was far from being unstained by the filth of the scandalous means employed on every side in these struggles. He employed, too, on occasions, the leaders of bands who were ready for the perpetration of any crime. But even in his youth, whenever he took a personal stand, he showed himself as noble as he was brave. He defended with energy the cause of his marriage against the powerful Sulla, who tried to dissolve it. He defended the cause of history against the ruling aristocracy when he restored in splendor the statue of the proscribed Marius, and lauded in public funeral orations the services of the fallen leaders of democracy. He defended the same cause of history against the narrow party rage of his own adherents by showing due honor to Pompey and Sulla, his political opponents. Whenever it seemed possible to attain a political purpose through an understanding with men the most prominent and powerful, he took all pains to take that peaceful course. Through the different alliances which he brought about, he won more than one great bloodless victory. He was especially averse to brute force and preferred the peaceful measures of political effort and demonstration, to military action. He did not love war, though he knew he was the greatest soldier of his time, and was sure in advance of the greatest triumphs. He was first a statesman and then a warrior. The great truth that war is merely the violent form of politics, and must therefore be conditioned, directed and limited by the political mind, has perhaps never been made so clear in history, as by the life and career of Julius Cæsar.—The magnanimity with which Cæsar spared his enemies is proverbial. Even during the civil war he respected the Roman and the man in his enemies. His humane conduct was the more praiseworthy when compared with the bloody persecutions which all victorious leaders of parties inflicted on their political opponents, both before and after him. Cæsar wished to combine all the forces of the nation and direct them to the common service of the fatherland. He was raised high above the narrowness and shortsightedness of party hatred. In this, too, he was a real emperor, that his guidance of the state did not favor the oppression of one party by another, but the free rivalry of all parties, for the common weal. He erred rather in forgiving his enemies too readily than in punishing them too severely. Conscious of his own magnanimity he was too much inclined to attribute to others better intentions than they had; and because he himself saw clearly how necessary he was to the state, he hastily, but too hastily concluded that the aristocracy saw it likewise.—Cæsar was not religious after the traditional manner of the Romans. He was initiated into the arts of the priesthood at an early age, and knew how greatly the ancient religion was misused for political purposes. He ridiculed the signs and wonders which the priests held in readiness to check obnoxious measures, and allowed himself to be guided in his acts neither by

the warnings nor threats drawn from the flight of birds and the omens of sacrifices. He even gave open expression to his contempt for these things, to the horror of the faithful and the vexation of hypocrites. But his firm belief in a divine destiny in which he confided, speaks for the instinctive religious trait in his character far more than the temples which he built in honor of the gods.—The cheerful amiability of his nature was especially manifest in his liberality, his social connections, and his relations with women. He was generous to such a degree that he might have been considered a spendthrift had he not been Cæsar. On this account he became involved in his youth in debt to such an extent that he was able to pay it only in his riper years. But when he controlled the power of the state, and with it corresponding wealth, his coffers were never empty, no matter how liberal were his gifts. The youth might have been considered a spendthrift, because he did not limit his expenses by his income. The man of mature years was evidently an excellent manager, for he achieved great things without disturbing the balance between his income and expenses. Different traits of his are handed down which show his tender relations to women. The respect for his mother, the love he bore his first and his last wife, the fatherly affection he bestowed on his daughter Julia, and even the tender regard shown his second wife after divorce, have been signalized by history. That such a man found much favor with women and enjoyed this favor in a high degree, can astonish no one. But no matter how many love affairs he may have had in later years, he was too much of a statesman to let his loves interfere with the interests of the state. He made good use of marriages to strengthen political alliances, but he drew a very sharp distinction between his private loves and politics. He could not endure that the institution of marriage should in any way be despised or attacked by the people.—He was like all men of monarchical nature, a lover of order and too great an organizer to undervalue the significance of fixed forms of law. At the same time his genius was so marked and his nature so imperial that often in his life he overstepped the barriers high and low of recognized law, and demanded without hesitation exceptions from the rule wherever it seemed needful to him from high political considerations. He carried the law of his own mode of action in himself; when in conflict with the laws of the land he broke through them in order to fulfill his mission; he was clearly conscious that he was called to found a new order of things.—He was not a hero of religion, but of science; not a churchman, but a statesman. He, like all distinguished Romans, had to thank Grecian masters for his early scientific training. He was as familiar with Greek as with Latin literature and was even a master of language. He was in his studies a sober but a penetrating investigator, and gave himself up with pleasure to natural sciences and grammar. His

correction of the calendar is one of the examples of the application of science to public uses most worthy of imitation. He had a great reputation as an orator even in those days of most brilliant formal eloquence, although he despised the framing of ornate phrases, and sought effect only through the clearness of his thoughts and the power of his personality. From his "Commentaries on the Gallic War," we learn to value his smooth and natural style, which describes situations and events so clearly, without pretension or idle ornament. He also engaged in written political controversies, being no less skillful in encounters with the pen than in battles with the sword. Pre-eminently in favor of publicity, he was the first to have the proceedings of the senate and the people made public, in writing. The political press may honor him as its intellectual father. He aided and promoted higher culture in every direction.—His chief study, however, was the state. Single men of antiquity may be named who surpassed him in all other branches of intellectual activity, but as a statesman he holds unquestionably the first rank in the ancient world. "His talent for organization was wonderful; never did a statesman so cement his alliances, never did a commander so weld and hold together an army of disconnected and opposing elements, as Cæsar did his coalitions and his legions. Never did a ruler judge his instruments with so penetrating a glance. No man ever knew better how to put the right man in the right place. He was a monarch, but never played at being king. Perfectly pliant and flexible, agreeable and graceful in conversation, obliging to every man, he appeared to desire nothing but to be the first among his equals. No matter how much cause troubled relations with the senate gave him, he never had recourse to brutality like that of the 18th Brumaire. Cæsar was a monarch, but he was never affected by the giddiness of tyranny. He accomplished the possible, and never neglected the good for the sake of the impossible better. He never disdained to mitigate incurable evils by, at least, palliative measures. But wherever he recognized that fate had spoken he always submitted. Alexander on the Hyphasis, Napoleon at Moscow, turned back because they could not help it, and were angry at fate because it grants only limited success to its favorites; Cæsar turned back willingly from the Thames and the Rhine, and kept in mind on the Danube and the Euphrates that it was not for him to entertain any exaggerated plan of world-conquest.—Like every true statesman he served the people not for the sake of reward, not even for the reward of their love, but sacrificed the favor of his contemporaries for the blessing of the future, and above all for the glory of saving and rejuvenating his nation." (Momm- sen.)—He restored long-absent peace to the state, and re-established law and order in it; he limited the power of the senate, and the influence of the comitia; but at the same time he saw to it that under his own personal direction and control only

proper men should be elected to public offices and should make a moderate use of their official power. He did not allow the provinces to be fleeced by their governors. He restored order to the finances; restrained the army within the bounds of duty, and purified the administration of justice of many abuses. He promoted the cause of civilization in every way on the basis of Greco-Roman science and culture. He sought to infuse new life into the old Roman aristocracy by taking into their body new persons of distinction to elevate the condition of the oppressed classes of the people by colonization on a large scale, by modifying the laws relating to debt and the opening up of new industries; to give support to the poor by the systematic distribution of corn among them. He extended the right of citizenship farther over the nearest provinces and thus broadened the real foundation of the Roman commonwealth. Through numerous colonies in the remote provinces he opened a new field to the progress of Roman civilization, and thus promoted the civilization of these provinces themselves. His great edifices employed the laboring power of the nation and increased the common weal, for in them the useful and the beautiful were combined. He was hindered in the execution of many great plans by the passions, as foolish as they were wicked, of the so-called patriots, who, by the murder of the greatest of Roman statesmen, inflicted the deepest wound on their fatherland which they thought to save in this manner.—Cæsar cherished the design of giving to the world a comprehensive code of law. If ever there was a Roman fitted to leave the world *Roman-human* laws, that Roman was Cæsar. But fate decided against him here, and 500 years later gave a far inferior ruler the glory of framing, from the memories of a greater past, a code which the most liberal Roman with creative mind had wished in vain to produce.—Cæsar, dying, bequeathed to the world the idea of empire. History was juster than Rome, inasmuch as it connected his name indissolubly with the grandest institution which antiquity introduced into the world, but the full perfection of which only the future was destined to see. The Romans themselves preferred the name of Augustus for their emperors.—The name of Cæsar designates also the degenerate variety of the empire known as Cæsarism which in our time has been renewed by the Napoleons, and which would therefore be more correctly termed Napoleonism. It has, it is true, certain characteristic traits which recall Cæsar, but still more his successors, the old Roman emperors, and which recall especially the connection with democratic institutions of a political one-man power inclined to dictatorship, an absolute autocracy on the basis of the fourth estate, upon which the ruler leans and whose interests he cares for. Cæsarism wishes well to the multitude which does homage to it, and is tyrannical toward all opposition which stands in its way. It has a political ideal which it wishes to realize, but in this ideal freedom has

no dignity and no power. Everything is directed from above, as if by a god, with the approval of an accommodating senate and subservient representatives of the masses. The financial, the military, the intellectual powers of the nation are all subservient to the state and to Cæsar who is the highest expression of the state and represents its unity, its power and its dignity. The administration introduced by Cæsarism is distinguished by a well-considered system of offices which are easily controlled from a centre by skillful machinery, and therefore such an administration has rather a mechanical than an organic character. Its character is such that it does not allow of any self-determination of its members. It prevents the danger of party rule, but it suppresses all parties. It acknowledges the duty of caring for the nation and advancing its interests; it is a powerful stimulant to enterprises which promote the common good, but still it hinders the free development of the best powers of the nation, for this is possible only in the atmosphere of a more general freedom. It seizes power quickly and wields it unsparingly. At home it wields too much power; abroad it is bold and enterprising. In order to find recognition and safety, it needs dazzling results at home and glorious victories abroad. Disaster and defeat endanger its existence.—A cultured nation endures Cæsarism only when morally debased and it apprehends the loss of its property and its pleasures. People who love freedom combat it as the enemy of their liberties. It can be approved only when the Cæsar far surpasses the nation which he rules, in mind and character. "An undeceivable, infallible and indefatigable head, and an incapable or unworthy nation," such are, according to Ollivier's happy expression, "the fundamental conditions of a Cæsarian democracy." Such a head is not to be found. The powers of a Cæsar even are limited from the first. Even for a gifted Cæsar it is not possible to acquire the wisdom of age in youth, nor to preserve youthful freshness in advanced years. Cæsarism is not reconcilable with hereditary monarchy, and an elective monarchy is no safeguard against the Cæsar-madness which seizes those who wickedly pretend to be the possessors of preterhuman power. J. C. BLUNTSCHLI.

CALENDAR. (See PARLIAMENTARY LAW.)

CALHOUN, John Caldwell, was born in Abbeville district, S. C., March 18, 1782, and died in Washington city, March 31, 1850. He was graduated at Yale in 1804, was admitted to the bar in 1807, and served as representative in congress 1811-17 (see BANK CONTROVERSIES, III.), when he became secretary of war. He was vice-president from 1825 until 1831, when he resigned (see NULLIFICATION) to become senator from South Carolina. He was secretary of state 1843-5 (see ANNEXATIONS, III.), when he again became senator, dying in office. He was the particularist of particularists, the leader of that ele-

ment of the democratic party which made no allowance for the country's development or growing necessities, but insisted on construing the constitution according to the needs of 1777-89. He held that the states were sovereign, (see STATE SOVEREIGNTY); that the constitution was merely a compact or treaty between separate, sovereign nations, to be construed entirely by the rules of international law; that such a treaty, when broken by one state, was no longer binding upon any; and that, consequently, the declaration of a state that the constitution had been violated, absolved the people of that state from any further allegiance or obedience to the United States until the wrong had been made good. (See ALLEGIANCE, SECESSION.) It must be remembered that, to Calhoun's mind, this theory did not militate against the existence of the Union; it only operated as a check upon the tyranny of a national majority. He was a master of logic; let his premises, that the states were originally sovereign, and that they separately, not unitedly, revolted from Great Britain (see DECLARATION OF INDEPENDENCE), be granted, and it would be difficult to make any head against his arguments. He was always in advance of the other politicians of his section, and the south only came up, in 1860, abreast with the doctrine which he had taught in 1850. He died in the unhappy belief that the south had been entrapped, under the supposition that she was merely forming an alliance with a more powerful neighbor, into a corporate union in which she was to be helpless under her neighbor's superiority in number of voters and other advantages. (See DEMOCRATIC PARTY, III., IV.; BANK CONTROVERSIES, III.; NULLIFICATION; ANNEXATIONS, III.; COMPROMISES, V.; SLAVERY; STATE SOVEREIGNTY; TERRITORIES; SECESSION; ADMINISTRATIONS, VIII., IX., XIV.)—See Jenkins' *Life of Calhoun*; Parson's *Famous Americans*; Crallé's *Works of Calhoun*; A. H. Stephens' *War Between the States*; Appleton's *American Cyclopædia*, art. "Calhoun"; Thomas' *Carolina Tribute to Calhoun*; *24 National Quarterly Review*. ALEXANDER JOHNSTON.

CALIFORNIA, a state of the American Union, formed from territory acquired from Mexico. (See ANNEXATIONS, IV.) One of the earliest events of the Mexican war was the formation of a provisional government in 1846 in the Mexican province of Upper, or Alta California, by commodore Stockton and colonel J. C. Fremont. When the treaty of Guadalupe Hidalgo, in 1848, transferred to the United States the title to the soil, the provisional military government was continued, owing to the inability of congress to settle the status of slavery in the acquired territory. (See WILMOT PROVISIO.) The discovery of gold, in 1848, increased the population so rapidly that in 1849 a convention, called by the military governor, framed a state constitution, Sept. 1-Oct. 13, which was ratified by popular vote, Nov. 13. It fixed the state limits as follows: "Beginning

where longitude 120° west from Greenwich intersects latitude 42° north; thence south to latitude 39° north; thence southeast to the river Colorado; thence down the Colorado to the Mexican boundary, and west on the Mexican boundary line to the Pacific ocean; thence in a northwesterly direction along the Pacific coast to latitude 42° north, and thence east to the beginning; including all the islands, harbors and bays on the Pacific coast." The capital was to be San Jose, since changed to Sacramento by the legislature, and the governor was to hold office for a term of two years, changed in 1862 to four years. Article I, § 18, provided that slavery should never be tolerated in the state. From this provision arose the opposition in congress to California's admission, which was not accomplished until Sept. 9, 1850. (See COMPROMISES, V.)—In national politics California was at first steadily democratic. In 1852 the democrats obtained entire control of the state government, and retained it until 1860. A strong whig opposition, averaging about 42 per cent. of the total vote, was kept up until 1855, and the opposition vote was then for several years very evenly divided between the republican and American, or know nothing, parties. After 1855 an opposition was developed among the democrats, headed by U. S. senator Broderick, but it never succeeded in ousting the regular wing from the control of the party. In 1860 democratic division gave the electoral vote of the state to Lincoln, the popular vote being 39,173 rep., 38,516 Douglas dem., 34,334 Breckenridge dem., and 6,817 const. union; but the Douglas democracy had a strong majority in the legislature. In *national* politics, 1860–76, the state was steadily republican, though usually by a close vote; in 1868 Grant had but 506 majority in a total vote of 108,660. In 1880 the state cast its electoral vote for Hancock by a very slender majority, one of the democratic electors being defeated.—In *state* politics, 1860–76, California has been alternately democratic and republican. Since 1876 its politics have been a chaos. The national parties have been supplemented by various state organizations based on opposition to Chinese immigration, to the influence of great corporations in politics, or to the growth of monopoly in land, or on a general support of the interests of workingmen. The result of the continuous agitation kept up by these was the formation of a new constitution which was adopted by a state convention, March 3, 1879, and ratified by popular vote May 7, 1879. Among other changes this instrument prohibited the admission of any native of China to the privileges of an elector; the grant of money or special privileges to corporations by the legislature; the passage of special or local laws by the legislature in thirty-three specified cases; the buying and selling of shares of stock in boards under the control of any association; the making of contracts for future delivery of stock, or of sales of stock on margins; the grant of aid or the pledge of credit, by the legislature, or by any county,

city, or municipal corporation, to any institution controlled by any sect, or to any individual or corporation whatever; and the grant by any of these bodies of extra compensation to any public servant. It authorized the legislature to limit the charges of telegraph or gas companies; retired two of the six supreme court justices at the end of each four years; withheld the salary of judges of the higher grades so long as their court decisions were more than ninety days in arrears; forfeited all existing charters under which *bona fide* organization had not taken place; forbade the "watering" of stock; provided for minority stockholders' representation in boards of directors; ordered all corporations to submit their books to the inspection of stockholders; made all railroad, canal and transportation companies subject to legislative control; established an elective board of railroad commissioners to fix rates of charges by railroad and transportation companies, which rates were to be observed by the companies under penalty of not more than \$20,000 fine for each offense, and, in the discretion of the legislature, the forfeiture of the charter; condemned the holding of large tracts of land by individuals or corporations as against the public interest; and forbade the employment of Chinese by private or municipal corporations. Its provisions have been thus fully given because they were, at the time of the adoption of the constitution, generally attributed to the influence of local California demagogues, and excited wide-spread alarm among capitalists and corporations, many of whom made preparations to leave the state. The success or failure of the constitution is not yet well assured. (See CONSTITUTIONS, STATE.)—The derivation of the name California is very uncertain; it was first applied by Bernal Diaz to a single bay on the coast, and thence transferred to the entire country. The popular name is *The Golden State*.—GOVERNORS: Peter H. Burnett (1850–52), John Bigler (1852–6), J. Neely Johnson (1856–8), John B. Weller (1858–60), Milton S. Latham (1860–62), Leland Stanford (1862–4), F. F. Low (1864–8), Henry H. Haight (1868–72), Newton Booth (1872–6), William Irwin (1876–80), George C. Perkins (1880–84).—See Poore's *Federal and State Constitutions*; Cutts' *Conquest of California*; Tut-till's *History of California*; Capron's *History of California*; Norman's *Youth's History of California*; Soule's *Annals of San Francisco*; McClellan's *The Golden State*; Appleton's *Annual Cyclopædia*, 1861–80.

ALEXANDER JOHNSTON.

CANADA. (See DOMINION OF CANADA.)

CANALS. A canal is an artificial channel, filled with water kept at the desired level by means of locks or sluices, forming a communication between two or more places—1. *Historical Sketch of Canals. Ancient Canals.* The comparative cheapness and facility with which goods may be conveyed by sea or by means of navigable rivers seem to have suggested, at a very early

period, the formation of canals. The best authenticated accounts of ancient Egypt represent that country as intersected by canals conveying the waters of the Nile to the more distant parts of the country, partly for the purpose of irrigation and partly for that of internal navigation. The efforts made by the old Egyptian monarchs, and by the Ptolemies, to construct a canal between the Red sea and the Nile, are well known, and evince the high sense which they entertained of the importance of this species of communication. (Ameilhon, *Commerce des Egyptiens*, p. 76.)—Greece was too small a territory, too much intersected by arms of the sea, and subdivided into too many independent states, to afford much scope for inland navigation. Attempts were, however, made to cut a canal across the isthmus of Corinth; but they did not succeed.—The Romans did not distinguish themselves in canal navigation. Their aqueducts, the stupendous ruins of which attest the wealth and power of their founders, were intended to furnish supplies of water to some adjoining city, and not for the conveyance of vessels or produce.—2. *Chinese Canals.* In China, canals, partly for irrigation and partly for navigation, have existed from a very early period. The most celebrated among them is the Imperial or Grand canal, commencing at Hang-tchou, near the mouth of the Tching-tang-chiang river, in about latitude 30° 22' north, longitude 119° 45' east; it then stretches north, and crossing the great rivers Yang-tse-Kiang, and Hoang-ho, terminates at Linting, on the Eu-ho river, in about latitude 37° north, longitude 116° east. The direct distance between the extreme limits of the canal is about 512 miles, but, including its bends, it is above 650 miles in length; and as the Eu-ho, which is a navigable river, unites with the Pei-ho, also navigable, an internal water communication is thus established between Hang-tchou and Peking across 10° of latitude. But apart from its magnitude and utility, the Grand canal does not rank high as a work of art. A vast amount of labor has, however, been expended upon it; for though it mostly passes through a flat country, and winds about to preserve its level, its bed is in parts cut down to a great depth, while in other parts it is carried over extensive hollows, and even lakes and morasses, on vast mounds of earth and stone. The sluices, which preserve its waters at the necessary level, are all of very simple construction, being merely intended to elevate or depress the height of the water by a few inches; as, excepting these, there is not a single lock or interruption to the navigation throughout the whole length of the canal. It is seldom more than 5 or 6 feet in depth, and in dry seasons is sometimes considerably less. The vessels by which it is navigated are sometimes rowed, and sometimes dragged by men, so that the navigation is for the most part slow. The canal is frequently faced with stone. The construction of this great work is usually ascribed to the Tartars, but the Chinese allege that it was merely repaired and renovated by the latter, and that it had been

completed in the remotest period of their history. (Barrow's *China*, p. 335, etc.; La Lande, *Canaux de Navigation*, p. 529, etc.)—3. *Italian Canals.* The Italians were the first people in modern Europe that attempted to plan and execute canals. They were principally, however, undertaken for the purpose of irrigation; and the works of this sort executed in the Milanese and other parts of Lombardy, in the eleventh, twelfth and thirteenth centuries, are still regarded as models, and excite the warm admiration of every one capable of appreciating them. In 1271 the Navilio Grande, or canal leading from Milan to Abbiate Grasso and the Tesino, was rendered navigable. (Young's *Travels in France*, etc., vol. ii., p. 170.)—4. *Dutch Canals.* No country in Europe contains, in proportion to its size, so many navigable canals as the kingdom of the Netherlands, and particularly the province of Holland. The construction of these canals commenced as early as the twelfth century, when, owing to its central and convenient situation, Flanders began to be the entrepôt of the commerce between the north and south of Europe. Their number has since been astonishingly increased. "Holland," says Mr. Phillips, in his "History of Inland Navigation," is "intersected with innumerable canals. They may be compared in number and size to our public roads and highways; and as the latter with us are continually full of coaches, chaises, wagons, carts and horsemen going from and to the different cities, towns and villages, so, on the former, the Hollanders in their boats and pleasure barges, their treckschuyts, and vessels of burden, are continually journeying and conveying commodities for consumption or exportation from the interior of the country to the great cities and rivers. An inhabitant of Rotterdam, may, by means of these canals, breakfast at Delft or the Hague, dine at Leyden, and sup at Amsterdam, or return home again before night. By them, also, a most prodigious inland trade is carried on between Holland and every part of France, Flanders and Germany. When the canals are frozen over, they travel on them with skates, and perform long journeys in a very short time; while heavy burdens are conveyed in carts and sledges, which are then as much used on the canals as on our streets.—The yearly profits produced by these canals are almost beyond belief; but it is certain, and has been proved, that they amount to more than £250,000 for about 400 miles of inland navigation, which is £625 per mile, the square surface of which mile does not exceed two acres of ground; a profit so amazing that it is no wonder other nations should imitate what has been found so advantageous.—The canals of Holland are generally 60 feet wide and 6 deep, and are carefully kept clean; the mud, as manure, is very profitable. The canals are generally levels; of course locks are not wanted. From Rotterdam to Delft, the Hague, and Leyden, the canal is quite level, but is sometimes affected by strong winds. For the most part the canals are elevated above the fields or the country, to

enable them to carry off the water which in winter inundates the land. To drain the water from Delftland, a province not more than 60 miles long, they employ 200 windmills in springtime to raise it into the canals. All the canals of Holland are bordered with dams or banks of immense thickness, and on these depends the security of the country from inundation; of course it is of great moment to keep them in the best repair; to effect which there is a kind of militia, and every village has a magazine of proper stores and men, whose business it is to convey stones and rubbish in carts to any damaged place. When a certain bell rings, or the waters are at a fixed height, every man repairs to his post. To every house or family there is assigned a certain part of the bank, in the repair of which they are to assist. When a breach is apprehended, they cover the banks all over with cloth and stones."—5. *Canal from Amsterdam to Nieuwediep, near the Helder.* The object of this canal, which is the greatest work of its kind in Holland, and probably in the world, is to afford a safe and easy passage for large vessels from Amsterdam to the German ocean. This city has 40 feet of water in the road in front of its port, but the pampus or bar at the junction of the Y with the Zuyder Zee, 7 miles below, has only a depth of 10 feet; and hence all ships of any considerable burden entering or leaving the port must unload and load part of their cargoes without the bar. As the Zuyder Zee is everywhere full of shallows, all ordinary means of improving the access to Amsterdam were necessarily ineffectual; and the resolution was, therefore, at length adopted, of cutting a canal from the city to the Helder, the most northern point of the province of Holland. The distance between these extreme points is 41 English miles, but the length of the canal is about 50½. The breadth at the surface of the water is 124½ English feet (120 Rhinland feet); the breadth at bottom 36; the depth 20 feet 9 inches. Like the Dutch canals generally, its level is that of the highest tides, and it receives its supply of water from the sea. The only locks it requires are, of course, two tide locks at the extremities; but there are, besides, two sluices, with floodgates in the intermediate space. It is crossed by 18 drawbridges. The locks and sluices are double, *i. e.*, there are two in the breadth of the canal; and their construction and workmanship are said to be excellent. They are built of brick, for economy; but bands of limestone are interposed at intervals, and these project about an inch beyond the brick, to protect it from abrasion by the sides of vessels. There is a broad towing-path on each side, and the canal is wide enough to admit of two frigates passing.—The line which the canal follows may be easily traced on a map of Holland. From the Y at Amsterdam it proceeds north to Purmerend; thence west to Alkmaar lake; again north by Alkmaar to a point within 2 miles of the coast, near Petten; whence it runs nearly parallel to the coast till it joins the sea a little to the east of the Helder, at the fine harbor of Nieuwediep,

formed within the last 50 years. At the latter place there is a powerful steam engine for supplying the canal with water during neap tides, and for other purposes. The time spent in towing vessels from Nieuwediep to Amsterdam is 18 hours. The Helder is the only spot on the shores of Holland that has deep water; and it owes this advantage to its being opposite to the Texel, which, by contracting the communication between the German ocean and the Zuyder Zee to a breadth of about a mile, produces a current which scours and deepens the channel. Immediately opposite the Helder there are 100 feet water at high tides, and at the shallowest part of the bar to the westward there are 27 feet. In the same way, the artificial mound which runs into the Y opposite Amsterdam, by contracting the waterway to about 1,000 feet, keeps a depth of 40 feet in the port (at high water), while above and below there is only 10 or 12.—The canal was begun in 1819, and finished in 1825. The cost was estimated at the sum of 10,000,000 or 12,000,000 florins, or about £1,000,000. If we compute the magnitude of this canal by the cubic contents of its bed, it is the greatest, we believe, in the world, unless some of the Chinese canals be exceptions. The volume of water which it contains, or the *prisme de remplissage*, is twice as great as that of the New York canal, or the canal of Languedoc, and two and a half times as great as that of the artificial part of the Caledonian canal. In consequence, however, of the facility with which the Dutch canal was dug, and of the evenness of the ground through which it passes, the difficulties the engineer had to meet in making it were trifling compared to those which had to be overcome in constructing the canals now mentioned. We have not learned what returns this canal yields; most probably it is not, at least in a direct point of view, a profitable concern. Even in Holland, notwithstanding the lowness of interest, it would require tolls to the amount of £40,000 a year to cover interest and expenses; and so large a sum can hardly, we should think, be raised by the very moderate tolls laid on the ships passing through it. This, however, is not the only consideration to be attended to in estimating the value of a work of this sort. Its influence in promoting the trade of Amsterdam, and, indeed, of Holland, may far more than compensate for its cost. It is evident, too, that the imposition of oppressive tolls would have effectually counteracted this advantage; that is, they would have defeated the very object for which the canal was constructed.—A new canal has been built in Holland from the Zuyder Zee at Vuurtoren to Amsterdam, through the Het-ij, Wij-Ker-meer to the North sea near Breesaap. The entrance into the North sea is by two jetties, that on the north 2,000 metres in length, that on the south 1,500. The canal drains 6,000 hectares (15,000 acres) of land, and shortens the journey from Amsterdam to the sea by 56 kilometres.—It is almost unnecessary to say that railways have superseded the use of canals for passenger traffic, and that the

service of the latter is confined almost entirely to the carriage of goods.—6. *Danish Canals.* The Holstein canal, formerly belonging to Denmark, is of very considerable importance. It joins the river Eyder with Kiel bay on the northeast coast of Holstein, forming a navigable communication between the North sea, a little to the north of Heligoland, and the Baltic, enabling vessels to pass from the one to the other by a short cut of about 100 miles, instead of the lengthened and difficult voyage round Jutland, and through the Cattegat and the sound. The Eyder is navigable for vessels not drawing more than 9 feet water from Tonnigen, near its mouth, to Rendsburg, where it is joined by the canal, which communicates with the Baltic at Holtzenau, about 3 miles north of Kiel. The canal is about 26 English miles in length, including about 6 miles of what is principally river navigation. The excavated portion is 95 feet wide at the top, 51 feet 6 inches at bottom, and 9 feet 6 inches deep (Eng. measure). Its highest elevation above the level of the sea is 24 feet 4 inches; to which height vessels are raised and let down by 6 locks or sluices. It is navigable by vessels of 120 tons burden, or more, provided they are constructed in that view. The total cost of the canal was about £500,000. It was opened in 1785, and has so far realized the views of its projectors as to enable coasting vessels from the Danish islands in the Baltic and the east coast of Holstein, Jutland, etc., to proceed to Hamburg, Holland, England, etc., in less time, and with much less risk, than, in the ordinary course of navigation, they could have cleared the point of the Skaw, and conversely with ships from the west. The smaller class of foreign vessels, particularly those under the Dutch and Hanseatic flags, navigating the Baltic and North seas, have largely availed themselves of the facilities afforded by this canal. About 3,000 vessels pass annually through the canal. This is a sufficient evidence of its utility. It would, however, be much more frequented, were it not for the difficult navigation of the Eyder from the sea to Rendsburg. The dues are moderate. (Coxe's *Travels in the North of Europe*, 5th ed., vol. v., p. 239, where there is a plan of the canal; Catteau, *Tableau des Etats Danois*, tom. ii., pp. 300-304; and *private information*.)—7. *Swedish Canals.* The formation of an internal navigation connecting the Cattegat and the Baltic has long engaged the attention, and occupied the efforts, of the people and government of Sweden. Various motives conspired to make them embark in this arduous undertaking. The sound and other channels to the Baltic were commanded by the Danes, who were able, when at war with the Swedes, greatly to annoy the latter by cutting off all communication by sea between the eastern and western provinces of the kingdom. Hence, in the view, partly of obviating this annoyance and partly of facilitating the conveyance of iron, timber, and other bulky products from the interior to the coast, it was determined to attempt forming an internal navigation, by

means of the river Gotha, and the lakes Wener, Wetter, etc., from Gottenburg to Soderkøping on the Baltic. The first and most difficult part of this enterprise was the perfecting of the communication from Gottenburg to the lake Wener. The Gotha, which flows from the latter to the former, is navigable, through by far the greater part of its course, for vessels of considerable burden; but, besides others less difficult to overcome, the navigation at the point called Tröllhætta is interrupted by a series of cataracts about 112 feet in height. Owing to the rapidity of the river, and the stubborn red granite rocks over which it flows, and by perpendicular banks of which it is bounded, the attempt to cut a lateral canal, and still more to render it directly navigable, presented the most formidable obstacles. But, undismayed by these impediments, on which it is, indeed, most probable he had not sufficiently reflected, Polhem, a native engineer, undertook, about the middle of last century, the Herculean task of constructing locks in the channel of the river, and rendering it navigable! Whether, however, it was owing to the all but insuperable obstacles opposed to such a plan, to the defective execution, or deficient strength of the works, they were wholly swept away, after being considerably advanced, and after vast sums had been expended upon them. From this period down to 1793 the undertaking was abandoned; but in that year the plan was proposed, which should have been adopted at first, of cutting a lateral canal through the solid rock, about 1½ miles from the river. This new enterprise was begun under the auspices of a company incorporated for the purpose in 1794, and was successfully completed in 1800. The canal is about 3 miles in length, and has about 6½ feet water. This is the statement of Catteau, *Tableau de la Mer Baltique*, tome ii., p. 77; Oddy, in his *European Commerce*, p. 306, and Balbi, *Abrégé de la Géographie*, p. 385, say that the depth of water is 10 feet. It has 8 sluices, and admits vessels of above 100 tons. In one part it is cut through the solid rock to the depth of 72 feet. The expense was a good deal less than might have been expected, being only about £80,000. The lake Wener, the navigation of which was thus opened with Gottenburg, is very large, deep, and encircled by some of the richest of the Swedish provinces, which now possess the inestimable advantage of a convenient and ready outlet for their products.—As soon as the Tröllhætta canal had been completed, there could be no room for doubt as to the practicability of extending the navigation to Soderkøping. In furtherance of this object the lake Wener was joined to the lake Wetter by the Gotha canal, which admits vessels of the same size as that of Tröllhætta; and the prolongation of the navigation to the Baltic from the Wetter, partly by two canals of equal magnitude with the above, and partly by lakes, has since been completed. The entire undertaking is called the Gotha navigation, and deservedly ranks among the very first of the kind in Europe. Besides the above, the canal of Arboga

unites the lake Hielmar to the lake Maelar; and since 1819 a canal has been constructed from the latter to the Baltic at Södertelje. The canal of Strömsholm, so called from its passing near the castle of that name, has effected a navigable communication between the province of Dalecarlia and the lake Maelar, etc. The total revenue of the 6 Swedish canals in 1864 was £36,436. (*Report of Mr. Hamilton, Secretary of Legation, of Feb. 9, 1867; Coxe's Travels in the North of Europe, 5th ed. vol. iv., pp. 253-266, and vol. v., pp. 58-66; Thomson's Travels in Sweden, p. 35, etc.*)—8. *French Canals.* The first canal executed in France was that of Briare, 34½ English miles in length, intended to form a communication between the Seine and Loire. It was commenced in 1605, in the reign of Henry IV., and was completed in 1642, under his successor, Louis XIII. The canal of Orleans, which joins the above, was commenced in 1675. But the most stupendous undertaking of this sort, that has been executed in France, or indeed on the continent, is the canal of Languedoc. It was projected under Francis I., but was begun and completed in the reign of Louis XIV. It reaches from Narbonne to Toulouse, and was intended to form a safe and speedy means of communication between the Atlantic ocean and the Mediterranean. It is 64 French leagues in length, and 6 feet deep; and has, in all, 114 locks and sluices. In its highest part it is 600 feet above the level of the sea. In some places it is conveyed, by bridges of great length and strength, over large rivers. It cost upward of £1,300,000; and reflects infinite credit on the engineer, Riquet, by whom it was planned and executed.—Besides this great work, France possesses several magnificent canals, such as that of the Centre, connecting the Loire with the Saône; of St. Quentin, joining the Scheldt and the Somme; of Besançon, joining the Saône, and consequently the Rhone, to the Rhine; of Burgundy, joining the Rhone to the Seine, etc. Some of these are of very considerable magnitude. The canal of the Centre is about 72 English miles in length. It was completed in 1791, at an expense of about 11,000,000 francs. Its summit level is about 240 feet above the level of the Loire at Digoin; the breadth at the water's edge is about 48 feet, and at bottom 30 feet; depth of water, 5½ feet; number of locks, 81. The canal of St. Quentin, 28 English miles in length, was completed in 1810. The canal joining the Rhone to the Rhine is the most extensive of any. It stretches from the Saône, a little above St. Jean de Losne, by Dol, Besançon, and Mulhouse, to Strasburg, where it joins the Rhine—a distance of about 200 English miles. From Dol to Vogeaucourt, near Monthéliard, the canal is principally excavated in the bed of the Doubs. It is not quite finished. The canal of Burgundy will, when completed, be about 242 kilomètres, or 150 English miles in length; but at present it is only navigable to the distance of about 95 kilomètres. In addition to these, a great many other canals have been finished, while several are in

progress, and others projected. There is an excellent account of the French canals in the *Histoire de la Navigation Intérieure de la France*, by M. Dutens, in 2 vols. 4to, and to it we beg to refer the reader for further details. He will find at the end of the second volume a very beautiful map of the rivers and canals of France.—The railroads now constructed in France, have, however, checked the progress of canals. We may observe, too, that the state of the law in France is very unfavorable to the undertaking and success of all great public works; and we are inclined to attribute the comparative fewness of canals in France, and the recent period at which most of them have been constructed, to its influence. In that country, canals, docks, and such like works, are mostly carried on at the expense and for behoof of government, under the control of its agents. No scope has been given to the enterprise of individuals or associations. Before either a road or a canal can be constructed, plans and estimates must be made out and laid before the minister of the interior, by whom they are referred to the prefect of the department, and then to the *Bureau des Ponts et des Chaussées*; and supposing the project to be approved by these, and the other functionaries consulted with respect to it, the work must after all be carried on under the superintendence of some public officer. In consequence of this preposterous system, very few works of this description have been undertaken as private speculations; and while not a few of those begun by government remain unfinished and comparatively useless, those that are completed have, as was to be expected, rarely proved profitable. There are some good remarks on this subject in the useful work of M. Dupin on the *Forces Commerciales* of Great Britain.—9. *Prussian Canals.* The Prussian states are traversed by the great navigable rivers the Elbe, the Oder, and the Vistula; the first having its embouchure in the North sea, and the others in the Baltic. The formation of an internal navigation to join these great *waterways* excited the attention of government at a distant period; and this object has been successfully accomplished partly by the aid of the secondary rivers falling into the above, and partly by canals. In 1663 the canal of Muhlrose was undertaken, uniting the Oder and the Spree; the latter being a navigable river falling into the Havel, also a navigable river joining the Elbe near Havelburg. But the navigation from the Oder to the Elbe by this channel was difficult and liable to frequent interruption; and to obviate these defects, Frederick the Great constructed, toward the middle of last century, the Finnow canal, stretching from the Oder at Oderburg to the Havel near Liebenwalde; the communication is thence continued by the latter and a chain of lakes to Plauen, from which point a canal has been opened joining the Elbe near Magdeburg.—The Elbe being in this way connected with the Oder by a comparatively easy navigation, the latter has been united to the Vis-

tula, partly by the river Netze, and partly by a canal joining that river to the Brahe, which falls into the Vistula near Bromberg. A vast inland navigation has thus been completed, barks passing freely through the whole extent of country from Hamburg to Dantzic; affording the means of shipping the products of the interior, and of importing those of foreign countries, either by the North sea or the Baltic, as may be found most advantageous. (Compare the above with Catteau, *Tableau de la Mer Baltique*, tome ii., pp. 11-18.)—10. *Russian Canals*. The inland navigation of Russia is of vast extent, and very considerable importance.—11. *Bavarian Canals*. A grand canal which was for a lengthened period in progress in Bavaria was completed in 1846, and promises to become of great public utility. It extends from Dietfurth on the Altmühl, a navigable affluent of the Danube, to Bamberg on the Mayn, a distance of 23½ German, or about 112 English miles. It is on a large scale, and has cost above £1,000,000. This magnificent undertaking, which carries an inland navigation through the centre of Europe, and realizes the project of Charlemagne for uniting the Black sea with the German ocean, is conducted by a joint-stock company, with the assistance of the Bavarian government. But the navigation of the Mayn and the Danube must be considerably improved before this grand channel of communication can acquire all the importance which, most probably, it is destined to obtain.—12. *Austrian Canals*. The Austrian empire is traversed in its whole extent by the Danube; but the advantages that might result to the foreign trade of the empire from so great a command of river navigation have been materially abridged by the jealousy of the Turks, who command the embouchure of the river, and by the difficulties in some places incident to its navigation. Two pretty extensive canals have been constructed in Hungary. That called the Bega canal is 73 English miles in length: it stretches from Fascet through the Bannat by Temeswar to Becskerek, whence vessels pass by the Bega into the Theiss a little above its junction with the Danube. The other Hungarian canal is called after the emperor Francis. It stretches from the Danube by Zambor to the Theiss, which it joins near Foldvar, being 62 English miles in length; its elevation where highest does not exceed 27 feet. Besides the above, the canal of Vienna establishes a communication between that city and Neustadt. It is said to be the intention to continue this canal to Trieste; but however desirable, we doubt much whether this be practicable. A railroad has been made from Munchausen on the Danube to Budweiss on the Moldau, a navigable river that falls into the Elbe, which promises to be a highly useful communication. (Bright's *Travels in Hungary*, p. 246; Balbi, *Abregé de la Géographie*, p. 216.)—13. *Spanish Canals*. Nowhere are canals more necessary, both for the purposes of navigation and irrigation, than in Spain; but the nature of the soil,

and the poverty and ignorance of the government as well as of the people, oppose formidable obstacles to their construction. During the reign of Charles II. a company of Dutch contractors offered to render the Mançanares navigable from Madrid to where it falls into the Tagus, and the latter from that point to Lisbon, provided they were allowed to levy a duty for a certain number of years on the goods conveyed by this channel. The council of Castile took this proposal into their serious consideration, and after maturely weighing it pronounced the singular decision, "That if it had pleased God that these two rivers should have been navigable, He would not have wanted human assistance to have made them such; but that, as He has not done it, it is plain He did not think it proper that it should be done. To attempt it, therefore, would be to violate the decrees of His providence, and to mend the imperfections which he designedly left in His works." (Clarke's *Letters on the Spanish Nation*, p. 284.) But such undertakings are no longer looked upon as sinful; and many have been projected since the accession of the Bourbon dynasty, though few have been perfected. The canal of the Ebro, begun under the emperor Charles V., is the most important of the Spanish canals; but it is only partially completed, and during dry seasons it suffers from want of water. It runs parallel to the right bank of the Ebro, from Tudela in Navarre to below Saragossa; the intention being to carry it to Sastago, where it is to unite with the Ebro. The canal of Castile is intended to lay open the country between the Douro and Reynosa, and to facilitate the conveyance of grain from the interior to Santander and Bilbao. It passes by Valladolid, Palencia, and Aguilar del Campos; a small part has been executed, and is now in operation. A company has also undertaken, what the Dutch contractors formerly offered—to render the Tagus navigable from Aranjuez to Lisbon; the free navigation of the river having been stipulated at the congress of Vienna. A project for deepening the Guadalquivir, and some others, are also on foot. (*Geographical Dictionary*, ii. 710.) It would appear from Mr. Sackville West's Report to the Foreign Office, of Jan. 1, 1867, that on Dec. 31, 1865, the total amount of canal shares and subventions was 211,040,251 reals vellon, or £2,110,402, and that the sum estimated as necessary for their completion was 11,816,190 reals vellon, or £118,561. (*Reports of Secretaries of Legation*, No. 5 of 1867.)—14. *British Canals*. Owing partly to the late rise of extensive manufactures and commerce in Great Britain, but more, perhaps, to the insular situation of the country, no part of which is very distant from the sea or from a navigable river, no attempt was made, in England, to construct canals till a comparatively recent period. The efforts of those who first began to improve the means of internal navigation were limited to attempts to deepen the beds of rivers, and to render them better fitted for the conveyance of

vessels. So early as 1635, Mr. Sandys, of Flatbury, Worcestershire, formed a project for rendering the Avon navigable from the Severn, near Tewkesbury, through the counties of Warwick, Worcester and Gloucester, "that the towns and country might be better supplied with wood, iron, pit-coal, and other commodities." This scheme was approved by the principal nobility and landowners in the adjoining counties; but the civil war having broken out soon after, the project was abandoned, and does not seem to have been revived. After the restoration and during the earlier part of last century various acts were at different times obtained for cheapening and improving river navigation. For the most part, however, these attempts were not very successful. The current of the rivers gradually changed the form of their channels; the dikes and other artificial constructions were apt to be destroyed by inundations; alluvial sand banks were formed below the weirs; in summer the channels were frequently too dry to admit of being navigated, while at other periods the current was so strong as to render it quite impossible to ascend the river, which at all times, indeed, was a laborious and expensive undertaking. These difficulties in the way of river navigation seem to have suggested the expediency of abandoning the channels of most rivers, and of digging parallel to them artificial channels, in which the water might be kept at the proper level by means of locks. The act passed by the legislature in 1755 for improving the navigation of Sankey Brook on the Mersey gave rise to a lateral canal of this description, about $11\frac{1}{2}$ miles in length, which deserves to be mentioned as the earliest effort of the sort in England.—But before this canal had been completed, the celebrated duke of Bridgewater, and his equally celebrated engineer, the self-instructed James Brindley, had conceived a plan of inland navigation independent altogether of natural channels, and intended to afford the greatest facilities to commerce, by carrying canals across rivers and through mountains, wherever it was practicable to construct them.—The duke was proprietor of a large estate at Worsley, 7 miles from Manchester, in which were some very rich coal mines, which had hitherto been in great measure useless, owing to the cost of carrying coal to market. Being desirous of turning his mines to some account, it occurred to him that his purpose would be best accomplished by cutting a canal from Worsley to Manchester. Mr. Brindley, having been consulted, declared that the scheme was practicable; and an act having been obtained, the work was immediately commenced. "The principle," says Mr. Phillips, "laid down at the commencement of this business reflects as much honor on the noble undertaker as it does upon his engineer. It was resolved that the canal should be perfect in its kind; and that, in order to preserve the level of the water, it should be free from the usual obstruction of locks. But in accomplish-

