestors, and the idea suited the fathers in this country because, in earlier times, land was the most abundant thing of value to offer for the less abundant commodity money, which was a necessity, though to a less extent. Banks were per-

mitted to issue notes to be used as money based on mortgages on land. A land bank was organized in 1740 at Boston. Each stockholder made over to the directors an estate in land for which he received its equivalent in bank bills which passed as money, the provisions for the payment of interest and a certain part of the principal per annum were very stringent, and yet the bank came to grief, its mortgage securities being insufficient to realize enough to pay its debts. Widows and children were large sufferers, and twenty-eight years after its organization, and many years after its failure, creditors were still clamoring for their just dues from the few remaining stockholders who were solvent. With such examples on their historical records, New England savings banks have loaned large sums on bond and mortgage belonging to other widows and children, not only to people in their own states, but in all parts of the United States, with similar results. The truth about mortgage loans is, that the value of land in this country is as changeable as that of most other security. When it is said that land security can not run away, which is thought to be unanswerable, it is not to say overmuch, for the land may remain and still become unsalable or worthless for the purpose of realizing the loans on it years after creditors have ceased from troubling; and even when good for the loans, foreclosures may be delayed and auctioneers driven away as they have been, although the interest money was not paid for more than one term.—To be good security for savings banks, mortgage loans should be taken on productive property, in the vicinity of the bank making it, at not more than 40 per cent. of its cash value, and receipted tax bills should be produced once a year, as well as certificates from proper authorities that no assessments remain unpaid. These mortgages should be made payable within one year, after which the bank should have the option of calling in the principal or any part of it. Not more than 20 per cent. of the bank's assets should be loaned in this way, and it should stipulate that both principal and interest should be paid in coin of the United States of the standard of weight and fineness fixed by law at the time the loan was contracted.—Had similar conditions been made by savings banks in this country, many would have been saved from the disaster and ruin which came to them between 1876 and 1879 and which may yet come to others in the future. Railroad stocks, which by their nature never become payable and may never pay a dividend, which are liens, only after five or more mortgages, are eminently unfit for investments such as we are considering. Railroad bonds secured by a first mortgage to a small amount per mile, wholly within the state in which the bank is located, which have paid the stock of dividends for at least three successive years previous to their purchase, may be considered proper investments for savings banks; but the purchase of bonds issued by a railroad for its equipment, or to raise

money to build or extend a road, because trustees know the men engaged in the enterprise and have confidence in their ability or integrity, is a mistake and should be prohibited. The prospects of the road may be first class, but, in this era of railroad building and managing, combinations and consolidations are too frequent, by which the small road with good prospects may become an insignificant feeder to a great system of roads, with a revenue insufficient to pay its fixed charges. In some instances sums large in amount are received, or allowed to accumulate on deposit. \$40,000 in one bank and \$34,000 in another are moneys of capitalists not of savings depositors. It should not be forgotten that these are benevolent and not charitable institutions, organized to assist those who are unable to take proper care of their own, who through poverty have no secure place, or whose savings are too small to be used singly to advantage. As a rule, owners of sums larger than \$2,000 should be directed elsewhere for investment, and not put needless burdens on trustees who work without fee or reward, because it is easier to do it, than to look about for themselves when pasturage elsewhere is scanty, and government bonds pay but 3 to 3½ per cent. They are the ones, who, in a time of panic, when prices are depressed and money scarce, ask eagerly for their large deposits to buy the very securities which savings banks are obliged to sell at a loss to pay their deposits with. If the receipt of deposits from a single person is limited to \$150 or \$200 in any six months, and no interest is paid on aggregates above \$2,000, it would have the effect to keep out capitalists and reserve the banks for their proper customers.—**BANK BUILDINGS.** Extravagant amounts spent for palatial buildings to be used simply for banking offices, or even if a part of the bank is rented, has an ill effect on its depositors and the community. It is not only unwise and unjust to expend deposits or surplus in this way, but the example taught is unqualifiedly bad. When depositors see the costly buildings, and on entering are startled at the sumptuous furnishings, no lesson of economy or thrift is taught them, even if the portrait of Franklin larger than life is posted in a conspicuous place, with the motto "Save your pennies." They learn rather that trustees who build such banking houses are not the proper custodians of their savings, and if they are wise they will go elsewhere than to a bank that has cost \$600,000, or even \$500,000, several of which exist in the empire state, for although they may be unable to cipher it out, they know there must be a great loss of interest, and it could with truth be told them, that 10 per cent. per annum is not too much to estimate for interest, taxes and repairs, and if the building cost \$500,000, \$50,000 must come off their dividends annually, and if the deposits are \$10,000,000, it is equal to one-half of 1 per cent. on each depositor's credit in the bank.—**SALARIES.** This is an item well worthy of notice. With the exception

of the executive officer, who devotes the principal part of his time to the interests of the institution and has charge of the internal management, no trustee should receive a salary or fees. Neither the secretary nor treasurer, who with the president jointly, should have charge of the bank's securities, should be a trustee, the influence of one salaried man in the board is enough; when the question of compensation to under officers or clerks is under consideration, it should be settled on its merits, and not with the bias that one must always feel for another of the same guild. The qualifications of a trustee should be integrity and capacity; honesty and common sense will enable any board to discharge its duties in a way that will place it above just reproach. Trustees should be selected from a class of men who have "made their way," soberly and honestly in the face of competition; these men know the value of money and how to use it economically. Great bankers are not required. Speculators should be kept out, for it is the principal sum that must be guarded, large profits are not to be sought. — Directors and stockholders in banks of discount in which any part of a savings bank's available or uninvested funds are kept, should not be trustees of the savings bank, as their interests are opposed to their trusts, and they are interested pecuniarily in having the sums deposited as large, and the interest paid for their use as small as possible, and when the trustee is called upon to vote, the director's interest comes up, so that he should not be required to submit to the temptation; his eligibility for one of the offices should be abolished. Directors of a corporation have been known to vote as trustees to loan the money of their savings bank in order to buoy up their sinking concerns, which resulted in the ultimate failure of the savings bank without saving the corporation. Trustees should never forget that the funds they manage belong to others, who have put them in their charge to be invested, so that the principal sum, at least so far as human foresight can determine, will be secure: trustees have no moral right, even if they are within the law, to take risks which as business men using their own capital they could afford to do. If errors are to be committed let them be on the side of security. — Investments worth more than par are very desirable on account of their salable value in case of need, but the premium paid should never be counted among the assets, but be regarded as a bonus paid for the guarantee that the bonds are good for their face at maturity, which is all that can be received, and that the interest will be regularly paid. — **EXPENSE OF MANAGEMENT.** This should be reduced to the minimum of safety. Large salaries, expensive bank buildings, incidentals, like coal, gas, janitor's wages, expensive stationery and the extravagant use of it, swell the expense account to 1 or more per cent. in some banks outside of New England, while there, notwithstanding the payment of large taxes, the average in most cases is not

much above $\frac{1}{2}$ of 1 per cent.; this amount, or, in large cities $\frac{1}{4}$ of 1 per cent., is the most that needs to be expended. — The business of savings banks should be confined to legitimate functions, that is, receiving, investing, and paying again, proper deposits, under suitable regulations. Accounts of business people, small traders and others, who require interest on monthly balances, draw checks at sight without the production of the bank book, who deposit notes and drafts for collection, should be refused; buying and selling domestic and foreign exchange should be prohibited; all belong to banks of discount which are liable to general taxation, from which savings banks, as benevolent institutions, are in great part relieved. New England savings banks are properly taxed by their states because they are permitted so wide a range of investments, and receive a higher rate of interest than in New York for example, where they are more restricted in investments and are mostly untaxed. — The practice of paying a premium on deposits arises from a desire to get new customers and increase the aggregate amount. Notices are posted in many institutions, that deposits made on the 10th day of January or July will commence to draw interest from the 1st day of those months. This is unfair to those whose money is in the bank on the first day, as it must earn dividends both for them, and the sharper customer who is making 10 days' interest for himself elsewhere, but who can, by making a deposit on the last day, claim a dividend for the days already passed, and so make his capital earn two dividends, although it was employed in but one place. The custom also tends to induce slothful habits and laxity in business, as there is nothing to be gained by promptness, for the profit is the same whether one gets to the bank 10 days earlier or later. Large aggregates of money are presented for deposit on the first 10 days of the half year to nearly all the large institutions in New York, although some of the banks refuse to credit them as deposits of the first day. — **SURPLUS.** The question of surplus to meet loss and depreciation in values, is attracting attention in all the states, although in the banks of some of them this important provision is overlooked, in others, a very small percentage accumulated gradually is considered sufficient. — In New York the general savings bank law forbids the payment of more than 5 per cent. — it may be less — interest per annum, until the surplus, estimating all securities that are worth it at par value, and those of less worth at the market value, amounts to 15 per cent. After this surplus is secured, extra dividends must be declared as often as once in 3 years out of the excess. When this time arrives, all accounts should be classified according to the length of time the money has been in the bank, so that accounts only 6 months old should receive a less proportion than others, the credits of which have been one or more years in possession of the bank, as it is evident that the surplus will have been earned with undisturbed

balances, and that recent accounts will have had no share in making the accumulations. If some such plan is not adopted, the best banks will be overloaded with money 3 or 6 months before extra dividends are declared, by persons determined to get a large interest for their capital, and who have not accepted the more moderate rate while the surplus was accumulating, and who, therefore, have no moral right to participate in extra profits which their capital did not earn.—Some instances of savings bank failures have occurred in this country through the dishonesty of officials, and many losses have been incurred by the rascality of clerks which they were enabled to accomplish by false entries. Nothing is more detrimental to the welfare of an institution than a slovenly or careless method of keeping accounts. Monthly examinations by trustees should be the inflexible rule, and the balance due depositors in dealers' ledgers should agree with the total deposits as shown by the general ledger, which should be confirmed at least twice a year when all accounts are listed.—In the larger cities where silver is refused, and the banks receive only gold or its equivalent on deposit, those securities should be preferred as investments which by their terms are to be repaid in gold of the present standard of weight and fineness, and in drawing mortgage instruments, clauses should be inserted whereby both principal and interest should be paid in like coin. As only gold or its equivalent is received, if the time should come when depreciated silver has to be returned, depositors will have good cause to complain that their trustees did not manage wisely, and there may be a responsibility fastened on the latter which it will be difficult to get freed from.—Failures among savings banks have generally occurred in the past on account of competition between them to pay large dividends; primarily this was the fault of legislatures in chartering too many institutions. In the city of New York, between the years 1867 and 1870, 20 new savings banks were chartered; 7 were located on one avenue, 5 of them failed before 1876. From 1819, when the first one was chartered by the state, to 1867, a period of 48 years, 22 new banks were established in that city, and nearly all were doing business at the last date. In the four years first named this number was nearly doubled, although it was afterward proved that the public necessities did not require them, as the entire assets of the 20 new banks in 1875 fell short of the deposits in a single bank of the better class in that city.—Savings bank charters in the days of the "ring," were made a means of payment for political services, and places of trust and honor in the banks were often given as rewards of partisan merit. The desire for new banks became an epidemic, and the legislature yielded to the solicitations of interested parties, and granted special charters with little or no reference to the qualifications of the incorporators for taking care of the people's money. They soon demonstrated their incapacity by buying low-priced securities

which promised large dividends on the sums invested; they fitted up expensive offices with extravagant furniture, built costly banking houses, paid round salaries, advertised largely agreeing to pay high rates of interest, which promise was kept as long as sufficient deposits could be kept available, but soon there came a chilling frost and nipped those flowers in the bud, states defaulted on their interest, land owners ceased to pay interest on their mortgages, towns repudiated and failed to pay interest on their bonds; depositors heard of these things and asked for their money, then the climax was reached and the receivers stepped in and took possession.—The percentage of loss by depositors, to the total deposits, has been small, still many individual cases of hardship have occurred, but they are not likely to be repeated from the same causes.—Deposits in savings banks are left there by their owners against a time of need, in many cases they remain undisturbed 10 and even 20 years to accumulate interest and increase in amount: the depositors have no voice in the management of their funds nor in the election of trustees; the state, therefore, is bound to exercise a strict supervision over the investments and practices of the latter in order to correct illegalities of every sort.—Sound laws are indispensable as guides, and proper authority should be invested in superintendents and commissioners, which they should not fail to exercise in case of need: much depends on good laws, more on their administration, but most of all on trustees themselves. A careless or foolish board may wreck an institution beyond hope of redemption before the supervising authority can have knowledge of the damage.—The largest and most successful banks now doing business, have been managed by prudent trustees, in a way that excites admiration and profound respect, but they have been conducted in the same way for 30 to 60 years, their present prosperity being attained by early economy and strict attention to right principles. Attempted rivals have come to grief, because they disregarded these requisites; they saw results but did not care to inquire how slowly they were obtained, they plunged into extravagances from the start, they had no idea of savings and lost all in speculating.—The general savings bank law of 1875 with its amendments, in the state of New York, is undoubtedly the best in existence in this country; some modifications, which have been suggested in the course of this article, might still be made. Its best features have been adopted in other states, and it would be for the interest of all if this was general in every state. Its prominent provisions are. All savings banks must conform to the law, old charters are repealed where their provisions conflict with it; the organization of new banks is thus restricted; notice of intention must be published previous to filing the certificate, in the local papers, and all savings banks in the county must be served with a copy. The superintendent is then to ascertain whether the proposed bank is needed, whether there is a pop-

ulation sufficient to promise success, and whether the proposed corporators are men who can command confidence; if not satisfied that the proposed institution will be a public benefit, he is to refuse his consent.—The trustees' meetings are to be held at least monthly, at which the president or one of the vice presidents must be present to form a quorum.—A trustee who fails to attend six consecutive meetings of the board unless he has been previously excused, or who becomes an officer, clerk or employé in any other savings bank, or upon borrowing directly or indirectly any of the funds of the bank, or becomes a surety for any money borrowed or loan made by his bank, vacates his office. Deposits shall be repaid after demand, in such manner and times as trustees shall prescribe, of which notices shall be posted in the banking room and printed in the pass books.—Trustees may limit deposits in amount, refuse to receive them, or return them after deposit, in their discretion. Deposits to the credit of any one individual or corporation shall never exceed \$3,000 in the aggregate, unless made prior to the passage of the act, or in pursuance of an order of court.—Deposits made by a minor or a female, are subject to their exclusive control, except creditors, and shall be paid, together with dividends thereon, to the person in whose name the deposit was made. Deposits made by one person, in trust for another, unless written notice of the existence and terms of a legal and valid trust shall have been given to the bank, may, in the event of the death of the trustee, be paid to the person for whom the deposit was made.—Investments may be made *only*: in United States bonds; three-sixty-five District of Columbia bonds, stocks or bonds of the state of New York bearing interest, and of any state which has not for 10 years previously defaulted in the payment of principal or interest on any debt authorized by any of its legislatures. In bonds of any city, county, town or village of this state, issued under state laws, or in any interest bearing obligations of the city in which the bank is situated. In bonds and mortgages on unincumbered real estate, situated in the state, up to 50 per cent. of the value of improved, or 40 per cent. of unimproved or unproductive property; but no loan shall be made except on a report of an investigating committee, which report shall certify to the value of the premises and be filed among the records of the institution; not more than 60 per cent. of the deposits shall be invested in mortgages. In real estate necessary for the bank's business, a portion of the building not required may be rented. The total cost of the buildings and lot must not exceed 50 per cent. of the bank's net surplus. In real estate purchased under foreclosure of mortgages, but such real estate shall be sold within 5 years, unless the time is extended by the superintendent of the bank department on application of the trustees. To meet contingencies, 10 per cent. of deposits may be kept on hand or deposited in state or national banks or trust companies, provided the sum de-

posited in any one does not exceed 25 per cent. of the paid up capital and surplus of such bank or trust company. In case of insolvency in depositories, savings banks are preferred creditors for the full amount of their lawful deposits in state banks, and in trust companies after a small class of accounts. They may loan on securities they are authorized to purchase, up to 90 per cent. of their market value, and not above their par. Interest is restricted to 5 per cent., until after the surplus is 15 per cent., estimating securities at par value, or, at their market value if it is below par, when, at least once in 3 years, the accumulation beyond is to be divided as an extra dividend. Trustees may classify their depositors, according to the character, amount and duration of their dealings with the bank, and regulate all dividends, so that each shall receive the same ratable proportion as all others of his class.—Loans upon notes, bills of exchange, drafts or any other personal security whatever, are forbidden, as well as buying or selling exchange, gold or silver, or collecting or protesting promissory notes, or time bills of exchange, or to deal or trade in any goods, wares, merchandise or commodities whatever, except as authorized by the terms of the act, and except such personal property as may be necessary in the transaction of the bank's business.—It is unlawful to allow interest on deposits for a longer time than they have been in bank, except 10 days of grace, at commencement of semi-annual interest periods, or 3 days at the beginning or end of any month may be allowed.—No dividends or interest shall be declared or paid except by a vote of the board of trustees duly recorded, and trustees voting for a dividend are made personally liable for the amount voted for unless it has been earned and appears to the credit of the bank on its books of account.—Trustees acting as officers, who give regular and faithful attendance at the bank, may receive such compensation as a majority of the board deem just and reasonable, but such majority shall be exclusive of the trustee to whom compensation is voted.—It is unlawful to pay trustees for their attendance at board meetings.—A committee of trustees must examine the books, vouchers, assets and affairs generally of the savings bank, twice each year, *i. e.*, in January and July, and report to the bank department, on or before the first of February and August in each year, under a penalty of \$100 per day, for each day's delay beyond the time; this report must give a list of bonds and mortgages, and location of the mortgaged premises, and of such as have been paid, wholly or in part, or have been foreclosed, since the previous report; the cost, par value and estimated value of all stocks or bonds owned, with a detailed statement of each particular kind; the amount loaned on the pledge of securities, with full details of each kind, and the amount invested in real estate, and cost of same; the amount of cash on hand, and in banks or trust companies, with the names of depositories, and the amount in

each; and any other information the superintendent may require. The report shall also state all the liabilities, the amount due depositors, any debts or claims against the corporation, which are or may be a charge upon its assets. The amount of interest or profits received must also be stated, as well as the amounts credited or paid to depositors, the number of accounts opened and closed during the half year, and the number remaining open at the end. All reports must be verified by the oath of the two principal officers of the institution, and the statement of assets shall be verified by the oath of a majority of the trustees who examined the same. Any willful false swearing regarding reports to the bank department, shall be deemed perjury, and subject to prosecution and punishment prescribed by law. — The superintendent of the bank department is required to make to the legislature, on or before the first of March, in each year, a statement of the condition of each bank that has reported to him, and to compile the whole. This report is afterward printed by the legislature with every detail. — The superintendent is required to visit in person, or by agents, and thoroughly examine each bank once in two years, and oftener, at discretion, and whenever he is satisfied that any one is violating law, or following unsafe practices, or whenever it appears to him to be unsafe or inexpedient for it to continue business, he shall communicate the facts to the attorney general, who shall institute proceedings, which may look to a removal of trustees, to consolidation with another bank, or to such other relief as may be required. — It is unlawful for any bank, banking association or individual banker, to advertise or put forth a sign, as a savings bank, or in any way to solicit deposits as a savings bank, under a penalty of \$100 for every day such offense is committed. — The development of savings banks in the New England and old middle states is simply enormous; from one, with a few thousand dollars, in 1816, they have increased to 594, with \$824,515,162 of deposits, belonging to 2,416,280 depositors. Institutions of the name do business in nearly all the states, but as they are organized with capital, do a general banking business, and receive the largest sums of capitalists on deposit, they are not considered in this article or as belonging to the system. From the imperfect data attainable, some states not requiring reports to be filed, and there being no uniformity among those which do require it, the table on this page is compiled. — The amount invested in and loaned on United States bonds is shown to be \$199,675,922, no inconsiderable part of the public debt, which is a sufficient guarantee that the public faith with its creditors will be maintained unimpaired. — The largest and among the oldest banks in the country, the Bowery savings bank, in the city of New York, chartered 1834, has 89,922 depositors, and \$37,435,877 deposits, and total assets of \$39,217,977, showing a surplus of \$1,782,100, estimating the securities at par value; estimating them at the market value it

is more than four times as much. \$22,671,000 of these assets are invested in United States bonds at par value.—The high place that the savings banks occupy in the states named, can not be over estimated; they are important regulators of the moral health of communities, they prevent crime, discourage pauperism, and lessen the tax-burdens of the people. Wherever a well managed institution exists, the people are industrious and thrifty; every week, on the days that wages are received, the bank is thronged with depositors; but their use should be still better understood, the cumulative nature of interest needs to be explained, and impressed upon the minds of the young and the poor, for many persons go through life without knowing anything of the fact that *their savings may be made to earn money as truly as their labor*. There are many states where savings banks have no existence, which present wide fields for benevolent labor, and which are well worthy the attention of the enlightened and philanthropic economist and statesman.—

SAVINGS BANKS IN THE UNITED KINGDOM. Like similar institutions in the United States they have been subjects of special legislation, but since 1863 all are managed under an act passed by parliament in that year. Every savings bank is certified under its provisions, and no other institution can take the title of "Savings Bank certified under the act of 1863." They are managed by boards of local trustees, none of whom are allowed to be depositors. At least two persons are required to be parties to every transaction with depositors; every officer must give good security for the faithful and just execution of his duties; one or more auditors, independent of the board of trustees, must be appointed by them, who shall examine the books and report in writing to the trustees the result of such audit, not less than twice each year; also at the close of each year examine an extracted list of the depositors' balances, and certify to the assets and liabilities of the bank, such extracted list to be open to the inspection of any depositor as regards his own account.—The depositor's pass book must be compared with the ledger on every transaction of repayment, and on its first production at the bank after the annual balance.—The trustees are required to hold meetings at least twice a year, and keep proper minutes of the proceedings; also to make weekly returns to government of business transacted, and render annually such general statement of the funds, etc., as the commissioners for the reduction of the national debt may require. If these regulations are duly complied with, the trustees are free from personal liability.—Savings banks may receive from individual depositors any sum up to £30 in any one year, or £150 in all, which, with interest credited, may run up to £200, when interest shall cease. From charitable societies or penny banks, £100 in one year and £300 in all, or without limit if the government officials give consent. From friendly societies, duly registered, deposits without limit either as

to time or amount.—No person is permitted to have more than one savings bank account. Every person on opening an account in a savings bank is obliged to testify in writing that he has no other account, and is not entitled to any benefit from the funds of any savings bank; any violation of this law within the United Kingdom works a forfeiture of his whole deposit or benefit, to the government.—These deposits are all to be placed in the bank of England, or the bank of Ireland, to the credit of the commissioners for the reduction of the national debt, who invest them in government securities, paying the bank £3 per cent. interest on the same.—The trustees of each bank allow their depositors such interest as they think proper, not exceeding £2 15s. per cent.; with the difference they must pay all expense of managing their bank.—To secure depositors whose balances amount to £200 from loss of interest, trustees may invest for depositor's benefit that, and any larger sums in any manner that may be desired, with the approval of the trustees, but at the depositor's risk. By an act of parliament passed at the last session, any depositor in a savings bank, besides having under £200 there, drawing £2 15s. per cent. interest, has the additional privilege of depositing any sum from £10 to £100 in a year or £300 in all, for the purchase of government stock. The bank and the national debt commissioners will effect purchases and sales for investors at the market price of the day, charging them a small commission for each transaction, viz., 9d. for £10; 1s. 3d. for £50; 2s. 3d. for £100, investors to take the risk of fluctuations in market value.—The returns for November, 1878, show that there were 458 banks with £44,255,890 deposits, due to upward of 1,500,000 depositors; the expense of managing averages about $\frac{1}{4}$ of 1 per cent. The surplus in commissioners' hands was about $\frac{1}{4}$ of 1 per cent.—The banks vary in size; nearly half the number have under 1,000 depositors, while several have over 50,000, and one, the National Security savings bank, of Glasgow, has 110,051 depositors, and £3,288,448 due them. The most successful banks are those which are open for business daily at convenient hours, where money is paid on demand without notice; which have branch offices and conduct their business with freedom from unnecessary routine. In Glasgow the bank named has a head office and four branches open daily from 10 to 3, and three evenings a week from 5 or 6 to 8 o'clock. In Manchester there is a head office and three branches; in Liverpool, a head office and two branches; in Edinburgh, a head office and two branches. All these are open during the same hours. In London there are several large banks, also at Exeter, Leeds, Sheffield, etc.—PENNY BANKS are feeders to the ordinary savings banks; their work is elementary and educational. In some towns they are associated to promote harmony of action, the formation of new ones, and for general efficiency. In Glasgow there are 209 such banks with 55,744 depositors, and an

Liverpool 119, with 33,674 depositors; all are conducted on the same principles. Each is an independent institution connected with some school or religious body, and under the management of a small number of trustees, who guarantee the depositors against loss and appoint the officials. They are generally open one or two hours on one evening a week and are conducted almost entirely by volunteers. Any sum from one penny upward is received, and wherever any depositor has saved a pound sterling, that sum is transferred in the depositor's own name to the savings bank. By this process the trustees diminish their responsibility, and their depositors are taught the way to the savings bank. These little banks do an incalculable amount of good in their modest way. In and around Glasgow last year £17,686 were thus transferred, and in Liverpool £5,296. Statistics show that 921 permanent savings bank depositors were trained during the year by the Liverpool penny banks. — The attention of educators has been directed toward the policy of giving some instruction in the principles of thrift in the elementary schools. The results are shown in the annual reports of the Glasgow and Liverpool penny banks already cited, and it is found that, not only are children easily taught, but that parents are induced by their children also to save and open accounts in the banks. — POSTOFFICE SAVINGS BANKS were established by act of parliament in 1861. On Sept. 16 of that year 301 were opened in England and Wales. They were chartered to meet the growing wants of the people for a place of security for their savings, and to give facilities to those who lived in places remote from any trustee savings bank. Losses had occurred, the result of fraud and embezzlement on the part of the officers of the last named institutions, for which trustees could not be held responsible; efforts to reform existing abuses resulted, in the year stated, in the establishment of the new system without arbitrarily interfering with the old. Certain postoffices in the United Kingdom are designated, which at present includes nearly all the money order offices, where the deposits of one shilling or its multiples are received. The law relating to the amount that may be received from one person and its accumulations, is the same as that in force with regard to other savings banks. The depositor receives a pass-book in which his deposit is entered, and the postmaster general is notified by the official on the same day, and he acknowledges it to the depositor within 10 days. — The money is invested by the national debt commissioners in the usual way, in government funds. Interest at the rate of £2 10s. per cent. per annum is allowed on amounts of £1 or any multiple, up to the maximum amount allowed to be deposited by one person. The government is responsible for the repayment of all moneys received at designated postoffices, so that depositors are secured against the dishonesty of officials. A depositor may apply for repayment at any postoffice savings

bank in the kingdom, and may direct payment to be made to him at that, or any other postoffice bank. His order is forwarded to the postmaster general in London, and after waiting two or three days, he receives a warrant on the designated office, which he presents, together with his pass-book, and receives the money. — These banks seem to grow in favor year by year; they are admirably adapted for the rural districts, small towns and villages, but the formality and delay inseparable from postoffice repayments, also the postman's visit with letters, revealing a postoffice account to the household, and often to the neighborhood, make them undesirable for many of the dwellers in large towns and cities. They are preferred in localities where the old savings banks are only open a few hours a week, while the postoffice banks are open every day during business hours. They pay $\frac{1}{2}$ per cent. per annum less interest; but the security is considered better for reasons before stated. — In December, 1878, the number of depositors in the United Kingdom was 1,892,756, of whom 1,773,010 were in England and Wales, 51,107 in Scotland, and 68,639 in Ireland. The balance standing to their credit was £30,411,563, the average balance to each being £16 1s. 4d., and the total amount of interest paid in the year £699,603. The number of deposits was 3,360,636, and the number of withdrawals 1,304,016. — The average daily number of deposits was 10,982, but one day they numbered 24,217, the amount deposited being £80,096. — The success of postoffice savings banks in the United Kingdom, and their introduction in other European countries, have attracted attention in the United States, and the late postmaster general recommended their adoption by the United States government as a means of funding the national debt. If this scheme should be resorted to, the government would be obliged to offer a fixed rate of interest. United States bonds having 25 years to run, are selling in the market at a price that pays the investor but a fraction over 3 per cent. per annum, and if a series should be issued to run an indefinite number of years at the pleasure of the *buyer*, as savings bank deposits do, they could be easily negotiated at par or above it, if they bore 3 per cent. per annum interest. This is the maximum rate that the government needs to pay when it wishes to borrow: now to manage a system of postoffice savings banks, would cost the department at least $\frac{1}{2}$ of 1 per cent., which deducted from the maximum rate, would leave but $2\frac{1}{2}$ per cent. for depositors. As the savings banks in the United States pay about 4 per cent., the government could not hope successfully to compete with them at this reduced rate. — The conditions not being the same in this and European countries, is another hindrance to the establishment of postoffice banks: there, public debts increase; here, the people pay off the debt, and if this is continued at the same rate, in the future, that has ruled in the past 15 years, the funded debt will be entirely paid off in about 25 years; therefore it is evident,

that the debt, on which it is proposed to found these institutions, being temporary, the institutions themselves would be short lived.—Looking at the matter from another standpoint, civil service reform would have to make further progress before it would be possible to induce the two million savings bank depositors, or two other millions, to place 824 million dollars into the hands of the postmasters of the country, and the government would require a higher standard of capacity for these officials than mere party loyalty before it could afford the risk of transit for so large a sum.—**MILITARY SAVINGS BANKS, and SAVINGS BANKS FOR SEAMEN,** have been established in the United Kingdom for the benefit of soldiers and sailors, and as auxiliaries to the general system.—The statistics are not important, and do not show anything of the thrift of these classes; those among them who desire to save usually prefer to go to the ordinary banks.—**SAVINGS BANKS IN FRANCE.** The first institution was a joint stock society established in Paris under the name of the "*Caisse d'Epargne et de Prévoyance de Paris*" in May, 1818, modeled after the English savings banks. Similar banks were established at Bordeaux and Metz in 1819, at Rouen in 1820, and at Marseilles, Brest, Nantes, Troyes, etc., in 1821. The founders were the managers, and they constituted a close corporation; this method has survived in some savings banks, but it has been generally replaced by an organization in which the administrators are elected by the municipal council and of which the mayor is president.—The personal liability of a joint stock association, became a source of uneasiness to the trustees who were doing a work of pure benevolence, and the state, by law in 1829, authorized the funds to be paid into the treasury, which in 1837 was amended by ordering them into the government deposit and consignment office, a bank under direct control of parliament. On the 15th of June, 1835, the first organic law was passed in relation to savings banks. An amendment of June 22, 1845, reduced the maximum of each deposit from 3,000 francs to 1,500 francs, or 2,000 francs, including accrued interest. In 1851 a further amendment reduced the maximum to 1,000 francs. This limitation was owing to the fear of difficulty in paying cash in a time of crisis, which owing to injudicious management in 1848 (a time of revolution) has forced nearly all the banks into liquidation. In 1870 they had less trouble, which in Paris was altogether neutralized by adopting a measure which had been used with success in this country in 1857: this was to pay a percentage only of deposits on the first application, and require an interval of time for each successive payment, except in cases of extreme necessity on the part of the depositor, when the regulation was modified to the circumstances of each case. This *clause de sauvegarde* was embodied in the Sella law for savings banks and adopted by the Italian parliament in 1875. The trustees of savings banks in the United States are allowed by law to require 30 or 60 days' notice of intention to

withdraw a deposit, which in a time of crisis they are obliged to take advantage of, and in a panic it usually stops a run on the bank if the institution is in a sound condition. At such times the great majority are influenced to ask for their deposits, only from fear that the early applicants will get all the money and leave them in the lurch. They know by experience, that if an unusual call is met at first by prompt payment in full, it is only a question of a few days when the bank will be compelled to suspend from lack of ready cash, if the demand continues. Their conclusions are right although they may not reason from the proper premises; but it is simply impossible to receive deposits and invest them and return the money on demand.—By the law of April, 1881, deposits with accrued interest may amount to 2,000 francs, but when an account surpasses this sum written notice is to be sent to the depositor, and if, within three months following, the deposit is not reduced, 20 francs of it will be invested in *rentes* for his account without expense to him. Interest on the surplus will cease from the time written notice is sent. This law also provides that in times of extreme necessity the council of state may authorize the savings banks to make payments in installments as small as 50 francs at intervals of two weeks.—All French savings banks are under state superintendence through its inspector of finance, and the government deposit and consignment office receives and manages the funds and pays 4 per cent. interest to each bank. The savings banks are, in fact, simple administrative agencies, intermediaries, between the depositors and the government deposit and consignment office, where the money is received and increased by interest. Each savings bank receives 4 per cent. interest, which it pays to each depositor, less a deduction reserved for expenses, which is from 25 to 50 centimes, except in Paris where it is 75 centimes, i. e., $\frac{1}{4}$ to $\frac{1}{2}$ of 1 per cent. in the provinces, and $\frac{1}{2}$ of 1 per cent. in Paris. Out of this amount, reserved for expenses, the best managed banks are enabled to create a surplus fund to meet crises and pay extraordinary expenses. Deposits of one franc and upward are received. The account of a mutual aid society may amount to 8,000 francs, or if the society is registered, the amount of the account may be equal to 1,000 francs for each member.—Sailors on the maritime registry are allowed to deposit at one time the total amount of their pay on being shipped or discharged.—Every depositor may have the whole, or any part of his account converted gratuitously into *rentes*, by his savings bank, and it may be authorized by the depositor to retain the securities and collect the interest.—The funds deposited are payable on demand, certain delays of the treasury excepted.—On making his first deposit each depositor receives a numbered book, in which is entered every transaction with the bank, and which is his voucher against the bank. No depositor can have more than one book, either in the same or different banks. If one violates this

rule his deposits will be returned without interest, and he will be forever excluded from the savings bank — By a law of Aug. 23, 1875, the post-offices and tax offices can be employed as auxiliaries by the savings banks, and be authorized by the minister of finance jointly with the minister of agriculture and commerce, who has the savings banks in his department. A bank which obtains these aids in its district, possesses the advantages of having more agents spread over a larger territory, particularly in the country, and working every day through the postoffices, and in the smaller localities through the tax collectors, thus taking as assistants the receivers and payers of deposits, who do the greater part of the work, and are paid the moderate sum of 10 centimes for each deposit or draft, which is less than the amount reserved for the expense of each transaction by the savings bank, and it transacts its business by means of documents, and without handling coin, or incurring the risk of embezzlement, since the agencies, both postmasters and collectors, receive the deposits for the bank and pass the funds directly to the government deposit office, where the savings bank is duly credited with the proper amount. In the same manner the withdrawals are paid to the depositor, with the money furnished by the same office, and all the transactions with the savings bank are in writing.—The convenience to the depositor is also augmented, and his deposits tend to increase by bringing the savings bank nearer to him. By the law of April, 1881, the postal savings banks received from the government $3\frac{1}{2}$ per cent. interest per annum, and will pay to the depositors 3 per cent. interest, beginning on the 1st and 16th of each month after the day of deposit. The majority of savings banks also have branches of their own; there were, in 1880, 521 banks and 736 branches, with about 3,838,000 depositors, and 1,281,000,000 of francs on deposit, equal to \$256,200,000.—

SCHOOL SAVINGS BANKS. The first legacy of 10,000 francs, which by his will, Dr. Guinard, who died in 1867, directed should be given in perpetuity, every 5 years, to the one, who should have made the best treatise, or the best invention, to ameliorate the material or intellectual position of the working class in general, without distinction, was in 1872 awarded to M. F. Laurent, professor of civil law in the University of Ghent, for his treatise entitled, *Conférence Sur l'Épargne*. The jury of five distinguished persons, chosen by the king of Belgium, from a list of ten, proposed by the royal academy, says: "that the idea which the treatise develops is so just, so fruitful for the future, and in the places where it has been applied, and notably in Ghent, has given results so remarkable, that it has appeared to re-unite all the conditions which the founder of the prize had in view in really ameliorating the condition of the working class, as to fully merit the suffrages of the jury."—The professor had demonstrated the benefits of the theory by 6 years of work, having commenced in 1866 to apply this new branch of

education, by showing the teachers in the public schools, the heads of families, and the pupils, the moral value of the idea, by means of his treatise and by personal visitation. The book was soon published in Flemish, as well as in French, by the government, and 12,000 copies were distributed. In it he shows that adults have inveterate habits of expenditure, and maintains that the best means of causing the spirit of economy to become a habit of the people, is to teach it to their children and require them to practice it; that nothing is easier than to inspire in the young a taste for saving which can be accomplished in the public schools, where the managers and teachers have constant opportunities of enforcing and illustrating the advantages of saving, and where facilities can be easily afforded for carrying out the lessons of economy, by means of penny banks, conducted in the schools. Then he arranged the operations of them, and their relations with the savings bank of the city, in a way which seemed to him the simplest, the safest, and the most educating. His labors were crowned with singular success; out of 15,392 pupils in the city of Ghent, in 1873, 13,032 were depositors in savings banks, and they had to their credit, 462,800 francs, nearly \$7.20 each.—The managers testify that the system has produced a marked effect for good on the social and moral life of the working class.—The system extended to hundreds of other towns, and has created great interest throughout Belgium, France, Great Britain, Austria, Hungary, Italy and other countries —In France these school banks had been introduced, up to 1879, into 83 departments out of 86 in the republic. Returns, duly certified, to January, 1878, show that there were in 60 departments, 8,033 school banks with 177,040 depositing pupils, 143,272 of whom had books in the large savings banks. The total deposit of these pupils was 2,964,352 francs.—The plan of operating these school banks is so simple and inexpensive, that they may be introduced into any school with little trouble. A blank book is provided for the school, ruled with 12 vertical columns for months, which are subdivided into 4 or 5 for weeks, with inter-columns for dollars and cents. At the left hand the pupil's name is written. On two or more large pages the accounts of a good sized school can be kept. Cards to be folded once, to keep the writing clean, are ruled like the register and provided for each depositing scholar, on which his name is written. An appointed hour one day in the week is set apart for instruction and practice in the lesson of thrift. As each scholar's name is called, he comes forward with his deposit of a penny or more, which is received by the attending teacher, the amount entered in the register, then in the scholar's card book, which is returned to him as his voucher. The total amount received each day is footed in the register and deposited in gross in some savings bank, in the name of the school. When any scholar's total deposit amounts to a certain sum, (in France and Belgium it is one franc, in Great Britain a

pound sterling,) it is transferred to his credit in the savings bank and charged to the school account by authority of the teacher, the school register and scholar's card book, each having conforming entries made in them. The card book is retained to enter pennies in and the account runs on as at first.—The scholar receives no interest until he opens his account in the large bank, but the school receives interest on the gross balance to its credit, which pays for stationery, and if anything remains over, it is distributed in rewards, to the most worthy or the most regular depositor among the scholars.—Parents become interested, and not only add extra pennies to their children's deposits, but are induced to try the experiment for themselves, by opening deposits in the savings bank on their own account. Once the habit is begun, it tends to increase as time goes on; and as they note the semi-annual additions of interest credited, which their savings have earned, but which they do not always quite understand, it acts as an additional stimulus, and induces further economies which in the beginning they had not thought possible.—No people, probably, need to be taught thrift more than the poorer class in the United States. On account of the ease with which money is obtained in prosperous times like the present, no nation is more extravagant and prodigal in expenditures. Too many of our wealthy people set bad examples by their luxurious habits, but there is a large class of prudent rich ones, who, though they may censure a servant for using two matches to light a candle when one is sufficient, still give \$100 for a benevolent object; they agree with Franklin who said, "whoever tells you that the condition of humanity can be ameliorated by any other means than labor and saving, is your enemy and would corrupt your judgment." Let us therefore, instead of opening soup houses in the days of adversity, establish savings banks in prosperous times, and by the systematic distribution of information in workshops and dwellings, instruct the people, and by establishing penny banks in the schools, teach the children how they may become capitalists, so that when they become men and women they will know how to help themselves and their posterity.—Savings banks in other European countries have increased in number and in influence since 1875. At that date in Switzerland, the depositors were about 1 in 5 of population; in Denmark about 1 in 6; in Sweden and Norway about 1 in 8; in Prussia about 1 in 12; in Austria and Hungary about 1 in 14; and they are conducted with success in Belgium, Holland, Italy, Spain and Portugal and Russia.—In the civilized part of Europe, comprising in 1879 210,000,000 of inhabitants, there were, according to A. de Malarce, 14,000,000 depositors with a sum on deposit of more than 8 milliards of francs, equal to \$1,600,000,000.—For fuller details the reader is referred to the following works and essays: *A Practical Treatise on Savings Banks, their Past History and Present Condition*, by Arthur Scratchley, M. A., London,

1860; article, *Caisse D'Epargne*, par Louis Leclerc and Ch. Coquelin, *Dictionnaire de L'Economie Politique*, Paris, 1873; *Conférence sur L'Epargne* par F. Laurent, Bruxelles, 1873; *précédée du rapport du Jury, qui a décerné le prix; Guinard a la Conférence sur l'Epargne; L'Ecole Primaire et la Caisse d'Epargne*, par Arthur LeGrand, Maire de Milly, Paris, 1874; *History of Savings Banks from their Inception in 1816 down to 1874, with discussions of their Theory, Practice, Workings, Present Condition and Prospective Development*, by Emerson W. Keys, New York, 1876; *The Law relating to Trustees and Postoffice Savings Banks, with notes of Decisions and Awards*, by Urquhart A. JOHN P. TOWNSEND, New York, 1881.

BAR, The, a term applied collectively to all who give professional assistance to others in legal controversies, and are licensed by some competent authority to do so. The term in this sense is variously ascribed to the fact that the space occupied by advocates in a court of justice, is separated by a rail or bar from that which is appropriated to spectators, and to a separation in a like manner of the benchers and readers from the students in ins of court on public occasions.—As soon as a people emerge from barbarism, a body of men who make it their business to expound the law, and assist those who may need assistance in legal matters, is always observed to make its appearance, as one of the requisites of civilization and legal order, and the state confers upon its members special and peculiar privileges by law, and at the same time places them under regulations more or less strict, for the protection of the public and of those who may place their interests in their care. In the earliest accounts we have of judicial investigations, the litigants are brought into court in person, and are permitted to give their own account of the controversy, and the judges, after inquiring further, if the case seems to require it, proceed to give judgment for

the one or the other, according as his story seems most plausible, or best supported by such evidence as is at hand. This places the ignorant and simple at the mercy of the cunning, crafty and designing, and it is easily made the means of perverting justice, and clothing wrong with the forms of law. In the famous description of the shield wrought by Hephæstus for Achilles, the picture of a judicial trial is given, and we perceive, immediately, that the most persuasive voice is expected to succeed, whatever may be the merits, unless perhaps the clamor of partisans, who are active and noisy about the court, shall sway the action of the judges in the other direction. That this would be so is by no means unlikely in any case in which popular sympathy is aroused or popular prejudice strongly excited, or even where money or family influence was able to produce the appearance of strong popular feeling. In Athens there seems to have been no distinct class of men who made advocacy their business, and causes were expected to be managed by some one interested therein; but friends sometimes appeared to support the cause of those who lacked the ability or the eloquence to speak on their own behalf, and sometimes a public prosecutor was appointed for a particular case, as Pericles was called upon by the people to prosecute Cimon, when the latter was accused of having been bribed to abandon the invasion of Macedon.—In Rome, in its early days, the state of things was quite as little conducive to regular and unimpassioned judicial investigations, but gradually patrons assumed the defense of their defendants or clients, and, as Niebuhr describes the obligations and duties springing from that relation, "all clients, however different in rank and consequence, were entitled to paternal protection from the patron; he was bound to relieve their distress, to appear for them in court, to expound the law to them, civil and pontifical. On the other hand, clients were obliged to be heartily dutiful and obedient to their patron, to promote his honor, to pay his mulets and fines, to aid him, jointly with the members of his house, in bearing burdens for the commonwealth and defraying the charges of public offices, to contribute to the portioning of his daughters, and to ransom him or whoever of his family might fall into the enemy's hands." The obligation to expound the law for his defendants rendered the patron subject to frequent calls, and made the study of the law a necessity, and those patrons who acquired reputation as specially learned and wise were frequently consulted by others also, and became known as *juris consulti*. So extensive was the business of some of them, that students attended them to learn the law from their exposition of it, and followed them into the forum that they might study and imitate their oratory. Some of them, however, were not advocates, but sat at home like oracles delivering opinions to those who called for them, with their students gathered about to listen and learn. The advocates were not com-

pensated for their services unless by voluntary gifts, nor did the patron expect payment from his client otherwise than in the discharge of the reciprocal duties of the client above enumerated; but it was the patron's aim and interest to make his clientage as large as possible, for his importance in the state, his political influence and the gratification of his ambition for high office depended largely upon it. He was, therefore, interested in espousing earnestly the cause of his client, and protecting him to the full extent of his ability. Many jurisconsults delivered opinions freely upon similar considerations, but others took fees, and their services were often employed by advocates in their preparation for important trials. Forensic orators were also sometimes employed by others than their clients, and instances are recorded where their services were engaged by cities and provinces to impeach or prosecute at Rome, the officers who were accused of high crimes. In such cases a gratuity would be expected, and the advocacy of causes thus, at length, became a matter of business, which was sometimes united with the giving of opinions and sometimes not. The advocate was not expected to gather the information, or, as it would now be phrased, look up the evidence for the trial, but this was done by a lower grade of professional agents called procurators. A like distinction between those who prepare the case for trial and those who present it to the court has prevailed in most European states in modern times; and in France, Belgium, Geneva, and some of the German states, the advocates constitute an association or order into which admission can be obtained only by their own consent.—Lawyers, as a distinct class or profession, made their appearance in England soon after the conquest, and as soon as the courts were permanently located at Westminster, practitioners gathered about the place of sitting, and schools for the reception of students sprung up, in which the most eminent and approved practitioners gave instruction. These schools were not always regarded with favor, and in 19th Henry III., that monarch issued a mandate for their suppression by the municipal authorities of London; and this led to, or was followed by, the establishment of inns beyond the jurisdiction. A palace before occupied by Henry Lacy, earl of Lincoln, was taken for this purpose in the early part of the fourteenth century, and has since been known as Lincoln's inn. The temple was also taken for the same purpose soon after, and a little later Gray's inn was established, the name taken for it being that of the proprietors of the soil. In the temple two societies were established, known as inner temple and middle temple, and the four inns of court exist as places for instruction in the law to this day, and each has subordinate and dependent inns known as inns of chancery, where instruction is given preparatory to admission to the inns of court. Each of the inns of court is independent of the others, but their regulations for calling

persons to the bar are substantially the same. The government is in the hands of the benchers, who are selected from the barristers according to seniority. Students are not called to the bar until they have been for 5 years members of one of these societies, unless they are of the degree of master of arts or bachelor of laws of one of the universities, when it may be 3 years; nor until they have passed an approved examination by the society to which they belong. The call makes them barristers, and after 16 years' service a barrister may be called to the degree of sergeant. From the sergeants the attorney general and solicitor general are chosen, and it is customary also to designate certain members as king's (or queen's) counsel; the designation being one of honor rather than of profit. The societies named enjoy the exclusive privilege of calling to the bar, and they may also expel a member for cause, and thereby disbar him. Barristers and sergeants can make no contract for compensation, but the custom is to deliver with the brief a fee proportioned to the importance of the case, and the expected value of the desired service, and also to pay a like fee on any consultation. The lower order of practitioners in England is that of attorneys, who are regularly admitted to practice by the respective courts upon examination. These issue writs, prepare and serve pleadings, do whatever may be necessary to prepare the case for the advocate, and then instruct the advocate by a brief which is to be his guide on the trial. They are not at liberty to appear as advocates in the higher courts, but are represented there by barristers or sergeants. Attorneys are paid according to a fee bill prescribed by law, and they may bring suit for their fees. In chancery the practitioners are called solicitors, corresponding to attorneys in the law courts, and counselors who are the advocates. In the ecclesiastical courts the practitioners are proctors and doctors of the civil law, and in the courts of admiralty they are proctors and counselors. Advocates may practice in different courts, but they are expected to choose the branch of law to which they will give attention, and confine their practice chiefly to the appropriate court or courts.—The profession in Ireland corresponds to that of England, and requires no special notice. The barristers are only admitted after keeping certain terms in the inns of court of London, and at the king's inn at Dublin.—In Scotland the several grades are writers, solicitors and advocates, the latter being licensed by the faculty of advocates.—In the United States the members of the legal profession are attorneys and counselors at law, solicitors and counselors in chancery, and proctors and counselors in admiralty; but the distinction between the two grades has become almost nominal in the states generally, and purely nominal in some. Attorneys may appear as advocates in all the courts, but in a few cases counsel are required to sign pleadings or give certificates of merits. Counsel, when any distinction is made, are merely attorneys who have

been for a certain time at the bar. They may not only contract for a compensation for their services, but in the absence of any special contract, the law implies one on which suit will lie. It is never thought discreditable for counsel in America to bring suit for fees which will not be paid without, though reputable counsel seldom do so except in extreme cases. In France, where an advocate may sue for his fees, it is commonly esteemed unprofessional to do so, but the custom is more general to pay in advance than it is in America. Attorneys are licensed to practice in the several courts by the courts themselves, sometimes under rules prescribed by statutes, and sometimes under regulations which the courts prescribe. The rules are exceedingly dissimilar: all that is prescribed in many states is, that an applicant for license shall be a male resident of the proper age, and pass an approved examination, but in other states he must produce evidence of having pursued the study of the law in the office of a practitioner or in a law school for a period of time named, which period ranges from two years to five. A very large proportion of students are educated in the law schools. In some states females, giving evidence of the proper qualification, may be admitted to the bar, and some few have been admitted. The federal courts admit, on motion, those who are practicing attorneys in the highest state court.—In Great Britain advocates as well as the judges must appear in court in wigs and gowns, but this is not required in America. In the supreme court of the United States, however, the judges wear gowns.—It is important now to understand what are the privileges of the members of the bar, and what are the rights and privileges of those who employ them. In general terms it may be said that the conduct of business in the higher courts is exclusively in the hands of the bar, though a party has a right to conduct his own suit in person if he shall see fit to do so, but unless he is familiar with legal forms he would scarcely be safe in venturing to act in person, whatever might be his ability. Judges of courts are also expected to be appointed from among the members of the bar, and in some states this is required by law. Prosecuting or district attorneys are also chosen from the same body of men, and so are the officers who perform the duties of master in chancery. In respect to justices and judges of inferior courts no such requirement is made, and in those courts any one may appear as an advocate whom a party sees fit to employ.—It is remarkable that the full privilege of transferring the defense of his case to counsel was formerly restricted in England to civil cases and cases of misdemeanor. On trials for treason and felony the accused was permitted to be heard by counsel on such questions of law as might arise; but it was considered the duty of the judge to be vigilant that no injustice be done to an accused party, and the judge alone could call the attention of the jury to such facts as might be supposed to favor the defense. This

idea that the accused, if innocent, would be protected by the counsel and assistance of the judge was pleasant in theory, but it could seldom have much foundation in fact, and was sometimes a cruel mockery. The prosecution was usually presented by able counsel, and the keenest and most fair-minded judge would be wholly unprepared, except in the simplest cases, to bring out the facts which might rebut the case for the crown. To do this, outside investigations would be required, and these the accused would seldom have the opportunity for making, and the judge never. "I have myself often," said a learned counselor whose practice in the last century was unsurpassed in extent, "seen persons I thought innocent convicted, and the guilty escape, for want of some acute and intelligent counsel to show the bearings of the different circumstances on the conduct and situation of the prisoner." Learned judges gave testimony to the same effect. Yet, although the privilege of full defense by counsel was conceded to persons accused of treason by stat. 7, William III, c. 3, it was not extended to those charged with felonies until 6 and 7 William IV., c. 114. In the United States the privilege is converted into a constitutional right. By the constitution of the United States a person charged with an offense in the federal courts is to have the assistance of counsel in his defense; and the several state constitutions contain similar provisions. If an accused party is unable to procure the assistance of counsel, because of his poverty, it is customary for the courts to designate some member of the bar to aid him; and though it has been decided in one state (Indiana) that counsel can not be compelled to give gratuitous services, it would be looked upon as unprofessional to refuse, and also as discourteous to the court. It is customary, however, for the state to provide some small compensation for counsel thus assigned. In the prosecution or defense of a case counsel are at liberty to do or say whatever might be done or said by their clients, and they are protected in doing so to the same extent that clients themselves would be if personally managing their own cases. The counsel is therefore privileged from prosecution for any defamatory matter that may be contained in his pleadings, and the same privilege protects his arguments in court. If, therefore, the counsel put forward theories or urge conclusions not warranted by the facts, he is not subject to responsibility, either civil or criminal, therefor. The privilege, however, may be said to be conditional: it is not so far absolute as to protect him if he shall wander from the subject in controversy to inflict gratuitous injury by dragging in irrelevant matters, or by defaming persons who have no connection with the controversy. It is expected that counsel shall argue questions of law to the court, and questions of fact to the jury when there is one, but in some cases—particularly in cases of libel—the jury, by constitution or statute, are made judges of the law as well as of

the facts, and it is proper to address the argument on the law to them. Some courts have also held that the jury were judges of the law in other criminal cases, but the prevailing doctrine is that they must receive the law from the court. Nevertheless, if the jury disregard the instruction of the court and acquit an accused party, the acquittal is final.—Next to being defended by counsel the most important privilege of the client is that his attorney shall preserve inviolable secrecy in respect to all facts which have been communicated to him for the purpose of obtaining his professional assistance, or which have come to his knowledge in the course of or because of his employment. The necessity that the client should be perfectly confidential with his counsel in order to have the full benefit of his assistance is conceded, and he is, therefore, encouraged by the protection which the law throws over his communications, to disclose fully all the facts known to himself which bear upon or may affect any question on which he needs advice or professional aid. The obligation to observe secrecy is not limited to the pendency of the particular case or controversy, but is perpetual, and the counsel will not be suffered to make disclosure as a witness in other cases, even if he were disposed to do so; the privilege of secrecy being that of the client himself, and not of the counsel. The client himself, however, may waive it, and permit a disclosure. The privilege is limited strictly to communications made with a view to professional assistance: what the party shall say in mere social intercourse, or communicate for any other reason than professional aid, is no more privileged than the ordinary talk between man and man. Communications in writing, the exhibition of title deeds, securities and other papers, are within the protection.—Attorneys and counsel have a lien upon all papers and securities their clients may place in their hands, and upon moneys collected by them, as security for any sum that may be owing to them for professional services and expenses. They probably have at common law no lien upon any judgment that may be recovered by them except to the extent of their own fees that may be included therein, and which have been taxed against the opposite party. As between themselves and their clients their own fees are not measured by the allowances of the fee bill, but, in the absence of special contract, rest upon a *quantum meruit*; the fee bill being the measure only as between the successful and the defeated party to the cause. But in England the attorney recovers according to the fee bill, and may be required to have his bill taxed before payment. Sometimes attorneys take charge of suits on an agreement that if successful they shall have for their services a certain portion of the damages or other thing recovered; but the practice is thought by many to be unprofessional, and is held by some courts to be illegal for champerty. An agreement by an attorney to warrant success in a

suit is contrary to public policy, and void.—An attorney when licensed to practice takes an oath, which is somewhat different in different states, but the most important provisions of which are that he will conduct himself with all due fidelity to the courts in which he may practice and to his clients. He then becomes an officer of the court, and is under obligation to assist the court with his advice whenever called upon, and becomes under a moral obligation to defend the honor and integrity of the court if they shall be unjustly assailed. He also becomes subject to the discipline of the court if he shall be guilty of improper practices, and he may be punished as for contempt of court for disorderly or unbecoming conduct in its presence, for refusal to obey its proper orders, for making wrongful use of its process, for abusing the confidence of his clients, or for dishonesty in his professional employment. In gross cases he will be disbarred, by which is meant that his license to practice will be revoked: and this may be done for any reason that would render him unworthy of general confidence; as for example, if his reputation for truth should become so bad that the community would not believe him under oath, or if he should be convicted of some heinous or degrading offense. The power to disbar an attorney for assaults made upon the judge out of court because of something done by him judicially, or for intemperate criticism of his judicial conduct in the public press, has sometimes been exercised, but the right to do so has as often been questioned, and a prudent judge will leave such abuses to the same remedies that are open to others.—In respect to the institution of suits the attorney must obey the directions of his client, and he will be responsible in damages in case he shall refuse or neglect to do so. When the suit is instituted, however, the attorney must exercise his own judgment, and the client's remedy, if he is dissatisfied, is to dismiss him and put his case into other hands. The employment obliges the attorney to give his client his best endeavors for success; but he never by any implication of law warrants success, and is entitled to compensation even when the client, acting upon his mistaken advice, has lost his cause. But for losses occurring through his fraud or negligence, the client may recover damages; and for gross frauds or other misconduct to the prejudice of the client, the court will sometimes give summary remedy by attachment.—How far the counsel is morally bound to consider the interests and the feelings of others when his client's interests are at stake, is a much mooted question. Lord Brougham, in the defense of queen Caroline, advanced the extraordinary doctrine that, "an advocate in the discharge of his duty knows but one person in all the world, and that person is his client." But advocates equally eminent with himself have rejected such a doctrine as being degrading to the profession, subversive of the very reasons upon which their peculiar privileges exist, and because it would convert a class

which are supposed to be ministers of justice, into instruments of injustice, oppression and outrage whenever the necessities of bad cases shall require it. No client has any right to require that any counsel shall in his interest pervert the law, or give a false color to the facts, or abuse witnesses who are apparently fair, or inflict wanton injury on any one: being called to the bar as an aid to the court in administering the law, the first duty of counsel is to assist in seeing justice done, and his services to his client must keep this primary duty in view. That sentiment, however, which is often expressed, that counsel have no moral right to render legal assistance to those whom they may know or believe to be guilty of crimes with which they are charged, has no just or reasonable foundation whatever. For, in the first place, the counsel is not made by the law the judge of his client's guilt, and if he were, he might misjudge upon some preliminary statement, and leave an innocent party to be condemned without a defense. But, in the second place, it is a duty which every one connected with the administration of the law owes to the law, to see that all, even those most guilty, are only condemned according to the law; for only by that course can order be preserved, and the law made an effectual protection to the innocent. The sentiment referred to, pushed to its legitimate conclusion, would justify summary execution without trial in every case where guilt appeared certain; for a trial without defense—especially if defense be refused because of supposed guilt—has little or no significance or value as a judicial investigation. It is, therefore, a part of the obligation the counsel assumes, not less to the law than to his client, to point out and insist upon all the defects, whether of law or of fact, that may exist in the case against him, and to urge an acquittal whenever he can show that the case is not complete. To this extent, to quote the language of Mr. Charles Phillips, "the counsel for the prisoner has no option. The moment he accepts his brief every faculty he possesses becomes his client's property. It is an implied contract between him and the man who trusts him." But further than this he can not rightfully go. It would be improper for him to endeavor to influence the jury by urging upon them his own opinion, and it would be as well unprofessional as dishonest if he were to do this when the opinion he expressed was not that which he held. In cases where only civil rights are involved, counsel has a right to take advantage of legal rules for the benefit of his client, even when in the particular case they seem to operate unjustly. Legal rules are established from reasons of general policy, and because they produce the best results in the great majority of cases, and injury in particular cases is inseparable from any rules of general order. All that can be properly required of counsel in such cases is, to use his best endeavors to bring about voluntary arrangements when equity seems to require it.—The evidence of an attorney's retainer in a case, as between himself

on the one hand and the court and opposite party on the other, is found in the fact of his entering his appearance of record. In general the opposite party is not at liberty to question the fact that the appearance has been entered on a proper employment, and if the appearance is unauthorized, the party is nevertheless bound, though he may move to set it aside on showing the facts. He may also have an action for the recovery of any damages he may have suffered as a consequence of the attorney's unwarrantable act. When the relation has been formed by an actual employment, it is supposed to be based on a degree of confidence in the professional adviser that must subject the client in a very great degree to his influence. As the attorney is an officer of the court it becomes then the duty of the court to see that this confidence is not abused; and any business dealings between client and counsel will be scrutinized with a degree of jealousy, and with some presumption against its fairness. In some cases the courts have set aside gifts that were made by the client pending litigation, and held contracts which were made for a larger compensation than was stipulated for at the outset to be *prima facie* oppressive and void. They have also held void all securities obtained by the counsel for the purpose of protecting him against liability for his own wrongful acts or negligences. So a purchase by the attorney of the claim of the adverse party would give him no interest as against his client, and any contract whereby, directly or indirectly, he would obtain compensation from both parties, would not only be corrupt and void, but might subject him to summary punishment. If an attorney, by means of his employment, acquires knowledge of any defects in his client's title, the disability to take advantage of the fact for his own profit does not terminate with his employment, but is perpetual.—All notices which a party to litigation may have occasion to serve upon the other, must be served upon his attorney, who is supposed to keep him informed of all the proceedings, and also of all collateral facts that may professionally come to his knowledge, so that it is a maxim of law that notice to the attorney is notice to the party himself.—The attorney's employment in a cause continues until judgment is given, and afterward, if his client is the successful party, so far as to authorize him to issue process and receipt the amount when paid. If his client shall discharge him, the discharge does not become complete so far as the opposite party is concerned, until it is made effectual by rule of court and the substitution of another in his place.—The following acts are not within the general authority of an attorney: To submit his client's case to arbitration against his will; to sell or assign a claim placed in his hands for collection; to compromise the claim; to accept in payment anything else but money; to buy in for his client land which he sells on execution or mortgage foreclosure; to file a creditor's bill or other supplementary proceedings to enforce the payment

of a judgment when collection is not made by execution; to employ assistance in the case, or to pledge the credit of his client except for the legal expenses and other necessary costs in litigation. If an attorney should make a compromise of a case by consenting to a particular judgment, the client, by showing that it was without his consent, might have it vacated.—An attorney may be a witness in a cause in which he is employed, but reputable attorneys seldom consent to this where their evidence is of much importance, or is disputed, but will withdraw from the case when they discover that their evidence is to be material and allow another to be substituted, that there may be no suspicion that they testify under bias.—The business of attorneys and counselors may be and frequently is conducted by two or more as partners, and under all the rules that govern partnerships in general. But as this is not a commercial partnership, one of the number has *prima facie* no right to give commercial paper in the name of the firm.—There is a bar association of the United States, composed of such members of the bar as see fit to join it, which holds annual meetings, at which an address is delivered by the president and papers read by others, and discussions had on important legal subjects. There are also state bar associations in some states, and also local associations in some cities and counties. These are expected, among other things, to promote good fellowship, and to take steps to rid the profession of members known to be unworthy.

THOMAS M. COOLEY.

BARNBURNERS (IN U. S. HISTORY). (See **FREE SOIL PARTY**.) The name was given and accepted as indicative of their supposed readiness to resort to radical measures, and its origin is usually assigned to a story, often told by Hunker orators, of a stupid farmer who was persuaded to burn his barn in order to free it from rats. (See **NEW YORK**.) A. J.

BARRICADE. In its widest sense the word *barricade* means an improvised fortification intended to obstruct the progress of an enemy.—Barricades are most frequently mentioned in connection with revolutionary movements. They were used for revolutionary purposes as early as in the middle ages. History tells us of those that were erected in Paris, in 1588 and 1648. In the nineteenth century they re-appear with distressing frequency. We may call attention, for instance, to the barricades erected in July, 1830, when the throne of the elder branch of the house of Bourbon was subverted, and the crown was placed upon the head of Louis Philippe, the duke of Orleans; also, to those of Sept. 17, 1831, raised on receipt of the news of the disaster at Warsaw. We may likewise recall those of June 5, 1832, on the occasion of the obsequies of general Lamarque; and those of Feb. 11, 1848, in France. The revolution of Feb. 24 resulted in the creation of the *ateliers nationaux*, the closing of which

was followed by the mournful days of June, 1848. At the time of the *coup d'état*, Dec. 2, 1851, the barricades erected were very weak and feebly defended. The events of the month of June had demonstrated the utter inadequacy of barricades to resist an attack by well disciplined soldiers.—During the empire no barricades were raised in the streets of Paris; two or three attempts were immediately checked. The empire did not fall through the agency of barricades. When will men understand that violence is generally a bad means to establish durable institutions, that reformation is better than revolution, and that the surest road to amelioration is the road of the law?—It is hardly necessary to say that Paris has had no monopoly of barricades. Brussels had her barricades in September, 1830. Berlin, Vienna and Dresden had theirs in 1848 and 1849. But neither in Germany nor in France has the use of barricades produced aught but a result of short duration.—No reference is here made to barricades erected in open cities with a view to stop the passage of an enemy. It would cause great evils, without any good to the country, to fortify an open or unfortified city, save when it becomes part of a strategic plan. MAURICE BLOCK.

BARTER. (See EXCHANGE.)

BASTILLE. In former times the term *bastille* denoted a fortification *extra muros*, a temporary construction for the siege or the defense of cities. In our day it is applied more particularly to the castle erected in the year 1380, under Charles VI., in the quarter of Paris called Saint-Antoine.—It was at first intended that the bastille should serve as a stronghold of defense against aggressions from without. We need, however, say nothing here of the part it has played in history as a military post. We are now concerned with the bastille only as a state prison. Looked at from this standpoint, the grim old pile furnishes matter for an interesting page in the annals of the French monarchy.—Hugues Aubriot who superintended the construction of the bastille, was the first prisoner to enter its walls; but political considerations had nothing to do with his incarceration. Suspected of heresy, accused, tried and convicted by ecclesiastical authority, he merely passed through the prison he had constructed, and thence to the perpetual confinement to which he had been condemned, behind the bolts in the dungeon of the bishop of Paris. The bastille became a place of confinement for prisoners of state, only when the conflict between royalty and the great vassals of the crown commenced. In 1477 we find there immured such powerful lords as Jacques d'Armagnac, the duke of Nemours. Later, when the circle of those who took an interest in the political life of the nation grew to much larger dimensions, and extended so as to embrace many of the great body of the people, members of the bourgeoisie and persons belonging to the humbler ranks of society were to be met within the walls of the bastille. But up to the middle of the sev-

enteenth century its doors closed only on men of quality and great dignitaries, who have left legendary accounts of their captivity. Those of cardinal Balue are not the least popular if not the most interesting. However, Charles XI., who struck so rude a blow at this prince of the church, made hardly any use of the bastille. He had his own private dungeons and executioner. Among the numerous political conflicts during his reign, Jacques d'Armagnac and Balue are nearly the only ones who underwent the severe penalty of the bastille. Richelieu, who followed up the line of policy pursued by Louis XI., caused many a man of gentle or noble birth to be imprisoned or executed in the bastille. Mazarin, the successor to Richelieu, restored to liberty most of the prisoners detained by order of the cardinal-duce, and, substituting craft for violence in the government of France, he used the bastille with moderation. It was under Louis XIV. that the memorable period of religious and political proscription commenced; and it was also from the beginning of his reign that the cells of the bastille began to be overcrowded with prisoners. Fouquet and the mysterious personage known under the name of the "Man with the Iron Mask," stand out conspicuously from the throng soon to be recruited from the ranks of the dissenters from the bull *Unigenitus*. Jansenists, Protestants, and religious enthusiasts of every kind, filled the dungeons of the royal prison. If the regency of the duke of Orleans checked somewhat the abuse of arbitrary warrants of imprisonment, the practice of sending out *lettres de cachet* soon became a sort of pastime for the mistresses of Louis XV. These *lettres de cachet*, or royal warrants, were frequently issued even under Louis XVI. Turgot and Malesherbes vainly attempted to effect the release of the prisoners, at least those not confined for what were called "state reasons" (*raison d'état*). The weak monarch, surrounded by advisers and courtiers who would yield in nothing to the progressive ideas of the time, sacrificed his ministers and abandoned to the bastille, the melancholy prerogative of royal absolutism. But this absolutism had seen its day. When, on July 14, 1789, the bastille fell under the blows of the Parisian populace and the "French guardsmen," it is said that the court was paralyzed with consternation. It seemed to it as if monarchy had received its death stroke. Nor was this fear ungrounded. The ruins of the old monarchy were soon mingled with those of the dread fortress which, for so many centuries, had stood the symbol of the omnipotence of kings. MAURICE BLOCK.

BAVARIA. The kingdom of Bavaria is, after Prussia, the most important state in the German empire.—It had its origin in the duchy of Bavaria, the title to which, as a fief, was conferred in 1180 by the emperor Frederick Barbarossa, on Otto Wittelsbach. The descendants of this prince gradually extended the limits of the territory. In 1506 they established the order of primogeni-

ture in the case of succession, and acquired the Palatinate, which entitled them to the rank and powers of electors.—The kingdom as composed at present is the result of events which agitated men's minds at the beginning of this century. The titles to the new provinces of Bavaria were acquired by the treaty of peace signed at Luneville in 1801; by the decision of the states of the empire promulgated on Feb. 25, 1803; the treaty of Presburg in 1805; the act of 1806, which created the confederation of the Rhine; the treaty of Vienna, 1809, and the treaty of Paris, 1814. Eighty-three pieces of territory, reckoned within the states of the empire but comparatively independent, were, by these different acts, annexed to the kingdom created on Jan. 1, 1806. In exchange for these possessions the kingdom ceded the part of the Palatinate situated on the right bank of the Rhine—Bavaria has 4,863,450 inhabitants (census of 1871), against 3,707,966 in 1818. The population is composed principally of Bavarians, Franconians and Swabians. A majority of the inhabitants, 3,439,000 in number, are Roman Catholics, while the Protestant churches comprise about 1,327,000 persons. There are, besides, about 50,000 Israelites. Most of the inhabitants are employed in agriculture. The farmers are almost twice as numerous as the mechanics and artisans. The mass of the people are in easy circumstances, since only 2 per cent. of the whole population are at the charge of public charities.—The area of Bavaria is 75,863.42 square kilometres. It is divided into two separate parts. The larger lies in the south of Germany, and principally in the basin of the Danube. Only a few districts are crossed by the river Main, and are thus drained by the Rhine. The valley of the Saale and the Eger slope toward the Elbe. The other part of Bavaria lies on the left bank of the Rhine, and is called the Palatinate (*Bayerische Pfalz*). The soil may be classified thus: 66.7 per cent. utilized by agriculture, 34 per cent. forests, and 5 per cent. uncultivated land. Agriculture supports, we may say, 67 per cent. of the whole population.—One-half of the forests of Bavaria belongs to private individuals, 34 per cent. belongs to the national domain, 14 per cent. to the communes, and the residue, or 2 per cent., is apportioned among endowed institutions.—Cereals and potatoes are everywhere the principal agricultural products. In several districts, such as the upper Palatinate, the farmers raise an abundance of flax. Hemp and tobacco are grown in Franconia and the Palatinate. Latterly the cultivation of hops has so gained in importance as to supersede the vineyards in many places. However, large quantities of wine are still produced, the best of which is grown in lower Franconia and the Palatinate.—For administrative purposes the country is divided into 8 circles (*Kreise*), 7 of which, upper Bavaria, lower Bavaria, the upper Palatinate, upper, middle and lower Franconia, together with Swabia, lie on the right bank of the Rhine. We have already

mentioned the eighth circle, the Palatinate. These circles are subdivided into administrative districts (*Bezirksämter*) and judicial circuits. In each circle there are from 4 to 7 courts of first resort, while the number of administrative districts varies from 17 to 25. Each circle, administered by a government (*Regierung*), or committee with governmental powers, has one court of appeal.—The political constitution of Bavaria began with the charter of May 26, 1818, granted by the king, Maximilian—Joseph I. This fundamental act has undergone many changes since that time; and it may here be remarked, to the honor of Bavaria, that these changes have been made in a constitutional manner. The government has respected the law it had imposed on itself.—The principal provisions of the Bavarian constitution are these: The crown is hereditary in the house of Wittelsbach, in the male line according to the law of primogeniture. If the male line becomes extinct, and no treaty for the succession has been concluded with a German family of the royal blood, then the crown goes to the female line. The king is the head of the state. He is invested with all governmental powers, and exercises them in conformity to the constitution, with the assistance of the chambers. His civil list amounts to 2,350,580 florins. The king has, in addition, the free use of the royal castles and other domains of the crown.—The diet (*Landtag*) comprises two chambers: that of the counselors of the empire (*Reichsräthe*) and that of the deputies. The former chamber includes hereditary members, and also life members appointed by the king. But the number of life members must not exceed one-third of the number of hereditary members. The following personages are members of the upper chamber, in virtue of their office or hereditary right: Princes of the royal blood, the four grand dignitaries of the crown, the two archbishops, one of the bishops designated by the king, the president of the superior Protestant consistory, the heads of the families of princes or counts who figured in the states of the empire up to 1806, and who at that period were *mediant* *zed*, and the owners of *majorats*, upon whom the king has conferred this dignity as hereditary.—A new election for all members of the chamber of deputies takes place every 6 years. There is one deputy for every 31,500 inhabitants. There are two degrees of electors. All citizens who have attained the age of majority, and pay direct taxes, are primary electors. There is an elector of the second degree for every 500 inhabitants. The electors of the second degree appoint the deputy. All citizens, from 30 years of age, who have not been convicted of crime or infamous offense, and have not forfeited their political rights, are eligible without distinction or restriction. The diet must be convened at least once every 3 years.—The constitution grants the diet the following rights: 1. No general measure concerning the personal liberty or the property of a citizen can be taken or modified,

except after the matter has been discussed and approved by the chambers. The chambers share with the government the right to propose new laws, but to approve them is the prerogative of the king, who possesses an absolute *veto*.—2. No new tax, no reduction nor increase of a tax, can be introduced without the concurrence of the chambers. The collection of direct taxes must be authorized by the diet, which generally grants the permission for a fiscal period of 2 years. The diet can not grant the permission for a longer time without an abuse of power. The chambers, before passing the budget of the revenues, have of course to examine the budget of state expenditure.—3. The debt is guaranteed by the diet, and can not be increased without its consent. Each chamber appoints a member of its body to watch over the state of the debt.—4. The chambers have likewise the right to present petitions, to make propositions, and even remonstrances whenever a provision of the constitution has been violated. The diet has also the power to impeach ministers of the realm and their agents before a high court of justice.—The constitution guarantees personal liberty to every citizen, as well as security for his life and property. Liberty of conscience is recognized. The protection of the state can be refused no one on account of his religion. All creeds are free to worship in private houses, but the liberty of public worship depends upon the authorization of the king, except of course in the case of creeds already recognized. The latter are divided into two classes. The Catholic, Lutheran and Reformed parishes are recognized as corporations or public establishments. The Greeks, Anglicans, Mennonites, Moravian Brothers, and Israelites constitute only private associations. The affairs of the Catholic church are regulated by the concordat of 1817, so far as its provisions do not conflict with the constitution subsequently promulgated. The affairs of the two Protestant forms are governed by a royal edict published with the charter of 1818.—The public law of Bavaria discriminates between three classes of communes: the local communes (*Ortsgemeinden*), the district communes, and the circle communes. According to official statistics there are now in Bavaria about 225 cities or urban communes (17 of which contain each more than 2,000 families), and 7,890 rural communes. These 8,125 municipal communes are divided into 222 cities, 400 boroughs, 11,100 villages, 11,200 hamlets, and 21,500 isolated dwellings. The communes of which a district is composed, taken all together, constitute a district commune; while the communes of one and the same circle, as we have stated, form a circle commune. We may simply add that the more important cities constitute separate districts.—The different classes of communes have each their representatives, freely elected. A syndic (*Gemeindevorsteher*) or mayor, assisted by a municipal committee, is at the head of each rural commune. The towns and bor-

oughs are governed by a committee invested with magisterial powers, which, in important matters, especially when contracts are to be made in the name of the commune, must consult; and by a municipal college or council, the number of whose members varies according to the population in the town. One-half of the committee and one-third of the municipal college are elected every 3 years. The burgomaster presides over these bodies.—The district commune, or the district itself, is represented by a council elected for 3 years, chosen from among the members of the municipal corporations, to whom are added delegates from the ranks of the great landed proprietors. The district council assembles only once a year, but it appoints, from its own members, a standing committee, charged with the duty of preparing the deliberations of the council, of attending to the execution of its decisions, and even taking action in all affairs concerning the district which have not been reserved especially for the action of the council.—The circle commune has for its organ the general council, composed of delegates elected for 6 years by the district councils, the municipal councils of cities with more than 10,000 inhabitants, the great landed proprietors, the parish priests, and, when there is one, by the university. The general council meets every year, but itself is likewise represented by a standing committee in the intervals between the sessions.—In Bavaria it is generally conceded that the best security for the rights of the citizens, and particularly for the liberty of the individual, is found in the principles upon which rests the administration of penal justice. Publicity and oral proceedings in judicature are powerful obstacles to arbitrariness, and foster a spirit of order and equity among the people. A jury passes judgment upon the guilt of a person accused of crime, after a defense to which the widest latitude is granted by the laws.—Every Bavarian citizen must pay taxes and render military service. Recruiting is done by casting lots. All young men who have attained the age of 21 years are liable to military duty. The length of service required is 6 years in the standing army and 5 years in the *landwehr*. Substitutes are no longer allowed.—The burden of taxation is not very heavy in Bavaria. It is certainly less than that borne in many other countries of the same size. About three-fifths of the 60,000,000 florins to which the national expenditure amounts, are derived from taxation. The other two-fifths come from the public domain, particularly from forests and royalties. The direct taxes furnish about one-third, and the indirect taxes two-thirds of the total taxation—say one-fifth and two-fifths of the whole revenue of the State.—In the statement of expenses, attention must be called, in the first place, to the interest on the national debt, and to the sinking fund, which, altogether, require the sum of 16,620,300 florins; the sinking fund is $\frac{1}{2}$ per cent. of the principal. Then follow the 6 ministerial depart-

ments into which the civil administration is divided, the maintenance of which costs 6,000,000 florins; the schools of education and of instruction, 1,153,000 florins; religious establishments, 1,600,000; public works, 2,500,000; public safety, 1,300,000, and the army, 11,450,000 florins.—But it would be an error to suppose that the 1,153,000 florins mentioned above, cover the exact amount expended in Bavaria for public education and instruction. This sum is only the state contingent. The greater part of the total expenditure is borne by the circles, the communes, and endowed institutions. The elements of education are taught in the *German schools* which the communes are required to establish and sustain. There are now 7,200 of these primary schools which, generally speaking, are intended exclusively for children of the same religion. Attendance at school is compulsory for children from 6 to 13 years of age. Children must, besides, attend a Sunday school, until they have completed their sixteenth year.—Teachers are trained in 10 primary normal schools, founded and maintained at the expense of the state. A law has fixed the minimum of their salaries at 350 florins, but in many communes the salary amounts to 500 florins.—Affiliated with the *German schools* are the agricultural and the industrial schools, 26 in number, whose special instruction is continued in the schools of exact sciences (*Realschulen*), and in a polytechnic school. The latter is designed to take the place of the three institutions which were formerly in operation under this name in Munich, Augsburg and Nuremberg—we mean a school of arts and manufactures.—Instruction of a secondary class is imparted, in the first grade, at the Latin schools. There are 96 of these Latin schools, but only 72 include the 4 normal classes, the remainder have only 2 or 3 normal classes.—Instruction in the higher branches of literature and science is reserved to the universities of Munich, Würzburg and Erlangen. It is proper here to mention the academy of sciences, founded in 1759.—There are also in Bavaria 10 lyceums, established principally as seminaries for the training of priests. There is likewise a multitude of other special institutions which, for want of space, we can not here enumerate.—For further details we would refer the reader to the following authorities: *Ueber den Zustand des Koenigreichs Bayern*, by Dr. Ig. Rudhart, a semi-official work published in three volumes, from 1825 to 1827; and also to *Bavaria, Landes- und Volkskunde des Koenigreichs Bayern*, etc., which was published under the patronage of the king. In regard to the public and administrative law of the kingdom, all requisite information may be found in the two following works by the author of this article: *Lehrbuch des bayerischen Verfassungsrechts*, 14th edition, Munich, 1870; and *Lehrbuch des bayerischen Verwaltungsrechts*, 3d edition, Munich, 1871.—Buchner, *Geschichte von Bayern*, 8 vols., Munich, 1820–51; Zschokke, *Sechs Bücher der Geschichte des bair. Volks*, 2nd ed., 4 vols., Aarau, 1821; Manert, *Geschichte Bayerns*, 2 vols., Leipzig, 1826;

Böttiger, *Geschichte Bayerns*, Erlangen, 1836; Rudhart, *Geschichte der Landstaende in Bayern*, 2nd ed., 2 vols., Munich, 1819; Spruner, *Leitfaden zur Geschichte von B.*, 2nd ed., Bamberg, 1853; same author, *Histor. Atlas von B.*, Gotha, 1838; Contzen, *Geschichte B's*, Münster, 1853; Rudhart, *Älteste Geschichte B's*, Hamburg, 1841; Sievert, *Grundlage zur ältesten Geschichte des bair. Volksstammes*, Munich, 1854; von Lerchenfeld, *Geschichte Bayerns unter Max Joseph I.*, Munich, 1854; Preyer, *Lehrbuch der bair. Geschichte*, Erlangen, 1864; Heigel und Riezler, *Das Herzogthum B. zur Zeit Heinrich's des Löwen*, Munich, 1867; W. Müller, *Polit. Geschichte der Gegenwart*, Berlin, 1867–74; same author, *Bayern seit 1870*, in '*Unsere Zeit*,' 1874; Quitzmann, *Die älteste Geschichte der Bayern*, Braunschweig, 1873.¹ DR. DE POEZZL.

¹ As a supplement to the foregoing article we may add the latest statistics which are comprised in the tables that follow:

Revenue and Expenditure for the financial year 1880–81.

REVENUE.		Marks.
Direct taxes.....	35,725,510	
Indirect.....	52,882,580	
State railways, postal telegraphs, mines, etc.....	100,706,574	
State forests.....	24,586,580	
Domains.....	9,039,110	
Miscellaneous receipts.....	1,911,838	
Total.....	221,872,192	
In dollars.....	\$57,218,045	

EXPENDITURE.		Marks.
Public debt.....	46,692,817

Ministry of finance.....	3,438,607	
Worship and education.....	19,634,144	
Pensions and allowances.....	7,549,987	
Reserve and guarantee fund.....	3,926,074	
Contribution to Imperial expenditure.....	16,329,370	
Total.....	134,709,545	
Charges of collection of revenue.....	90,162,647	
Grand total.....	224,872,192	
In dollars.....	\$57,218,045	

The Public Debt, comprising the Ordinary and the Railway Debts.

YEARS.	Ordinary Debt.	Railway Debt.	Total.	
	Florins.	Florins.	Florins.	Marks.
1855....	134,045,964	72,369,700	206,415,664	\$ 86,006,525
1859....	123,280,680	90,913,134	214,193,814	89,247,420
1862....	136,298,375	104,735,559	241,033,934	100,428,720
1867....	209,874,601	146,156,600	356,031,201	143,346,335
1870....	261,926,754	163,428,800	425,355,554	177,231,480
1872....	181,377,265	212,609,300	393,986,565	164,161,070
1874....	232,399,043	398,345,143	630,744,186	157,686,045
1876....	360,162,999	728,426,229	1,088,589,223	272,147,305
1878....	351,252,225	816,091,537	1,167,343,762	291,835,940

The public debt results partly from the deficit of former years and partly from the construction of public works, particularly railroads, which latter have cost 650 million marks (\$162,500,000), and are the property of the state. In 1879 the expense of railroad management exceeded the receipts by 5,735,789 marks; this deficit had to be covered by other sources during the next financial year.

BELGIUM. *History.* Considered as the creation of the treaties of 1815, modified after the successful insurrection of 1830, Belgium is one of the youngest states of Europe. Considered as a nation, it is one of the most ancient, its origin dating back 2,000 years.—Three or four centuries before the Christian era, and six or seven before the incursion by the Franks, the Belgians—a German or Teutonic race on the right bank of the Rhine—crossed that river and conquered the northern part of Gaul. This extensive country, which the Romans called Belgic Gaul, was divided into Upper and Lower Germania, and First and Second Belgium. Within these historical limits, Belgium comprised Strasburg, Speyer, Worms, Mayence, Coblenz and Andernach; Cologne, Nimègue, and Leyden; Treves, Metz, Verdun, and Toul; Bavai, Tournai, Cambrui, Théro-uanne, Boulogne, Arras, Amiens, Beauvais, Soissons, Reims, and Châlons-sur-Marne.—The coasts of Brittany and of other more distant regions were settled by Belgian colonists. Saint Jerome, in the fourth century, traveling in Asia Minor, recognized among the Galatians, to whom the apostle Paul addressed one of his epistles, the language used in the vicinity of Treves. Ireland was peopled by the Menapians, the original inhabitants of Flanders.—The Belgians who, says the historian Florus, fought for liberty, were, according to Cæsar in his Commentaries, the most valiant of the Gauls; a testimony which can not be said to be exaggerated, when we consider what little sympathy exists between the victors and the vanquished. Propertius, a writer almost contemporaneous with Cæsar, says: "It is folly for you to paint your face after the manner of the Belgians. Believe me, there is no true beauty but that of nature, and Belgian colors can only render homely a Roman head." It is true that the emperor Claudius raised the Belgians to the highest dignities, such as those of senator, knight, consul, pretor and general. But this was not without opposition on the part of the people of Rome.—The warlike disposition of the Belgians did not belie itself during the centuries which followed, and up to the time of the empire of Napoleon I. At the battle of Raab, in Hungary, on June 14, 1809, a regiment, the 112th of the line, composed entirely of Belgians, won the distinction of having the cross of the legion of honor fastened to its victorious colors.—In other respects the Belgians, true to the faith of their fathers, have been counted among the most zealous of Catholics. Francis Xavier, writing from India, used to say: "Send me Belgians." The first leaders of the crusades were Belgians. An equestrian statue of Godfrey de Bouillon has stood, since 1848, in one of the public squares in Brussels.—*Territory and Population.* The southern provinces, having been violently separated from the northern provinces of the Netherlands, formed themselves into an independent state under the title of the kingdom of Belgium, and adopted a constitution after free deliberation.