ing this end many difficulties were deemed insurmountable. It was necessary that the canal should be carried over rivers, and many large and deep valleys, where it was evident that such stupendous mounds of earth must be raised as would scarcely, it was thought by numbers, be completed by the labor of ages; and, above all, it was not known from what source so large a supply of water could be drawn, even on this improved plan, as would supply the navigation. But Mr. Brindley, with a strength of mind peculiar to himself, and being possessed of the confidence of his great patron, contrived such admirable machines, and took such methods to facilitate the progress of the work, that the world soon began to wonder how it could be thought so difficult. When the canal was completed as far as Barton, where the Irwell is navigable for large vessels, Mr. Brindley proposed to carry it over that river by an aqueduct 39 feet above the surface of the water in the river. This, however, being considered as a wild and extravagant project, he desired, in order to justify his conduct toward his noble employer, that the opinion of another engineer might be taken, believing that he could easily convince an intelligent person of the practicability of the design. A gentleman of eminence was accordingly called, who, being conducted to the place where it was intended that the aqueduct should be made, ridiculed the attempt; and, when the height and dimensions were communicated to him, he exclaimed, "I have often heard of castles in the air, but never was shown before where any of them were to be erected." This unfavorable verdict did not deter the duke from following the opinion of his own engineer. The aqueduct was immediately begun; and it was carried on with such rapidity and success as astonished those who, but a little before, thought it impossible."—Before the canal from Worsley to Manchester had been completed, it occurred to the duke and his engineer that it might be practicable to extend it by a branch, which, running through Chester parallel to the river Mersey, should at length terminate in that river below the limits of its artificial navigation, and thus afford a new, safer and cheaper means of communication between Manchester and its vicinity and Liverpool. The execution of this plan was authorized by an act passed in 1761. This canal, which is above 29 miles in length, was finished in about 5 years. It was constructed in the best manner, and has proved equally advantageous to its noble proprietor and the public.—"When the duke of Bridgewater," says Dr. Aikin, "undertook this great design, the price of carriage on the river navigation was 12s. the ton from Manchester to Liverpool, while that of land carriage was 40s. the ton. The duke's charge on his canal was limited by statute to 6s.; and together with this vast superiority in cheapness, it had all the speed and regularity of land carriage. The articles conveyed by it were, likewise, much more numerous than those by the

river navigation; besides manufactured goods and their raw materials, coals from the duke's own pits were deposited in yards at various parts of the canal, for the supply of Cheshire; lime, manure and building materials were carried from place to place; and the markets of Manchester obtained a supply of provisions from districts too remote for the ordinary land conveyances. A branch of useful and profitable carriage, hitherto scarcely known in England, was also undertaken, which was that of passengers. Boats, on the model of the Dutch *treckschuyts*, but more agreeable and capacious, were set up, which, at very reasonable rates and with great convenience, carried numbers of persons daily to and from Manchester along the line of the canal." (Aikin's *Description of the Country round Manchester*, p. 116.)—The success attending the duke of Bridgewater's canals stimulated public-spirited individuals in other districts to undertake similar works. Mr. Brindley had early formed the magnificent scheme of joining the great ports of London, Liverpool, Bristol and Hull by a system of internal navigation; and though he died in 1772, at the early age of 56, he had the satisfaction to see his grand project in a fair way of being realized. The Trent and Mersey, or as it has been more commonly termed, the Grand Trunk canal, 96 miles in length, was begun in 1766 and completed in 1777. It stretches from near Runcorn on the Mersey, where it communicates with the duke of Bridgewater's canal, to Newcastle-under-Lyne; thence southward to near Titchfield; and then northwesterly, till it joins the Trent at Wilden ferry, at the northwestern extremity of Leicestershire. A water communication between Hull and Liverpool was thus completed; and by means of the Staffordshire and Worcestershire canal, which joins the Grand Trunk near Haywood in the former, and the Severn near Stourport in the latter, the same means of communication was extended to Bristol. During the time that the Grand Trunk canal was being made, a canal was undertaken from Liverpool to Leeds, 130 miles in length; another from Birmingham to the Staffordshire and Worcestershire canal, joining it near Wolverhampton; and one from Birmingham to Fazeley and thence to Coventry. By canals subsequently undertaken, a communication was formed between the Grand Trunk canal and Oxford, and consequently with London, completing Brindley's magnificent scheme. In 1792 the Grand Junction canal was begun, which runs in a pretty straight line from Brentford, on the Thames, a little above the metropolis, to Braunston, in Northamptonshire, where it unites with the Oxford and other central canals. It is about 90 miles in length. There is also a direct water communication, by means of the river Lea navigation, the Cambridge Junction canal, etc., between London and the Wash. In addition to these, an immense number of other canals, some of them of great magnitude and importance, have been constructed in different parts of the coun-

try; so that a command of internal navigation has been obtained, unparalleled in any European country, with the exception of Holland.—In Scotland, the great canal to join the Forth and Clyde was begun in 1768, but it was suspended in 1777, and was not resumed till after the close of the American war. It was finally completed in 1790. Its total length, including the collateral cuts to Glasgow and the Monkland canal, is 38½ miles. Where highest it is 150 feet above the level of the sea. It is on a larger scale than any of the English canals. Its medium width at the surface is 56, and at the bottom 27 feet. Originally it was about 8 feet 6 inches deep; but its banks have been raised, so that the depth of water is now about 10 feet. It has, in all, 39 locks. In completing this canal many serious difficulties had to be encountered. These, however, were all successfully overcome; and though unprofitable for a while, it has for many years past yielded a better return to its proprietors. Swift boats on the plan of those subsequently described were established on this canal in 1832. (Cleland's *Statistics of Glasgow*, p. 170, etc.)—The Union canal joins the Forth and Clyde canal near Falkirk, and stretches thence to Edinburgh, being 31½ miles in length. It is 40 feet wide at the top, 20 at bottom, and 5 deep. It was completed in 1822. But it appears to have been an extremely ill-advised undertaking; so much so that its proprietors have sold it at a heavy loss to the Edinburgh and Glasgow railway company, who employ it in the conveyance of coal and other heavy goods.—A canal intended to form a communication between Glasgow, Paisley and Ardrossan was commenced in 1807; but only that portion connecting Glasgow with Paisley and the village of Johnstown has hitherto been finished. This part is about 12 miles long; the canal being 30 feet broad at top, 18 at bottom, and 4½ deep. It was here that the experiments were originally made on quick traveling by canals, which are said to have demonstrated that it was practicable to impel a properly constructed boat, carrying passengers and goods, along a canal at the rate of 9 or 10 miles an hour, without injury to the banks!—The Crinan canal across the peninsula of Kintyre, admitting vessels of 160 tons burden, is 9 miles in length, and 12 feet in depth.—The Caledonian canal is the greatest undertaking of the sort attempted in the empire. It stretches southwest and northeast across the island from a point near Inverness to another near Fort William. It is chiefly formed by Loch Ness, Loch Oich, and Loch Lochy. The total length of the canal, including the lakes, is 60½ miles; but the excavated part is only about 23 miles. At the summit it is 96½ feet above the level of the Western ocean. It is mostly constructed upon a very grand scale, being intended to be 20 feet deep, 50 feet wide at bottom, and 122 at top; the locks are 20 feet deep, 172 long, and 40 broad; and had it been wholly executed as was originally intended, frigates of 32 guns and merchant ships of

1,000 tons burden might have passed through it. It was opened in 1822, being executed entirely at the expense of government, from the designs and under the superintendence of Thomas Telford, Esq. The entire cost amounted, exclusive of interest, on the 1st of May, 1853, to £1,347,780. It would appear, however, to have been projected without due consideration, and has been a most unprofitable speculation. The revenue of the canal amounted in 1852-3 to only £5,889, whereas the expenditure during the same year, excluding allowance for wear and tear, and including £900 for repairs, amounted to £7,429! But this is not all. Owing to a wish to lessen the expense and to hasten the opening of the canal, parts of it were not excavated to their proper depth, while others were executed in a hurried and in-efficient manner. Hence the canal does not really admit vessels of above 250 or 300 tons burden, and previously to steam tugs being provided on the lakes, they were frequently delayed in making their passage across for a lengthened period. During 1837 and 1838 the works sustained considerable damage; and the reader need not be surprised to hear that it was gravely debated whether it would not be better entirely to break up and abandon the canal!—There was naturally, however, an extreme disinclination to destroy a work which, how inexpedient soever originally, has been executed at an enormous expense, and various schemes have been suggested for relieving the public from the expense of keeping it up without involving its destruction. Among others it has been proposed to assign it to a joint-stock company, on their agreeing to complete the works and keep them in repair; and an act authorizing such transfer was passed in 1840. But hitherto it has not been found possible to dispose of the canal in this way, and parliament has since voted large sums for the partial repair of the works, which, though a good deal improved, will every now and then require fresh outlays.—Some other canals have been projected and completed in different parts of Scotland. Of these the Monkland canal, for the supply of Glasgow with coal, has been the most successful.—15. *Irish Canals.* Various canals have been undertaken in Ireland, of which the Grand canal and the Royal canal are the principal. The Grand canal was begun in 1765, by a body of subscribers; but they could not have completed the work without very large advances from government. The canal commences at Dublin, and stretches in a westerly direction, inclining a little to the south, to the Shannon, with which it unites near Banagher, a distance of 85 statute miles, and thence on the west side of the river to Ballinasloe, 14 miles. But exclusive of the main trunk, there is a branch to Athy, where it joins the Barrow, a distance of about 27 miles; and there are branches to Portarlinton, Mount Mellick, and some other places. The total length of the canal, with its various branches, is about 164 English miles. Its summit elevation is 200

feet above the level of the sea at Dublin. It is 40 feet wide at the surface, from 24 to 20 feet at bottom, has 6 feet water, and cost, in all, above £2,000,000.—Two capital errors seem to have been committed in the formation of this canal—it was framed on too large a scale, and was carried too far north. Had it been 4 or 4½ instead of 6 feet deep, its utility would have been but little impaired, while its expense would have been very materially diminished. But the great error was in its direction. Instead of joining the Shannon about 15 miles above Lough Derg, it should have joined it below Limerick. By this means barges and other vessels passing from Dublin to Limerick, and conversely, would have avoided the difficult and dangerous navigation of the upper Shannon; and the canal would have passed through a comparatively fertile country; and it would not have been necessary to carry it across the bog of Allen, in which, says Mr. Wakefield, “the company have buried more money than would have cut a spacious canal from Dublin to Limerick.” (*Account of Ireland*, vol. i., p. 642.)—The Royal canal was undertaken in 1789. It stretches westward from Dublin to the Shannon, which it joins near Tormanbury. Its entire length is about 92 miles, exclusive of a branch of 5 miles from Kilshee to Longford; its highest elevation is 322 feet above the level of the sea. At bottom it is 24 feet wide, having 6 feet depth of water. It had cost, exclusive of interest on stock, loans, etc., advanced by government, in February, 1823, £1,421,954.—This canal seems to have been planned in the most injudicious manner. It has the same defect as the Grand canal, of being extravagantly large; and throughout its whole course it is nearly parallel to, and not very distant from, the latter. There are consequently two immense canals where there ought, perhaps, to be none. At all events, it is abundantly certain that one canal of comparatively moderate dimensions would have been quite enough for all the business of the district, even if it were much greater than it is at this moment, or than it is ever likely to become.—It appears from “Thom’s Almanac” for 1868, that in 1866 the gross revenue of the Royal canal was £10,504, while the net revenue of the Grand canal for the first half of 1866 was £7,535; and deducting from these sums the expense attending the working of the canals, and allowing for their ordinary wear and tear, it is extremely doubtful whether these great public works, which have cost between £5,000,000 and £6,000,000, produce a sixpence of clear revenue.—Besides the above there are some other canals, as well as various river excavations, in Ireland, the chief of which is the Ulster, 48 miles long; but hardly one of them yields a reasonable return for the capital expended upon it. They have almost all been liberally assisted by grants of public money; and their history, and that of the two great canals now adverted to, strikingly corroborates the caustic remark of Arthur Young, that “a history of public works

in Ireland would be a history of jobs." (*Tour in Ireland*, part ii., p. 66, 4to ed.) Those who wish to make themselves fully acquainted with the history and state of the canals of Ireland may consult the Report by Messrs. Henry Mullins and M'Mahon, in the Appendix to the "Report of the Select Committee of 1830 on the State of Ireland," and the valuable "Report on Railways." —16. *American Canals*. The United States are pre-eminently distinguished by the spirit with which they have undertaken, and the perseverance they have displayed in executing, the most magnificent plans for improving and extending internal navigation. Besides many others of great, though inferior, magnitude, a canal has been formed connecting the Hudson with lake Erie. This immense work is 363 miles in length, the rise and fall along the entire line being 692 feet. It was originally 40 feet wide at the surface, 28 feet at bottom, and 4 feet deep. But these dimensions being found, from the rapidly increasing traffic and importance of the canal, to be far too limited, an act was passed in 1835, providing for its enlargement. Under this act the canal has been increased, so as to be 70 feet wide on the surface, 42 feet at the bottom, and 7 feet in depth, the locks being of corresponding dimensions. The original cost of the canal was \$9,027,456, and the cost of the enlargement has been about \$25,000,000, or nearly three times its first cost. The Erie canal is the property of the state of New York, and is one of the greatest and most important works of its kind in the world. Notwithstanding the contracted scale on which it was originally constructed, it has completely verified the predictions of its projector, De Witt Clinton, having been at once extremely profitable as a mercantile speculation, and of singular advantage in a public point of view to the state of New York and the Union generally. —The Chesapeake and Ohio canal would, had it been completed, have been a great and useful work. It begins at the tide water of the Potomac river above Georgetown in the District of Columbia, and is intended to terminate at Pittsburgh, in Pennsylvania, a distance of 341½ miles. Its dimensions are nearly identical with those of the new Erie canal; its breadth at the surface being from 60 to 80 feet, and at bottom 50 feet, with a depth of water varying from 6 to 7 feet. Several tunnels occur in the line which crosses the Alleghany ridge. The cost of this work was estimated at \$22,275,000, which were to be subscribed partly by individuals, and partly by the United States and the states of Maryland and Pennsylvania. Owing, however, to the inability, or rather disinclination, of the two last-mentioned states to make good their engagements, the works on the canal have been suspended, after about 10 millions of dollars have been expended upon them. But the probability is that they will be resumed and completed at some future period; their completion being the only means by which the capital already expended upon them can be

made to yield anything. —A great many other canals have been completed and are in progress in different parts of the Union. Of the former, the Ohio canal, uniting the Ohio with lake Erie, is by far the most important, and is, if at all, only less advantageous than the Erie canal. Cleveland, where the canal unites with lake Erie, has become one of the greatest emporiums on the lakes —17. *Utility of Canals*. The utility of canals, when judiciously contrived, and opening an easy communication between places capable of maintaining an extensive intercourse with each other, has never been better set forth than in a work published in 1765, entitled "A View of the Advantages of Inland Navigation," etc. But the following extract from Macpherson's *Annals of Commerce* (1760) contains a brief, and at the same time eloquent, summary of the principal advantages resulting from their construction. "They give fresh life to established manufactures, and they encourage the establishment of new ones by the ease of transporting the materials of manufacture and provisions; and thence we see new villages start up upon the borders of canals in places formerly condemned to sterility and solitude. They invigorate, and in many places create, internal trade, which, for its extent and value, is an object of still more importance than foreign commerce, and is exempted from the many hardships and dangers of a maritime life and changes of climate. To this may be added that they greatly promote foreign trade, and consequently enrich the merchants of the ports where they, or the navigable rivers they are connected with, terminate, by facilitating the exportation of produce from, and the introduction of foreign merchandise into, the interior parts of the country, which are thus placed nearly on a level with the maritime parts; or, in other words, the interior parts become coasts and enjoy the accommodations of shipping. The price of provisions is nearly equalized through the whole country; the blessings of Providence are more uniformly distributed; and the monopolist is disappointed in his schemes of iniquity and oppression by the ease wherewith provisions are transported from a considerable distance. The advantages to agriculture, which provides a great part of the materials, and almost the whole of the subsistence, required in carrying on manufactures and commerce, are pre-eminently great. Manure, marl, lime and all other bulky articles, which could not possibly bear the great expense of cartage, and also corn and other produce, can be carried at a very light expense on canals; whereby poor lands are enriched, and barren lands are brought into cultivation, to the great emolument of the farmer and landholder, and the general advantage of the community, in an augmented supply of the necessities of life and materials of manufactures; coals (the importance of which to a manufacturing country few people not actually concerned in manufactures are capable of duly appreciating), stone, lime, iron ore, and minerals in general, as

well as many other articles of great bulk in proportion to their value, which had hitherto lain useless to their proprietors by reason of the expense, and, in many cases, impossibility of carriage, are called into life, and rendered a fund of wealth, by the vicinity of a canal; which thus gives birth to a trade, whereby, in return it is maintained."—18. *Increased Speed of Traveling by Canals.* Great as have been the advantages derived from the formation of canals, their progress has been to a considerable degree checked by the formation of railroads. We believe, however, that canals will always be preferred for the conveyance of coal and other bulky and heavy products; and even passengers could be conveyed along them with a rapidity that would previously have been supposed impossible. This new system was introduced on the Paisley and Glasgow canal, by Mr. Houston, in June, 1831. The results are described in the following statements, to which it is unnecessary to call the reader's attention.—Mr. Thomas Graham, civil engineer, in his "Letter to Canal Proprietors and Traders," says, "The experiments of great velocity have been tried and proved on the narrowest, shallowest, and most curved canal in Scotland, viz., the Ardrossan or Paisley canal, connecting the city of Glasgow with the town of Paisley and village of Johnstoun—a distance of 12 miles. The result has disproved every previous theory as to difficulty and expense of attaining great velocity on canals, and as to the danger or damage to their banks by great velocity in moving vessels along them.—The ordinary speed for the conveyance of passengers on the Ardrossan canal has, for nearly 2 years been from 9 to 10 miles an hour; and, although there are 14 journeys along the canal per day, at this rapid speed, its banks have sustained no injury. The boats are 70 feet in length, about 5 feet 6 inches broad, and, but for the extreme narrowness of the canal, might be made broader. They carry easily from 70 to 80 passengers; and, when required, can and have carried upward of 110 passengers. The entire cost of a boat and fittings up is about £125. The hulls are formed of light iron plates and ribs, and the covering is of wood and light oiled cloth. They are more airy, light and comfortable than any coach. They permit the passengers to move about from the outer to the inner cabin, and the fares per mile are one penny in the first, and three farthings in the second cabin. The passengers are all carried under cover; having the privilege also of an uncovered space. These boats are drawn by 2 horses (the price of which may be from £50 to £60 per pair), in stages of 4 miles in length, which are done in from 22 to 25 minutes, including stoppages to let out and take in passengers, each set of horses doing 3 or 4 stages alternately each day. In fact, the boats are drawn through this narrow and shallow canal at a velocity which many celebrated engineers had demonstrated, and which the public believed, to be impossible.—The entire amount of the whole expenses of attendants and horses,

and of running one of these boats 4 trips of 12 miles each (the length of the canal) or 48 miles daily, including interest on the capital, and 20 per cent. laid aside annually for replacement of the boats, or loss on the capital therein invested, and a considerable sum laid aside for accidents and replacement of the horses, is £700 some odd shillings; or, taking the number of working days to be 312 annually, something under £2 2s. 4d. per day, or about 11d. per mile. The actual cost of carrying from 80 to 100 persons a distance of 30 miles (the length of the Liverpool railway), at a velocity of nearly 10 miles an hour, on the Paisley canal, one of the most curved, narrow and shallow in Britain, is therefore just £1 7s. 6d. Such, in brief, are the facts, and, incredible as they may appear, they are facts which no one who inquires can possibly doubt."—Boats on this principle were for a time established on a great many British canals, and on the Grand and Royal canals in Ireland. J. R. M'C.

CANON LAW. (See LAW.)

CAPITAL, a politico-economical term. It may be said, in a general way, that capital is the result of accumulation. It is the sum total of values withdrawn from unproductive consumption, and bequeathed to the present by the past.—This definition is exact enough, and is, strictly speaking, sufficient. It agrees with that of J. B. Say, which is as follows: "Capital, in the broadest sense, is an accumulation of values withdrawn from unproductive consumption." It differs, however, in some respects—if not in substance, at least as to the number and variety of the objects it embraces—from that given by some other economists, and, in certain cases, from that given by J. B. Say himself.—With the exception of certain writers who are not authority in the science, all economists are agreed in not comprising under the term capital, either land or the instruments of production furnished by nature, but only such values as are created by man and which are the result of previous accumulation. Thus, in treating of the great agents of production, economists always enumerate three: land, labor and capital; drawing a clear distinction between land, the primitive basis of production given by nature, and the total of the values or products which man has successively added to it by his labor, and which is called capital.—But does capital comprise all the values previously produced by man, or only those which are used for purposes of reproduction? Here economists are not all agreed; for some consider all accumulated products as capital, whatever their nature or use, even articles reserved for the immediate consumption of man; while others consider as capital only such objects as are directly devoted to reproduction, such as raw materials, tools, machinery, buildings, etc.—What is most remarkable is, that in the minds of all economists, without distinction, the idea of reproduction is inseparably

associated with the idea of capital. However great their disagreement may seem, all conceive capital to be not only wealth acquired to society by its previous labor and saving, but also a lever to increase the energy, the power and the fruitfulness of its future labor. But some accord the reproductive faculty to a greater number of objects than others. Some grant it to all acquired wealth, even to things reserved for the immediate satisfaction of human wants, now considering them as a necessary reserve to facilitate future labor, sometimes as productive of utility or pleasure. Others recognize this productive faculty only in instruments of labor, properly speaking, to the exclusion of articles intended for immediate consumption—This disagreement is more apparent than real, in this sense, at least, that it is more about words than things, and does not modify substantially the final conclusions of economists. As it tends nevertheless to introduce an element of uncertainty into economic reasoning, we shall endeavor to put an end to it, so far as in us lies; or at least to show the real cause of the disagreement, which is the insufficiency of the language economists are forced to use.—To understand the exact nature of capital, says Rossi, is one of the most difficult things in political economy. However this may be, we shall endeavor, first, to define precisely the nature of capital. We shall then show what are the functions of capital in human society, the nature and the extent of the services which it renders, the manner in which it is distributed and employed, the necessity of its alliance with labor, and the manner in which it divides with labor the new wealth produced. This is one of the most important parts of economic science.—I. *What is capital? Of what does it consist?* We have just seen that there are two very different definitions of capital. In the one, all accumulated values are comprehended under the term; in the other, it applies exclusively to those which are directly devoted to purposes of reproduction, such as raw materials, tools, machinery, etc. Between these extreme opinions there are intermediate ones; but we take them in their absolute formularization, better to estimate their respective value.—Among French economists this difference is most marked between J. B. Say and Rossi. Among English economists we find the difference at least as great between Adam Smith and Malthus on the one hand, and M'Culloch on the other. Garnier, in his *Éléments de l'Economie Politique*, thus sums up the divergent opinions of Say and Rossi: "According to the same economist," says he, speaking of Rossi, "we must define capital, a *product saved and intended for reproduction*. This definition includes three notions, the notion of *product*, of *saving*, and of *reproduction*. J. B. Say has frequently introduced into his definition only the first two. He understands by capital, the *simple accumulation of products*. Rossi, to explain his thought clearly, analyzes the labor of the savage who, having killed a beast, divides its carcass into

three parts: one of them he eats, one he lays by for the next day, and one he uses in hunting—the horns of the animal for instance, which thus become an instrument of labor or of production, in other words, capital. Rossi does not consider as capital what is laid by to be consumed on the following day. If it were capital, then it might be said that even the ant accumulated capital."—Such is the difference of opinion found in the writings of these two men. The difference is even more marked than it seems here; for although he does not always say so, and attaches the idea of capital inseparably to the idea of reproduction, J. B. Say certainly includes in the term all objects of consumption which Rossi just as certainly excludes from it.—The English economists we have mentioned differ in about the same way. M'Culloch agrees with J. B. Say, whose views he sometimes carries to an extreme; while Adam Smith and Malthus seem to have suggested Rossi's views to him.—Whichever one of these views we adopt it is proper to remark that the principles of political economy are not seriously involved here. It is a question of nomenclature and nothing more. But nomenclature has its importance, for, if it is not science, it serves at least to make science accessible to those who do not know it. There is nothing more annoying than the endless discussion of the use of words. It uselessly taxes the minds of men who might make better use of their faculties. It tends even to discredit science in the eyes of those who only follow it at a distance.—In political economy it is useful, nay almost necessary, for the explanation and demonstration of certain great truths of science, to possess a word to designate and include generally the sum total of the values which the past has bequeathed to the present, which are the fruit of previous labor, of saving, of accumulation, and which add so much to the power of mankind. In the beginning man found himself alone, with only his natural faculties, face to face with brute nature. In this condition, his existence was very precarious, his influence over nature small, and his power of production extremely limited. But owing to the peculiar foresight with which he was gifted, he, by degrees, invented for himself instruments fitted to second the labor of his hands. He built dwellings to shelter him from the inclemency of the weather. He stored up provisions, reserve stores, which enabled him to devote himself to more continued labor by assuring him sustenance for the morrow. In a word, he adapted the earth to his own use, while he continually increased his means of turning it to account. The values with which he surrounded himself in order to better his condition, assumed a thousand different forms, and ministered to a thousand wants. These are instruments, tools, dwellings, domestic animals, seeds, clothing, provisions of every kind; but they all have this in common, that they elevate the condition of man and increase his power over nature. It is desirable that we should be able to designate

by a single word this immense stock of values which has been added in a thousand forms to man's original domain, and to distinguish it from the primitive basis of production furnished by nature, to which it is only an addition. The word capital has been used by political economists to perform this service.—The broad meaning given to the word capital by J. B. Say, is rejected by Rossi, who considers as capital only that part of accumulated values which is so employed as to produce a revenue. He thinks that he is thus more faithful to the definition and classification adopted by the English economists, Adam Smith, Malthus and others. We shall see directly if he is right on this point. But when he refuses to apply the term capital to the total of accumulated values, has Rossi found any other word to take its place? He has not. In his vocabulary all this mass of wealth previously acquired, has no special appellation, and can only be designated by means of a circumlocution. This seems to us decisive. J. B. Say's vocabulary appears to us decidedly preferable, in this, that it is not irreparably defective.—Shall we therefore say with M'Culloch, that accumulated values should always be considered as a whole; that there is no distinction to be drawn between those reserved for the immediate satisfaction of the wants, or even the fancies, or the caprices of men, and those which are specially intended for production? Assuredly not. To pretend that all these values are equally productive, and productive in the same sense, is to go counter to reason which bears witness to the contrary. J. B. Say has perhaps fallen into this error sometimes, but it is especially peculiar to M'Culloch, who, in his extreme desire to place all accumulated values on the same level, goes so far as to pretend that articles of luxury which merely satisfy the desire of ostentation of the rich, contribute as much as anything else to production, as much as agricultural implements, for instance.—But it does not follow necessarily that, because these values should not be confounded with one another, they may not receive the same designation, especially since there are not two names equally fitted to apply to them separately. All that follows is, that there is a good reason to divide and to classify different kinds of capital, and to distinguish them from one another by adding to the general and common appellation qualifying terms to indicate the difference between them. Rossi believes that values intended for purposes of reproduction are distinct from others. We believe so, too, though the distinction does not appear to us always easy to make. Let them, therefore, be called productive capital, to distinguish them from other values called simply, capital. Thus, whatever meaning be attached to the word, we must admit that there are several kinds of capital, and classify them. This merely necessitates our drawing a distinction the more, a first and general distinction which will serve as a point of departure for all

other distinctions. In this way there need be no defect in the vocabulary of political economy, and all the demands of science may be met.—Rossi, in restricting the sense of the word capital as he has, believed he was following the thought or the method of Adam Smith and Malthus. He was mistaken. It is very true that these two economists understand by capital only values used for purposes of reproduction, but they have another and broader word by which they designate the total of values produced and accumulated by man: stock is the word.—The nomenclature of these writers is satisfactory and complete. They use the word *stock* to designate the total of accumulated values, and the word *capital* to express that portion of the values accumulated which is specially devoted to reproduction.—This is capital as Rossi understands it. Thus, stock is the total of accumulated values, of whatsoever nature they may be, and to whatsoever use they are applied, whether they serve solely to support men or are used in reproduction. Capital is a part of stock, that part which is specially employed in reproduction, that is to say, in the creation of revenue. Owing to the use of these two words, the nomenclature is complete; the whole and the part being designated by special terms.—Let no one suppose that these definitions are peculiar to Malthus. They are literally conformable to those followed by Adam Smith. In book II. of his work, where he treats specially of accumulated wealth and the employment of capital, he establishes very precisely the distinction just made, first in the introduction to his work; then in the commencement of chapter 1, he writes as follows: "When the stock which a man possesses is no more than sufficient to maintain him for a few days or a few weeks, he seldom thinks of putting it out to interest. He consumes it as sparingly as he can, and endeavors by his labor to acquire something which may supply its place before it be consumed altogether. His revenue is, in this case, derived from his labor only. This is the state of the greater part of the laboring poor in all countries.—But when he possesses stock sufficient to maintain him for months or years, he naturally endeavors to derive a revenue from the greater part of it; reserving only so much for his immediate consumption as may maintain him till this revenue begins to come in. His whole stock, therefore, is distinguished into two parts. That part which he expects is to afford him this revenue, is called the capital. The other is that which supplies his immediate consumption, and which consists either, first, in that portion of his whole stock which was originally reserved for this purpose; or, secondly, in his revenue, from whatever source derived, as it gradually comes in, or, thirdly, in such things as had been purchased by either of these in former years and which are not yet entirely consumed; such as a stock of clothes, household furniture, and the like. In one, or other, or all of these three articles, con-

sists the stock which men commonly reserve for their own immediate consumption."—Since in the English language, there are two words well fitted to designate, the one the genus stock, the other the species capital, why should writers confound the two under a common designation? The English nomenclature is a good one. Besides, it is sanctioned by the authority of the first masters of the science. We are, therefore, very far from approving the attempt made by M'Culloch to change the old vocabulary, by giving to the word capital a meaning broader than that given by J. B. Say. Malthus is right in accusing him on this account of introducing obscurity into the science, breaking with traditions without any valid cause. The arguments by which he undertakes to justify his new theory are of still less value than the theory itself. English economists will do well to preserve their nomenclature as it is fixed by Adam Smith and his immediate successors.—II. *Division or Classification of Capital.* Capital may be divided or classed in different ways. There is no absolute or unvarying rule in this matter. This alone is important, that no kind of value produced should be omitted, and that the classification should be from generals to particulars.—Adam Smith has given a classification of capital which seems to us satisfactory enough, and which has been adopted as he gave it, or only slightly modified, by a great number of his successors. It is true that he uses the word capital to designate only such values as are directly intended for purposes of production, but his classification embraces, none the less, values put aside for purposes of consumption. He was far from ignoring the importance of the latter.—It is not capital only as he conceived it, but the general stock of accumulated values which he divided and classified. We may advantageously adopt his classification of capital.—Adam Smith divides the general stock of accumulated values into three parts: the first comprising all the objects which serve only for the maintenance of man; the second, that part of productive capital which is stationary and which he terms fixed capital; the third, that part of productive capital which is not fixed, and which he calls circulating capital. He thus illustrates his division of capital: "The general stock of any country or society," he says, "is the same with that of all its inhabitants or members, and therefore, naturally divides itself into the same three portions, each of which has a distinct function or office.—The first is that portion which is reserved for immediate consumption, and of which the characteristic is that it affords no revenue or profit. It consists in the stock of food, clothes, household furniture, etc., which have been purchased by their proper consumers, but which are not yet entirely consumed. The whole stock of mere dwelling houses, too, subsisting at any one time in the country, make a part of this first portion. The stock that is laid out in a house, if it is to be the dwelling house of the proprietor,

ceases from that moment to serve in the function of a capital, or to afford any revenue to its owner. A dwelling house, as such, contributes nothing to the revenue of its inhabitants; and though it is, no doubt, extremely useful to him, it is as his clothes and household furniture are useful to him, which, however, make a part of his expense, and not of his revenue."—Passing then to the specifically productive part of capital which he calls fixed capital, he describes it in the following manner, with his subdivisions, in which he does not fail to include that which afterward has been called immaterial capital, that is to say, useful talents and varieties of knowledge acquired by man.—"The second of the three portions into which the general stock of the society divides itself, is the fixed capital; of which the characteristic is, that it affords a revenue or profit without circulating or changing masters. It consists chiefly of the four following articles: 1. Of all useful machines and instruments of trade which facilitate and abridge labor. 2. Of all those profitable buildings which are the means of procuring a revenue, not only to their proprietor who lets them for a rent, but to the person who possesses them and pays that rent for them; such as shops, warehouses, workhouses, farm houses, with all their necessary buildings; stables, granaries, etc. These are very different from mere dwelling houses. They are a sort of instruments of trade, and may be considered in the same light. 3. Of the improvements of land, of what has been profitably laid out in clearing, draining, inclosing, manuring, and reducing it into the condition most proper for tillage and culture. An improved farm may very justly be regarded in the same light as those useful machines which facilitate and abridge labor, and by means of which, an equal circulating capital can afford a much greater revenue to its employer. An improved farm is equally advantageous and more durable than any of those machines, frequently requiring no other repairs than the most profitable application of the farmer's capital employed in cultivating it. 4. Of the acquired and useful abilities of all the inhabitants or members of society. The acquisition of such talents, by the maintenance of the acquirer during his education, study, or apprenticeship, always costs a real expense, which is a capital fixed and realized, as it were, in his person. Those talents, as they make a part of his fortune, so do they likewise of that of the society to which he belongs. The improved dexterity of a workman may be considered in the same light as a machine or instrument of trade which facilitates and abridges labor, and which, though it costs a certain expense, repays that expense with a profit."—We have next, the other part of productive capital, circulating capital, with its three principal subdivisions.—"The third and last of the three portions into which the general stock of the society naturally divides itself, is the circulating capital; of which the characteristic is, that it affords a revenue only by circulating, or

changing masters. It is composed likewise of four parts: 1. Of the money by means of which all the other three are circulated and distributed to the proper consumers. 2. Of the stock of provisions which are in the possession of the butcher, the grazier, the farmer, the corn merchant, the brewer, etc., and from the sale of which they expect to derive a profit. 3. Of the materials, whether altogether rude, or more or less manufactured, of clothes, furniture, and buildings, which are not yet made up into any of those three shapes, but which remain in the hands of the growers, the manufacturers, the mercers and drapers, the timber merchant, the carpenters and joiners, the brick makers, etc. 4. And lastly, of the work which is made up and completed, but which is still in the hands of the merchant or manufacturer, and not yet disposed of or distributed to the proper consumers; such as the finished work which we frequently find ready-made in the shops of the smith, the cabinet maker, the goldsmith, the jeweler, the china merchant, etc. The circulating capital consists in this manner, of the provisions, materials, and finished work of all kinds that are in the hands of their respective dealers, and of the money that is necessary for circulating and distributing them to those who are finally to use or to consume them."—This classification leaves little to be desired. It comprises capital in the broadest acceptance of the term. Besides, it enumerates all the species of capital, while putting each one in its own place. It is to be wished, perhaps, that Adam Smith had drawn a distinction in the case of values reserved for the immediate consumption of man, similar to that which he drew in the case of capital specially devoted to reproduction. The latter is divided, as we have seen, into fixed and circulating capital; into fixed capital which renders continual service in the hands of its possessors, and circulating capital which renders no service except in so far as it is exchanged or transformed. In like manner, of objects destined for immediate consumption there are some which are consumed altogether, and are of use only because they are thus consumed: such are eatables generally. There are others, on the contrary, which last, at least for a time, and only their use is consumed: such are furniture and especially dwelling houses. But we do not insist on this distinction which is much less important than the other.—III. *Formation and Increase of Capital.* There is scarcely an economist who has not devoted a special chapter of his work to explain the manner in which capital is acquired and increased. The different kinds of capital are the fruits of saving and accumulation. (See SAYING, ACCUMULATION.)—IV. *Necessity of Capital as an Auxiliary to Labor.* Whatever difference of opinion may exist among economists, on the definition of capital, there is none on the necessity of capital as auxiliary to labor. Here all disagreement disappears. From Adam Smith's time all adepts in the science are at one on this point, that without the assistance

of capital in production man can do nothing and his labor is even fruitless.—How could so simple a truth be ignored? The cultivator of the soil can not till his land without the plow or spade. He can not utilize the fruits of the harvest without wagons, beasts of burden, granaries, threshing machines and other implements. The blacksmith can not work without his hammer and his anvil. He needs, besides these instruments, a bellows, a furnace, fuel and iron, not to speak of his shop which is also capital. A weaver can not weave his cloth without a loom. He also needs thread. He must buy it or it must be furnished him; not to mention many other necessary things. There is no industry, no trade, in which certain instruments are not needed, although the importance of these instruments varies much with the kind of labor.—"This part, however," writes Adam Smith, "is very small in some, and very great in others. A master tailor requires no other instrument of trade but a parcel of needles, to which should be added, however, scissors and a board. Those of the master shoemaker are very little more expensive. Those of the weaver rise a good deal above those of the shoemaker." But, considerable or not, instruments are always necessary, and the difference relates only to their number. And this is only a small part of the capital required in every trade. It is necessary, moreover, to have raw material, which is sometimes more costly than the tools. If a tailor's tools are of little account, the cloth, on the other hand, which he makes into clothes, and which he generally pays for in advance, is higher in price. The case is the same with the leather which the shoemaker uses, and both one and the other must have a certain supply of material to enable them to live while waiting for the price of their labor. Tools, raw material, supplies of every kind, are indispensable in different degrees, whatever the trade may be; and all these are capital.—It is certain then that in all production, capital is the companion, the indispensable auxiliary of labor, so that it may be truly said that without capital there is no labor. This is true, even in the savage state, such as it has always been known, where man does not go to hunt without a bow and arrows, or some other instrument to take their place. This for a more cogent reason is strictly true in civilized life, where labor is always more complicated and never gives such speedy results.—This truth, we say, is so simple that it almost flows from the simple definition of the words. It does not seem to need any demonstration. However it is denied daily, not by economists, it is true, but by eccentric writers, whose pens, unfortunately, do not fail to exercise great influence on a considerable part of the public. They declaim against capital which is supposed to be, not the servant, but the lord of labor; they wish to free labor and workmen from the yoke which this alleged tyrant imposes on them. They go further: they pretend that capital is really unnecessary and that they can do without its assist-

ance. It seems almost useless, at first sight, to refute propositions of this kind which refute themselves. But it is necessary to pause when it is seen that they find a great number of adherents among a misled public. It is well, moreover, to go to the source of these errors which generally originate from the false idea formed of capital. Let us first look at an example of this kind of eccentricity.—We find it in an extract from a so-called democratic journal, one reproduced with approval in Proudhon's last work.¹ Although he had only imperfect ideas of economic matters, frequently disfigured by the eccentricities with which he associated them, Proudhon knew enough when it suited him not to be mistaken on the nature of capital, which he defined sometimes in rather exact terms. But it often suited him to depart from the definitions which he himself had given, or to accept the grossest errors of his disciples, when these errors seemed to prop up his system. Thus he approved the vagaries of which we here make mention.—A certain number of journeymen tailors come together and associate for the purpose of making clothing, and profess to be without capital; that is to say, they work on their own account, without the intervention of any employer. These workmen, as it appears, succeed in their endeavor, which is nothing very surprising. The writer cited by Proudhon concludes from this that they have refuted an axiom of political economy and dethroned capital. He thus sets forth and justifies this singular proposition. "Here are workmen who deny altogether this saying of the old economists, *No capital, no labor*, a saying, which, if it were true in principle, would condemn to slavery and misery without hope and without end, a numberless class of laborers who live from hand to mouth, and have no capital whatever. These journeymen tailors could not admit the truth of this terrible conclusion of official science. Seeking for the rational laws for the production and consumption of wealth, they discovered that capital which was supposed to be a generative element in labor, has only a conventional utility; that the only agents of production are man's intellect and muscles; that hence it is possible to produce and to guarantee the normal circulation and consumption of commodities, by the sole fact of the direct communication of producers and consumers with one another. That by the doing away of a burdensome intermediary, and the establishment of new relations, producers and consumers would reap the profits now given to capital, that sovereign lord of the labor, life and wants of all."—According to this theory the emancipation of workmen is possible by the union, in groups, of individual powers and wants; in other words, by the *association of producers and consumers*, who, ceasing to have opposing interests, escape forever the domination of capital.—The wants of consumption being permanent, if producers and consumers enter into direct relation, associate together, and

give credit to each other, it is clear that the rise or the fall, the artificial increase or the arbitrary decrease which speculation forces upon labor and production, would no longer have a cause.—It is scarcely necessary to say, as we shall see presently, that the maxim, *No capital, no labor*, does not in any manner condemn to endless servitude and wretchedness, that numerous class of workmen who have no capital. Capital may indeed come to the assistance, in different ways, of those who have none; and this necessarily happens every day. But to the principal question: How have the workmen above referred to, refuted the truth of the axiom, *No capital, no labor*? Have they, perchance, discovered how to sew without needles, to cut cloth without scissors? They probably have not been able to do without a shop and a press-board. Now the needles, scissors, shop and press-board used by the tailors are capital. Further, these workmen could not have made the clothing without the use of cloth, which is also capital. In fact, they have been satisfied to work on cloth, that is to say on capital, which did not belong to them but was furnished by others. But this capital was none the less an indispensable auxiliary to their labor, and if it be true that it was put at their disposition by third parties, it is only a proof of the truth of what we have just said, that it is not always necessary to be the owner of capital in order to make use of it. Moreover, these workmen, whatever be the manner in which they did it, were obliged to provide for their own maintenance, until they had received the price of their labor; and they could thus provide for their maintenance only by means of capital possessed by themselves or borrowed from others. They, therefore, have had recourse to capital. But they did not, we are told, submit to conditions imposed by an employer. Furthermore, they found means of dispensing with the agency of merchants in dealing with consumers. This is apparently what the unknown author of the strange dissertation just quoted, wished to say, and this is what he calls destroying the tyranny of capital. If the workmen found a way of doing without an employer, or took his place themselves, they did well, especially if any real advantage resulted to them therefrom. They did well also to dispense with the aid of merchants, if they were able to do so without prejudice to the sale or circulation of their products. But what has all this to do with the truth of the economic proposition? The workmen in question, no more than other men, discovered the means of dispensing with capital. They simply worked with their own capital instead of working with the capital of others, a thing done every day, for the majority of employers who have come from the working class have acted in this manner. After accumulating their savings as workmen, they used them to begin business with on their own account, and to become employers of labor. The workmen whose example is cited here did the same,