This constitution was voted for and promulgated by representatives of the people assembled in a national congress. The first article of the constitution enumerates, in alphabetical order, the great divisions of the kingdom called provinces, in conformity with historical traditions. This enumeration we may complete by the full number of urban and rural communes, the area of the country according to the official land registers, the population according to the census of Dec. 13, 1869.

PROVINCES.	Communes.	Hectares.	Inhabitants.
Antwerp.....	150	283,173	485,883
Brabant.....	340	323,296	862,982
Flanders (Western)...	250	323,467	660,029
Flanders (Eastern)...	294	299,995	829,387
Hainaut.....	435	372,162	834,319
Liège.....	334	289,388	584,718
Limburg.....	26	241,234	198,727
Luxemburg.....	25	441,776	204,826
Namur.....	350	366,025	310,965
Totals.....	2,564	2,945,516	5,021,736

—2,945,516 hectares are equivalent to 11,373 English square miles. On Dec. 31, 1876, the population of the kingdom, by provinces, was as follows:

Antwerp.....	538,881
Brabant.....	936,962
Flanders (West).....	684,468
Flanders (East).....	863,478
Hainaut.....	956,754
Liège.....	632,228
Limburg.....	205,237
Luxemburg.....	204,201
Namur.....	315,796
Total.....	5,336,185

Belgium is the densest inhabited country in Europe. In 1876 its population averaged 469 per square mile.—In 1856 the people were engaged as follows: in agriculture and sylviculture, 1,062,115; exploitation of mines, ores and quarries, 73,292; metallurgic industry and working of metals, 58,657; glass works, pottery, etc., 6,012; flax and hemp industries, 199,779; woolen industries, 22,044; cotton mills, 24,746; setiferous industry, 4,486; leather dressing, skins, carriage works, saddlery, etc., 30,021; articles of food, 45,146; clothing, 252,517; building, 108,478; furniture and ornaments, 16,167; chemical products, printing and various other industries, 25,662; commerce, 156,803; general administration, 15,888; administration of justice, 9,100; religious communities, 22,450; public instruction, 9,005; sanitary service, 5,206; literature, arts, and sciences, 5,862; police force, 36,106; property holders, persons living on their income, pensioners, 50,314; domestics, 86,974. The remaining 2,202,790 inhabitants, or nearly the half of the whole population, include persons without profession or occupation, and also old men, women and children.—The census of 1866 shows that in Belgium the population is remarkably sedentary. On an average in every 1,000 inhabitants of a Belgian com-

mune, 694 were born within its limits, 227 within same province, and 63 in some other province; leaving a remainder of 16 foreigners. The foreign element which, in 1856, was 21 in every 1,000, therefore diminished during the following decade.—In proportion to its population Belgium contains a great number of large cities. It has 4, with a population of more than 100,000 each. Brussels, the capital of the kingdom, had, in December, 1876, 376,965 inhabitants; Antwerp, 150,650; Ghent, 127,653; and Liège, 115,851.—Two distinct languages are spoken in the country: Flemish in the north, in the provinces of the two Flanders, of Antwerp and Limburg, also in the districts of Brussels and Louvain in Brabant. French or Walloon is spoken in the south, including Nivelles and its district in Brabant, the provinces of Hainaut, Namur, Luxemburg and Liège. This contiguity of two races speaking different languages, may be explained by the fact that the first Belgian colonists did not succeed everywhere in their attempt to supplant the native inhabitants. The part of the latter who remained in the country were called Walloons, a corruption of the word Gaul, while Flemish is a Low-German dialect perfected in the thirteenth century. It is somewhat remarkable that the line of demarcation of the two languages is about the same which divides the country into two large valleys: the Escaut in the north and the Meuse in the south. Numerically, four-sevenths of the Belgian population are of Flemish or of German origin, while the remainder are of Walloon or of Gallic extraction. Out of the 35,356 Germans enumerated in the census of 1866, 20,799 inhabited the eastern frontier of the province of Luxemburg, and 10,793 the province of Liège.—The use of either language is optional in Belgium, according to article 23 of the constitution; but the French prevails generally, even among the Flemish inhabitants, notwithstanding their ceaseless opposition to it, which does more credit to their patriotism than to their intelligence. But it is certain that the use of French, as it spreads into the Flemish provinces, will not suppress the primitive language.—*Political and Administrative Organization.* The Belgian constitution of Feb. 7, 1831, gives its sanction to the most liberal principles in matters of public right. It may suffice here to mention the most salient of them.—Art. 6. There exists in the state no discrimination between classes. All Belgians are equal before the law. Only Belgians are eligible to civil and military offices, save the exceptions which may be established by law to meet particular cases.—Art. 14. Liberty of conscience, liberty of the public practice of religion, and also liberty of speech in all matters, are guaranteed; but crimes or misdemeanors committed under the pretense of the exercise of these rights are punishable.—Art. 17. Education is free; every preventive measure is forbidden; the repression of misdemeanors is to be exercised only by the law.—Public education, given at the expense of the state, is also regulated

by law.—Art. 18. The press is free; no censorship shall ever be established over it; no bond of security is required of writers, publishers or printers.—When the author of a writing is known, and domiciled in Belgium, the publisher, printer or distributor can not be prosecuted.—Art. 20. All Belgians have the right of free association, and this right can not be submitted to any preventive measure.—All powers emanate from the nation. They are exercised in the way prescribed by the constitution.—In the enjoyment of these liberties loyally respected by the depositaries of power, Belgium has progressed in every direction. The sovereign, identified with the Belgian character, is beloved by the people, as was the duchess of Parma, governess in the place of her brother, king Philip II. According to Strada, in his *Histoire des guerres des Pays-Bas*, the duchess of Parma used to say that terror is a bad means to win the affections of the Belgians or conciliate them. A law of Dec. 23, 1865, fixed the civil list at 3,300,000 francs, with the use of the royal palaces. The endowment of the king's brother is 200,000 francs.—Art. 68 of the constitution, which confers upon the king the right to declare war and to make treaties of peace, provides, besides, that no cession, no exchange, no addition of territory can take place except by virtue of some law.—Three principal enactments determine the public law of Belgium, and the position of the kingdom in relation to foreign powers: 1. The law of Nov. 7, 1831, which authorized the government to sign the treaty called the Treaty of the Twenty-four Articles, concluded on Nov. 15, 1831, between Belgium and the plenipotentiaries of the five great powers assembled in London, but the fundamentals of which the king of the Netherlands accepted only in 1839. 2. The law of April 4, 1839, which authorized the king to conclude and sign the treaties regulating the separation of Belgium and Holland, upon the basis laid down in the London congress, on the 23rd of the preceding January. 3. The law of Feb. 3, 1843, approving the boundaries between Belgium and the Netherlands, definitely fixed by the treaty concluded at the Hague on the fifth of November in the year previous.—In consequence of the constitutional principle already mentioned, that all power emanates from the nation, Belgian citizens are entitled to direct election to the legislative chambers, the communal councils and the provincial councils. The body of electors is composed of all citizens who pay direct taxes, the minimum of which is fixed by law. Formerly, in 1830, the liberal professions were also admitted, without further qualification, as electors to the national congress.—The electoral law relating to the formation of the chambers, was passed March 3, 1831, and modified by several successive amendments. The communal law and the provincial law have each been modified 17 times, and the electoral law 25 times, since their promulgation. According to the terms of article 26 of the constitution, the legislature is composed of a senate and a chamber of

representatives. Since the law of June 2, 1856, the apportionment of the members of the legislative chambers is based upon the general census of the kingdom taken every 10 years. Their number, as determined by the law of May 7, 1866, is 124 for the representatives, which would be at the rate of 1 representative for each 40,000 inhabitants; and 62 senators. The latter hold office during 4 years, and every 2 years a new election takes place for one-half the number of representatives.—The enactments of June 3, 1859, and Feb. 29, 1860, fix the number of provincial and communal judges according to the latest returns of the number of the population.—The number of provincial and commercial councilors was increased according to laws passed in 1872.—The offices established by the organic law of March 30, and April 30, 1836, in the communal administration, were those of burgomaster, aldermen (*échevins*), college of burgomasters and aldermen, and the communal council. In the provincial administration the offices are those of governor, provincial council, standing committee of the provincial council, and *arrondissement* commissioner. The governors and *arrondissement* commissioners, corresponding to prefects and sub-prefects in France, are appointed by the king, as are also the burgomaster and the aldermen or *échevins*, who correspond to the mayors and deputy-mayors in France. The provincial councilors are elected for a term of 4 years, and the communal councilors for 6 years. The burgomasters and the aldermen (*échevins*) are likewise appointed for the term of 6 years. The king's ministers, 7 in number, in the departments of foreign affairs, the judiciary, the interior, public works, war, finance, are the heads of the general administration, each within his own sphere. Assembled in council, they deliberate upon the subjects which the king submits to them, or which any one of them proposes. There are also ministers without portfolio, entitled *ministres d'état*, with or without admission to the council.—*Finance.* Official documents establish the fact that Belgium, during the 15 years of her union with Holland, annually contributed more than 81 million francs to the expenditure of the state. This was one of the principal grievances which brought on the revolution of 1830. After the separation, there was an increase of expenses, instead of the diminution which had been expected. During the period of 27 years, between 1851 and 1857, the average revenue was 127,220,100 francs per annum, while the average expenditure was 127,439,900 francs, showing a deficit of 219,800 francs a year, for which provision was made by the emission of treasury notes.—These deficits greatly increased during the ensuing years, the final accounts furnishing the following figures: Receipts, 155,830,739 francs for 1858; 158,349,646 francs for 1859; and 169,709,218 francs for 1860. Then 209,641,495 francs for 1868, against 223,404,893 francs for the year 1867. A loan of 50 millions is included in the amount for 1867, and a loan of 33 millions in the amount

for 1868.—Revenue and expenditure of Belgium, from 1870 to 1879, (the figures for the years 1870 to 1875, both included, are the actual figures, the others are estimated):

YEARS	Revenue	Expenditure.
1870.....	\$35,909,715	\$35,293,635
1871.....	35,624,800	33,872,580
1872.....	37,782,800	36,684,820
1873.....	36,944,600	34,789,600
1874.....	45,928,600	47,233,480
1875.....	55,742,315	58,444,500
1876.....	54,518,800	53,952,400
1877.....	51,758,285	54,288,500
1878.....	50,809,150	49,288,500
1879.....	52,066,770	51,921,350
1880.....	55,742,315	58,444,500

Every year the chambers decree the law of accounts, and vote the budget estimates. All laws relative to the revenue and expenditure of the state, or to the appropriations for the army, must first be passed by the house of representatives, (articles 27 and 115 of the constitution).—Summary, under proper heads, of receipts and expenses, according to the official financial statement for the year 1879:

RECEIPTS.		France
Land taxes.....		21,903,000
Assessed taxes.....		15,300,000
Trade licenses.....		6,000,000
Mines.....		800,000
Customs.....		18,230,000
Succession duties.....		17,320,000
Excise on foreign wines and spirits.....		3,355,000
Excise on native spirits.....		15,892,000
Excise on beer and vinegar.....		10,172,700
Excise on sugar.....		3,190,000
Registration duties and fines.....		28,800,000
Domains.....		2,400,000
Postoffice.....		5,902,500
Railways and telegraphs.....		92,000,000
Packet boats between Dover and Ostend.....		1,150,000
Miscellaneous receipts.....		23,156,360
Total.....		263,141,860

EXPENSES.		France
Interest on public debt.....		74,785,815

Floating debt (<i>Bons du Trésor</i>).....	19,400,000
Total debt.....	1,541,347,444

—*Military Organization.* The Belgian army consists, on a peace footing, of 42,933 men, officers included, and of 8,791 horses; the war effective is 104,658 men, officers included, and 15,052 horses. These numbers comprise the *gendarmerie*, with 1,562 men and 1,114 horses.—The army is recruited by voluntary enlistment and by conscription. In times of peace the service of the volunteers and militia-men lasts 8 years, or from the age of 19 to 26.—Barracks are established in 38 places, for the accommodation of 80,000 men and 10,000 horses.—Sleeping accommodations are provided by a company, and also by cities, which have undertaken, for a compensation, to furnish quarters for the troops.—The military workshops and the school of pyrotechny are located at Antwerp. Liège has a foundry for casting cannon and an establishment for the manufacture of arms.—In 1872 there were 11 strongholds, forts and fortified posts in the kingdom: while the garrisoned towns, or posts not fortified, occupied by the troops, were 20 in number.—There are military bakeries in 18 towns. The ration of provisions during a campaign consists of 75 *décagrammes* of bread, 25 *décagrammes* of meat, 3 *décagrammes* of rice, 16 grammes of salt, 5 *centilitres* of gin, 4 *centilitres* of vinegar. The ration of firewood is 1.375 of a *stère*. Each soldier in camp receives 5 *kilogrammes* of straw for bedding, every fortnight.—The ration of forage, for horses of heavy cavalry and artillery, is 4½ *kilogrammes* of oats, 4 *kilogrammes* of hay, 4 *kilogrammes* of straw. For the horses of light cavalry, 4 *kilogrammes* of oats, 3½ *kilogrammes* of hay, and 4 *kilogrammes* of straw. The military pensions registered in favor of retired soldiers, from 1880 to Jan. 1, 1872, inclusive of pensions transferred by Holland, are in number 13,534, reduced by expiration to 4,084, and amounting to 3,815,162 francs. The pensions to widows amounted to 4,198 francs.—The state navy, formerly reduced to 1 brig and 1 schooner, now comprises 5 steamers. An allowance in the budget has been proposed to build a sixth steamer. In 1878 the commercial marine consisted of 48 vessels, inclusive of 23 steamers.—The civic guard is in Belgium what the national guard was in France. It numbers about 22,000 men. On June, 1, 1879, the effective force was thus distributed: 23,983 infantry, 5,339 cavalry, 6,937 artillery, 1,262 engineers, and 3,069 other troops.—Besides this active civic guard, there are yet 668 battalions of civic guard in reserve, representing an effective force of 200,400 men, with commanders and staffs.—*Public Education.* On Dec. 31, 1869, there were in Belgium 1,522 primary schools for boys, 1,854 for girls, and 2,265 for both sexes, making, together, 5,641 public and private schools. At the same period there were 5,178 male teachers, and 4,350 female teachers. On Dec. 31, 1869, there were 593,379 school children, of whom 290,510 were boys, and 302,869 were girls. 366,572 boys and girls received gratuitous instruction. The subtraction of 593,379,

the number of children in attendance at school, from 753,200, the number of children from 7 to 14 years old, would leave a remainder of 159,821 not receiving instruction. But of this number, at least 20,000 children attended the middle schools, the athénæums and colleges, or special institutions such as schools in almshouses, poor-houses, penitentiaries, and reformatories at Ruyselade and Beermen. Other children attended private classes at home or schools in military garrisons. In 1869 there was one school to every 890 inhabitants. The proportional number of pupils to the population, in 1869, was 11.8 to every 100 inhabitants. Of 44,179 militia-men inscribed for the levy of 1869, 16,337 could read, write and cipher; 13,811 could only read and write; 2,626 could only read; 10,943 had no school education whatever; and there were 462 whose degree of proficiency in education was not known. Independently of the primary schools, there were, on Dec. 31, 1869, in asylums and infant schools, 27,219 boys and 33,371 girls, or 60,590 altogether; of whom 37,133 were admitted gratuitously. In midday, evening and Sunday schools for adults, there were 112,787 males and 104,381 females, or 217,168 altogether; of whom 214,213 were admitted gratuitously. Among these 217,168 pupils were included 97,737 children under 15 years of age, a large part of whom attended also the primary or industrial schools. In the industrial and manufactory schools and charity workshops (*ateliers de charité*) there were 1,310 boys and 25,873 girls, or 27,183 children altogether; of whom 18,928 were admitted gratuitously. In the schools connected with hospitals, almshouses, reformatories and prisons, there were 3,713 boys and 1,851 girls, or 6,564 children altogether. Industrial and manufactory schools, charity workshops and schools for apprentices, etc., are found almost exclusively in the provinces of Hainaut and the two Flanders. Most of the children who attend these schools also attend Sunday schools and their number is included in the figures above, which represent the attendance at the Sunday schools. In 1869 the expenses incurred for the ordinary maintenance of the primary schools amounted to 14,500,518 francs. This sum consisted of the following items: Cash balance in hand, 236,155 francs; received from the state, 5,675,036 francs; from the provinces, 1,633,313 francs; from the communes, 5,258,366 francs; from public and private donations, 487,990 francs, and from tuition fees, 1,009,651 francs. From 1867 to 1869, 12,370,910 francs were expended for the construction, purchase, etc., of schoolhouses and residences for teachers. There are two state normal schools, one at Lierre and the other at Nivelles. There are also seven Episcopal normal schools, and five normal sections connected with the middle schools at Bruges, Ghent, Huy, Couvin and Virton, where pupils are trained to become teachers. Female teachers are trained in 15 model schools connected with establishments for the education of young ladies.

These establishments are situated in different provinces. At the royal institute of Messines there is, for the daughters of soldiers, a normal school, including a section for the special training of teachers of infant schools.—The law of June 1, 1850, relative to education in the middle schools, limited the number of athênæums to 10, 2 for Hainaut and 1 for each of the other provinces. The establishments, 50 in number, of the next grade below, are called state middle schools (*écoles moyennes de l'état*), 18 of which belong to the lower class, 25 to the intermediate, and 7 to the higher class. There are, besides, many communal colleges and communal middle schools, almost all of which are subsidized by the public treasury. There are also some private institutions or boarding schools in the different provinces. In 1869 there were 312 prefects of studies, professors, masters and tutors connected with the athênæums; 506 directors, professors, regents, teachers and assistants in the state middle schools; 181 directors, professors, etc., in the communal colleges which received a subsidy from the public treasury; 96 in the subsidized communal middle schools; 33 in the middle schools exclusively communal; 100 in the colleges; and 43 in the middle schools patronized by the state. At the same period there were 3,569 students in the royal athênæums; 8,313 in the 50 middle schools of the state, 1,453 in the subsidized communal colleges, 1,374 in the subsidized communal middle schools; 456 in the middle schools exclusively communal; 1,236 in the colleges; and 723 in the middle schools patronized by the state. The number of scholars in private schools is not known. 691 pupils are admitted to the athênæums gratuitously or on reduced terms; 1,911 to the state middle schools; 341 to the subsidized communal colleges; 158 to the subsidized communal middle schools; 9 to the middle schools exclusively communal; 195 to the colleges; and 77 to the middle schools patronized by the state: total, 3,382. In 1869 the funds of the middle schools amounted to 2,391,451 francs. Of this sum the state furnished 1,051,773 francs; the provinces, 6,800 francs; the communes, 724,298 francs; tuitionary fees, 554,272; bequests, 19,995; and the balance of cash in hand from the accounts of the previous year, 34,312 francs. The normal institution for the training of teachers in the higher middle schools, is divided into two sections: one for the humanities and the other for the sciences. The humanities are taught at Liège, and the sciences at Ghent. There is a normal institution at Bruges and another at Nivelles for the training of teachers in the lower middle schools. There are two schools of practical agriculture, an agricultural institute, and a veterinary college. There are naval academies at Antwerp and at Ostend, a higher commercial school at Antwerp, more than 80 workshops for apprentices in eastern and western Flanders; 11 institutions for deaf-mutes and the blind, a royal institution exclusively for

the benefit of soldiers' daughters, and a reformatory school for boys and one for girls.—The higher branches of education are taught in a state university at Ghent and another at Liège, in the Catholic university at Louvain, and in another free university at Brussels. A school of civil engineering is connected with the university of Ghent, and a school of arts, mines and manufactures with the university of Liège. During the academic year 1866-7, there were 2,313 students in the four universities, including the special schools connected with the university of Ghent and the university of Liège.—During the year 1877-8 the number of students attending the various branches of study in each of the four universities was as follows:

UNIVERSITIES.	Philosophy and Letters.	Law.	Sciences.	Medicine.	Theology.	Total.
Gand.....	14	81	237	81	413
Liège.....	68	144	411	115	738
Louvain.....	91	194	125	195	108	713
Brussels.....	36	191	75	147	449

—The military school in Belgium is intended for the training of officers for the infantry service, the cavalry, the artillery, the corps of engineers, and also the marine. From the foundation of this school in 1834, until Dec. 31, 1871, 1,424 young men were received into the establishment and afterward admitted to the different branches of the army. The other schools organized in the army are the war school intended for the training of staff officers; the target school for the artillery; the pyrotechnic school; the cavalry school; the special school of subordinate officers of infantry and cavalry, etc.; the regimental schools; and the company of soldiers' boys, composed at present of 257 pupils.—*Public Charity.* The charitable institutions include three principal classes: 1. The local institutions which afford relief or an asylum to the indigent in sickness, old age, in case of desertion, want of work, and accidents of every kind. 2. The state institutions which are particularly designed to prevent and repress vagrancy and mendicity, to reform beggars and vagabonds. 3. The institutions which are intended to secure the independence of the working classes by fostering among them a spirit of foresight. These institutions are under the patronage of the state.—Besides these public institutions there are many private establishments of charity, organized by citizens and benevolent associations. These establishments are not under the control of either state or municipal authorities.—Public charity is dispensed through relief offices and almshouses.—According to the terms of article 92 of the communal law, every commune must have a bureau of charity for the distribution of provisions at the homes of the needy.—Establishments managed by hospitalers are generally found in cities. Most of these establishments are old

endowed institutions. — On an average, from 160,000 to 170,000 indigent families, representing 600,000 or 700,000 persons, are yearly registered in the offices of public charity. In years when great distress prevails, there may be registered 200,000 pauper families or 800,000 individuals. The provisions distributed are valued at eight or nine million francs. A law of Feb. 18, 1845, laid down the principle that a pauper is entitled to public assistance by his native commune, provided he has not removed from it. He must have resided during eight consecutive years in one place, before he can become entitled to draw assistance from the communal bureau of public charity. Every pauper has a claim to assistance by the commune in which he happens to be. A commune which furnishes relief to an itinerant pauper has the right to demand re-imbursement of his commune. Donations and bequests made by private citizens, for the benefit of charitable institutions authorized by the terms of article 910 of the civil code, have been valued, in an average year, at more than a million francs. — In 1869 there were in Belgium 439 almshouses and hospitals, with 30,000 inmates. Their expenses amounted to some 7,500,000 francs per annum. — In some of the provinces poor-farms (*fermes-hospices*) were established. — There are special lying-in hospitals at Brussels, Louvain, Ghent, Bruges, Nieuport, Tournai and Liège. The Brussels hospital, the most important of all, annually receives from 700 to 800 women, who receive all the necessary assistance during their confinement. — In some of the larger cities of the kingdom there are societies organized to aid friendless women during confinement, and for the maintenance of infant asylums. — In some 20 towns there are special institutions for the benefit of foundlings and abandoned children who, under the protection of these institutions, are sometimes boarded in the country with farmers. The *lours* or receptacles for foundlings, introduced by imperial decree on Jan. 11, 1811, have been gradually discontinued. Since the discontinuance of these receptacles, the number of foundlings born of unknown parents has noticeably, even considerably, diminished. The expense of the maintenance of these children formerly amounted to more than 150,000 francs per annum. It has been reduced to 50,000 francs. The last receptacle for foundlings, at Antwerp, was closed in 1860. — In Brussels, Ghent and Antwerp there are special establishments for the treatment of sick and deformed children. — There are 10 institutions for the maintenance and instruction of deaf-mutes and the blind. The number of these unfortunates received at the expense of the communes, the province, and the state, is about 300. In 1869 there were 617 blind persons and 521 deaf-mutes in the different asylums, almshouses, etc., besides 3,058 blind persons and 1,463 deaf-mutes living at home. There are 58 insane asylums, of which 18 are public and 40 private, including the colony at Gheel, the only one of its kind, with 1,200 in-

mates. The number of insane is reckoned at 5,000 in the public institutions, and 2,000 cared for at home. — There are ophthalmic institutes at Brussels, Mons and Namur. — In manufacturing towns there are savings banks, most of which are founded by financial corporations. — There are 22 *monts de piété*. The capital loaned on pledges amounts to 10 million francs. There are only 3 poor-houses left: one at Stoogstrachin, the other at Bruges and the third at Reckheim. The poor-houses at Mons and Cambre have been discontinued; but a new agricultural colony for the benefit of able-bodied paupers has been established at Merxplas. The inmates of the poor-houses number 1,800. In the reformatory schools at Ruysselede and Beermen there are also 500 boys and 250 girls, committed on account of mendicancy or vagrancy. — In the cantons there are committees appointed to aid liberated prisoners who manifest a disposition to engage in some honest pursuit. Children acquitted by the magistrates for having acted without discernment, and likewise young beggars and vagrants, are indentured or placed in apprenticeship through the instrumentality of these committees. But most of these committees have gone out of existence. At Namur, Mons, Antwerp, Brussels, Liège and Ghent there are houses of refuge for girls and women, discharged from custody, who show a disposition to renounce the ways of vice. There are also charity workshops for the poor and for those who can not procure work elsewhere. — Mutual benevolent societies, more than 200 in number, are organized for the benefit of workmen when sick. These societies are regulated by a special law of April 3, 1851. There are savings associations for the purchase and distribution of provisions in winter. — There are savings institutions for mining laborers, laborers of the state railways, fishermen and seamen. These institutions extend their benefactions to workmen when sick, wounded, or otherwise disabled, and likewise to their widows and children. — A law of March 8, 1850, created a general *caisse de retraite* for the special purpose of providing, by the payment of a certain sum during life, a sure way for any provident person to lay up means against old age. This institution, under the management of the government, was reorganized by a law of March 16, 1855, which added to the institution a savings bank. Deposits in this bank may be effected through any postoffice. — *Religion.* The population of Belgium is almost exclusively Catholic. There are only some 13,000 Protestants, and about 1,500 Jews. — The country is divided into 6 dioceses: the archbishopric of Malines, including the provinces of Antwerp and Brabant, and the bishoprics of Bruges, Ghent, Liège, Namur and Tournai. The archbishopric has 3 vicars-general and a chapter of 12 canons, and each of the bishoprics 2 vicars-general and a chapter of 8 canons. In each diocese is an ecclesiastical seminary. There are few endowments, and the clergy derive their maintenance chiefly

from fees and voluntary gifts. The state pays a salary of 21,000 francs to the archbishop; 16,000 francs to each of the bishops; 2,000 francs to canons; and about 700 francs to parish priests. According to the last census there are 1,322 religious houses, 178 for men, and 1,144 for women, with an aggregate number of 18,196 inmates.—There are 8 ministers of the English Episcopal church, and also 8 chapels—3 in Brussels, and one each in Antwerp, Bruges, Ostend, Spa and Ghent. There is a central Jewish synagogue in Brussels—3 branch synagogues at Antwerp, Ghent and Liège, and 2 of an inferior class at Arlou and Namur.—*Justice.* The civil and criminal laws of Belgium are based upon the laws of France, to which country Belgium was long united. Many of these laws have been revised, particularly the penal code, the laws on mortgage, and the legislation in reference to bankruptcy and judicial organization—Justice is administered under the control of the *cour de cassation* (highest court of appeal), by appellate, military and *assize* courts, by tribunals of first resort, tribunals of commune, councils of war, justices' courts, and councils of *prud'hommes*. The *cour de cassation* is located in Brussels. There are 3 courts of appeal, one at Brussels, another at Liège, and the third at Ghent. There are 26 tribunals of first resort, one in each *arrondissement*; and 204 cantons, each having a justice of the peace.—The officers of the courts and tribunals are the following: 30 first presidents, 24 presidents and vice-presidents of chambers, 149 counselors and judges; 37 examining officials; 30 attorneys general and king's counselors (*procureurs du roi*); 8 general and military auditors; 59 attorneys general and substitutes of inferior courts; 30 clerks of courts; 97 deputy clerks; and 48 secretaries and clerks to the prosecutors.—The tribunals of commerce consist of 74 members, including the presidents and 14 clerks. There are 203 justices of the peace.—In the budget estimates for the year 1872 the sum of 3,595,850 francs was appropriated for the administration of justice.—The jury takes cognizance of criminal matters and of political offenses as well as offenses of the press.—In 1870 the costs of the courts amounted to 722,608 francs. In the same year the fees accruing to the treasury aggregated 246,530 francs.—*Agriculture.* Belgium is rich in agricultural products, although its cereals do not suffice for home consumption. It has, considering the relative extent of its area, as much live stock as any other country in Europe. According to the enumeration taken at the same time with the census of the population at the close of the year 1866, there were 283,163 horses, 1,242,445 horned cattle, 586,097 sheep, and 632,301 swine in Belgium.—In 1866 there were 2,663,753 *hectares* of land under cultivation, of which 1,359,795 *hectares* (the *hectare* equals 2.4711 acres) were cultivated by the owners of the soil, and 1,323,958 *hectares* were leased. These 2,663,753 *hectares* were divided among 744,007 cultivators, comprising 246,302 owners of all the

land which they cultivated; 74,670 owners of more than half the land which they cultivated; 279,433 lessees of all the land which they cultivated; and 143,603 lessees of more than half the land which they cultivated. Cereal and farinaceous products covered 967,135 *hectares*: vegetables, 37,909; roots, 200,204; grasses and forage, 495,051; plants used in manufactures, 115,308; woods and forests, 434,596; heath, brushwood and fallow ground, 262,477 *hectares*.—1871 was a good year for crops, except wheat, spring rye, buckwheat and potatoes, of which the crop was only middling. During the year the average yield to the *hectare* under cultivation was estimated to be as follows: Summer wheat, 16.70 *hectolitres* (the *hectolitre* equals 2.75 bush.); bearded wheat, 26 *hectolitres*; spring rye, 15.87 *hectolitres*; summer barley, 30 *hectolitres*; buckwheat, 22 *hectolitres*; pease, 19 *hectolitres*; potatoes, 8,838 *kilogrammes* (the *kilogramme* equals 2.67951 lbs. troy); summer colza, 19 *hectolitres*; flax, 561 *kilogrammes*; meadow grass, 3,931 *kilogrammes*; clover grass, 20,319 *kilogrammes*.—Official statistics of a subsequent date show that agriculture is making steady progress in different parts of the country. This is especially apparent in actual improvements, new manures employed, new modes of cultivation, agricultural implements, the use of plaster in fertilizers, the increase in the market value of land and the price of farm rents.—Between 1847 and 1869, 28,289 *hectares* of waste land belonging to the communes, were converted into arable lands; 28,277 into forests, 3,878 into meadows, and 260 into gardens; which gives an average of cleared land amounting to 2,640 *hectares* a year. There still remain 102,455 *hectares* susceptible of improvement.—*Industry.* The main branches of industry, generally prosperous, are constantly improving, according to the official statistics of the mines and foreign commerce.—In 1869 there were in exploitation 285 coal mines, covering an extent of 140,640 *hectares*. These mines yielded 12,944,000 tons, valued at 136 million francs, and furnished work at wages showing an upward tendency to 89,900 laborers. In 1865 there were only 82,000 men working in the coal mines.—In 1869 the metallic mines gave employment to 8,526 workmen who worked in 99 mines, and 81 communes having free mines. The yield of these mines represents a value of 5,708,943 francs for the iron, 2,941,065 for the lead, and 2,638,509 for the calamine. In 1840 the corresponding figures were 1,470,896, 12,147 and 804,990.—In the same year, 1869, there were 322 welding furnaces for the manufacture of iron and cast-iron, employing 23,024 workmen, and yielding products valued at 135,507,352 francs, against 125 millions in 1866, 117 in 1865, 109 in 1867, 103 in 1868, 81 in 1860, and 30 millions in 1850. In other establishments, during the same year, the product of zinc amounted to 34,001,670 francs; of glass, to 28,652,500 francs; of lead, to 5,078,798 francs; of copper, to 4,576,000 francs; of steel, to 2,190,000

francs; of alum, to 331,014 francs; and of nickel, to 152,100 francs. The products of the quarries, 2,361 in number, with 21,262 workmen, amounted to 27,289,509 francs in 1869, a figure slightly different from that of the four preceding years, but ten millions above that of 1860.—Seraing, near Liège, Verviers, Tirlemont, Brussels and Ghent are the principal places for the manufacture of machinery.—In Liège and the neighboring communes there are more than 20,000 artisans, men, women and children, engaged in the manufacture of arms. The cannon foundry of Liège is a monopoly of the state. It ships iron and bronze cannon to every country on the continent, and also to countries beyond the sea.—Among other metallurgical industries of Belgium we might mention the cutlery of Namur, the flourishing manufacture of nails, and especially of zinc in its various forms, at Vieille-Montagne, Corphalie and Nouvelle-Montagne, the three great establishments in the province of Liège. The factory of Corphalie turns out also large quantities of lead.—Woolen industries have long existed, in Belgium, in a prosperous condition. For many years they have proved a source of comfortable livelihood to the people in the Flemish districts. Woolen factories, like all others, had to be centralized and subdivided into several branches, such as spinning, weaving and bleaching, separately conducted in large factories. Uniformity of management and the magnitude of the capital invested have been the principal factors of a cheap production such as the times demand. In the inevitable crisis which ensued Flanders came out victorious. The spinning mills turn out threads of a quality at least equal to the threads manufactured by the best mills in other countries. Belgian textile fabrics compete as exports with the English in many a market.—The manufacture of woollens and cloths, which formerly constituted the wealth of Flanders, has had to undergo the same phases of transformation as the manufacture of flax and linens. At the opening of this century Verviers resolutely adopted the steam woolen spinning which was to supersede hand spinning. Woolen factories are now ranked among the most rapidly developing industries in Belgium. Verviers and its suburbs continue to be the centre for these factories. A considerable number of mills and more than 18,000 operatives are kept busy turning out woolen fabrics, cloths and fancy stuffs.—Carpet factories are mostly found at Tournai. For some time past there has been an important carpet factory also at Ingelmünster in western Flanders.—It is estimated that 28,000 persons are engaged in cotton industries, only one-third of this number being in eastern Flanders. Calicoes made at Ghent still find buyers at Manchester, the centre of English manufactures. Cotton industry, which was planted in Belgium at the beginning of this century, grew rapidly during the French empire and the union of Belgium with Holland. After having remained almost stationary from

1830 to 1845, commencing at this last date cotton industry entered on an era of prosperity, such as marked the progress of other branches of manufactures in Belgium. Hosiery, a branch of industry which is constantly improving, is carried on mainly near Tournai and the French frontier. Besides the workmen regularly employed in these factories, these establishments furnish work to a large number of women and girls, who derive great benefit from it. Ribbon-making, one of the old industries of the country, is rising from the decay into which it had fallen. The *passementerie* is also advancing, and its contributions to foreign markets become more important every year in consequence of improvements introduced into this branch of industry.—Lace-making, one of the principal branches of manufacture in Flanders and the provinces of Brabant and Antwerp, gives employment to about 125,000 women and girls, 20,000 of whom are engaged at work in Brussels, which is celebrated for its lace works. Nets, the best of which formerly came from Scotland, are now manufactured at Brussels in such perfection that the best houses in Paris import them from Belgium to apply on them the flowers which for some years past are being manufactured in France. The *Mechlin*, made of linen, the *Grammont*, made of cotton and silk, the *Brussels* and the *Valenciennes*, are the four principal laces manufactured in the kingdom.—The manufacture of silks is not sufficient for home consumption. There are about 600 looms in operation, divided among some 30 manufacturers, in the provinces of Antwerp and eastern Flanders, and also at Brussels. Belgium has a rich population, who consume perhaps more silks than any other in Europe, and among whom silk materials are yearly entering more largely into the manufacture of garments and upholstery.—Breweries and distilleries, sugar refineries, cigar and tobacco factories, manufactories of paper and articles of gold, have received a great impetus and yield large profits every year.—*Commerce*. From 1841 to 1850 the import and export business of Belgium amounted, in the aggregate, to 6,500 million francs. From 1851 to 1860 this figure was more than doubled, having risen to near 14,000 millions; and from 1861 to 1870 it was quadrupled, or amounted to 25,850 millions. These figures need no comment.—In 1870 the "general commerce" amounted to 3,282 million francs, of which 1,760,200,000 was for imports and 1,521,800,000 for exports; or 2,094,800,000 francs by land and by river transportation, and 1,187,200,000 by sea.—The value of the general commerce in the year 1878 was represented by 2,450,858,592 francs for imports, and 2,084,341,792 for exports. The "special commerce" was as follows in the year 1878: imports for home consumption, 1,457,240,512 francs; exports of home produce, 1,117,287,288 francs.—*Means of Transportation*. The number of highways constructed since the independence of Belgium is truly marvelous. During this period more

roads have been opened than had been constructed for centuries before. In 1869 there were 1,053 leagues (of 5,000 metres) of state roads, 289.71 leagues of other roads, and 127.61 of leased roads, making altogether, 1,473.15 leagues.—The first railway in Belgium from Brussels to Malines, was opened for traffic on May 5, 1835.—In 1869 there were 589 *kilomètres* of railways belonging to the state, and more than 259 *kilomètres* of lines constructed by private companies, but operated by the state. Travelers to the number of 13½ million were carried by the roads belonging to the state. There are more than 2,000 *kilomètres* of roads operated by private companies.—On Jan. 1, 1880, there were in operation: state railways, 2,662 *kilomètres*; private companies' railways, 1,350 *kilomètres*; total, 4,012 *kilomètres*.—The opening of parish roads is also encouraged by the government. A law of April 10, 1841, provides for the preservation, improvement, maintenance and police of these roads. At the close of the year 1830 there were 1,495 *kilomètres* parish roads of all classes, and in 1855 there were 9,866 *kilomètres*. From 1841 (when the state assumed a part of the expenses of roads then inaugurated) until the year 1866, the various sources of revenue applied to the defraying of these expenses amounted to 66,927,054 francs. By means of these subsidies about 11 million metres of roads were paved, ballasted and finished.—In Belgium there are 851 *kilomètres* of canal and 974 *kilomètres* of river navigation. The two longest canals are the Campine, which unites the Meuse to the Escaut, and measures with its branches, 168 *kilomètres* in length; and the Charleroi at Brussels, which is 89 *kilomètres* long, including its branches. Since 1830 only one-half of the length of these canals has been open to navigation. Several other canals and rivers have undergone improvements since 1830. The principal navigable rivers are the Escaut (233 *kilomètres*), the Meuse (186), the Lys (115), the Sambre (94), the Dendre (75) from Ath to Termonde.—**BIBLIOGRAPHY.** There are many works of reference on Belgium. Confining ourselves to political history and statistics, we may mention the following: *Essai historique et politique sur la révolution belge*, by J. B. Nothomb, third edition, Brussels, 1833, 1 vol. 8vo; *La Belgique sous le règne de Léopold I. Etudes d'histoire contemporaine*, by J. J. Thonissen, 2nd ed., Louvain, 1861, 3 vols. 8vo; *Les fondateurs de la Monarchie belge*, by Thomas Juste, Brussels, 12 vols. 8vo, (1872); *Statistique générale de la Belgique, Exposé de la situation du royaume, période décennale de 1841 à 1850*, published by the minister of the interior, Brussels, 1852, 1 vol. 4to. The ensuing period, from 1851 to 1860, appeared in 1864–5, in 3 vols. 4to, *Annuaire Statistique de la Belgique*, published since 1870, by the department of the interior; *La Belgique; ses ressources agricoles, industrielles et commerciales*, by H. Tarlier, Brussels, 1879, 8vo; *La révolution belge de 1830, d'après des documents inédits*, Brussels, 1872, 2nd ed.

XAVIER HEUSCHLING.

BELL, John, was born near Nashville, Tenn. Feb. 15, 1797, and died near Nashville, Sept. 10, 1869. He was graduated at the university of Nashville in 1814, was admitted to the bar in 1816, was a representative in congress (whig) 1829–41, was secretary of war under Harrison and Tyler (see ADMINISTRATIONS), and was United States senator 1847–59. During the latter part of his term of office he was one of the "south" Americans (see BORDER STATES, WHIG PARTY) who held aloof from both the democrats and republicans, only wishing to stop all agitation for or against slavery; and in 1860 he was the candidate of the constitutional union party for the presidency. A. J.

BELLIGERENTS, parties actually at war.—I. Just as, in the eyes of international law, not every armed contest is a war, the quality of belligerents is not recognized as existing in all parties engaged in war. Sovereign states at war are always belligerents. Doubt arises only when one of the parties to the struggle, or both, are not in the enjoyment of political sovereignty. Combatants must therefore be *recognized*, either implicitly or explicitly, as belligerents. In what case do they enjoy this quality? This depends on circumstances. Generally the quality of belligerents is accorded to members of a confederation which engage in a struggle with each other. The reason of this is, on the one hand, because they are regularly organized and observe the rules of international law; on the other, because the neutral states have neither the wish nor the right to decide which party is in the wrong, the interpretation of a constitutional or federal question being a domestic affair; and finally, for humane reasons, because belligerents are treated more mildly than insurgents. The quality of belligerents is accorded to two parties even in the case when a federal government presents the question as in the nature of an execution, that is to say, as an act of justice or coercion foreseen by the law. This was the case in the struggle of the Sonderbund in Switzerland, in 1847; in that of the United States from 1861 to 1865; and in that of Prussia in 1866 against the majority of the other states of the German Confederation.—In case of civil war what the custom of nations in the premises is, is not so well defined. Usually, the quality of belligerents is refused to insurgents as long as the government they have rebelled against remains in a condition to subdue them. When insurgents seem about to gain the upper hand, other states consult their own policy and act accordingly. More than one state has come to the assistance of insurgent provinces, and even been seen to foment the rebellion to its own profit; but these acts are not within the domain of international law. Their forum is conscience, public opinion and history.—Governments do not see with pleasure the quality of belligerents accorded to these whom they look upon as rebels, because this lends the latter a certain moral force: in return, however, it frees such

governments from all responsibility for any damage which the insurgents may commit. For example, during the war of secession in the United States, if English or French subjects had suffered a loss by the act of one of the agents of the government of the south, it was to this government of the south only that England or France could turn for redress, and with the fall of the confederacy every chance of remedy was lost. In the case of a Turkish subject it would have been different. Turkey not having recognized the confederates as belligerents, could have had recourse to Washington and said: Your rebels have committed depredations to my loss; I ask to be indemnified.—Here is a case somewhat older, cited by Mr. Lawrence (Commentary on Wheaton): Mr. Canning wrote to Lord Granville, June 22, 1826, that if the English government admitted with M. de Villèle that the powerlessness of the Greek government to keep its population in order justified an appeal to the English government and reprisals in case of the failure of such an appeal; that if it admitted with Austria (and he feared then with France) that the Greek government itself was only an insurrection, without rights or national duties, then the Turkish government itself was the one to which appeal should be made; that if the Turkish government was rendered responsible for the acts of piracy committed by certain Greek ships, then the Greek government being only a great act of piracy, the porte was responsible for the consequences.—Moreover, recognition of belligerents is often nothing more than the recognition of a fact, and does not in any way weaken the legal tie which may exist between the combatants (see session of the French senate, Feb. 12, 1864, *Rapport sur la pétition des Polonais*). In other terms it is recognized that there is war, that is all: no decision is made as to which side is in the right.—But how if a government at war with insurgents recognizes them as belligerents? Then one should distinguish according as the neutral states have themselves recognized the insurgents as belligerents, or have not recognized them. In the first case they relieve the rightful government of all responsibility for the acts of the *de facto* government; in the second, it is the government *de jure* which is responsible. It may happen that the insurrection is so great that a government, while proclaiming the insurgents to be rebels, treats them in fact as belligerents, through humanity or for other reasons, as took place during the war of secession in the United States. As a matter of fact an order of the day issued at Memphis, announced in April, 1865, that, beginning with May 25, confederate soldiers who should not have surrendered by that date should be treated as rebels and not as prisoners of war. This kind of recognition has no influence on international law. It is a domestic matter entirely.—The character of belligerents has never been accorded to pirates, nor to filibusters, nor brigands, nor to any of those who commit violence in their own private interest, or even to those who, guilty

of violence, have not been duly authorized by their sovereign.—Thus, in 1866, during the war between Prussia and other German states, and notably Bavaria, a Bavarian collected some men together and made an incursion into a place in the vicinity of the principality of Hohenzollern, of which he took possession in the name of his government, without having been censured for the depredation. He was nevertheless brought before a Bavarian tribunal for this deed and punished for having acted without authorization. For the same reason citizens not forming a part of the army should abstain from taking part in war, for the enemy will not recognize them as belligerents and will punish them severely. All nations are at one on this point.—II. Having examined the question as to whom the quality of belligerents belongs, we shall set forth in brief what the rights and duties connected with it are.—These rights, which in ancient times and up to the middle ages were considered without limit, since there was no right for the conquered—*væ victis*—became more restricted by degrees since modern usage did not permit more harm to be inflicted on the enemy than was necessary to obtain victory. Even this is enough to make humanity shudder, but once war is admitted, it can not be otherwise. Consequently, combatants have a right to kill the soldiers of the enemy who attack them, but they must spare the wounded and the soldiers who surrender. The lives of non-combatant citizens and, for a greater reason, the lives of women and children, are sacred; for them the law of war does not exist; they remain under the rule of peace, provided, be it well understood, that they commit no warlike act. If non-combatants violate the peace, their punishment is all the greater, as they were not suspected. All civilized nations without exception are agreed on this point—Just as the lives of non-combatants are safe, so should their property be. But as the occupation of the enemy's territory brings with it the suspension of the authorities established there who are replaced by those of the enemy, the latter enjoy, provisionally or temporarily, all the rights of sovereignty. The hostile authority, therefore, can demand of the inhabitants of the places occupied all that the national authority might have exacted, notably the maintenance of their troops, of ordinary or extraordinary taxes, requisitions in kind according to regular rule, and by giving receipts, so that if there is a chance the requisitions may be paid for by the country. Requisitions, however, can be levied only in so far as they are necessary to the enemy's army. But the single soldier never has the right to use force in his own private interest.—However, if the established authorities are *de jure* suspended, the enemy may nevertheless see fit to retain them. He can do so in his own interest as well as through humanity; but if this step is useful to him it is far from being harmful to the country occupied. Governments have seen fit to command their agents to quit their posts under similar circumstances, and the agents may

have thought patriotism imposed on them the duty of departing; but we do not know if this way of looking at the question is correct. Their departure causes less harm to the enemy than to the people. On the other hand, if the enemy enjoys *de facto* all the rights of sovereignty, the sovereignty of the enemy does not go to the length of prescribing constitutional changes. In return he is not limited by the ordinary laws of the country, since he can legislate in virtue of his temporary but *de facto* sovereignty.—The powers which the usages of war accord to belligerents are too extensive not to make it their duty to use them moderately. The modern laws of war condemn cruelty and useless devastation, the breaking of one's parole, and everything contrary to honor. They proscribe also the use of barbarous weapons, poison, explosive bullets (but not cannon balls). Happily if war has remained cruel (and it will be so always), no nation has here a right to throw stones at its neighbors—still the horrors so frequent in former times have become rare. Adversaries, it is true, mutually accuse one another of abominable cruelty, but these are generally either exaggerations or disputed facts, more frequently the latter. Lies are always to be regretted, but in this case they are criminal, for they envenom and perpetuate quarrels, and always cause the shedding of innocent blood. The evil is great enough of itself: it is quite unnecessary to add anything to it. (See WAR; WAR, CIVIL.)

MAURICE BLOCK.

BENTON, Thomas Hart, was born near Hillsborough, N. C., March 14, 1782, and died at Washington City, April 10, 1858. He began practicing law in Nashville, Tenn., and was Jackson's aide; but a street fight with Jackson made life in Nashville so unpleasant to him that he removed to Missouri, and served as United States senator from that state (democrat) 1821–51. In the senate he was a voluminous and rather tiresome speaker, but his speeches were widely read and had great influence with the country. He was a southern democrat, opposed to secession and to agitation for or against slavery, and so lost ground in his own state. He served as representative in congress 1853–5, but was defeated in every other election after 1851.—See 1 Parton's *Life of Jackson*, 392; Benton's *Thirty Years' View*; Benton's *Debates of Congress*; 26 *Atlantic Monthly*.

A. J.

BERLIN DECREE. (See EMBARGO.)

BILL. A bill is a draft of a law presented to a legislative body for enactment. In the British parliament it is a form of statute submitted to the house of lords or commons, and becomes an act after passing both houses and receiving the royal assent. It is the same in the American congress, with the exception that under its rules, a joint resolution may be construed to be a bill. In English legislation no bill can become a law without the sovereign's assent. In American

legislation a bill may become a law without the sanction of the president, provided, that after its disapproval by the executive, upon its reconsideration by congress, two-thirds of both houses shall agree to pass the bill. It is also provided by the constitution that if any bill shall not be returned by the president within ten days (Sundays excepted) after it shall have been presented to him, the same shall be law. In England, previous to the reign of Henry VI., the form of proceeding was by petition from the house of commons, with the concurrence of the house of lords and prelates, assented to by the king, and enrolled thereafter by the judges or others of the king's council. Frequently by modification or addition to the subject matter presented by the commons, or by abridgment in the answer of the crown, the certain purpose of the proceeding was defeated. As early as the reign of Henry V. the house of commons remonstrated, and insisted that the statutes should be framed in strict accordance with the petition. The opposition to these evils became so intense, that in the succeeding reign of Henry VI. the practice was established of presenting the matter for which the sovereign's approval was entreated, in the form of a bill, and since that period the rule has been engrafted upon English constitutional law, that nothing shall be enacted without the consent of the commons; and while the crown, at its option, may reject or assent to the bills of parliament, it can not alter them. But the rule is likewise established, that if the crown is specially interested in a bill, its assent must be obtained *before* its passage by the two houses; and should the royal patronage in anyway be affected, royal assent must be had before any proceedings are begun. The English rule also prescribes that the purport of a bill of attainder, or a bill granting titles, before presentment in parliament, must be laid before the sovereign. In early times the chief duty of the commons when summoned by the crown, was, at its dictation, to vote its supplies. The custom is partially preserved as the house of commons will not entertain a supply bill unless the crown first submits it. A bill granting a pardon is always first signed by the sovereign before any proceedings are entertained, and is subject to but one reading in each house of parliament. A bill consists of a preamble stating the need of the particular legislation, and the enacting clauses. Bills are of two kinds, public and private. A public bill relates to matters in which the public generally are interested. A private bill is for the particular interest or benefit of an individual, a private corporation, or a town or county.—The procedure with regard to bills is in many respects similar in both English and American legislation. In fact, American parliamentary law has been moulded after that of the English. Any member can introduce a bill in congress on one day's notice (unless by unanimous consent) in the senate, and in the house every Monday, and at other times by unanimous con-

sent. There are under the rules three readings of every bill, two of which are usually by the title only: the first on its presentment, the second at least one day later, and the third before the vote on its final passage. In cases of emergency, however, under a suspension of the rules, requiring a vote of two-thirds, all the proceedings may take place on the same day. On the second reading the bill is either committed or ordered to be engrossed and read a third time. If committed, it is then referred to committee of the whole house, or to a standing committee, which the speaker names. When ready to report, the chairman, or some member of the committee to whom the bill was referred, presents a written report to the house, with or without amendments to the bill, as the case may be, and the committee is discharged from its further consideration. Upon order of the house, however, the same matter may be re-committed to them; in that event the whole question comes before the committee *de novo*, and they proceed again upon its consideration as if nothing had passed. After the bill has been read a second time, if no proposition for commitment be made, it is read by paragraphs, and if it has come from the other house the order is, whether it shall pass to the third reading. If it originates with themselves the question is, whether it shall be engrossed and read a third time. After the bill is passed it can not be altered in any particular; its title, however, can be amended. The bill is then sent by message to the other house, requesting its concurrence. After its passage by both houses it is enrolled on parchment, certified by the clerk or secretary of the house in which it originated, and sent to the joint committee on enrolled bills for examination. Having been signed by the speaker of the house and the president of the senate, and entered (by title) on the journal of each house, it is presented finally to the executive for his approval. (See ACT.) JOHN W. CLAMPITT.

BILL OF EXCHANGE. In commerce this term is generally used to designate that species of mercantile transactions by which the debts of individuals residing at a distance from their creditors are canceled without the transmission of money.—Among cities or countries having any considerable intercourse together, the debts mutually due by each other approach, for the most part, near to an equality. There are at all times, for example, a considerable number of persons in London indebted to Hamburg; but, speaking generally, there are about an equal number of persons in London to whom Hamburg is indebted. And hence, when A of London has a payment to make to B of Hamburg, he does not remit an equivalent sum of money to the latter, but he goes into the market and buys a *bill* upon Hamburg; that is, he buys an order from C of London addressed to his debtor D of Hamburg, requesting him to pay the amount to A or his order. A, having indorsed this bill or order,

sends it to B, who receives payment from his neighbor D. The convenience of all parties is consulted by a transaction of this sort. The debts due by A to B, and by D to C, are extinguished without the intervention of any money. A of London pays C of ditto, and D of Hamburg pays B of ditto. The debtor in one place is substituted for the debtor in another; and a postage or two, and the stamp for the bill, form the whole expenses. All risk of loss is obviated.—A bill of exchange may, therefore, be defined to be an order addressed to some person residing at a distance, directing him to pay a certain specified sum to the person in whose favor the bill is drawn, or his order. In mercantile phraseology, the person who draws a bill is termed the *drawer*; the person in whose favor it is drawn, the *remitter*; the person on whom it is drawn, the *drawee*; and after he has accepted, the *acceptor*. Those persons into whose hands the bill may have passed previously to its being paid, are, from their writing their names on the back, termed *indorsers*; and the person in whose possession the bill is at any given period, is termed the *holder* or *possessor*.—The negotiation of inland bills of exchange, or of those drawn in one part of Great Britain and Ireland on another, is entirely in the hands of bankers, and is conducted in the manner already explained. Bills drawn by the merchants of one country upon another are termed *foreign* bills of exchange, and it is to their negotiation that the following remarks principally apply.—*Par of Exchange.* The *par* of the currency of any two countries means, among merchants, the equivalency of a certain amount of the currency of the one in the currency of the other, *supposing the currencies of both to be of the precise weight and purity fixed by their respective mints.* Thus, according to the mint regulations of Great Britain and France, £1 sterling is equal to 25 fr. 20 cent., which is said to be the *par* between London and Paris. And the exchange between the two countries is said to be at *par* when bills are negotiated on this footing; that is, for example, when a bill for £100 drawn in London is worth 2,520 fr. in Paris, and conversely. When £1 in London buys a bill on Paris for more than 25 fr. 20 cent., the exchange is said to be in favor of London and against Paris; and when, on the other hand, £1 in London will not buy a bill on Paris for 25 fr. 20 cent., the exchange is against London and in favor of Paris.—The foregoing statements explain what is usually meant by the *par* of exchange; but its exact determination, or the ascertaining of the precise equivalency of a certain amount of the currency of one country in the currency of another, is exceedingly difficult. If the standard of one be gold and that of another silver, the *par* must necessarily vary with every variation in the relative values of these metals. This, however, is not all: even where two countries use the same metal for a standard, its value may be greater in one than in the other, and in estimating the *par* of exchange between them this dif-

ference must be taken into account. In illustration of this we may take the case of France and Mexico: they both, let us suppose, use silver for a standard; but silver being largely produced in Mexico, is always cheaper there than in France, and is extensively imported into the latter; and taking the cost of this importation at 2 or 3 per cent., it is plain that the exchange would be really at par when it appeared to be 2 or 3 per cent. against Mexico. But the value of the precious metals, even in contiguous countries, is always exposed to fluctuations from the over-issue or withdrawal of paper, from circumstances affecting the balance of payments, etc., as shown above. It is obvious, therefore, that it is all but impossible to say, by merely looking at the mint regulations of any two or more countries, and the prices of bullion in each, what is the par of exchange between them. And, luckily, this is not necessary. The importation and exportation of bullion is the real test of the exchange. If bullion be stationary, neither flowing into nor out of a country, its exchanges may be truly said to be at par; and, on the other hand, if there be an efflux of bullion from a country, it is a proof that the exchange is against it, and conversely if there be an influx of bullion into a country.—*Circumstances which Determine the Course of Exchange.* The exchange is effected, or made to diverge from par, by two classes of circumstances: *first*, by any discrepancy between the actual weight or fineness of the coins, or of the bullion for which the substitutes used in their place will exchange, and their weight or fineness as fixed by the mint regulations; and, *secondly*, by any sudden increase or diminution of the bills drawn in one country upon another.—1. It is but seldom that the coins of any country correspond exactly with their mint standard; and when they diverge from it, an allowance corresponding to the difference between the actual value of the coins and their mint value must be made in determining the *real* par. Thus, if, while the coins of Great Britain correspond with the mint standard in weight and purity, those of France were either 10 per cent. worse or debased below the standard of her mint, the exchange, it is obvious, would be at *real* par when it was *nominally* 10 per cent. against Paris, or when a bill payable in London for £100 was worth in Paris 2,772 fr. instead of 2,520 fr. In estimating the real course of exchange between any two or more places, it is always necessary to attend carefully to this circumstance; that is, to examine whether their currencies be all of the standard weight and purity, and if not, how much they differ from it. When the coins circulating in a country are either so worn or rubbed as to have sunk considerably below their mint standard, or when paper money is depreciated from excess or want of credit, the exchange is at real par only when it is against such country to the extent to which its coins are worn or its paper depreciated.—2. Variations in the actual course of exchange, or in the price of bills, arising from circumstances

affecting the currency of either of two countries trading together, are *nominal* only: such as are *real* grow out of circumstances affecting their trade.—When two countries trade together, and each buys of the other commodities of precisely the same value, their debts and credits will be equal, and, of course, the *real* exchange will be at par. The *bills* drawn by the one will be exactly equivalent to those drawn by the other, and their respective claims will be adjusted without requiring the transfer of bullion or any other valuable produce. But it very rarely happens that the debts reciprocally due by any two countries are equal. There is almost always a balance owing on the one side or the other; and this balance must affect the exchange. If the debts due by London to Paris exceeded those due by Paris to London, the competition in the London market for bills on Paris would, because of the comparatively great amount of payments our merchants had to make in Paris, be greater than the competition in Paris for bills on London; and, consequently, the real exchange would be in favor of Paris and against London.—The cost of conveying bullion from one country to another forms the limit within which the rise and fall of the *real* exchange between them must be confined. If 1 per cent. sufficed to cover the expense and risk attending the transmission of money from London to Paris, it would be indifferent to a London merchant whether he paid 1 per cent. premium for a bill of exchange on Paris, or remitted money direct to that city. If the premium were less than 1 per cent., it would clearly be his interest to make his payments by bills in preference to remittances: and that it could not exceed 1 per cent. is obvious; for every one would prefer remitting money to buying a bill at a greater premium than sufficed to cover the expense of a money remittance. If, owing to the breaking out of hostilities between the two countries, or to any other cause, the cost of remitting money from London to Paris were increased, the fluctuations of the *real* exchange between them *might* also be increased; for the limits within which such fluctuations *may* range correspond in all cases with the cost of making remittances in cash.—Fluctuations in the *nominal* exchange, that is, in the value of the currencies of countries trading together, have no effect on foreign trade. When the currency is depreciated, the premium which the exporter of commodities derives from the sale of the bill drawn on his correspondent abroad is only equivalent to the increase in the price of the goods exported, occasioned by this depreciation. But when a premium on a foreign bill is a consequence, not of a fall in the value of money, but of a deficiency in the supply of bills, there is no rise of prices; and in these circumstances the unfavorable exchange operates as a stimulus to exportation. As soon as the *real* exchange diverges from *par*, the mere inspection of a price current is no longer sufficient to regulate the operations of the merchant. If it be unfavor-

able, the premium which the exporter will receive on the sale of his bill must be included in the estimate of the profit he is likely to derive from the transaction. The greater that premium, the less will be the difference of prices necessary to induce him to export. And hence an unfavorable *real* exchange has an effect exactly the same with what would be produced by granting a bounty on exportation equal to the premium on foreign bills.—But for the same reason that an unfavorable *real* exchange increases exportation, it proportionally diminishes importation. When the exchange is really unfavorable, the price of commodities imported from abroad must be so much lower than their price at home as not merely to afford, exclusive of expenses, the ordinary profit of stock on their sale, but also to compensate for the premium which the importer must pay for a foreign bill if he remit one to his correspondent, or for the discount, added to the invoice price, if his correspondent draw upon him. A less quantity of foreign goods will, therefore, suit our market when the *real* exchange is unfavorable; and fewer payments having to be made abroad, the competition for foreign bills will be diminished, and the *real* exchange rendered proportionally favorable. In the same way it is easy to see that a favorable *real* exchange must operate as a *duty* on exportation, and as a *bounty* on importation.—It is thus that fluctuations in the *real* exchange have a necessary tendency to correct themselves. They can never, for any considerable period, exceed the expense of transmitting bullion from the debtor to the creditor country. But the exchange can not continue either permanently favorable or unfavorable to this extent. When favorable, it corrects itself by restricting exportation and facilitating importation; and when unfavorable, it produces the same effect by giving an unusual stimulus to exportation, and by throwing obstacles in the way of importation. The true *PAR* forms the centre of these oscillations; and although the thousand circumstances which are daily and hourly affecting the state of debt and credit prevent the ordinary course of exchange from being almost ever precisely at *par*, its fluctuations, whether on the one side or the other, are confined within certain limits, and have a constant tendency to disappear.—This natural tendency which the exchange has to correct itself is powerfully assisted by the operations of the bill-merchants.—England, for example, might owe a large excess of debt to Amsterdam; yet, as the aggregate amount of the debts *due* by a commercial country is generally balanced by the amount of those which it has to receive, the deficiency of bills on Amsterdam in London would most probably be compensated by a proportional redundancy of those on some other place. Now, it is the business of the merchants who deal in bills, in the same way as of those who deal in bullion or any other commodity, to buy them where they are cheapest, and to sell them where they are dearest.

They would, therefore, buy up the bills drawn by other countries on Amsterdam, and dispose of them in London; and by so doing, would prevent any great fall in the price of bills on Amsterdam in those countries in which the supply exceeded the demand, and any great rise in Great Britain and those countries in which the supply happened to be deficient. In the trade between Italy and Great Britain the bills drawn on the latter country amount almost invariably to a greater sum than those drawn on Italy. The bill-merchants, however, by buying up the excess of the Italian bills on London, and selling them in Holland and other countries indebted to England, prevent the *real* exchange from ever becoming very much depressed.—*Negotiation of Bills of Exchange.* Bills of exchange may be made payable on *demand* (the invariable term of payment in the case of checks), at *sight*, at a certain specified time *after sight* or *after date*, or at *usance*, which is the usual term allowed by the custom or law of the place where the bill is payable. In most countries, though not in all, a few days are allowed for payment beyond the term when the bill becomes due. These are denominated *days of grace*, and vary in different parts. In Great Britain and Ireland, and the United States, three days' grace are allowed on all bills except those payable on demand, which must be paid as soon as presented.

J. R. McCulloch and HUGH G. REID.

BILL OF RIGHTS. A bill of rights is an abstract of rights and privileges claimed by a people.—In English constitutional law the bill of rights is known especially as the act of parliament 1 William and Mary, (sess. 2, c. ii.), by which certain demands contained in the declaration of rights, were enacted as essential principles of political liberty.—The formation and adoption of the English bill of rights constitutes one of the most important epochs in the history of British constitutional law. It is the last of the three great acts upon which the liberty of the English citizen has been founded, and which, with such a unity of principle, so pervades and sustains his personal freedom, that they may be proclaimed to be a trinity of principles, consolidated in a great fundamental truth, forming what lord Chatham called "the Bible of the English constitution."—The first of these acts which have been so firmly engraven upon English constitutional law, is that of *magna charta*, which in crude text before the discernment of legal forms had appeared, proclaimed in king John's oath before the barons at Runnymede, in 1215, that "No freeman shall be taken or imprisoned or disseized or outlawed or banished or any ways destroyed—nor will we pass upon him, nor will we send upon him, unless by the lawful judgment of his peers, or by the law of the land." "We will sell to no man; we will not deny to any man either justice or right." This has become a perpetual law of the realm, and each English sovereign swears, in express

form of words, to support it, as a part of the coronation oath.—The second of these acts was the famous “Petition of Rights,” which was an explicit affirmation of the principles of *magna charta*, applied to existing grievances. The arrest of John Hampden and four other citizens, for refusing to pay certain taxes levied by the king’s order, and their subsequent treatment, occasioned the excitement which produced this act, and started the revolution which fills so many memorable pages of English history. They applied to the court of king’s bench for the writ of *habeas corpus*, to know whether their commitment was by the “law of the land,” and the charge upon which it was made.—The writ was granted; but the warden of the fleet made return that they were detained by a warrant from the privy council informing him of no particular cause of imprisonment, but that they were committed by the special command of his majesty, the king.—This return, made by the warden of the fleet, was followed by fierce denunciation on the part of the people, resulting in the petition of rights. This instrument, among other things, recited that, “whereas by the statute called the ‘Great Charter of the Liberties of England,’ it is declared and enacted that no freeman may be taken or imprisoned, or be diseized of his freehold or liberties, or his free customs, or be outlawed or exiled, or in any manner destroyed, but by the lawful judgment of his peers, or by the law of the land.” “And in the eighth and twentieth year of the reign of king Edward III. it was declared and enacted by authority of parliament, that no man of what estate or condition that he be, should be put out of his lands or tenements, nor taken, nor imprisoned, nor disinherited, nor put to death without being brought to answer by due process of law.” “Nevertheless, against the tenor of said statutes and other the good laws and statutes of your realm, to that end provided, divers of your subjects have of late been imprisoned without any cause showed, and when for their deliverance they were brought before your justices by your majesty’s writs of *habeas corpus*, there to undergo and receive as the court should order, and their keepers commanded to certify the causes of their detainer, no cause was certified, but that they were detained by your majesty’s special demand, signified by the lords of your privy council, and yet were returned back to their several prisons without being charged with anything to which they might make answer according to law.”—In answer to this petition, to appease the excitement of the people, the king signed new guarantees of liberty. The royal word was, however, again broken, and odious and oppressive acts imposed upon the nation. The struggle between the people and the king began again and raged with great passion until Charles I. was beheaded, and the form of government known as the “Protectorate of Oliver Cromwell” came into existence.—The third great act in British history which was the culmination of the principles of *magna charta*

and the *petition of rights*, was after the *restoration*, in the year 1689, and under the reign of James II. This revolutionary period closed with the enactment of the “Bill of Rights,” the exile of James II., and the closing forever, among British sovereigns, of the line of kings from the house of Stuarts.—James II. ascended the British throne with two aims as the summit of his ambition. One was the overthrow of the constitutional system of England; the other, the restoration of the Catholic religion. In these endeavors the king resorted to the use of a vast number of illegal means, chief among which was the creation of a great standing army; the erection of a new court of ecclesiastical commission; the violation of the privileges of the universities; the suspension of the writ of *habeas corpus*; the nullification of the *test* act; and the modeling and remodeling of corporations in the hope that a parliament might be packed that would give to the king’s illegal acts the color and form of law.—By these acts of usurpation and oppression, in the attempted overthrow of the English constitutional law, he arrayed against him nearly all of his subjects. And, as it were, to complete that alienation of feeling between the subject and the sovereign, he adopted other odious measures. He made the foreign policy of his country subservient to that of France, so as to gain the favor of Louis XIV. to his home policy. And to crown his acts of illegal seizure, he ordered the arrest of the archbishop of Canterbury and six bishops of the church of England, and their imprisonment in the Tower, for petitioning the king against his majesty’s order that the “declaration of indulgences should be read in the churches.”—These tyrannous acts so aroused the people that upon the *pretended* birth of a son to queen Mary to create an heir to the kingdom and thus perpetuate the king’s line, the revolution began.—William, prince of Orange, Protestant, and Mary his wife, who was the daughter of James, were invited by the earls of Shrewsbury, Devonshire and Derby, lord Lumley, Henry Sidney, Edward Russell and Henry Compton, the suspended bishop of London, to invade England and strike for the crown. In response to this invitation from some of England’s most powerful leaders, William landed with a military force of 15,000 men. Although meagre compared to king James’ army, and totally inadequate to the conquest of a kingdom, yet such was the feeling of the English people, and so pronounced their hostility to James, that all classes in great numbers flocked to the standard of the prince of Orange, and James, abandoned by all, including his daughter Anne, fled to France, where he was received and pensioned by the French king Louis XIV. In the following year he attempted to regain his throne by invading Ireland, and in July, 1690, fought the battle of the Boyne, where he was signally defeated by William, and driven forever from British soil.—At the time (Feb. 13, 1689,) that the crown was tendered to the prince and princess of Orange, an instru-

ment called the "Declaration of Rights," a digest of those fundamental principles of the English constitution, which were to be imposed as a condition of their acceptance of the crown, was delivered. This *declaration* recited the principal grievances which the nation had suffered under the preceding reign, viz., the assumption as a royal prerogative to grant a dispensation from penal acts of parliament; the establishment of a new tribunal to determine ecclesiastical questions; levying taxes without consent of parliament; maintaining a standing army in time of peace; interfering with the administration of justice, and the freedom of elections; exacting excessive bail from prisoners; inflicting barbarous and unusual punishments; exercising to an unlawful degree the dispensing power; and treating as criminal, petitions for redress of wrongs—all of which acts were declared to be illegal. The instrument then proceeded to assert the right of petition to the subjects of the crown; the right of freedom of debate in parliament; the right of electors to choose their representatives without interference by the emissaries of the king; the right of the people, through their representatives in parliament, to levy taxation in support of the crown; the right of the subject to a speedy and impartial trial under the laws by established courts of justice; the right to have jurors duly empaneled, and that jurors in trials for high treason should be freeholders; the right of impartial proceedings under writs of *habeas corpus*; the right of the subjects to have arms for their defense; the right that excessive fines should not be imposed, and that all grants and promises of fines and forfeitures before conviction shall be adjudged illegal; and that for redress of all grievances, and for the amendment, strengthening and preserving of the laws, parliaments ought to be held frequently.—This declaration of rights was presented to the prince and princess of Orange at Whitehall, and by them accepted with the crown. The establishment of the claims of the English citizen to personal and political freedom under constitutional law appeared complete. There were those, however, who had aided in the re-establishment of English liberty who firmly and conscientiously believed that the convention known as "A Convention of the Estates of the Realm," which had proclaimed this declaration of rights and conferred the crown on William and Mary, was an illegal and revolutionary body; that it was not a parliament in a lawful acceptance; that it had not been convoked in accordance with long established usage, not having been summoned by a royal writ, which was held to be indispensable to its legal authority; that the instrument it had drawn up and presented to the prince and princess of Orange was unknown to the ordinary law, not having received the royal sanction, and was not therefore binding in any lawful degree.—It was urged by others, equally zealous in the interest of constitutional law as a protection of personal rights, that the royal writ was a mere

matter of form, and that to expose the substance of laws and liberties to serious hazard for the sake of a form would be senseless superstition. They further held that no royal writ had summoned the convention which recalled Charles II., and that it continued to perform legislative functions after his restoration without a change of *legal statutes*. Finally, that where the sovereign, the peers, spiritual and temporal, and the representatives freely chosen by the constitutional bodies of the realm, were met together, there was the *essence* of a parliament. It was finally determined that this great contract between the "governor and the governed," this "title deed," by which the king held his throne and the people their liberties, should be put into a strictly legal and regular form. To effect this, it was resolved that the declaration of rights should be converted by law into a bill of rights. The first act to be performed was that of changing the "Convention of the Estates of the Realm" into a parliament, so that its legislative acts might acquire a *legal status*. This was speedily accomplished by the king appearing in state at the house of lords, taking his seat on the throne and summoning the commons before him, for the purpose of delivering his speech to the two houses of parliament. On the king retiring, a bill declaring the *convention* a parliament was rapidly passed by both houses, and, on the tenth day after the accession of William and Mary, received the royal assent.—The house of commons immediately thereafter passed an act converting the provisions of the declaration of rights into a bill of rights. It did not, however, become a law at this session.—The *declaration*, among other things, had settled the crown first on William and Mary jointly, then on the survivor of the two, then on Mary's posterity; then on Anne and her posterity; and lastly, on the posterity of William by any other wife than Mary. The bill was drawn in exact conformity with the declaration.—At the suggestion of the king, when the bill of rights came before the house of lords for passage, an amendment was adopted, defining that the crown should, failing heirs of his majesty's body, be entailed on an undoubted Protestant, Sophia, duchess of Brunswick, Luxemburg, granddaughter of James I., and daughter of Elizabeth, queen of Bohemia. On the return of the bill to the house of commons for concurrence in this amendment, for some cause not clearly discernible, that body, by a unanimous vote, refused to concur. As the house of lords likewise refused to recede from its amendment, the bill of rights was dropped for that session. On the re-assembling of parliament at the following session, the house of lords no longer insisting upon the amendment entailing the throne upon Sophia, the granddaughter of James I., or any other person designated by name as successor, the bill became a law, and the declaration of rights, that changed the dynasty, seated William and Mary on the throne and secured to the English citizen personal and political liberty, became

engrafted upon English constitutional law as the "Bill of Rights."—The bill of rights, in addition to reiterating the privileges contained in the provisions of the declaration of rights, embraced some others of greater stringency. It stipulated that every English sovereign should, in full parliament and at the coronation, repeat and subscribe to the declaration against transubstantiation. It also enacted that no person who should marry a Papist should be capable of reigning in England, and that if the sovereign should marry a Papist, the subject should be absolved from allegiance.—The declaration of rights had contained no other provision with regard to the *dispensing power* of the king than to pronounce that power, as of late exercised, as illegal. All authorities and precedents sanctioned the theory that to the crown there belonged a certain *dispensing power*. How far that power might be exercised for the good of the realm, to what extent it might be judiciously exerted for the benefit of the subject, and to what limits it should be imperatively confined to prevent encroachment upon the constitutional law of the land, were questions that occasioned a wide divergence of opinion. Consequently every attempt to frame a definite policy failed from want of unison, and it was finally determined, as the only concurrent sentiment that could be obtained, to abolish it entirely. And thus, by the bill of rights, this peculiar privilege which for centuries had been held a prerogative of English kings, and which had been the cause of many fierce contentions, was forever swept away. The constitutional rights contained in this bill, with some additions, were re-asserted in the act of settlement by which the crown was limited to the Hanover family. (12 and 13 William III., c. ii.)—Similar provisions to those contained in the English bill of rights were appended to the constitution of the United States as amendments. Article I. provides, that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press, or the right of the people peaceably to assemble and to petition the government for a redress of grievances." Article II. provides, that "A well regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed." Article III. provides, that "No soldier shall, in time of peace, be quartered in any house without the consent of the owner; nor in time of war, but in a manner to be prescribed by law." Article IV. provides, that "The right of the people to be secure in their persons, houses, papers and effects, against unreasonable searches and seizures, shall not be invaded, and no warrant shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the person or things to be seized." Article V. provides, that "No person shall be held to answer a capital or otherwise infamous crime, unless on a presentment or indictment of a grand

jury, except in cases arising in the land or naval forces, or in the militia when in actual service in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor shall he be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty or property without due process of law; nor shall private property be taken for public use without just compensation." Article VI. provides, that "In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the state and district where the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense."—It has been held by American statesmen that the foregoing amendments to the constitution of the United States are a concentration of all the tenets of liberty contained in *magna charta*, its continuation in the petition of rights, and its extension in the English bill of rights. And in verification, as it were, of the tribute paid by the earl of Chatham, that "the great acknowledgment of national rights contained therein is not confined to themselves alone, but confers a common blessing upon mankind," their adoption in the American constitution is a broad exemplification. Other nations have taken them for a guide in promulgating their principles of personal liberty, notably the declaration of rights adopted during the reign of Louis XVI., by the French national assembly. It differs somewhat from the English bill of rights in form of expression, its opening sentence resembling that of the American declaration of independence. It declared that all mankind are originally equal; that the ends of the social union are liberty, property, security and resistance to oppression; that sovereignty resides in the nation, and that all power emanates from it; that freedom consists in doing everything that does not injure another; that law is the expression of the general will; that public burdens should be borne by all the members of the state in proportion to their fortune; that the elective franchise should be extended to all; and that the exercise of natural rights has no other limits than their interference with the rights of others. This declaration of rights by the French assembly became a law by the sanction of the king.—A similar recital of rights as contained in the amendments to the constitution of the United States, usually including the writ of *habeas corpus*, is found in the laws or constitution of a number of the states of the American Union.¹

JNO. W. CLAMPITT.

¹ In the constitution of a state of the American Union, says Judge Cooley, in his "Constitutional Limitations," we shall expect a declaration of rights for the protection of individuals and minorities. This declaration usually

BILLON. Economists call by this name the instruments of exchange of a metallic nature which take the place of money, for two special uses: for small change and small payments which could not be made with gold or silver coins, because these coins are not small enough. The

word billon is applied to pieces formed of a base alloy of silver, as well as to those made of copper. Although pieces of billon are always given in the form of pieces of money, care must be taken not to confound billon with money. There is this radical difference between them, that the piece of

contains the following classes of provisions: "1. Those declaratory of the general principles of republican government; such as, that all freemen, when they form a social compact, are equal, and no man, or set of men, is entitled to exclusive, separate public emoluments or privileges from the community, but in consideration of public services; that absolute, arbitrary power over the lives, liberty and property of freemen exists nowhere in a republic, not even in the largest majority; that all power is inherent in the people, and all free governments are founded on their authority, and instituted for their peace, safety, happiness, security, and the protection of property; that for the advancement of these ends they have at all times an inalienable and indefeasible right to alter, reform, or abolish their government in such manner as they may think proper; that all elections shall be free and equal; that no power of suspending the laws shall be exercised except by the legislature or its authority; that standing armies are not to be maintained in time of peace; that representation shall be in proportion to population; that the people shall have the right freely to assemble to consult of the common good, to instruct their representatives, and petition for redress of grievances; and the like. 2. Those declaratory of the fundamental rights of the citizen: as that all men are by nature free and independent and have certain inalienable rights, among which are those of enjoying and defending life and liberty, acquiring, possessing and protecting property, and pursuing and obtaining safety and happiness; that the right to property is before and higher than any constitutional sanction; that the free exercise and enjoyment of religious profession and worship, without discrimination of preference, shall forever be allowed; that every man may freely speak, write and publish his sentiments on all subjects, being responsible for the abuse of that right; that every man may bear arms for the defense of himself and of the state; that the right of the people to be secure in their persons, houses, papers and effects against unreasonable searches and seizures, shall not be violated, nor shall soldiers be quartered upon citizens in time of peace; and the like. 3. Those declaratory of the principles which ensure to the citizen an impartial trial, and protect him in his life, liberty and property against the arbitrary action of those in authority: as that no bill of attainder or *ex post facto* law shall be passed; that the right to trial by jury shall be preserved; that excessive bail shall not be required, nor excessive punishments inflicted; that no person shall be subject to be twice put in jeopardy for the same offense, nor be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty or property without due process of law; that private property shall not be taken for public use without compensation; and the like."—Our author, writing of bills of attainder, says: "*Bills of attainder* were prohibited to be passed, either by the congress or by the legislatures of the several states. Attainder, in a strict sense, means an extinction of civil and political rights and capacities; and at the common law it followed, as of course, on conviction and sentence to death for treason; and, in greater or less degree, on conviction and sentence for the different classes of felony.—A bill of attainder was a legislative conviction for alleged crime, with judgment of death. Such convictions have not been uncommon under other governments, and the power to pass these bills has been exercised by the parliament of England at some periods in its history, under the most oppressive and unjustifiable circumstances, greatly aggravated by an arbitrary course of procedure, which had few of the incidents of a judicial investigation into alleged crime. For some time before the American revolution, however, no one had attempted to defend it as a legitimate exercise of power; and if it would be unjustifiable anywhere, there were many reasons why it would be specially

obnoxious under a free government, and why consequently its prohibition, under the existing circumstances of our country, would be a matter of more than ordinary importance. Every one must concede that a legislative body, from its numbers and organization, and from the very intimate dependence of its members upon the people, which renders them liable to be peculiarly susceptible to popular clamor, is not properly constituted to try with coolness, caution and impartiality a criminal charge, especially in those cases in which the popular feeling is strongly excited, —the very class of cases most likely to be prosecuted by this mode. And although it would be conceded that, if such bills were allowable, they should properly be presented only for offenses against the general laws of the land, and be proceeded with on the same full opportunity for investigation and defense which is afforded in the courts of the common law, yet it was remembered that in practice they were often resorted to because an obnoxious person was not subject to punishment under the general law, or because, in proceeding against him by this mode, some rule of the common law requiring a particular species or degree of evidence might be evaded, and a conviction secured on proofs that a jury would not be suffered to accept as overcoming the legal presumption of innocence. Whether the accused should necessarily be served with process; what degree or species of evidence should be required; whether the rules of law should be followed, either in determining what constituted a crime, or in dealing with the accused after conviction,—were all questions which would necessarily address themselves to the legislative discretion and sense of justice; and the very qualities which are essential in a court to protect individuals on trial before them against popular clamor, or the hate of those in power, were precisely those which were likely to prove weak or wanting in the legislative body at such a time. And what could be more obnoxious in a free government than the exercise of such a power by a popular body, controlled by a mere majority, fresh from the contests of exciting elections, and quite too apt, under the most favorable circumstances, to suspect the motives of their adversaries, and to resort to measures of doubtful propriety to secure party ends?—Nor were legislative punishments of this severe character the only ones known to parliamentary history; there were others of a milder form, which were only less obnoxious in that the consequences were less terrible. Those legislative convictions which imposed punishments less than that of death were called bills of pains and penalties, as distinguished from bills of attainder; but the constitutional provisions we have referred to were undoubtedly aimed at any and every species of legislative punishment for criminal or supposed criminal offenses; and the term 'bill of attainder' is used in a generic sense, which would include bills of pains and penalties also.—The thoughtful reader will not fail to discover, in the acts of the American states during the revolutionary period, sufficient reason for this constitutional provision, even if the still more monitory history of the English attainders had not been so freshly remembered. Some of these acts provided for the forfeiture of the estates, within the commonwealth, of those British subjects who had withdrawn from the jurisdiction because not satisfied that grievances existed sufficiently serious to justify the last resort of an oppressed people, or because of other reasons not satisfactory to the existing authorities; and the only investigation provided for was an inquiry into the desertion. Others mentioned particular persons by name, adjudged them guilty of adhering to the enemies of the state, and proceeded to inflict punishment upon them, so far as the presence of property within the commonwealth would enable the government to do so. These were the resorts of a time of extreme peril; and if possible to justify them in a period of revolution, when everything was staked

money is reckoned in exchange as equivalent in value to the objects for which it is bartered. It is otherwise in the case of billon. When a Frenchman pays five francs for an article, the article has a value equal to that of 25 grammes of silver nine-tenths fine, contained in the five-franc piece. If he pays 20 centimes in copper for a kilogram of bread, the metal which he gives is far from equaling the value of the bread which he receives. The proof of this is, that it is not worth the twenty-hundredths, that is to say, one-fifth part of the quantity of silver in a one-franc piece; the respective value of the two metals, silver and copper, in an uncoined state, shows this clearly. The difference between the real value and the nominal value of the copper coins varies in different countries. It is generally between one-half and two-thirds. A grain of copper passes as if it was worth two or three. With base alloyages of silver, there is always a smaller departure from equality. There have been cases in which this departure was almost nothing. In England, where silver coin is considered billon, the nominal value of these coins differs from their real value only by one-tenth.—The difference between the nominal and the real value of copper coins is based upon this reason, that it would be too great an inconvenience for the public to carry even a very small number of them, if they contained an amount of metal equivalent to their nominal value. Besides, copper is a metal whose value is very variable, as compared with that of silver. The tables of prices current prove this; within a space of a few

on success, and when the public safety would not permit too much weight to scruples concerning the private rights of those who were not aiding the popular cause, the power to repeat such acts under any conceivable circumstances in which the country could be placed again was felt to be too dangerous to be left in the legislative hands. So far as proceedings had been completed under those acts, before the treaty of 1783, by the actual transfer of property, they remained valid and effectual afterward; but so far as they were then incomplete, they were put an end to by that treaty.—The conviction of the propriety of this constitutional provision has been so universal, that it has never been questioned, either in legislative bodies or elsewhere. Nevertheless, cases have recently arisen, growing out of the attempt to break up and destroy the government of the United States, in which the supreme court of the United States has adjudged certain action of congress to be in violation of this provision and consequently void. The action referred to was designed to exclude from practice in the United States courts all persons who had taken up arms against the government during the recent rebellion, or who had voluntarily given aid and encouragement to its enemies; and the mode adopted to effect the exclusion was to require of all persons, before they should be admitted to the bar or allowed to practice, an oath negating any such disloyal action. This decision was not at first universally accepted as sound; and the supreme courts of West Virginia and of the District of Columbia declined to follow it, insisting that permission to practice in the courts is not a right, but a privilege, and that the withholding it for any reason of state policy or personal unfitness could not be regarded as the infliction of criminal punishment.—The supreme court of the United States have also, upon the same reasoning, held a clause in the constitution of Missouri, which, among other things, excluded all priests and clergymen from practicing or teaching unless they should first take a similar oath of loyalty, to be void, overruling in so doing a decision of the supreme court of that state."

years it is not unusual to find variations of one-fourth, one-third and one-half. In order, therefore, to give to copper coins, as compared with silver, a value free from great variations, they would have to be frequently recoined.—But when the law rigorously limits billon to the two uses indicated above, to the making of change, and to all minor transactions, such as those of the daily purchase of bread, meat and coal for a poor family, this sort of *faiblage* of copper coins has no inconvenience. The restriction of billon to these uses also reduces the amount necessary even in very large states to quite a moderate sum. In France this sum is reckoned (1853) at from 40,000,000 to 45,000,000 francs, as against 2,500,000,000 of money; this is not 2 per cent. In Russia, at one time, the issue of billon had been exaggerated to the utmost. From 1762 to 1811 it amounted to 90,000,000 rubles against 137,000,000 rubles in gold and silver: 65 per cent. In England, if we consider silver billon alone, it forms quite a considerable proportion. The coinage from Jan. 1, 1816, to Jan. 1, 1848, amounted to £13,590,000 of silver against £92,029,000 of gold, or nearly 1 to 7, but the legitimate circulation of silver coins is necessarily much more extended than that of copper coins.—It has happened more than once that governments have wished unreasonably to increase the uses of billon, by decreeing that it should constitute a certain proportion, one-twentieth or one-fortieth part, for instance, of payments of every kind. This was actually debasing the money of the country exactly in this proportion, leaving out of consideration the real value of the billon. If it be decreed that merchants must accept in payment one-fortieth part billon, and this billon contains only one-fourth of its nominal value, the debasement is three-fourths of one-fortieth, or nearly 2 per cent. All prices rise in this proportion, and this without almost any noticeable effect at home; but accounts with foreign nations give warning of the evil, for the course of exchange becomes unfavorable in the same proportion.—The poverty of the treasury is the motive which determines governments to tolerate or expressly authorize these abuses. Thus the French directory, when extremely hard pressed undertook to coin a quantity of copper *décimes* (nearly 20,000,000), and the right which it gave to private persons to use them in making payments enabled it to put them into circulation after having coined them. Mexico was flooded in like manner in 1835, with small pieces of a similar origin called *quartillas*.—This mischievous practice is met with several times in French history. It is met with under the old *régime* in the times immediately preceding the revolution. Necker, who had been a banker, and in this quality had recognized the inconvenience of the practice, although tolerably familiar with the principles of public economy, did away with it. The directory, with monstrous effrontery, restored it in 1796 by a simple resolution. Beginning with this year, in all commercial payments one-fortieth part was

paid in copper coin. This abuse, once established in principle, led to many other vicious practices. So-called banks were established, which issued notes payable in copper coins. Under pretext of correcting the most palpable inconveniences of the abuse, this served to sanction it, and to give it consistency; this was giving private individuals an interest in it, who would violently defend it when attacked. The bank of France itself, under the directorship of Cretet, paid the proportion allowed its own notes in copper coin. Mollien gives some curious details on this subject in his *Mémoires d'un ministre du Trésor*, vol. 3, pp. 165, 469. Finally, in 1810, this enlightened minister obtained of the emperor Napoleon a decree which forbade the use of copper coins in commercial payments, except in making change, to an amount not exceeding five francs. The receivers of the public revenues had, up to the time of the issuing of this decree, taken an excessive proportion of *sous*; so that nine-tenths of the receipts from the mail service consisted of *sous*, and in a total budget of 850,000,000 francs, some 40 millions in *sous* were annually paid into the treasury. All the receivers of the revenue were ordered, by this decree, to be very severe on this point in future. Those who were likely to receive considerable quantities of these *sous* were paid a supplementary salary to induce them to reduce to an insignificant proportion the quantity of copper they took in. Nothing more was needed to destroy a custom which savored of the grossness and ignorance of barbarous times.