¹ *Idee générale de la révolution au dix-neuvième siècle.*

with this difference, that as the savings of each man were probably not large enough alone, they united them in a common stock. They called to their aid the power of association, which is not to be despised when a good use is made of it; thus forming, by the union of several small savings, a capital sufficient to found an establishment of their own. From workmen, which they were, they become employers. There is nothing in this which strikes at the dignity of capital. On the contrary, it is in many respects a new proof of its productiveness, since by its aid the workmen in question succeeded in changing, if not in bettering their condition.—We have noted the preceding passage, which is really unworthy to appear here, for the sole purpose of showing by an example, the kind of ideas that are current in certain circles, and how the simplest truths of science are interpreted in them. Surely if those who wrote these strange lines had given themselves the trouble of opening any work on political economy, they would have easily found in it a correction of their error. But what is their idea of capital?—At first one would be tempted to believe they have simply confounded capital with money—a very common error. Money, as we know, is only a fraction, and rather a small fraction, of capital. But even if this were their point of departure, would they be justified in saying, in the case they mention, that capital has been dethroned? The workmen of whom they speak have not succeeded in dispensing with money, more than with any other article. They have been obliged to make use of it, at least to buy provisions while awaiting the completion of their work. All they can mean to claim is that the workmen, through association, succeeded in freeing themselves from the rule of a master, from that inconvenient and annoying person whom they looked upon as a tyrant, and who in their eyes is the personification of capital.—J. B. Say has shown the necessity of capital in these terms: “We shall soon see, by observing its processes, that industry alone and unaided is not able to give value to things. It is necessary that the person engaged in industry should possess products already existing, without which his labor, however skilled, would remain inactive. These things are: 1. Tools, implements of the various arts. The cultivator of the soil can do nothing without his pick and spade, the weaver without his loom, nor the sailor without his ship. 2. The products which are to support the workman engaged in industry, until he has completed his part in the work of production. The product on which he is busied, or the price which it will bring, ought in reality to bring back the expense of keeping him; but he is obliged continually to advance what is necessary for his support. 3. The raw material which his industry has to change into finished products. It is true that these materials are often furnished him gratuitously by nature; but more frequently they are industrial products already existing, such as seeds

furnished by agriculture, metals furnished by the miner and founder, etc. The manufacturer who uses them in his industry is obliged to advance their value. The value of all these articles constitutes what is called *productive capital*.” All economists are agreed on this subject. Here, for example, is another quotation taken from the “Theory of Social Wealth,” by Fredrick Skarbek, professor of political economy at Warsaw: “When we observe man occupied in collecting primitive values, or in producing new ones, we see that, in both cases, he can not act without having in his possession a certain stock which furnishes him the means of subsistence, or the objects necessary to fit him to work. A hunter needs some kind of weapon to strike down the wild beast that is to furnish him with food or clothing. Uncertain of the result of the chase, he must be supplied with a certain amount of provisions to enable him to endure one day's or several days' fatigue. If, later, with more developed means, he wishes to construct a dwelling he can not do so without first having the necessary tools for the purpose, without having felled the trees to be used in its construction, without having such a supply of provisions as will free him from the care of procuring a subsistence while he is building his house; in one word, he can neither collect the values which he finds ready in nature, nor produce new ones, without possessing a *stock* which will enable him to work by giving him the means of existence and the objects of labor.”—These are exactly the same ideas which we found in the works of J. B. Say. Both are agreed in considering as necessary for the execution of any labor whatever, not only the preliminary possession of tools and raw materials, but also a certain supply of food which enables the laborer to live till his work is finished and its product sold; thus considering such supply as an essential part of the capital. Although Rossi and some other economists deny this last, they have really the same views; since they consider the stock of provisions necessary to the laborer, as well as the raw materials and tools.—Earlier than any of these economists, Adam Smith had established the same principles. He first supposes, it is true, that capital is not necessary in a barbarous or savage state. This we must not take too literally, for it is sure, and Adam Smith is not mistaken here, that the savage himself has need of tools. But he shows later, which is strictly true, that the necessity of capital increases in proportion as civilization advances and the division of labor extends.—“In that rude state of society in which there is no division of labor, in which exchanges are seldom made, and in which every man provides everything for himself, it is not necessary that any stock should be accumulated or stored up beforehand in order to carry on the business of the society. Every man endeavors to supply by his own industry his own occasional wants as they occur. When he is hungry he goes to the forest to hunt; when his coat is worn out, he clothes

himself with the skin of the first large animal he kills; and when his hut begins to go to ruin he repairs it, as well as he can, with the trees and the turf that are nearest. But when the division of labor has once been thoroughly introduced, the produce of a man's own labor can supply but a very small part of his occasional wants. The far greater part of them are supplied by the produce of other men's labor, which he purchases with the produce, or, what is the same thing, with the price of the produce of his own. But this purchase can not be made till such time as the produce of his own labor has not only been completed, but sold. A stock of goods of different kinds, therefore, must be stored up somewhere sufficient to *maintain* him, and to supply him with the *materials* and *tools* of his work till such time, at least, as both these events can be brought about. A weaver can not apply himself entirely to his peculiar business, unless there is beforehand stored up somewhere, either in his own possession or in that of some other person, a stock sufficient to maintain him, and to supply him with the materials and tools of his work, till he has not only completed, but sold his web. This accumulation must, evidently, be previous to his applying his industry for so long a time to such a peculiar business."—We have underlined in the text the words *maintain*, *materials* and *tools*, in order to call attention to the fact that Adam Smith, although he does not include the stock for maintenance in his definition of capital, does not fail to consider it as an indispensable condition precedent of production.—Capital being necessary, in different degrees, in all the employments of labor, we may conclude, first, that the number of these employments naturally increases in proportion as capital increases; then, that labor becomes more productive in the same proportion in the sense that it gives more abundant results for the same amount of labor and effort, consequences equally favorable to the progress of society and the well being of the masses.—We say that the increase of capital increases the employment of labor. Just as man can produce nothing without capital, capital can not act without the assistance of man. If the agricultural laborer can do nothing without his plow and his spade, the plow and the spade can do nothing unless the arm of the laborer puts them in operation. Dependence is reciprocal; it is even greater in the case of the instrument than of the hand and the intelligence which urges it on. It is easy to understand from this, that every increase of capital, every creation of a new capital, affords man new opportunities to utilize his power or his intelligence. As soon as there is formed anywhere, by saving and accumulation, by an excess of production over consumption, any amount whatever of capital—unless the owner hides it away, which happily is becoming rarer every day—that capital seeks employment in production, and it can not find that employment unless an ampler field for the employment of human labor be found. It is very true, more-

over, that the sphere of possible labor widens in proportion as capital increases, because if there are many kinds of labor like those of the tailor and shoemaker, which can be carried on successfully on small capital, there are many others which can not be completed or even undertaken, except by the aid of enormous advances.—If we wish to appreciate this truth in its broadest bearings, we have but to follow humanity in its principal stages, from the savage or barbarous state to the condition of civilization to which it has advanced.—In the savage state there is scarcely anything but the chase, the most elementary and fruitless of all kinds of work. The soil can not yet be cultivated. Even if the savage had the idea, which he has not, of cultivating the soil which he occupies, to increase its natural fertility, he would be unable to carry out this idea in practice from want of capital. Having neither plow nor spade to break the earth, he would be reduced to stirring it up with the branch of a tree. And even if he should succeed in this, which would be very difficult, he would be stopped in the course of his work for want of seed. Let us add, besides, that the cultivation of the soil which hardly repays the laborer after a year's waiting, is not suitable to a man whose stock of provisions can last only a few days. The vast circle of agricultural labor is closed to him by this fact. All that he can do in this direction is to collect here and there, in a very small number, such fruits as the earth produces spontaneously.—When, thanks to the accumulation of capital, the cultivation of the earth becomes possible, the circle of agricultural labor enlarges, but it does not reach at once its greatest extent. With a few tools, such as the spade and the plow, the harrow and a small number of draught animals, and with seeds and provisions for a year, a man can doubtless set about the cultivation of some lands, but not of all kinds of land, at first. Tools being imperfect, as always happens when capital is not abundant, only the lighter soils are cultivated, those which offer the least resistance and yield the least. Even on them, all the labor necessary to make them as productive as they might be, is not expended. Men abstain from the working of the heavier soils which are the most fertile but which require more powerful implements. Especially lands are avoided which present obstacles that must be removed before they can be cultivated at all, and which are not susceptible of giving immediate results. Such are lands covered with forests or swamps. In a state which we shall not call savage but only barbarous, man is merely able to cultivate bare or prairie land which responds to the touch of the feeblest instrument in his possession, and which at most presents no other obstacles but the long weeds that fire can destroy. As soon as he meets greater obstacles, such as forests or marshes, he halts. It would be necessary previous to the cultivation of such lands, to fell the forests and drain the swamps. But these operations require time, tools, etc., and can be performed only

with the assistance of a large amount of capital. In this state of things the sphere of the agricultural laborer is still quite restricted. It widens only in proportion as the amount of capital increases.—It is the same in almost all the paths of production. A nascent people, or one which is not sufficiently provided with capital, can not begin the working of mines and quarries. All that such a people ask of the mines and quarries is what can be got from them with little effort and labor. Later, when the amount of their capital becomes greater, they explore its depth to wrest from the earth the riches hidden in its bosom. Here is a vast career closed almost entirely during the earlier ages to the labors of man, which is opened and developed only by degrees, through the increase of capital. No monuments or edifices are constructed in a barbarous state; men scarcely build houses. They are content with the most modest dwellings, built at the smallest cost possible. The great *building industries*, which play so great a part in civilized countries, in which they give employment to so much intelligence and so many hands, are here reduced to their simplest expression. What shall we say of navigation, ship-building, preparing, transporting, collecting materials, lading and unlading, the piloting of ships, building and management of harbors, etc.? Much more might be said on manufacturing industry, which scarcely exists in barbarous states. It is almost always the last to follow in the path of civilization, for, more than any other, it requires a large appliance of acquired knowledge and a considerable development of capital. Still what a vast career this industry opens to the activity of man, when we consider it in its various branches. And what a lively impulse it gives through its contact with them to all the others! It is true, therefore, that in a barbarous state human labor is restricted on every side, and that it multiplies and extends at once in all directions in proportion as the increase of capital furnishes men with the means of action which they need.—It is proper to remark that if capital, generally speaking, increases the employment of labor by the opening up of new careers to the activity of men, it sometimes diminishes also their number in certain special branches of industry, since by the introduction of machinery it dispenses with the labor of many hands. This is a reproach directed especially against machines, which have, it is said, the great drawback of depriving workmen of work by doing a great part of that which was theirs. It is true that a steam engine, under the care of a single man, is able to replace the muscular power of a great number of men. It is none the less true that a spinning machine, for example, managed by one or two persons at most, can do the work of many women, and it may be said that in this sense it takes a part of their work from the women. These are facts. The error consists solely in the general consequences drawn from them.—We do not intend to anticipate here what will be said in the article *MACHINES*. We may be permitted,

however, some brief reflections on this subject, which are very naturally related to the subject of capital.—The object of industry is not to furnish occupation to man, but to provide for his wants. Labor is but a means; the satisfaction of his wants is the end. When, thanks to the increase of capital, industry enters new paths, it is to satisfy these wants that it enters them. In this way it offers, it is true, more numerous employments to the activity of man, but this is only accessorially. Its final aim is the extension of production and the increase of the number of products. Even when by simplifying its methods, by increasing the power of its means, by subjecting a greater number of natural agents to its empire, industry increases production with a less expenditure of force, or assists the labor of man by natural forces which it yokes to labor, it merely remains faithful to its chief mission. In this way it continually increases the mass of our wealth. Does it result from this that the amount of labor which man performs is really decreased? By no means. Capital, by increasing, always creates more labor than it destroys. If, thanks to the power of the agents set at work, it does away with part of the labor of man in special branches, it communicates a great activity to all the other branches; it opens in other directions so many new paths to industry, that for one employment it destroys it creates ten.—If men were well convinced of this truth, they would have given the great question of machinery a solution different from what they have sometimes given it. Does the invention of new machines increase or diminish the employment of labor? It diminishes it, say some economists, at least in certain cases, by satisfying the demand for commodities by a much smaller amount of labor. Others say it does not diminish it, except temporarily, for the simplification of the process of production by lowering the price of products, increases the demand for them, and industry grows in the same proportion. Taken in this sense, the question does not appear to us susceptible of a general decision. There are facts in support of both sides of it. There are to-day more printers than there were formerly copyists: this is an undoubted fact. Cotton spinning also employs more persons now that it is done by machinery, than it employed when it was done by hand. But again, are there more printers of music than there were formerly copyists of music? Does paper making by machinery employ as many workmen, notwithstanding the real increase of the demand, than paper making by hand employed some years ago? Does linen spinning by machinery employ, in France, as many men, and especially women, as hand spinning employed some time ago? Here we can boldly answer, no. But this is not the real question at issue. What should be asked is this: Is it not true that the introduction of machines—which in certain directions supplant the labor of man—is the result of the increase of capital and would not have taken place without such increase? Is it not true, on the other hand,

that this increase of capital has given to all the other branches of industry a greater impetus, to say nothing of the new industries which it has called forth; and that, in consequence, the small number of employments which have been done away with on one side have been amply replaced by new ones? Thus put, the question will not appear to us subject to the least doubt. It will always be objected, it is true, that if labor has not been decreased, it has been at least displaced. But displacements of this kind which are less annoying than is generally supposed, would be almost imperceptible were they not too frequently sudden, produced as they are by artificial means, and if the distribution and handling of capital were less subject to restrictions.—It is true that capital, by increasing, tends unceasingly to produce a wider development of human labor. This truth is strikingly evident when we compare two nations placed at a great distance from each other with respect to the accumulation of wealth. A sparse population may be seen to languish in inaction for want of employment, while another and a dense population works and is active. But even when the contrast is not so strongly marked, this truth is none the less apparent.—As to the advantages which the increase of wealth yields to society in other regards, by augmenting, in ever-increasing proportions, the sum of the products which it can dispose of, they are so evident that it is scarcely necessary to dwell on them.—V.

By what Methods is the Co-operation of Capital and Labor effected in a Nation? Since capital and labor can do nothing alone, they always seek each other. They have been represented as necessarily in conflict. Nothing falser can be imagined. The fact is, that placed by the law of their nature in reciprocal dependence, they tend constantly to association. It is true that the conditions of this alliance vary, as we shall soon see, according to circumstances, and these are not always equally favorable to labor. But association is none the less necessary to them in all cases. We have here to explain the different methods by which this association is effected.—When capital is in the hands of a man who can use it, there is nothing simpler than this association. The man who possesses an amount of capital sufficient to engage in some industry, and strength enough to employ this entire capital, has no need of inquiring further as to the manner in which he shall utilize the one and the other, nor to have recourse to outside aid in this matter. He works and calls his own capital to his assistance. A water-carrier whose capital consists in a barrel and a few pails, goes for water to the public well every day, and distributes the water to his customers himself. In this work he needs no outside aid: capital and labor are naturally allied in his hands. It is the same with most itinerant vendors who travel the streets of great cities, and even of some small hawkers. In general they own an amount of capital sufficient to buy in the morning the wares which they dispose of during the day. Some-

times, it is true, the capital which they use does not belong to them; they are forced to borrow it from others. In this case the alliance between capital and labor is not so simple; but if we suppose that they are really owners of the merchandise which they sell, capital and labor are combined, so to speak, in their persons, and work without difficulty side by side. It is the same with certain small artisans who carry on a trade on their own account, without employing workmen, their personal labor being sufficient to accomplish the work they have to do.—But these simple combinations of capital and labor are rare. They are moreover only applicable to very small industries, which require only the strength of a single man. The moment an owner of capital possesses a greater amount than he can utilize in his own work, he is forced to call in, in some way, the labor of another person. He must then either undertake an industry, by associating with his labor assistance, under the name of workmen, with whom he will naturally share the fruits of their common toil, by paying them a remuneration freely agreed upon between them, or turn over a portion of his capital as a loan, as stock or in some other form at a stipulated price to a master of an industry who will make it effective in his stead. On the other hand, when a man does not possess the amount of capital necessary to employ his mind and his hands usefully, he is forced to associate his labor in some way with the capital of another. This is the condition of the greater number of those who belong to what is called the working class. We have here various situations, in which capital and labor, not being at first united in proper proportions in the same hands, men are obliged to bring them together. How is this done? The preceding suffices to give an idea of the operations, it only remains to enumerate and define the several ways.—An owner of an amount of capital which he can not utilize himself, or of an amount of capital so great that he is unable to utilize it at all, has three principal means of calling to his assistance the labor of others: 1. He can engage in some industry by setting up an establishment answering to the amount of the capital which he possesses, and calling to his assistance men who, under the name of workmen, and for fixed wages, will give him the co-operation of their labor. 2. He can lend his capital to a man of enterprise who engages in some branch of industry, and who will use the capital at his own risk and peril, on condition of returning it later, and in consideration of the payment of a yearly percentage, under the name of interest, during the time he keeps it. 3. He can become interested in an industrial enterprise, by investing his capital in it as a shareholder, that is to say, by associating his capital with all the chances of the enterprise in order to share its profits or losses. In each of these cases, which comprise, in their general expression, nearly all the possible combinations, the owner of capital, in reality, but associates his capital with the

labor of another. Whether he makes it of avail directly, through the co-operation of his workmen, or gives it, in consideration of a yearly interest, to another proprietor who will make it available at his own risk and peril, or invests it in an outside enterprise by exposing it to all the risks of that enterprise, it is always true, that this capital is put at work, in whole or in part, by the hands of other men. There is here, therefore, a real alliance of the capital of the one with the labor of the other. These two necessary instruments of production, capital and labor, placed in different hands, are brought together, combined, united, and owing to this alliance they work from that time forward together.—The man who possesses only his labor has also three methods of obtaining what he wants by joining this labor to the capital of another; and these methods correspond exactly to those which we have just examined. He can either offer his services to the proprietor of an industry, or try to obtain by a loan and for a given interest the capital which he lacks, or he can call upon money-lenders who will consent to risk their capital in his enterprise. Of the three methods, the first is undoubtedly the least favorable to workmen, in this sense at least, that if they run no risk of loss, neither can they hope for very great advantages. The returns which they get vary doubtless according to places and times. They also vary frequently with individuals, on account of their activity or respective capacity; but in general they are very much inferior to those which men may hope for who succeed, either by means of a loan, or in any other way, in putting the capital of others at work for their own profit, and at their own risk. But the reasons for this are so easily understood that it is scarcely worth while to set them forth. The man who obtains the capital of others in the form of a loan, to make it available on his own account, is in an altogether special position. The very fact of the loan which he has contracted, proves that special confidence is placed in his morality or capacity, which all workmen do not inspire in the same degree. He is besides weighted with a heavier responsibility than comes upon others, and is exposed to greater risks. It is therefore quite natural that he should aspire to make greater profits. It is the same with him who has been able to induce capitalists to interest themselves in his undertaking, by investing their money in his enterprise.—VI. *Effects of the Scarcity or Abundance of Capital—Absolute and Relative Abundance—Active Capital and Dormant Capital.* We have seen how, in proportion as capital develops in a country, industry opens up new paths for itself, daily extending the dominion of man and daily satisfying new wants. But this is not all. Even in the branches already cultivated, industry operates more profitably and on a larger scale in countries where capital abounds than in countries where it is rare.—“Nations with small capital,” says J. B. Say, “are at a disadvantage in selling their products; they are unable to

grant their customers at home or abroad long terms of credit, or easy payments. Those with still less capital are not always in a condition to make even the advances of their raw materials and labor. This is why men are obliged, in India and Russia, to send the price of what is bought six months and even a year before their commissions can be executed. These nations must be greatly favored in other regards in order to make such considerable sales in spite of this disadvantage.”—The total of their sales is considerable, it is true, but not proportionate to the territory they occupy, nor nearly such as they might make if they possessed a greater amount of capital. Besides they always operate at a relative disadvantage, in this, that they scarcely ever realize the amount of profit to which they might lay claim; the greater part of it always comes to those nations who traffic with them, and who, so to speak, lay down the law to them.—This disadvantage, however great, is not the only, nor even the greatest which they have to bear. A nation poor in capital knows little of the spirit of enterprise. It reaps small advantage of favorable occasions which present themselves and which another better provided nation always seizes. It also derives but a medium advantage from new inventions, through lack of power or boldness to put them to use. It drags along painfully in the old ruts, hesitating always to depart from the beaten track. If by chance it takes a risk in some new enterprise, it does so almost always with insufficient capital, and reaps disappointment. It may be that in such a nation the greater part of its land is cultivated; but the cultivation is ill managed, for want of capital sufficient to second the efforts of man, and the results are not proportionate to the energy of the laborers' work. It may be also that in such a nation the chief branches of manufacturing industry are carried on, but as they are only carried on with defective machinery, because proprietors either dare not or can not renew them in time, industry vegetates instead of flourishing. Their products are almost always imperfect, except when they depend more particularly on the labor of man. Moreover, these products are naturally dearer, at least they would be were it not for an almost fatal necessity which in this case throws the loss, resulting from lack or imperfection of tools, on the workmen, by reducing their wages.—These truths appear in all their prominence when we compare the people of England and the United States, so rich in capital, with the majority of the nations on the European continent, which are so generally devoid of it. The spirit of enterprise is active in England; it is still more active in the United States. Every favorable chance to realize a profit is seized upon there with eagerness. Besides, an enterprise generally obtains all the capital necessary to its success. The agricultural and manufacturing industries are commonly provided with the best instruments, the best tools known, so that they are carried on under the most favorable

conditions possible; and the sweat of man, his talents and his acquired knowledge are never spent in vain.—The most serious matter, perhaps, is that the decrease of wages is the inevitable consequence of scarcity of capital. There are two decisive reasons for this. The first is, that where the spirit of enterprise is not much encouraged, there are fewer careers open to the activity of man; consequently there are a greater number of idle men, either voluntary or constrained. The second is, that fewer products are obtained with the same amount of labor. Where there is less labor, where, besides, fewer results are obtained with the same amount of labor, is it not inevitable that each man's share shall be smaller? We say that in this case wages fall, and it must indeed be so: but this is not all. The general level of wealth falls; the sum total of consumption is reduced, together with the sum total of production. And this is true not only with reference to the laboring classes, but with reference to all classes of society, with a few rare exceptions. The poor become poorer in consequence and the rich less rich, in this sense, at least, that all are obliged to be satisfied with a smaller number of products.—Protests are often raised against these results, in so far as the working classes are particularly concerned. Why is it not seen that they are inevitable under certain circumstances? When the sum total of production is small, is it possible to distribute to each one a large part? Doubtless that of the workmen is relatively very small. There are here and there certain men who obtain much more and whose situation presents a striking contrast to that of their fellows: but if we reduce the part belonging to these latter would that of the workmen be much increased? But the strangest thing is, that men on this account declaim against capital, to which they impute the distress of the working classes. There can be no greater folly. The truth is, that the cause of this evil lies in the absence or in the scarcity of capital. But the abundance of capital is absolute or relative; and this is a truth ignored, upon which we should insist more were it not sufficiently dwelt on elsewhere.—It is not always the relative importance of the values which it has accumulated that constitutes the superiority of one people over another; it is sometimes, and more frequently, its superiority in making use of these values. As to England it may be admitted as very sure that the sum of its actual capital is greater than that of any other nation in Europe. But is the same true of the United States of America? It is more than permitted to doubt it. North America, a new country, which in great part is still almost unexplored, can not possess an amount of capital equal to that which some European countries, France, for example, owe to the labors of past generations and the slow accumulations of many centuries. Nevertheless it is true, in fact, that capital is much more abundant in the United States than in France, in the sense at least that it lends itself more easily and with

indefinitely greater profusion to the requirements of labor. Whence comes this? From several causes, which are summed up in one, to wit, that in the United States capital always goes to its real destination and there is never inactive. One would be alarmed if it were possible to give an account, in France, of the amount of capital daily turned away from fruitful employment to be dragged into sterile uses. One would perhaps be still more astonished could an exact calculation be made of the amount of capital lying idle, not only in the form of money, but in the form of merchandise and values of every kind. This evil, though not altogether unknown, is far less in the United States than in France, and this is the reason that with perhaps a smaller amount of actual capital there is relatively a much greater abundance. There is perhaps more capital in France, but in the United States there is much more active capital.—And if it is asked whence comes the inferiority of France in this regard, we shall answer that it comes, first, from the almost total absence of those institutions of credit whose chief object is to distribute and dispose of capital; that it depends, also, on the vices of French legislation on commercial associations, and on the presence of certain ill-planned institutions, which have no other effect than to strike the greater part of social wealth with sterility.

CHARLES COQUELIN.

CAPITAL, The National (IN U. S. HISTORY).

The congress of the revolution and the confederacy was peripatetic, and at various times in its history held meetings at Philadelphia, Baltimore, Lancaster, York, Princeton, Annapolis, Trenton and New York. (See CONTINENTAL CONGRESS) June 21, 1783, a handful of insubordinate and unpaid militia marched into Philadelphia, where congress was sitting, and, unchecked by any efforts of the state or city authorities to keep the peace, broke up the session of congress by jeering the members and pointing muskets at the windows. This, among other incidents, gave an impulse to the desire to obtain a permanent home for the national legislature, and Oct. 7, 1783, congress resolved that a building for its use should be erected at some place near the falls of the Delaware. This was soon after modified, in deference to sectional jealousy, by requiring the erection of a suitable building near the falls of the Potomac, that the meetings of congress might alternate between the two places. After long and warm debate, congress returned to its first resolution, and decided that there should be but one capital, and commissioners were appointed to lay out a federal town near the falls of the Delaware. Dec. 23, 1784, it was resolved to meet regularly in New York city until the new town was completed. But, while money was wanting for more pressing demands, congress was unable to go any further than the plan. The commissioners made their report, but no action was taken upon it.—The successful establishment of the constitution,

with the prospect of a federal government whose wealth and resources would surpass any previous experience in America, revived the notion of a federal town. Objection was made to New York city as a permanent capital by many of the delegates from agricultural districts, who considered a commercial metropolis very ineligible, because of the direct influence which the moneyed interest might exert on congress; and objections were also made to Philadelphia by many of the southern members, who were affronted by the assiduity of the Quakers in preparing and presenting to congress propositions for the abolition of slavery. When the new congress also came to the conclusion to fix the location of the federal town in the north, placing it this time on the banks of the Susquehanna, the decision roused intense anger among the southern delegates, and Madison declared that if this action had been foreseen, his state might never have entered the Union. As a compromise, it seemed probable that congress would drift back again to the plan of two capitals, and of alternate meetings north and south, an arrangement excellently adapted for preserving the two sections in their separate integrity, and for facilitating their ultimate separation.—The inevitable compromise finally took another form. The anti-federalists, whose strength was mainly southern, succeeded by a majority of two in the house in voting down Hamilton's plan for the assumption of state debts by the federal government. (See *FEDERAL PARTY*, I.) By Jefferson's mediation (though he afterward claimed that he was "entrapped" into it), two anti-federalists from the Potomac agreed to vote for Hamilton's plan, which was thereby adopted, the federalists in return agreeing to vote that the national capital should be fixed upon the Potomac, after remaining ten years at Philadelphia. The result was an act passed June 28, 1790, with the following clause "That a district of territory on the river Potomac, at some place between the mouths of the Eastern Branch and the Connogochegue, be and the same is hereby accepted for the permanent seat of the government of the United States." By the same act congress was to meet at Philadelphia until the first Monday in November, 1800, and then remove to the Potomac.—By separate cessions of Maryland in 1788 and Virginia in 1789, a federal district ten miles square was acquired, which was laid out by Washington in person, by act of March 30, 1791. The place was officially known as *The Federal City* until Sept. 9, 1791, when, by order of three commissioners appointed by the president, the district was named *The Territory of Columbia*, and the city *The City of Washington*.—Congress made no adequate appropriations for the work on public buildings, and in December, 1796, Washington was compelled to make a personal appeal to the legislature of Maryland, which advanced \$100,000 on the pledge of the private credit of the commissioners. Nov. 17, 1800, the federal government removed to "the Indian place, with the long name, in the woods,

on the Potomac." Its discomforts are feelingly described in letters of the time, and more particularly in those of Mrs. John Adams. There were few public buildings, except the capitol, of which only the two wings were finished, connected by a wooden passage.—Aug. 24-25, 1814, the British army burned the public buildings, and when congress re-assembled the two houses met in a small brick building known as Blodgett's hotel. The project of establishing the capital in the north was at once revived, and liberal offers for the location were made by Philadelphia, and by Lancaster, Penn., formerly the capital of Pennsylvania. Oct. 3, 1814, a resolution for removal was carried in the house by the casting vote of the speaker, nearly the whole southern vote being in the negative. A bill for the removal was ordered to be prepared but was smothered in committee. The citizens, who were naturally anxious to prevent any removal, furnished a building which was used by congress until a portion of the present capitol was finished, Dec. 6, 1819. The building was completed in 1827, being surmounted by a wooden dome. In 1851 an extension was begun, and in 1863 the whole structure was finished in its present form by the completion of the iron dome (begun in 1855), crowned by Crawford's bronze statue of freedom.—The position of the national capital proved exceptionally fortunate during the rebellion. The necessity for securing communication with the loyal states forced the federal government into a policy far more aggressive than would have been the case if the capital had been further north. The location of Washington upon the Potomac, which the south had so eagerly desired, was one of the causes which made peaceable secession, and northern acquiescence in a division of the country, equally impossibilities.—In 1846 Virginia's cession was retroceded, leaving only 64 square miles in the District of Columbia. This tract has always been governed directly by congress, excepting during the years 1871-74, when the experiment was tried of erecting a territorial government, with the power to raise money by tax and loan. This body rushed at once into a very extensive system of public improvements, which resulted in the creation of a debt of over \$20,000,000 on an assessed valuation of less than \$80,000,000. The District of Columbia is now under the supervision of commissioners, appointed by the president, but controlled by congressional legislation. Like other territories it has no voice in national elections, and the city of Washington thus presents the anomaly of a city of 147,307 inhabitants (in 1880) whose own citizens, except in local elections, are disfranchised. (See *CONTINENTAL CONGRESS*, *DISTRICT OF COLUMBIA*)—See Poore's *Political Register*, 1; 1 Curtis' *History of the Constitution*, 220, 227, and 2: 268, and authorities there cited; 6 Hildreth's *United States*, 528; Varnum's *Seat of Government*; J. Elliot's *Historical Sketch of the Ten Miles Square*; Howe's *Virginia Historical Collec-*

tions; 9 *Curtis*, 65; and authorities under DISTRICT OF COLUMBIA.

ALEXANDER JOHNSTON.

CAPITULATION. When an army corps or a fortress feels no longer able to resist the enemy, and the belligerents are not induced by passion to refuse all quarter, there remains only to surrender at discretion or on condition. The latter form of submission, especially when a fortress is in question, is called more particularly a capitulation. Nevertheless, it would seem that in ordinary language a distinction is no longer made between a surrender pure and simple and a capitulation.—The rules regarding capitulations are very simple. They are treaties whose clauses have been discussed beforehand, and which, once signed, become binding on the contracting parties, except, say some writers, when one or both of them have exceeded their powers. Now, the officer in command of the fortress, on the one hand, and the commander of the besieging army, on the other, are authorized by usage and necessity to negotiate and conclude this kind of treaty; and the supposition of the treaty containing other provisions than those relative to the capitulation is a case which it does not seem worth while to consider here. Neither do we wish to consider the case of non-fulfillment of the capitulation on the part of the victor. A general who did not keep his engagements with the vanquished, would dishonor himself, and would expose himself or his side to reprisals.—The stipulations which may be contained in capitulations depend on circumstances. According as the chances of relief are greater or less, according as the defense has been more or less prolonged, according to the extent of the means of resistance still left the garrison, the terms granted will be more or less lenient or severe. It rarely occurs that a garrison is allowed to leave a fortress with "the honors of war," that is to say, with arms and baggage, colors flying, and bands playing martial airs; but neither, on the other hand, is it necessary to stipulate that the lives of the garrison shall be spared. That is understood, for prisoners of war are no longer put to death. The soldiers, also, are allowed their personal effects, and sometimes the officers, too, are permitted to retain their swords. The victor must not seize on anything but the property of the state, and he ought not to forget that peaceful inhabitants are not to be considered as enemies.—Prior to the capitulation the commander of a fortress is master there, and is accountable only to his superiors. But the capitulation once signed, the *United States Instructions for Armies in the Field*, § 144, says that, the capitulator has no right, during the time that elapses between the signing and the execution of the capitulation, to destroy or injure the defensive works, the arms, provisions and munitions in his possession, unless it has been otherwise agreed.—Thus far we have considered capitulations from the standpoint of international law;

there remains still the standpoint of the military code. The government which has intrusted a soldier with the charge of a fortress has a right to demand an account of his acts, and this account is often required. In France, the decree of May 1, 1812, provides as follows: "Art. 1. All generals and all commanders of armed forces, whatever their rank, are forbidden to enter into any capitulation, written or verbal, in the open field.—Art. 2. Every capitulation of this sort, that results in a laying down of arms, is declared dishonorable and criminal, and shall be punished with death. [But what if there are absolutely no means of defense?] The same shall hold true of all other capitulations where the general or commander has not done all that honor and duty prescribed.—Art. 3. In a fortified place, besieged and invested, a capitulation is allowed in the cases provided in the next article.—Art. 4. A capitulation of a fortified place besieged and invested may be made if the provisions and munitions are exhausted after due economy, if the garrison has sustained an assault on its *cucurte*, and is unable to withstand a second, and if the governor or commandant has fulfilled all the obligations imposed upon him by the decree of the 24th of December, 1811.—The governor or commander, as well as the officers, shall in no case separate their own lot from that of their soldiers but shall always share the fortunes of the latter.—When the conditions prescribed in the preceding article shall not have been fulfilled, any capitulation or loss of the place that shall ensue is declared dishonorable and criminal, and shall be punished with death * * * ."—Other countries have analogous provisions. (See *ARMISTICE, SIEGE*, etc.)

MAURICE BLOCK.

CARICATURE. Political caricature, and this is the only kind we refer to, is only one form of the liberty of the press. It is the weapon of the weak, the book of people who have not yet learned to read. It was the newspaper of the rustic, before newspapers proper came into existence. An event occurs. The caricaturist seizes it, and with the point of his pencil nails it to the pillory. The impression produced is immediate. The people see the point. Indifference here is out of the question. The idea is caught at a glance, and at the same time people declare for or against the artist. Better than the newspaper article or the book, caricature gives body to ideas and sets up a target for the shots of rancor. The history of political caricature is intimately connected with that of nations. While the aristocracy and the middle class write books or edit newspapers, the engraver's art tells the story of popular joy and sorrow, hope and wrath. The people paint themselves as they are, and represent their enemies as they appear to them. They call things by their right names. In 1496, long before Luther, they held up papal Rome to execration. Before the league they drew Henry III., the

hermaphrodite, on the hurdle. Richelieu made every one tremble before him; yet he feared the shafts of caricature, which did not respect even the terrible majesty of Louis XIV. Caricature helped the French revolution by familiarizing the people with the idea of revolt. It showed foresight on the eve of the 18th Brumaire, by representing the first consul thimblerrigging the republic under the pyramids as goblets. Vanquished in 1815, it avenged itself by ridiculing the victors.—We do not, however, pretend to say that caricature has been always in the right. In the first place it has been frequently malicious, and consequently given to exaggeration. And then the desire to provoke laughter and be witty has more than once blinded the artist. But in these cases the public was not with it; or, if they applauded its wit for a time, they did not approve its malice. Social and political caricature was, for a long time, only a representation of the personages whom it wished to expose to public ridicule. Words surrounded by a pencil line, and issuing from the mouth of one of the actors in the scene, expressed in a comic way the thought of the artist. It was seldom that caricature, faithful to its etymological significations, exaggerated personal defects or attitudes, or facial expression. The point was altogether in the written words, the apparel, or the peculiarities of the person represented; but with William Hogarth, Goya and Callot, caricature attained its highest degree of development. It became less ingenuous, but wittier. To allegory, the general form of caricature, succeeded the observation, and bringing out into relief of certain contours or lines. This was the artistic period of caricature.—Caricature attained great importance under Louis XVI. and during the French revolution. It fell into disuse in France before public spirit disappeared. The hero of a hundred battles could not allow his acts to be commented on by the pencil. What he exacted from the press was disciplined admiration. During his reign caricature took refuge in England, and contributed, not a little, by the daily irritation it kept up, to the maintenance of that hatred which was one day to be his ruin.—The restoration was not much more liberal in this respect, and it took the revolution of 1830 to restore caricature to its rights. The establishment of daily papers devoted to caricature dates from this period. Struck down in France at the same time as the press by the laws of September, 1835, it rose again in 1848, only to fall once more under the decree of Feb. 17, 1852. Caricature in that country to-day, subject to a preliminary authorization, attacks the foibles or the vices of citizens. In France it was for a long time forbidden to touch on political subjects, unless the country was at war, in which case the artist was allowed to discover and bring into relief the motives in the eye of the enemy, on condition, however, of not perceiving the beam in the eye of the nation.—The caricaturist's art, in our own time, is so frequently employed, that

no large city is without one or more satirical illustrated papers. We need only mention the "Uomo di Pietra" of Milan, the Paris "Charivari," "Il Fischietto" of Turin, the Berlin "Kladderadatsch," and the London "Punch."—Caricature plays in England a part similar to that played by the *chansons* in France and the pasquino at Rome; but with this difference in England's favor, that the pasquinades were purposely obscure, the *chansons* or popular songs were liable to the severest penalties, while in England the only limit to the right of saying anything is the right to contradict it. Has the government reason to regret the liberty it allows its citizens? We may form an opinion from one fact. In England caricature is pitiless to the most important personages in the state, but the moment it represents government personified, that is, the king, it reproduces his features faithfully; and the correctness of the picture of the king, showing the artist's respect for the principle of authority itself, renders only more scathing the epigram intended for the public functionary.—In proportion as ideas of liberty generate ideas of dignity, caricature will certainly diminish in importance. The power of freely expressing one's thoughts will take away all desire to express them with malice. When a man has the right to expound great and immortal truths, he does not waste his time in fighting trifles. For example, in 1858 a mass of *fischietti* appeared all over Italy who with pencil and pen ridiculed and caricatured the Austrians and the principal feudatories of Vienna. Since then the *fischietti* have become almost mute and are content with preaching liberty and defending national unity.—Caricature when it strikes home, is as good as the best newspaper article, and whether the precursor or interpreter of popular dissatisfaction, it sometimes gives salutary warning. The following was the design of a satirical drawing called "The Assembly of Notables," which appeared in 1787. Calonne, the minister, dressed as a court cook, and armed with a large knife, harangues a whole army of poultry, representing the notables. The legend runs thus. Calonne: "*Dear people, whom I govern, I have gathered you together to know with what sauce you would like to be eaten.*" The Notables: "*But we do not wish to be eaten at all.*" Calonne, severely, "*That is no answer to my question.*"—This caricature is the sad and faithful representation of human history. It is only the sauce that changes. When the notables persist and will not keep to the point, we have what is called revolution.

HECTOR PESSARD.

CARPET BAGGERS, the name given by the southern whites after 1865 to northern republicans who settled in the south. Originally it was given only to those politicians who, retaining their homes and connections in the north, went (with no more baggage than a carpet-bag) to the south for a time long enough to qualify them for admission to congress or for state offices. Grad-

ually the name was extended to all whites who endeavored to organize or lead the colored vote. (See RECONSTRUCTION.) A. J.

CARTEL. (See EXCHANGE OF PRISONERS.)

CASS, Lewis, was born at Exeter, N. H., Oct. 9, 1782, and died at Detroit, June 17, 1866. He was admitted to the bar in Ohio in 1802; reached the rank of brigadier general in 1813; was governor of Michigan territory 1813-31; secretary of war under Jackson, secretary of state under Buchanan, (see ADMINISTRATIONS), and United States senator from Michigan (democrat) 1845-57. In 1848 he was the democratic candidate for president. (See DEMOCRATIC PARTY, IV.)—See Smith's *Life of Cass*; Young's *Life of Cass*. A. J.

CASUS BELLI. A nation is accountable to itself alone. It is always the nation itself that, in the end, judges its relations to other powers. It can, at its pleasure, change the nature of those relations, and pass from a state of peace to a state of war. But wars always have a pretext or a reason. When the pretext or reason can be shown beforehand, it is said to be a *casus belli*, a case of war. It would be impossible to enumerate the various causes of war. The cause of a war may depend on fortuitous circumstances; on the choice of a prince to succeed to a neighboring throne; on the change of a form of government; on wounded vanity. We shall confine ourselves to a general summary of the principal causes that lead to war. They arise either from a violation of rights or from the violation of the interests of one nation by another; or else from offenses against the dignity of the nation.—“The rights of states,” says Klüber, (*Droits des gens modernes*, sec. 2, chap. i., p. 208), “are violated in the same manner as the rights of individuals. They are violated directly or indirectly; directly, if the injury has been done to the body of the state itself; indirectly, if it has been done only to individual subjects of the state; it may be by some of its members, provided their government has been affected in any way by the violation.” The state, like a man living isolated and in a state of nature, Klüber further says, according to the most eminent juriconsults, has the right to defend itself by acts of violence, in the measure that may be necessary, against injuries actual or to be apprehended. Thus a state may be injured by the mere fact that a neighboring state has acquired an excess of territory. It may declare such acquisition a *casus belli*.—There have been cases in which war has been waged under the pretext that a moral invasion, an intellectual contagion, a political epidemic, was feared, or because there was a pretense of fearing them. However, a revolution, or even a rebellion, when it is purely national, and unaccompanied by direct danger to other states, does not justify the intervention of these states in affairs not theirs.

Bluntschli expresses himself as follows, in his *Codified International Law*, on this point: “We must acknowledge and admit the necessity for every state and people to modify itself according to the political needs of the period, on the same ground that historical rights should be protected when they are not in conflict with principles admitted by its contemporaries. By opposing the formation of a new law, the living breath which animates the law is lost sight of, and the law itself is kept from progressing, together with the nation. We do not see why a people should have the right to go to war to defend the crown of their prince, and not have the right to resort to arms to establish national unity. Is it, perchance, because an old piece of parchment determined during the middle ages the right of succession of the prince, while a series of disastrous events hindered during several centuries the consolidation of national unity? It seems to me that the right of a people to resort to arms when necessary to give themselves the constitution they claim to develop their natural qualities, to fulfill their mission, to provide for their safety, defend their honor, is much more natural, more important and more sacred than musty manuscripts, the evidence of the rights of a dynasty.” MATRICE BLOCK.