BI-METALLISM. (See PARIS MONETARY CONFERENCE.)

BIRNEY, James G., was born in Danville, Ky., Feb. 4, 1792, and died at Perth Amboy, N. J., Nov. 25, 1857. He was a slaveholder, and, while practicing law in Huntsville, Ala., was general agent for the colonization society in northern Alabama. In 1834, returning to Kentucky, he freed his slaves and undertook to establish an abolition newspaper. He was compelled by violence to leave Danville and go to Cincinnati, whence he was again driven to New York city in 1836. Here he became corresponding secretary of the American anti-slavery society. In 1840 and 1844 he was the abolition (or liberty party) candidate for president. (See ABOLITION.) In 1842 he removed to Michigan, and there became disabled for political work, by a fall from his horse.—See Beriah Green's *Sketch of Birney*.

BLACK COCKADE (IN U. S. HISTORY). Throughout the American revolution a black cockade upon the side of the hat was a part of the continental uniform. When, therefore, the intense war feeling against France, roused by the

dispatches from the X. Y. Z. mission, became useful in politics, the black cockade was mounted by the federalists, partly as a patriotic badge, and partly as a popular reminder of the tri-color cockade, which the republicans had been accustomed to wear as a mark of affection for France. The new badge provoked the anger of the more violent republicans, and several persons were beaten for wearing it. In the decadence of the federal party, "black cockade federalist" became a common term of reproach.—See 5 Hildreth's *United States*, 207; 1 Schouler's *United States*, 387.

BLACK CODE. (See SLAVERY.)

BLACK REPUBLICAN. (See REPUBLICAN PARTY.)

BLAINE, James Gillespie, was born in Washington county, Pa., Jan. 31, 1830; became a newspaper editor in Maine; was a representative in congress, (republican), 1863-75; was speaker of the house, 1869-75; was United States senator, 1876-81; and became secretary of state under Garfield. (See ADMINISTRATIONS.) In 1876 and 1880 he was one of the prominent competitors for the republican nomination for the presidency. (See REPUBLICAN PARTY).
A. J.

BLAIR, Francis P., Jr., was born at Lexington, Ky., Feb. 19, 1821, and died at St. Louis, July 8, 1875. He was graduated at Princeton in 1841, began practicing law in St. Louis, and served as a representative in congress, (free soil), 1857-62. In the Union army he reached the rank of major general. Until 1868 he was a republican, but then, because of his opposition to reconstruction by congress, was the candidate of the democratic party for vice-president. He was United States senator, 1871-73.
A. J.

BLOCKADE is the shutting out of neutral commerce from access to an enemy's ports or coast. The right of blockade can not be confined to ports or fortified towns alone, as has been sometimes urged. It may include the entire coast line of a state, with all harbors, mouths of rivers or localities of any sort where goods can be landed. For the object of a belligerent in laying blockade is to prevent trade between his enemy and neutral states. Any spot along the coast where this trade could take place can therefore be blockaded. But if a river or other waterway serves as the boundary between the hostile and a neutral state, only the enemy's portion can be closed.—Some writers found the unquestioned right of a belligerent to shut out neutral trade from his enemy's shores, upon the sovereignty which he has acquired, by occupation, over its coast sea, in the course of his blockading operations. But this is not a good explanation. For, first, the sovereignty over waters near a coast is simply an incident to the possession of the coast itself, and not separable from it. And again,

many of the operations of a blockade take place far beyond that distance from the shore which is the accepted limit of territorial waters, and therefore outside of the jurisdiction formerly claimed by the hostile state. So that a blockade has greater extent than a simple transfer of sovereignty can account for.—The true basis of the right of blockade is to be found in the general right, which every belligerent possesses, of distressing his enemy and weakening his powers of resistance by cutting off his foreign trade. Incidentally this may injure the neutral too, but plainly that is not the object of the act; it results from the necessities of war; and the neutral who may gain in other ways, in marketing certain products or in his carrying trade, must be content to lose in this. The part which blockade may play in warfare is readily seen in our own recent history. So long as the ports of the southern confederacy were open, and the south could exchange its cotton and rice and tobacco for European manufactures, its power of resistance could be indefinitely prolonged. But with its ports closed to foreign commerce, unable to market its products or supply its necessities abroad, it was at an immense disadvantage from the outset.—Since blockade is a belligerent right, its observance is a neutral duty. Yet the onus of prevention is not laid upon the neutral, nor can a breach of blockade be considered a municipal offense, which he is bound to take cognizance of.—If the neutral ship owner tries to run a blockade and is caught, his property suffers penalty, just as dealers trying to introduce provisions into a besieged town would lose their venture. The principles involved in siege and in blockade are somewhat the same, but the two should never be confounded. For siege implies a trying to get in, as well as a shutting out, on the part of the besieger, and is a term in land warfare; while blockade is simply restrictive and preventive, and the term applies solely to traffic on the sea.—The declaration of blockade is a sovereign act, open, generally speaking, only to the highest executive authority of a state. Yet it has been delegated sometimes to lesser authorities—a fleet commander, for instance, with instructions to blockade a certain port at his discretion. But to-day, when all parts of the world are reached by telegraph, such discretionary powers would not be necessary.—Since a blockade is a very serious limitation upon the rights and interests of neutral states, the neutral has a right to demand a certain efficiency in its operations, and a due notice of their beginning and end, before he is bound to recognize it as valid. Thus, it must be a positive act, and not a mere threat without the power to enforce it, and it must be preceded by notice of the extent of its operations, and their date of commencement. For obviously a neutral ship owner ought not to suffer penalty for failing to respect a restriction of which he is necessarily ignorant. These principles in the course of time have been formulated into rules, so that now, in order to make a cap-

ture for breach of blockade valid, three things must be proved: 1, that the blockade is effective; 2, that due notice of it has been given; 3, that there has been an attempt to break it.—1. *Effective Blockade.* We proceed to examine these rules more particularly. The first was in doubt for many years, but is now happily settled. There is no general agreement, it is true, as to the number of ships, their arrangement or armament, which shall make any given blockade effective. It has been suggested that an arc of circumvallation be drawn about the blockaded point, with ships patrolling up and down along it. But the method of conducting a blockade must differ according to the nature of the navigation, the contour of the coast or harbor, and the importance of the operation. A hundred miles of harborless coast might be patrolled by a single ship, while a port like Charleston would need a number.—Nor is it inconsistent with an effective blockade that it be occasionally evaded. Some blockade runners made the round trip from Nassau to Wilmington and back almost every month in spite of the blockade, yet it was not considered invalid. It is enough if there is so great risk of capture, in running the blockade, as to make the operation a very dangerous one. No blockade has been or could be laid an evasion of which would be impossible. This rule, however, that blockades to be binding must be effective, was aimed at a specific abuse of the system, generally called cabinet or paper blockades—those which do not exist in reality but only on paper. The most striking instances of this, though not the earliest, occurred during the wars between France and England at the beginning of the present century. Prussia, in return for Hanover, went over to France, and closed her ports against England. It was a treacherous act, but if she were resolved upon war, the closing of the ports was a legitimate war measure. England, in retaliation, after trying a milder measure, declared the coast, from the Elbe to Brest, under blockade. It was far beyond the power of the English navy to blockade effectually so great a stretch of coast, with its ports and river mouths and intricate estuaries. So that the declaration of blockade could not be supported by the fact. The ports under blockade were really closed not by a belligerent force, but by a stroke of the pen. The harm and injustice of such a course, to the neutral, is plain enough. Such a method of closing an enemy's ports is not blockade. It is an order to the neutral not to trade with one's enemy, even in innocent, non-contraband property, under penalty of capture and confiscation, which is an entirely different thing from a warning that certain ports or a certain coast are closed to neutral commerce by their blockade. And, as was immediately seen, the system was capable of indefinite extension. For Napoleon, by his Berlin decree of Nov. 21, 1806, laid the whole British coast under blockade, although he had hardly an available ship with which to enforce it, and never

intended to enforce it in fact, but simply to exact the penalty for its breach, when neutral ships which had traded with Great Britain came to his ports. Then England, in turn, laid the entire continent under blockade from Prussia to Italy, and Napoleon renewed his Berlin decree with fresh penalties. Neither state justified its stretch of the correct principles of blockade, save as a measure of retaliation. As a matter of fact this retaliation affected neutrals rather than the other belligerents. In their deadly struggle neither combatant regarded the rights of third parties, so long as it injured its foe. When peace returned, and men's passions grew cool, they could look at such acts more calmly, and even condemn what they had themselves before defended. During the Crimean war a correct system of blockade was observed by the allies, and after it, when the representatives of the great powers met in Paris to settle the terms of peace, they took up, among various questions of international interest, this one of paper blockades; and declared as between the signatories that "Blockades, in order to be binding, must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy." This is the fourth article of the important declaration of Paris, of 1856. The United States unfortunately did not accede to this declaration, but had long before, and very consistently maintained the same rule, so that it may now be considered universally adopted.—II. *Notice of Blockade.* There must be an actual notification of the commencement of a blockade, before valid captures can be made for breach of it. Common notoriety is not sufficient, without this official notice, even when a blockade has been raised and then renewed again. (The *Hoffnung*, 6 Rob. 112.) This notice may be of two kinds: a special notice to each ship trying to enter the blockaded port, at its mouth, with the fact of the warning inscribed upon her register; or a general diplomatic notice to all neutral governments. After sufficient time for it to become generally known, this is constructive notice to every captain or shipper in that state. These two forms of notice are sometimes made to supplement one another; for example, the blockade of the ports of the south in 1861. On the 19th of April president Lincoln, by proclamation, put under blockade the ports of the confederacy, from South Carolina to Texas inclusive. A week later this was extended to Virginia. But at that time there were but 42 United States ships in commission, and some of these were on foreign stations. How could a blockade of such vast extent be laid, when so few ships were available to make it effective, without being open to the charge of being a paper blockade? To avoid this, with the general diplomatic notice was coupled for awhile a special notice at the mouth of each port actually closed; so that *in spite* of the general announcement, one warning was allowed every ship touching at a blockaded port before capture. Thus each port

was brought under the application of the proclamation, only when this was supported by the fact, and a squadron was at its mouth. Though within the letter of the law, this course was unjust to the neutral. For, shut out from all southern ports by proclamation, when only a few were actually blockaded, he was exempt from capture indeed but could not know, at any given moment, which were still open and where he could trade. But no special complaint seems to have been made of this looseness. By degrees, as the blockading force grew larger, the blockade became more extensive and more stringent. And as this occurred, the general replaced the special notice, so that after the effective closing of any port had become notorious, the special notice was no longer given, and capture took place without a warning. A state may thus employ either form of notice at will; it is only the French who think both together necessary—that there must be a diplomatic notification and notice at the harbor's mouth also. The ground for this seems to be the idea that a shipper's or ship captain's knowledge of a blockade, announced only officially, can not be presumed; in other words, that no constructive notice and knowledge of its existence can fairly be ascribed to him. But what, as a matter of fact, is better known than that a certain country is under blockade, whether by hearsay, by public announcement, or through the newspapers, among seafaring men? Upon such matters, within reasonable limits, it is their duty to be informed. The French usage simply opens the door to fraud. What motive can a captain have in visiting a port which he knows to be blockaded, if it be not to evade that blockade, knowing that no penalty can attach until after one attempt?—With this exception, the usage of maritime states in regard to notice is pretty much the same. When a blockade is raised for any reason, notice of this should be given as publicly and as widely as of its commencement. And even the temporary departure of the blockading squadron is to be considered a raising of the blockade, except only when caused by stress of weather. Thus, if driven away for two days by the enemy's fleet, and returning at once thereafter to its post, it is a new blockade of that port, and fresh notice should be given. This is the rule, though it is not always strictly enforced. Thus, during the blockade of the south, in several instances there was an interval of a number of days between the departure of one vessel or squadron and the arrival of another sent to relieve it, yet no new notice was thought necessary by Mr. Seward, though his attention was called to the irregularity.—III. *Breach of Blockade.* There must, lastly, be an attempt to break the blockade, after it has been effectively established and duly announced. This may appear from a ship's actual entrance within the lines of the blockade, or from such circumstances as imply an intention to effect an entrance. Such facts as the avowed destination and actual course of the

ship; the owner's instructions; the nature of the cargo, its form of consignment; any irregularity in the vessel's papers, their concealment or destruction, would be carefully looked into by the courts, and might fasten upon ship or cargo an intended breach of blockade. Thus at the very outset of the voyage a ship may be liable to capture; because it has thus taken the first step toward committing the offense. Sir William Scott states this authoritatively (*The Columbia*, 1 Rob. 154): "I am clearly of opinion that the sailing with an intention of evading the blockade of the Texel, was beginning to execute that intention, and is an overt act constituting the offense. From that moment the blockade is fraudulently invaded." This seems to be the rule adopted by English and American prize courts, though not universally accepted by foreign jurists. Bluntschli, for instance, would attach no penalty to a ship, although intending to run a blockade, until it was so near to the blockaded port as to leave its intention beyond doubt, on the plea that until then its original intention might be changed. Some recent decisions of United States courts¹ have gone still further in inferring this intention to break blockade, by means of the doctrine of continuous voyages. This was applied to ships and cargoes bound nominally to a neutral port, but which appeared to have as their ultimate destination a blockaded port. The touching at a neutral port *en route*, Nassau, for instance, between London and Charleston, was not allowed to free the voyage, *thus far*, of its noxious character. It was still held one continuous voyage to a blockaded port.—A breach of blockade is committed by egress from as well as entrance into a blockaded district. And in this case no notification need be proved. The fact of the blockade is presumed to be known to the place blockaded. But not to be too severe toward neutrals, after the closing of a port, a certain delay is usually granted, to enable neutral ships loaded or in ballast to get away. This was 15 days in the blockade of the southern ports, and in special cases the time was extended.—Upon these three conditions, then, that the blockade is effective, that notice of it has been duly given, and that its violation is attempted, a neutral ship may be arrested, tried, and, upon conviction, may suffer penalty. This penalty is primarily the confiscation of the ship. The cargo follows the fate of the ship unless its owners can remove it from complicity in the act of the ship by direct evidence. The captain is the agent of the owners of the ship, not always for the cargo too, so that it may happen that a voyage to a blockaded port is undertaken without any interest in such a venture, or knowledge of the existence of a blockade, on the part of the owners of the cargo. But if both ship and cargo are owned by the same persons, the guilt of the latter is conclusive. And in general the presumption seems to lie against the

innocence of the cargo. For if not for the cargo's sake, why should a master imperil his ship by attempting a blockade?—We have already seen that the penalty for attempting to break a blockade may attach at the very commencement of a voyage. It also lasts during the return voyage or round trip, which is looked upon as one transaction. Thus after successful egress from a blockaded port, a ship might remain liable to confiscation during a year's cruise. As soon as the blockade is raised, however, this liability ceases.—There are two possible exceptions to the rule forbidding neutrals to enter a blockaded port. Neutral ships of war are sometimes admitted, out of comity, on diplomatic errands; and a ship in absolute danger of destruction from accident or storm, may take refuge in it, if no other refuge is possible. A general license to trade granted to the neutral by the government laying the blockade, does not warrant entrance within the blockading lines.—The penalty for breach of blockade is confined to the ship and its cargo; no punishment can be visited upon the crew. When during the war of secession certain northern officers paroled the crews of blockade runners not to serve again during the war, they were unauthorized, and their prisoners were discharged without condition.—*Pacific Blockade*. This, in spite of its title, is not properly a branch of our subject. It should rather be classed among preliminary war measures. It is a contradiction in terms, for blockade implies a war. No blockade can be laid unless excused by the necessities of war, since it would violate the rights of neutrals. Pacific blockade is simply an act of force employed by a strong toward a weaker power, in order to compel it to redress certain wrongs, or pursue a certain line of action. The one state closes the ports of the other, yet without considering this a war measure, or taking any other steps toward war. Thus the allied fleets closed certain ports in Greece, in 1827, in order to force Turkey to do her justice. Whatever may be thought of such an act, the term *pacific blockade* is to be deprecated.

THEODORE S. WOOLSEY.

BLOODY BILL. (See FORCE BILL, under NULLIFICATION.)

BLUE LAWS (IN U. S. HISTORY), codes of laws of remarkable severity against minor offenses, based upon the Mosaic law, so far as applicable, said to have been adopted by the original settlers of Connecticut and New Hampshire. Their existence, in the form commonly attributed to them, has been frequently disproved.—See *Code of 1650, with extracts from the laws of New Haven, commonly called Blue Laws*; Trumbull's *True Blue Laws*; 107 *Blackwood's Magazine*; 80 *New Englander*.

A. J.

BLUE LIGHT (IN U. S. HISTORY). In 1813 Decatur attempted, on several dark nights, to get to sea with his two frigates from the blockaded

¹ *The Bermuda*, 3 Wall, 514; *The Springbok*, 5 Wall, 1.

port of New London. On each occasion, as he claimed, he was prevented by signals made with blue lights at the harbor mouth, to warn the British fleet to be upon the alert. The story spread, and all opponents of the war, in New England and elsewhere, were stigmatized as "blue light federalists."—See 6 Hildreth's *United States*, 467.

BOARD OF TRADE. (See CHAMBER OF COMMERCE.)

BOLIVIA. Bolivia is a vast territory of South America, of 1,297,255 square kilometres, extending from 7° to 26° 40' south latitude, and from 60° to 75° west longitude. It is bounded on the south by a branch of the Andes and the desert of Chaco, which separates it (and this word should be understood here in its strictest sense) from the Argentine republic; on the southeast, east and the northeast by the plains of Uruguay and Brazil; and on the north, northwest and west by other spurs of the Andes or by the principal chain itself which separates it from Peru, and by the Pacific ocean which it touches for a distance of about 250 miles, between San Taltal Point and the river Loa. This country, which later received the name of Bolivia, was formerly a part of upper Peru. It was dependent at first on the vice-royalty of Buenos Ayres, with whose capital the great distance and a number of deserts rendered communication almost impossible. It was afterward united to the vice-royalty of Peru. It took part but tardily in the movement which, for many years, had raised up the Spanish colonies against the mother country. The impulse to this came to it from the north. It was only in 1824 that Sucre, a young Colombian general, the conqueror of Pinchincha, where he had assured the independence of Colombia, for a moment the supreme chief of Peru which he had freed by the victory of Ayacucho, the friend and principal lieutenant of the celebrated Bolivar, the man who next to the *liberator*, was most distinguished in the war of independence, conquered that part of upper Peru. In the name of the revolution he proclaimed the independence of these provinces, on the 6th of August of the same year, and on the 11th of March, 1825, he gave them the name of Bolivia, in honor of his master. Bolivia was at first united to the republic of Peru, and Bolivar exercised over it an unlimited power, the rigor of which Colombia and Peru themselves had not felt to the same extent. However it was erected into an independent state soon after, and when the Peruvian congress at Lima, in 1825, renounced its rights to these provinces and gave its consent to the separation, Bolivar imposed on them the constitution known as the Bolivian code, and offered the presidency of them to general Sucre, who till then had governed them in his name; but this régime was of short duration. It had lasted barely two years, when Bolivar, seeing his power menaced by insurrection in Colombia,

left Peru in all haste. The fragile structure which he had wished to raise did not survive his departure. Two insurrections against marshal Ayacucho (Sucre), one at La Paz, on the 25th of December, 1827, the other at Chuquisaca, on the 18th of April of the following year, broke out; they were forcibly put down; but the president, disgusted with the exercise of power thus contested, gave in his resignation, and, after incurring great danger, succeeded in rejoining Bolivar. —The first constitution of Bolivia intrusted the executive power to a president for life, to a vice-president, and to three secretaries of state. The legislative power, shared by three chambers, that of the tribunes, that of the senators, and that of the censors, was the result of an election of two degrees. Each chamber was composed of 30 members, elected for 4 years, and held a session of 2 months each year. This first constitution was followed by several others. The most recent, voted in 1868, intrusted the executive power to a president elected for 4 years, and the legislative power to a congress. It is true that this constitution was abolished in 1869, but that which was to replace it and those which may have followed this, can not but reproduce the two fundamental institutions of the South American republics, a congress and a presidency. Moreover, whatever be the mechanism of these governmental forms, often borrowed from the most elaborate and most liberal theories of Europe, the Spaniards and the Indians of South America scarcely understand the exercise of power, except by means which would pass in Europe for simple tyranny. We are seized with an invincible sadness when we compare the debasement into which these vast and rich countries have fallen under the dominion of European conquerors with the prosperity which they enjoyed under the paternal government of native princes, called barbarians. Europe brought misery and oppression to a happy people, who, under the mild government of native princes, lived in plenty. Have the conquerors fared better? This may be doubted. Victims of low ambition torn by factions, incapable of reaping any advantage from the wealth of their soil, they seem doomed to inevitable decay. Let us hope that they will find a means of escape by attracting foreigners to the country, and by an infusion of new blood.—Some administrative and judicial progress is due to Mr. J. M. Linarès, a liberal raised to the presidency in 1858. Although he maintained an army very burdensome to the country, and put at the head of the troops too many colonels and generals of his own style, although it is impossible to approve all his financial schemes, we must give him the credit of having introduced some economy into the finances, of having increased the number of schools, of having had laws made in favor of the Indians, of having regulated municipal government and reformed the judiciary. A quarrel with Peru, in which Peru seems to have been

altogether in the wrong, came near compromising, in 1860, this favorable movement, but harmony was restored between the two republics, and they became more closely united, some years later, under the influence of common interests and common dangers. The idea of a federation of South American republics was obtaining root. It was desired to hasten, by more intimate political relations, the civilization of that vast continent, to create a counterpoise to the influence of the United States, and to reject all intervention of Europe in the politics of the new world. But the states which it was desired to unite are separated by much more than their geographical distance; and four states alone occupying the Pacific coast, in the central region of South America, commenced the realization of this vast plan.—In 1864 Bolivia, Chili and Ecuador sent deputies to a congress convened at Lima by the Peruvian government, which was threatened by the arms of Spain. Spain justly claimed reparation for damages done to her citizens, but the plenipotentiary sent from Europe to set forth the grievances of the former mother country assumed the aggressive title of commissioner extraordinary of the queen, the title of the governors before the period of independence. The war of secession in the United States was at its height, as was also the Mexican war. The republics of South America were convinced that France and England favored the dismemberment of the United States, and the congress of Lima inferred from this the existence of a European plan, by which Spain would endeavor to recover her colonies.—Peru secured the alliance of the three republics which had sent delegates to the congress of Lima. Bolivia concluded its treaty in February, 1866, but was not able to furnish any other assistance in the war except to prevent the revictualing of the Spanish fleet in the Bolivian harbor of Cobija. The war was closed by the retreat of the Spanish fleet, which was repulsed at Callao, but the treaty of peace was not signed till 1868.—In the interval Bolivia formed a more intimate alliance with Chili. The two republics were disputing the ownership of the guano deposits on the islands of Mejillones. A treaty of the 10th of August, 1866, confided the working of the deposits to a French company.—Bolivia occupies, in the centre of the American continent, a very unfavorable situation which condemns it to an isolation almost absolute, and seems to raise up an insurmountable obstacle to the development of its political or commercial power. It is divided by nature into two very distinct parts: the mountainous country in the west, and the country of the plains in the east which forms the largest portion of it and which extends from the banks of the Pilcomayo, an affluent of the La Plata, on the south, to the northeast point of the territory, where the Rio Mamore joins the Rio Beni and forms the Rio Madeira, the principal affluent of the Amazon. The valley of Pilcomayo occupies the south of

the eastern region. The north is watered by the Desaguadero, which empties into lake Titicaca, the largest lake of South America. It constitutes the boundary between Bolivia and Peru. Its immense basin is inclosed by a double chain of mountains, the Cordillera of the Andes and the Cordillera of Alama. The mean elevation of this valley is 13,000 feet above the level of the sea. It communicates with the ocean by six passes, whose highest points overlook the Pacific at a height of 15,000 feet, and the valley at 2,000 feet. Besides lake Titicaca and the great watercourse just named, the valleys and plains of Bolivia are irrigated by numerous rivers which flow southward to the Rio de la Plata and north to the Amazon. Bolivia owes to the elevation of the greater part of its territory a more temperate climate than would seem to be indicated by its geographical position. Gold is found in some parts, especially on the slope of the eastern Cordillera. The silver mines of Potosi have a reputation of ancient date which, according to report, they have ceased to deserve. Copper is met with in abundance, particularly in the district of La Paz, as are also deposits of lead and tin. The soil of these vast countries, ill cultivated, badly worked, and lacking inhabitants, yields to the most varied kinds of cultivation. The fruits of Europe and the products of tropical regions are there gathered: Cocoa, sarsaparilla, copaiba, India rubber, aromatic and medicinal plants, quinine, etc.—The population of Bolivia, of which little is known, is variously estimated. In 1835 it was estimated at more than 2,300,000 inhabitants, of whom 1,650,000 were whites of foreign origin or of mixed blood, and from 700,000 to 800,000 Indians. Dr. Petermann reduced it, in 1848, to 1,742,000, not including about 245,000 aborigines. In 1867 it amounted to 1,987,352, the number of aborigines being still estimated at 245,000.—The organizers of Bolivia took the French administration as their model. They introduced the French prefect, sub-prefect and municipality. They have translated the French civil code which was unceremoniously called the Santa Cruz code. The republic is divided into two bishoprics, whose seats are at Cochabamba and at Santa Cruz. The army consists of 2,500 men, with 3,200 of a national guard. The revenue of the republic was estimated, in 1850, at 1,976,000 piastres, and the expenses at 1,730,000 piastres; the public debt at 5,850,000 piastres. Since then the debt has been increased by the total of the unpaid interest. In 1870 the receipts rose to nearly 2,500,000 piastres or pesos, of which about 1,000,000 were in direct taxes. Anarchy does not allow Bolivia to use the elements of wealth which its soil contains. Its agriculture is neglected, its industry amounts to nothing, and its commerce is in a languishing condition. It manufactures some cotton stuffs, especially at Oropesa; woolen cloths, from the wool of the lama and alpaca, among which those of La Paz occupy the first rank; and wigonia hats and glass

of good quality, made especially at Oropesa. But metals are its chief article of foreign commerce. The export of copper is estimated at 400,000 quintals per annum. In 1869 the total exports, from the port of Cobija, reached 17,403 tons, distributed as follows: coined silver, 1,000,000 piastres; copper, 17,300 tons; tin, 4,000; guano, 6,000. The imports reached, it is said, the figure of 7,000,000 piastres. They consist chiefly in iron or hardware, to which must be added certain articles of luxury, especially silk stuffs. In June, 1852, the navigation of all the rivers which flow into the Amazon and the Rio de la Plata, were declared free to all nations.—**BIBLIOGRAPHY.** *Bosquejo estadístico de Bolivia*, by M. A. RABUTAUX.

BOOTY. Borrowed from the Scandinavian word *buty* (latinized into *butinum*), in middle German *büten*, at present *beute*. Booty is analogous to the Anglo-Saxon *bot*, and appears now as the English word booty. It is found in the Italian *bottino*. The word is found in all languages, and it could not be otherwise since it expresses a fact of war, almost general, in former times.—To take booty is to take possession, by the right of the stronger, of that which belongs to the vanquished. At present the word booty is applied only to movable objects, but formerly it comprised immovable property. Most of the great feudal fortunes had no other beginning. In Sicily and in England the Norman barons divided the estates of the conquered among them, and what the Normans did the Franks had done in Gaul, and the Visigoths in Spain. In a word, wherever there was a conquest there was booty. With the development of civilization the word booty gradually lost its original extensive application. The following are the provisions relating to it, now considered in accordance with the law of nations: The armies and the navies of states, privateers and even isolated combatants, may take as booty from armies, war vessels and the privateers of the enemy, by force, open or concealed, as well as all the movable property possessed by the latter. (Klüber, *Droit des gens moderne de l'Europe*, page 324, § 253; Heffter, § 153.) This booty belongs, according to the natural law of nations, to the government waging war, but to-day it is generally left to the soldiers who have taken it. (Vattel, liv. III, chap. ix,

§ 164.) The victor in our day respects public monuments, products of literature and fine art, the movable property of the castles, edifices and gardens belonging to sovereigns or their families, as well as objects pertaining to worship, and ordinarily abstains from destroying or carrying them away. (Kamptz, *Neuere Lit.*, § 309.) According to the usage of the law of nations established in Europe the enemy acquires, in wars on land, the ownership of booty by a possession of it during twenty-four hours, (Strube's *Rechtliche Bedenken*, Bd. II, No. 20); so that when this term has expired, any third party may acquire it of him, by a true title without danger of its being reclaimed, and to the exclusion of the right of postliminy. (Vattel, liv. III, chap. xiii, § 196.) Most governments still recognize the same principle with regard to captures made in naval warfare by war vessels or privateers, (Martens, *Essai concernant les armateurs*, chap. iii, sec. 11); still there are some who pretend that property in this booty is not lost to the original owner till it is put in a safe place, that is to say, till it has been transported to the territory of the victor or into a neutral country. (Vattel, liv. III, chap. xiv, § 208) The plunder of a marauder or pirate does not enjoy these advantages. Movable property belonging to private persons not taking part in hostilities, is not accounted booty by the laws of war, and can not be taken from the proprietors, with the exception of merchant ships and their cargoes, which are lawful prizes for war vessels. (Martens, *Recueil*, II, 56, et *Déclaration de 1856*).—War has such a demoralizing effect that men who leave home with a horror of booty, become sometimes, if the war is long, familiar with the idea, and permit themselves to take that which does not belong to them. But the plundered proprietor has been seen to follow his goods to the enemy's country, bring the thief before a court and win his case. It would be well if such instances—of which we know but one—should become more frequent; for no matter how rigorous discipline may be, there is always in a large army a number of people who have few scruples. It would be well to teach them that war does not insure impunity.

MAURICE BLOCK.

BORDER RUFFIANS (IN U. S. HISTORY), pro-slavery Missouri men who, in 1855 and afterward, made a practice of crossing the border into Kansas to carry elections, or to overawe free state settlers. The name does not seem to have been entirely one of contempt, as it was occasionally accepted and used by the border ruffians themselves—See 1 Greeley's *American Conflict*, 238; Cairnes' *Slave Power*, 117; and authorities under KANSAS.

A. J.

BORDER STATES. The (IN U. S. HISTORY), the tier of slave states, Delaware, Maryland, Virginia, Kentucky and Missouri, lying nearest the free states. North Carolina, Tennessee and Arkansas were sometimes included among the bor-

der states as distinguished from the gulf or cotton states, but the name was usually given to the states first named. The rise of a distinct border state interest first becomes evident about 1820-30 (see SLAVERY), when the development of the cotton culture in the extreme south had begun to create a demand for slaves there, which could be filled only by the inter-state slave trade, since the African slave trade had been abolished. (See ABOLITION, I.) From that time until 1860 the border states, except Missouri, became a breeding ground for slaves to be sold in the gulf state markets when mature. Even in 1832 it was admitted on all hands in the Virginia convention of that year that Virginia's exportation of slaves was more profitable than any of her domestic industries. The border states therefore suffered most from the operations of the underground railroad (see ABOLITION, II.), and were loudest in their complaints of the non-execution of the fugitive slave law. In 1860 this feeling caused the introduction, by a Missouri senator, of a proposition to maintain an armed national police force along the line between the border and free states, to prevent the escape of slaves.—During the political excitement of the period, 1850-60, the position of the border states was one of peculiar difficulty, owing to the acceptance in the north and south of the slavery question as an issue in American politics. In this acceptance the border states never concurred; to them it meant only present trouble and confusion, and a threat of future armed conflict of which they should be the principal theatre. They were therefore only anxious to keep the slavery question out of sight. In this section the American party, or know nothings, first took rank as a national party; in 1856 it carried Maryland, and polled a strong vote in the other border states. Here again, in 1860, the constitutional union party, based also on the desire to ignore the slavery question, found its strongest anchorage: all the electoral votes given to its candidates were those of Kentucky, Virginia and Tennessee, and the plurality against it in the other border states was exceedingly small. When Lincoln's election had brought the rebellion into plain view, the border states were still anxious for compromise and peace. They originated the peace conference of 1861 (see CONFERENCE, PEACE), and the Crittenden compromise (see COMPROMISES, VI.), and labored with little prospect of success to secure the adoption of either of them as a basis of settlement.—At the outbreak of the rebellion the border states were emphatic in demanding that neither the federal government nor the seceded states should do anything "calculated to provoke a collision of arms between the states and the government of the United States." (See STATE SOVEREIGNTY, SECESSION.) When president Lincoln's call for troops in April, 1861, showed that the federal government meant to fight for its existence, Virginia, North Carolina and Arkansas seceded: the other border states refused to do so, though some of their ancient politicians wished to maintain an

attitude of "neutrality." Governor Beriah Magoffin, of Kentucky, by proclamation, even warned "all other states, separate or united, especially the united and confederate states," that he forbade any occupation of Kentucky without consent of its legislature and governor; but the people of Kentucky, and of the other border states, except Tennessee, which was divided, and the three seceded states, generally supported the government. (See the states in detail.)—Throughout the war against the rebellion the border states continued to urge, but without success, their project for "reconstruction," which, in its original sense, meant the settlement of all existing difficulties by a convention of all the states, including those that had seceded. (See RECONSTRUCTION.) Delegates from all the border states, even from those which had not seceded, except Delaware and Maryland, held seats in the congress of the confederate states, but these were chosen by soldiers of regiments in the rebel armies, or by those districts temporarily under rebel control, and in no sense represented the people of the state. (See DEMOCRATIC-REPUBLICAN PARTY, SECESSION, REBELLION, UNITED STATES, and authorities cited there and under articles above referred to.)

ALEXANDER JOHNSTON.

BOURGEOISIE. The history of the bourgeoisie is mixed up in its origin with the history of the renaissance of towns. The middle ages had founded two classes of society: the one dominant and idle, warlike, and in possession of the soil; the other subject and laborious, under the protection of the proprietors of fiefs, and excluded from all share in the sovereignty. The first protest against this order of things showed itself in the opposition of the cities against the feudal system in the twelfth and thirteenth centuries. In Italy and in the south of France the political movement was the consequence of Roman reminiscences; in the north of France and in Germanic countries the *sworn* commune came from German customs. It is the municipality formed by association and by mutual assurance on the faith of an oath. These two origins led to the same end. Whether it be under Roman or Germanic influence this restoration of the cities and of their civil and political liberties laid the foundation of modern society.—The history of the bourgeoisie, or of what is known in France as the third estate, is the history of evolution which by degrees acquired for the lower and oppressed classes of society the fullness of political rights and abolished all unjust inequality among the people. This is not the place to write the history of communal life in the middle ages; but it must be at least mentioned since it was the cradle of the bourgeoisie. The bourgeoisie was from the first opposed to the feudal principle. Nevertheless, it found the means of winning, by degrees, a regular place in the society of the middle ages. In France the third estate was the soul of the states general. By its alliance with roy-

alty it modified feudal society up to the very point of the dissolution of that society, and when the municipal spirit of the towns commenced to grow weak, and the king to do away with the privileges of the lords, the third estate remained none the less powerful. Offices of justice and administration, which demanded long study, became the property of the third estate. The nobility rather retired of its own accord from these offices than was removed from them. In the sixteenth and seventeenth centuries the third estate was everywhere. It was in vain that Sully wished to attract the nobility to the council of state. The nobility limited itself to retaining the command of the army, the government of the provinces and the offices of the king's household. But the council of state, the *intendants* created in 1635, and the parliaments, were recruited mainly from the third estate, from what is called to-day the upper bourgeoisie. The parliaments, especially after the suppression of the states general, represented the third estate. The parliaments thus became an inferior kind of aristocracy, and in the last two centuries of the ancient French royalty the development of the third estate was rather a social than a political fact. The lower classes rose silently to power, and in 1789, at the time of the convocation of the states general, the third estate endeavored to take advantage of its numerical superiority and to represent the entire nation. Hence the saying of Sieyès: "What is the third estate? Nothing. What should it be? Everything." This statement defined the culminating point of the development of the bourgeoisie at the opening of the French revolution, and at the same time put an end to it. From the twelfth century the third estate had tended toward the suppression of privileges, even when it had itself granted them, to guarantee its own liberties. Its rôle of emancipation terminated the moment that the revolution made liberty and equality before the law its fundamental principle, applicable to all without distinction. The word bourgeoisie from that time forth changed its meaning. A man is no longer a bourgeois because he belongs to such and such a town, but because he fulfills certain social conditions. By the bourgeoisie is now understood that part of society which represents property acquired, or in course of acquisition, through industry or commerce, and that which follows the liberal professions. In this sense the expression third estate is not sufficient to define it; for the third estate was not the bourgeoisie, but the nation minus the nobility and the clergy. To-day, on the contrary, the bourgeoisie is not a close caste. It has a character of universality such that by the finest shades of difference it is lost in the nobility above and touches the proletariat below. In a state of society in which fortunes are made and lost with a rapidity unknown to our fathers, the passage from one class to another is so frequent that it is hard to find lines of demarcation between them. Nevertheless, the word bourgeoisie has a more special meaning when it

serves to express the distinction between the bourgeois and the peasant and workman. In this sense the bourgeoisie has pretended to a political rôle independent of the two latter classes. Taking the saying of Sieyès literally, it wished to assume the entire government of society. It has manifested in this attempt qualities and defects which are easily described. These qualities consist in a reasonable conduct of affairs, in a taste for *self-government*, in the want it experiences of controlling the government; in a word, in the practice of constitutional government in monarchies and of representative democracy in republics. Its defects consist in too great an attachment to its own interests, and, generally, in a too great timidity. It exhibits more adroitness in petty than in great affairs, more aptitude for a temporary than for a permanent policy. It may be said that the defects and qualities of the French bourgeoisie were manifest during the reign of Louis Philippe. What contributed most, then, to put an end to the rule of the bourgeoisie was its neglect of the interests of the lower classes. It forgot that it should not be a distinct class, but simply the medium in which all should meet. The endeavor, therefore, to found a government on the middle classes alone, or even to consider them as a class apart, is an undertaking that has no chance of success. M. Guizot, in an able article, entitled *Nos mécomptes et nos espérances*, denies that the middle classes have good political judgment, the political sense; and he requires, as a counterpoise to their changeable disposition, the political influence of a nobility or of great landed proprietors. It is impossible to find such a counterpoise in France in our day, for the reason that well defined classes no longer exist there. The nobility is dead, socially; large landed estates are not permanent. Neither the one nor the other, therefore, could serve as a counterpoise to the alleged inconstancy of the bourgeoisie. The salvation of the latter will depend on its solicitude for all the interests of the nation even when they are not its own. It should open its ranks to all, and take into them all who are not as yet a part of it. There is no better way to attain this end than to disseminate public instruction and favor the creation of public wealth, by the proper application of sound principles of political economy. By the development of public instruction the social strata, which have not yet taken part in the intellectual life of the nation, and which consequently contribute but little to the formation of public opinion, will do their part in the formation of that opinion, and free it from the narrowness inherent in opinions born of special interests. By the application of sound principles of political economy, which is a corollary to the diffusion of education, the opposition between the interests of classes would be made to disappear. The social rôle of the bourgeoisie before the revolution was to elevate the lower classes. This is its rôle to-day. It is the only one which can guarantee it enduring influence. It is also the only one which has a

meaning. The bourgeoisie commenced as a solvent of feudal society. It prepared the way for democracy. It would poorly understand its interests were it to oppose that which it contributed to establish. It has better work to do. After its negative and dissolving labors come positive work and the work of organization. This remains to be accomplished, and the expression bourgeoisie should have no meaning but that of an educated and intelligent democracy.