CAUCUS, The Congressional, (IN U. S. HISTORY). The convention of 1787, in framing the system of choosing a president and vice-president, carefully provided that “no senator or representative, or person holding an office of trust or profit under the United States, shall be appointed an elector.” (See CONSTITUTION, ARTICLE II.) The convention's suspicions of congressional influence have been signally justified by the extreme difficulty of keeping the electoral system free from it. (See ELECTORS.) At the first two presidential elections the electors were real officers with discretionary powers, and even in the third election, though some of them were pledged in advance by their constituents, most of them retained their original functions. In 1796 the republican members of congress informally agreed to support Jefferson and Burr equally, while the selections of Adams and Pinckney were due mainly to federalists out of congress. But the next election developed a system of congressional caucuses which reduced the electors to the position of mere ciphers, and gave all their powers to the members of congress. These caucuses were seven in number, extending over the years 1800-24. —1. In the winter of 1800 the federal party controlled both houses of congress, and, as was asserted by the Philadelphia *Aurora* (for which assertion its editor, Duane, was arrested for contempt of the senate), a compact clique of senators controlled the decisions of the majority in the senate. President Adams, the nominal head of the federal party, was heartily disliked by the leaders of his party (see ELECTORS), and, although prudence forbade an open quarrel with him, the federalist members

of congress, in February, 1800, met in caucus and decided that their party electors should support Adams and Pinckney equally, in hopes that their decision would be respected in New England, while in the south Pinckney would gain enough scattering votes to head Adams, and, under the then provisions of the constitution, become president. Without any similar design against the precedence of Jefferson, the republican members soon after met and resolved that Burr, whose feeble support in the south at the preceding election had been a ground of complaint in New York, should have an equal support with Jefferson. The result was the downfall of the electoral system. The electors of both parties, in passive obedience to the dictates of the caucuses, voted the tickets prepared for them, except that in Rhode Island one elector withheld his second vote from Pinckney, so that South Carolina's vote would have quietly seated both Adams and Pinckney. (See DISPUTED ELECTIONS, I.)—II Feb. 29, 1804, the first open caucus of republican congressmen met. Jefferson was renominated for the presidency without hesitation, but a selection for the vice-presidency was a different matter. The incumbent, Burr, distinguished equally for brilliancy and lack of principle, had always been an object of mingled terror and suspicion to the Virginia interest (see VIRGINIA), had come too near the presidency in 1800 to become prominent again with Jefferson's good will, and was at war with his own party in his own state. (See BURR, AARON.) His chances in a congressional caucus were therefore not worth considering. But it was essential that New York should not be alienated, and in Burr's place the Virginia interest preferred George Clinton, the leader of the Clintonian faction of New York democrats, against whose domination Burr's following was arrayed then and after. The votes in caucus were, for Clinton, 67; for Hugh H. Breckenridge, of Pennsylvania, 20; for Levi Lincoln, of Massachusetts, 9; for John Langdon, of New Hampshire, 7; for Gideon Granger, of Connecticut, 4; and for William Maclay, of Pennsylvania, 1. The caucus action was indirectly the cause of Alexander Hamilton's melancholy death. (See BURR, AARON.) No record of any federalist caucus of this year can be found. Their action was governed by a knot of leaders who had determined to effect a coalition between the New England federalists and the middle state democrats, who were tired of Virginia domination. Of this scheme Burr's candidacy for governor of New York was a part. Had he succeeded he would probably have been sprung upon the country as a coalition candidate for the presidency in 1804.—III. Jefferson, in answer to requests from democratic state legislatures to accept a third term, had decisively refused. Jan. 19, 1808, Stephen R. Bradley, senator from Vermont, and chairman of the last previous caucus, "in pursuance of the powers vested in him," called a caucus for Jan. 23. This strong symptom of the organi-

zation of a machine was displeasing to many of his party, who knew that they were only summoned to register the selection previously made by the Virginia interest, and to transfer the presidency from Jefferson to Madison. Of the 130 democratic congressmen only 89 attended on the appointed day, the votes for the presidential candidate being 83 for Madison, 3 for George Clinton, and 3 for Monroe. For vice-president, Clinton received all the votes cast, 79. Monroe was an aspirant for the presidency, and both his friends and those of Madison claimed to be the veritable "Virginia interest." Jan. 21 the Virginia legislature had split into two caucuses, one of which gave Madison a unanimous vote, 134, and the other 50 for Monroe and 10 for Madison. Each caucus nominated a set of electors, and began an active canvass. Monroe's friends in congress published, March 7, a protest which objected to Madison as unfit for the presidency in troublous times, and denounced the presumption of congressmen in arrogating to themselves "the right (which belongs only to the people) of selecting presidential candidates." Against this charge the caucus had sheltered itself under the assertion that its members acted "only in their individual character as citizens." No record remains of any federalist caucus. That party could not well make nominations while coquetting with Clinton and Monroe (see FEDERAL PARTY), and, when their candidacy proved a failure, the federalists by common consent fell back on their old candidates, Pinckney and King.—IV. In 1812 the democratic-republican party had become a war party, and its new leaders were determined that the peace-loving president should, at least in appearance, head them. A committee, headed by Henry Clay, informed Madison that a war message was the price of his renomination, and to this condition Madison unwillingly submitted. The caucus was accordingly held May 18, 1812, 82 of the 133 democratic congressmen being present. Madison was renominated unanimously, and John Langdon, of New Hampshire, received a majority of votes for vice-president. On Langdon declining, Elbridge Gerry was substituted. The caucus again announced its action to be that of "individual citizens," but it took a step in advance by appointing a national committee to see that its nominations were observed. In New York, where the Clintonian faction at present controlled the state, 95 of the 99 republican members of the legislature met in caucus, May 29, and by 87 to 8 voted to nominate Clinton as the anti-administration candidate, in opposition to congressional caucus action, which "always resulted in the selection of a Virginia candidate." In September a secret convention of federalists from all of the states north of the Potomac, and from South Carolina, met in New York city, and after three days' debate agreed to support Clinton for president and Jared Ingersoll for vice-president.—V. Monroe, who had always been regarded as the foreordained successor of Madison, had not by any means

shown great brilliancy in his conduct of the war, and only through the lack of any available opponent was his nomination possible. Even when the caucus met, March 16, 1816, 118 of the 141 democratic congressmen being present, the result was by no means certain. Two resolutions were offered, one by Henry Clay and the other by John W. Taylor, of New York, that caucus nominations ought to be abolished, but these were voted down, and Monroe received the nomination by 65 votes to 54 for William H. Crawford, of Georgia. Had Crawford chosen to make any strenuous effort against Monroe he could probably have secured the nomination, which was equivalent to an election. For vice-president Daniel D. Tompkins, of New York, received 85 votes to 30 for Simon Snyder, of Pennsylvania. The federalists, whose continued existence was only a matter of form, made no nominations, but their New England electors voted by common consent for Rufus King, and for various vice-presidential candidates.—VI. In 1820 Samuel Smith, of Maryland, chairman of the last previous caucus, called a new one, but only about 50 members assembled, and these yielded to the general impatience of the further existence of this irresponsible nominating body and separated without action. The incumbents, Monroe and Tompkins, were voted for by common consent and without opposition.—VII. In 1824 party lines had disappeared through the extinction of the professed federal party. There was but one party from which to select candidates, and it was now generally felt that a selection made by a congressional caucus indirectly gave to congress that power of electing a president and vice-president which had been carefully denied by the constitution. Furthermore, various state legislatures had willingly assumed the functions of nominating bodies, and, being unwilling to see their action overslaughed by congressmen, had instructed their senators and representatives not to attend a caucus, if one should be called. But the friends of Crawford, who felt that his self-abnegation in the caucus of 1816 had cost him the nomination then, were determined to secure for him the usual stamp of "regularity," and called a caucus for Feb. 14, 1824. Only 68 of the 258 members were present, and of these 64 voted for Crawford, 2 for John Quincy Adams, 1 for Andrew Jackson, and 1 for Nathaniel Macon, of North Carolina. A motion to adjourn the meeting until March had been voted down. For vice-president Albert Gallatin (see AMERICAN PARTY, I.) received 57 votes and was nominated. The manner of nomination brought more injury than benefit to Crawford, and the reign of "King Caucus" was ended. In 1828 the nominations were made by state legislatures, and in 1832 the still existing system of nominating conventions was introduced, under which the official nullity of the electors has become fixed. ING CONVENTIONS.)—See 25 Niles' *Register*, 244-258, 4 Hildreth's *United States*, 687; 5: 357, 516; 6: 63, 298, 376, 595, 620, 701; 1 Hammond's *Political History of New York*, 315, 411, and 2: 128; 3 Parton's *Life of Jackson*, 24; Mackenzie's *Life and Times of Van Buren*, 44, 55.

ALEXANDER JOHNSTON.

CAUCUS SYSTEM. A caucus, in the political vocabulary of the United States, is primarily a private meeting of voters holding similar views, held prior to an election for the purpose of furthering such views at the election. With the development of parties, and the rule of majorities, the caucus or some equivalent has become an indispensable adjunct of party government, and it may now be defined as a meeting of the majority of the electors belonging to the same party in any political or legislative body held preliminary to a meeting thereof, for the purpose of selecting candidates to be voted for, or for the purpose of determining the course of the party at the meeting of the whole body. The candidates of each party are universally selected by caucus, either directly, or indirectly through delegates to conventions chosen in caucuses. In legislative bodies the course of each party is often predetermined with certainty in caucus, and open discussion between parties has been, in consequence, in some degree superseded. The caucus system is, in short, the basis of a complete electoral system which has grown up within each party, side by side with that which is alone contemplated by the laws. This condition has in recent years attracted much attention, and has been bitterly denounced as an evil. It was, however, early foreseen. John Adams, in 1814, wrote in the "Tenth Letter on Government": "They have invented a balance to all balance in their caucuses. We have congressional caucuses, state caucuses, county caucuses, city caucuses, district caucuses, town caucuses, parish caucuses, and Sunday caucuses at church doors; and in these aristocratical caucuses elections have been decided."—The caucus is a necessary consequence of majority rule. If the majority is to define the policy of a party, there must be some method within each party of ascertaining the mind of the majority, and settling the party programme, before it meets the opposing party at the polls. The Carlton and Reform clubs discharge for the Tories and Liberals many of the functions of a congressional caucus. Meetings of the members of the parties in the *reichstag*, the *corps législatif* and the chamber of deputies are not unusual, though they have generally merely been for consultation, and neither in England, France, Germany or Italy has any such authority been conceded to the wish of the majority of a party as we have vested in the decision of a caucus. What has been called a caucus has been established by the Liberals of Birmingham, England, as to which see a paper by W. Fraser Rae, in the "International Review" for August, 1880.—The origin of the term caucus

is obscure. It has been derived from the Algonquin word *kaw-kaw-wus*—to consult, to speak—but the more probable derivation makes it a corruption of caulkers. In the early politics of Boston, and particularly during the early difficulties between the townsmen and the British troops, the seafaring men and those employed about the ship yards were prominent among the townspeople, and there were numerous gatherings which may have very easily come to be called by way of reproach a meeting of caulkers after the least influential class who attended them, or from the caulking house or caulk house in which they were held. What was at first a derisive description, came to be an appellation, and the gatherings of so-called caulkers became a caucus. John Pickering, in a vocabulary of words and phrases peculiar to the United States (Boston, 1816), gives this derivation of the word, and says several gentlemen mentioned to him that they had heard this was the derivation.—Gordon, writing in 1774, says: "More than fifty years ago Mr. Samuel Adams' father and twenty others, one or two from the north end of the town where all the ship business is carried on, used to meet, make a caucus and lay their plan for introducing certain persons into places of trust and power. When they had settled it they separated, and each used their particular influence within his own circle. He and his friends would furnish themselves with ballots, including the names of the parties fixed upon, which they distributed on the days of election. By acting in concert, together with a careful and extensive distribution of ballots, they generally carried their elections to their own mind. In like manner it was that Mr. Samuel Adams first became a representative for Boston." (History of the American Revolution, vol. i., p. 365.) February, 1763, Adams writes in his diary: "This day I learned that the caucus club meets at certain times in the garret of Tom Dawes, the adjutant of the Boston regiment. He has a large house and he has a movable partition in his garret which he takes down and the whole club meets in one room. There they smoke tobacco till you can not see from one end of the room to the other. There they drink flip, I suppose, and there they choose a moderator who puts questions to the vote regularly; and selectmen, assessors, collectors, wardens, fire wards and representatives are regularly chosen before they are chosen in the town. Uncle Fairfield, Story, Ruddock, Adams, Cooper, and a *rudis indigestaque moles* of others, are members. They send committees to wait on the merchants' club, and to propose in the choice of men and measures. Captain Cunningham says, they have often solicited him to go to these caucuses, they have assured him benefit in his business, etc." (Adams' Works, vol. ii., p. 144.)—Under the title Caucus should be considered the congressional nominating caucus; the caucuses of legislative assemblies; primary elections, still known outside the larger cities as caucuses; the evils which have been attributed to the latter, and

the remedies which have been proposed. These will accordingly be mentioned in the order given.—I. *The Congressional Caucus* marks the departure from the electoral scheme provided for by the constitution, and is the first appearance of the caucus, as we now understand it, in our history. In the continental and confederate congresses the pre-arrangement of business attributed to the caucus system, was in some measure accomplished by committees, but the first appearance of the existing institution is in the congressional nominating caucus. Members of congress held meetings quickly called caucuses, by which candidates were nominated, between whom it was understood the electors provided for by the constitution should choose, thus depriving the electors themselves of the free choice it was intended they should exercise, and thence it followed that the support of particular candidates soon became the sole issue in the choice of electors.—In 1796 a general understanding among the members of congress of the republican and federal parties was had, that Jefferson and Adams should receive the votes of the republican and federal electors respectively, but this result does not seem to have been arrived at through formal meetings of those members. In 1800 such formal meetings were held by the members of both parties in congress, for the purpose of consulting about presidential candidates, great pains being taken at the time to preserve the fact of these meetings secret, on account of the popular jealousy of any attempt at general direction by those connected with the general government. Adams and Pinckney were selected by the federalists, with the understanding that each should be voted for equally, and Jefferson and Burr by the republicans, with, however, the distinct understanding that Jefferson was the candidate for the presidency.—In 1804 the first caucus, not secret, was held by the republicans, Jefferson was unanimously nominated for re-election, and George Clinton, governor of New York, substituted for Burr as the vice-presidential candidate, by a vote of 67 out of 107. The probability of a vacancy in the governorship of New York through the election of Clinton was thus created, and Burr was brought forward as an independent candidate. At a caucus of the federal members of the legislature at Albany his support was favored by a large majority, and the bitter opposition of Hamilton was the foundation of the feeling which culminated in the fatal duel. The proceedings of this federal caucus were said to have become known through Burrites who were concealed in an adjoining bedroom. C. C. Pinckney and Rufus King were selected by a federal caucus in this same year, as the federal candidates. The republican congressional caucus in this year was much criticised because republican voters in congressional districts represented by federalists complained that they were unrepresented in it, and that they were therefore being dictated to by districts in which the republicans had the majority.—In 1808 Stephen

R. Bradley, senator from Vermont, who had been chairman of the caucus in 1804, assumed the responsibility of sending out written notices to the republican members in both houses, to meet at a time specified in the notice, in the senate chamber. The purpose of the meeting was not mentioned in the call, but it was understood to be the selection of republican candidates to be voted for at the ensuing election. The result of this caucus had already been determined by private consultation, and out of 138 members, 89 were present, by whom Madison and George Clinton were nominated by 83 and 79 votes respectively. This caucus was open, and proceeded as if the selection of candidates was its unquestioned business. In consequence, there appeared very soon, a protest of 17 representatives, denying the authority of Bradley, the regularity of the caucus, and finally the necessity of any caucus whatever, which was stated only to have been necessary for the concentration of the party when the federal party was powerful. This protest the caucus had in a measure anticipated, by declaring that its members "acted only in their individual character as citizens." Separate caucuses were also held during this year by the members of the Virginia legislature who favored Madison and Monroe respectively, for the purpose of furthering the candidacy of each.—In 1812 the republican caucus was attended by 82 members. It was held openly like the previous caucus, and the members resolved as before that they made the nomination in their individual characters only. It took, however, one step forward, by the appointment of a committee of correspondence, of one member from each state, to see that the nominations it made were duly respected. Madison was unanimously renominated, with Gerry as vice-president, but it is noteworthy that a committee headed by Clay had formally demanded of Madison a war policy as the price of their support in the caucus. This caucus, like the last, was bitterly criticised, and on May 29 a caucus of 91 republican members of the New York legislature was held which refused to recognize the decision of the congressional caucus, and nominated De Witt Clinton by a vote of 87. In consequence of this, the federalists held in New York, in September, 1812, a national caucus or convention, composed of 70 delegates from eleven states, for further consultation and by which it was resolved to give the federal support to Clinton.—In 1816 the attempt was made in the republican caucus by the friends of Crawford to declare the selection of candidates by the members of congress inexpedient, as the caucus was likely to be controlled by the friends of Monroe, but the attempt failed, and Monroe was nominated by a vote of 65 to 54. Burr, who had done so much for the perfection of the caucus, had foreseen this result in 1815, and in order to defeat it had advised some popular nomination of Andrew Jackson, declaring that "if it could be made respectable his success would be inevitable."—In

1820 a call for a republican caucus was issued by Smith of Maryland, who had been chairman of the last caucus, but only about 50 members of congress attended, and the renomination of the incumbents was acquiesced in.—In 1824 a great question was raised as to whether there should be any attempt to nominate a candidate by means of a caucus, and there was a combination of the friends of other candidates than Crawford to prevent such a caucus. It was, however, strenuously advocated by the Albany regency under the lead of Van Buren, which took the position that those who opposed the congressional caucus, which it called the "regular nomination," were to be treated as enemies of the democratic party, which was the first pronouncement of the more modern notions of the sanctity of party majorities and of all the proceedings of the party organization. During this discussion a caucus of the republican members of the New York legislature was held, which decided that a congressional caucus ought to be held, and an account of the proceedings of this New York caucus was forwarded to Washington, without, however, much influencing the result. Comparatively few members of congress attended the congressional caucus which was finally called, and its nomination of Crawford was of questionable assistance to him. This was the last congressional nominating caucus. In 1835 the democrats nominated candidates in a national convention, and in 1839 the whigs adopted the same method. While the congressional caucus lasted it is to be mentioned that the nominee and most of the candidates before the caucus had been, in every case after Jefferson's second term, previously nominated by the legislature of some state, or by a caucus of the members of one party in a state legislature.—II. *Legislative Caucuses.* It has been the practice for the members in each party in congress and the state legislatures to meet in a caucus and decide their course in the assembly by a vote of the majority. The officers to be elected by each legislative body are invariably so selected. The first mention of such caucuses is in the Statesman's Manual, vol. i., p. 338, where, speaking of the second session of the eighth congress, it is said: "During the session of congress there was far less of free and independent discussion on the measures proposed by the friends of the administration than had been previously practiced in both branches of the national legislature. It appeared that on the most important subject the course adopted by the majority was the effect of caucus arrangement, or, in other words, had been previously agreed upon at meetings of the democratic members held in private. Thus the legislation was constantly swayed by party feelings and pledges rather than according to sound reason or personal conviction." Since that time the practice described has steadily increased, and at present the course of each party in the house of representatives with reference to any measure which has been made a party measure is determined in

caucus In particular the election of the officers of the house is predetermined in the caucuses of the party in the majority. Long and active canvasses are undertaken by candidates for the speakership, for the caucus nomination to that position. In the senate party lines are less strictly drawn, but when they are drawn, a caucus decision exercises the same authority over the majority there as elsewhere. In 1881 the caucus nominees of one party for the officers of the senate were generally alleged to be of worthless character. The opposite party, as a result of caucus deliberation, declined to permit these caucus nominations to be ratified by the election of the nominees. There ensued, in consequence of the unyielding adherence of senators to these caucus decisions, one of the most persistent "deadlocks" on record, in the course of which, members of each party produced the most gory speeches about the "revolutionary" tendencies of their opponents; and the members of the senate, by what was felt to be their obdurate fidelity to their respective caucuses, in a petty matter, brought their body for a time into public contempt.—In the state legislatures the caucus system also prevails, but in a less degree than in congress. The authority of the caucus is there mainly invoked in the selection of candidates for the positions filled by the legislature itself. It is especially used in selecting the candidates for the speakership and for the United States senate. Aspirants for these positions not unfrequently attend at the place of meeting of the legislature in time to receive the members as they arrive, and to make personal supplication for their votes in caucus. Every sort of influence is brought to bear to obtain such votes, candidates often opening "headquarters," a sort of a club room with free entertainment for all comers, and in one flagrant case a candidate for the senate was accompanied to the state capital by his wife, and his nomination and election were alleged to have been entirely due to the success of her personal appeals to members of the legislature for their votes in the party caucus. The whole of these influences are brought to bear to secure, not the votes of members in the legislature, but only the caucus nomination. No matter how that is secured, it stands as definitive. It determines the course of the legislature, and the decision of a legislative caucus about candidates has come consequently to be invested with all the attributes of a fetish. Politicians talk about it as if it possessed some peculiar and intrinsic virtue or efficacy, and members of the legislature are no more free to disregard such a nomination, no matter how ridiculous or scandalous it may be, and no matter by what agencies it was secured, than they are free to violate their oaths. The notion that the legislative caucus was an opportunity for consultation has been eliminated, and it has become merely an instrumentality for conferring absolute power upon a majority.—III. *Primary Elections.* This expression is rapidly supplanting the use of the word

caucus to designate the meetings of voters, for the direct nomination of candidates, or for the election of delegates to nominating conventions. In the country districts generally, and particularly in New England, the word caucus is still used. In the cities the increase of the safeguards which have been found necessary for the ascertainment of the results of a caucus, have surrounded it with so many formalities that it is properly becoming known as a primary, or preliminary, election. Its primitive form is as follows: A few days before an election is to be held or a convention to meet, a call is issued addressed to the members of one political party residing in the same election district, usually a township, calling upon them to meet at a specified time and place, for the purpose of holding a caucus to choose candidates or delegates. This call is posted in prominent places in the town, such as the postoffice, but it is now also generally published in the local paper, if there be one. It was in the first instance usually issued by individuals acting on their own responsibility, and over their own names. At the appointed time, those assembled in response to it are called to order by one of the signers of the call, and a presiding officer and secretary are nominated and selected. The meeting is then declared to be organized and ready to proceed to the transaction of business, the nature of which is stated either by the presiding officer or by the person by whom the meeting was called to order. Any member of the caucus may nominate persons to be the candidate or delegates to be chosen, and several persons are usually nominated for each position. These nominations, if seconded, are acted upon in the order in which they are made. There is more or less formal debate, and the vote upon each nomination is taken *viva voce*, and the result announced by the chair. If the announcement is questioned, upon the demand of any member the vote is taken by a show of hands, or, more rarely, by actual count by the secretary and tellers. Members of the opposing party are not excluded from the meeting, but if detected in voting, any person may call the attention of the meeting thereto, and if the result has been affected in consequence, the intruder is turned out, and another vote taken, but the test of the right of any person to participate in the caucus is whether or not he voted with the party at the last general election, and of that fact his own assertion is almost invariably received as evidence. The caucus having made its nominations or selected its delegates, usually appoints a committee to prepare ballots and distribute them at the polls—though this is sometimes left to the enthusiasm of individuals—and adjourns *sine die*. The secretary, if delegates have been chosen, gives them a letter stating the fact of their election, which serves as their credentials in the convention to which they have been sent. Up to this point the caucus presents very nearly the pure democratic ideal, a return to which is so frequently held up as the sole remedy for machine politics, and the exactness of this description may

be verified every year, in parts of New England and the west—It is, however, the fact, constantly overlooked, that such a caucus system does not rest upon political equality, but upon an amount of actual and therefore social equality, and of personal acquaintance among voters, which the great increase in the density of population and in the unequal distribution of wealth has tended to destroy, and which that increase has made impossible outside of small and comparatively thinly populated constituencies. The development of the caucus itself indicates this. As population thickens, especially in manufacturing districts in which there is a large comparatively transient class of voters, the personal acquaintance of voters with each other is no longer sufficient to detect whether all those who participate in the caucus are members of the party, or even whether they are all voters within the district. Strange faces appear, and the caucus is found to be controlled by workers in a particular interest, who may not be residents of the district, or even members of the same political party. Consequently the use of a check list is necessitated as the remedy. That is, no person is allowed a vote whose name is not registered as a voter within the district at the last election, and if, as in some states, there are no registration laws, the only means of preventing fraud seems to be violence. So long also as the regular party caucus may be called by individuals acting on their own responsibility, there is found to be danger that two or more caucuses will be held, each claiming to be the regular caucus; the authority to call the caucus must therefore be located, and committees, for that purpose, and later, for the purpose of providing the proper check lists, and of taking charge of the organization of the caucuses, have to be provided for. Such committees are the basis of the whole structure of American party government. The members of the committees thus appointed hold from year to year, and as they are frequently re-appointed, they come thereby naturally into that greater knowledge of the politics and politicians of their districts which is the source of their undue political influence and of the power of political mechanism, which has lately attracted so much attention, and as the remedy for which, a return to that very system is urged, from which such committees have necessarily been evolved. With the increase of the necessity of these two agencies—committees and check lists—the caucus system has assumed, in various places, all of the forms which make up the whole chain of development between the primitive caucus above described and the elaborate primary organizations in New York city which will alone be further mentioned, as the ultimate form toward which the whole caucus system is tending. There are in New York three primary election systems, the republican, Tammany hall and democratic. The basis of the republican system is the republican district associations, of which there is one in each of the 24 assembly districts. These associations

are permanent clubs, sending delegates to the republican central committee composed of 159 members, which has the general direction of the affairs of the republican party in the city, and is, in its turn, practically controlled by a small executive committee. The district associations all have the same constitution, which is published together with that of the central committee, and this constitution can only be amended by a vote of two-thirds of all of the associations after the amendment has been proposed by the central committee at the request of five of the associations. A meeting of a district association is theoretically a caucus of the republicans of the assembly district in which it is located. The fact is, however, widely different. No person is admitted to the meeting of the association, *i. e.*, to the primary meeting or caucus, who is not a member of the association. But in order to become a member of the association it is necessary to be proposed by one who is already a member. The applicant's name must then be posted upon a bulletin board; after which, a report upon the applicants may be presented to a meeting of the association, and all those whose names are favorably reported may become members of the association, provided a majority of the members present at such meeting vote in their favor, and provided that the applicant shall thereafter sign the roll within a specified period, but not otherwise. It is, however, a prerequisite to signing the roll that applicants should take a pledge, observance of which is a condition of admission to, or continuance in, the membership of any primary association. This pledge requires that the applicant shall: 1. "Support the republican party organization of which the association is a recognized portion." 2. "Submit to the legally expressed action of the association and of the central committee." 3. "Honorably sustain all nominations made by the republican party through its legally constituted conventions called or recognized by the central committee." 4. "Not become a member of any committee or body which does not recognize the authority of the association."—In order to secure the better observance of these pledges, there is in each association a standing committee for the investigation of breaches of them, known as the committee on discipline, and it is provided that for a willful failure "to keep the pledge of membership, any guilty member may be expelled by the vote of a majority at any meeting" of the association. This authority has been frequently exercised, and it has been stretched so far that in one case a member was expelled because he had opposed the nomination by the president to a federal office, of one of the officers of the association. The tendency is obviously to control the whole political action of members of the association, and to exclude from membership such republicans as decline to allow such control, or to take the required pledges. As a matter of fact the very great majority of republicans are thus excluded. Although there are no means of ascer-

taining exactly how many republicans belong to these associations, their number probably does not exceed one-tenth of the whole. The remaining nine-tenths are for all party purposes disfranchised. They have no share whatever in making nominations, they can have no standing in conventions, and they are not recognized by the party organization as members of the party. At the election of 1880, the republican vote in New York city was about 80,000, while the rolls of the republican associations contained less than 15,000 names, and a large number of these names were of persons who had died, or removed. In 1879, Mr. George Bliss, than whom no person can be better qualified to speak on this subject, in a letter to Mr. Arthur, says: "The rolls are deceptive; in one district half the names of those on the rolls are not known in the district. These bogus names afford a convenient means for fraudulent voting," and the rolls of other districts "are full of the names of men not republicans." It may, therefore, be fairly said that 8,000 is a liberal estimate of the number of republicans who are members of these associations, and who are, therefore, eligible to participate in the primaries. —Such is the constitution and membership of the republican primaries. They are not representative but exclusive, and because of the conditions of membership they are composed of the least worthy portion of the party. In case an association expels or refuses to admit a member, a nominal remedy is provided, by an appeal to the central committee, but that body frequently refuses to act on such appeals, and if the district association simply refuses to act upon the name of any applicant, there are no means of compelling them to do so —The procedure of these associations is quite as far removed from that of the primitive caucus as their constitution. The officers are permanent and elected annually, the voting is by secret ballot, and a meeting together of any considerable number of the members of any association is extremely rare. Practically, all the business of the association is transacted by small committees. If, for instance, a candidate is to be nominated, or delegates to a nominating convention are to be chosen, a ticket prepared by the executive committee is printed, and the function of the association is discharged by voting for or against this ticket, for which purpose the polls are opened for two or three hours in an evening, and probably not more than half a dozen members of the association will meet together during that time. —The Tammany system is theoretically completely popular; primary elections are nominally held in each of the election districts of the assembly districts, or altogether in 678 election districts, to which all democrats, resident in the respective districts, are invited. After the polls are closed, the ballots are, however, subjected to a process called "inspection" by the central committee of Tammany hall or its appointees, and in its practical workings the whole Tammany system is a farce. Under the cloak of popular forms, it is

one of the most complete and corrupt instrumentalities for the centralization of power which has yet been devised. (See article on TAMMANY HALL.) —The democratic system is the result of the reorganization of the various anti-Tammany democratic factions, brought about, in 1881, by a practically self-appointed committee of 100. Under this system primary elections are to be held annually in each of 678 election districts, at which all democratic electors resident in the respective districts may participate, provided they were registered at the last general election. The persons voting at any primary shall be members of the election district association for the ensuing year, which is to be organized in January of each year. The associations may admit democratic residents in their respective districts, who are not members, to membership, and they have general supervision of the interests of the party within their districts. Primaries are held on not less than four days' public notice, through the newspapers, of the time and place, and at the appointed time the meeting is called to order by the chairman of the election district association, provided 20 persons be present; if that number shall not be present, the meeting may be called to order with a less number, at the end of 15 minutes. The first business of the meeting is to select a chairman, and all elections of delegates or committeemen shall take place in open meeting. Each person, as he offers to vote, states his name and residence, which may be compared with the registration list at the last election, and each person shall state for whom he votes, or he may hand to the judges an open ballot having designated thereon the persons for whom he votes and for what positions. Nominations are all made by conventions of delegates from the districts within which the candidate to be chosen is to be voted for. There is an assembly district committee in each assembly district, composed of one delegate for each 100 votes or fraction thereof, from each election district within the assembly district. There is also a county committee, composed of delegates from each of the assembly district committees. The function of these committees is generally to look after the interests of the parties within their respective spheres. This system is too new for its workings to be as yet fairly criticised. It may prove a really popular system, or it may prove only an inchoate form of the other systems; at present it can only be said that the first primaries under it were participated in by 27,000 electors. —IV. The evils of the caucus and primary election system lie in the stringent obligation which is attached to the will of a formal majority; in the fact that the process of ascertaining what the will of the majority is, has been surrounded with so many restrictions that the actual majority of voters are disfranchised, and take no part in that process, so that the formal majority is in consequence no longer the majority in fact, although it continues to demand recognition of its decisions as such;

and in the further fact, that under a debauched system of civil service the machinery for making nominations, or of finding out what the will of the majority is, has fallen largely under the control of those who hold or seek public office, as a consequence of the prevailing theory that such offices are the proper reward of political services and the spoil of the victors in a political contest. This conception of public offices as spoils, furnishes officeholders with an illegitimate incentive to political activity, the effect of which is seen in the fact of their control of the organization. In the democratic organization in New York, a very large number of those who serve on committees and direct primary elections are officeholders, and in the republican organization, under the Arthur and Cornell régime, in 19 out of the 24 assembly districts the chairman of the district associations, in whom is vested an almost controlling power, was a federal officeholder, the secretaries of these associations were likewise federal officeholders, and in the central committee, out of 159 members, 93 were salaried servants of the federal government. It is obviously preposterous to assume that a primary system thus officered, and including only one-tenth of the voters of a party, represents that party, yet this is precisely the assumption which is acted upon by the republicans of New York. The organization described is the regular organization, and none other is recognized. It exercises all the authority of a majority. It chooses all delegates to conventions, makes all nominations, and its nominees are supported upon no other possible theory than that they are the choice of the majority. Very distinguished men have taken pains to make it known that they always support the "regular" ticket, and as they and the large class they lead, have actively supported the men most obnoxious to them, whose nominations were stated to be for the purpose of "disciplining the party," nominations have come to be made without regard to this class, and to suit the pleasure of the nominating machine. In consequence, elective officers have come to look upon those who thus control the nominating machinery, and not the mass of voters, as their true constituents, and to act accordingly. The separation between the organization and the party, between those who nominate and those who elect, is the sum of the evils of the highly organized caucus system. It has its roots in the notion that the majority is right, because it is the majority, which is the popular view, thus expressed by Hammond: "I think that when political friends consent to go into caucus for the nomination of officers, every member of such caucus is bound in honor to support and carry into effect its determination. If you suspect that determination will be so preposterous that you can not in conscience support it, then you ought on no account to become one of its members. To try your chance in a caucus and then because your wishes are not gratified, to attempt to defeat the result of the deliberation of

your friends, strikes me as a palpable violation of honor and good faith. You caucus for no other possible purpose than under the implied agreement that the opinion and wishes of the minority shall be yielded to the opinions of the majority, and the sole object of caucusing is to ascertain what is the will of the majority. I repeat that unless you intend to carry into effect the wishes of the majority, however contrary to your own, you have no business at a caucus." (Political History of New York, vol. i., p. 192.)—In accordance with this theory the will of the majority becomes obligatory as soon as it is made known, and one can not assist at a caucus in order to ascertain the will of the majority, without thereby being bound to follow it; and the theory is so deeply rooted that, under the caucus and primary election system, it has been extended to cases in which the majorities are such only in form.—V. The remedies as well as the evils of the caucus and nominating system have been made the subject of general discussion in connection with civil service reform. It is claimed that that reform, by giving to public officers the same tenure of their positions which is enjoyed by the employes of a corporation of a private business house, or during the continuance of efficiency and good behavior, would abolish or greatly diminish the evils of the caucus system, by depriving public officers of the illegitimate incentive to maintain it under which they now act. Other more speculative remedies have been suggested. It is proposed, on the one hand, to very greatly diminish the number of elective offices, and, in order to do away with the pre-determination of elections, to restrict the political action of the people in their own persons to districts so small that they can meet together and act as one body, and that in all other affairs than those of these small districts the people should act by delegates. The theory here seems to be, by doing away with elections, so far as may be, to get rid of the necessity for election and nominating machinery. (See "A True Republic," by Albert Strickney, New York, 1879, and a series of articles in Scribner's Monthly for 1881, by the same writer.) On the other hand, it is proposed to greatly increase the number of elections, by taking the whole primary system under the protection of the law. This plan proposes: 1. The direct nomination of candidates by the members of the respective political parties in place of nominations by delegates in conventions. 2. To apply the election laws to primary elections. 3. To provide that both political parties shall participate in the same primary election instead of having a different caucus for each party. 4. To provide for a final election to be held between two candidates, each the representative of a party, who have been selected by means of the primary election.—This plan would undoubtedly do away with the evils of the present caucus system, but it contains no guarantee that a new caucus system would not be erected for the purpose of influencing "the primary election" in

the same manner in which the present primary system now influences the final election. (See, however, "The Elective Franchise in the United States," New York, 1880, by D. C. McMillan.)—The effective remedy for the evils of the caucus system will probably be found in the sanction of primary elections by law, in accordance with some such form as is known in Pennsylvania as the "Crawford County System," so called after the usage of that county, which provides for a direct vote by the electors within a district for the person to be nominated, and that the person receiving the greatest number of votes shall be the candidate. But no satisfactory method of thus legalizing primaries has yet been devised. Bills for this purpose were introduced by the Hon. Erastus Brooks into the New York legislature in 1881, which provided substantially for the system proposed by Mr. McMillan, but they were left unacted upon, and no legislative attempt to regulate primaries, except by providing for their being called and for their procedure, has been made elsewhere. In Ohio what is known as the Baber law provides that where any voluntary political association orders a primary, it must be by a majority vote of the central or controlling committee of such party or association; that the call must be published for at least five days in the newspapers, and state the time and place of the meeting, the authority by which it was called, and the name of the person who is to represent that authority at each poll. The law also provides for challenging voters, for the punishment of illegal voting, and for the bribery or intervention of electors or judges. (Rev. Stat. Ohio, secs. 2916-2921.) A similar law in Missouri is made applicable to counties only of over 100,000 inhabitants, but by this law it is made optional with the voluntary political association whether it will or not hold its primaries under the law, and if it does, it is provided that the county shall incur no expense in the conduct of such elections. (Laws of Missouri, 1875, p. 54.) A similar law also exists in California. (Laws of California, 1835-6, p. 438.) These laws comprise all the existing legislation on the subject.—Until an effective legal control of the caucus system shall be devised, and the civil service shall be reformed, the only remedy at hand for the evils of the caucus system is a greater amount of what has been described as "individuality in politics." Public opinion may in this country never permit self-nominations to elective officers, but in smaller districts, at least, very much may be accomplished by spontaneous or independent nominations, made by a few well known men of high character, which shall claim popular support not because they pretend to be made by a majority of a party, but because they are intrinsically excellent, and are certified so to be by the men of recognized reputation who make them. If, however, character can not be thus in some degree substituted for the majority as the basis of the political action, individuals must make it plain that the authority of the majority

rests in the fact of its being right, and not merely in the fact of its real or pretended existence. Votes should not be yielded unconditionally at the mention of the party name, and until the legal remedy for the existing caucus shall be found, the true attitude of the individual toward it is perhaps best expressed by John Jay in the following language used by him in a letter replying to criticisms of himself for bolting a caucus nomination in 1812. He says: "We approve of the customary mode of nominating candidates, and have uniformly concurred in it; that concurrence certainly involved our tacit consent to be bound by the nomination which should be so made. But it is equally certain that such consent did, does and ever will rest on the condition, trust and confidence that such nominations only be made as we could or can support without transgressing the obligation we are under to preserve our characters and our minds free from humiliation and reproach." (Life and Writings of John Jay, vol. i., p. 448.)

FREDERICK W. WHITTRIDGE.

CAUSE AND EFFECT IN POLITICS. Nothing seems more natural and, at first sight, easier, than to refer facts, if not always to their true, at least to their probable and apparent cause. And still we see men, at every instant, bringing two circumstances, two facts, into connection, and making one follow from the other without inquiring whether it is materially or morally possible that the one should issue or result from the other. This error often goes so far as to confound cause and effect. Have laws their origin in customs, or customs their origin in laws? Is it the government that corrupts the nation; or is the government itself an emanation of the nation, made in its image? Here are questions, and they might be multiplied, which will be answered well or ill according as men are able or not to distinguish cause from effect.—It is evident that the answer to such questions is no mere trifle; but that attention should be directed to the effects of our own actions, individual or national, is of still greater importance. A well known precept tells us to foresee the consequences of our own acts. All admit the necessity of this, and still it is neglected in many cases.—How often are men satisfied with saying, "I shall do this," or "we shall do that," without carrying their thought beyond. "I shall do this," or "I shall do that," is very quickly said; but the purpose can not generally be carried out except when man is face to face simply with dead nature, with clay and stone. In such case the resistance may be easily calculated, and a man may say: "I shall do this;" for he can overcome stone and clay and iron. But when opposed to men we are not so sure of success. Other men are almost always our equals, and as often our superiors as our inferiors. And we should ask: What would others do if we should act against them in this or that manner? What would be the effect of our action? We should

never for a single moment lose sight of the fact, that each one of our acts is a cause.—We are greatly afraid of preaching in the wilderness. Nations will continue to close their ports to foreign goods, and yet will be astonished (just as if it were not a natural effect of the cause) that other countries should do the same to theirs. The French will shout, *death to the English!* and then find it wicked that the English should cry, *down with the French!* Men try to weaken their neighbors and then grow angry because these neighbors in turn try to weaken them. We demand liberty for ourselves and are still unable to understand that our fellow citizens should have it also; we find it natural to enjoy liberty ourselves, and take it away from those who think differently from us. We might multiply examples if we wished to depart from generalities applicable to all countries for the purpose of citing special determinate facts. But why do this? Would men thereby become more accustomed to put themselves mentally in the place of others? Would they see the beam in their own eye more clearly, or give a stricter application to the golden rule of doing unto others only that which they would that others should do to them? In a word, would men look at causes more seriously and better foresee effects?

M. B.

CELIBACY, Clerical, an institution of the Roman Catholic church which prohibits the marriage of her clergy. Even outside the Roman church, and in times anterior to Christianity, we find traces of a like attempt to subdue human nature by its own power. But we must here limit our considerations to that form of celibacy which has attained a real historical importance, the celibacy of the Roman Catholic clergy.—The Old Testament knows nothing of a command prescribing the celibacy of the priesthood; neither does the New Testament, although we there find it intimated, in a general way, that under certain circumstances it may be more advisable not to take a wife (1 Cor. 7: 38); and this intimation was not without influence during the early period of Christianity and the church. During the first three centuries we find some of the clergy practicing celibacy, but always voluntarily, not because it was a law. It was far from being the rule. The fourth century, however, made a decided move in the direction of celibacy. Regulations favoring it were drawn up, as, for instance, at the council of Ancyra in 314. It was distinctly declared that the unmarried priest deserved the preference over the married priest, although marriage was not yet prohibited. Toward the end of the fourth century (375) Silicium, bishop of Rome, declared that marriage impaired the efficiency of the priesthood and their calling, and his opinion was followed by his successors in the fifth century. At first the prohibition of marriage was intended for the higher grades of the clergy only, for bishops, priests and deacons; but, before long it was extended to sub-deacons after

ordination also. The temporal power did not oppose the attempts made to elevate the prohibition of marriage into a law for the priesthood; on the contrary, it favored the endeavor as much as it could, and gave it the support of its authority.—We must not forget that there was in the development of the Catholic church something which strove to establish the supremacy and promote the universal establishment of celibacy. Opposition to celibacy was not slow in manifesting itself, an opposition which came from the ranks of the clergy themselves. It was not without foundation, therefore, that the observance of celibacy was repeatedly enjoined. Yet it was reserved for the eleventh century to decide in favor not only of this law, but to assert the triumph of the church generally. Pope Gregory VII., with whose name this triumph is connected, in this case, invented nothing, nor introduced anything new, any more than into his whole system; but he understood how to give the celibacy of the clergy enduring power and to overcome the resistance of the nations on whom the church had chiefly to lean, notably of the Germans. There can be no doubt that in considering the question of celibacy pope Gregory VII. gave much less thought to considerations of abstract morality than to expediency; and that his only object was to establish the supremacy and unity of the church through a clergy independent of the state. He declared this himself in an unmistakable manner when he said: *Non liberari potest ecclesia a servitute laicorum, nisi liberentur clerici ab uxoribus.* Gregory's successors remained faithful to his doctrine, and propagated it, without, however, being able everywhere to enforce it practically, as for instance in the case of the Slavonian Catholics.—Yet however necessary the regulation may have been or have seemed to be at the time of its introduction, it was soon followed by crying evils, especially in the fourteenth and fifteenth centuries. The complaints of the immorality of the clergy became so general that doubts as to the propriety of celibacy were soon everywhere expressed, and it was asked whether morality did not lose by the system at least as much as the power of the church gained by it.—At the time of the reformation there were voices enough heard in the Catholic church demanding the abolition of the rule of celibacy. Several princes, even king Charles V. in interim endeavored to bring it about, in the hope of thus paving the way to a reconciliation between the Protestants and the Catholic church. Opposition was not wanting even later, noticeably in the eighteenth century, but to no purpose. **LITERATURE.** F. A. and August Theiner, *Die Einführung der erzwingenen Ehelosigkeit bei den christlichen Geistlichen und ihre Folgen*, Altenburg, 1828, 2 ed. 1845, 2 vols; Carové, *über das Cölibatgesetz des römisch-katholischen Klerus*, Frankfort-on-the-Main, 1832, 1853, and *das römische Cölibatgesetz in Frankreich und Deutschland*, Offenbach, 1834; *Der Cölibat*, Regensburg, 1841. **WEGELE.**

CELIBACY, Political Aspects of. In the same country, at different times, religion has been seen exalting celibacy, making it a virtue, and the civil law condemning, stigmatizing and subjecting it to taxation, excluding it from certain honors or dignities. It is not our task here to decide what a church should prescribe to its believers. That is an affair of internal discipline, and we do not recognize in ourselves any right of interference. But in politics or in administration and taxation, every distinction between married and single men is unjust and rests on false views. The legislator hoped sometimes to be able to compel marriage, forgetting that the man who does not yield to the powerful law of nature which makes marriage desirable to every adult, and even to minors, has sufficiently strong reasons not to be forced to contract marriage by financial or other like penalties imposed by the state. We say it is unjust to make celibacy an offense, for more than one avoids marriage for reasons of health; others because they are burdened with a family which they are obliged to support, for example, aged parents, etc.; and still others from motives quite as laudable. These celibates far from being punished should rather be honored for being able to overcome an inclination to which nature has given such power. Moreover, we understand (without justifying them, be it well understood) the measures favoring marriage in new countries, as though the facility of rearing a family were not a sufficient encouragement needing no other incitement; but in very populous countries it would be difficult to modify these laws in a suitable manner. Who knows but a time will come when people will think rather of encouraging celibacy in order to arrest, if possible, the rising wave of population? M. B.

CELTS. (See RACES.)

CENSURE. (See PARLIAMENTARY LAW.)

CENSURE OF MORALS. Beginning with the sixteenth century, the noble name of censure was given to that ill-starred guardianship of the press, which for a length of time interfered with the progress of political education, but did not keep back the dreaded revolution in Europe, and was at length abolished by general consent. The word censure was borrowed from the Romans, who had thus modestly named one of the grandest and worthiest institutions of their state.—We find kindred institutions among other ancient nations. Thus the Areopagus and the Archons among the Athenians, and the Ephors among the Spartans, exercised the functions of moral judges. The remarkable Chinese institution of Tu-tschea-Yuen, is also essentially a court of moral censure. Its members are considered commissioners of heaven, as the “visible conscience of the state,” and give expression to praise or blame, even concerning the highest officials. The emperor himself is not spared by them when he deviates from the sacred customs. But the Romans distin-

guished more clearly between morality and law, and could not allow the magistrate who presided in a law suit, nor the judge who decided on the right and the wrong, to watch over morals and punish immorality, without surrendering the legal security they had won. So far, therefore, as the Roman state used its authority for the preservation of good morals and to take decisive steps against immorality, a special magistracy seemed to be needed; and the censorship was created for that purpose.—During the middle ages the Christian church showed a decided tendency to assume the entire moral direction and education of nations. Ecclesiastical now took the place of civil censure. The state itself needed the moral care of the church. The ancient Roman-Byzantine empire was, in a moral sense, weak: it was in decay. It needed a physician, and the still uncivilized Germanic peoples, although morally healthier and stronger, submitted willingly to the divine authority and felt the ideal elevation of the Christian religion, which in the Roman priesthood found its first devoted advocates and representatives. This continued even after the reformation, though under changed conditions, and the reformers of the sixteenth and seventeenth centuries were especially distinguished for their church discipline. When the temporal power assisted here with its external repressive measures, it did so with the moral authority of ecclesiastical censure, not as an independent temporal-moral power. Church and state divided the work of ruling nations. The one took the moral, the other the legal province. It is evident that at this time the idea of a political censure of morals could not easily arise.—Still in the modern state the want of filling up the void thus left is felt, and not simply because ecclesiastical censure has lost its principal power, and a restoration of it, in the spirit of the middle ages, is an impossibility. Even if we recognize that the life task of the church lies essentially in the province of morality, and that that of the state, on the other hand, is the control of legal relations, it only results therefrom, that, as a rule, the state should leave purely moral questions either to the church or to private persons, and should guard against untimely and officious interference in this sphere. Since the state itself is a moral being and must in its own interest take morality into consideration, it must, when and in so far as its very life is concerned, issue general moral regulations, and also, if exceptionally, take a position against peculiar moral dangers.—As a rule, the state should not be allowed to interfere at all in private morals. This is the affair of individuals, not of the state. If the state exercises authority here, the distinction between morals and law is confounded, and the moral powers of the citizen, which become manifest and are developed by free self-determination, are fatally injured, not strengthened. But the power of the state may here be called forth exceptionally, when the open immorality of individuals threatens the moral

foundations, both of the social life of men and the public welfare; that is when their harmful action on public morals is evident. Thus, for example, as a rule the state concerns itself with the relations of the sexes only in so far as the law is violated or scandal calls upon it to defend good morals. In like manner, money matters are left to private persons and free contract. But when a rich man misuses his property mercilessly and openly to oppress and exhaust the poor, even in a form which can not be reached by the law, or when a sensual profligate outrages the feelings of decency and good morals among the people through his display of senseless luxury, the state has good ground to practice censure after the manner of the Romans.—If the intervention of the state in cases of private immorality is justifiable only in rare cases and under exceptional circumstances, it may interfere more readily where public (*political*) morality appears immediately concerned; but in such a case only to supplement the law, and only when the political immorality is undoubted, and the moral health of the state appears seriously affected. The Roman censors denounced the breach of a political oath; immoral projects of laws; breach of political decorum; and cowardly conduct in time of danger, which is the more blameworthy in proportion to the greatness of the confidence demanded by the public character of the position. An excess of haughty harshness toward subordinates, and indecent stockjobbing on the part of high and influential officials and similar persons, may be considered as further reasons which, in clear cases of public scandal, may rouse political censure to activity.—The police regulations of the present are utterly insufficient in all these cases. The Romans had the fine tact not to intrust the exercise of high political censure to subordinate servants of authority. Only the most honorable and most distinguished statesmen were chosen censors. There was no dignity in the Roman republic more highly respected than that of censor. "Majesty" was ascribed to the office. In this lies the surest and greatest guarantee of the whole institution. Nothing would be more destructive than to give it to ordinary officials, or, through court favor allow it to be exercised in bureaucratic fashion. The opponents of all political censure are perfectly right so long as there is any danger of its being administered in this manner. Better no censure than a bureaucratic one. Only he whose person has moral authority should exercise such a power in the state. Political *offices of honor* well organized in this spirit *might* furnish the state with the same guarantees, and render it services similar to, and even better than the Roman magistracy rendered the Roman republic.—With regard also to the course of procedure and means of correction the censure of the Romans is worth considering. The censors lodged official accusation, but they gave the accused whom they summoned before them full opportunity to defend themselves. They pro-

nounced their sentences in public, and assigned reasons for them. A check was imposed on the partiality or passion of a single censor by the intervention of other censors; and if the censors of one lustrum acted too severely, their successors in office in the following lustrum might remedy the evil.—The corrective measures of the censors answered to the fundamental character of the censorship as a moral institution. They did not affect, as does punishment proper which belongs to the law, the person, the property, or the freedom of the accused, particularly not his private rights, but exclusively his political honor and political rights. Their action was, therefore, limited to the field of moral appreciation and political life. The unworthy senator might be struck from the list of senators. The immoral knight might be deprived of his horse; other citizens less highly placed might be excluded from their class and reduced to a lower voting class, or deprived of suffrage altogether. Exclusion from honors and office was a regular effect of censorial blame, and the dishonor inseparable from the same was sensibly felt in social intercourse.—Modern censure would have nothing new to discover in all these respects, but merely to transfer Roman thought to modern life. Exclusion from rights of association and from those of honor, from suffrage and eligibility to places of public trust, would be in our day a very effective and at the same time a thoroughly justifiable means of seriously punishing open immorality and enforcing political morals. J. C. BLUNTSCHLI

CENSURES (IN U. S. HISTORY). In case of violation of law by the president, the constitutional process of punishment is impeachment by the house, conviction by the senate, and removal from office. (See IMPEACHMENTS, I.) In two cases, where a legal majority for impeachment was impossible, a single branch of congress has endeavored, by separate action, to inflict an extra judicial condemnation upon the president.—I. March 28, 1834. (see BANK CONTROVERSIES, III.; DEPOSITS, REMOVAL OF), after a three months' debate, in which the resolutions had been variously modified, the senate resolved, by a vote of 26 to 20, "That the president, in the late executive proceedings in relation to the public revenue, has assumed upon himself authority and power not conferred by the constitution and laws, but in derogation of both." April 15, in a special message, president Jackson protested against the resolution on the ground that it accused him of perjury in violating his oath of office, and was thus an indirect and illegal method of impeachment, a condemnation against which he had no opportunity to defend himself. The senate refused to receive the protest or place it on record upon the journal. Senator T. H. Benton, of Missouri, at once gave notice that he would offer a resolution each year to expunge the resolution of censure. After an intermittent struggle of three years. Jackson's supporters carried the ex-

punging resolution, and the resolution of censure was marked around by broad black lines with the memorandum "Expunged by order of the senate this 16th day of January, 1837." The argument against this was, that it violated the constitutional direction to the senate, to "keep a journal" of its proceedings; and in favor of it, that the original resolution was extra legislative, had no more place on the journal than the record of a horse race, and ought to be stricken out. As the former argument involves a plain direction of law, it must have more weight than the latter, which is wholly a matter of opinion.—II. During the session of 1841-2 (see WHIG PARTY; TYLER, JOHN; TARIFF), a tariff bill was passed containing a provision for the distribution of surplus revenue among the states. To this president Tyler objected as an innovation directly designed to encourage extravagantly high tariffs beyond the needs of the country, and he therefore vetoed the bill Aug. 9, 1842. The conflict between Tyler and the whigs had become extremely embittered. The whigs, though in a majority in both houses, could not command a sufficient vote either to impeach or to pass bills over the veto. They therefore took the unusual step, in the house, of referring the veto message to a committee whose majority report censured the president for improper use of the veto. Against this report Tyler protested, but, as he had voted against the reception of Jackson's protest in the senate in 1834, the house sent him a copy of the senate resolution on that occasion.—See (I.) 12, 13 Benton's *Debates of Congress*; 2 von Holst's *United States*, 68; 4 Webster's *Works*, 103-147; 1 Benton's *Thirty Years' View*, 423, 717-730; and authorities under DEPOSITS, REMOVALS OF; (II.) 14 Benton's *Debates of Congress*, 505-529; 2 von Holst's *United States*, 458; 2 Benton's *Thirty Years' View*, 413-417; and authorities under BANK CONTROVERSIES, IV.

ALEXANDER JOHNSTON.

CENSUS. Census taking, or the counting of the population of a country, has been practiced from time immemorial. The Bible makes mention of it, but not always approvingly. The oriental nations still retain their prejudices against the taking of a census, which is so necessary in every state. It is fortunate that Christian countries do not share these prejudices; for there are many cases in which it is indispensable to know the number of the population.—The operation is not, however, so easy as one might believe. Various systems have been tried, and agreement among specialists in the matter is of only recent date. Formerly the custom was to count the *legal population*, that is, inhabitants with a domicile, and who were present, or only temporarily absent, when the census was taken. Now the census gives the *actual population*.—The actual population is that which is found in each locality, at a given time, whether it be "resident" or "floating." An inhabitant of Bordeaux or Lille, so-

journing in Paris at the time of the census, would, under the old system in France, be numbered among the inhabitants of Bordeaux or Lille, and under the new system, among the floating population of Paris (as a traveler).—In order to ascertain the actual population the census must be taken throughout the entire extent of a country on the same day (or same night). For this reason, before the day indicated for the taking of the census, the government sends to all the householders blanks which they are required to fill. This is the method adopted in England, and we think it may be recommended. We would not even hesitate to establish by law, as that country does, a penalty against such as refuse to furnish the desired information, or who give it in an incorrect manner. In Germany they have tried to substitute individual blanks for family ones, but we do not know whether the experiment has been successful.—In some countries, in France for example, the taking of the census lasts several weeks, because the census-takers go from house to house. This method admits of more errors, and especially of more repetitions than the other. The traveler may be counted in two places in the same census.—In many countries the census includes, beside the inhabitants, an enumeration of the cattle, houses, and factories, and the government also avails itself of this circumstance to collect other information. MAURICE BLOCK.

CENTRALIZATION and DECENTRALIZATION. The contrast between centralization and decentralization is to be found everywhere: in social and political life, in the state and the church, in the municipality and even in the family; in public concerns and in the private affairs of large and small benevolent and educational institutions as well as of industrial establishments. Everywhere we find the relation of head and members, of centre and circumference, either stamped upon the original organism or formed by man; everywhere we find the task of properly understanding and regulating this relation, of distributing in proper measure the power of the centre and the independence of the circumference—the question of centralization and decentralization.—When political centralization is spoken of, it must not be forgotten that the expression is only approximately correct; that it implies an imperfect comparison, which may lead to erroneous conclusions. It reminds us too strongly of the construction of a machine the different parts of which mechanically obey the central power without any capacity for self-determination. To the different members of the state organism there belongs, however, by virtue of natural necessity—although in intimate connection with the life of the centre—a sphere of free and independent action.—The idea of political centralization admits of a strict or broad interpretation. When we compare the state of the middle ages with the modern state, the characteristic difference between them becomes apparent at once, the latter giving a

wider scope to its action and consequently bringing a larger part of public life under its control than the former brought. While the care for instruction and for the support of the poor devolved formerly chiefly upon the church, the care for security and means of communication upon the municipality, and that for the administration of justice in a great measure upon the *patrimonial* tribunals in every part of Europe, the modern state has drawn these and other matters either entirely or partially into the sphere of its activity. Even at the present day this process is not finished, and the problem is not yet solved, how far the centralization of public life in the state should be extended. The problem embraces, at the same time, the question of separation of those things which should be subjected only to state supervision, from those which come within the immediate sphere of action of the state power. Within the wider or narrower limit which the state puts to its sphere of action, the question of centralization again arises. Should legislation be reserved entirely to the central state power, or be partly transferred to provincial and district legislative organs? Should it be placed entirely in the hands of the head of the state, or be made dependent upon the co-operation of the representatives of the people? Should the law give expression to the variety of interests in the state, as well as to the unity of the state? Should the administrative offices of secondary or subordinate rank be simply the tools of the centre, or be invested with relative independence? Should the people take a part in the business of government, or is all the business of administration of affairs of state to be concentrated in government offices? After the centralization of public life in the state, therefore, the centralization of the life of the state in the head of the state and in *offices* is a subject for reflection. —The contrast between political centralization and decentralization is not confined to the constitution of the state which is a unit; it is also apparent in the laws regulating the union of a number of federated states. On the other hand, it is met with within the unit-state in the wider and narrower circles of district and municipal constitutions. There does not exist, for the proper measure of centralization, any general rule equally well adapted to all states and to all times. —The members of the political organism do not show the same aptitude and the same desire for an independent expression of their life, in different nations and at different times. The French surrender themselves, more than do the Germans, to the whole. Their nature, more than the German, seems to be able to bear strict centralization and to require it. In states where the people belong to *one race* or have become melted into one in course of time, there is less necessity to individualize the legislation and the administration than in states that have either been recently formed or which are composed of essentially different elements. In Spain the independence of municipal constitutions is of greater importance than in

France; Joseph II. utterly failed in the attempt to adapt the same political system to Germans, Italians, Belgians, Bohemians and Hungarians. It is true that the peculiar nature of the state in his case imperatively demanded that every existing element of unity should be carefully nurtured from a strong centre; the holding together of nationalities striving for political disruption consists in the art of taking into consideration the peculiarity of their nature and of letting them fully experience the economical and political advantages arising from union with a large and powerful state. During any serious crisis, particularly in the event of a war for external independence, the necessity of centralization is much stronger than in times of peace. It here becomes imperative to increase the concentration of all available forces, thereby securing the power of the state against any impediment that might be created by the obstinacy of external force. In moments of the greatest danger centralization goes so far as to reach dictatorship. —I. *Centralization of Legislation.* Under this head we have to consider, in the first place, the organization of legislative bodies; and next, the extent and the nature of their action. Correctly to represent the political and legal ideas prevalent among the people, their ideas of the state and of right must either be framed with the co-operation of the people themselves, or emanate from a personage of towering ability in whom their consciousness of law and right is concentrated. As the appearance of such individuals can not be counted on, the constitutional system in monarchical states has provided that laws shall be framed with the co-operation of the people. The representation of the people in the work of legislation can not keep the defects of the national character and the errors of the times from finding expression in the laws, but it can keep the errors and whims of single individuals from leaving their imprint on them. When properly regulated, the participation of the people in legislation not only guarantees the harmony of the law with the spirit of the people, at least in that which is fundamental, but also that the resources of the country shall not be employed to excess for state objects and that the wants of the different parts of the country and of the different classes of the entire people shall be recognized more certainly, duly appreciated, and properly attended to. There is no compensation for such guarantees when the central power has recourse to the advice of officials or boards (*Behörden*) which only too often are the mere reflection of the thought of the central powers, and of both its good qualities and its defects. The greatest although not insuperable difficulty in constitutional legislation lies in the danger, that in the multiplicity of elements at work the unit thought may be lost. This danger, it is true, is present to a less degree when legislation is in the hands of the head of the state, but even there it may be produced by rival influences. —If the centralization of the legislative power is properly modified, the sphere of action of that

power should not be extended further than is required by a centralized legislation. Both in legislation and administration the principle holds good, to assign to each its centre in the circle of those who are immediately concerned in its result, but to secure also to the more distant circles interested in it the possibility of affecting its action; the state does not meddle with legislation on subjects that are not of a state or political nature, and confines itself to the most general direction and supervision of those concerns which interest it only in a secondary degree. The defect in mediæval decentralization did not lie in the fact that the state left to each interest the care for its own concerns, but that it drew too narrow a limit to *its own* action, excluding much that concerned it very particularly or was intimately connected with its own interests.—On the other hand, it is acknowledged, in principle at least, that civil legislation should not interfere with the free action of those who share in it; also that criminal legislation (although central in quite another sense), should leave room for the judge's estimate of the individual case, and that so-called administrative legislation can not commit a greater blunder than when, by disregarding the variety of economical conditions, intellectual culture and civilization, it takes as its starting point the fiction of an average state which exists nowhere, or which imposes the conditions of one part of the country upon all others.—Nevertheless, this latter kind of faulty centralization is often found in modern laws, sometimes as the result of a false principle and again as a consequence of overhaste or superficiality. A sufficient protection against such errors is not afforded even by a representative constitution; it can only be secured through the preliminary discussion of the law at provincial and district meetings, by chambers of commerce, by conventions of business men, etc., in fact, particularly by the proper organs of the classes most interested in and most familiar with the subject. In other cases, in connection with these measures, the examination of experts or other competent persons by a committee of the legislative body may prove beneficial.—We have been considering the decentralization of legislation from two essentially different points; in the first place, as the recognition of an autonomy which the state can not refuse without exceeding the limits of its powers and its rights; then as a matter of expediency, which may indeed be overlooked without violation of the law, but not without injury to the state. In the first place, the state power is called upon not to extend its sphere of action to matters foreign to it, and in the second, not to pass laws regulating any subject in its own sphere of action without the concurrence of those possessed of the most perfect knowledge of it and directly interested in the result.—The recognition of autonomy above spoken of should find a place in the affairs relating to the church, to communities, institutions, associations, but not in the sense that state legis-

lation could ignore them altogether. Even with regard to the church, which is allowed full independence within its own province, it behooves the power of the state to, protect its own sphere from encroachment, and to regulate the extent and the conditions of its grants to the church and which the church expects from it.—The state has more to do with the organization of other associations and corporations, especially of municipalities; but here, also, a state legislation, properly limited, acknowledges the principle of *autonomy*, and all legislative provisions are preceded by the question, not *how* the subject is to be regulated, but whether it can be regulated by the state at all.

—II. *Centralization of the Administration.* The contrast between state legislation and autonomy corresponds with the contrast between administration by officials and self-government. In both cases a line must be drawn between the right of independent action in matters which lie outside the jurisdiction of the state and the institutions called upon to co-operate in state affairs.—The right of independent action belongs to churches, municipalities, and to all corporations which have neither been created by the state nor for it, not only in administration but also in legislation. These independent bodies possess the prerogative to be ruled according to their own conception of their mission, by authorities they themselves appoint and who are responsible to them. Only their independence is not absolute, and in so far as it behooves the state to interfere in their autonomy with its legislation, it has to superintend and define their administration through its authorities.—The participation of citizens in the affairs of the state is called *self-administration* in a wider sense, and appears chiefly under two forms: first, when public offices are held as *honorary positions* by citizens who do not devote themselves to a public career with the view of earning a livelihood; secondly, when a committee of citizens is placed side by side with the administrative state power, with the right to make proposals, express opinions and interpose a veto.—A state which excludes autonomy and self-administration, or limits them to a fictitious existence, deprives itself of a great power. It extends its task beyond its natural limits, while it, at the same time, diminishes its capacity to perform that task even within its natural limits. The state, like any other society, reaches its ends all the more completely, the better its members understand them, and possess the strength and inclination to fulfill them. This political education of the people, which made Rome great in antiquity and England in modern times, and the want of which has made Germany small, can only be attained through the participation of the many in public life. This political education alone overcomes the spirit of egoism, which knows no interest but personal advantage; makes no sacrifice for the general weal unless compelled; and which, where the state is concerned, does not shrink from acting in a manner considered immoral in private life, and

remains a passive spectator during the perturbation of the order of the state until the danger has entered into the narrower circle of private interests. As the feeling for the common weal, so is also the capacity to serve it, a natural consequence of that political education which is acquired and practiced in the management of the affairs of the municipality, of corporations, associations and in the honorary offices in state administration. The constitutional state can least of all dispense with it, an institution requiring the people, through its representatives, to take a part in the highest work of legislation, will prove a failure rather than a success if these representatives are not returned by politically educated electors. Autonomy and self-administration in the electors are necessary conditions to the sharing of the people in the functions of the central power; and for the prosperity of the constitutional system. On the other hand, the constitutional system itself serves as a means of political education, exercising a beneficial influence upon the narrow circles of public life, and so they mutually condition each other.—The objection has been raised against the principle of self-administration, that this liberty can not be granted to a people deprived of public spirit and sunk in individual interest, without endangering the treasure intrusted to them. That thus consciously or unconsciously the constitutional system is rejected, is evident from what has preceded. This objection would be well founded if the officers of government were chosen from a race endowed with higher political capacity, and not from the same nation as the governed. But the state takes its servants from the same people subject to the same imperfections. What they acquire in training for service and in the administration of their office, is scientific knowledge and refinement of manner, not public spirit. This highest qualification will be wanting in the civil service class, unless it has come to them as an inheritance, and unless kept alive in them by the public spirit of the whole people. The office accepted by the citizen as a duty of honor, without remuneration, is a school for political virtue and constant self-denial; but to the paid servant of the state the same office is merely a livelihood. A higher conception of his calling he acquires not by the possession of the office, but from the spirit of the community at large and from a supreme state direction in harmony with it. History confirms this; the lower a people had sunk, the more did official calling degenerate into bureaucracy.—The administration of foreign affairs in which the state as a unit has to do with another state, should be concentrated entirely in the hands of the supreme power, but without prejudice to the granting of extraordinary powers in critical moments, on the one hand, and to regular intercourse with neighboring states on the other.—Military affairs require a complete unity of administration, frequently reaching even to the smallest details. In war, when military operations are conducted far away from the centre of

the state, the commander-in-chief should be invested with extensive powers so as to act any moment as the moment demands. The evil consequences of a disregard of this principle are abundantly shown in the German and more particularly in the Austrian annals of war. Of the affairs concerning the internal administration of the state, those referring to the state budget are the most adapted to a centralized treatment; they are managed by paid officials according to prescriptions frequently reaching down to the smallest details given by the supreme authority. This refers particularly to taxes and customs dues.—Centralized administration is required also in the case of the police. The object of the police institution can often be attained only when the measures taken by the central or provincial authorities are speedily and uniformly carried out in all parts of the country. On the other hand, under pressing emergencies, even subordinate officials may find themselves compelled to act without delay according to their own view of the case.—The administration of justice comes within the principle of centralization to some extent.—Proper centralization has nothing in common with the ideas of absolutism, of state omnipotence and bureaucracy. "In unity, in the irresistible power of the whole, lies all that is great in the moral world. Centralization is in no way opposed to liberty; only the man is free who lives in the whole and in whom the whole lives. Nothing makes man more impotent, less free and weaker than isolation, extreme division and anarchy." (C. Rössler, *Allgemeine Staatslehre*, v. i., p. 347.)—But proper decentralization has just as little in common with the ideas of radicalism, state impotence and anarchy. It keeps the power of the state together by preventing it from forcing itself into circles foreign to its calling. It secures to it the good will of capable men who wish to devote themselves to the state, but not to be absorbed by it. It grants every part its individual value, each office a competent sphere of action, and each existing force its freedom of movement.—Proper decentralization grants every part the liberty to really *live* within the whole; and to the whole the power which is secured by a healthy development of all parts.—BIBLIOGRAPHY. Some of the above questions have been treated in von Bülow's *Die Behörden in Staat und Gemeinde*, Leipzig, 1836. For France, see de Tocqueville, *L'ancien régime et la révolution*, Paris, 1856; von Mohl, *Geschichte und Literatur der Staatswissenschaften* v. iii., p. 193, etc. For England, see Gneist, *Englisches Verfassungsrecht*, 2 vols., 2nd ed., 1867; *Englische Kommunalverfassung*, 2nd ed., 1863.¹ K. BRATER.

¹ We here add an extract from M. Coquelin on Centralization in the *Dictionnaire de l'économie politique*: "We think A. de Tocqueville entirely correct when in his work 'Democracy in America,' he expresses himself as follows: 'Centralization is a word very often repeated in our days, although, generally speaking, no one ever tries to define its meaning. Certain interests are common to all component parts of the nation, such as the framing of general laws and the relation of the nation to foreign nations.

CEREMONIAL, International. By ceremony we here understand the aggregate of prescriptions of form which regulate intercourse in select circles of society. International ceremonial is therefore the collection of formal rules to be used in intercourse between the representatives

of states.—Since certain forms are indispensable in all intercourse of any importance; since, further, all intercourse in its inception finds difficulty in overcoming the vanity and self-exaltation of those who are concerned in it, it is natural that we should find ceremonial precepts and

There are interests, on the other hand, which belong especially to certain parts of the nation, as for instance, municipal enterprises. The concentration in a place and in one and the same hand of the power to direct the former interests, constitutes what we may call governmental centralization. And by concentrating in the same manner the power to manage the latter we have administrative centralization. But there are cases in which these two kinds of centralization are confounded with one another. Still by taking, in the aggregate, the objects which belong more especially in the domain of each of them, we are able to distinguish them easily. It is evident that governmental centralization acquires immense power when it is combined with administrative centralization. This people are accustomed to completely and continuously leave their will out of consideration; they are made to obey not only once and upon a given point, but in everything and every day. Not only does such centralization subdue them by force; it isolates them and then takes hold of them one by one in the great mass. These two kinds of centralization mutually aid each other; the one draws the other after it; but we do not think that they are inseparable. Under Louis XIV. France witnessed the greatest governmental centralization imaginable, for the one man who framed general laws and had the power to interpret them, represented France abroad and acted in her name. 'I am the state,' he used to say, and he was right. And yet, under Louis XIV. there was much less administrative centralization than in our days in France. We have in our time a country, England, where governmental centralization has attained a very high degree; the state there seems to move like one man; it raises immense masses at its will, and the effects of its power are everywhere felt. England, which has accomplished great things during the last 50 years, has no administrative centralization. For our part we can not conceive how a nation could exist, much less prosper, without a strong governmental centralization. But we think that administrative centralization only enervates the people who submit to it, because it ever tends to diminish their public spirit. Administrative centralization succeeds, it is true, in bringing together all the forces the nation can dispose of, at a given time and in a given place; but it is prejudicial to the reproduction of these forces; it makes the nation triumph on the day of battle, but it diminishes her power in the long run. Administrative centralization can, therefore, very well contribute to the greatness of one man, but never to the durable prosperity of a nation. It must not be overlooked that in saying that a state can not act because wanting in centralization, we almost always unconsciously have in view governmental centralization. The German empire, it may be argued, has never been able to draw all the advantage possible from its forces; and why not? Because the national power has never been centralized; because the state could never enforce obedience to its general laws; because the several component parts of this great body always had the right or the possibility to refuse their co-operation to the depositaries of the general authority even in questions which interested all citizens alike; in other words, because there was no governmental centralization. These same remarks apply to the middle ages also. All the misery of feudal society was brought about because the power not only of administering but also of governing was divided among a thousand hands and split up in a thousand ways. The entire absence of governmental centralization prevented at that time the nations of Europe from striving with energy toward any goal.—Consequently it is true that there exists a political and an administrative centralization. The former—the only one which really affects the unity and power of the state—has, to our knowledge, never been seriously attacked. It is, therefore, an error, when, in defending the cause of French centralization, people incessantly invoke the great, the supreme argument of the unity

and the power of the state—an argument which has such ascendancy over unthinking minds. The unity and the power of the state have nothing to do with the question. As long as the state is invested with the general attributes of public authority; as long as it makes laws and appoints judges; as long as it holds in its hands the entire public force and directs its movements; as long as it can levy the taxes necessary for its support and collect them by its own agents; as long as the central government enjoys these essential prerogatives and some others besides which are attached to them, the unity of the state will be guarded and its power of concentration will be as great as it can be. But it does not follow, therefrom, that this government should interfere incessantly in the particular affairs of provinces, counties and cities; and still less should the state usurp the natural right of citizens whom it should confine itself to protecting. All the arguments advanced on the subject are therefore good to defend political centralization which nobody attacks; but they have no value whatever when advanced in defense of administrative centralization which alone is in question.—And says Ch. Dunoyer, in his *De la liberté du travail*: 'The apologists of the system we reject, hold the following language: It lies in the nature of centralization, they say, to produce a stronger government, a stronger nation, a more highly developed civilization, and, above all, a more general and a more equal development, a more complete and better organized system of roads, canals and all other means of communication; a greater unity in all the means of exchange, in language, in money, in weights and measures; more uniformity in the ways of manufacturing, of clothing, lodging, and of doing a multitude of things; more equality of feeling and thinking. * * * In one word, the system has the pretension to render the government better organized for the mission of order and peace it has to accomplish, to make it better fit to develop social forces and more apt to give rapidity and unity to this development. I do not think much penetration is needed to perceive that the system succeeds but poorly in bringing forth such results and that in many respects the results are negative.—More uniformity in the way of feeling and thinking! But what if everybody complains—unfortunately not without reason—of the anarchy of ideas nowadays reigning in France. More equality or uniformity in the manner of manufacturing, of dressing, of lodging? But this uniformity which is desirable only in a certain sense and in a certain measure, exists to a greater extent in England, the country of municipal institutions, than in centralistic France. As to the unity of the monetary system, of weights and measures, which is a good thing in many respects, there is no necessity, in order to establish it, to deprive local authorities or individuals of the right of managing their special interests as they deem best. With respect to the uniformity of language, it is worthy of note that all the efforts of an exaggerated centralization have not succeeded in bringing it about in France, while it exists, although it may seem incredible, in the United States, the most decentralized country of the world, and among the heterogeneous population which has only recently come to the country from the extremities of the globe. If it becomes a question of the power of concentration to be given to France, and with right, for the maintenance of her political power, we may say that this political power does not result from administrative centralization, but from political centralization, which, in our opinion, should be kept intact. All the rights, all the attributes, all the prerogatives relating not only to the defense of the country but also to the general affairs of the state, must be reserved for the central government. We thus understand the question. So much is necessary, but it is sufficient. But to these natural, legitimate and necessary prerogatives, governments are wont to add others which make them intervene at all times and at

disputes beginning at the period when European states came into more frequent contact with one another. At that period (the sixteenth century), Spain stood at the summit of her power. This explains why the Spanish ceremonial was enabled to make its way first to France and thence over the whole continent of Europe. The infinitely rigid forms of this ceremonial (see *Leti Cereemoniale-historico-politicum*, Amsterdam, 1685,) was in keeping with the exclusive rule of dynastic interests and the low degree of culture in that age.—We remark in the eighteenth century a decrease in the stiffness of ceremonial forms and in the number of ceremonial disputes. An abrupt change was brought about in this direction by the French revolution, whose diplomates and generals purposely showed their contempt for the ancient court ceremonial. After the imperial throne of Napoleon was established all this was changed. The congress of Vienna effected a restoration of ceremonial. In this case, of course, the restoration was in accordance with the spirit of modern times. It was felt to be the task of ceremonial not to render intercourse between political representatives more difficult, but to facilitate it. Efforts were made to simplify it; and this tendency has happily continued to grow.—There are different kinds of ceremonial according to the manner in which, and the difference of place at which, the representatives of several states meet. If the intercourse is personal and oral it is carried on according to the rules of court or diplomatic ceremonial, whether diplomates or diplomates and sovereigns are present. Court and diplomatic ceremonial are designated by the common name *etiquette*.—Chancellery ceremonial gives the necessary rules for written communications between the representatives of states.—Lastly, ships have long been considered as floating portions of territory, and both their meetings on the high sea, and their entering or leaving foreign maritime districts have been considered as the meeting between different state powers, and rules for salutation have been established. The collection of these rules is called *sea-ceremonial*.—Space forbids us to enter into detail concerning these different ceremonials. We content ourselves with citing a few chief points. It is first to be remarked with regard to court ceremonial that sovereigns to whom kingly honors are due treat one another on a complete footing of equality. According to general usage the host yields precedence to his guest; grand dukes do the same when they meet emperors or kings. As to states to which royal honors are not due, at least everything is to be avoided which might be interpreted

as want of respect for their sovereignty. That their representative, however, must give precedence to those of first class states, is self-evident.—Those questions of diplomatic ceremonial which had previously given occasion to most disputes were settled by the protocol of the congress of Vienna signed March 19, 1819. This protocol established a classification of representatives and the order of their rank. Precedence in each class was to be regulated according to priority of credentials. In signing treaties the names were to be alternate or the country was to decide. (See AGENT, DIPLOMATIC.) At present the alphabetical order is usually resorted to, by taking the initial letter of the names which the countries bear in the French language. In personal intercourse diplomates often free themselves from the formalities of ceremony by the so-called *poleméle*.—Chancellery ceremonial has become remarkably simple. Official letters to a sovereign with the so-called *great* or *middle* title, are scarcely seen. The *small* title, limited to a description of the chief dignity of the sovereign, is considered sufficient.—The diplomatic intercourse of states is carried on mostly by *dépêches communiquées*, that is, through dispatches which the minister of foreign affairs sends to his ambassadors who read them to the minister of foreign affairs of the state to which they are accredited.—In autograph letters between sovereigns of royal rank, the title brother is so usual that Napoleon III. considered the refusal of it on the part of the emperor Nicholas as an offense.—In *sea-ceremonial*, the principle has been long in force that the ship which enters foreign waters must salute first. Formerly the great truth was not understood that the high sea could not be subjected to the rule of any state. England claimed dominion over certain parts of the high sea, and demanded in them the first and a humiliating salute from foreign flags, which gave occasion to the bitterest disputes and even to war. This pretension is at present extinguished. The obligation to give the first salute after entering foreign waters is as generally recognized as that on the high sea ships of various nationalities can not require salutes of each other. Flag salutes on the part of war vessels are no longer customary. Cannon only are used in salutes.—Though on the high sea a salute can no longer be demanded, it is generally given on both sides from reasons of politeness. It is the general rule that the first salute is given in the following cases: by merchantmen to ships of war; by a war ship having on board an officer of inferior rank to one with an officer of higher rank; by single war ships to squadrons, etc. Compare on this question, the queen's (of England) regulations, and the admiralty instructions for the government of her majesty's naval services, (1861); further, the United States navy regulations, etc.—In reviewing the precepts of the existing international ceremonial, we call special attention to two points: The ceremonial of the present loses its personal character more and

the wrong time in the private affairs of provinces, of communities and of individuals. Far from adding to their original power, governments thus embarrass, enervate and efface themselves."—What is here said of administrative centralization may with great force be applied to the government of the several states of the Union, but with greater force what is said of political administration to the power which should be lodged in the federal government of the United States. —ED.

more, that is, its rules are considered less with reference to the single sovereign, diplomat or naval officer, than to the nation which is represented by either of them. Besides, the correct view is becoming more widely accepted, that the rules of ceremony and the claims arising from them, are rules and claims not of right but of manners. This sentence expresses our view of the future significance of ceremonial in the intercourse of nations. Ceremonial will retain in the future, also, its significance for the representatives of states, just as the rules of politeness are of high value in the intercourse between cultured men, but its precepts will disappear more and more from international law.—BIBLIOGRAPHY. Bluntschli, *Modernes Völkerrecht*, § 171, note, §§ 188, 189; Heffter, *Völkerrecht*, § 193 ff., 218 ff.; Martens' *Guide diplomatique*, 5th ed. by Geffcken, I., pp. 122 ff., 196 ff., 207 ff.; II., pp. 10 ff., 113 ff. 320 ff. STRAUCH.

CHAMBER OF COMMERCE. Mr. McCulloch, the English economist, thus defines a chamber of commerce: "An assembly of merchants and traders where affairs relating to trade are treated of," and Bouvier in his "Law Dictionary" as follows: "A society of the principal merchants and traders who meet to promote the general commerce of the place." There are several establishments of this kind in France. In the United States, the term, "Chamber of Commerce," or "Board of Trade," is frequently applied to an institution which would be more appropriately called "Exchange" or "'Change." The economic utility of these institutions will be treated of in the article EXCHANGE, which see. E. D.

CHARGÉ D'AFFAIRES. (See AGENT, DIPLOMATIC.)

CHARITY, Private. Economists reject public or state charity as producing incomparably more evil than good. This has sufficed to bring upon their doctrines the accusation of extolling egoism, of stifling feelings of charity, of undervaluing generosity and devotion. Happily these accusations are as stupid as they are odious, a fact which may be shown without difficulty.—We shall first examine the arguments put forward by the two most eminent defenders of public charity, Lamartine and Thiers. Says Lamartine, in his *Le Conseiller du Peuple*: "Are fraternity and charity virtues? They are. Then society itself ought to exercise these two virtues; society should not, as is pretended by economists, who have no religion but arithmetic, free itself from these great duties and let misery and death take their course." Thiers, in his report to the French legislative assembly on public assistance, brings up the same considerations: "If the individual has virtues, can not society have them too? To our thinking, the answer is not doubtful. We must not look upon the state as a cold, senseless,

heartless being. The collection of members composing the nation, as they may be intelligent, courageous, polished, may be humane, charitable, as well as individuals themselves."—What is society? If it be the collection of members composing the nation, it is clear that this collection will unite in themselves the total of all the virtues possessed by each one of the individuals composing it. If it is wished to personify the collection, and to make of it that creature of the mind called society or the state, it is absurd to attribute to this being which has no existence, an action independent of that of all the members composing the nation. If, however, we understand by society or the state the government, the question is changed altogether; and we must no longer ask whether charity being a virtue in the individual, is not equally a virtue in society, but whether it is proper, moral and advantageous to have charity practiced by the government, or whether it is even possible for the government to practice charity at all. We say not. It is very evident that charity and fraternity are virtues only when they are free and spontaneous. State and, therefore, forced, charity is not a virtue, it is a tax. Now, the sacrifice imposed on some in favor of others clearly loses the character of charity. The legislator has no merit in the case, for all he has to do is to cast his vote in its favor. The executive power or the tax collector has still less, for, instead of giving, he retains a part of the gift as pay for his services. Neither has the tax payer, since he contributes only in spite of himself. Where can we find here the conditions of charity: *a benevolent inspiration followed by a voluntary sacrifice on the part of him who feels it?* Is not that a strange kind of charity whose acts are performed by the tax gatherer and policeman?—Economists who, according to Lamartine, have no religion but arithmetic, have always shown themselves filled with pity for the sufferings of their neighbors, as profound as that which he himself felt; and if we look into the lives of the most illustrious among them, Quesnay, Turgot, Malthus, Smith, J. B. Say, Charles Comte, etc., we shall find a series of acts of noble disinterestedness, of devotion to truth, to justice and the unfortunate classes, worthy to be held up to all men animated by real philanthropy.—Economists are specially occupied with the means of dispensing exact justice to every man, and with diminishing misery by acting on the causes which produce it; but they know that preventive measures will never be enough to eradicate it: that there will always exist in society a great number of individuals absolutely incapable of obtaining for themselves enough to escape from the sufferings brought on by indigence, and whose support can never be assured except through the wealth created by others; that, consequently, feelings of pity, benevolence and charity will always be indispensable; and that too much force and activity can not be given them when there is a question of solacing unmerited misfortune.—But

economists deny that public charity is a means of supporting and developing these sentiments. On the contrary, they are convinced that it tends to weaken them continually, to blot them out, by apparently diminishing the necessity for them, by adding to the suggestions of egoism plausible pretexts against generous impulse. They are convinced that charity practiced by individuals or free associations would be more extensive and powerful in proportion to the decrease of state interference in the collection and distribution of relief; that this interference tends to suppress the principal stimulant to charity and the condition which can best assure its efficacy, by destroying direct relations between the benefactor and the benefited; that by this state interference the individuals assisted are bound to feel grateful only to the law, that is to say, to no one, and that, by making assistance obligatory to those who render it, they naturally dispose those who receive it to look upon it as a right; that thenceforth, relief loses all character of uncertainty or contingency and that the poor classes accustom themselves to count on it, and yield more and more to improvidence, idleness and other vices, productive of misery; that, in this way, public charity engenders more evils than it can cure.—Charity consists in interesting one's self in the misfortunes of others, and in the making of sacrifices to diminish them. When it is freely practiced it can present no danger; the sacrifices are generally proportioned to the resources of those who make them, and no one can count on them positively; they have not the inconvenience of lessening the preventive effects of penalties attached to misconduct and habits generating misery. But if charity is imposed by the law, what shall be its limit? What part of the penalties on improvidence, etc., will be left in force? That will depend on the opinions, the disposition, the caprice of the legislator. Lamartine, for example, wished to bind the state to begin 500 million francs worth of public works. Louis Blanc understood popular fraternity in a wider sense. He wanted all the shops to be taken by the state and put at the disposition of associated workmen. On another occasion, Barbès and Sobrier, "considering that fraternity is not an empty word, and that it ought to manifest itself in acts," wanted a tax of a milliard of francs on capitalists for the benefit of workmen. It is evident that if this principle of fraternity or public assistance be once admitted, its consequences have no assignable limits, and might extend until one-half of the population was despoiled in favor of the other half.—Such are the motives which have caused economists to reject public charity and oppose all measures tending to give it a greater extension than it already has; but far from wishing to weaken the feeling of charity by this action, or restrain charity freely practiced, they claim, on the contrary, that they give it more intensity and breadth, for they contend that the interference of the law, in place of rendering the sources of charity more

abundant, tends inevitably to exhaust them. Political economy does not approve of state rule, either in the practice of charity or in the church, or in industry. It maintains and demonstrates that but for the unfortunate claim of governments to direct these different branches of social activity, we should be more charitable, more religious and more industrious.

AMBROISE CLÉMENT.