JULES GRENIER.

BOUTWELL, George Sewall, was born at Brookline, Mass., Jan. 28, 1818; was admitted to the bar in 1850; was governor of Massachusetts 1851-2; was a representative in congress (republican) 1863-9 (see RECONSTRUCTION); was secretary of the treasury 1869-73, and United States senator 1873-7.—See Boutwell's *Speeches during the Rebellion*. A. J.

BRAHMANISM. Brahmanism is an institution at once civil and religious, which by the grandeur, originality and unshaken persistence of its results should hold a considerable place in the history of mankind. It has governed Hindoo society from time immemorial and governs it still. There is no possibility of assigning a term to the all-powerful influence which it exerts on Hindoo society, an influence legitimate in certain respects, but disastrous in others. It seems destined to endure as long as the race which it has guided for the last 3,000 years.—Brahmanism has this peculiar character, among all the religions resting on sacred books, that it has no founder, and that the person who first conceived the system is altogether unknown. Brahma, from whom it takes its name, is no other than the infinite being, the universal soul. Brahma is not the name of an individual like those of Buddha, Moses, Jesus, or Mohammed. The origin of Brahmanism is hidden by a veil thus far impenetrable, and it is not to be believed that this obscurity can ever be cleared away completely. India has not written its own annals, any more than the rest of Asia; and history as written in the west, since the time of the Greeks, is a virile work of intelligence such as Asia never conceived, and which even seems to be beyond its power. India, therefore, can not tell us herself whence Brahmanism has come, and her monuments do not yield up to the questionings of erudition the secrets which are contained in them only in an imperfect manner. At present when we know the Vedas, the source of Brahmanic religion, it can be affirmed that they do not contain Brahmanism as afterward organized, and the only hymn of the Rig-Veda in which there is mention of the four castes, passes justly either as apocryphal or of much later origin than most of the others. It is the famous hymn to Purusha, which we read in the tenth and last Mandala, in which are brought together in a confused mass fragments more or less authentic and more or less orthodox. Now the Vedas, and above all the Rig-Veda, be-

ing a collection of the religious and national hymns of the Aryans when they arrived in India from the northwest by the passes of the Hindu Kush, the last ramification of the Himalayas, it may be looked on as certain that these people had not yet established in their midst that special form of religion and society called Brahmanism. We read in the Vedas of priests presiding at sacrifices and solemn prayers; but they do not form a class apart; they are not the masters of society nor the spiritual governors of the people. At what epoch did they become such? This can not be precisely told; but it is necessary to go back at least fifteen centuries before the Christian era to come near the epoch, and perhaps it may be necessary to ascend to a remoter time. In the seventh century before Christ Buddhism arose among the Brahmans to reform and destroy Brahmanism. Brahmanism must, therefore, have existed a long time in order to reach the state of corruption in which Buddhism exhibits it to us, and from which it strove to rescue it. The date of Buddhism itself is incontestable (623 to 543 B. C.), and it puts the date of the origin of Brahmanism very far back, which, without exaggeration, must have arisen ten or twelve centuries earlier.—On the other hand, the canon of the Vedic scriptures is composed of several parts which are held to be equally sacred and equally revealed. They are first the *mantras* or prayer hymns, mostly in verse; then the *brahmanas*, with the *upanishads* and the *aranyakas*, mainly in prose. The hymns which, properly speaking, constitute the Veda, are much the more ancient, unless it be those of the fourth and last Veda, called the *Atharvan*. Now if the hymns or *mantras* mention Brahmanism only in the manner of which we have just spoken, we meet, on the contrary, with all its developments and with its whole power in the *brahmanas* which are, as their name indicates, for the special use of the brahmanic caste, who alone perform the sacrifices. It is, therefore, in the interval between the *mantras* and *brahmanas* that the Brahmans acquired power. But since there is in India no chronology for monuments of the mind any more than there is for events of history, it is impossible to determine the epoch of the *mantras* or the liturgical books which accompany them and which regulate all the details of worship. Nevertheless, by a process of reasoning, probably correct, the learned have come to believe that the primitive *mantras* appeared at least 1,500 years before the Christian era, and by the same method they fix hypothetically the date at which Buddhism originated in the bosom of the brahmanical society already grown aged and corrupt.—One may well believe that not without a struggle did the Brahmans attain that dominion which they afterward held in such an imperturbable manner. The earliest traditions of the Aryans show that when these people came to India to conquer and civilize the country, they were under the lead of military chiefs, and no matter how pious they might have been from the beginning, it was their

kings and not their priests whom they obeyed. This was a necessity of their situation, and in that splendid epic poem, the Ramayana, the legend of a hero who conquered the south of India and even the island of Ceylon (Langkâ), it was the kings who led the people and the Brahmans occupied only a subordinate place. But when the time of combat had passed away and the Aryans were able to enjoy their conquests quietly in the immense space that extends from the headwaters of the Indus and the Ganges to the Vindhya mountains, the priestly class could become dominant without danger, and as the nation had no longer anything to conquer or even to defend, it yielded itself up entirely to its religious instincts, and, once upon that incline, soon intrusted to the priestly caste the power which had at first belonged to the warriors or *kshatriyas*. The latter resisted energetically, and if dissensions had not then sprung up among them, it is likely that they never would have lost the supremacy, and the Brahmans would never have acquired it. But Parasu-Rama, a *kshatriya* famous for his courage and his ferocity, took sides against his own class to avenge certain outrages inflicted on his family, and, through bloody victories, he assured to the Brahmans a power which without him they would probably have never usurped.—It is from this time, of which a vague souvenir is preserved by tradition and by some important works, among them the laws of Manu, that Brahmanism really dates, and that it began to give to Hindoo society its final and immutable form. At the head of this new society, as a permanent divine incarnation, stood the Brahman, issued from the mouth itself of Brahma. Below him, but at an impassable distance, was the *kshatriya*, or warrior, who had come from the arms of the god. Below the warrior was the Vaisya, or laborer, who had sprung from his thighs. Last of all, and very far from the other three, was the Sudras, made to serve and support the others because his origin was in the feet of the divinity. These are the genuine castes, four in number, and no one of their members could marry legitimately except in his own circle. By force of circumstances some marriage unions were necessarily contracted outside these narrow limits. But these exceptional alliances were contrary to law, and religion, so far as it was able, proscribed them by menace of eternal punishment and by social reprobation in this world, while the punishment of the next was being deferred. This creation of castes is both the masterpiece and the strength of Brahmanism, thanks to which it has endured for upward of 30 centuries and may perhaps endure still longer.—The religious faith of the Hindoo people must have been blind indeed and quite irresistible, to accept this dogma and yield to it so completely. Birth fixed forever the rank of each man in society, and instances of escape from the social limits it imposed have never been numerous or lasting. Caste is maintained with its essential characteristics, and it could be seen by the insur-

rection of 1857, that the popular conviction is far from being weakened, and that superstition has retained all its inextinguishable ardor. How have the Brahmans been able to impress such a belief on men's minds traced in ineffaceable lines? This can not be explained by their adroitness alone. The Hindoos, independent of the priests who have gained their confidence, have beliefs which may be called endemic and which have singularly favored usurpation. Every one in Brahmanic as well as Buddhistic India believes in the transmigration of souls, and as the present life in all its conditions results inevitably for each man and each creature from the lives and existences which they led previously, they submit without murmur or despair to the destiny given them and from which nothing can escape. It is true that in Asia there are many other peoples besides the Hindoo who believe in transmigration, and that none of them have been subjected to caste to the same degree; but if belief in transmigration is not the only cause of Brahmanism, it is certainly the chief one, and without it the others would to all appearance have remained powerless. The Hindoo people have found in caste the irrevocable decree of God, or rather, the indestructible chain put upon them by another more mysterious and terrible power than that of God, such as it is understood by religions more humane and enlightened. The Hindoo has bowed down his head with all docility, and one may predict almost certainly that he will never raise it again. Once in possession of power Brahmanism left nothing undone to retain it, and one of the most curious spectacles that can engage our attention is the minute and astonishingly effectual precautions taken to maintain forever the superior caste in the high position assigned to it. The education of the Brahman is a marvel, and it would have been surprising if with care so intelligent and continuous there had been a failure in forming persons worthy to succeed their instructors. Nothing can be looked for on this most interesting and weighty subject either in the sacred or liturgical books, or at most very little can be found in them. It is to the codes we must turn and particularly to that one known as the laws of Manu, a work less ancient than it was thought to be at first, but which without the least doubt antedates our era by three or four centuries, and which still enjoys unquestioned authority in the tribunals of India.—To begin with, the legislator has the most exalted idea of the Brahman. By the very order of Brahma, the first of his sons, the Brahman charged with the study and teaching of the Vedas, the performance of sacrifice and the duties of worship, is of right the lord of all creation and of all beings. Master of everything, it is only through his generosity that other men enjoy the goods of this world (Laws of Manu, book I., verses 88, 93, 100 and 101). He alone is rightful proprietor of these goods which he yields to others, and this is why the other castes, to whom he shows himself so kind, owe him in

return respect and a large part of all the benefits which he leaves them. Even before the Brahman is born the law concerns itself with him. He is barely conceived in the womb of his mother when it is necessary to offer a sacrifice in his favor for the purification of the fœtus (book II., verse 27). After his birth and before cutting the umbilical cord he must be made to taste of honey and clarified butter. There are certain conditions connected with the name given him, as there are to the taking him for the first time into the open air, and for his weaning. He must receive the tonsure at an age of from one to three years (book II., verse 35). He may be invested with the sacred cordon beginning with his eighth or even fifth year; but he must not be invested with it after his sixteenth year under pain of excommunication. The law regulates the composition of the sacred cordon put about the novice, and of the belt and baton which he carries, made of a certain kind of wood and of a certain length. The novice, once initiated through the ceremony of *Kesanta*, must no longer receive his food otherwise than in alms, and he must beg his bread. He may not take more than two meals a day, one in the morning, the other in the evening. He must sit while eating, and observe the prescribed rules, and perform his ablutions. At the age of 16 he begins his studies with a spiritual preceptor called a *Guru*, who becomes his second father, even more venerated than the father whom nature gave him. The *Guru* never gives any but free lessons, and it is with difficulty that the disciple when leaving his master after 15 or 20 years of study is able to offer him a slight souvenir of his gratitude. The *Guru* makes the novice study the Vedas constantly, and the young man must pray night and morning every day, and read the sacred books with the explanations which complement and interpret them. The *brahmachari* or novice must also daily, without exception, witness the rising and the setting of the sun, and while he imbibes respect for the sacred writing and for his teacher, he learns to bridle his senses and his youthful passions (book II., verses 220, 245). All his acts are determined in the minutest details, from which he can not depart without sin.—The novitiate, no matter how painful it may be, is at least of 9 years duration, and may extend to 18 or even 36; in a word, as long as necessary, depending on the student's intelligence for the understanding of the Vedas and everything connected with them (book III., verse 1). When the novitiate is finished, the *brahmachari* may become father of a family and head of a house, *Grihastha*, and this is the second period in the life of the Brahman. He is obliged to marry and choose a woman of his own caste for his first marriage. For subsequent unions, in case such should take place, the law is less exacting and the wife may be chosen from the other castes, although this is a degradation more or less censurable (book III., verse 12). The law prescribes carefully the means which the *Grihastha* should use for his own support

and that of his family. He can never descend to degrading labor; even the cultivation of the earth is forbidden him. It is from alms especially that he is obliged to live, and this is how the law proposes the holy practice of almsgiving to the rich, (book IV., verse 226), by which they only return to the Brahmins the property belonging to the latter. The *Grihastha* should always devote the best part of his time to reading the Veda, to the numberless ceremonies of worship, to the sacrifices which they require, and all the prescriptions of the liturgy. He must abstain from meat (book V., verse 4), and all impurity which might defile him must be removed according to the rites. The second period in the life of a Brahman finishes when he is the father of a family and has brought it up. He may then, especially if he has a grandson, retire from the world and think only of himself, that is, of his eternal salvation. This is a new career begun, and which is divided into two parts. The *Grihastha*, withdrawn from society, and living in the forest (*Vanaprastha*), has not yet broken all his ties with the world. First of all, he may take with him his old wife, and preserve certain bonds of relationship with his neighbors. However, all his existence is ordered as is that of the novice. He has taken with him the consecrated fire, and all the utensils needful for religious oblation. Wearing the skin of a gazelle or a garment of bark, he must bathe night and morning (book VI., couplet 6); he must leave his hair long, gathered up on the top of his head, and let his beard grow, also the hair of his body and his nails. Occupied continually in reading the Veda, he is to live ordinarily on roots alone or wild fruits gathered by himself. And it is only in rare cases that he is still permitted to receive alms. He must remain as inflexibly chaste as the novice, endure without complaint the burning heat of summer and the driving rains of winter. The earth is his only couch, and if an incurable disease should attack him, "let him walk without stopping in the direction of the northeast till his body is dissolved, living only on air and water," (book VI., couplet 31).—To this third period, hard enough, succeeds a last, more rigorous still, if possible. He definitively takes up the ascetic life and renounces every species of affection. He becomes *Sannyâsi* (or yet a *Yati*, *Parivrajaka*); he has need no longer to read even the Veda, he must remain absolutely alone and without companions, (book VI., couplet 42); he has no longer a hearth or a home; when hunger torments him he goes to seek for food in the neighboring village; he purifies his steps by seeing to it that he does not tread on any impure object; he cleanses the water he drinks by filtering it lest he should kill any animalcule it might contain; he purifies his words by truth; inaccessible to his every surrounding, raised above every sensual desire, without any society but that of his soul, he has but one perpetual thought, that of the Supreme Soul (*Paramâtma*), the divine spirit with which he is to be united in eternal beatitude.—"Just

as the trunk of a tree leaves the river bank when the current bears it away, just as the bird at its caprice leaves the branch where it has perched, so the Sannyāsi, freed by degrees from every earthly affection and become insensible to all tribulation, leaves his body and is forever absorbed in Brahma," (book VI., couplets 78 and 81.)—Such are the four periods of a Brahman's life. We can understand how, with such a rigid discipline, an intelligent and superstitious race has been able to produce all that Indian genius has produced. Almost numberless generations of masters and disciples, of fathers of families, and hermits, have accumulated by degrees all those Brahmanic works which we know, and they have ended by building an indestructible edifice which may be indeed criticised in some of its parts, but which must in justice be admired in many others.—This is not the place to linger over Sanskrit literature, but it is nevertheless well to cast a rapid glance at the chief monuments of which it is composed and which are exclusively Brahmanic work. First of all, by right of religion and age, are the Vedas, four in number: the Rig-Veda; the Sama-Veda; the Yajur-Veda, in two texts known as the white and the black; and the Atharva-Veda, more recent than the other three. Although in the Vedas there is not anything but a system of naturalism, about the same as the paganism of Greece and Rome, the hymns are so beautiful and the religious sentiment in them so profound, that they may be ranked inferior only to the Bible. Around the Vedas is grouped a whole liturgical literature, presenting at times, moreover, admirable morsels of inspired semi-poetical metaphysics. The study of the Vedas has besides given birth to an immense exegetical literature, leading, on one hand, to grammatical studies in which the Hindoos, while learning no language but their own, have outstripped in philology all other people, and in which they will be without rivals for all time; leading, on the other, to systems of philosophy (*Darśanas*), six in number, some orthodox, the others independent and heretical. So much for sacred and serious literature. Next come the epic poems, of which the two principal, the Mahabharata, the receptacle of all the national traditions, is in more than 200,000 verses, and the Rāmāyana in 70,000. Then they have a dramatic literature entirely indigenous which dates from the first century of the Christian era. Lastly, there are their codes, written in verse, it is true, but put in this form so that all the laws of these people should be engraved on their memory. The Hindoo genius has had less success in the sciences, except that of grammar. Herein lies its weakness. It has not been able to write history, just as it has not been able to observe accurately a single fact in nature.—But in spite of these deficiencies, the Hindoo, or more correctly the Brahmanic genius, must take a very high rank in the annals of the human mind; and in many regards we may say with justice that it is second

only to the genius of Greece. The Semitic race to which we owe in part our religion, is very great indeed. That must be admitted, but it must be acknowledged, also, that it is somewhat inferior to the Aryan; and on the banks of the Ganges intelligence was more amply developed than in the deserts of Palestine or Arabia. At present, when a great number of Hindoo productions are being printed and translated and commented, we must without doubt withdraw from them some of the excessive admiration which was felt for them when unknown, whether in antiquity, or in the eighteenth century: but while making a correct estimate of them, our esteem for them has hardly diminished. The object and the nature of our esteem is changed, but it has become at once more enlightened and more impartial.—The most undoubted discoveries of the learned of our time should also increase our curiosity and our sympathy for the Brahmans. It has been shown that they are of the same race as ourselves, not only from an ethnological point of view, which would be of no great account, but from a point of view the most intimate and direct. This Aryan people, who turned their steps from the high plains of Asia toward the northwest of India, between the sources of the Indus and the Ganges, had for a long time inhabited the same region as the ancestors of almost all the European peoples, and as our own, Greeks, Latins, Celts, Germans, Goths, Slavs, etc. The common birthplace of all these peoples is shown by the evident affinity of their languages. The Sanskrit is not the mother of all these idioms, as was once said, but it is their sister, and the Aryans, who went eastward to the Indian peninsula, belong to the same current of civilization which went westward through Persia, Asia Minor, and the centre and north of Europe. Thus the Brahmans are really our brothers: they are one with us, and yet as distinct as we from the other two currents of civilization which formed the Semitic world, and the world called Turanian which is made up of China, Tartary, Thibet, Turkey and some countries of Europe. We can say with just pride that the civilization to which we belong is the true one, and without belittling others, we may believe ourselves their superiors. The Aryans share our glory, and they are certainly one of the most distinguished branches of the great family. They are represented especially by the Brahmans, who are at once the religious and intellectual chiefs of the people whom they enlighten and govern. The military element found among them in the beginning, disappeared to make room for the spiritual. The *kshatriyas* subordinated themselves to the Brahmans; and these two orders which came from the north imposed themselves on the natives who were incapable of resistance and who have formed the two other castes, the *Vaiśyas* for the higher, and the *Sudras* for the lower classes, who already occupied the country. Little by little Brahmanic rule, starting from the higher Indus and the

sources of the Ganges, gradually spread through the peninsula and finally became prevalent, but in proportion as it penetrated southward, its influence became less marked, and there are in certain parts of southern Hindostan peoples which have escaped its yoke. These are the remnants of the most ancient inhabitants who may be called autochthones, while the Aryans were only strangers and conquerors.—However the case may have been, Brahmanism has reigned over these vast countries, not only by the right of the stronger, but by right of intellectual superiority. And the organization which it founded answered so well to the genius of these peoples that they have lived under it for 40 centuries, and nothing indicates their desire to reject it. India has been frequently conquered, but without changing at all since the Brahmans appropriated it. The invasion of Alexander only touched some western parts and touched them without leaving any traces beyond the establishment of kingdoms, half Greek, half Hindoo, which have lived down to our era. Later, the Mussulman conquest went much farther. It invaded whole provinces, and Islamism spread over a great part of the peninsula without making many proselytes there. After Islamism, the incursions of Tartar hordes created frightful disorder in Hindostan. The torrent only swept over it. It did not extend very far, and left nothing permanent in its track. Even the power of the Mongols who ruled almost the entire peninsula for a considerable length of time, and who had taken firm hold in the ancient home of the Aryans, brought little change, and Brahmanism was neither destroyed nor even greatly modified by them. After the sixteenth century new adversaries appeared. Europeans came into contact with the Hindoos. The conflicts of the French and English with them during the last century are well known. The English came out victors and masters of India, and to-day their government is at once more firmly seated, and more beneficial than it has ever been. The authority of the crown of England has replaced that of the East India company, an inestimable advantage to colonization. During the last century, the English have done wonders in Hindostan, but their task is an immense one, and it is an enterprise worthy of a great Christian people to civilize 200,000,000 of subjects. Will England, energetic and powerful as she is, succeed? Only the future can answer this question.—As to Brahmanism, it is sure that it never has had to fear a graver crisis than that which Christianity is preparing for it, both under the form of a religious faith and a better civilization. Brahmanism is perhaps able to stand this trial. On its side are tradition, and an immemorial antiquity. It has also popular superstition; and as Christianity is at heart very tolerant, especially in the Anglo-Saxon race, there is little probability that simple preaching can ever make great progress and effect a general conversion of the Hindoos. The most serious danger that Brahmanism

ever met, was the Buddhistic reformation, because it was so like the faith it sought to replace. Where Buddhism has failed, it is not likely that Christianity, with all its worth, will succeed. The English individually have an enormous proselyting zeal; but as to the government it is very reserved on these delicate questions; and save certain barbarous customs, which to its honor it has eradicated, as the sacrifice of widows by burning themselves on the dead bodies of their husbands, it wisely abstains from all interference in the national worship, leaving to each one full liberty of faith and religious observance. This is perhaps the surest method of propagandism. The use of force, besides being odious on the part of a Christian people, would be fruitless. It would revive instead of destroying the national faith. It was religious scruples that served as pretexts to the military insurrection which desolated the north of Hindostan in 1857 and 1858.—If it be permitted us to cast a glance into the dim future, it must be supposed that Brahmanism, no matter how degraded it be to-day, has not much to fear from Christianity. The two religions will live in peace without the better absorbing the other. This will be a new phase in the history of Brahmanism, and that is all. It will not be its ruin. In the meanwhile there is much work to be done, to learn it thoroughly, and European philology, which, since the opening of the nineteenth century, has made so many discoveries regarding India and its religions, has before it still a vast field which is far from having been exhausted.—BIBLIOGRAPHY: Colebrooke, *Essays on the Religion and Philosophy of the Hindoos*, 2nd ed., London, 1858; Moore, *Hindu Pantheon*, London, 1810, new edition by Simpson, Madras, 1864; Coleman, *Mythology of the Hindus*, London, 1832; Muir, *Original Sanskrit Texts*, etc., London, 2nd ed., 1873; and the works of Lassen, Benfey, Roth, Max Müller, Weber, Kuhn, Spiegel, de Gubernatis, etc.—(See BUDDHISM, LAMAISM.)

BARTHÉLEMY SAINT-HILAIRE.

BRAZIL. This South American empire is of yesterday. Formerly a Portuguese colony Brazil has had an independent existence only since Sept. 7, 1821. Its constitution dates from March 25, 1824.—Brazil, discovered in 1500 by Pedro Alvares Cabral, belonged continuously to the crown of Portugal until the Brazilians, with the spontaneous concurrence of the regent Dom Pedro, the immediate heir of the house of Braganza, proclaimed and won their independence, which was subsequently ratified by a treaty concluded with Portugal. Since that treaty, dated Aug. 29, 1825, a separation has been effected *de facto* and *de jure*, and the new American monarchy has been recognized by all the powers, with its chief Dom Pedro I. as *constitutional emperor and perpetual protector of Brazil*.—The entire surface of Brazil is estimated at 3,275,326 English square miles. Brazil is watered by numerous rivers. Nearly all of these are navigable or capa-

ble of being made so. The principal one is the Amazon. Owing to these rivers which fertilize the soil and bear its products to the sea, to the vast extent of its coasts and to its splendid harbors, Brazil's relations with the civilized world are destined to increase and grow in importance from day to day.—The resources of the country are as rich and abundant as they are varied. It has magnificent forests which will furnish for centuries the rarest and most exquisite wood for dyeing purposes, for cabinet makers' work, building, and for all the uses of industry, and of the arts and sciences. It is also extremely rich in agricultural products. Coffee, sugar, cocoa, cotton, and tobacco, are produced in abundance in this favored land, the population of which, still unfortunately too sparse, receives with eagerness the fruits of the genius of Europe as well as the agricultural products of its temperate zone.—All that Brazil wants is a population more nearly in proportion to its extent, and that would furnish to agriculture the hands it needs, and to foreign commerce buyers to increase its exports; that is to say, it needs producers and consumers. This immense territory, which could easily maintain 200,000,000 people, has a population of only 9,448,233 (1872).—This population concentrated in the large cities of the coast, is divided among 20 provinces, only 4 of which do not border directly upon the Atlantic ocean.—These 4 provinces of the interior are: Amazon, Matto-Grosso, Goyas, and Minas-Geraes. This last province is the most populous of the empire. It contains 1,500,000 inhabitants. Gold and diamond mining has attracted thither and kept there for a long time a considerable number of workmen. The other 3 central provinces, almost entirely covered with virgin forests, contain altogether, according to the census of 1872, 280,000 inhabitants.—The maritime provinces, in their order from north to south on the map, are: Para, Maranhão, Piauí, Rio Grande do Norte, Ceará, Paraíba, Pernambuco, Bahia, Sergipe, Alagoas, Espírito-Santo, Rio Janeiro, São Paulo, Paraná, Santa-Catharina, Rio Grande do Sul.—Four of these provinces alone contain nearly one-half the population of Brazil. They are: Rio Janeiro, 1,050,009; Bahia, 1,450,000; Pernambuco, 841,000; São Paulo, 837,354. The capitals of the first 3 principal provinces are the 3 great seaports of Brazil, where the population is very dense. Rio Janeiro, the capital, had a population of 274,972 in 1872. The province of São Paulo also has its port, Santos, which has a rapid growth; but the population increases faster in this province, principally on account of its magnificent coffee plantations, where experiments of free labor have been tried with doubtful success at first, but which it appears must result favorably.—Three races contribute to the population of Brazil, in unequal proportions. The white race, mainly made up of natives of Portuguese origin, constitute a majority of the inhabitants. The black race, of African origin, was composed in 1872 of free-

men and slaves. The number of the latter was not given by any official returns. It was placed at one-fourth of the population. A law of 1871 has opened the way for emancipation of the slaves, and after a time all the blacks will be free.—The red race, indigenous to the soil, has a very small place in the total of the population. The Indians are either *domesticated* or *savage*. The first, converted with great difficulty by the missionaries, inhabit small villages (*aldeias*) where they perform rude labor very unwillingly, ready as they are at the slightest pretext to go back to forest life. Others, in greater numbers, lead a savage life. Save with rare exceptions, there is no progress observable among these tribes. Thus, in South as well as in North America, the red race is on the road to extinction.—The mixture of these three races has produced in Brazil an infinite variety of colors and all the shades of complexion which arise from the mingling of blood in every degree. Even the yellow race is not wanting there, since certain attempts at Chinese colonization have been made. But another element, which has also come from abroad, is of more value to the physical and mental improvement of the population: we mean the European element. Not all Europeans who settle in Brazil intend to become Brazilians. Many desire to return, and preserve their nationality with care. These last live in the cities, are occupied in wholesale and retail trade, and in manufacturing. They contribute to the prosperity of the empire by their capital, their spirit of enterprise or their industrial power. The beauty of the climate, the cheapness of living, the connections and relations which a long residence creates, often cause them to forget their native country which is replaced in their affections by their adopted one.—But without taking these numerous exceptions into account, there is in Brazil at present, a considerable number of Europeans who have come to seek in the new world, in return for their labor, the prosperity which the old world did not give them. These immigrations, made without thought of leaving the country again, have assumed considerable proportions. The principal current between Brazil and Europe is that which starts from Portugal. This ancient country, while losing its dominion over Brazil, has preserved its relations and affinities with it. Thus the Portuguese in Brazil are numerous; in the cities of the coast they are artisans, and the retail business is partly in their hands—a fact which rouses somewhat violent jealousies in the Brazilian people, which from time to time give rise to disturbances, quelled only with some difficulty by the police. In these times of crisis, it is the recollection of the old tyranny of the mother country which causes the populace to assail these unfortunate people, whose only fault is that they bring more activity and intelligence than the natives do to the lower walks of commercial life and industry.—It is not in the cities alone that the Portuguese settle; and Brazil is indebted to them for an exceptional class

of colonists. The north of the empire, that is to say, the portion nearest the equator, is uninhabitable for nearly all Europeans, on account of the prevailing heat. The Portuguese alone, especially the Portuguese of the Azores, are able to endure this torrid climate, and the few attempts at colonization which have succeeded in the equatorial provinces have had the Portuguese element as a basis. Where enterprises of this kind have failed, notably on the banks of the Amazon, the failure has come, not from the heat of the sun, which the native of the Azores endures to a marvel, but from the insalubrity of the climate and the pestiferous evaporations of the soil covered with slime and marshes.—The colonists of German and Swiss origin form, after the Portuguese, the most considerable element of European immigration. It is in the south of the empire, in comparatively temperate latitudes, from the south tropical border to 33° of south latitude, that German colonization has met with the greatest success. In the province of Rio Grande do Sul there is a whole city, of 10,000 souls, peopled almost entirely by Germans, who are very prosperous. Its success is so complete that at the present time, without any effort on the part of the government, but by the sole instigation of the colonists, who have maintained their relations with the mother country, a stream of emigration is kept up between this province and Germany, so that land is becoming scarce in Rio Grande for new colonists who come of their own accord to acquire it. The province of Saint Catherine, until recently almost covered with forests, is beginning to be inhabited by Germans, thanks to the initiative of the prince de Joinville, who has prepared and opened to colonization the immense domains given as dowry to his wife, the sister of the emperor Dom Pedro II. This enterprise seems on the road to success. Other colonies are springing up by the side of Dona Francisca. The government is constructing ways of communication which will afford an outlet to the products of these virgin lands.—In the neighboring province of São Paulo, the Swiss element predominates in the work of colonization. At all times the intelligent and industrious population of this province has cultivated coffee on a large scale. Certain very rich and enlightened landholders have had the idea of introducing free labor in the cultivation of their plantations. They have brought in Swiss colonists by making arrangements with them, based on the system of shares, in use in the south of Europe. The attempts did not succeed completely at first; it is evident that the system of working on shares is not the final form of colonization in Brazil, and that in order to attract European immigration it is necessary to offer it the inducement of ownership.—To these three classes of emigrants must be added a small number of Belgians and Italians. The French are barely numerous enough to be mentioned among the colonists. Except in a few cantons of the

Pyrenees, where the stream of emigration is turned toward the La Plata, the French people do not abandon their homes, and if they do emigrate it is to cities and with the intent of returning.—*Constitution.* The fundamental law of Brazil did not originate with a constituent assembly. In proclaiming its independence, the Brazilian nation proclaimed monarchy as its form of government, and as its monarch Dom Pedro I., eldest son and legitimate heir of the head of the house of Braganza, Dom João VI., king of Portugal. It was now necessary to draw up a constitution.—This was the time when the old and new world were in a ferment; when the first attempts of Italian liberty had failed; when Spain and Portugal given up to adventure were still debating in sovereign assemblies over the most arduous problems of the government of empires. Common sense was rarely present at these deliberations.—In Brazil the difficulties peculiar to the country still increased the dangers arising from the general situation. On a single point the immense majority of the nation had taken an irrevocable decision. They had determined to crush the monopoly of the mother country, to separate themselves for ever from Portugal, and to govern themselves by the chief whom they had chosen. But the mother country did not consent to yield its rich colonial prey without a struggle. War broke out on land and sea between Brazil and Portugal. Besides, an entire army of officials lived in the empire, regretting the past which had honored and enriched them, and little disposed to open the way to new ideas which for them meant new men in their stead. These champions of a fallen régime, through the position which they occupied and their personal weight, were not without influence.—It is under these circumstances, and with these elements to deal with, that the emperor Dom Pedro I. was called to give a constitution to Brazil. He set about the task without delay. A short time after the proclamation of independence a constituent assembly was convoked at Rio Janeiro.—It soon became evident that this attempt, honestly undertaken, could have no useful result. To begin with, the assembly adopted all the methods of demagogues; the whole country was given over to a feverish agitation, and the emperor having tried in vain to restore quiet by changing his ministry, decided on a *coup d'état*. He had the house of representatives surrounded by troops, the doors closed, and announced by a proclamation to the Brazilian people, that the assembly was dissolved and that another chamber, to be called later, would deliberate on the plan of a constitution which the emperor would lay before them, and which would give the surest guarantees for the liberties of the nation.—This engagement was only half carried out. There was not a new constituent assembly, but the emperor granted a constitution which was submitted for approval to the nation, which was accepted unanimously by the municipalities, and which,

on the demand of the elective bodies, was promulgated March 24, 1824, as the supreme law of the empire. The method, indeed, was not regular; but Brazil was so steeped in anarchy that the act was accepted with thankful enthusiasm, and no protest came after the event, not even when the chiefs of the dissolved assembly came later into power.—It must not be forgotten here that the works of Benjamin Constant were consulted by Dom Pedro I. in drawing up the constitution, and that the machinery put in movement by that constitution, and the original points which it contains, were thought out by the fertile and ingenious brain of that man, who, by reason of his habits of opposition, one could not have believed endowed with common sense to such a degree. Better inspired than Rousseau, who, ruled by socialistic instinct, offered the people only impossible constitutions, Benjamin Constant, enlightened by experience and by his fertile intelligence, applied himself to the solution of problems raised up by practice, and there he succeeded. By adopting the ideas of the old French parliamentarian, by adapting his plan to the genius of the Brazilian nation, Dom Pedro I. performed an act of sovereign good sense, and immortalized his reign.—We have not to speak here of the numerous points in which the Brazilian constitution resembles all other constitutions past and present. The important thing is to note the points in which it differs from them, and what are the original points which it presents. Brazil is a monarchical state. To the title of constitutional emperor, the head of the state adds that of *perpetual protector of Brazil*, an appellation connected with the historical position of the time when the struggle with Portugal was still unfinished and which imposed upon the emperor, the heir of the house of Braganza, the irrevocable duty of maintaining the separation between the two countries. Essentially a Catholic nation, Brazil has a state religion, and, as in certain European monarchies, the rules of the council of Trent regulate the civil status of the citizens. But the necessities of colonization have in this respect brought about a reform, in so far as civil marriage is concerned, which must in time be completed. Constitutions generally admit but three powers: the legislative, the executive and the judicial. The constitution of Brazil recognizes a fourth: the moderating power, which is assigned exclusively to the chief of the state. It defines in these terms (article 98) the function of this power: "The moderating power is the keystone of the whole political edifice; it is delegated exclusively to the emperor, as supreme chief of the nation and its first representative, in order that he should watch incessantly over the upholding of its independence, and the equilibrium and harmony of the other powers."—This power is exercised without the aid of ministers and under the following circumstances, enumerated in article 101: nomination of senators according to form prescribed by the constitution; convocation extraordinary of

the general assembly; sanction of the decrees of the same assembly; approval or suspension of the resolutions of the provincial chambers; prorogation or adjournment of the general assembly; dissolution of the chamber of deputies; nomination or dismissal of ministers; suspension of magistrates in cases provided for by the constitution; exercise of the right of pardon or mitigation of punishment; exercise of the right of amnesty.—These attributes of the moderating power, if examined closely, are connected with the exercise of the very prerogatives of the monarch whom they free from all ministerial pressure. When, for example, the chief of the state wishes to change his ministry he should be free to do it without obtaining the signature of the members whom he dismisses. All these acts, by which he exercises the moderating power, have the same character, and the innovation noted in the constitution of Brazil seems intended to put in practice the celebrated maxim: *The king reigns but does not govern*.—But the moderating power, although outside of ministerial action, is not exercised without control. The council of state, established by the fundamental pact, is called upon to give its advice in every case in which the emperor undertakes to exercise any of the prerogatives peculiar to the moderating power, and the constitution declares the members of the council of state responsible for the advice which they give. Parallel with this responsibility is the guarantee of permanence in office, or irremovability granted to these high functionaries.—This institution is held to be the highest in Brazil. In the Imperial Almanac, the council of state takes rank before the senate and the chamber of deputies. This pre-eminence, accorded it by public opinion, is based upon the importance of the services which the council is called upon to render, and upon the personal significance of the members who compose it.—The legislative power is exercised in Brazil by the emperor and the general assembly: what is called the *general assembly* is composed of the senate and the chamber of deputies, which contribute almost always separately, but in rare cases in common, to the passing of laws. Both chambers are chosen by a popular election. The deputies are chosen directly by the country, according to a system of election of two degrees. The same method is applied in the election of senators, but popular action is restricted to designating to the emperor for each vacant senatorial place three candidates from among whom the emperor makes a choice. Senators are appointed for life, but the chamber of deputies is removed every 4 years. To be senator a person must be 40 years of age and have an income of 2,400 francs. To be elected deputy a person must be 25 years of age and have a revenue of 1,200 francs. The ordinary session begins, according to the constitutional provisions, on the 3rd of May of each year, and lasts 4 months. Unfinished work is carried over from one session to another during the 4 years' interval between the meetings of the legislature.

—Deputies and senators receive a salary. In case of the deputies this salary is fixed during the last year of each legislature for the following legislative term. The salary of the senators is one and a half as great as that of the deputies.—The right of initiative belongs to the emperor and the two chambers. The chamber of deputies has the exclusive initiative in questions of taxation and recruiting for the army. It also must pass upon the choice of a new dynasty in case of the extinction of the reigning one, as well as upon proposals by the executive power.—As in all constitutions implying a responsibility of political agents, it is the chamber of deputies in Brazil which decides whether ministers and counselors of state are to be impeached or not; and it is the senate which, performing the functions of a high court of justice, passes upon these accusations and certain others of an exceptional character.—Such, in short, are the attributes of the Brazilian chambers. As to the forms of procedure, we may mention, in passing, the application of the English system which is very happily made in Brazil, and which consists in obliging the orator to address his speech to the president of the assembly. This rule, which lightens the effects of attacks and personal recriminations by turning them aside, maintains habits of calm and *decorum* during debates which are sometimes violent. Besides this parliamentary detail there are two points to be noted as giving an imprint of originality to the Brazilian constitution: in case of conflict between the two chambers, if one adopts and the other rejects a proposed law, the constitution has created a very simple procedure to terminate the difference. It authorizes the two chambers to form themselves into one, and to decide the question according to the majority of votes. The other point is: Who shall have the last word in case of disagreement, the monarch or the chambers? The publicists of Europe have long debated the question. The constitution of Brazil has solved it in favor of parliament. The refusal to sanction a law is only a retarding power; but in order that a proposition emanating from the chamber should have the full force of law, it is necessary that it should have been adopted by three successive legislatures, that is to say, by three votes of three different assemblies, at an interval of four years between two of these votes at least.—The organization and working of the elective body has just been mentioned. It now remains to indicate, in a few words, what the institutions are which protect the provincial and municipal interests of the empire. Since 1834 there are provincial *assemblies* in Brazil, which have legislative authority in all matters concerning finance and administration in the provinces. Decentralization exists in Brazil in the broadest sense of the term. Each province uses its resources as it likes. The central government, represented by the chief of the administration, who bears the title of president of the province, has only a very limited power in matters of provincial interest, and although there is a method of reform-

ing the decrees of provincial assemblies, recourse is scarcely ever had to it.—It is needless to say that in a country where provincial institutions enjoy a liberty so complete, under the shadow of the elective principle, municipal liberty, which comes nearest to individual liberty, is fully respected. The cities govern themselves through administrators of their own choice under the control of elected assemblies.—There are two degrees of electors in Brazil, parish voters and provincial voters.—Every Brazilian citizen, native or naturalized, is a voter, provided he is 25 years old. The only exceptions to this rule are paid laborers, cloistered monks, and persons who have not an income of 300 francs, no matter from what source, even the product of daily manual labor.—The first degree of electoral right is thus constituted. Voters of the first degree, or of the parish, have but one thing to do: they name the provincial voters who form the second electoral degree; the latter choose incumbents for all elective offices. Every Brazilian citizen may be chosen provincial elector provided he has a revenue of 600 francs.—On periodical occasions, determined by law, the whole electoral machinery is put in motion in the empire. Parish voters choose the provincial voters, these in their turn choose men to every elective office, from justice of the peace, who is elected, to the deputy in the general assembly.—The election of deputies to the assembly was made, up to 1836, by voting for the representatives of a whole province on a single ticket.—At this date the system of electing deputies was modified by law. Election by districts and individually was substituted for collective elections and by provinces. Another law, passed in 1860, has in a certain way established a middle system between the old and the new, by suppressing a certain number of electoral districts having but a small number of provincial voters, and establishing, in such cases, collective election.—To complete this general description of the constitution of Brazil, it remains to mention the *declaration of rights*, contained therein. The last article of this constitution (179) enumerates in 35 paragraphs, all the guarantees which in Brazil protect the man and the citizen.—*Finances*. The increase of public receipts is the surest sign of the prosperity of states, provided this increase does not result from an increase of old taxes or the creation of new ones. Now the government of Brazil for the past 30 years has been decreasing the public burdens. Its budget of receipts has increased each year in considerable proportions. We have the table of these receipts from July 1, 1844, to June 30, 1861, and, in the space of these 17 years, the receipts increased by an almost continuous movement upward from 74,000,000, in round numbers, to 157,000,000. In 17 years the public revenue has more than doubled, and the mean annual increase has been about 5,000,000 francs.—Expenses have naturally increased in proportion to the growth of the receipts; but the years 1867, 1868, 1869 were exceptional on account of the war with

Paraguay. Then the expenses were 306, 426 and 392 millions. The year 1870 brought a normal budget, and the amount of expenses scarcely reached 177,000,000 francs.—A rapid glance at the budget of expenses for 1870 gives an idea of the burdens which the government is called to bear. The ministry of the empire (interior) expends about 14,000,000 francs. In this sum is included the allowance to the emperor, 2,400,000 francs; the allowance to the empress, 288,000 francs; the salaries of the counselors of state, senators, deputies and presidents of provinces; expenses of schools of law and medicine, of the school of fine arts, of the sanitary establishments, etc. Expenses of religion at the charge of the state, belong to the budget of the interior, and amount to about 2,500,000 francs.—The budget of the minister of justice amounts to a little less than 10,000,000 francs. Justice is dispensed in Brazil by a supreme court; four courts of appeal, sitting at Rio Janeiro, Bahia, Maranhao and at Pernambuco; and by judges of courts of first resort, distributed throughout the extent of the empire. The police and the national guard are connected with the ministry of justice. The allowance of the ministry of foreign affairs does not exceed 2,500,000 francs. It is almost entirely devoted to the salaries of diplomatic and consular agents.—The ministry of marine takes from the general budget a sum of about 21,000,000 francs. The Brazilian navy has developed considerably during the last decade. The budget of the ministry of war is about 33,000,000 francs. The chief expenses of this department are for the army 17,000,000 and for arsenals more than 5,000,000 francs. The ministry of finance expends annually more than 70,000,000 francs. This department has charge of the public debt, both home and foreign, which alone consumes a good part of the sum.—The ministry of agriculture, commerce, and of public works uses about 30,000,000 francs. It is with this department that the expenses made in view of progress are connected, those which have the future in view and which should be considered as reproductive. In this class of expenses, the first place should be given to the interest guaranteed to railroads, the grant made for the development of colonization amounting to 2,000,000 francs, and the subsidy of nearly 7,000,000 francs given to various companies which serve the vast coast of the empire and the immense river Amazon with steam navigation. Postal communication forms a comparatively recent part of this ministry.—To meet these expenses the budget for 1870 placed the receipts at about 194,000,000 francs. The principal receipts are the import duties, about 100,000,000 francs; the export duties nearly 35,000,000 francs; receipts for railroads 7,000,000 francs; post-office, 1,200,000 francs; stamp duties, 13,500,000 francs; patents, 3,000,000 francs; land tax, 3,500,000 francs; lottery, nearly 4,000,000 francs; court fees, 1,500,000 francs; beside receipts extraordinary to a considerable amount.—The amount of the debt was 1,453,000,000 milreis, in 1870, of which

113,600,000 milreis, or 283,000,000 francs, were a foreign debt, and 240,000,000 milreis, or 600,000,000 francs, home debt, at 4, 5 and 6 per cent.; 150,000,000 milreis, or 375,000,000 francs, in paper money; and 54,000,000 milreis, 135,000,000 francs, in treasury bonds. The interest on the public debt amounted, in 1872, to 15,900,000 milreis, that is, 38,750,000 francs. In 1860 the foreign debt was 125,000,000 francs, and the consolidated debt 145,000,000.—*Defensive Power.* The army of Brazil is composed of 25,000 men, and the navy has 76 vessels of all sizes, carrying, altogether, 290 cannons.—*Products.* We can understand that it has not yet been possible to draw up the industrial and agricultural statistics of so large a country; only the figures of its commerce are known which in 1868 amounted to 460,000,000 francs exports, and 350,000,000 imports; in 1869, to 500,000,000 and 410,000,000 francs, respectively. The export of coffee amounts to 150,000,000 francs; of cotton, to nearly 75,000,000; of sugar, to 50,000,000; of skins, to 18,000,000; of tobacco, to 8,000,000; of diamonds, to 7,000,000; of india rubber, to 5,000,000; of cocoa, to 3,000,000.—Let us add, in conclusion, that the length of railroads was 651 kilometres in 1870, and that of telegraphs was estimated at 1,500 kilometres.¹—*BIBLIOGRAPHY.* *Brazilien Land und Leute*, by A. BRECKENRIDGE, John Cabell, vice-president of the United States 1857–61, was born Jan. 21, 1825, at Lexington, Ky., where he died May 17, 1875. In 1860 he was nominated for the presidency by the slavery-extension wing of the democratic party (see DEMOCRATIC-REPUBLICAN PARTY), and was defeated; but in the same year was elected United States senator, his term expiring in 1866. He took considerable part in the extra session of 1861 (see REBELLION), then went south and became a major general in the confederate army. He was expelled from the senate by vote in December, 1861. As his state had shown no intention to secede, his action in taking service

¹ The following figures are taken from the Statesman's Year Book, 1881: In the budget for the financial year 1879–80, the revenue of Brazil was set down at 117,273,800 milreis, and the expenditure at 116,675,690 milreis.—In April, 1879, the total national debt, home and foreign, amounted to 786,116,837 milreis. In the same year the internal debt amounted to 565,000,000 milreis.—There were actually under arms, according to official reports, at the end of the year 1878, 16,000 troops. But the nominal strength of the standing army is fixed at 20,000 on the peace footing. At the end of June, 1879, the navy consisted of 57 steamers.—The area of the empire is estimated at 8,515,848 geographical square kilometres, or 3,275,326 English square miles, with a population, in 1872, of 9,448,233, besides 1,000,000 aborigines.

under a foreign and hostile government was remarkable from any point of view of the relations between state and federal governments. After the rebellion he practiced law in his native place until his death. A. J.

BROAD SEAL WAR. The (IN U. S. HISTORY). I. Until 1846 all the six members of the house of representatives were chosen in New Jersey, by general ticket, by the people of the whole state. At the election in 1838, (Oct. 9-10), the democratic candidates received an average majority, on the face of the returns, of about 100 votes in a poll of nearly 57,000. In one township (South Amboy) of Middlesex county, giving 252 democratic majority, the return had no certificate of the election of one of the inspectors, and was not signed by the election clerk; the county clerk therefore struck the whole return out, thus giving the whig candidates a majority in the state. The democrats claimed that exactly similar defects had been passed without question in whig counties, and that in any such case the laws required the state canvassing board, the governor and council, to send by express for the missing returns and decide upon their validity; this the board refused to do, decided that they were bound by the clerk's decision, and gave the whig candidates certificates of election, under the broad seal of the state. A case similar in most respects occurred in Millville township, Cumberland county; and the whigs claimed to have discovered a number of illegal votes cast in democratic townships. But the Millville democratic majority was under 100, and so was not vital, and the alleged fraudulent votes were not brought before the board and did not influence its decision. The South Amboy case, and the county clerk's power to finally decide it, were therefore the pivotal points of the controversy.—II. When congress met, Dec. 2, 1839, the house contained 119 democrats and 118 whigs outside of New Jersey, whose seats were claimed by both parties. The clerk of the house, H. A. Garland, of Virginia, offset the action of the Middlesex county clerk, by refusing, when the roll call reached New Jersey, to call the names of five of the whig delegation, on the ground that their seats were disputed, a fact of which he could have had no official knowledge. His decision made the house for the next three days a bedlam, each party struggling to force in its New Jersey delegation, in order to control the house and the election of speaker. Dec. 5, the house spasmodically chose John Quincy Adams, a neutral (see ADAMS, J. Q.) speaker *pro tempore*. An angry, confused and disorderly debate, and unsuccessful attempts to choose a permanent speaker, followed, both New Jersey delegations voting on many questions. Dec. 11, the right of either delegation to vote was denied by a small majority, and Dec. 17, the house at last chose as speaker R. M. T. Hunter, of Virginia, a whig, but in favor of the sub-treasury, and therefore (see INDEPENDENT TREAS-

URY) more acceptable to the democrats. March 10, 1840, by a vote of 111 to 81, the democratic contestants were seated, and July 16, the majority report of the committee on their case, declaring them duly elected, was adopted by a vote of 102 to 22. Owing to the length of the report and testimony, and lack of time to examine them, most of the whigs refused to vote.—The controversy is mainly interesting because of the reversal of parties upon it. The loose constructionist whigs, in this case, held the action of a state government binding, even in a congressional election, until reversed by the house; the strict constructionist democrats, on the other hand, treated the action of a state government, in this case, as a nullity. In this respect the broad seal war is illustrative of the disputed election of 1876. (See DISPUTED ELECTIONS, IV.; CONSTRUCTION, III.)—See 2 von Holst's *United States*, 337; 10 Adams' *Memoir of John Quincy Adams*, 176, 236; 2 Benton's *Thirty Years' View*, 159; *Democratic Review*, June, 1839. 16 Benton's *Debates of Congress* practically ignores the whole affair.

ALEXANDER JOHNSTON.

BROKERS, persons employed as middlemen to transact business or negotiate bargains between different merchants or individuals. They are sometimes licensed by public authority, and sometimes not.—Brokers are divided into different classes; as bill or exchange brokers, stock-brokers, ship and insurance brokers, pawnbrokers, and brokers simply so called, or those who sell or appraise household furniture distrained for rent. Exclusive, too, of the classes now mentioned, the brokers who negotiate sales of produce between different merchants usually confine themselves to some one department or line of business; and by attending to it exclusively they acquire a more intimate knowledge of its various details, and of the credit of those engaged in it, than could be looked for on the part of a general merchant, and are consequently able, for the most part, to buy on cheaper and to sell on dearer terms than those less familiar with the business. It is to these circumstances—to a sense of the advantages to be derived from using their intervention in the transaction of business—that the extensive employment of brokers in London and all other large commercial cities is wholly to be ascribed.—In France the brokers who deal in money, exchange, merchandise, insurance, and stock, are called *agents de change*, and their number at Paris is limited to 60. The company of *agents de change* is directed by a chamber of syndics chosen annually by the company. They are severally obliged to give bonds to the amount of 125,000 francs for the prevention of abuses. They are also obliged to keep books; are restricted to a charge of from $\frac{1}{4}$ to $\frac{1}{2}$ per cent.; and are interdicted from carrying on, or having any interest in, any commercial or banking operations. In the United States brokers are not licensed nor do they give bonds.

J. R. M'C.

BROOKS, Preston, a representative from South Carolina in the 34th congress, and a nephew of senator Butler, of the same state. In a speech on the Kansas troubles senator Charles Sumner, of Massachusetts, had criticised senator Butler, and May 22, 1856, after the senate's adjournment, Brooks, backed by two other southern representatives, Keitt, of South Carolina, and Edmundson, of Virginia, entered the senate chamber, struck Sumner senseless to the floor with a heavy cane, and then beat him so cruelly that an absence of several years in Europe was necessary for his recovery. The house censured Brooks, who resigned, and was unanimously re-elected by his district. Massachusetts refused to choose another senator, and Sumner's empty chair was for several years her silent protest against Brooks' unpunished violence. (See authorities under SUMNER, CHARLES.) A. J.

BROWN, John, was born in Torrington, Conn., May 9, 1800, and was hanged at Charlestown, Va., Dec. 2, 1859. He had lived in Essex county, N. Y., in "John Brown's tract," until 1851, when he removed to Akron, Ohio, and in 1855, without his younger children but with his four older sons, settled in Kansas, where he soon became known as "John Brown, of Osawatomic," one of the foremost leaders in resisting Missouri border ruffian violence by force. He at last began the forcible liberation of Missouri slaves, and rewards were offered for his arrest by state and federal authorities. In January, 1859, he left Kansas for the east, to fulfill his life-long ambition of beginning a forcible, not a political, opposition to slavery by renewing the liberation of slaves on a far larger scale. In July, 1859, he settled near Harper's Ferry, Va., with some of his Kansas associates, and began preparations. Late on Sunday evening, Oct. 17, with 17 white and 5 colored men, he seized the United States arsenal at Harper's Ferry "by the authority of God Almighty," and spent the next 18 hours in freeing slaves, cutting telegraph wires, preparing defenses, and making white prisoners, of whom he secured nearly 50. His intention was to retreat at once, with his negro recruits, to the strongholds of the mountains, and keep up a guerrilla warfare, with the Alleghenies from Alabama to Maryland as his base, but he delayed until he was too late. By noon of Monday militia began to pour in, and before evening 1,500 soldiers, of all arms, had surrounded the armory engine house, which was Brown's last refuge. Early on Tuesday morning the United States marines, using a ladder as a battering ram, burst in the engine house door, and the Harper's Ferry insurrection was over. Eight of the insurgents had been killed, one was dying, and three had already been captured, two of them mortally wounded. The prisoners in the engine house were Brown, three other whites, and half a dozen negroes. John Brown's trial was fair, but his conviction was inevitable, and he was executed as above stated. Four of his associates,

Cook, Coppoc, Copeland, and Green (a negro), were hanged at Charlestown Dec. 16, and two others, Stevens and Hazlitt, on the 16th of the following March. His sons, Watson and Oliver, had been mortally wounded, and died during the conflicts at the armory. Owen Brown, Barclay Coppoc, Tidd, Merriam, and Anderson (a negro), escaped.—The political importance of the Harper's Ferry insurrection was twofold. In the north it forced the slavery question upon public attention, and put the abolitionists (as distinguished from the republicans) in an entirely new light. Opinions, in a democracy, are always more respectfully considered when their holders are ready to die in their assertion, and, though the north almost unanimously condemned the whole insurrection, John Brown's steadfast life and death, for most northern men, laid the foundation of a kindly reception of the emancipation proclamation only three years afterward. In the south the officeholders and slaveholders, who had hitherto found it a work of much difficulty to convince other southerners of the general wickedness of the north, had now a clear opening for the lever. An abolitionist rising had taken place, and the north, while condemning it, had failed to do so with the heat which was natural to southern men, whose homes, wives and babes were at stake in such a struggle. The charge of complicity in John Brown's undertaking was urged angrily and persistently against many persons and associations in the north who were identified with the abolition movement, and the desire for a separate commonwealth, separated by national lines from the abolitionists of the north, grew steadily stronger in the south until the election of 1860 offered a pretext for secession.—See 1 Greeley's *American Conflict*, 280; Redpath's *Life of John Brown*; Webb's *Life of John Brown*; *Report of Congressional Committee on Harper's Ferry Insurrection*; and later authorities under SECESSION.

ALEXANDER JOHNSTON.

BUCHANAN, James, president of the United States 1857–61, was born in Stony Batter, Franklin county, Pa., April 23, 1791, and died at Wheatland, Pa., June 1, 1868. He was graduated at Dickinson college in 1809, and was admitted to the bar in 1812. He began political life as a moderate federalist, joining the democratic party in 1826–7. He was in the house of representatives 1820–30, in the senate 1833–45, secretary of state 1845–9, and minister to Great Britain 1852–6. (See OSTEND MANIFESTO.) Through all this period of public service he had maintained the character of a cautious and safe politician, who had made no slips or mistakes, and who was devoted to the favorite northern policy of ignoring the slavery question and stifling discussion about it. He was therefore chosen president in 1856. (The leading events of his administration are given under DRED SCOTT CASE; KANSAS; BROWN, JOHN; SECESSION; DEMOCRATIC-REPUBLICAN PARTY.) At the close of his term, having succeeded in

keeping the peace until March 3, 1861, he retired to private life with the contempt of both sections, and devoted his leisure to the preparation of a defense of his administration. This book deserves the careful reading of any one who wishes to understand the history of the times, though public opinion in the north has become so fixed in attributing to Buchanan's cowardice and hesitation the disasters of 1860-61 that no defense of his administration will find any general attention for many years to come. His defense is, in brief, that both sectional parties, the republicans and the Breckenridge democracy, were determined on war, and were not to be balked either by the president or by the Douglas democracy; that, while congress was in session, the inception of measures to suppress rebellion belonged to congress and their execution to the president; that congress, through the whole session of 1860-61, persistently and willfully refused to strengthen the army or navy, to fill the treasury, or to provide in any way for the common defense; and that all the blame for the first successes of secession and the development of a southern confederacy should fall upon congress and not upon the president. In the latter part of this there is undoubtedly more force than is commonly conceded; had Buchanan attempted to use, in December, 1860, the war powers which Lincoln used in April, 1861, he would perhaps have been impeached by a coalition of the anti-republican elements of the house and removed by the senate, and Breckenridge would have become president. But the effort was worth the risk. In 1832-3, congress being then also in session, Jackson "took the responsibility;" in 1860-61, Buchanan made no sign, and his memory must take the responsibility.—See *Buchanan's Administration on the Eve of the Rebellion*; Horton's *Life of Buchanan*; 1 *Atlantic Monthly*, 745. ALEXANDER JOHNSTON.

BUCKSHOT WAR, The (IN U. S. HISTORY). In 1838 the control of the Pennsylvania house of representatives, on which depended the choice of a United States senator, turned upon the election in Philadelphia, Oct. 9. Here the democratic candidates for senators and representatives were elected by average majorities of about 350; but the democratic candidate for congress was defeated. Ascribing his defeat to whig frauds in the Northern Liberties district, he induced the ten democratic return judges to cast out the entire 5,000 votes of that polling place, and thus obtained a certificate of election. Hereupon the seven whig judges met separately and gave certificates not only to their party candidate for congress, but also to the whig candidates for the state legislature, though these had no claim to a majority with or without the Northern Liberties vote. The whig certificates, sent by rail, came first to the secretary of state, who was also chairman of the whig state committee. He at once accepted them as the true ones and issued an address to his party, calling on them, until inves-

tigation could be made, "to treat the election as if they had not been defeated, and abide the result." This was a signal for both parties to muster strong bodies of armed partisans at Harrisburg before the meeting of the legislature, "to see fair play."—The legislature met Dec. 4, 1838, in the presence of riotous crowds. In both houses the secretary of state banded in the whig returns from Philadelphia, ignoring those of their opponents. The whig senate was organized without great difficulty, but adjourned because of the mob. In the house two organizations were formed in the same room, one (whig) recognizing the secretary's returns, the other (democratic) recognizing the election judges' returns. As speaker the former chose Thomas S. Cunningham, and the latter William Hopkins. The Hopkins house remained in session after the adjournment of the Cunningham house, and, having thus got possession of the hall, guarded it securely and compelled their opponents to meet elsewhere.—The whig governor, Ritner, issued a proclamation during the day, declaring the capital to be in the hands of a lawless mob, and calling on the militia throughout the state to prepare for action. Dec. 5, he called on the commandant at Carlisle barracks, Capt. Sumner, for United States dragoons, but was refused. He then, Dec. 7, called on president Van Buren for troops to protect the state from domestic violence. (See *INSURRECTION*, II.) This request was also refused, Dec. 11, on the ground that the trouble arose from no opposition to the laws, but from a political contest for the organization of the house; and that it was indelicate and improper for the federal government to interfere for the support of either party. (See *KANSAS*.) In the meantime about 1,000 militia had been brought to Harrisburg, but, after a two weeks' stay, departed, as the mob violence had ceased, and the senate and the dual house were holding regular and quiet sessions.—The senate stood 22 whigs to 11 democrats; but, when the excitement fell, it was found that many whigs disapproved the secretary's assumption of power to decide disputed returns. The feeling spread, and Dec. 17 three Cunningham members took seats in the Hopkins house, thus giving that body a majority of all the representatives. On motion of a whig senator, Dec. 25, the senate recognized the Hopkins house, and this ended the "Buckshot War." The other Cunningham members, during the next three weeks, took seats in the Hopkins house, with the single exception of their leader, Thaddeus Stevens, who absented himself during the rest of the session. May 7, 1839, at an extra session, he presented himself to take the oath, but the democratic majority, to punish him for his part in the struggle and for his strong and repeated expressions of contempt for the Hopkins house, declared his seat vacant. At the consequent special election he was again chosen, and took his seat in June. The popular name for the whole conflict was given from a reported

threat of a whig member that the mob "should feel ball and buckshot before the day was over." The "Buckshot War" is interesting as throwing light upon the meaning of the term "domestic violence," and upon the power of the United States to protect the state governments therefrom. (See DORR REBELLION; INSURRECTION, II.)—See *Armor's Lives of the Governors of Pennsylvania* (under *Ritner*); *Harris' History of Lancaster County*, and *Political Conflict in America*; and authorities under PENNSYLVANIA.

ALEXANDER JOHNSTON.

BUCKTAILS (IN U. S. HISTORY). A part of the insignia of the Tammany society in New York city was a buck's tail worn in the hat instead of a feather; hence "Bucktails" became a common name for the members of the society. The bill which committed the state of New York to Clinton's canal building policy was passed April 15, 1817, and the members most furiously opposed to it were the bucktail members from New York city. The name "Bucktail" then became for some years a common name for the opponents of the canal system throughout the state. Under Martin Van Buren the bucktails gained control of the state, and in 1824 Clinton was summarily ejected from his office of canal commissioner. At the election of 1824 Clinton was chosen governor by a popular majority of over 16,000, and again in 1826. After Clinton's death, in 1828, the bucktails became the democratic party of New York under the lead of the Albany Regency. (See NEW YORK.)—See 1 Hammond's *Political History of New York*, from page 450.

A. J.

BUDDHISM is a religion which to-day has more adherents than any other on the face of the earth. Professed in China and Japan, in the islands of Ceylon and Java, in Cochin China and Laos, in Burmah and Pegu, in Nepaul and Thibet, in Kashmire, in Mongolia and Tartary, it has at least three hundred millions of adherents; and although in these countries, so remote from each other, it has assumed different forms, it has still preserved its individuality which neither time nor place has been able to modify in any essential degree. For this reason alone, Buddhism merits the greatest attention, since it holds so prominent a place in the religious history of mankind. What renders it besides no less worthy of interest is the fact that in reality it is a doctrine which seems to contradict in many regards the most natural instincts of the heart and mind. But it possesses the glory of having never been propagated by force and persecution, and of never having employed other than the mildest methods of persuasion to extend itself over so many peoples and lands. If we try to sound its special dogmas, an absolute ignorance of God is discovered, of whom Buddhism has never had the slightest notion, and a negation not less absolute of the immortality of the soul, which seeks eternal salva-

tion only in annihilation, an unshaken belief in metempsychosis or the transmigration of souls, and a complete system of nihilism as its sole philosophy. Considered under these aspects, Buddhism is one of the most curious and afflicting phenomena which can be examined. It is only within the last half century that Buddhism has become known in an authentic manner, and it was only after the discovery of its sacred books that it was possible to find out anything definite about it. Up to that time, the only sources of information regarding it was faith in the most obscure and least certain traditions. It was Mr. Brian Houghton Hodgson, an English resident at Kathmandu, the capital of Nepaul, who first made this splendid discovery and revealed it to the learned world. Intimate with Buddhist priests, he gained their confidence and soon learned that in the convents of the country Sanskrit books were preserved which were the foundation of the whole Buddhist religion. These books contained the discourses and biography of Buddha, the rules of discipline which he had imposed on his monks, and the metaphysics of the whole Buddhist doctrine. Mr. Hodgson procured copies of these books, which he gave to such learned societies as could make best use of them—the Asiatic societies at London and Paris, and the Asiatic society of Bengal at Calcutta. He repeated these generous gifts at various times, and the learned world was put in possession of 88 of the principal works which form the canon of the Buddhist scriptures. This took place in the interval between 1824 and 1834. Almost contemporary with Mr. Hodgson, a young Hungarian doctor, Cosma de Körös, entered Thibet and learned the language which no European before him knew, and was able to analyze two great collections of more than three hundred Thibetan volumes, faithful translations of the Sanskrit originals discovered by Mr. Hodgson. Mr. J. L. Schmidt, of St. Petersburg, established the fact, that the Thibetan translations of Buddhist Sanskrit books had in turn been translated into Mongolian, and that just as the Buddhist faith had passed with the books containing it from India to Nepaul and from Nepaul to Thibet, it passed from Thibet to Mongolia. At the other extremity of India, in the island of Ceylon, treasures no less precious were discovered. Mr. George Turnour, a civil employé like Mr. Hodgson, discovered a second rendering of the Buddhist scriptures in a dialect derived from, and very nearly allied to the Sanskrit, the Pali, which has become the sacred language of the Singhalese; and he published a Pali work, the *Mahavamsa*, containing the annals of Ceylon after it was converted to Buddhism. About 1868, M. Grimblot, consul of France at Colombo, brought home with him a complete collection of the Buddhist canon, in Pali, according to the southern text, and this collection deposited in the national library invites the labor and knowledge of our Hindoo scholars, who will find in it unexpected treasures. Sino-logues added the testimony of China to that al

ready collected from so many sides. China, like Tibet and Mongolia, had translated the Buddhist scriptures in the early centuries of the Christian era, and M. Abel Remusat published, in 1836, the travels of Fa-hien, one of those courageous missionaries who went from the celestial empire into India, to search for the sacred books and bring them home. Later it was reserved for M. Stanislas Julien to complete information of this kind by a translation of the Biography and Memoirs of Hiouen-Tsang, the most instructive and illustrious of the Chinese pilgrims. In the seventh century of our era he traveled, for 16 years, through all the Buddhist kingdoms of India and northern Asia. All these data on Buddhism were confirmed, 20 years ago, by the discovery of numerous inscriptions in every part of India, containing decrees of a Buddhist king Piyadasi or Asoka, who reigned in the third century before Christ (from 263 to 226).—Thus Indian inscriptions, Chinese translations and narratives of Chinese pilgrims, Pali texts, annals of Ceylon, Mongol and Tibetan translations, and especially the original Sanskrit, are the basis on which rests our knowledge of Buddhism to-day, to say nothing of a few less direct ideas which the Greeks have transmitted to us from the expedition of Alexander to the time of Clement of Alexandria. It is well to collect here all these details concerning the authenticity of Buddhism, so that there may be no doubt on such a subject; and as the doctrines of Buddhism are calculated to cause the most painful surprises, it is necessary that we should well understand that if they contain many errors, they no longer present any points of obscurity. They may be deplored, but it is clearly known what they are. The two most important Buddhist works have been translated into French. The one is the *Lalitavistāra*, translated from Tibetan and compared with the original Sanskrit by M. Ph. Ed. Foucaux, containing the biography of Buddha. The other is the *Lotus of the Good Law*, translated from the Sanskrit by the much to be regretted Eugène Burnouf, and containing one of the *sūtras* or sermons of Buddha.—We can now see the principal points in the history of Buddha and his doctrine. Buddha, that is to say, the Intelligent, the Wise, died 543 years before our era, at the age of 80. This is the most probable date despite striking divergences, and it is taken from the Singhalese annals. Buddha, son of a king of Kapilavastu, in the north of India, on the left bank of the Ganges, was called Siddhārtha, from his title of prince, and he took that of Buddha only when he had decided, after long meditation, on the basis of the new doctrines which he presented to mankind to save and instruct them. Married, at an early age, by his father who observed in him an unconquerable melancholy, he left the court and the world to adopt the life of a mendicant at the age of 29. Going first to the Brahman schools at Vaisali and Rājagriha, the capital of Magadha, (the present Bihar), he soon

convinced himself of the insufficiency of their systems, and to strengthen himself better in his own, he shut himself up, for six years, in the most austere retreat near the village of Onrouvilva on the banks of the Nairandjanā, the Phalgou of modern geography, not far from mount Gaya. Subjecting himself to mortifications which frightened the gods themselves, struggling inflexibly against his youth and his senses, the Bodhisattva remained five years in this rude hermitage, and after having many ecstasies, he had one at last in which he thought he had found, in all its fullness, the law which could lead men to salvation and eternal deliverance. Thanks to this beneficent law, man could save himself from the odious necessity of being perpetually born over again; he might issue out of the circle of successive existences; in a word, save himself from transmigration. Once in possession of this marvelous doctrine, Buddha, "perfectly accomplished," left his long retreat and went to Benares to preach his religion, or, as the Buddhists phrase it, "to make the wheel of the law turn round." During the remainder of his life, that is to say, during 45 years, he did nothing but teach, by word and persuasion, peoples and kings who were willing to believe in him. He resided chiefly at Rājagriha, in Magadha, at Sravasti, in Kosala (Fizabad in Oude), and died near Kusinagara in the kingdom of that name, in the shade of a grove composed of trees called *salas* (*shorea robusta*). His disciples gave him a magnificent funeral and divided his sacred relics among themselves, some of which, if popular superstition is to be believed, exist to the present time. This life of Buddha, so simple and so probable, was disfigured later by the most extravagant legends, from under which, however, it may be rescued and written.—Buddha dead, the devotees or *bhikshus* assembled in council under the protection of king Adjātasatrou, and the most influential among them, Kāsyapa, Ananda and Upāli, drew up the works which were henceforth to form the orthodox canon. Kāsyapa, who as president of the council had directed all the deliberations, took charge of the metaphysics or *Abhidharma*; Ananda, first cousin of Buddha, revised his sermons or *sūtras*; and Upāli compiled everything relating to discipline or *Vinaya*. The *Abhidharma*, the *sūtras* and the *Vinaya* comprise what the Buddhists call the *Triple Basket* or *Tripiṭaka*, just as the Buddha, the Law and the Council, form the *Three Pearls* or the *Three Precious Things*, the *Triratna*. This first council, held under the patronage of Adjātasatrou, who was converted by Buddha himself, was followed by two others, of uncertain date, one of which was held under king Asoka who extended his rule over the entire Indian peninsula, during the third century before our era. It was these three councils that settled the text of the Buddhist works such as they have come down to us and such as they were accepted by all the peoples who submitted to Buddhism.—The following is the doctrine contained therein.

Buddha sets out with the axiom accepted by all in India, and in a great part of Asia: Man has been condemned from all eternity to perpetual renewals of existence which succeed each other without end, and the present life, exposed to sickness, old age and death, is a terrible chain from which he should seek to free himself at any cost, and in such a manner as never to fall into the same abyss again. Brahmanism, with its complicated worship drawn from the Vedas, gave to men the means of salvation; but Buddha proclaimed these means to be ineffectual, and he wished to substitute better or rather infallible means for them. The first theory which he taught to lead man to the desire for deliverance, was that of the four sublime truths. These truths are the following: 1, pain is the inevitable heritage of man in life; 2, the cause of pain arises from acts, activity, desires, passions and faults; 3, pain for man may cease forever through Nirvāna; 4, the way to reach this final end of pain is that taught by Buddha. These four sublime truths were resumed in the sacramental verses adopted by all the Buddhists and repeated by them continually as a creed or act of faith.—The four sublime truths are followed by ten prohibitions which form the Buddhist decalogue: Not to kill, not to steal, not to commit adultery, not to lie, not to get drunk, not to eat outside the appointed hours, not to attend dances or theatrical representations, not to use perfumes or dress with luxury, not to have rich beds, and not to accept either gold or silver. Of these commands some are addressed to all the faithful, others more particularly to the monks for whom moral discipline is more severe. Buddhist monks have special observances of extreme rigor. They are allowed to clothe themselves only in rags collected on the streets, in the dirt heaps or in cemeteries, as Buddha did; they can not have more than three of these wretched dresses, sewed with their own hands, and always covered with a yellow mantle obtained through the same means. Their food is more simple still than their dress. The monks can live only on alms, receiving food given them in the wooden vase which they hold out without saying the least word to ask for it, and without any sign of impatience. They eat but one meal a day and before noon. The woods are their only habitation. In sleeping they sit with the back against the trunk of a tree, and the rest of the body on a mat. Once a month, at least, they pass the night in a cemetery to meditate on the instability of human things. Moreover, the monk must remain in celibacy and the most complete chastity. The only mild provision in this fierce code is that in the rainy season, the winter of these climates, it is permitted to the *bhikshous* or mendicants to shelter themselves in *viharas* or convents, which the sympathy of the people or the munificence of kings had erected for their use in all the Buddhist countries.—As to ordinary believers, Buddha recommended to them the practice of the six transcendent virtues:

almsgiving, purity, patience, courage, contemplation, and knowledge. He added reserve in speech in order to avoid all grossness and all calumny, and humility which guarantees man against the evils of pride. He prescribed also to the monks and even to laymen, the public confession of their sins, and this institution has existed for a long time and under various forms, as may be seen from the moral edicts of Piyadasī and the memoirs of Hiouen-Tsang.—Such is the code of Buddhist morals, exaggerated in some parts, excellent in nearly all, and in general worthy of Christianity itself. This code has exercised a salutary influence upon simple men, on kings, and even nations, as is shown by an array of facts to be found in the *sutras*, in the legends, and even in civil and political history of Buddhist nations. It is founded upon a metaphysical system of which only a few words can be said here, but which should not be passed over in silence. Transmigration of souls, accepted as a dogma not to be discussed, meant for Buddha that man before coming into this world and after leaving it, may have already appeared under millions and millions of different forms, from inert matter and stone, for example, up to living matter in the bodies of the most perfect animals, including man. The only cause for these transformations is the conduct of men in a previous existence. In the present the fate of the future life is determined. But what was the cause of man's first existence, and how did the series commence? Buddha neglected this impenetrable problem of the origin, and seemed to believe in the eternity of beings, or rather, in their eternal mutability. Accordingly he declared that everything in the world is void, that there are only appearances without reality, and that the only faith possible is to believe in nothing, or rather, to believe in nothing but Nirvāna.—There has been much discussion among scholars as to the meaning to be attached to Nirvāna. Some have pretended that it is the absorption of the human soul in God, but it has been answered that Buddhism believes neither in God nor in the human soul; and it may be seen by the preceding that neither the one nor the other has a place in the Buddhist system. Nirvāna, therefore, had for Buddha no other meaning than nothingness from which man never returns because he no longer exists. This faith is an abominable one, but it forms unquestionably the basis itself of Buddhism. First of all, the sacred books attest it, and although a doctrine of this kind is necessarily very obscure, it is what the *sutras* set forth. Moreover this doctrine is perfectly in accord with the atheism of Buddhism; it is the same which the Brahmaus who have a horror of it, attribute to their adversaries; it springs from the whole system of Buddhist metaphysics, and it is still in our day the faith of all the Buddhist priests, who have been consulted by Christian missionaries, as can be seen by reference to the works of Spence Hardy, Bigandet, Wassilief, Müllens, Grimblot, and many

others. This interpretation of Nirvāna is adopted by Eugene Burnouf, the most competent judge in these questions, and his arguments may be found in his admirable work: *Introduction à l'histoire du Bouddhisme Indien*.—If it be a matter of surprise that nothingness should be the object of religious worship for so large a portion of humanity, we may answer, first of all, that these people are in this as in many other regards, very different from us, and that they seem to despise life at least as much as we love it. It may be added that nations generally understand little of the ultimate principles of the religions they profess, and it is not probable that among Christians there are many more who understand the admirable depths of the Christian faith than there are among Buddhists who can give an account of the true sense of Nirvāna. They adore Buddha, they pay a mild and simple worship to his virtues, they turn to him in their prayers without ever having thought of making him a god; they try to imitate his virtues and free themselves from transmigration by following his precepts. But for them, as well as for Christians, metaphysics are of little account, and it is only the ablest adepts who read the *Pradīnā pāramitā*, or the book of transcendental wisdom, a vast collection which we possess in three or four orthodox versions, and which contain nothing but a system of absolute nihilism, as decided as it is absurd. In one word, it is no longer permitted to doubt the significance given by Buddha and his most intelligent disciples to Nirvāna. For them Nirvāna is nothingness; that is the most definite and deplorable assurance that man can give himself against every return to life under whatever form it may be.—Although there are voluminous works on Buddhism it is impossible to write its history at present, and perhaps it will never be written. We can easily see that even with all the necessary material it would be very difficult to write, on account of its enormous extent and long duration, since it comprises 15 or 20 nations, at least, from Kashmere to China and Japan, and covers a period of 2,500 years. All that may be stated here is, that Buddhism had its birth in India, on the banks of the Ganges, and was able to grow and flourish there for about 1,200 years, since it was still very prosperous when the Chinese pilgrim, Hiouen-Thsang, visited the country (from 629 to 645 of our era). Brahmanism, long tolerant, apparently stopped being so at this epoch; and Buddhism, exiled forever from India, its birthplace, existed only in the neighboring countries. It had penetrated into Ceylon about two centuries after the death of Buddha. It entered China about the Christian era, and the zeal of the Chinese was so intense that they produced thousands of works of every kind on this pious subject. Buddhism was not introduced until somewhat later into Nepal, Kashmere, Thibet and Mongolia, and the countries forming the so-called India beyond the Ganges. But in all these countries it has struck firm roots, and it is there that it must be studied

to-day, if we wish to know what it has become and on what it subsists. Ceylon is one of its principal centres, though in this island itself the progress of Christianity, especially under the form of Catholicism, becomes more considerable and more menacing to Buddhism from day to day.—It is not to be hoped that Christianity will ever replace Buddhism among the populations who have accepted that faith, and who find it on a level with their light and their needs. Christian missionaries undertake a most laudable work, but it is to be feared that this work will be as fruitless as it is beautiful, which does not, of course, prevent attempting it with persistence. There are hidden and all powerful reasons, no doubt, why these peoples should have accepted Buddhism and clung to it with so blind and sincere a devotion. Their turn of mind, their manners and habits, demand no more reasonable or complicated worship. Buddha, the man, is a sufficient ideal for them, and it is certain that this worship, deplorable though it appear to us, has formed some noble souls, such as Hiouen-Thsang, for example, who may be ranked among saints and sages. But as far as one may judge, the Buddhist faith has not greatly favored the advance of civilization among the peoples converted to it; they have never been able to organize in their midst regular and firm governments; and it is undoubted that when, in the concerns of life, such renunciation is practiced as Buddha recommends, and which those nations are instinctively ready for, men are ill prepared for all the labors and struggles demanded by civilization. The personality of man, destroyed by the idea of universal transmigration, has never cared for the liberty which it does not recognize in itself and which it seeks not to establish and cause to be respected by others. All Asia seems at all times devoted to despotism, but the Buddhistic peoples are particularly adapted thereto, and it would have been a marvel if Buddhism, which has never suspected that man is a free being, should have sought to maintain his freedom and dignity in the society in which he lived. But since the needs of society necessitate a governing power, whatever power has been established in Asia has been allowed to have its own way. It has never sought to control, limit or improve it in any way. The only attention paid to government there is to overthrow it with violence when it can no longer be endured.—It is quite remarkable that the Buddhist monks, while distinct from the crowd, and having a species of hierarchy in their different schools, have never thought of forming a corporation properly speaking, and founding a spiritual power side by side with the temporal. It is only in Thibet that this has been attempted by Lamaism, and there it has not produced any of the results witnessed in Christian lands. The Buddhist priests make a vow of poverty and keep this vow strictly; those of Ceylon, for example, do not possess any property individually. Still, among the greater part of the Buddhist peoples,

the piety of the faithful and of kings has erected for the use of devotees during the rainy season splendid convents, capable sometimes of receiving thousands of guests. To these convents temples have been joined, and to the temples estates have been added for the maintenance of worship. The Buddhist clergy do not appear generally to have abused this consideration, and conflicts have been rare between them and the civil power, which has always remained the master. In Brahmanism, on the contrary, the religious body, upheld by caste, became the veritable master of society, and the political power submitted as a matter of fact to the spiritual authority. The *kshatriya* had nothing except under the hand and with the tacit permission of the Brahman. After long and bloody struggles the kings were obliged to yield and remain forever obedient.—Buddhism, born in the midst of Brahmanism, and perhaps 12 or 15 centuries later, tried to reform the latter, but failed in the undertaking, and India has not accepted it because she did not find it better than the ancient faith to which she has remained invincibly attached. For us, who are impartial in these debates, Buddhism must also seem very inferior to its rival, and although Vedic worship has not borne very good fruits, it was of much more value than that which sought to replace it. It has allowed the Indian genius to unfold with luxuriance in nearly every direction, while Buddhism, both puerile and sombre, has inclosed in a narrow and cheerless circle the people who embraced it. The Buddhist nations have absolutely no literature outside their sacred books; and as the human mind never loses its rights, rein has been given to the imagination in the orthodox books themselves with a license to reason that is truly wonderful. We may easily be convinced of this by reading the *Lotus of the Good Law*, or *Lalitavistara*. If the Buddhist religion is the most widely spread among men, it is also the most singular and deplorable they have ever professed, though it has more than one apparent resemblance to Christianity; and among the founders of religions the figure of Buddha is the most pure and noble after that of Christ himself. Moreover the resemblances which men have sometimes tried to find between Christianity and Buddhism are altogether mistaken. The systems originated and were developed independently of each other, and Christianity would have to blush at being the child or the father of Buddhism as has sometimes been pretended through motives that were neither honorable nor well founded.—To become acquainted with Buddhism, it is necessary to read the books cited above, and also the work on "Buddha and his Religion," in which the author of this article has collected all the results obtained by erudition up to the present day. Compare Alabaster, *The Modern Buddhist*, London, 1870; Beal, *Outline of Buddhism from Chinese Sources*, London, 1870; Eitel, *Buddhism, its Historical, Theoretical and Popular Aspects*, London, 1873. (See BRAHMANISM, LAMAISM). BARTHÉLEMY SAINT-HILAIRE.

BUDGET. The word *budget* is immediately derived from the French *bougette*, a bag or purse, and is applied in modern times to the statement of receipts and expenditures of governments for the year. This use of the word had its origin in England, in applying the name of the bag containing the papers and documents laid before the house of commons by the chancellor of the exchequer, to the financial exhibit which the bag contained. France and other countries, which have borrowed so much of their parliamentary usages and terms from Great Britain, have adopted the word budget, which has a fixed meaning in the financial vocabulary.—While the fiscal year varies widely in different countries, beginning and ending in France with the calendar year, or the 1st of January, in Great Britain with the 1st of April, and in the United States with the 1st of July, there is a uniform usage in all nations for the government to present a budget to the legislative body at the beginning of its sessions. The consideration and examination of these estimates are devolved upon committees, though the system of permanent committees upon the budget prevails only in Belgium, in Holland and in the United States. In other countries the legislature appoints commissioners or special committees upon financial matters. The finance ministers in different nations, sometimes orally, and sometimes by written reports, advance their views and estimates, and defend them before the standing or special committees or before the committee of the whole house, according to the established custom of each country, the legislative body reserving to itself (everywhere except in Russia and Turkey, where no representative government exists) the final power of voting upon all estimates submitted.—Notwithstanding this general control by the representatives of the people of the expense of government, there is a constant tendency toward increased expenditure of the public money, in the multiplication of offices, in the advance of salaries, in the expense of administration, and in the erection of costly buildings and extensive systems of public works. That this increased costliness of government advances in a much greater ratio than population or public wealth, is manifest; and the rapid strides made in this direction during the last 25 years in three countries may be seen in the following:

EXPENDITURES OF GOVERNMENT.