CHARITY, Public. 1. *Principles and Effects of Public Assistance.* Mutual aid is a precept dictated by the best sentiments of human nature and which the very constitution of society renders necessary.—Misfortune excites our pity. Natural law prescribes to us the duty of relieving it, and religion most imperatively recommends it. Christianity is instinct with a tender affection for those whom it calls "the suffering members of Christ." "Help one another!" Does not this command, without which society is impossible, flow from the divine precept: "Love one another?" Moreover, in a political society founded, on the one hand, on the principle of responsibility which leaves each man to the consequences of his faults and makes misery the punishment of improvidence and vice, and on the other, on the principle of inequality which is indispensable to order and progress, but the effect of which is to permit involuntary wretchedness—a wretchedness which falls, as a burden, inevitably on those possessed of assured and ample means of subsistence—the whole question is, how and in what form that assistance shall be given. Shall it remain purely individual, that is to say, in the hands of individuals acting with their own resources alone, and coming into direct contact with the poverty-stricken? Shall it be the work of voluntary associations, which afford more abundant and more regular aid? Shall it be made a matter of public concern by the county or city, or shall it have for organ that collective being known as the state? It is evident that the science of politics is not less interested in the solution of these questions than political economy and morals. They are questions which involve the power, the wealth and the safety almost of the nation. A faulty distribution of assistance by exhausting the sources of public wealth, and by destroying much productive power, strikes a blow, not seldom serious, at the health and vitality of the entire social body. Too many examples, from the days when assistance was dealt out in Rome to the time of the poor laws of England, bear witness to the truth of this statement. It is therefore of the highest political importance to know what rule is to be followed here in a matter thus delicate and dangerous, in which the least error may lead to cruel suffering. Not to relieve misery, and to relieve it by unwise means, are two lines of conduct equally exposed to engender the hatred which divides classes of men, and gives rise to dark discontent and revolution. We shall therefore endeavor to establish, first of all, as clearly and precisely as we can, the prin-

ciple which governs in this matter of public assistance, a matter so important in itself and so much involved in controversy.—All charity, no matter how sacred its principle, how indispensable its practice, how useful its effects, has its drawbacks. It runs the risk of perpetuating poverty. Men accustom themselves to depend on aid, they cease to labor and be provident. The will grows weak; the mind loses that generous pride which is the very mainspring of moral life and of the industry which is nobly anxious to provide for itself. Here is the danger. There is not an economist who has not called attention to it. Must we conclude, therefore, that charity should be suppressed? That would be a conclusion as barbarous as it is visionary, but a conclusion which we might perhaps be justified in drawing if, by means unknown to the most advanced civilization, the great majority of men were insured against evil chance or an error of calculation. But even on this chimerical hypothesis, charity would be unable to abstain from action. Misfortune even when deserved would not find it indifferent. Charity which takes pity even on crime and vice, would not remain insensible to suffering resulting from a simple want of foresight or some degree of carelessness. The privations of a man who has fallen by his own fault acquire at times such a degree of intensity that society itself could not look on them unmoved and refuse him all help. Policy which is calculating, just as charity is guided by feeling and duty, will always be loath to reduce a human being to despair by leaving him no alternative but theft or suicide. If the help thus given saves from the abyss the person who receives it, both policy and charity will congratulate themselves on the fact. If he does not improve his condition, they try nevertheless to prevent the unfortunate from dying of hunger. But it is imperative to regulate relief in such a way that the culpable improvidence, which it frequently generates, shall be reduced to a minimum. In this lies the difficulty in the way of assistance, and this difficulty becomes manifest to a greater or less extent according to the form it takes. Who would not understand, even if experience had not shown it in so striking a manner, that individual charity could not have precisely the same moral and economic effects as charity organized in vast associations, and that this in turn would be different from the public assistance which takes the name of *state charity*? A policy jealous of the interests of the people, and the future of the state, should therefore examine and compare with the greatest care these three kinds of assistance, as to their principles and their results upon the minds and condition of those who receive them.—The most blameless, the most sacred, the most beautiful of all forms of assistance is the individual charity born of the impulse of the heart and the heroism of devotion, which, looking on the human race as one family, inquires into the sufferings endured by this one or that of its members; and which, not satisfied

with throwing down a few pennies under the momentary empire of pity or importunity, goes out to meet the unfortunate, visits him in his abode, and, with delicate discernment adjusts the aid given to the extent of the need, and dresses the wounds of misery with tact and even with tenderness. Charity is admirable where it is voluntary and spontaneous, and where it establishes the mild and powerful bond of attachment and gratitude between him who gives and him who receives. How could hatred and envy find a place in minds brought into close relation by the strongest and deepest feelings of the human heart? The merit of this charity in the eyes of the statesman and philanthropist, is that it is exposed to fewer errors, that it reaches real suffering, that it infuses a kind of modesty into the recipient and places a certain limit to the acceptance and asking of aid. In the case of such charity, there is less risk that the beneficiaries will carry on a shameless traffic in assistance and lose the salutary check of shame.—But whatever economists may say on the matter, isolated charity is not sufficient. too many cases of misery escape its notice. By a tendency common to every powerful and permanent feeling, charity is obliged to have recourse to the power of association. It must be organized in such manner as to increase its resources on the one hand, and on the other to supply aid with a regularity of which individual action, always limited and somewhat capricious, is not capable. Such is the object of charitable associations. They reach misfortune and adapt themselves to its manifold forms with an efficacy which private assistance could never attain. Charitable associations are the means of doing much good. Only it is to be feared that, in assuming an administrative form, these associations may destroy the affectionate relations between the benefactor and the recipient, and that charity may begin to have its pensioners who count upon its aid as upon an assumed income.—The third species of assistance is that represented by the county, municipality or state. It, also, does a good which associations could not always do. It has more wealth at its disposal and is better organized. Such state or municipal charity has an extent and sometimes a grandeur to which that of private associations can rarely aspire. While noting these circumstances, political science should not forget that some of the drawbacks which attach to private charitable associations are much more apparent here and in an almost fatal form. It is no longer with charitable men that the befriended individual has to deal, but with officials. Hence a certain curtness which takes from charity its amiable and tender character, and puts the coldness of official relations in its place. Hence fewer scruples on the part of him who asks relief, and less affection on the part of those who are nothing more than salaried distributors of assistance. The aid funds then become a kind of plunder, the better part of which the most adroit and most audacious strive

to bear away. These are the considerations which have caused economists generally to pass so severe a judgment upon assistance given by the state, a judgment which has caused their science to be accused of pitiless harshness. Such certainly was not their intention when they reproached legal charity with increasing the number of the poor, and creating more misery than it removed. Let us recognize the fact, however, that they have at times condemned state assistance too absolutely. Its legitimacy lies in its necessity. There is suffering of a kind that demands a prompt remedy and immense sacrifices of money or the employment of means which the state alone can command in sufficient quantity. The assistance rendered by the state to the needy is sometimes recommended as an act of justice even or at least of equity. Does the state owe no aid to its servants grown infirm in its service, and who have not attained the age when a pension is their right, or to their widows, or orphans of a tender age? Is it not sometimes equitable, even when the law does not make it an obligation, to accord some indemnity to those whom certain measures of general utility have crippled in their resources? Why should prudence not make it obligatory on the state, no matter what the purely economical objections may be, to help those whose sudden poverty has become a menace and a peril to society? Are there not cases in which humanity itself cries out? What is to be done with the poor in times of commercial depression, whom private charity is powerless to feed and who fall exhausted by the wayside? Let us suppose that fire has destroyed a village, or that an inundation has extended its ravages over a whole country. What can fit the remedy to the evil unless it be public assistance? It is the same with certain diseases, the care of which demands a more regular attendance than that which private charity can afford, and more means than are at the disposal of voluntary associations. Unfortunately aid must also be extended to healthy men. Here, above all, moderation is difficult. It is a matter of experience, which can not be too often recalled, that the slightest regular aid nourishes idleness and generates pauperism. There are brutal natures who would rather content themselves with the most miserable pittance, upon which they might count with certainty, than yield themselves to the least continuous labor. It is to them and to the excess of assistance unmeasured and unenlightened that the sadly significant words of William Stone, an English author, are applicable. The words were spoken of a weaver, a type of this whole class of beneficiaries without heart and without dignity. He was, says Stone, born for nothing, nursed for nothing, reared, taught, clothed for nothing; he learned a trade for nothing, was ill and cured for nothing, married and had children for nothing, who came to the world and lived like their father, for nothing, till their death, then received a shroud, a grave and prayers

for nothing.—We do not intend to relate in detail England's experience with the poor tax. It is but too well known that the obligation imposed on the parishes, of finding work for able bodied paupers, of caring for the infirm, for foundlings, and in general for all persons unable to earn their living by labor, acted as a premium paid to improvidence, as an encouragement to laziness, to premature marriages and to the increase of poor families. The reform bill of 1834, called forth partly by the writings of Malthus, while maintaining the principle of legal charity, introduced into the organization intended to realize it, two important modifications, to wit: 1, the obligation of parishes to group themselves into unions, for the levying of the tax, and the distribution of aid, where the higher authorities think proper to so order it; 2, the establishment of workhouses, where all able bodied paupers were obliged to go, under pain of being deprived of all share in the poor tax, and where they are submitted to a régime of restraint and privation with separation of the sexes and of ages. This reform, introduced into English legislation, produced happy results. A saving of \$8,000,000 was realized immediately, and \$15,000,000 in 1837. Still the poor tax in England recently amounted to nearly \$20,000,000. A single house of charity which in 1840 had admitted only 767 homeless poor, received 6,300 in 1846, and 11,674 in 1847. But in spite of the tax the number of beggars increased; in 1847 there were 265,000 depending on other than legal charity.—The situation has improved since then; but is it to the poor tax that we are to attribute the improvement? It must be attributed to causes of well being with which political economy is well acquainted, to the development of industry, the abundance of capital, the increase of wages, and the freedom of trade.—How can we doubt the truth that state assistance when regular, perpetuates pauperism, when it is known that in the 15 years preceding 1856, the number of names inscribed in the charity bureaux of Belgium rose from 400,000 to 1 000,000? Must we see in this increase only the proof of the fact that many paupers were not inscribed in them before? We do not think so. There are communes in western Flanders where the number of paupers is invariable, whatever be the state of labor and the price of provisions. In speaking of the charity bureaux of France, M. Watteville remarks: We see to-day enrolled on the registers the names of the grandsons of paupers admitted to public assistance in 1802, while the sons of these had in 1830 in like manner been put on the list. It is thus that the condition of pauper becomes almost a hereditary profession. Many parishes in England presented this same scandalous spectacle. What do you do? asked a traveler of a tolerably well dressed man who was walking with a cane. "I am a pauper," answered the latter, just as a man would have said he was a sailor, a miner, or a weaver.—One of the consequences most detrimental to

justice and to the wealth of a country which public assistance entails, whether the assistance is given in the form of aid by work or of alms, is that this assistance is levied in part on the fund destined to feed what has been known as the wage fund. Assistance thus becomes a tax imposed on workmen who receive no assistance. It is to them a source of fresh embarrassment. Now add to this the competition of subsidized labor, and the result is that the assistance given to their prejudice tends to force them to have recourse to assistance themselves. There is only a certain amount of work to be disposed of.—What should political science conclude from these views borrowed from observation? That we should endeavor rather to limit than extend legal assistance; that its practice should be such as to detract as little as possible from the moral force of those whom it benefits, and that if possible it should even aid this moral force, which it does when it saves an individual from discouragement, or when it takes the form of instruction given gratuitously to those who are unable to bear its expense. Except in this case it is only a palliative. How can we avoid being struck by the fact that in a time of famine it has not been given to charity to create a single bushel of wheat, to make up the deficit in the harvest? It is to be remarked also, shocking as the proposition may appear at first, that as the wealthy who buy bread for the poor, do not eat a morsel of bread the less on that account themselves, it follows that such bread is taken from the share of the non-assisted poor. We have no idea of denying the benefits of charity because of this. In reality the aided poor being considered the most unfortunate ran the risk of dying of hunger, but well-to-do people took what they gave from their own savings. What does this example and so many others show but that assistance does not increase the resources upon which workmen live? These severe lessons of political economy do not go so far as to do away with assistance, a point which can not be dwelt upon too much. It is proper that this should be kept in mind that there may be no illusion on the subject. The poor man reduced to sad extremity must be assisted, and his life must not be embittered by the sad feeling of his being forsaken. This has been recognized by the economist who passes for the most systematic adversary of public assistance. Let us not forget, says Malthus, speaking of disastrous periods, that humanity and true policy demand imperatively the giving to the poor of all the assistance which the nature of things allows to be given them. It is important to know well what this nature of things is. The state in matters of assistance is bound to conform to certain rules. There is, so to speak, a policy of assistance. What this policy is we shall now point out.—II. *Rights and Duties of the State in the Matter of Assistance.* Two extreme opinions have been upheld relative to public assistance. On the one hand, it was denied that the state had the

right to perform acts of benevolence, for the reason that it could do so only by taking from some of its members to give to others. Taxes, it is added, are paid back to those who contribute them in the form of moral and material advantages by the state. The tax payer's sacrifice has its compensation. In case of assistance this sacrifice is a pure loss. It is a species of spoliation. On the other hand, it was maintained that assistance is not a charitable duty on the part of the state, but the strict right of the assisted party. We know under what circumstances the famous thesis of the *right to assistance* in France was produced, which had for corollary the *right to labor*—a thesis developed in books and journals at a period when everything was called in question, from the bases of society to the facts of the day—To question the right of the state to assist in a certain measure the classes suffering from poverty is, in our eyes, only an exaggeration of the logic of *laissez faire* and *laissez passer*, a maxim good in itself, but the abuses of which should be avoided. Side by side with the individual and his action, there is a principle with which we must reckon, the principle of solidarity. Society is not a simple juxtaposition of individuals; it is a living organism; and the state which represents it is also to a certain point a moral person, a sort of collective individuality, which society itself intrusts with doing that which it could not do through each of its members standing alone. The state does not exceed its rights in performing acts of charity. How could it if, in doing so, it filled not only the rôle of benefactor to those it assisted, but performed also a duty of social prudence, and of preservation in certain cases?—As to the right of the individual to ask public or legal assistance, as a thing rigorously due him, how can we avoid looking on its assertion as one of the grossest errors of the socialist school? What is a right and what does it imply? Every real right brings with it this consequence, that it can not be denied an individual without real oppression. The vindication of this right, when all other means of obtaining the exercise of it have failed, may go so far even as to justify the use of force. Are not the most decided adversaries of revolution constrained to admit that there have been rightful revolutions? Is the pretended right to assistance of such a character? By no means. Can I in truth call myself oppressed, because the government does not take money from tax payers' pockets to meet my wants? Should not all aid be received with gratitude, as something not due? The *right to live* has been invoked as the basis of the *right to assistance*. What is meant by this? Is the right to live one which the state should and can enforce? I have the right to support myself, to breathe, to go and to come; that is to say, no one has the right to take measures or commit acts to hinder me from doing these things; but it is not the duty of the state to procure them for me. Otherwise we should look on the state as a producer

and distributer of wealth, and hence as communistic. I have the right to live, and to live even a hundred years, if I can, was the just answer given the French socialist orators in 1848, but not that others should be charged with my support. The state has fulfilled its task when it insures me the right to live by sheltering my person from violence, when it insures the free exercise of my labor by a good police system, and guarantees me the possession of its fruits. The right to live can not give me any power over the results of other men's labor. To take up arms to obtain assistance, is not the exercise of a right but an act of violence. The man most pressed by hunger who steals a loaf of bread, may have done a deed deserving the judge's pity, no doubt, but he has none the less committed a theft.—The right and the duty of the state in the matter of assistance would seem to be sufficiently well stated in these observations which we have thought it our duty to insist upon in this work, intended to set forth the fundamental principles of all social and political questions. State like individual aid should be free. To force it, is to change the principle of all governments which have liberty, responsibility and property as their foundation. It is to become a spoliator, and a traitor to justice, under pretense of completely realizing the dogma of fraternity.—The state's policy of assistance reduces itself to this rule: to intervene only in cases of real necessity, and when individuals or associations are unable to act as effectually. In this latter case the state should endeavor to lend to assistance the forms which best accord with the principles of personal responsibility, which alone constitute personal dignity and secure the permanent well-being of individuals. It should avoid as much as possible everything which weakens the family spirit. It is not for those who are united by the ties of blood to call on a social providence to discharge their duties for them. If there were some form of assistance which could help the unfortunate individual to recover, and give him strength for the future, the state should adopt it by way of preference. It should also examine whether there are not cases in which wisdom prescribes that it should not act itself, but aid charitable associations in the work of assistance.—III. *Forms of Assistance.* Every age has its share of infirmity and evil, difficult, if not impossible, to avoid. The best division of the means of assistance is that which keeps in view the three ages of man: infancy, maturity and old age. It is the one adopted by M. Thiers, in his general report in the name of the commission of assistance and public provision presented to the French national assembly during the sitting of Jan. 26, 1850.—That infancy recommends itself in too many cases to public assistance, we can not deny. Here there can be no responsibility nor the possibility of self-support. It is true that the family has been created by Providence to come to the assistance of the mental and physical weakness of the child.

The whole difficulty here lies in reconciliation of these two principles: the sacred interest of the infant which can not be ignored, neglected nor abandoned, and the family spirit, which we must avoid weakening. There are circumstances in which the family, no matter how well intentioned it may be, is powerless to give the child the help which it needs. Such is, for example, the case of an infant born lacking one of its senses. What can be more admirable than the institutions for deaf-mutes and blind children? Is it in the bosom of the family that the child could learn to supplement the organs which it lacks, by a further development of those which remain to it? The institutions intended for the reception of infancy from the most tender age until the school years, *crèches*, and asylums, are much praised. Their object is to take the place of the mother who can not nurse her new born infant, or is obliged to labor far from her child. It is difficult, however, not to recognize that these philanthropic institutions which have multiplied so rapidly in France, have put some mothers too much at ease with their duties, and the good which they do is not an unmixed one.—The assistance of the state in the case of the child extends to all the conditions of its physical and moral life. Almost all publicists are at one in acknowledging that it should above all afford the child the means of instruction. Assistance given in the form of instruction is the best of all. It has this very commendable character, that it places him who receives it in a condition to dispense with all other assistance. There are other forms of assistance for childhood. Is not the contract of apprenticeship a legitimate object of the care of the legislator? It has been contended that the same is true of the fixing of the hours of labor in factories. Such a regulation, however, does not encroach in the least on the legitimate power either of the father of a family or the manufacturer: neither of whom should be allowed to violate the laws of morality, or to exhaust the strength of the young creature whose guardian the state becomes when its natural guardians fail to do their duty.—It is when we come to people of mature age that the most delicate questions arise. This is the time when man is usually in the full enjoyment of his intellectual faculties and his physical power. If in exceptional circumstances public assistance must come to his aid, it should not be allowed to take the place of his own endeavors and forethought. This is the rock on which so many philanthropic efforts, and more than one administrative measure have been wrecked. Rules established to raise wages in an artificial manner, the forced limitation of working hours, the organization of labor in the *ateliers nationaux*, aid distributed to healthy men without motive or sufficient discrimination, are open to the serious objection of rendering the individual indifferent to his fate, of weakening his energy, and of disturbing labor. Such, for instance was the outcome of an institution really praiseworthy in its charitable intent, that of work-

shops for poor women. These are admitted in a warm building and assured wages in exchange for their labor. What is the result? In one of these workshops in Paris the making of a shirt is as low as twenty-five centimes. At the Salpêtrière it is not more than ten centimes, and the making of twenty pieces of baby linen does not amount to more than one franc and ten centimes. How can free operatives meet such competition? How can the mother who works at home earn enough to feed and bring up her children?—Does this mean that assistance can not be given to mature age without radical drawbacks which cause the evil to outweigh the good? We do not think so. Are not savings banks a striking proof of this useful interference, at least at the inception of aid institutions, if one may give this designation to an institution of credit, which more than any other brings the power of responsibility into play? Societies of mutual assistance give rise to the same reflections. They present the characteristic well worthy of our sympathy, of uniting in the body of the same institution the principle of responsibility which urges to labor, to save, with the solidarity or charity which is the happy corrective of whatever there is narrow and egotistical in personal motives. As to assistance under the form of work in times of crises or lack of employment, it does not present, perhaps, insoluble difficulties. M. Thiers, in France, undertook to show this in his report. Although political economy has in general reproached this remarkable paper with yielding too large a field to assistance, even in theory, it can not, to our thinking, but approve the idea of reserving certain public works for periods of distress and revolution, instead of being too prodigal of them in time of prosperity. Thus, instead of improvising fruitless occupations on the spur of the moment, the state would hold itself ready in such manner as not to be forced to wait in a moment of urgency for plans, estimates and votes in the matter of public works. It would be well to reserve for these general crises which are more or less periodical, the work of building fortified places, digging ditches, putting up walls, laying out certain roads, etc.—There is need also of caring for natural diseases, as well as those of advanced age. This is done in the hospitals and almshouses. These have been often condemned as institutions antagonistic to labor and the family. Here again moderation is necessary. Not all have a family capable of receiving and nursing them. There are diseases of such a nature that the sufferer must be removed for the sake of public health, or which require more continuous or costly care than a poor family can give them. In this case private individual charity could not alone suffice. It is said truly that it is dangerous to suggest to families the idea of getting rid of their members by leaving to others the care which duty exacts of them. From this it has been concluded that home remedies are preferable. But are they always possible? Must we look unmoved on the wretched care given by poor families to their sick

members in difficult cases, or the detestable hygienic conditions in which they live? Can doctors go to a hundred places the same day gratuitously? Is there not here something touching and fitted to reconcile the heart of the poor man with society—which he sometimes accuses of harshness—since he receives the care of the best trained and distinguished experts? How can almshouses for the infirm and incurables be condemned? Still it is the almshouses, even those for the aged, which have given rise to the greatest number of well-founded objections. The admission of aged persons in good health seems to present the greatest difficulties. This prospect of the almshouses for the poor classes renders some improvident, and creates culpable callousness in those who should support the head of the family, who has become incapable of hard labor.

HENRI BAUDRILLART.

CHARITY, State. I. *State charity, public charity, official charity*, these are expressions often used the one for the other, although each of them has a very distinct meaning. And so it is with the words poverty, indigence, misery, pauperism, which designate the objects of charity. The language of science has suffered from the confusion prevailing in this respect in everyday language. Let us endeavor to define carefully the sense in which we shall employ these words, so that we may not add to the difficulties already existing those of an ambiguous or variable terminology. Of the first three expressions the widest in meaning is undoubtedly state charity, comprising, as it does, every kind of charity administered by a public authority in the name of the state, of the municipality or any other territorial division, whether by furnishing funds or by organizing or distributing relief.—When the authorities intervene by virtue of laws imposing upon them, more or less explicitly, the duty of helping the poor in general, or certain classes of the poor in particular, this charity we may define as *legal charity*. The intervention of the authorities in so far as the distribution and application of relief is concerned, may be called *official charity*. Legal charity and official charity, where they exist, are comprised under the term *public charity*; but this latter can exist without either legal or official charity. The state may aid, without being obliged by law to do so, purely private charitable institutions, as for instance, mutual aid societies, etc. When the funds destined for purposes of public charity are obtained by means of taxes levied expressly for that object, such taxes are called the *poor tax*.—The word *poverty* expresses but a relative idea. The poor are, in all countries, the class subject to the greatest privation. On the other hand, the words indigence and indigent express an absolute idea, viz., that degree of poverty which implies the deprivation of things necessary to existence, and implies consequently the need of charitable assistance.—By *misery* we mean the poverty

which, grown permanent through the permanent causes that engender it, generally produces absolute indigence and manifests itself in the poor by a characteristic number of physical and moral habits. We reserve the word *pauperism* for that kind of misery which, being produced by general causes, constitutes the normal condition of whole classes of individuals.—II. In all nations whose history is known to us, wealth has been unequally distributed, and consequently there have been rich and poor. Poverty is, therefore, a universal fact. This is not the case with indigence, nor misery, and especially not with pauperism. Both historically and in theory, indigence is a product of charity. That a number of families incapable of procuring the means of subsistence strictly necessary to life by their own efforts might exist, it was imperative that a portion of the revenue of the rich should first have been distributed to poor people by public or private charity.—Let us imagine a primitive nation, in which no religious, moral or political motive has awakened the liberality of the rich toward the poor, and in which, consequently, the poor do not rely upon any generosity on the part of the rich or on the part of the ruler who governs them. Indigence in such a country would be dreaded as much as pestilence or any other affliction, since it would be a no less certain cause of suffering and death. Hence all the powers of the poor man would tend to the one end: the preservation of the means of subsistence which he possessed. If his labor no longer suffices to support him, inevitable and speedy destruction threatens him. Feeble or timid, he dies of misery; strong and courageous, he has recourse to theft, to brigandage, and soon meets with a violent death. In any case, his terrible fate is an exceptional fact which strikes with fear all who might possibly meet with a similar one, and which prevents the propagation of the scourge. Under such circumstances indigence can not exist as a social disease and as such attract the attention of the legislator. The western political communities of ancient times were organized in a manner that excluded indigence and misery; the poor in such communities were not isolated and abandoned to themselves; they were grouped around the rich in large numbers, in the family by the bonds of slavery, in the city by those of patron and client. The master had an interest in the preservation of his slaves who constituted his wealth; and the patron had an interest in ensuring the well being of his clients whose numbers and good will were his power in the city. It was only after the bonds which grouped the poor around the rich had been slackened, and an independent plebeian class devoted to trade or to the mechanic arts had by degrees sprung up in the cities, that misery, that is, extreme and permanent poverty, manifested itself; then they obtained from the wealthy, either by selling them their votes or exciting their pity, regular bounties, and this soon raised indigence, followed by mendicity, to the rank of

normal facts, of organic and henceforth incurable affections of the social body.—Although the polytheism of the Greeks and the Romans did not make almsgiving a religious duty, private charity, with its abuses, soon introduced itself among them. Plautus, who wrote during the third century before the Christian era, and who only copied the Greek comedians, places in the mouth of one of his personages (*Fruumus*) this entirely Malthusian sentence: *De mendicis male meretur qui ei dat quod edet aut quod bibat; nam et illud quod dat perdidit, et illi producit ad vitam miseriam.*¹—In the east, on the contrary, religion made charity a positive duty. The sacred books of the Hindoos, the Persians and the Jews went so far as to prescribe the amount of alms the wealthy should give the poor. The Koran, without prescribing a minimum, lays down in several places the religious precepts concerning charity. Thus indigence and mendicity attained in the eastern nations a development against which only the unchangeable organization of theocratic nations was capable of resisting.—Christianity—which is superior to other religions in this, that it makes a religious duty of everything which can inspire love for one's neighbor, but which none the less recommends almsgiving as a chief manifestation of such love, as an essential form and fruit of charity—caused numerous institutions to be established in the Roman empire, destined for the relief of various classes of poor, while the abundant alms distributed by monasteries and the clergy gave to the increase of mendicity an impulse the effects of which are still visible in several countries of modern Europe.—Nevertheless, neither ancient nations nor those of the middle ages were acquainted with pauperism, that form of misery which extends to entire classes of the population and becomes their normal condition, by reason of the causes which favor the increase of wealth and the growth of general prosperity. In former times the poor were grouped around the rich, the working classes around property, in such a manner as to prevent the formation of a proletariat, that is to say, of an independent working class, subject by their very independence to the immediate and constant action of the laws which regulate the distribution of wealth.—Under the successors of Constantine, at a time when indigence was already very widespread, and had, on more than one occasion, called for the interference of the legislator, we find that the laws destined to remedy the evil contained striking proofs of the influence which was still exercised by slavery still present in Roman society at the time of the downfall of the empire, and by the serfdom which tended little by little to replace it. In a constitution, of which Justinian has preserved a fragment, the emperors Gratian, Valentinian and Theodosius proposed to put an end to the abuse of mendicity. Did they intend, in or-

¹ He deserves ill of the mendicant who gives him to eat and to drink; because what is given is thus lost, and it perpetuates his misery.

der to attain this object, to establish workhouses, asylums, home assistance; in one word, to practice public charity? They simply decreed that able-bodied mendicants should be arrested; that if slaves, they should be returned to their masters; and that those who were free should be reduced to slavery. Later, slavery was replaced by servitude in the case of the agricultural poor and by trades corporations and political and religious confraternities in the case of city poor. The poor man who did not find admission into any of these groups, ceased to belong to any class of workmen whatever, and in some sense to society itself. Mendicity or brigandage then became his only resources; and mendicity, practiced on a large scale, as an industry, so to speak, as the only expedient of large numbers of the poor, often assumed the character of brigandage. We have all heard of those organized bands of mendicants, who under different names, appeared in former times, in the large cities in Europe, and went from country to country, carrying with them their vulgar cunning and disgusting manners. But this wretched condition of whole multitudes whom industry had cast away from it, differs essentially from pauperism, which attacks the working classes even in the centres of industry, of the very industry which had attracted them thither.—The dissolution of ancient social groups, the emancipation of agricultural and industrial laborers, alone could give birth to the proletariat and with it to pauperism; but it is only since the commencement of the present century that this scourge has, in some countries, assumed alarming proportions. A system which, by giving every workman the liberty to choose his trade, to change it at will, to offer his labor to whomsoever he pleases and at what price he will, and which leaves him, at the same time, exposed to all the effects of competition and to all the chances of life, good and bad, could not help sooner or later, under the force of certain circumstances, but create, in the general condition of the poorest among the working class of a country or some certain industry, a lamentable crisis, marked by a temporary interruption of the demand for labor or by an exceptional lowering of wages. The advantages of this system to society in general, and also to the laboring classes taken as a body, are immense and incontestable. Often even the immediate cause of partial or temporary crises which produce pauperism are conquests made by industry, absolute progress, the proximate and definitive result of which proves beneficial to the poor working classes and ameliorates their condition. But the suffering inseparable from distress which extends to hundreds, perhaps to thousands, of families, were this distress to last but a few days, is none the less cruel and felt none the less by those who experience it.—Legislators, statesmen and writers have not waited for this last phase of the development of poverty in order to busy themselves, some actively, others theoretically, with the lot of the poorer classes, and to devise means by which

to render it more tolerable. Misery and mendicity, these two old and open wounds of the social body, produced by the imprudent, thoughtless or abusive liberality of private charity, have raised grave questions in the solution of which, religion, public peace, humanity and morality are equally interested.—The necessity of a solution of these questions was felt more than ever at the time of the reformation, when the suppression of a great number of monasteries and the secularization of a considerable part of the property of the church had, if not exhausted, at least turned into other channels, the former abundant gifts of private charity, and when a disastrous and prolonged war, in which all the nations of Europe were more or less involved, had destroyed or consumed unproductively the capital accumulated by preceding generations. Hence the most important law that was ever passed for the relief of the poor, dates from the end of the sixteenth century. We refer to the famous statute of queen Elizabeth, which introduced simultaneously into England legal charity, and the poor tax, by imposing on each parish the obligation of relieving its disabled poor and of furnishing its able-bodied poor with work.—After this period no book treating of natural law, public law or political economy has been published in which the question of poverty has not been discussed more or less completely, and there is scarcely one of the numerous solutions proposed which has not been tried by some nation or other. Public charity like poverty has become a universal fact, a social necessity which is no longer a matter of discussion, although many of those who admit it consider it an evil, and do not think themselves bound to tolerate it except within certain limits and under certain forms.—III. A question properly put, is half solved. It is because the questions relating to charity have nearly always been incorrectly put, that they have received so many different or contradictory answers, and that they have appeared insoluble to so many otherwise enlightened minds.—It is not the business of the economist to investigate what should be done by a humane and Christian nation, in which indigence, misery and pauperism are found in any degree, nor to lay down a rule of conduct for the legislators who govern such a nation. Such a question far exceeds the limits of political economy. Many and grave motives perfectly foreign to this science may counterbalance those borrowed from it, and justify laws or measures which are contrary to the principles of political economy. We do not affirm that it is generally or always so; we simply maintain that it does not come within the province of political economy to weigh and judge of motives which are foreign to it, and to decide in what case these motives should prevail.—Poverty in all its forms is an economic phenomenon; a phenomenon of the distribution of social wealth. What are the laws or the general causes governing this phenomenon? These laws once known, what is the effect, on the distribution of social

wealth, of a proposed institution, of a proposed system of assistance or charitable act? Such are the terms in which the questions relative to poverty are formulated in political economy. Political economy can and must be able to say whether such or such a law, such or such a measure, having for its object to remedy indigence, misery or pauperism, under certain given circumstances, will attain its object fully or in part. Its domain reaches thus far and no further.—It is then without any kind of foundation, and because of the strangest confusion of ideas, that political economy has so often been accused of being inhuman, cruel and unmerciful, as if it were responsible for the evils it explains or foresees, for the evils the effects of which it investigates and the causes of which it lays bare. We might with as much reason reproach medical science with seeking and enumerating the disastrous results of certain diseases, certain organic defects, certain accidents to which the poor are particularly exposed. If it should happen that the application of an economic principle became really inhuman and barbarous, the fault would not be with the science but with those who had applied it without discretion, and without having weighed beforehand the considerations or the facts by which the principle should have been modified. And then, where are the principles of our science, at least among those we recognize as true, which do not tend toward the improvement of the condition of men, poor or rich, and notably of the working class? Political economy, our readers will soon be convinced, teaches nothing that can alarm an intelligent philanthropist. Let us begin by searching for the law of the phenomenon.—Indigence, misery, pauperism, the only forms of poverty that can be considered as absolute evils, manifest themselves only in one class of society, in that of the working class, who depend upon their work for a livelihood, because they possess no other source of revenue, or because they possess it in an insufficient measure. Now, in the case of the individuals of this class indigence may result either from their not having worked in proportion to their real or artificial wants, or from the fact that the price of their labor is not sufficient to insure them the necessities of life. Insufficiency of labor, insufficiency of wages: these are the two causes of indigence, misery and pauperism.—Insufficiency of labor may result from the poor having left their work to satisfy artificial wants, from their misbehavior or from accidents independent of their will. In all of these cases the poor have been wanting in foresight. Knowing what his labor could bring him, and what would be required for the satisfaction of his most indispensable wants, knowing also that human weakness exposed him to infirmities of different kinds, that is to say, to forced interruptions of work, he has not fixed beforehand the quantity of his work and the quantity of his outlay, in accordance with these data, which, in a great part, can be easily and certainly determined.—As to the

insufficiency of wages, it results invariably from the competition of the workmen themselves; in other words, from the too large supply of labor compared with the demand, or with the quantity of disposable productive capital. This excess in the supply of labor may result from the fact that the number has increased more rapidly than productive capital; and then it evidently has as its first cause, the improvidence of the class who depend on their labor for a livelihood, and who ought to have foreseen that by increasing their numbers they would destroy the equilibrium between their income and their wants. The excess may also result, it is true, in a given place or in a given industry, from the fact that a portion of the capital employed has become unproductive, or that it has changed form or destination. For instance, a commercial outlet has been closed; a rival industry has received an unexpected development; the capital, formerly employed in the remuneration of human labor, has been invested in costly machinery. The very increase of wages has a manifest tendency to provoke these different changes in the employment, and consequently in the distribution of capital. But as these changes are nearly always local and temporary, as they do not necessarily involve an absolute diminution in the amount of productive capital employed in the country, and as they frequently have for effect a more rapid accumulation of this same capital, they can plunge only improvident workmen into indigence, workmen who, in their economic life, had not taken any account of future contingencies. Improvidence is, therefore, the first and radical cause of misery and pauperism. Destroy this root—do away with this aggregate of vicious habits, of wrong calculations and thoughtless actions which may be expressed by the word *improvidence*—and you at once do away with all three evils. The duty of foresight, like all duties, needs a sanction, and, in the natural order of things, this sanction is not wanting to it. It is the responsibility weighing upon every family, the concatenation of causes and effects which condemn the improvident workman to suffering in his own person or in the persons of the members of his family; it is misery, the menaces of which are ever sounding in the ears of the needy, and which is always at his heels, ready to make him atone by privation, by physical and moral suffering, for the least idleness, the least vicious habit.—What are the means of weakening this responsibility and of neutralizing the sanction resulting therefrom? They would consist in breaking the chain which connects effects with their causes; in so arranging it that destitution, privation and disease should no longer be to the poor the natural consequences of an insufficiency of work or of an insufficiency of wages. Such, in fact, is the part played by charity, both private and public, when it takes upon itself the task of assisting the indigent and alleviating misery. This is the end toward which all its works

tend, whether it relieves the poor from the care of providing for and educating their children; whether it provides for the wants of those who, either by sickness or old age, have been rendered incapable of working; whether it distributes assistance, under one form or another, to those whose labor can find no market or is insufficiently remunerated. The practice of charity is incompatible with complete responsibility on the part of the poor, that is to say, with the complete sanction of the duty of foresight, and this sanction must exist in direct proportion to the degree of activity displayed by charity and to the extent of its labors. This truth is too evident to be dwelt on longer. Assistance and responsibility are two ideas which mutually exclude each other, the one being implicitly the negation of the other. Can charity replace responsibility in such a manner as to render it superfluous? In other words, can charity by providing for the wants of all the indigent and relieving all misery, relieve the poor of the duty of foresight? It might if indigence were susceptible of assignable limits; if it had a determinable maximum which it could never exceed, and which itself could not exceed the means at the disposal of charity. But it is not so, at least not as a rule. Let 100 represent the actual wants of indigence at a given period and in a given place. If charity provides entirely for the wants of the indigent, the encouragement it gives to improvidence will be felt by the entire class of the non-assisted poor, the unknown number of whom is perhaps a hundred times that of the actually indigent; and therefore improvidence will unceasingly tend to increase as a consequence of the very guarantees given it against the fatal results of its growth. Thus, an amount of assistance equal to 100 will have as its result, beginning with the next year, to increase the amount of wants perhaps to 200, perhaps to 500 or even 1,000, while the ulterior increase will have no assignable limit, so long as the amount of charity is capable of augmenting in proportion.—Still another cause accelerates the increase of indigence. Whatever may be the immediate source of the assistance distributed by charity, it is always levied upon the revenues of the country. Whether the charity takes the form of contributions, or some other form, the assistance given is subtracted from the savings which have been made, and the power of saving and capitalizing has been diminished by so much. Consequently, in proportion as the amount of assistance given increases, it will absorb a greater part of the funds which were destined to replace or to increase the capital consumed in production, of the funds which represent the present and future demand for labor, the support of workmen and of those who will succeed them. Of course we must suppose that charity will first be practiced at the expense of unproductive consumption; and as charity can only substitute for such consumption other unproductive consumption, the condition, on the whole, of non-assisted workmen will

not be changed. Whether a portion of our revenue be devoted to the satisfaction of wants of luxury, or used to procure the bare necessities of life for the poor, it must in any case be exchanged for the products of labor. But it is impossible that charity, gradually extending its work, should not end by reaching the funds destined for reproductive consumption; and then it can not concern itself for the assisted poor, except at the expense of the unassisted; the work or help it provides for some is taken from others; it then reduces to indigence a number equal to that which it relieves.—Such are the laws of political economy governing the subject under discussion. It is easy to deduce from them the solution of the questions connected with this subject. The general effect of charity is to increase the improvidence of the poor, and consequently to produce indigence, misery and pauperism; to insure the increase in the future of present evils; in fine, to render more and more pernicious, and more incurable the disease of which it partially attenuates the ravages.—How does charity produce this effect? By lessening the individual responsibility of the poor and the sanction resulting therefrom; by engendering in them an expectation contrary to this sanction, contrary to the natural concatenation of causes and effects, that is to say, to the natural course of things.—Thus, the more general and well founded this expectation, the greater will these effects be, since the intensity of a cause is the exact measure of the action of that cause. This principle furnishes us with a criterion for judging, from the strictly economical point of view, the different modes of the practice of charity.—The expectation in question rests either upon declarations or upon presumptions; it is better founded the more explicit the declarations and the stronger the presumptions; and it is all the more general the more such declarations and presumptions are notorious and of a wide application.—No declaration could be more explicit, more notorious, nor wider in its application, than the law imposing upon the state or upon the provinces the formal obligation to assist all the indigent within their limits, thus creating for the poor a positive right to assistance. Legal charity is, therefore, the most vicious of all the modes of assistance, for it is the system which produces the best founded and most general expectation of assistance, especially when it is combined, as in England, with the poor tax, when to the absolute right of the indigent corresponds an unlimited burden to the nation.—At the other extreme we find private charity, less mischievous in so far as it is practiced individually and with the discretion and prudence characteristic of true charity. The expectation of assistance it gives rise to rests merely on a presumption, and this presumption is, of all its kind, the weakest, the least notorious, the least susceptible of extended application: the least strong, since, from the fact that an individual has done an act of charity to-day, it can not be inferred that he will always

perform charitable acts, nor even that he will do so again, nor that any other person will feel disposed to imitate his example; the least notorious, because private individual charity avoids publicity from interest if not from duty; lastly, the least susceptible of an extended application, because this charity reaches only chosen poor and those belonging to one limited locality.—Between these two opposite extremes may be placed and grouped all the other forms of charity, forms more or less pernicious, according as they approach nearer to legal charity or private charity; they all participate to some extent in the inconveniences which attach to the very principle of charity. We shall limit ourselves to a brief enumeration of the most characteristic of these forms.—Almsgiving begets mendicity, and mendicity in turn begets almsgiving. Almsgiving and mendicity, once they have become a habit, tend to become more and more frequent; the two habits support one another. To prevent almsgiving is an impossibility; to repress mendicity is a little less difficult; but this repression is always costly and it can never become efficacious except with the aid of institutions which approach very near to legal charity. Hospitals and houses of refuge must be established for the sick or infirm poor; work and shelter must be provided for the able-bodied poor, were it only in a house of correction or a prison. Hospitals are commonly considered altogether inoffensive, because they serve as a refuge for a kind of indigence the causes of which do not naturally tend to increase. This is an error. It must not be forgotten that these causes are among the contingencies which stimulate the poor to foresight, and that from the moment these stimulants are neutralized, the number of poor families which fall into indigence through any of the causes connected with insufficiency of labor or insufficiency of wages necessarily increases. The poor man will not become sick voluntarily so as to avail himself of the assistance a hospital affords, but he will make fewer efforts to avert from himself and from the other members of his family these ever imminent calamities, and, as a general rule, he will occupy himself less with providing for contingent future wants.—With respect to the institutions destined to afford labor and shelter to the able-bodied poor, the expectations they engender are all the greater the more completely they provide for the wants of the indigent and the easier the terms are which they impose. These institutions can not, therefore, neutralize this expectation unless they assume a penal character; and the less they have of the penal character the less will the expectation of assistance be neutralized, and consequently the less will the scourge of indigence and misery meet with opposition.—Official charity has always the inconvenience of causing a very strong presumption of assistance, thus creating a general expectation of relief. We may say the same of collective private charity practiced by permanent organized associations.—The principles we have exposed

may be easily applied to all other forms of public or private charity.—IV. It may happen—and some such instances are known to us—that all the indigent of a locality may be assisted, and amply too, and yet their number not increase from year to year. We once visited a commune in Switzerland in which there was neither mendicity nor misery. Upon asking whether indigence was wholly unknown in the canton we were shown a large house in which about a hundred persons of both sexes, young and old, were supported in a condition of comfort that would excite the envy of the poor of other countries. Here is the explanation of the phenomenon.—In the country just mentioned each commune being obliged to assist its own poor, mendicants not belonging to it are pitilessly ordered to leave it. The commune in question is one of the richest in the land, and is besides an agricultural one in which property is very widely distributed, so that the middle class comprised all the inhabitants with the exception of some hundred poor, who, thanks to the influence of legal authority, had all fallen into indigence. The plague had stopped there for the last two generations, and although the assisted families had somewhat increased, the fund destined for their maintenance had amply sufficed till then to keep them. We must not be surprised at the fact that the middle class escaped the demoralizing influence of legal charity; this is a general fact, although it would naturally occur on a larger scale among the inhabitants under the circumstances we have described. In all nations advanced in civilization the help of charity implies for the man of the middle class who is its recipient an absolute forfeiture of social position to which death is not seldom preferred. Hence the horror inspired by indigence is not lessened and the stimulant resulting therefrom is not neutralized, in the case of this class, by any charitable institution nor by any hope of assistance however well founded and general we may suppose it. This fact explains how the principle of legal charity could be adopted and practiced in England during more than two centuries without completely ruining the country; it is this fact, too, which establishes that there is an essential difference between the principle of legal charity and that of the *right to labor*. The most rugged nation would not long resist the application of this last principle; and yet the law which would apply it might be framed in about the same terms as the statute of queen Elizabeth.—Legal charity none the less contains a germ whose development sooner or later brings grave dangers to the social body. Under the influence of this principle the number of the indigents constantly increased in England and the *poor tax* had reached the exorbitant sum of \$33,957,995 for a population of 13,894,574 inhabitants, which is more than \$2.50 a head. There were districts in which misery had reached such proportions that farmers unable to bear the burden of the poor tax gave up their leases; the land did not pay the cost of cultiva-

tion, and the able-bodied population was left without work or wages. The obligation imposed upon parishes to find work for the able-bodied poor and to take care of the infirm, of abandoned children, in fact, of all those who were not in a position to gain a livelihood by their labor, had the effect of a bounty paid to improvidence, and acted as an encouragement to idleness, to early marriage, to the increase of poor families. Such is the substance of the investigation made by order of the British parliament in 1833.—The system of legal charity does not exist in England only. It is found in Sweden, Norway, Denmark, Holland, Belgium, in all the states of Germany, in a great part of Scotland, Switzerland, and the United States. France had kept free from this economic error until 1789; she again abandoned the system in 1814 only to fall into the error again in 1848, the constitution of that year (preamble § vii. and article xiii.) making it a duty of the state to furnish labor to able-bodied indigent people and to assist the indigent sick.—Moreover, the countries where legal charity was not adopted, none the less practiced public charity, and in some of them, notably in France, this was done on a very large scale. What has been the result of public charity in all these cases? Has it put an end to indigence, done away with misery, or remedied pauperism? It has not. On the contrary, everywhere the increase in the number of the indigent has been more rapid, in proportion as charity, private or public, showed itself more generous and active.—Public charity moves in a vicious circle from which it can not possibly escape; it creates an expectation of assistance which it can not satisfy; finally, it tries to render this expectation illusory so as to diminish the burden with which it has rashly loaded itself.—Can it be said that these results are owing to the mode of administration of public charity rather than to the system? These modes of administration have all been tried and they have all had the same result. We refer to the innumerable facts which have been collected in many modern works, especially to a *mémoire* crowned in 1835 by the French academy of moral and political sciences, and which has been since published by its author, M. Naville of Geneva, under the title of *De la charité légale*. M. Naville proves by facts and figures which can not be disputed, that all the modes of practicing public charity, and especially workhouses and agricultural colonies from which such happy results had been anticipated, have been inadequate to remove the plagues of misery and of pauperism. After having partially attained their object, after having been prosperous for some years, the best organized establishments break down, because not able to meet the very demands to which they give rise. Hospitals, poorhouses, workhouses and generally all charitable institutions intended for a special class of indigents only, or which have not been established to help the poor indiscriminately, may exist and in fact do exist, much longer; we know of some cen-

turies old; but their duration is owing to the fact that the assistance they afforded was limited and consequently incomplete and insufficient. With them, and even side by side with them, are found deep-rooted misery and indigence, a misery and an indigence more widespread probably than they would have been had these charitable institutions not been established. Besides, if by availing themselves of public charity, the poor do not altogether forfeit all right to social consideration, their feeling of honor is lost, because public charity has a humiliating effect. Now what is the difference between refusing relief altogether and giving it in a manner that renders it unacceptable?—Thus the facts which at first sight seem to contradict our theory are explained by it and confirm it. Not a single case has come under our observation which does not corroborate our statements. From the moment that public charity becomes regular and notorious it becomes injurious, not only to society as a whole but to the poor in particular; injurious to those it assists and to those it does not assist; injurious both morally and physically; injurious even in proportion to the liberality of its intentions and to the means it employs. If public charity were not condemned by political economy, it should be condemned by philanthropy.—V. The ideas we have here developed are the same as those of the majority of English and Scotch economists of any reputation who have either written general treatises on political economy or who have devoted special attention to the subject under discussion. Adam Smith, Ricardo, Malthus, Chalmers, Mac Farland, Townsend, and several other authors not so well known, have demonstrated (or have expressly laid it down as already demonstrated) that the tendency of state charity is to increase indigence, misery and pauperism because of its influence on the moral character of the poor.—On the continent of Europe the subject has never been looked at from a proper standpoint. It has been made a question of morals or of politics, we might almost say of theology; the *duty* of society to the poor has been the sole thought of writers, as if before discovering what society *should* do it were not necessary to see what it *can* do!—German and Italian economists do not concern themselves with legal charity except to point out the best means to promote the practice of such charity by the state, as an end; they do not even think of denying the propriety and absolute legitimacy of public charity; whereas it is precisely in its end that charity sins, and because of its end that it must be condemned.—Have French economists better understood and better treated the question? J. B. Say, in his *Cours complet*, scarcely devotes ten pages to it. And this lucid writer does not see in the result of English legislation on the subject of the poor, anything but a local experience, containing no fruitful principle and no general lesson. According to Say everything depends upon the nature of the means employed, and upon the political character of the institutions

of the country in which the relief is afforded.—Duchâtel, in his work on charity, gives a very clear exposition of the causes of misery and of the fatal tendencies of legal charity; but after thus entering upon the right path, he stops midway and admits that governments can do charity without danger, in the case of indigence resulting from causes which man can neither prevent nor foresee; he even makes it the duty of the state to assist the poor *whenever prudence or charity do not suffice to prevent or to relieve indigence*.¹ “These words,” Naville justly remarks, “might be written upon the banner of legal charity; the most declared partisans of the system hold no other language.”—What shall we say of writers not economists, such as de Morogues, de Ville-neuve, de Gérando, Thiers, Dufau, etc., who have especially busied themselves with the question? From the moment that it is tacitly or expressly admitted as a dogma that the state must do charity, and that it can do so without producing more evil than good, we do not deny that there are a thousand means of relieving actual misery, at least partially.—Baron de Gérando, in his work so replete with science and warm philanthropy, while he admits that *public charity is a duty*, does not admit the correlative right of the indigent; and he is of opinion that if public charity has sometimes a dangerous tendency, it can have such a tendency only in a country in which such a right is publicly proclaimed or expressly recognized. This is evidently an error; the danger of public charity consists in that it creates an expectation of relief. Undoubtedly the expectation is greater where the right to public charity is recognized, but it exists independently of such right and of any explicit declaration; to create this expectation it suffices for the state to perform acts of charity at its own cost. Even private charity, as we have shown, is not free from this inconvenience when it is practiced collectively or in the form of alms.—M. Thiers sums up his opinion in the following terms: “The state, like the individual, should be charitable; but like the individual, it must be so of its own free will, and, moreover, it must be so in a prudent manner; and it is not to assure it the means of giving less or giving little that we assign these limits to it; it is with the object of saving the nation’s wealth which belongs to the poor more than to the rich; it is to keep up the duty of labor for every one, and to prevent the vices of idleness, which, with the multitude, easily become dangerous and even atrocious. But the state, free and prudent in its liberty, must not be parsimonious in doing charity. Just as the state tends toward everything great and beautiful by its taste for the great and beautiful; just as it erects magnificent monuments to excite the admiration of men, as it sacrifices the blood of its soldiers to preserve to the nation its reputation for heroism; so will the

state practice charity in order to win universal esteem. We shall not allow our cities to be the haunts of misery or vice; the state should try to diminish the amount of suffering by the love of the good which should equal its love for the great and the beautiful. The state should be as proud to spare strangers the sight of beggars dying of hunger, as to exhibit to them the monuments of art and of glory, the column of Vendôme or the Hotel des Invalides. The state, in a word, will be a good man when led by the same impulses as a good man, namely by the love for the good and the beautiful; and being good it will be just and wise. Such are the only true principles in the matter of charity.”—We have transcribed in full this strange passage because it very well explains why M. Thiers always professed to ignore and to deny political economy. M. Thiers, in order to be consistent with himself must deny a great many things besides. Still arithmetic because denied and ignored by spendthrifts is none the less positive. The state must be *prudent and largely charitable* at the same time. But if prudence excludes public charity altogether, what then? The state must be *charitable for the love of the good*. But what if charity necessarily ends in producing more evil than good?—VI. Political economy is not the only science which must find application in the conduct of states; it furnishes some directing principles but not absolute principles. It therefore does not come within the province of economists to draw up a plan of legislation on the poor. What it teaches in this respect may be modified by many considerations drawn either from other moral and political sciences or from local and temporary circumstances. All that can be asked of us is to give a solution of the problem of misery in accordance with political economy, to point out what are the means economically proper to relieve indigence. This is what we purpose to do in a few words.—The state should neither practice public charity nor interfere with the exercise of private charity. The want in question is one of those which society can not satisfy except by itself, by the free development of its productive powers and of its moral faculties. Left to its own inspiration, society would not be slow to perceive that if charity is to be efficacious; if it is not to become an encouragement to idleness, vice and fraud; if it is not to provoke an imprudent increase of the poor class, it must adopt certain principles and impose upon itself certain duties, which may be set forth thus: 1. Charity must combat *the causes of indigence*, namely *prevent* them, at the same time that it endeavors to relieve indigence itself. It should strive to destroy, not to relieve it. It must be at once *preventive and subventive*, but it should above all and always be *preventive*, since subvention has limits while prevention has none. 2. Purely preventive charity may be practiced collectively by establishing, for instance, savings banks, mutual aid societies, and other similar institutions. 3. Charity both preventive and sub-

¹ *Considérations d'économie politique sur la bienfaisance, ou de la charité*, par F. Duchâtel, ministre du commerce.

ventive should be practiced individually at least in so far as the application of relief itself is concerned; its action should have as its permanent and principal aim the improvement of the moral character of the indigent, and, as far as possible, consider their position rather than the satisfaction of their material wants and the saving them from present privation. 4. Charity can not be efficacious and its works will not really abolish misery and prevent indigence unless it is ever and before all, charitable, that is to say, the result of benevolence and love and not of ostentation or of contemptuous pity; unless it is affectionate in its forms, patient and active as well as firm and vigilant; unless, in fine, it employs in the attainment of its object that personal action, that natural patronage practiced by every man, when he will, on those who stand in need of him. Such would be charity according to political economy.

A. E. CHERBULIEZ.

CHASE, Salmon Portland, was born at Cornish, N. H., Jan. 13, 1808, and died at New York, May 7, 1873. He was graduated at Dartmouth in 1826, and admitted to the bar in Ohio, in 1830. In politics he was a democrat, but took part with the liberty party (see *ABOLITION*, II.) until 1848, when he joined the free soil party. He served as United States senator, having been elected by a coalition of democrats and free soilers, 1849-55, was governor of Ohio 1856-60 (republican), was secretary of the treasury under Lincoln 1861-4 (see *ADMINISTRATIONS*, XIX.), and chief justice of the U. S. supreme court 1864-73. (See *IMPEACHMENTS*, VI.) In 1868 his name was before the democratic national convention for the presidency, but he refused to so modify the expression of his political principles as to conciliate the majority of the convention. He prepared, and allowed to be published, a statement of his own views of democratic principles, all points of which would have been acceptable to all the convention, excepting the first half of the first paragraph, which was as follows: "Universal suffrage is a democratic principle, the application of which is to be left, under the constitution of the United States, to the states themselves * * * * *". This so-called "Chase platform," therefore, would have committed the democratic party to the acceptance and maintenance of negro suffrage in the south, coupled with general amnesty and restoration of all the political and police rights of the southern states. (See *DEMOCRATIC PARTY*, VI.)—See *Warden's Life of Chase*; *Bartlett's Presidential Candidates of 1860*, 95-117; *Schuckers' Life of Chase*, (the "Chase platform" is at p 567). A. J.

CHECKS AND BALANCES. This term of modern political language finds a place only in the vocabulary of mixed governments, and even, more properly speaking, only of free governments. It is applied to the equilibrium which, for the proper conduct of public affairs and the liberty

of the citizen, should be established between the different powers by means of the constitutional definition of their rights and the limitation of their functions.—A distribution of powers is to be met with, to a greater or less degree, in all governments which are not based upon the autocratic principle. For if certain classes of the citizens are oppressed by discriminating laws and exposed to penalties not pronounced by judicial magistrates; if the peers, instead of being placed under the régime of law, can be attacked by administrative decrees; if the nation does not enjoy full liberty of representation, all powers are confused and the country is deprived of the most essential guarantees of its liberty.—We must, therefore, regard the proper separation of powers as the first condition of liberty, and the just equilibrium of power as the only means of preventing liberty from degenerating into license and anarchy, or from being destroyed by despotism.—There are in every state three classes of powers: the legislative power, the executive power, and the judicial power. The first two, the political powers, are those whose functions are the most difficult to separate; their relations are the most delicate, and their action, now independent and now of necessity concurrent, is variously regulated and limited according as the constitution tends to extend or confine the prerogatives of the executive, and according as in the formation of the legislative power the aristocratic or the democratic element predominates, or a just balance between the two obtains. The judicial power, charged with the application of the laws, the settlement of differences between individuals, and the punishment of offenses and crimes against persons or the state, ought to be made completely independent of the legislative power, which is easily done, and as independent as possible of the executive power, a result of more difficult attainment. At all events, the principle of the necessity of a separation between the judicial power and that of making and administering the laws, is generally accepted and generally respected, except where mere arbitrary power prevails; were this principle not recognized, all notion, all possibility, of a just balance between the powers confounded, or separated by fictitious lines of demarcation, would be virtually done away with. We need, therefore, consider here only the conditions necessary for the maintenance of an equilibrium between the legislative power and the executive power. These conditions can not be the same in a monarchy and in a republic; and representative government admits equally of both forms. Montesquieu thinks that England drew from the Germania of Tacitus the idea of the institutions to which she owes her stability, her wealth and her greatness.¹ Whatever may have been the origin and the successive transformations of mixed government, to England belongs the honor, an honor which can not be disputed her, of having been the first to establish representative govern-

¹ *Esprit des lois*, book xi. chap. vi.

ment on its true foundations; all the countries of the world which desired to become free have imitated her more or less. But every country has been able and has been obliged to preserve or introduce in its own constitution differences which its customs or genius made advisable or necessary.—Thus the United States organized themselves as a republic, and modern France has not been able, and never will be able, without danger, to abandon the great principles of 1789.—It does not fall within the limits of our subject to examine and compare, still less to judge, the various forms of representative government. We shall not undertake to set forth and discuss the means of equilibrium best adapted to secure a just distribution of powers under each of these forms of government. We will suppose, then, a representative government existing in the form and under the conditions that most frequently occur, that is, an executive power in the hands of an hereditary sovereign, and two chambers (whatever be the method of their election or nomination) sharing the legislative power with the head of the state. Peace, war, treaties and international relations belong to the powers of the sovereign. The courts render their decrees in his name, and he sees to their execution: he has the appointment to military and civil offices, but he governs by the delegation of his powers to responsible ministers; he has no power to dispose by treaty of any part of the public territory or treasure, nor can he make war without having the necessary grants from the representatives of the country. If the policy pursued by the executive ceases to have the support of the chambers, if the representatives of the country manifest their distrust and refuse their concurrence, the sovereign appeals to the electoral body by dissolving the elective chamber, or he changes his ministers, who may be brought to trial, in cases and by forms regulated by law; he himself remains irresponsible and inviolable. The opponents of representative government attack it particularly by arguments of fact drawn from revolutions which overthrew thrones in vain protected by a vicarious responsibility which was not even invoked, and by an inviolability which was not respected. Ministerial responsibility having failed to save the monarchy, it has been attempted to infer, not only that it is a useless fiction, but that it is even dangerous, the sovereign being too dependent on the chambers when the latter have the power, so to speak, to dictate to him the choice of his advisers.—An attempt has been made to go even further than the suppression of ministerial responsibility, and to conceive of the personal responsibility of the sovereign before the nation. Now though it is easy to comprehend the meaning of the responsibility of the elective head of a republic, the question becomes singularly complicated when we have to consider the hereditary sovereign of a monarchical state. When, how, in whose name, and by whom could this responsibility be invoked? Who would be

the judges and where would be the sanction? There is something in this that fails to present any clear idea to the mind, something that never has been explained and probably never will be explained. Such a clause, whatever meaning we may choose to attach to it as a declaration of principles, is, therefore, destined wherever it occurs to remain, in reality, a dead letter. It is very fortunate that this is so, for can we conceive of the state of a country where the sovereign could be, we will not say brought to trial, but publicly discussed in person and conduct? We need not hesitate, therefore, to declare that, since the sovereign can not be responsible, it follows that when the ministry is not responsible, no responsibility exists anywhere.—The first condition of a balance of powers in a representative government being to place the sovereign above all attack and outside of all discussion, it has been found that the best way to accomplish this object is to subject all intervention in the affairs of government on his part to the counter-seal of a minister whose responsibility covers him.—Every act exceeding the powers of a ministerial department ought to be discussed and approved in a council of ministers, so as to unite the entire cabinet in strict community of interests. This is the very foundation of representative governments, and, this form of government once accepted, the principle of ministerial responsibility has never been called in question. Where this responsibility does not exist, the form of government, whatever its name and whatever our opinion of it, is not the true and free representative form. Such is not the case with the prerogatives of parliament, which have been more or less enlarged or restrained according to the age, the country and the customs. In treating of these prerogatives we shall only touch on the principal points: the right to vote taxes to regulate the expenditure, the right of discussion of the laws, the right of amendment, of initiative, and the right to interrogate the ministers. On each of these points we shall dwell only on that which is essential to the balance of powers.—The right to vote taxes, granted to deliberative assemblies without the right to regulate and control expenses, is only an illusory guarantee. The only effective safeguard of this double right lies in the power of the representatives of the people to modify the propositions of the budget, and in making it the duty of the executive to conform to the specification of expenditures voted, and never to undertake a new expenditure without a special appropriation by the legislative power. In speaking of the right to introduce amendments in the laws and retrenchments in the budget, a distinguished statesman has said: "The discussion of laws without the power to alter them, is only a sterile agitation. To place before the chambers the alternative of absolute rejection or adoption, is to reduce them to extreme resolutions and to destroy the spirit of compromise, which ought to be the true spirit of free countries." (History of the Consu-

late and of the Empire, vol. xviii., p. 177.)—The right of amendment, balanced by the reservation in the hands of the head of the state of the right of initiative, and of approval of laws, can not be denied the representatives of the people, (or submitted to a body composed, like a council of state, of functionaries appointable and removable by the executive power, of which power the body is, as a matter of fact, a mere delegation,) without seriously diminishing the part of the assemblies. Chambers deprived of the right of amendment are reduced to obstructing the course of the government by their resistance, or to following it with absolute docility; they are no longer, properly speaking, deliberative bodies, but advisory commissions.—We must not, in spite of certain resemblances between the two, confound the right of amendment with the right of initiative, and employ against the former objections in reality applicable only to the latter. The initiative in all matters, even in matters of legislation, may be safely left to the executive power to which it belongs to act.¹—When the majority seriously desires and resolutely demands changes in legislation, the power which possesses the initiative will not wish, nor indeed have the power, to resist long. A responsible ministry could not keep the support of a chamber to which it refused the presentation of a law decidedly required by the representatives of the country. The recollection of the embarrassments caused in legislative assemblies by the exercise of the right of initiative is still fresh in the memory of every one. When this right exists it is impossible not to grant by the rules regulating it, or at least to allow in practice, an important part to the minority. The result is that assemblies lose valuable time in examining in committee or discussing in public sessions, propositions which have not the least chance of being adopted, propositions whose object may be, whose result frequently is, a useless agitation of the public mind. But quite another thing is the right to interrogate the government or to communicate information to it on affairs and on passing events which will soon become accomplished events. In such cases the representatives of the country ought not to find in the regulations of the assembly insurmountable obstacles to the putting of their questions at the proper time to the depositaries of the executive power. The majority should be free to authorize the interrogation, the answer to which, usage, in conformity with reason, allows the ministers on their own responsibility to refuse or defer. On all the points which we have thus summarily passed in review the prerogatives of the two chambers are equal in all governments where the powers are well balanced; but the rule is almost general that the priority in voting on money grants and financial measures belongs to the

chamber of deputies, or to that body, whatever its name, which is most directly and most frequently renewed by election.—To make a law the concurrence of the two chambers and of the executive power is indispensable. Each of the chambers may reject laws presented to it, and the sovereign may refuse to approve laws which the chambers have amended. Thanks to these salutary precautions none of the three wills which must concur to change a proposed bill into a law of the state, is exposed to the danger of finding itself alone in opposition to another will. There are always two on the same side, and the third ordinarily in the end submits.—When the constitution has established between the sovereign represented by his ministers and the chambers representing the country, relations admitting of a reciprocal action of one on the other, uniting them both in a community of moral interests and responsibilities, and obliging the sovereign, not to be dependent on the legislative power, but to associate with himself in the exercise of the executive power men to whom the chambers accord their confidence and support, it becomes inevitable that the necessary moderation can not be imposed upon all parties. Concessions are made on either side. Neither of the powers probably obtains, but neither is forced to give up all that it desires. The sovereign may sometimes be embarrassed in his projects, hampered even in the good which he would like to do; but by a just compensation he is protected against more than one mistake, more than one rash impulse. Do we mean to say by this that a country is thus secured forever against revolutions? No, for all things human have their end. It is not merely dynasties and governments that pass away, societies themselves perish and peoples disappear. Human wisdom can not make anything eternal, and should confine itself to seeking the conditions most favorable to stability. History can show us no government that fell for having made timely concessions, but more than one has been overthrown for having resisted too long. The great advantage of representative government, honestly administered, is, that it allows public opinion to manifest itself and renders the concessions of the sovereign easy and in no wise harmful. It is, furthermore, the only government where the separation of powers can be legally and actually complete—the only one where, as proved by the example of England, the just distribution of powers, maintained quite as much if not more by political customs as by the fundamental law of the state, softens, regulates and protects the play of the institutions, and thus secures their durability.

CASIMER PÉRIER.

CHEROKEE CASE (IN U. S. HISTORY). In 1783 the territory included in the present states of Mississippi and Alabama, and the western and northern parts of Georgia, had been from time immemorial in the possession of a number of powerful Indian tribes, the most important being

¹ We deem it preferable, nevertheless, that the chambers should share the right to take the initiative with the executive power, but we think the representative ought to make only an occasional use of the right.

the Cherokees, Creeks, Choctaws and Chicasaws. The Creeks, or Muscogees, were the fiercest and most savage, and their still more savage refugees or "wild men," were afterward better known as Seminoles. In 1802 the newly erected territory of Mississippi (which then included Alabama) was entirely owned by the Indians, excepting small strips of land about Natchez and on the Tombigbee. By cessions from the Choctaws, Nov. 16, 1805, from the Creeks, Aug. 9, 1814, (as the result of Jackson's victories over them), and from the Chicasaws, Sept. 20, 1816, a great part of Mississippi and Alabama was ceded to the United States; and in the end the Choctaws, by treaty of Sept. 27, 1830, and the Creeks, by treaty of March 24, 1832, ceded all their lands east of the Mississippi in return for an equivalent area on the other side of that river.—The boundaries of the Cherokee country had been first fixed by the Hopewell treaty of Nov. 28, 1785, and modified by the Holston treaty of July 2, 1791, and by other treaties until that of Feb. 27, 1819. By the Hopewell treaty, to which the others were supplementary, the United States recognized the Cherokees as a nation, capable of making peace and war, of owning the lands within its boundaries, and of governing and punishing its own citizens by its own laws. By these treaties, which were part of the "supreme law of the land," the United States "solemnly guaranteed" (Art. 7 of the Holston treaty) to the Cherokees the lands not ceded by them; and by act of congress of March 30, 1802, the president was authorized to employ military force for the removal of all trespassers, and particularly of surveyors.—Thus given and guaranteed the right of self-government, the Cherokees had certainly made very considerable advances in civilization before the year 1824. They had formed a government closely modeled after that of the United States; had established churches, a school system, a judiciary system and national courts of law; had developed a written language and introduced printing; and were quite successful in working the gold mines in the northern part of their domain, which lay mainly within the present limits of Georgia.—The cession of western lands by Georgia, April 24, 1802, was accompanied by a stipulation that the United States should extinguish for the use of Georgia the Creek and Cherokee title to lands within the state, "as soon as it could be done peaceably and on reasonable terms;" and the federal government fulfilled its agreement. In 1808 deputations from the upper and lower Cherokees visited Washington to state the wishes of the former, who were husbandmen, to retain their location, and of the latter, who were hunters, to remove beyond the Mississippi. Accordingly, by the treaty of July 8, 1817, a tract of land of equivalent size beyond the Mississippi was granted to the lower Cherokees in exchange for their lands in Georgia. By this treaty and eight other treaties concluded with the Cherokees, and by four treaties with the Creeks,

all concluded between 1802 and 1819, the United States had acquired about 15,000,000 acres of Georgia, leaving about 5,000,000 acres in possession of the Cherokees and about 4,000,000 acres in possession of the Creeks.—In 1819 the Georgia legislature, impatient of the probably permanent continuance of the upper Cherokees in the state, memorialized the president for the complete fulfillment of the agreement of 1802. But the remaining Cherokees, who were now homogeneous in their tastes and tribal character, utterly refused to consider the matter of further cessions, and declared their intention to remain where they now were; and the more savage Creeks, at the Tuckebatchee council, May 25, 1824, after emphatically announcing their resolution not to sell one foot of their land in future, denounced the punishment of death by shooting or hanging against any chief who should disobey the national will. It was therefore impossible to obtain any further cessions of land by treaties with the Indians in their national capacity. It was equally impossible by the natural operations of bargain and sale of land to white immigrants; for, by Creek and Cherokee law, recognized by section 12 of the act of March 30, 1802, the land of the whole district was the property of the whole nation, and no individual held in severalty or had the power of alienation. By the presence within her borders of two exceptionally able and intelligent Indian nations, the state of Georgia was thus threatened with the permanent establishment of an *imperium in imperio* over which state laws did not operate, a district of refuge within which any criminal, if agreeable to the Indians, might set state officers and writs at defiance. In Alabama and Mississippi, which Georgia had ceded to the United States, the Indian title had been successfully extinguished, with the exception of that to the few remaining Creek lands in Alabama; only in Georgia itself did the federal government seem unable and unwilling to relieve the state from this excrecence upon its dominion. With this grievance as a vehicle, it was natural that the greed for the rich Creek and Cherokee lands should urge not only private speculators, but the state government also, to active efforts to oust the rightful owners, despite the supreme law of the land, and the solemn guarantee given by the United States.—The first attempt was made upon the Creeks. Three Creek chiefs, M Intosh, Tustenugge and Hawkins, were induced to sign a treaty at Indian Springs, Feb. 12, 1825, conveying the Creek lands to the United States for the use of Georgia. The Creek nation repudiated the treaty, and executed the chiefs, but the president and senate of the United States, willing thus to settle a very troublesome question, ratified the treaty and accepted it as binding. Governor Troup, of Georgia, at once gave orders for a survey of the Creek country, regardless of article 8 of the treaty, which gave the Creeks undisturbed possession of the country until Sept. 1, 1826, and regardless of the prohibition of such surveys by the act of March.

30, 1802. President Adams, at first mildly, and finally emphatically, forbade the survey, which was abandoned after considerable opposition by the governor and legislature. Jan. 24, 1826, a new treaty was made with the Creeks at Washington city, by which they ceded, under defined boundaries, most of their lands, but not, as in the Indian Springs treaty, their "whole territory lying within the state of Georgia." In the meantime Troup, by a very small majority, had been re-elected governor, and, being thus supported by the people as well as by the legislature of his state, he renewed the order for the survey, basing his orders upon the Indian Springs treaty, and refusing to recognize its substitute as valid or binding. President Adams again forbade it, ordered the arrest of the state surveyors, and sent a detachment of federal troops to enforce his orders. In reply, governor Troup notified the federal government of his "defiance," and ordered out the sixth and seventh divisions of the Georgia militia to resist the forces of the United States. He further announced to the Georgia congressmen that in his action he should be governed by the principle (see STATE SOVEREIGNTY) that Georgia and the federal government were equally sovereign and independent powers, and that disputes between them could not be decided by the supreme court, but by negotiation, until some competent tribunal should be established for that purpose as a part of the constitution. Unwilling to press the matter to the arbitrament of arms, president Adams referred the question to congress for action. No action was taken, and the Creeks were left to their fate. As before stated, they were finally forced to leave their lands in 1832.—The case of the Cherokees presented more obstacles to state action than that of the Creeks. They were fewer in number (about 10,000), perfectly united, and intelligent enough to be more than a match for Georgian diplomacy. Club-law was the only resort, and to this the state was encouraged by the vacillation and timidity of the federal authorities in the Creek case. Very little attempt was made by the state authorities to justify their action on legal and constitutional grounds. But the basis seems to have been that the state had a sovereign right to extend the operation of its laws over all its territory; that the federal government had no right, by treaty or otherwise, to erect another sovereignty within the state limits; and that, when the federal government assumed to do so, the state executive was bound to obey the laws of the state even to the extent of armed resistance to the national authority. To this the natural answer was that treaties were a part of the supreme law of the land, which the governor himself was sworn to execute; that by such a treaty the quiet possession of their lands was guaranteed to the Cherokees; and that Georgia, as one of the United States, was a party to that treaty, and was estopped to deny what she had thus solemnly admitted. Thus, even supposing Georgia still a sovereign state in all respects, she could have had

no standing in a court of law or equity. Nevertheless the Georgia legislature took the initiative, expecting the governor to fulfill its laws, and careless of any interference by the federal authority. Indeed, as the result showed, the new federal executive was unexpectedly found determined to stand neutral.—By act of Dec. 20, 1828, the legislature divided the Cherokee country into five parts, added them respectively to the counties of Carroll, De Kalb, Gwinnett, Hall and Hubersham, and extended the laws of the state over them. By the same act all Cherokee laws, usages and customs were declared null and void, and provision was made that Cherokees should not be competent witnesses for or against a white citizen; but the laws of the state were as yet to affect only white men living in the Cherokee country. The act of Dec. 19, 1829, extended state laws over all persons, white or Indian, in the Cherokee country, provided for punishment of any Indian resisting state writs, and made executions, under the Indian law against the sale of lands by individuals, murder in the first degree. By the act of Dec. 21, 1830, the lands of the Cherokees were authorized to be surveyed and laid off into small tracts which were to be distributed by lottery or raffle among the people of Georgia. By act of Dec. 23, 1830, the Cherokees were declared incapable of making contracts with white citizens. By act of Dec. 22, 1830, the improvements of the Cherokee landholders were seized by the state, as were also their gold mines by the act of Dec. 2, 1830, and white persons were forbidden to enter the Cherokee country except on conditions. By act of Dec. 22, 1830, the Cherokees were forbidden, under heavy penalties, to hold legislative assemblies or courts, or to execute the writs issued by their national courts. By these successive acts the state, so far as its legislative authority availed, completely ousted the Cherokees from the country whose possession the United States had solemnly guaranteed. The only question was, whether the state executive would be hindered in carrying out the laws by the national executive or by the supreme court. From congress no impediment was expected, for congress had refused or neglected to interfere when President Adams had laid the Creek case before it.—It must not be supposed that the Cherokees had remained passive or quiescent during these aggressive proceedings of the legislature. Their printing presses at New Echota, their capital, and elsewhere, were burdened with the printing of appeals to the justice of the people of the United States. Early in 1829 their "beloved men," or head chiefs, had appealed to President Adams for the protection which the act of March 30, 1802, authorized him to afford, but he felt compelled to leave the case to the incoming administration of Jackson. April 18, 1829, through the secretary of war, president Jackson, on substantially the grounds enumerated above as the only authorized defense of Georgia's action, refused to interfere, and em-

phatically advised the Cherokees either to submit to the laws of Georgia, or to remove beyond the Mississippi and rejoin the lower Cherokees. It is difficult to defend president Jackson's refusal to uphold the treaties made with the Cherokees, or to execute, as he was sworn to do, the law of March 30, 1802. His refusal was in flat opposition to the practice of every president from Washington to Adams. Jefferson, who always and firmly upheld the rights of the Indian tribes, in his instructions to general Knox, Aug. 10, 1791, had laid down the principle that "the Indians have a right to the occupation of their lands, independent of the states within whose chartered lines they happen to be; that until they cede them by treaty or some other transaction no act of a state can give a right to such lands; * * * that the government is determined to exert all its energy for the patronage and protection of the rights of the Indians, * * * and will think itself bound, not only to declare to the Indians that such settlements are without the authority or protection of the United States, but to remove them also by the public force." On the contrary, Jackson's decision held the federal government bound to stand neutral unless it could persuade the state to listen to reason and cease to nullify the treaties made by the United States. When South Carolina followed Georgia's precedents, president Jackson preached a very different doctrine. (See NULLIFICATION.) In the Cherokee case his mind may have been biased by his long continued frontier warfare against the southern Indians.—Having found the president deaf to their appeal, the Cherokees at once tried the supreme court. The time fixed for extending the laws of Georgia over the Cherokee country was June 1, 1830. George Tassels, a Cherokee, was found guilty of homicide in resisting the execution of a state writ, and was sentenced to be hanged. By writ of error from the supreme court, dated Dec. 12, 1830, the state was cited to appear in January following, and show cause why the judgment against Tassels should not be corrected. The legislature, to which notice of the writ had been sent by the governor, at once passed resolutions instructing the governor and other state officers to pay no attention to the writs of the supreme court in the case, except to resist their execution by force if necessary, and Tassels was executed.—William Wirt, attorney general from 1817 to 1825, and John Sergeant, had been engaged as counsel for the Cherokees, and they caused notices to be served, Dec. 27, 1830, and Jan. 1, 1831, upon the governor and attorney general of Georgia that an application would be made to the supreme court for an injunction restraining the state of Georgia from executing her laws within the Cherokee country. The state refused to appear. The case turned upon the right of the Cherokees to sue Georgia under the constitutional provision that the national judicial power should extend to cases between a state "and foreign states, citizens or subjects." Wirt and Sergeant united in an ex-

trremely able argument going to show that the Cherokees were a sovereign and independent nation with all the national powers of making peace, war, and treaties, and of self-government; that in these respects they were more sovereign and independent than the state of Georgia; that their national sovereignty and independence had been recognized by the United States in a long series of treaties which it was the sworn duty of the court and the president to maintain and enforce; and that the word "foreign" in the constitution was a political, not a local or geographical, term, so that it was perfectly possible for a "foreign" nation to exist within the limits of the United States. Their argument was re-enforced by the opinion of chancellor Kent, of New York, but was rejected by the court, which held that, while the Cherokees were a state, they were not a foreign state, but a domestic, dependent nation in a state of pupilage, holding their soil only by occupancy, and bearing the relation to the United States of a ward to his guardian. The injunction was therefore refused, and the Cherokees were relegated to the mercy of the state of Georgia, since the president, their constitutional protector, refused to intervene in their behalf.—Another opportunity soon offered for the adjudication of the state laws in the supreme court. By the state law of Dec. 22, 1830, white persons were forbidden to enter the limits of the Cherokee country without obtaining a license from the governor and without the taking of the oath of allegiance to the state of Georgia. For violating this act, ten persons, mostly Presbyterian and Methodist missionaries, were arrested, cruelly handled, indicted, and, in September, 1831, sentenced to four years' imprisonment. Eight of the number, having given assurance that they would conform to the state laws, were pardoned, but two, Dr. Butler and Rev. Mr. Worcester, refusing to submit, were imprisoned, and Worcester brought suit in the supreme court for relief. The decision of the court was given in March, 1832. It reviewed the entire proceedings of the state in the case of the Cherokees, declared them to be violations of the constitution, treaties and laws of the United States, and ordered Worcester to be discharged, since the act was void and the judgment a nullity. In contempt of the mandate of the supreme court the state court refused to grant a writ of *habeas corpus*, and Worcester and Butler continued to serve their term of imprisonment. There was no prospect of relief for them until January, 1833, at the next sitting of the supreme court, when it would have been competent for the court to enjoin the marshal of the district of Georgia to summon the *posse comitatus*, and the president to assist in enforcing the decree with the land and naval forces. The question of the national authority would then have been imperatively put at issue. Unfortunately the missionaries wearied of their experience as martyrs, and on their submission to the state authorities, were pardoned by the governor, Jan. 14, 1833. The

state officials persisted successfully in executing the state laws, and they and the national administration at last succeeded in extorting from the Cherokees the treaty of Dec. 29, 1835, by which the United States paid \$5,700,000 for the territory in dispute, and removed the Indians beyond the Mississippi. The political importance of the Cherokee case lay in the fact that its result was the first successful nullification, in its modern sense, of the laws of the United States. (See NULLIFICATION, STATE SOVEREIGNTY, SECESSION.)—See 1 von Holst's *United States*, 433; 8, 10, 11, Benton's *Debates of Congress*; 3 Jefferson's *Works* (ed. 1829), 280; 2 Clay's *Speeches*, 249; 1 Greeley's *American Conflict*, 102. The *Cherokee Case* is in 5 *Pet.*, 1, (9 *Curtis*, 178), and that of *Worcester vs. Georgia* in 6 *Pet.*, 515, (10 *Curtis*, 214). The arguments of Wirt and Sergeant, together with the opinions of chancellor Kent, the treaties, and the acts of the Georgia legislature, are in Richard Peters' *The Cherokee Nation vs. The State of Georgia*. The treaties referred to are in 7 *Stat. at Large*, those of Hopewell and Holston at pp. 18, 39. The law of March 30, 1802, is in 2 *Stat. at Large*, 139.

CHESAPEAKE CASE. (See UNITED STATES.)

CHILI. This country, under Spanish rule, formed, with the vice-royalties of Granada, Peru, and La Plata, a captaincy general under the authority of an officer having the rank of lieutenant general, president, governor, and captain general of the kingdom of Chili.—The unhappy events which convulsed Spain during the second half of the reign of the first Napoleon, had already reacted on the American continent when the new spirit crossed the Andes and disturbed Chili. The republic of Chili began its revolution under sad auspices. The first struggle for emancipation was in 1810. On the 18th of September of that year, she declared her independence. Dissatisfaction provoked by electoral questions afforded the three Carrera brothers, young and ambitious debauchees, a pretext for taking an active part in the movement. On the 11th of December, 1811, they dispersed the congress, seized the reins of government, were driven from power, returned to it, and as a result of their rule Chili was almost reduced by the arms of Spain.—The cause of independence seemed lost when help from an unexpected quarter was obtained, giving it new life and finally insuring its triumph. General San Martin, the real founder of the Chilean republic, hurried from Buenos Ayres with 3,000 men, crossed into Chili in 1817, and restored courage and confidence to all. He reorganized the national army, and defeated the royalists at Chacabuco; was defeated in turn at Canchaarayada, a disaster he soon repaired by the famous battle of Maypo, which he won April 5, 1818. It decided the success of the revolution and assured Chilean independence.—The new state had to defend itself against the dangers which threatened it

from within. It happily surmounted them. In 1821 San Martin had gone northward from Chili to free Peru, of which he had been proclaimed protector, from the Spanish yoke. Generals O'Higgins and Freyre had succeeded him in turn as president. To them succeeded general Pinto, whose elevated mind and travels in Europe had given him a higher reputation in the country. He governed with an ability that assured Chili some years of tranquillity. The country showed its appreciation by re-electing him, but an irregularity in the election furnished the malcontents a pretext for agitation. He allowed himself to be influenced by the counsels of the extreme liberals, and gave to Chili an ultra-democratic constitution. This imprudent course excited violent opposition. The reactionary party, that is what is there called the "moderate" party, had, at its head general Prieto, and among its members the unfortunate Portales. A civil war excited against them, ended in their victory and in the abolition of the constitution.—In 1838 Chili finally adopted its present constitution, "one of the wisest in America," says a traveler, "which gives to the government the legal means of enforcing obedience to its commands, and to the country satisfactory guarantees of liberty." The president is elected for 5 years. Besides the ministry which governs with him, he is assisted by a council of state composed of the ministers, 2 judges, an ecclesiastical dignitary, 2 generals, and a like number of ex-ministers. The legislative power is vested in a senate of 20 members, elected for 9 years, and a triennial house of representatives, consisting of one member for every 20,000 inhabitants. Under the firm rule of general Prieto and of Portales peace was firmly established; habits of order and political wisdom prevailed in the country. Chili began a career of progress which has since been only occasionally interrupted and then for but short periods. The question has been asked, "How did Chili come to have this exceptional history, and what favorable circumstances gave it a destiny so different from that of the other democracies of South America?" Several causes have been assigned for this: First the non-interference of the resident Spanish population, of whom very few took part in the revolutionary struggles, thus guaranteeing their own security and not adding a third party to the two already opposed to each other; the purity of the Creole race, which has very little admixture of Indian blood and preserved its vigor and moral preponderance; the destructive character of that active and serious race who are fond of comparing themselves to the English, and whom a traveler has likened to the Dutch; the depth of Chilean national sentiment, their taste for commerce, and the isolation of the country, which, defended on the east by the chain of the Andes and on the west by the sea, is protected both from the ambition of its neighbors and from its own; and lastly, by the geographical features of the country which does not admit of long wars, and in which every quarrel must be

quickly decided.—After the republic had passed through its period of crises and had nothing to do but to devote itself to the development of its institutions, an unfortunate incident, brought about by the ambition of general Santa Cruz, president of Bolivia, checked its progress for a time. Santa Cruz had united Bolivia and Peru into a confederation of which he was the head. He wished to include Chili, and to further his plan, began by exciting civil war in the country over which he desired to extend his rule. The attempt at insurrection was soon crushed, but Portales was its first victim. Order was re-established but Chili had lost one of its most distinguished men, the one on whom it based the most legitimate hopes, and who had already done so much for the reformation of its laws and the perfecting of its organization. At the beginning of 1859, however, new storms arose. A party of liberal opposition had been formed. It demanded constitutional reforms and allied itself with its most decided opponents, the reactionary and clerical parties. Although this coalition of extreme parties inspired no confidence in the country, and although, moreover, it was wanting in leaders, it was none the less dangerous. It brought on an armed insurrection. The president took energetic measures. Extraordinary powers were voted him by congress. He usurped the dictatorship which he had the courage and the honor not to abuse. The insurrection was suppressed on the 29th of April at Pemelas, and peace assured.—The Chilians dreaded the approach of 1861. During the course of the year every branch of the government of the state was to be re-elected. They had to meet at the polls several times during the year; on the 28th of February, to elect members of the house; on the 15th of May, to vote for senators; on the 25th of June, to choose presidential electors, and on the 31st of September the president himself. But all these elections passed off in an orderly and lawful manner.—While these contests, attended with much excitement* but no bloodshed, were going on in the interior, Chili did not neglect its foreign relations. In 1859 a treaty concerning the payment of a certain indemnity which Chili acknowledged that it owed the United States, was signed with that power. At the same time it signed a treaty of navigation and commerce with Belgium, while a similar treaty with Austria was in course of preparation. On the 11th of April it concluded an extradition treaty with France.—But the good understanding between Chili and the European powers did not last long. In 1864 it espoused the cause of Peru against Spain.—In the article BOLIVIA the reader will find an account of the manner in which the war between Peru and Spain broke out, and how the republic of Ecuador, Bolivia and Chili came to sign a treaty of alliance, offensive and defensive, with Peru. This alliance was preceded in Chili by active hostilities with Spain, which was irritated at the indirect assistance given to Peru by Chili. Ad-

miral Paréja, commanding the Spanish squadron, declared the coast of Chili blockaded in September, 1865. The Chilian government declared war against Spain and entered into the Peruvian alliance in December.—The bombardment of Valparaíso has made this war celebrated in Europe. The Chilian squadron had had some success in its engagements with the Spanish vessels, and the United States offered its mediation, which Chili refused. The Spanish admiral Mendez-Nunez gave the Chilian government four days to accept the proposition of the United States, failing which, he threatened to open fire on Valparaíso, an unfortified place, its only battery having been recently dismantled. It was the great entrepôt of all foreign commerce. In vain did the ministers of England, France and the United States represent to the Chilian president the folly of resistance. He was controlled by the press and by public opinion. Both had become excited to such a degree that they would not listen to reason. He was imprudent enough to defy the threat of the Spanish commander, who had the inhumanity to carry it out. March 31, 1866, the bombardment set fire to the custom house buildings which contained \$30,000,000 worth of goods. French merchants lost \$3,400,000, the English and American \$500,000 each, the Chilians \$400,000. A portion of the city, valued at \$15,000,000, was reduced to ashes.—The news of the bombardment caused in Europe an indignation that found vent in the English parliament and in the French *corps législatif*. But the French and English governments considered the act justified by the necessities of war, and not contrary to the law of nations, so Spain was not asked to make good the loss. Besides, the war with Chili had virtually terminated with the retreat of the Spanish squadron, which had laid siege to Callao unsuccessfully. (See PERU.) Both sides saw fit to postpone the concluding of a treaty of peace, which was not signed until 1868.—The territory of Chili consists of a narrow strip of land running from north to south along the Pacific coast, between 25° and 44° south latitude; and its area is 132,606 English square miles. It possesses, at some distance from its southern coast, the archipelago of Chiloë, and it claims authority over a much vaster extent of territory which belongs to Patagonia, and which, added to Chili, would double its area. But its authority over the territory situated between 37° and 42° south latitude, beyond the river Biobio, seems to be nominal. The inhabitants of this region, the Araucanian Indians, are independent in the strict sense of the word. Chili is bounded on the north by the desert of Atacama, belonging to Bolivia; on the east by the Argentine republic and Patagonia, separated from them by the chain of the Andes; on the south also by Patagonia; and on the west by the Pacific ocean. Its rivers, the Rio Maypo, the Maule and the Rio Biobio, are of little importance. The climate, as a general thing, is mild and healthy; but this advantage is offset in a terrible manner by the earth-

quakes to which Chili is subject, perhaps more than any other country, especially on the coast. The country is divided into 16 provinces. The provinces are, Atacama, Angel, Arauco, Coquimbo, Aconcagua, Santiago, Colchagua, Valparaiso, Talca, Maule, Nuble, Concepcion, Valdivia, Chiloë, Llanquihue, Linares, Curico. Santiago is the capital of the whole republic, with a population of 129,807 (1875). Valparaiso, the commercial and business centre, is the most important city. Its population in 1875, was 97,775.—The population of Chili, estimated at 240,000 in 1764, and placed at 600,000 in 1825 by an English traveller, reached 1,080,000 in 1843. In 1857 it was 1,465,492; in 1868, 1,908,340; and in 1875, 2,283,568. We here speak almost exclusively of the population north of the Biobio, where there is very little admixture of negroes and Indians. South of that river there are hardly any other inhabitants than members of the Araucanian tribe. Their number in 1790 was estimated to be 70,000.—Education is with the Chilean government an object of great and legitimate solicitude. Santiago has a university which has founded five colleges; among them the national institute, and the institute of Coquimbo. Santiago has also private educational institutions. More than two thousand young men attended the state colleges in 1860. The private colleges are 50 in number, 26 for boys and 24 for girls. The former was attended by about 6,000 scholars, the latter by about 2,000 pupils. There were 477 primary schools; 329 for boys, 23 for adults, and 125 for girls; 22,000 pupils of both sexes attended them, while the 84 municipal schools had 4,500 pupils. In 1867 there were 993 primary schools, with 50,877 pupils.—The Chilean government seems to neglect no opportunity to develop the elements of prosperity in the country. Important reforms have been introduced in the civil and criminal codes, also in the administration of justice, for which tribunals of first resort, three courts of appeal and one supreme court, are provided. Railways are being built, and in 1860 80 kilometres of railway were already in operation and had carried nearly 300,000 passengers. In 1871 the total length of railway lines was about 761 kilometres. There are telegraph lines from Valparaiso to Santiago, and from the latter place to Talca, over 750 kilometres in length. 2,650 miles of telegraph were in operation in 1878. The use of the decimal system, decreed in 1848, for measures of length and volume, was to be enforced during the course of the year 1860. The military spirit is not very prevalent in Chili, and has not had the pernicious influence there that it exerted in the other South American republics. The regular army, consisting of a few battalions of infantry and some squadrons of cavalry, does not reach the number of 5,200 men. The national guard, however, is well organized. It numbers 50,000 men. The navy consists of 6 steamers, with 40 guns and 400 men.—From 1825 until 1832 the average revenue of the republic did not exceed

\$1,700,000 per annum, and the expenditure was in excess of the receipts. In 1851 the expenses amounted to more than \$4,700,000, while the receipts in 1852 were only about \$4,480,000. The budget of 1853 nearly restored the balance of the two parts which composed it. The receipts appeared in it as 6,419,000 piasters, and the expenditures as 6,336,000 piasters. In 1871 the receipts were 11,550,000 piasters, and the expenditures 12,542,000 piasters. The principal source of revenue was the customs duties, which amounted to more than 4,000,000 piasters. In 1878 the revenue of Chili amounted to 20,443,977 pesos, and its expenditure to 21,375,728. At the end of the same year the total debt, internal and foreign, was 63,397,022 pesos.—In 1879, on the outbreak of war with Peru and Bolivia, Chili had 22,000 men under arms. The navy consisted of 10 steamers, of 120 to 300 horse power, and 2 ironclads.—Metals form an important part of the mineral wealth of Peru. Spangles of gold are found at the bottom of some of its rivers. It contains silver mines, and especially copper mines. In 1856 the yield of fine gold and silver amounted to 529,000 piasters, in 1857 to about 1,100,000 piasters, and in 1858 to 1,000,000 piasters. But Chili is, above all, an agricultural country. Besides the precious metals it exports grain and lumber. The most fruitful source of its industrial wealth is the vast extent of its pasture lands, in the midst of which may sometimes be seen a herd of 10 or 20,000 head of stock belonging to one man. In 1856 the imports amounted to 99,000,000 francs, and the exports to 90,800,000 francs, or 189,800,000 altogether. The principal countries which fed this commerce figured in the following order: Imports—England, 34,500,000 francs; France, 21,300,000; the United States, 12,100,000; Germany, 9,600,000. Exports—England, 41,500,000 francs; the United States, 15,500,000; Peru, 11,900,000; France, 7,000,000. The whole foreign commerce of Chili in 1869 amounted to 291,235,000 francs, of which, 144,319,000 were for imports and 146,916,000 for exports. Adding the coasting trade the grand total foots up 524,806,000 francs. During the year 1856 2,602 vessels, Chilean or foreign, entered Chilean ports, and 2,568 cleared for other ports: total, 5,170. England ranks first, with 1,156 ships; the United States follow, with 475; France only holds the fifth rank, with 122. In 1867 arrivals and departures were as follows: arrivals, 3,553 vessels, registering 1,723,617 tons; departures, 3,334 vessels representing 1,680,868; total, 6,877 vessels, and 3,374,485 tons. England retained her first rank, with 1,073 vessels; the United States came next, with 665; France had fallen back to the sixth rank, with 148 ships. The intermediate ranks were held by the Hanseatic cities, San Salvador and Italy.—BIBLIOGRAPHY. *The Progress and Actual Condition of Chile*, by G. Rose Innes, London, 1875; *Historia General de el Reyno de Chile*, by R. P. Diego de Rosales, Valparaiso, 1877-8. A. RABUTAUD.