COUNTRIES.	1855.	1880.
France.....	\$297,012,665	\$687,000,000
Great Britain.....	255,874,195	412,017,425
United States.....	58,630,683	207,642,958

—In the United States, a statement of the annual receipts and expenditures of the government has been laid before congress by the secretary of the treasury ever since 1790, and published as required by the constitution. A committee of ways and means, to consider and report upon

estimates for supplies needed in the administration of the government, was first constituted in congress in 1789, at its earliest session, consisting of one member from each state. In 1795 this committee was made a standing or permanent committee of the house. Reduced to 7 members in 1802, it was increased to 9 in 1833, to 11 in 1873, and to 13 members in 1879. The functions of the ways and means committee, which once included all matters relating to the revenue, the public debt, and the expenditures of the government, were divided in 1865, on account of the very great amount and variety of public business pressing upon this one committee, and a distinct committee on appropriations was created. This has direct charge of all measures appropriating money for the support of the government, while to the committee on ways and means are referred all matters relating to the revenue and the bonded debt of the United States. Bills proposed by the committee on appropriations take precedence of other business in committee of the whole house, and the yeas and nays on the passage of such bills are required to be entered in detail on the journal of the house. But the house has repeatedly suspended this rule, and passed river and harbor appropriations without debate.—The constitution provides that no money shall ever be drawn from the treasury but in consequence of appropriations made by law, and the checks upon unnecessary or extravagant expenditure are all in the hands of congress. That body has provided apparent safeguards to the treasury by adopting rules that no appropriation shall be reported in any bill or admitted as an amendment, unless previously authorized by law, or in continuation of such public works and objects as are already in progress, also prohibiting any provision in such bills or amendments to change existing laws, except such as shall retrench expenditures.—The senate, like the house of representatives, has a committee on appropriations, but its committee to consider revenue measures is styled the committee on finance.—The treasury estimates for appropriations are prepared by the various departments and bureaus of the public service in the autumn, and are required to be sent by the secretary of the treasury to the speaker of the house on its annual meeting in December. They set forth: 1, the authority in previous legislation for the expenditure estimated for; 2, the estimated amount required under each item of expenditure for the service of the fiscal year ensuing; 3, the same estimate for the fiscal year then current; and 4, the amount actually appropriated for the fiscal year preceding. These estimates, with the annual report of receipts and expenditures of the United States for the fiscal year ended on the 30th of June prior to the assembling of congress in December, form the basis upon which the secretary of the treasury makes up his annual report to congress, which embraces a careful review of the working of the revenue system, and an estimate of the probable

receipts of the government from all sources for the remainder of the current fiscal year, as well as for the ensuing one, for which congress is asked to appropriate. At the same time, or by special communications at a later period of the session, estimates for deficiencies in the appropriations of the current year to meet expenditures, are laid before congress, which is asked to grant the amount necessary to defray them. These deficiency bills are occasioned sometimes by unforeseen sources of expenditure, sometimes by careless accounting or extravagance, but more frequently by the failure of congress to incorporate in the regular advance appropriation bills a sufficient sum to defray the whole expenditure for a year of certain branches of the public service.—The original estimates submitted by the departments usually undergo considerable reductions by the house of representatives (as reported by its committee on appropriations) and while the tendency to restore the full amount in the senate, which is the less popular body, is very strong and prevails to a considerable extent, the net result is a compromise between the two houses, in which the aggregate appropriations are made less than the senate passes them, but larger than limited by the house, while still much below the estimates as submitted by the several departments. It is usual for the committees on appropriations of both houses to receive, orally or in writing, statements from the officials seeking appropriations, pertaining to the amount and the necessity for the public service of the sums asked for. As none of the heads of departments have seats in either branch of congress, where they could make public statements or answer inquiries relating to appropriations under consideration, letters from these officers are frequently read in open house, although addressed only to the chairman of the appropriations committee.—Besides the sums specifically asked for in the annual budget, and appropriated by congress with or without amendment, there are what are known as "permanent annual appropriations," which are expended by the treasury in pursuance of acts continuously operating, without annual re-enactment. These permanent appropriations are of two kinds: 1. Specific, including only three items of expenditure—1, the cost of collection of the customs revenues, \$5,500,000 per annum; 2, the arming and equipment of the militia of the United States, \$200,000 per annum; 3, the payment of 6 per cent. interest on the bequest to the Smithsonian institution, held by the government of the United States, \$39,000 per annum. II. Indefinite annual appropriations, which include the interest on the public debt, the amount annually paid into the sinking fund, the interest on bonds issued to the Pacific railways, and a great variety of refundings, indemnities, etc., liable to be paid out under obligation of existing laws, but the amount of which is indeterminate, or varying from year to year. The aggregate of all these permanent specific and

indefinite appropriations for the year 1880 was \$145,939,438. Of this sum, no less than \$134,000,000 was on account of the sinking fund, and interest on the public debt. The aggregate of the annual appropriations specifically made by congress for 1880 was \$162,404,647, while the actual expenditure, as rendered by the treasury report for the same year, was \$171,885,383. The appropriations "to supply deficiencies" have ranged in the past 10 years from \$1,000,000 to \$15,218,259 per annum. The following shows the various heads of expenditure under which the appropriations were made for the fiscal year 1881:

Legislative, executive and judicial expenses....	\$16,785,309
Sundry civil expenses.....	24,216,137
Support of the army.....	26,425,800
Naval service.....	14,405,797
Indian service.....	4,657,263
Rivers and harbors.....	8,976,500
Forts and fortifications.....	550,000
Military academy.....	316,234
Post office department.....	3,883,420
Invalid and other pensions.....	41,644,000
Consular and diplomatic service.....	1,181,335
Miscellaneous.....	4,959,332
To supply deficiencies.....	6,118,085
Total.....	\$154,118,212

Under a general law, all unexpended balances of appropriations are covered into the treasury after two years.—In Great Britain the budget is annually prepared and printed by the officers of the treasury. It is carefully and minutely classified, each head of expenditure under the different departments of government being subdivided in detail. It makes three folio volumes, one devoted to estimates for the civil service, one to the army, and one to the navy. Indefinite expenditure or extravagance is almost impossible under the strict system of the British budget. The speech of the sovereign at the beginning of each session asks the commons for supplies of revenue, and that body appoints a day when it will resolve itself into a committee of the whole house to consider the supply bill. The member of the government representing each department explains to the committee the estimates, answers questions, and proceeds to propose each grant in succession. This comes after the set speech on the budget delivered by the chancellor of the exchequer, who has the duty of proposing to the house of commons any increase of taxation rendered necessary by deficient revenues, or any abolition or reduction of the customs or excise taxes which a surplus of revenue may justify. Very rarely does the British budget entail the necessity of an increase of taxes; it is much more common for the chancellor of the exchequer to have the pleasing duty of proposing a reduction. This is in part owing to the careful accounting which prevails in all departments, as well as to the great resources of a people occupying a front rank among commercial and manufacturing nations. The rarity of a deficit is also owing in part to the fact that the budget, in place of being voted a whole year in

advance, as in many countries, is adopted usually about the time when the expenditure of the fiscal year it provides for begins. Thus the wants and the resources of the treasury can be estimated with greater precision, while the ministry can avail itself of the fluctuations in receipts and expenditures to a late period of the session of parliament, thus avoiding the miscalculations that lead to deficits.—There is in the British budget what is termed the consolidated fund, made up of the receipts from customs and internal revenue. This fund is specially set apart to the expenses of the public debt, the civil list, pensions and allowances, (including the royal family), and salaries of government officers. These expenses are not submitted to an annual vote in parliament, but the surplus of the consolidated fund over and above these necessary charges can not be expended without appropriations voted in the usual form of a supply bill. A similar feature is found in the expenditure under what are known as "permanent appropriations" in the United States. In both cases, the provisions of law on the faith of which the various public loans have been contracted constitute a special and inalienable guarantee of their payment, so that neither parliament nor congress can disturb the public faith by refusing to appropriate money to pay the interest as it falls due. In France, on the other hand, no pledge of a special revenue is attached to the public debt, the interest being paid out of the treasury funds without distinction of source.—All the other expenditures of the British government have to be provided for by annual vote. No expenditure is permitted in the course of any financial year beyond the sums voted, and if the whole amount appropriated has not been expended, the surplus has to be turned into the treasury.—In time of war, to provide for unforeseen expenses during the recess of parliament, a vote of confidence for so many million pounds sterling has been customary. These funds can be employed for no other than military objects, and if they are exhausted, the government must summon parliament and lay before it its demands for additional credits.—In France, where order and method were introduced into the management of finances early in the middle ages, we find a classification of ordinary and extraordinary expenses as early as 1314. There were then general administrators of the finances, with a receiver-general, who administered the treasury, and apportioned the revenue and expenditure to the wants of each succeeding year. Each deficit was provided for by a general tax, which in case of war frequently amounted to very large sums. In the reign of Francis I. the financial operations of the government were further concentrated in the hands of a treasurer general, charged with the disbursements and collections of the state, while the management of the public debt was placed in the hands of a special agent. The treasurer presented the budget to the king at the beginning of each year, but no publication of it was made. Not until 1789 was any require-

ment made for annual publication of the statement of receipts and expenditures. The constitution of the republic of 1795 re-affirmed this provision, and gave the sole power of levying taxes to the *corps législatif*, limiting the operation of each tax law to one year. By the same constitution the government was for the first time required to submit a statement of expenses to the *corps législatif*. From this time dates the use of the term "budget" in French finance. During the whole period of the French revolution there was great looseness of control as to the expenses of the government, and, under the first empire, the annual accounts of revenue and expenditure were published in a very inexact and imperfect form. Sometimes, even, the government forgot to have the budget voted by the *corps législatif*. A simple imperial decree sufficed for the most enormous taxation, and no thought was given to the legitimacy of any expenditure ordered by the same authority. —On the establishment of the constitutional government in 1814 great changes were made. The budget became the faithful balance-sheet of the debits and credits of the state. Every item of expenditure and of revenue had to be reported to the two chambers. In 1818 parliament returned to the rule of fixing the expenditure of the government, which had been for years determined by the administration. The functions of the receiver charged with the revenues, and the treasurer charged with the expenditures, were consolidated in a single minister. By degrees the budgets were systematized, and in 1831 all their statements were required to be specific, and divided into separate heads. This secured the immense advantage of concentrating any reduction or increase of expenditure upon a definite object or of throwing out any item by refusing to appropriate at all. In 1833 the control of the chambers was extended by ordering the distribution of printed reports of the *cour des comptes* among the members, and requiring a special act for every expenditure on public works or buildings. In 1850 the payment of any expenditure not directly authorized by law was prohibited, but this restriction was repealed in 1852, and the budget was required to be voted in mass, the law of special divisions being abolished. Much extravagance and increased expenditure resulted. —In 1862 a reform in the budget, proposed by M. Fould, was legalized, dividing the public expenditures into three categories: 1, the ordinary budget, providing for the necessary and permanent expenses, the execution of the laws, the collection of the revenue, etc.; 2, the departmental budget, or expenditures discharged by taxes imposed by localities; 3, the extraordinary expenses which, without being of absolute necessity, are of public utility. To these has been added by a later act the budget of redemption (sinking fund). —The court of accounts, under the present French system, is a branch of the civil service charged with reducing to order and system the whole of the public accounts, and

submitting them to the legislative chambers with an elaborate report. The minute completeness with which everything is stated in the budget prevents misappropriation of the public moneys, supplies exact information for checking any needless expenditure, and brings the revenue and expenses of successive years into parallel view, showing how far the anticipated income and outgo have been realized. But the French republic has inherited a most expensive system from the second empire; government without control and constant extravagance have entailed the costliest government in Europe, which the enormous debt, the indemnity of a thousand million dollars to Germany, and the military disease which is eating out the substance of so many European peoples, have contributed to maintain. —The German empire exhibited a budget of 539,252,640 marks for 1880-81 of ordinary expenses, and 72,962,921 marks extraordinary, or a total of only \$135,000,000, in which, however, the military expenditure figures for over 90 millions of dollars. Each member of the German confederation has its own separate budget also. The revenue for federal administration is voted by the *reichstag* under similar general regulations as those which prevail in Prussia. A finance commission is selected from among the members of the *reichstag*, having charge of the budget in its details. —The Prussian budget is voted for a calendar year beginning the 1st of January. Amendments to it can be proposed only by the representative body of the diet, where its items are first discussed, before being sent to the house of lords, which can only accept or reject it in mass. In case of disagreement on the budget, the two chambers propose to each other financial bills until they come into accord. This direct agency of the people's representatives in voting on revenue and expenditure dates only from 1848, before which the lower chamber had no control over the finances. But it has sometimes happened that when the diet would not pass the financial bills of the government as offered by the ministry, no account has been made of their refusal. The budgets which were rejected have been published as ordinances, and the people have acquiesced. —In Austria the second chamber of the *reichsrath* has the power of fixing the receipts and expenditures. The public debt has grown heavily, especially since the war of 1866, the result of which obliged Austria to cede her rich Italian provinces. A commission of finance, embracing 36 members of the lower house (or one-tenth of the entire chamber), examines the estimates of the budget, and has charge of the bills of supply. —The budget of the Russian empire was, up to 1863, an unknown quantity. In that year a balance sheet of receipts and expenditures was published, showing a deficit of about 15,000,000 roubles. The financial statements since published have been neither regular nor exact. There being no legislative control whatever (for Russia has no parliament), the enormous expend-

iture goes on at a rate which strains even the prodigious resources of an empire of 90,000,000 of inhabitants. The Russian budget is prepared by the minister of finance, then subjected to the scrutiny of the committee of council of the empire, and finally it is submitted to the emperor's approval.—The unification of Italy as a kingdom, while greatly increasing its power and resources, has obliged the new government to expend vast sums in maintaining a great military force. At the same time the development of public works has been entered upon on a grand scale. Notwithstanding numerous and heavy loans, the demands of the treasury have been such that it has been impossible to balance the receipts and expenditures. The annual budget of the ministry is referred in parliament to a commission composed of 30 members of the chamber of deputies and 15 from the senate.—The Spanish budget must, by the constitution, be voted by the cortes. The ordinary budget represents the produce of the taxes; the extraordinary budget is derived largely from the alienation of the ecclesiastical benefices. The total expenditure for 1880 was \$181,647,000.—The budget of Portugal sets forth continual deficits, the state maintaining its regular expenses only by means of loans and financial expedients.—In Switzerland there is a federal budget for the whole republic, and as many local budgets as there are cantons. The federal treasury has in its hands the customs, postoffice, the telegraphs, and special imposts. These yield an annual revenue of about \$8,000,000. The heaviest charge of the federal budget is that of the military, which amounts to \$2,600,000. The general expenses of the government amount to only about \$8,000,000 annually, showing Switzerland to be, perhaps, the most economical government in the world. The salaries of the principal officers vary from \$800 to \$1,200, and every officer is required to be faithful and intelligent. In the cantons of Switzerland the larger part of the budget goes to education and public works, the roads absorbing about 40 per cent. of the taxes raised.—The Turkish budget has only been made public since 1864, and then only through the persistent demand of the English and French governments. The necessity of continual loans to keep the Ottoman porte going as a government, has also precipitated this publication. The budgets, however, have been denounced as deceitful, all of them exhibiting an excess of receipts over expenditures, while the actual condition of the treasury was a continual deficit.—In Belgium the budget is voted in the year preceding the expenditure provided for. Deficiencies are met by supplementary credits. Expenses have risen from 87 million francs in 1835, to 386 million francs in 1880. Public works are not provided for in the regular budget, but by special taxes, or more frequently by loans. The budget, when submitted to the chamber of deputies, is distributed among six sections of the members, each corresponding to one of the six ministerial depart-

ments, viz., of justice, of foreign affairs, of the interior, of finance, of war and of public works.—The system of the Netherlands is similar, the upper and lower chambers of the legislature being each divided into five permanent committees, each of which has charge of a specific portion of the budget.—In Denmark the budget is voted for two years in advance by the diet. Indirect taxes bring in the greater part of the revenue. The very democratic constitution throws the power of appropriations into the hands of the peasants, who form the majority of the lower house. The expenses of education, public communication, etc., are readily voted, but the folksthing keeps a firm hand on the salaries of public functionaries, and rejects many proposed expenditures for fortifications and the increase of the army.—In Sweden the right of the nation to tax itself is exercised exclusively by the diet. The king is required to submit annually a detailed report on the condition of the finances. The diet appoints three commissioners of finance: the first reports on the financial administration and the public debt; the second brings in the necessary bills for raising revenue, and the third is charged with the regulation of the national bank. Besides the regular appropriations, the diet places at the disposal of the king an extraordinary credit, to be used in the interval of its sessions, only for great emergencies like the national defense, under advice of the council of state.—Sweden and Norway have each their separate budget, that of the former amounting to about \$25,000,000, and that of Norway to about \$18,000,000.

A. R. SPOFFORD.

BULL, Papal, authentic acts issued by the court of Rome. A bull—the name of which comes from the Latin word *bullare*, to seal—is written on parchment in gothic letters, sealed with lead and signed by the pope; it always relates to very important matters; it is drawn up in Latin, and generally named after the first words of the introduction. A brief is concerned with less important subjects. It is sealed with red wax, and signed by the secretary of briefs.—The collection of bulls is called the bullarium. Several have appeared since 1727, and their importance, from a political point of view as well as from that of the Catholic religion, can not be doubted. The changes in the influence of the holy see can be traced in them. Confining themselves at first to the regulation of religious matters, the bulls after Gregory VII. had scarcely any other object than the exercise of political supremacy, religious decisions being given under the form of decrees, constitutions, rescripts, etc. After the reformation the bulls were brought back gradually to their ancient province, and at present the political manifestations of the pope take another form.—On account of the peculiar constitution of the Catholic church which gives so great an influence to its chiefs, making it almost a state within a state, the reception of bulls is in most countries subjected to a special

authorization by the government. In France no bill or any act of general interest can be published without having been examined by the council of state.

MAURICE BLOCK.

BUNDESRATH. The bundesrath is, we may say, the highest executive and administrative power in the German empire. Its principal features had been defined by the constitution of the Nord-Deutsche Bund (the North German Federation) of 1867, whose provisions on this head were, in the main, incorporated into the constitution of 1871. As forming an essential part in the government of the empire, the bundesrath is, as far as its powers and its relation to the other branches of the government are concerned, a peculiar body. It can neither be likened to our senate nor to the upper house of a bi-cameral legislative assembly; nor is it a purely executive body, although it is not altogether unlike the latter, and may, in some respects, be likened to a state council. A better idea of the bundesrath than any definition can give, is furnished by simply describing its organization and enumerating its several powers.—1. The bundesrath is now composed of 59 members, the delegates of the several states which under the headship of Prussia compose the German empire. Prussia is represented by 17 delegates or votes, Bavaria by 6, Württemberg by 4, Saxony by 4, Baden by 3, Hesse by 3, Mecklenburg-Schwerin and Braunschweig by 2 each, and the rest by 1 delegate or vote.—Each state may send as many delegates as it has votes, or it may send fewer, but in all proceedings the entire vote of each state is counted, and, when cast, must be a *unit* vote. The principal feature which marks the distinction between the bundesrath of the North German federation and of the German empire is, that none of its members or delegation can hamper or delay its proceedings, or force an adjournment for want of special instructions, touching the matters at issue, from the state they may represent. The bundesrath may, however, pass on a question by common consent, or by permission of its presiding officer. The presidency of the bundesrath is vested in the emperor, who has the power of appointing the chancellor of the empire the acting chairman of the bundesrath and controller of its business.—2. The bundesrath has power to decide on the legislative measures to be proposed to the imperial diet, on the rules, regulations, and means to be adopted in the administration and execution of the laws of the empire, (const. of 1871, art. 7). As far as the proposing of legislative measures is concerned, the bundesrath resembles a council of state, while in other respects it has more of the powers of an executive. It has, also, the power of deciding on the ways and means of removing defects apparent in the execution of the laws of the empire, or in the rules and regulations which govern, and the institutions which aid in the administration and execution of those laws. It is thus invested with a species of supervisory power.—3. The several members of the bundesrath have the privilege of

being present at the proceedings of the imperial diet, of expressing their opinions on the questions pending, and of otherwise taking part in the deliberations of this body. They may take the floor at any time. In case the delegates of a certain state are unable to carry a measure, in the interest of their government, in the bundesrath, they may still submit the question to the imperial diet, and claim the right to be heard before that body. The bundesrath advises on the adoption or rejection of the legislation resolved upon by the imperial diet. Again, each of the governments forming part of the empire has the right, through its delegates, to propose and advocate any measure in the bundesrath which may come within the province of the latter. In deciding a question of legislation an absolute majority is held sufficient, while on questions touching constitutional amendments, or any change in the organic law of the empire, a two-thirds' majority is required. It is in the president of the bundesrath (the emperor) that the authority is vested to convene it, to adjourn it from time to time, or without day. It is also he who represents the empire in its relation to foreign governments, determines its diplomatic relations, appoints consular and other officers, etc., and enforces the execution of its laws in the several states coming within its jurisdiction. MAX. EBERHARDT.

BUREAUCRACY. The word bureaucracy indicates a deep-seated infirmity which very generally characterizes the political administration of modern times in Europe. The more the principle prevailed that the state should look after all public interests which could be cared for only by its concentrated strength, the greater and more difficult became the task of administration, and the more dangerous, at the same time, the erroneous conception of that principle. If, formerly, care for certain interests was left too exclusively to persons and corporations, the tendency now was to undervalue these individual powers and carry the interference of the state too far. Conscious design was here added to error, since it seemed to those in power that the rule of the whole was best assured when every movement was regulated from above. This was the starting point of a system of over-government from which, among all civilized states of the old world, only Switzerland and England have kept themselves entirely free.—Besides this, the problem rightly understood had become greater and more difficult. If governments are to satisfy the demands increased tenfold that are made on the modern state, then their conduct demands a greater amount of ability, insight and patriotic devotion. Where this ability, insight and devotion were not found, administration became superficial in proportion as it extended its action. It failed to control the infinite amount of material which it sought to rule, and dropped into a senseless and selfish formalism. Finally the bureaucratic body in the modern state takes another position, through its centralization,

its multiplied numbers and its consciousness of increased power. It feels itself, under this system of over-government, absolutely the ruling centre in all public life, and forms a class outside of and above the people.—Under the pressure of an over-governing and formally-governing bureaucratic body imbued with this spirit, the governed have to suffer in three ways: 1, those affairs in which they need the intervention of public authority are more frequently ill managed than well managed; 2, they have to put up with this intervention and its harmful results in a thousand cases in which they might have done without it; 3, they seldom come into personal contact with the agents of authority without going away with a feeling of personal humiliation.—These three closely connected evils, in their combination, are designated by the expression *bureaucracy*. An ignorant, indolent or corruptible administration with humane forms, or an administration under rude forms but which does its duty with intelligence and real zeal, or a government which leaves things to take their course and interferes only at intervals with strong measures, is not *bureaucracy* in the sense which a precise and proper use of language connects with the word.—*Bureaucracy* wherever established has its seat in the organs of the government, but first of all in the police power; from this point it easily extends to the whole body of officials and still further to kindred circles. It is then found at the counters of the postoffice, in the departments of communal administration, and in the courts of law. In constitutional states, in which public officials, municipal employes and lawyers have a preponderant part in legislation, as well as in the absolutist state, where the work of legislation proceeds entirely from state officials, legislation itself bears the stamp of the bureaucratic spirit, in proportion as the administration is ruled by it.—The error that *bureaucracy* and *absolutism* are inseparable was corrected to some extent by the experience of 1848. It was then shown that radicalism, too, when it comes to the helm, finds *bureaucracy* essentially consonant with its nature. It was also shown that radicalism had had a great number of silent adherents among the most zealous servants of absolute government; and they now followed its victorious banners. Since this inability to sacrifice his means of livelihood and official position to an idea, always makes the bureaucrat a willing servant of the power which furnishes him with both, it is always seen in reactionary times to be a mistake that the ruling power has in him the most reliable tool.—*Bureaucracy* is not exclusively connected with any particular constitutional form; it appears in republican as well as monarchic states, in constitutional as well as in absolute monarchies. But in absolute monarchies or in democratic republics, where the official depends either upon the monarch or on repeated elections, the spirit of caste from which *bureaucracy* receives its oppressive force can not develop itself.—In order to estimate the action of a *bureaucracy* rightly it

is necessary to examine its characteristic qualities, formalism and spirit of caste more closely.—The observance of certain forms is indispensable in all complicated private business; and so it is in public administration. These forms must increase with the extent of the work, and the endless “red-tapeism” of modern administration is so far an unavoidable attendant of a more highly developed political life. But the bureaucratic condition differs from a healthy condition in this, that in the latter form is observed for the sake of the substance, and in case of necessity is sacrificed to it, while a *bureaucracy* cultivates form for its own sake and sacrifices substance to it. *Bureaucracy*, in the lowest rank, performs its official work not to be useful in its appointed sphere, but to carry out the orders received from above; that is, it observes a series of prescribed formalities for the satisfaction of superiors. Those stand higher who seek to satisfy their sense of duty, by the same formal service, not without a certain devotion to their calling, but without any intelligent understanding of the task to be accomplished and the means to be used in accomplishing it. Under a bureaucratic régime, the fault of the careless official consists in his want of familiarity with, and skill in forms, and, conversely, it is the merit of the zealous official that he knows how to dispatch business quickly and in a manner with which no fault can be found.—When a bureaucratic government feels the resistance which its over-government awakens, it seeks to break that resistance by governing still more. When it strives to improve its machinery the improvement consists in an increase of formalism in the public service. When its officials break down under these increased demands made upon them, it makes still higher demands to secure the execution of its will. Formerly the substance was sacrificed to the form; now, the form loses even its relative value. Pressed by the excess of demands which can not be met, the most conscientious public servants have recourse to the falsifying of forms, as their make-shift. When, for example, more value is placed on the formal correctness of tables and reports of the condition of a district than on that condition itself, a bureaucratic régime must renounce the intrinsic value of such representations; it must satisfy itself with reports and tables determined by the power of invention and combination possessed by their author, and which correspond to the actual condition only when the truth is as easily discovered as untruth.—The second mark of *bureaucracy* is its caste-like separation from civil society. The state selects its officials from all classes. It brings together the sons of noble families, citizens and peasants in the same departments. Under healthy conditions this facilitates for officials the understanding of their calling. They have been collected from all classes in order to serve the interests of all classes with equal devotion. In states governed by a *bureaucracy*, the official rather feels himself placed outside of all classes, and this po-

sition is not capriciously chosen. For while, on the one hand, he shares his life calling with none of these classes, he, on the other hand, is not filled with the impulse to serve and the consciousness of serving their common interests. Thus there exists between them and him no natural bond. As a participant in the positive power which is exercised by the state over all, he consistently claims his isolated place above all other classes.—Since this claim, in a bureaucratic state more than in any other, is not supported by superior education, political intelligence and services rendered the whole community, it does not appear in the worthy forms in which real moral and intellectual superiority assert themselves. In official intercourse the middle classes are treated harshly, the lower classes rudely; and the nobility and clergy are made to feel that their former power has passed over to the bureaucrats. In social intercourse we find either complete exclusion on the part of the bureaucrats, or a condescension to other classes of citizens humiliating to the latter.—This expression of the bureaucratic spirit of caste which only the sturdiest natures are able to avoid, acts deeply and destructively on the relations of the masses to the state. When the masses see, as the visible representatives of the state, officials who rise above them in such isolation, and when the necessity of meeting them is considered an impending misfortune, the state itself becomes a foreign and hostile being in the eyes of the people. Men submit to its superior force when it takes from them, and overlook its good deeds when it bestows anything upon them. The consciousness of belonging to the state, of forming a living part of the great organism, the political sense, the power and desire of sacrifice are lost. But it is this political sense which strengthens the state in time of peace and maintains it in time of danger.—Bureaucratic officials excite a prince who puts himself in their hands to an abuse of his power. On the other hand, they cripple the power of a prince who is not inclined to rule to their liking, and still does not dare to break their power. In reality such a prince is more limited in the exercise of the rights of sovereignty, by the hampering influence of a bureaucracy, than he could be by constitutional provisions. For every useful measure of government originating with him is deformed and rendered worthless by the bureaucratic carrying out of it, or it will be set aside and not carried out at all by tacit agreement of the bureaucratic body who oppose it. His rule is only an apparent one because effect can not be given to his will. The greatest posthumous fame he can hope for finds expression in the familiar saying: his intentions were good, but his officials were to blame.—Bureaucracy can reach complete power only when at the head of affairs there are personages who belong to it, or at least officials with no statesmanlike endowments and who endure it. In like manner the rule of bureaucracy can only be broken when statesmen are

at the head of the government.¹ It would be vain to expect that any impulse from below should have power enough to compel the internal reform of bureaucracy. This impulse would have to reach to the highest point, that is, produce a revolution; and if the revolution succeeded in changing all the institutions of the state but not in placing statesmen at the head of affairs, a new bureaucracy would simply take the place of the old.—It is possible to free the state from bureaucracy entirely—and in this case it is possible in every form of government to the same degree—only through the intervention of leading personages filled with the spirit of statesmanship, the very opposite of the spirit of bureaucracy. “Under the rule of statesmen, bureaucracy is annihilated and the official body elevated. The official now receives what bureaucracy could never give him, the guarantee that ability of any kind will be put in the place belonging to it, and the certainty that he can lay the truth before the powers above him without fear, and that he may reckon on its being understood. The official knows then that he is of real use; he knows that his work is no longer condemned like that of the Danaids, and that his labor is no longer forced to pour endless floods of ink through the sieve of desperate circumstances, but that it as a means in a higher hand accomplishes the sacred life object toward which it strives.”—The case of Stein at the head of the Prussian administration has shown how the most elaborate bureaucracy may be metamorphosed at a blow by the power of a single statesman. But from the course of affairs under his successors the further lesson may be drawn that the evil develops fresh germs from below as soon as the statesman element has disappeared from above.—See v. Mohl, *Staatsrecht, Völkerrecht und Politik*, v. ii., p. 138, etc., 1862.² K. BRATER.

BURGESSES (IN U. S. HISTORY). I. In New England the supreme legislative body in each colony was *The Great and General Court*, so called because it exercised judicial functions also. As settlers spread further from the radiant

¹ Compare Fr. Rohmer's work, “Deutschlands alte und neue Bürokratie,” (Munich, 1848), from which the above is in part literally taken.

² Bureaucracy was the creature of that so-called enlightened absolutism which enunciated the principle: “Everything for the people, nothing through the people,” and which supposed that it could best serve the interest of the state and of citizens by regulating and controlling not only the affairs of state, but those of municipalities and even of private persons, leaving nothing for the individual himself to do. Bureaucracy placed all interests under the supervision and guardianship of the state. Officials came to form a class or caste, distinct from the rest of the community, and standing above it. This bureaucratic rule was opposed by the nobility and by the liberals. Its influence is not yet everywhere entirely at an end, but it can not long survive the opposition of a free press, of the general participation of the citizens in public affairs, and the general extension of constitutional government. See the article “Bürokratie” in Brockhaus's “Conversationslexikon.” Ed.

centre of population, they were expected to form township governments, whose deputies were admitted to the general court by vote. At a later period new townships were formally incorporated. Townships were therefore the basis of the New England states; counties were afterward formed, but were always formal divisions of territory, mainly for choice of members to the upper house of the legislature, or for judicial convenience. The active exercise of local government was, and is, altogether in the hands of the town meetings. In Maine the name "plantation" is still retained.—If in any part of a township the population grows denser, so as to create special interests, such as the lighting or paving of streets, to the care of which the general town meeting, controlled by the agricultural vote, would be incompetent, the legislature of the state will, on application, erect such territory into a *borough*. The borough is governed, as to the objects and privileges specifically named in the charter, by a warden and a board of burgesses; in all other respects it is still a part of the township. The warden is the executive officer, answering to the mayor of a city, as the burgesses do to the common council. Boroughs are also chartered in Pennsylvania.—II. In Virginia the lower house of the legislature was known as the house of burgesses until 1776, when it became the house of delegates. (See ASSEMBLY.)

ALEXANDER JOHNSTON.

BURLINGAME, Anson, was born at New Berlin, N. Y., Nov. 14, 1822, and died at St. Petersburg, Russia, Feb. 23, 1873. He was graduated at Harvard in 1846. was admitted to the bar in 1849, was a representative in congress (at first American, and afterward republican) 1855-61, and minister to China 1861-7. He then became the Chinese government's ambassador to negotiate treaties with foreign powers. A. J.

BURR, Aaron, vice-president of the United States 1801-5, was born at Newark, N. J., Feb. 6, 1756, and died at New York, Sept. 14, 1836. He was graduated at the college of New Jersey in 1772, and began the study of law, but gave it up to enter the continental army, in which he reached the rank of colonel. He was admitted to the bar in Albany in 1782, and in 1783 removed to New York city. In 1791 he was chosen United States senator, and almost immediately began to be prominent as an anti-federalist. Until his time the politics of New York, 1776-91, had really been a triangular contest between the three great families of the state, the Livingstons, Clintons and Schuylers. (See NEW YORK). To an unsurpassed genius for political intrigue, Burr joined very considerable ability as a soldier, and abundance of that *pseudo*-democratic spirit which consists in a willingness to use popular force for personal advancement. To fight the three great clans he contrived a union of the popular interest by introducing semi-military discipline among

the anti-federalists of New York city. He himself was commander-in-chief; a knot of young disciples, Van Ness, the Swartwouts, and others (called by the federalists the "Little Band") were the aides; and at the word of command, given through the aides, the popular rank and file were to move forward with the rigid discipline of an army and the pitiless precision of a machine. Under this species of Cæsarism the masses, by yielding a temporary headship to Burr, the creature of their will, were to free themselves from the domination of the great families. (See TAMMANY SOCIETY; VAN BUREN, MARTIN; NOMINATING CONVENTIONS.) In the spring of 1800 Burr thus secured the electoral vote of New York and the national success of his party. In the following winter he was chosen vice-president. (See DISPUTED ELECTIONS, I.) Here his advancement stopped, for in national politics he had become dangerous to the Virginia interest, and in the state the great families united actively against him. In the spring of 1804 many New England federalists, despairing of success in the south, were disposed to unite with the Burrites in the middle states. As a preliminary Burr was nominated against Morgan Lewis, the Livingston and Clinton candidate for governor of New York, but through Hamilton's active personal exertions against Burr, the New York federalists did not support him heartily, and he was defeated. He therefore forced a duel upon Hamilton, and shot him fatally, July 11, 1804. In the resulting excitement Burr disappeared from politics. After engaging in a mysterious expedition down the Mississippi, he spent several years in Europe, and then, returning, practiced law in New York city until his death.—**BURR CONSPIRACY**. In the spring of 1805, Burr, indicted for murder in New York and New Jersey, a homeless and bankrupt man, made an extensive tour in the west, ostensibly for the purpose of securing a nomination as congressman from Tennessee. The Mississippi valley, separated by distance and difficulty of communication from the states east of the Alleghanies, was apparently very loosely attached to the Union, and many of its prominent citizens, including the commander of the federal army at New Orleans, had been for years pensioned by the Spanish government. Whether Burr's design was to found a new Union, or perhaps a republican empire like that of Napoleon, in the Mississippi valley, or to press on and invade Mexico, is an impenetrable mystery. The people of the eastern states, dreading that east and west division of the Union which was only eliminated from political calculation at last by the introduction of the railroad (see ANNEXATIONS, I.; UNITED STATES), charged Burr with the former design, and it is certain that some of the reckless spirits who sought him during his tour, would not have shrunk from any enterprise in which he offered to head them. During the next year Burr completed his preparations for that which, on the surface was a colonizing expedition to the river

Washita, in Texas. He had interested many of his former party associates in this expedition, as well as ex-senator Jonathan Dayton, of New Jersey, and general Wilkinson, commanding at New Orleans; and had good grounds to expect aid from Great Britain and from Mexicans disaffected to Spain; but from his first entrance into Kentucky he found that any attempt upon the unity of the nation would be resisted by the great mass of the western people. He succeeded in breaking away from legal proceedings, which were at once begun against him in Kentucky, by protesting that his real design was land speculation, by hinting at his aim against the Spaniards in Mexico, and by private assurances that he was acting under the direct sanction of the administration. While on his way down the Mississippi he found that Wilkinson had abandoned the undertaking, and made a merit of betraying it; that president Jefferson, on Wilkinson's information, had issued a proclamation, Nov. 27, 1806, cautioning all good citizens against joining the expedition; and that the whole design was a failure. He therefore left his boats at Natchez, in January, 1807, was arrested by the president's order, at Fort Stoddard, and conveyed in March to Richmond for trial, his expedition having been begun in Virginia. In May his examination began before chief justice Marshall and justice Cyrus Griffin. June 24, the United States grand jury brought in two indictments against him, one for treason and one for misdemeanor, both based on his action in levying war within the United States against a friendly nation, but with the further intention, if possible, of proving him guilty of an attempt to divide the Union. He was defended by able counsel and supported by the federal party, who considered his arrest, by the president's order and without a warrant, an act of usurpation, while the president, anxious that the result should justify his action, took almost a personal oversight of the management of the case. His correspondence contains nine long letters to the district attorney, June-September, 1807, filled with legal hints and directions, criticisms on chief justice Marshall's action, and denunciation of Luther Martin, Burr's leading lawyer, as an "unprincipled and impudent federal bull-dog." Nor did Burr shun the appearance of a contest. He even subpoenaed the president as a witness, though

the demand for personal attendance was not pressed, and allowed the trial to take the form of a pitched battle between the federal party and the president, the head of the republican party. Consequently, his acquittal of the charge of treason, Sept. 1, for want of jurisdiction, made him the enemy of every supporter of president Jefferson, and ended his political career forever. The acquittal was given only because no overt act of war had been proved by two witnesses, and for this reason the jury at first endeavored to give a Scotch verdict of "not proven," but the court directed it to be entered "not guilty." Burr was then tried and acquitted for misdemeanor, and bound over to appear for trial in Ohio, but the further prosecution was dropped. A few of Burr's confederates came to public view, but the secretiveness and caution of the leader has made the full extent of the conspiracy a matter of conjecture only. (See *HABEAS CORPUS*.)—See 1 Hammond's *Political History of New York*; 4 Randolph's *Works of Jefferson*, 70-103; Davis' *Life of Burr*; Parton's *Life of Burr*; Monette's *History of the Mississippi Valley*; Robertson's *Trial of Aaron Burr*; Carpenter's *Trial of Aaron Burr*; Van Ness' *Examination of the Charges against Burr*; *Memoirs by General Wilkinson*.

ALEXANDER JOHNSTON.

BUTLER, Benj. F., was born at Deerfield, N. H., Nov. 5, 1818, was graduated at Waterville college in 1838, and practiced law in Lowell, Mass. Until 1860 he was a democrat. He served through the rebellion as major general, and was a representative in congress (republican) 1867-75 and 1877-9. In 1878 and 1879 he was the candidate of the greenback party for governor, and in both years was supported by the mass of the democrats.—See Parton's *Butler in New Orleans*.

A. J.

BUTLER, William Orlando, was born in Jessamine county, Ky., in 1793; was admitted to the bar of Kentucky; entered the army and reached the grade of lieutenant colonel in 1812 and that of major general in the Mexican war; was a representative in congress 1839-43; and was nominated for the vice-presidency in 1848 as a democrat. (See *DEMOCRATIC-REPUBLICAN PARTY*).—See Blair's *Life and Writings of Wm. O. Butler*.

A. J.

C

CACHET, Lettres de, were letters proceeding from and signed by the kings of France, and countersigned by a secretary of state. They were called also *lettres closes*, or "sealed letters," to distinguish them from the *lettres patentes*, which were in the nature of public documents and sealed with the great seal. *Lettres de cachet* were rarely employed to deprive men of their per-

sonal liberty before the seventeenth century. It is said that they were devised by Père Joseph under the administration of Richelieu. They were at first made use of occasionally as a means of delaying the course of justice; but during the reign of Louis XIV. they were obtained by any person who had sufficient influence with the king or his ministers, and persons were thus imprisoned for

life, or for a long period, on the most frivolous pretexts, for the gratification of private pique or revenge, and without any reason being assigned for such punishment. The terms of a *lettre de cachet* were as follows: *M. le Marquis de Launay, je vous fais cette lettre pour vous dire de recevoir dans mon château de la Bastille le Sieur —, et de l'y retenir jusqu'à nouvel ordre de ma part. Sur ce, je prie Dieu qu'il vous ait, M. le Marquis de Launay, en sa sainte garde.* These letters, which gave power over personal liberty, were openly sold in the reign of Louis XV. by the mistress of one of the ministers. "They were often given to the ministers, the mistresses and favorites as *cartes blanches*, or only with the king's signature, so that the persons to whom they were given could insert such names and terms as they pleased." (Welcker.) The *lettres de cachet* were also granted by the king for the purpose of shielding his favorites or their friends from the consequences of their crimes; and thus were as pernicious in their operations as the protection afforded by the church to criminals in a former age. Their necessity was strongly maintained by the great families, as they were thus enabled to remove such of their connexions as had acted in a derogatory manner. During the contentions of the Mirabeau family 59 *lettres de cachet* were issued on the demand of one or other of its members. The independent members of the parliaments and of the magistracy were proscribed and punished by means of these warrants. This monstrous evil was swept away at the revolution, after Louis XVI. had in vain endeavored to remedy it.—Mirabeau, *Des Lettres de Cachet*, etc., 1782; Translation, published at London, in two volumes, in 1787; Rotteck and Welcker, *Staats-Lexicon*, art. "Cachet, Lettres de," by Welcker.

H. G. BONN.

CÆSARISM. A sketch of Cæsar's life and character is a proper introduction to the subject of Cæsarism. Alexander and Cæsar, the two greatest statesmen of the classical period of European history, appeared when the nations to which they respectively belonged had already passed the period of their highest internal development. Alexander did not even dream of the future greatness of Rome. He knew not that the course of empire was taking its way westward. His eyes rested, by way of preference, on the east. He loved Asia and he conquered Asia as a lover, with the consciousness and the affection of a man who feels within himself the power to attract and make happy the half-resisting, half-yielding object of his love. Cæsar was more fortunate than Alexander, in this, that his victorious campaigns were mainly fought to subjugate the west of still barbarous Europe. He thus moved with the course of the world's history and his memory was borne onward by its current. He had no love for the people he conquered and to whom he brought Roman civilization. In the long struggle of the Gauls for freedom from foreign rule Cæsar, who always showed himself generous

toward the Romans, practiced all the terrible harshness of the military usages of Rome. He conquered the west exclusively from motives of Roman policy. Cæsar loved Rome as he did himself. Rome was called by destiny to unite in one humanely ordered empire all the nations which had prepared the way for, or produced, European civilization, and to make this civilization accessible to the still backward nations of Europe. But no Roman understood this vocation of his country so well as Cæsar, and no one did more to fulfill it than he did. If Rome ever became mistress of the world Cæsar deserved to become the head of Rome. When he recognized this and strove for this mastery, he acted not from motives of morbid ambition, as his enemies and enviers supposed. He desired to be the first, because he was the first. The character and spirit of Rome were personified in him.—Caius Julius Cæsar, both by his birth and family relations, was connected with the two principal parties which in his time strove for political influence in the capital. By origin he belonged to one of the highest old noble families. He moved, especially in his younger years, in the highest circles of the aristocracy of his time, but on his mother's side and by his marriage with Cornelia, the daughter of Cinna, he was also related to the great plebeian Marius, and connected with the democratic party. Politically he had joined this party at an early day. In reality Cæsar was neither a democrat nor an aristocrat. He felt himself a monarch to whom all parties should be subordinate.—But Cæsar was also a thorough stranger to the thought of merely playing the rôle of the friend of the people and to erect a tyranny by the aid of the lower masses. He had a heart for the weal and woe of the people. The weaknesses and failings of the multitude could of course not escape his clear vision. He knew that the multitude needed direction and in certain circumstances a firm hand, but he cheerfully fulfilled the first duty of a monarch—to do good to the people. He clearly saw that the aristocratic party would yield to monarchic power only if forced to, and he well knew that the democratic party would far more readily conquer power for its chief leader, and leave it to him. He held to his party even when the following of its colors brought him the very reverse of promotion; but he looked after the interests of the great masses of the people more carefully and diligently after he had come to full power and needed their approbation no longer, than at the time of his rise. With increasing self-consciousness Cæsar became purer, more humane, greater. Power, which ruins so many weaker men, was to him a condition of his own ennoblement. Without it his unsatisfied spirit was unrestrained, passionate, excitable. In power he recognized his lofty destiny and by it his intellect received a harmonious development. There is no greater proof of his inborn greatness than this. In his youth he was deeply involved in the intrigues of parties, and