CHINA. This patriarchal empire, having the oldest existing government in the world, consists of China proper, Manchuria, Mongolia, Tibet, and Ili, or Eastern Turkestan, with the large islands of Formosa and Hainan. The various countries of Indo-China, Burmah, Siam, and Annam, the tribes of Amuria, the Riu Kiu (Loo Choo) islands, Corea, and Japan (under the Ashikaga line of shōguns, from 1401 to 1573) were formerly tributary vassals, but their relations are now those of ceremony only, or of complete independence.—The official title of China, under the present dynasty, from which it is named, is *Tsin*, ("pure") *Tai-tsin*, ("Great Pure") or *Tu-tsin-kwo*, (Empire of Great Tsin). Popular names are *Chung-hwa* ("Central Flower") or *Chung-hwa-kwo* ("Central Flowery Land"), a name formerly applied to Ho-nan province; and *Chung-kwo* ("The Middle Kingdom") also an old name of Ho-nan. This central province formerly situated between the "foreigners of the east" or seaboard, and the hill tribes of the west, under the Han dynasty, finally gave its name to "all the Chinas"—the favorite conception being that of one central empire, while all other countries lay outside. *Chu-Hia*, ("All the Chinas") *Shi-pa-san*, ("The Eighteen Provinces") referring to China proper, and various appellatives derived chiefly from dynastic titles, are in popular or literary use. The terms China and Chinese (Fr. *Chine*, *Chinois*), are Anglicized forms of the ancient native "Tsin," "Chin," or "Sin," used long before the Tsin dynasty (255–209 B.C.) and found in Sanskrit, Persian and Hebrew, meaning a silk-worm. China is the home of the silk-worm, and the first land of silk. The Russians and north Asiatics use the old Mongol names *Kitai* or *Kitan* (whence Marco Polo's "Cathay"); the Annamese, *Sina*, the Tibetans, *Yulbu*; the Japanese, *Shin*, *Shina-koku*, *Kara*, *Morokoshi*, or *Kanto*. The name used by most Chinese emigrants, and in Java, the Straits and the Sandwich islands, is *Tang-shan*, from a famous mountain in Chi-li province; the emigrants being termed *Tang-jin*—the first Chinese settlers in Java having left their homes during the Tang dynasty, (618–905 A.D.) The vulgar term "Celestial" is not of Chinese origin, unless it be borrowed from *Tien-chau*, ("Heaven-rule or Theocracy") applied to the great government, irrespective of dynasty.—The chief boundary lines of China are rivers, mountains and the sea. Her whole northern frontier borders on Russia in Asia, the supplementary treaty of 1860 negotiated by general Ignatieff having deprived her of Amuria, and all the coast north of Corea, leaving her without a seaport beyond China proper. South of Corea and the Usuri river, her eastern boundary is a seacoast line, 2,000 miles long. Her neighbors, on the south, are Annam, Burmah and India; and on the west, Turkestan and India. In brief, with the exception of the sea line, and part of Burmah, China is now surrounded by three great European nations, Russia, England, and France, in Asia.—

Manchuria is, in the main, a grassy fertile basin, lying between the Amur river and the Great Wall, and Corea and the Usuri river, and the Kin Ghan mountains. Mongolia is largely desert, poorly watered, alternately very hot and cold, and hemmed in by lofty mountain ranges, the Altai and the Kin Ghan. Tibet is a plateau, the highest in the world, walled in by the Himalaya and Huen Lun mountains. Ili, or Eastern Turkestan, another desert plateau, was completely reconquered by the Chinese in 1877, after it had lapsed into rebellion and set up an independent government. China proper, the only division of the empire having maritime boundaries, is a vast plain or series of fertile river basins lying on the slope toward the sea, and threaded by those great rivers which have their source in the central Asian plateau. Four of the five great divisions of the empire are inhabited by mixed races of people, with divers religions, and are governed rather as conquered territory. China proper alone has a homogeneous population and political system. The area of the whole empire is about 5,000,000 square miles, or one-third of Asia, or one-tenth of the land surface of the globe. China ranks third among the great landed governments of the earth, the British and Russian exceeding, the United States and Brazil falling short of the Chinese area; the five together occupying more than one-half of the known land of the world. China proper has a land frontier of 4,500 miles, an area of over 2,000,000 square miles, or half as large as Europe, and a population of 360,000,000, according to Dr. S. Wells Williams—the entire empire containing probably 450,000,000 souls, or one-third of mankind. Dr. Williams, who has spent nearly 40 years in China, and who devoted more time to the preparation of his chapter on population in his master book, "The Middle Kingdom," than to any other, bases his calculation on the government census of 1812, which was made for purely official purposes, and not for the use or eye of foreigners. It is certain that the empire is very far from being overpopulated, there being immense fertile districts in Manchuria and Mongolia very scantily inhabited; while Ili, Tibet, and the abandoned flats of the Hoang ho (or Whang ho), or Yellow river, at present sustain a mere fraction of the population that under the pressure of necessity, or the blessing of a better government, they could sustain. Agriculture is in but a few places carried to its extreme possibilities, and the real cause of famine, as in most old countries, is the lack of means of transportation. The division of China proper into 18 provinces dates from the fourteenth century, the nineteenth province having been added by the present dynasty. They are subdivided into 182 prefectures, and 1,279 districts. Those best known to foreigners are the maritime provinces, containing the treaty ports with a population estimated at 4,990,000, open to the trade and residence of aliens, of whom there were, in 1878, 3,814. The coast provinces are, Shin-king, Chi-li, Shan-tung,

Kiang-su, Che kiang, Fo-kien, Kwang-tung. The frontier provinces are Kwang-si and Yun-nan, adjoining Annam and Burmah; Se-chuen and Kansu, adjoining Tibet; Shen-se and Shan-se, adjoining Mongolia; Ho-nan, Ngan-wi, Kiang-si, Hunan, Kwei-chow and Hu-pe, are the interior provinces. Shin-king, or the imperial province, was formerly a part of Manchuria, but has been incorporated with China proper during the present dynasty, making the actual number 19. The metropolitan province is Chi-li, in the extreme north, in which, very inconveniently situated, is the *King* or capital, Peking; the ancient capital having been Nanking.—The political system of China is the most perfect example in history of the idea of the family expanded into that of the nation. Its vast imperialism is but the perfected evolution of the parental and filial relations. The popular term for the nation or commonwealth is the hundred families. Before the dawn of history, the Chinese ideal and fact of government was that of a father ruling his children, and in this, perhaps, the forty-sixth century of their existence, the primal idea, scarcely modified in its essence, binds together the administrative system under which one-fourth of the human race dwell. This is not the production of conquest, but is due to the unfolding of the original genius of the people. Neither foreign wars, nor internal commotions often vast in form and long abiding in time, nor their repeated subjugation by conquerors from the north, alien in blood, language and religion, nor the immense local diversity of the tribes and regions comprised in this colossal country, have more than temporarily affected this nationality. Filial piety—the obedience of the child to the parent, and the reverence of the young to the aged—is the corner-stone of China's unique civilization. After forty-five centuries of existence, the Chinese people are to-day the living witness to the truth wrapped up in the fifth commandment given by Jehovah (Chinese Shaug-ti) on Mount Sinai, to the Hebrews: "Honor thy father and thy mother, that thy days may be long upon the land which the Lord thy God giveth thee." While all the other political systems of antiquity have crumbled and passed away leaving only their ruins, the land of filial piety is inherited to-day by a nation whose social structure is more firmly settled than that of any other on earth. If Egypt gave us architecture and agriculture, the Phœnicians letters, the Hebrews religion, the Greeks beauty, the Romans jurisprudence, the Germanic nations personal liberty, China brings to the sum of truth possessed by the race, the demonstrated power of filial reverence to preserve the life of nations. If political science be based on fact, and not merely on theory, and if longevity be the quest of nations as of individuals, then China has this supreme lesson, in addition to many others, to teach the younger nations of the west. "The peculiar character of the Chinese—for they have a character which is one and distinct—is not to be accounted for by their residence in great

plains, for half their empire is mountainous. Neither is it to be ascribed to their rice diet, as rice is a luxury in which few of the northern population are able to indulge. Still less is it to be referred to the influence of climate, for they spread over a broad belt in their own country, emigrate in all directions and flourish in every zone. It is not even explained by the unity and persistency of an original type, for, in their earlier career, they absorbed and assimilated several other races, while history shows that at different epochs their own character has undergone remarkable changes. The true secret of this phenomenon is the presence of an agency which, under our own eyes, has shown itself sufficiently powerful to transform the turbulent nomadic Manchu into the most Chinese of the inhabitants of the Middle Kingdom. The general name for that agency, which includes a thousand elements, is education. It is education that has imparted a uniform stamp to the Chinese, under every variety of physical condition." (W. A. P. Martin, "The Chinese.") Yet this term "education" does not suggest in China what it does in Christendom of this century. With us it means the training of all the faculties of mind and body, the discipline of every one of man's powers, to the end that all nature may be subordinate to man's needs, and new truths be continually won as man progresses. In China, education looks entirely to the past. It is a combination of the purely literary and scholastic training like that of mediæval Europe, with the pupillage of the child still under parental rule. The family idea rules even in the schools, and subordination and filial obedience are the principles which form the core of Chinese education. Because of this very idea of the family dominating that of state and empire, there is seen in China a vast interplay of despotism and liberty—the absolute rule of the father or emperor, and the easy freedom within limits of his children the people. What the Americans are in Christendom, the Chinese are in extra-Caucasian humanity—the freest people in Asia. Since the political genius and concrete system of China are unique, original, the oldest in the world, absolutely independent of foreign influence, we shall best expose them by a brief outline of the history of the Chinese people.—The purely mythical period of their history, which even the native critics reject, comprises a period of 2,267,000 years before the birth of Confucius in B. C. 551. The legendary portion, which can not, except in its outlines, bear the rigid requirements of modern historical criticism, begins about 2852 B. C. Passing over this, we reach the semi-historical period in the reign of Wu (B. C. 1122), of the Chow dynasty (1122–255 B. C.). The opinions of most modern critics are now gravitating toward the year 781 B. C. as the beginning of trustworthy Chinese history.—The early legends of the Chinese are perhaps no more vitiated by fable than are those of most ancient peoples. In the gray dawn of their history we

find a people settled within the loop of the Hoang Ho, in what is now the modern province of Shen-se, dwelling as one family ruled by a father or patriarch. Within a few generations, the increasing number of immigrants was divided into tribes and classes, to each of which a name was given, the *wang* or king being still the father of all the people. Agriculture was the chief occupation, but arts and trades began to be developed among them—the rudiments of that vast subdivision of labor seen in the China of to-day, with its guilds and trades-unions of hoary age. It is now nearly certain, however, that many of the inventions ascribed to them or their leaders originated farther west, and before their departure from the land whence they came. Linguistic science, aided by researches in other domains of thought, is gradually bridging the gulf between the Chinese and Euphratean nations, one of the most brilliant recent discoveries being the identification of the primitive forms of the Chinese characters with the Accadian hieroglyphs from which the cuneiform writing of Assyria was derived, and the agreement in the ancient pronunciation of them. M. de Lacouperie, who makes this claim, also asserts that the enigmatical Yh-king, a system of mystic characters whose real meaning had been forgotten before the age of Confucius, is really a collection of syllabaries and lists of words similar to those with which the clay tablets of the library at Ninevah have made us familiar. (See *Early History of Chinese Civilization*, and *Le Yh-King et les Origines asiatiques occidentales de la Civilization Chinoise*; by M. Terrier de Lacouperie.) From their first origins, the Chinese type of intellect is easily perceived. Unlike the dreamy, metaphysical Hindus “who think away matter and hate the physical toil which develops its uses,” we find at once “a swarm of plodding utilitarians, sternly adherent to things actual and positive; who insist that the world is the plainest of facts and needs no explanation; that it is purely a working world, wherein a seventh day rest would be an impertinence,—a world where every atom is intensely real and valuable; where domestic and social uses stand for poetry, metaphysics and religion.” (Johnson's *Oriental Religions—China*.) In India—the other great reservoir of mankind—we find brain, pure thought; in China, muscle, pure labor. The type of the Hindu intellect is cerebral, that of the Chinese is muscular; in the cosmogeny of the former, the world issues from mystic thought, in that of the latter, the earth is already existent and self-shaping, the first man having hammer and chisel in his hand, himself and tools being a part of it. In India the type of architecture is the bubble, symbol of unreality; in China, it is the pagoda, pile on pile of tents or dwellings. Contrasting the Chinese physical mould—the flattened profile, the uninspired air, the plump, muscular and enduring physique, with the clear bright eye and rapid graceful motion of the Arab; with the dreamy languor yet

exquisite nervous susceptibility of the Aryan Hindu; with the prominent features, the collected self-conscious and expectant bearing of the Teuton or the Greek; and we easily discover the persistent mental type corresponding to it, so lymphatic, so incurious, so fast-bound in things as they are, and have been. The Chinese creative faculty remains within the plane of certain organic habits, failing to rise from the formalism of rules to the freedom of the ideas. The Chinese mind buries itself in its materials, but does not go beyond them. Hence the stability of the structure, without growth or development in the idea. (Johnson's *China, passim*.) We may add that the above philosophical analysis of the Chinese mental qualities, by a distinguished American scholar, is valid as well for the pre-Confucian era as for this sixth year of Kwang-si (A. D. 1881).—A change from simple patriarchalism in the direction of feudalism was made by Wu Wang (1122 B.C.) who allotted portions of land for the support of the now numerous sons and brothers of the sovereigns, who had gradually formed a kind of nobility of the state. Seventy-two principalities were allotted to the royal relatives, all of whom were tributary to the sovereign. Yet even in this rudimentary feudalism, there were few or no restrictions of the privileges of the people, such as were seen in mediæval Europe. The inherent viciousness of the system soon, however, developed itself; jealousies, tribal fights, internecine wars, and the mutual weakening of loyalty to the tribe-father or suzerain and his authority over the vassals, resulted. Worse than all, the tributary nations on the north called Tatars (vassals), emboldened by the internal weakness of their conquerors, began, about 950 B. C., the inroads which continued for many centuries, necessitating the constant arming of the people, and, before the Christian era, the building of the Great Wall. Into the details of Chinese feudalism we need not enter. It lasted from 1122 to 221 B. C., a period of 900 years. The best picture of feudal China is seen in the *She King* or Book of Ancient Poetry, translated into English verse by Dr. James Legge, London, 1876. The sage Kung, the one being on earth whom the Chinese regard as endowed with unalloyed wisdom, and who is known to Europeans as Confucius, was born at the time of greatest feudal misrule, 551 B. C., in the petty kingdom of Lu. By this time the sovereignty of the rulers or kings of the Chow dynasty had become reduced to little more than an empty pageant. The actual functions of government had passed into the hands of a varying number of vassal dukes who ruled their respective territories with the attributes of sovereign power. Confucius was not, in any sense of the word, an original thinker, a revealer, or an inventor, but only a reverent student of antiquity, a teacher who re-presented the old traditions, and enforced them by his example. Like our own great theologian of Princeton, he doubtless boasted that “he had never invented a new idea.” He was

compiler, editor and annalist, but composed no doctrinal work. To his disciples we owe what is known of his life and works. "He held up for the admiration of his pupils and countrymen at large the virtuous endeavors of these wise rulers [of antiquity] and the principles upon which, under their government, the empire was ordered. The lessons which he drew from these sources and inculcated in his conversations or by his example (translated by Dr. Legge under the title of *Confucian Analects*), constitute the most sacred portion of the Chinese canon of philosophy and instruction." (Mayer.) Late in life he collected and arranged the substance of the ancient books and traditions, in prose and poetry, under the title of *King*, which form the second portion of the canon. These works, together with a meagre chronicle of the events of his native state (722-481 B. C.) constitute a body of writings which, to the Chinese, have been for a period of 2,000 years the basis of the national education, religion and government. In them, one finds the keys to the entire Chinese political and social system, in ideal and in fact; yet it must never be forgotten that Confucius added nothing new, he simply reproduced the archaic norm and ancient genius of the nation. On the other hand, it is very probable that he purposely failed to properly express what the ancients had taught concerning religion. (See Dr. Legge's *Religions of China*, 1880.) Though revered in his life, the sage was not practically successful as a reformer. Meng Tsze (372-289 B. C.), a native of the same state in which Confucius was born, is honored as "Sage Second" of China. His work was to popularize the doctrines of his predecessor. The record of his teachings and conversations with princes who sought his counsel, or with disciples who gathered round him for instruction, forms the fourth of the canonical books—the standard of the national ethics and social order. The Jesuit scholars at Peking who first Latinized the names of these two sages might have rendered familiar to western ears and minds other famous Chinese names, had they given them the same familiar terminology. —Thirty years after the death of Mencius, was born the man, by whose genius and labors the feudal system was swept away, and a homogeneous empire, nearly conterminous with modern China, erected on its ruins. He broke with the traditions of the past, and attempted to forever destroy the power of the literati, the idolaters of letters and the opponents of progress, by ordering the destruction of all the ancient records. He built the Great Wall—the most stupendous monument of human industry on earth, by uniting in one the several walls of the various states, with great additions. He divided the vast empire into 36 provinces ruled by governors sent out from the capital, and thus created centralized monarchy. In thus securing the extinction of feudalism, China anticipated Japan by the space of 2,000 years. He combined the ancient title, *Wang*, (sovereign), with *Ti* (Divine ruler, or

deity), and took the title of *She Wang Ti* (First Universal Emperor; or First Autocrat ruling by Divine Right.) This is the initial appearance of that shibboleth of Chinese imperialism: for to China's emperor alone can this august title be granted. All other sovereigns and rulers on earth whosoever are only *Wang* (king or sovereign). None can be *Wang Ti*, either by law, custom or fact; nor will Chinese diplomatists ever in document, official address or conversation apply this title to any king, emperor, czar, shah, mikado or president. All tributary nations receive investiture of their rulers under the title of *Wang* (king), or *Wang kwo*, Japanese, *Koku O* (king of a country). The ineradicable conception in the Chinese mind is, that as there is one father to a family, so there is but one ruler for the world. His ideal for the whole race of mankind is the family, hence the emperor must be the world-father. To the average Chinaman, who saw that European sovereigns were not addressed in equal terms with the Chinese emperor, the idea of the inferiority or vassalage of the latter to their *Wang Ti* instinctively arose. Of late years the foreign legations in Peking have insisted upon and compelled the Chinese officials to use specially-coined terms to express the titles of European sovereigns in such a manner that absolute, or at least apparent equality may be secured, and the suggestion of inferiority be eliminated. The obnoxious, vulgar word, "barbarian," has also been stricken out of official correspondence, and "foreigner" or "foreign countryman" substituted. The incurable jealousy, mutual contempt and chronic unfriendliness between the Japanese and Chinese have their roots in the fact that the former persist in applying the title *Wang Ti* (Japanese *Kotei*) to their mikado; and the term *Tei Koku* (land ruled by a theocratic dynasty) to their country. The proposition of the dissatisfied ministers of China to bestow the simple term *Wang-kwo* (Japanese *Koku O*, Nation-king), upon even the Japanese Shōgun (or "Tycoon,") has been deemed a sufficient *casus belli* in several historic instances. In the case of the ministers of the Ming dynasty, and Hidēyoshi of Japan in 1593-7, it was the cause of the renewals of hostilities in Korea after a truce. All tributary sovereigns or their envoys on entering the imperial hall of audience, must perform the *kono-tou* (nine prostrations). The refusal of foreign ambassadors to submit to this humiliation, has been the cause of their non-admission to the presence of the emperor. In these audiences the tribute-bearers and mandarins of the empire who are privileged to enter the imperial presence, face the "Son of Heaven," whose throne fronts toward the south. The following extract from a letter of the king of Corea, addressed to the Chinese emperor, through the board of rites, Nov. 20, 1801, is a characteristic specimen of the language used on such occasions: "Turned toward the north, I keep my eyes fixed upon the cloud-enveloped heaven, which I hope will be favorable to him

who is below." In this phrase we have suggested the throne facing the south, the prostrate suppliant and the "heavens covered with clouds," which signifies his majesty's severity or wrath, his pleasure being expressed as "a gentle rain." The symbol of all that pertains to the emperor is the dragon, or chief of the divinely constituted beings, possessed of all powers of destruction and blessing. Hence the representations of this creature are embroidered on the imperial dresses, banners and insignia, and are found on all that pertains to the emperor. His throne is called "the dragon throne," his face "the dragon countenance," and "the ruffling of the dragon's scales" the disturbance of his feelings. The imperial color is yellow, from the legend of the yellow dragon that rose out of the river Loh and presented the elements of writing to Fuh-hi, the mythical founder of the Chinese polity. Further details concerning the Son of Heaven will be given below. We have but shown the substance of those popular ideas which underlie and support the throne. Enlightened Chinese probably do not now mean by *Wang-ti* more than "autocrat," or "sovereign;" foreign successes with improved cannon having greatly modified the old superstition.—The ancient records edited by Confucius and destroyed by She Wang Ti, were recovered from memory and written fragments, after the death of the tyrant, and the doctrines of the sage being always acceptable to the possessors of the throne, the sovereigns of the Han dynasty began to enforce the Confucian political ethics. Henceforth, though the history of China was varied by internal convulsions, and inroads of barbarians and periods of anarchy, though a new dynasty occupied the throne every second or third century, though Tatar, Mongol and Man-chiu hordes rolled out of the north upon the fertile plains of China, to conquer and then to be quietly absorbed, the Chinese never changed but rather consolidated their political system, steadily developing the idea of the family into that of universal empire. Under the overmastering genius of Confucius, whose principles are now practiced by 500,000,000 people in China, Corea, Japan and Indo-China, the Middle Kingdom was carried to a grade of civilization far beyond that of other nations of eastern Asia, and during mediæval Europe, it was the most highly civilized country on earth. While the nations of Europe awoke to renaissance and second morning, and have gone on progressing, China has remained stationary; for there is no germ of progress in the Confucian ethics. In eliminating the principle of popular religion, and relegating divine worship to the emperor alone, Confucius cut the tap-root of national progress. The poverty of their spoken language and its difficulty of acquisition by foreigners the multiplicity of their ideographic writing in which the monosyllables of their national infancy have been petrified; their geographical isolation, added to the fact that for fifteen centuries their chief intercourse was with rude barbarians

and pupil nations from whom no improvement could be gained, nor even comparison made except to show their vast superiority and flatter their vanity, have kept the Chinese satisfied with their excellence in civil polity, arts and literature. It is not possible at once for the nation, so long a teacher, to become the pupil. Whether in the presence of modern civilization, and its forces of war, science and religion, or the genial influences of mutual comity, the ancient system can stand, remains to be seen.—The Confucian ethics, the basis and norm of all government in the family and nation, are summed up in the doctrine of the Five Relations. The relation being stated, the correlative duty arises at once. These are: 1, between sovereign and subject; 2, between father and son; 3, between elder and younger brother; 4, between husband and wife; 5, between friend and friend. Confucius might have made his system of ethics a religion, by adding a sixth, or supreme relation—between God and man. He declined to do so, thus leaving his people without any aspiration toward the Infinite. By setting before them a finite goal, he sapped the principle of progress. With obedience to the emperor, the supreme duty of the individual is fulfilled. Hence, if the emperor fails to do his duty, if the public works are neglected, if decay and ruin overtake the national edifices and enterprises, if stagnation and paralysis seize upon the national policy and government, the individual cares not, the subject takes no concern, since his duty is fulfilled in obedience to the emperor who is the representative of God and destiny. "Of all crimes the greatest is rebellion, but if the rebellion succeeds, it is evident that heaven has willed it so." Success is the manifest will of God. "Thus the first duty of a citizen is absolute fidelity to his sovereign, and at the same time an immediate and absolute acknowledgment of whatever may be an accomplished fact." (Hübner.) The people are the children of the emperor, and he is the Son of Heaven. He alone mediates between his subjects or children, and his Father, Heaven. In the temple of Heaven in Peking, the emperor offers an annual sacrifice with prayers on the lofty stone altar, on behalf of the nation; the master of all the earth thus worshipping the Master of Heaven, vicariously, for all his people. Like the pagan father, he holds the power of life and death over his household. His word is absolute. From this point of view China is a despotism. But the duties of the emperor and his subjects are reciprocal. Peace in the empire is the result of his fatherly rule. Rebellion, as he himself acknowledges, arises from his lack of ability or wisdom. Mencius, the popularizer of Confucius, taught the inherent right of rebellion against an unjust prince. This right has been often exercised by the people; yet, with rare exceptions does rebellion pass beyond a demand for justice. As in a family children are punished for wrong doing, but rewarded for being good, so exemplary filial piety, loyalty,

valor, and minute, even trivial, domestic virtues are rewarded by the government. Official cognizance is often taken of incidents that in western countries belong to the privacy of the family. To old people on their birthday, to children for their filial piety, to widows for not re-marrying, etc., etc., presents of rolls of silk, money and other desirable articles are made by the authorities. In the case of illustrious services rendered to the nation, or of public individuals deserving of honor, there are eight grounds of distinction or privilege, as follows: 1, Imperial connection; 2, Long service; 3, Meritorious service; 4, Wisdom and virtue; 5, Ability; 6, Zeal on behalf of the state; 7, Exalted official rank; 8, Descent from privileged ancestors. It will be seen from the above order, which is part of the statute law of the existing dynasty, that mere rank or descent counts for very little, while long, faithful or brilliant services are the criteria of distinction. There is no permanent feudal or hereditary rank in China, no primogeniture, and few if any of those restrictions of birth or class which hinder the rise of commoners to lofty rank, office and station. The only hereditary nobility is that enjoyed by the descendants of Confucius. By a gradual process even the blood relatives of the emperor take their places among the people; for with every generation they descend one degree. The descendants of a prince of the blood will in the sixth generation be common people. The five degrees of feudal rank, instituted in the dawn of Chinese history, once the symbols of actual land and power, but existing only in name in modern times, may be translated "Duke," "Marquis," "Earl," "Viscount" and "Baron." After their reduction to the ranks of the common people, the emperor's relatives form one of the numerous clans of the nation, called the imperial clan, and are governed by a special board. In the succession to the throne, the emperor chooses an heir from among the offspring of his three wives. Of these wives one is the *wang-hoi*, or empress, and two rank as queens. The large number of concubines, female servants, and ladies in waiting form an establishment in which many eunuchs are required, and a soil in which palace intrigues are ever ready to spring, and from which a counteracting influence to reformatory ideas continually proceeds. The eunuch system is an exotic from Persia. The "solitary" or "peerless" man, as the emperor is styled, lives with his harem in the Forbidden City, or group of yellow-tiled buildings surrounded by a wall, in the very heart of Peking. He rarely appears in public, and then he is guarded by a large military force. The now ruling Tsing dynasty trace their ancestry to the Manchiu chieftain Chao Tsu Yuan, the seat of the original tribe being in the valley of the Hurka, a tributary of the Sungari river. Gradually increasing in land, in men and in horses, during the sixteenth century they mustered mighty hordes of cavalry, and began to raid the Chinese province of Lia Tong (now Shing King). Invited by a Chinese

general to assist in deposing a usurper, they entered China proper in 1636 and defeated the rebels, but declined to go out again. Easily finding a pretext, they deposed the Ming dynasty and set their own ruler Shun Chi on the dragon throne in 1644. The Manchus then began the conquest of China in earnest, but only after much bloodshed succeeded. The badge of loyalty to the new régime was a shaven scalp, with the hair braided into a queue—the "pigtail," to which the Chinaman now after three centuries of custom clings as a symbol of nationality. Gradually the native opposition to the Manchiu foreigners became weaker, and the Chinese quietly adopted the "pigtail" and absorbed their conquerors. The fierce Manchiu became a pupil of Chinese civilization. The sciences of Europe were patronized at Peking; Tibet was added to the empire; Nipal was invaded, and western Formosa conquered; while foreign commerce, diplomatic relations and Christian missions entered upon their ever-increasing career of influence in China. On the 12th of January, 1875, Tung Chi, the eighth Manchiu occupant of the dragon throne and the last of the direct line, died of small pox, and "became a guest in heaven." Kwang Si ("Succession of Glory"), the present ruler, now in his eleventh year, and a cousin of Tung Chi, became emperor, having been so nominated in the deceased emperor's will. During his minority, the government is carried on by the empress-dowager, the empress-mother, and prince Kung, uncle of the late emperor, and the ablest of all the imperial officers. Thus the succession to the throne has passed out of the direct line—a fact which may yet be made the pretext for revolution or intrigue in the future. One of the dowagers regent, mother of the late emperor Tung Chi, died at Peking, April 11, 1881, an event which most probably throws more power and influence into the hands of the progressive prince Kung. She was the ruling spirit of the court of Peking, and serious intrigues may follow her demise.—In its external form, the government is a bureaucracy. The emperor is assisted by the *Nai-Ko*, or supreme or privy council, consisting of nine Manchiu and seven Chinese officers, who prepare opinions for the emperor's judgment. The general council, or *Kiun-Chi Chu*, is composed of the heads of the six boards, and tribunals, with various high personages, princes and commissioners. It has less power and influence than the privy council, its functions being mainly distributive. It issues the imperial edicts, presides over the civil service examinations, directs various national procedures, decides upon and prepares the matter for the *Peking Gazette*, or "government journal," and takes cognizance of affairs in the empire outside of China proper. There are five imperial courts, presided over by high functionaries who are usually at the same time connected with one or other of the six boards. These courts are, of judicature, religious ceremonial, imperial stables, banqueting, and

entertainment. The greater portion of the actual work of administration is carried on by the six boards. These are, of civil office, revenue, ceremonies, war, punishment, and public works. At the head of each board are two presidents, four vice-presidents, and three lower grades of officers, supplemented by a large staff of clerks. Nearly all the higher grades of office are filled by an equal number of Manchus and native Chinese. Not only is a check upon arbitrary power sought to be secured by having two heads to each department, but no one board is entirely independent of the others. A real and potent element of popular representation is found in the college of censors, which exercises a supervisory and judicial control over all the boards and officials. The censors scrutinize all acts of the courts, boards and councils, form themselves into investigating committees, inquire into and object to measures which they deem unlawful or injurious, and freely accord audience to complainants of every class. The college also directs the metropolitan police, at Peking, and is a supreme court of appeals, in that it reviews criminal cases referred from the provinces. Even the emperor is not freed from the censorate, but is occasionally rebuked in firm but respectful language, when he has violated the spirit of China's constitution. Irresponsible government is not found in China. From the most ancient times, the drum of justice has hung at the palace gate opposite the throne, and any subject has the right to memorialize the sovereign or prefer requests. Such appeals are received and forwarded by the court of request. The eight causes for removal from public employ are: 1, a grasping disposition; 2, cruelty; 3, indolence and inactivity; 4, inattention to duty; 5, age; 6, sickness; 7, indecorous behavior; 8, incapacity. The members of the Han Lin Yuan (Forest of Pencils), or imperial academy, are a body of civil functionaries forming an integral part of the machinery of state, exercising considerable influence upon the government, and recruiting from their number many of the higher offices. The memorial of an imperial academician laid before the throne will often outweigh in influence that of a provincial officer higher in rank. The *Peking Gazette*, before alluded to, is, in one sense, the organ of the government for disseminating official intelligence throughout the empire, and is an expression of the democratic element in the Chinese political system. It is named *King Pao* (Metropolitan Reporter). When reprinted in the distant provinces, it is often called *King Chao* (Transcripts from the Capital). It is issued at an early hour daily in Peking at several establishments. This "newspaper" is stitched with paper cord and covered with the imperial yellow. The price of the full edition is about six dollars a year. It is printed with movable wooden types on bamboo paper, on one side of the sheet; its length is 9 inches by $3\frac{1}{4}$ inches wide, and it contains from 6 to 20 or more leaves, according to the documents issued. The offices of publica-

tion are not limited, but each one issues its own cover. The date and table of contents occupy the first page, then follow the names of persons admitted to an audience, lists of officers reporting for duty or on leave of absence, records of memorials, reports, sentences of criminals in the capital, lists of official changes, the movements of imperial princes, and of the emperor, the fall of rain and snow in Peking, and various other matters. The *Peking Gazette* has, properly speaking, no editor, no contributors, contains no remarks on public acts, and inserts no advertisements or news articles of any kind. It is not in any sense a review, magazine or journal, according to the western use of these words. It is simply a transcript, by government permission, of such public documents as the supreme council allows to be placarded for public use. Couriers carry copies of these public documents to all the provincial capitals, but it is by means of the *Peking Gazette* that all classes of people are enabled, by clubbing together, subscribing or borrowing, to read the government news. The supervision of the *Gazette* rests with a sub-committee of officials connected with the supreme council. Occasionally documents intended to be kept secret are surreptitiously published. Some of the memorials and remonstrances which are allowed to be published show a surprising bluntness of criticism and boldness of reform. On the other hand, nothing concerning any of the details of the opium war of 1839-42 was mentioned. The first instance in recent times in which the name and title of a foreign functionary were properly mentioned was in July, 1859, when the American minister Hwa-joh-han (Ward John, or John E. Ward) was reported as having come to Peking. The *Gazette* was established probably at the beginning of the present dynasty. It is now translated into English, and reprinted by the *North China Herald* at Shanghai. Many thousands of copies are read all over China, furnishing information such as no other Asiatic government allows to its subjects.—Each of the 19 provinces of China proper is divided into *fu* (prefecture or department) embracing a population of about 2,000,000 souls. The *fu* is subdivided into *chu* (districts), and further into *hien* (sub-district). The larger provinces are ruled by a viceroy. Of the smaller provinces a viceroy may rule over two. Each province has a governor, (*Tao-tai*, chief, or intendant of circuit) prefects, treasurers, judges, tax-collectors, and a large number of officials, whose duties are multifarious. The salary of the viceroys or governors general varies, but is not less than \$40,000; that of a *Tao-tai* or governor is \$5,175; that of a prefect, \$3,425; that of a district magistrate, \$1,375 per annum. To the salaries there are no legal perquisites, but large additions are often made to them by bribery and exactions of various kinds. The three-year limit to office, while acting beneficially to popular liberty, tends to make the mandarin improve all his opportunities of levying "squeezes" upon the people. The chief

sources of revenue are from taxes on land, customs and transit duties, government monopolies, licenses, stamp duties, and various forms of taxation on salt, mining, fisheries and manufactures. There is no "national debt." In grave emergencies, extraordinary levies are made on rich merchants throughout the empire to provide funds. Each province collects its own taxes and pays its own expenses. A certain proportion of the provincial revenues go to Peking to support the central government, which receives its quota partly in grain and partly in money. The total revenue of the empire from taxation is over \$200,000,000, of which \$55,000,000 go to Peking, and \$145,000,000 are kept in the provinces. Exact figures can not as yet be obtained by foreigners. In addition to the numerous local officials, imperial commissioners, who are usually selected from the Han Lin academy, are sent out from Peking to act as censors and spies. The chief executive officers of each province, the governor, chief military mandarin, chief treasurer and judge form a local council who advise with and limit the power of the viceroy. Each province has its own army and navy, and must defend its own borders, and keep the peace within its own area. By official espionage from above, and below, and on either side, by registration of all important facts, by the transmission of every detail to the central bureaus, by reports expected from all respecting their doings and misdoings, the entire administration of affairs in the provinces and capital becomes known, in theory, to the supreme head of the nation. In actuality, no emperor, however able, can control so colossal a bureaucracy, which at times is corrupt to the core.—The term applied by foreigners to Chinese *kuan*, or officials, is "mandarin"—a word unknown to most Chinese. It is derived, probably, from the Sanskrit *mantrin*, counselor; and more directly from the Portuguese *mandar*, to command. The badge of official rank, in distinction from the nobility of birth, is a peacock feather in the hat, which varies according to services rendered. Both classes of military and civil mandarins are divided into nine grades, each grade having two classes. This division dates from 220 A. D. Each of the nine grades is marked by a "button" toggle, tassel, or knob, worn on the crown of the cap, and in vogue since 1730 A. D. These simple but sufficient substitutes for shoulder-straps, stars, garters, robes or breast decorations are in their order, in color, or material, ruby, red coral, sapphire, turquoise, crystal, white coral, plain gold, wrought gold, chased silver. The official robes are likewise embroidered with symbolic designs, those of the military differing from those of the civil mandarins. This personal dignity of rank adheres to the possessor, whether in or out of office. The number of officials within the nine grades is stated at 40,000, the majority being military. About one-fourth are Manchiu. The number of civil mandarins paid by the government is stated at 10,000. The administration of the provinces

outside of China proper is intrusted to a separate department called the *Li-fan-yuen*, and by foreigners, the "Colonial Office." The foreign relations of China were formerly considered of so little importance that they were put in charge of a sub-bureau of a department. Since 1858 the Tsung-li Yamen (Board of Control, or Office for Foreign Affairs) has been established, and foreign envoys now communicate directly with the Tsung-li Yamen.—In the local forms of administration there is more or less imitation of the imperial rule, with accountability in both directions, to the higher magistracy and to the people. In the court the mandarin is judge, jury and bar, but the ordinary procedure is without fee, open alike to rich and poor, with the right of protest or appeal to the higher judicatory. The ten heinous offenses known to Chinese law, are in their order, as follows: 1, Rebellion; 2, Conspiracy against the sovereign's person; 3, Treason, or Revolt; 4, Parricide, and similar crimes; 5, Inhumanity, comprising willful murder, mutilation for nefarious purposes, etc.; 6, Sacrilege; 7, Unfilial conduct; 8, Discord; 9, Insubordination; 10, Incest. Though cruelty, bribery and official corruption of all kinds do undoubtedly prevail all over China, yet the actual freedom of the people is superior to that of the masses in ancient Rome, or in India or Russia. The imperial officers are in a measure detached from local influences by the rule that no man shall hold office in the province of which he is a native, and by the additional rule—as old as the fifth century of our era—that their term of holding office is limited to three years. The influence of the censors at Peking, who do not spare even the emperor, acts also as a powerful factor of popular freedom. Furthermore, the continuous and rapid republication in the provinces of the *Peking Gazette*, containing the criticisms and memorials of the censors at the capital and complainants in the provinces, keeps public affairs before the eye of an intelligent and thinking people. The perpetually exercised right of pasting up placards, tracts and pasquiuades on walls and public places exerts a powerful restraining influence on the local mandarins. If justice is often bought and sold at the *yamen*, the right of influencing the public by the written appeal flourishes. Distinct elements of popular freedom are also found in the organization of the clans, in the town and district councils, in the trade guilds, the special clubs, and, in an extreme form, in the secret societies. These last are always large and numerous, and are usually organized with designs inimical to the reigning dynasty, but not to the nation. One of the most powerful of these was the "queue-cutting" band, who secretly cut off the "pigtales" of people and officials, with the object in view of insulting the Manchiu dynasty, by mutilating their distinctive badge of loyalty.—The foundation of the entire commonwealth is found in the clans, of which there are about 450 in the empire. The designs of their organization

are, defense against the centralized bureaucracy in Peking, mutual aid and protection in business, and the common transactions of life, and for festive enjoyment and the worship of the spirits of their ancestors. The clan organization is so complete that while it may secure justice to the innocent, it may also thwart the design of the magistrate, and even of justice. In some parts of the country bitter and often bloody quarrels, inherited from many generations past, are kept up. The chiefs of the clan at Peking are able by their power to prevent the punishment of murder and violence committed by members of it in the provinces. The feuds of these hostile clans often render property and travel in certain sections of the country insecure for months at a time. Marriage with another of the same clan is forbidden. The proper degree of consanguinity is thus preserved among the people, and very few towns are inhabited entirely by men of one clan. These clan divisions, however, are not kept up by emigrants abroad. Another element of popular freedom, against which the power of the local mandarin is vain, is trades-unionism. Often beneficent in their operations, these leagues are equally oppressive and tyrannical. Useful as a check to over-government, they are an injury to free industry, and offer a fertile field to intrigue, revenge and depravity.—More truly beneficial are the town and district councils of elders, which contain real elements of representative government; they exercise local powers with which the imperial magistrates rarely dare to interfere. The administration of villages and city wards, police arrangements, and taxation, are within their control. The elders or officers are salaried, and usually hold their office during good behavior. The council consists, as a rule, of the elders of 50 or 100 villages or city wards, having a central hall and assistants for clerical labor. In the cities the wards or gates are closed at night, and guarded by a watchman, who also strikes the hours. By this minute subdivision of authority, disturbances are easily localized and offenders found out. Not only have foreign residents repeatedly experienced the potency of these popular forms of power and opinion, but the apparent apathy and unwillingness of the Peking government to carry out a promised policy becomes intelligible. In most cases the central authority is utterly unable to override the local sentiment of the democracy. Hence the vacillations and radical difference of opinions among foreign writers and even long residents in China. "The mandarins and government are all; there are no such ideas as 'rights' or 'liberty' in the Chinese mind; the administration is a despotism in theory and in fact," says one. "China has no government worthy of the name; the mob is everything," says another. The truth seems to be, that for centuries government in China has rested in equilibrium between democracy and bureaucracy, between the throne and the people. The symbols of government and justice in west-

ern lands are the sword, and the scales held by the blindfolded goddess. The more prosaic and correct emblem for China might be found in the *tembimo* or carrying-pole of the native laborer, whereon all burdens are distributed and balanced by being divided into two equal parts, though the double weight falls on one shoulder. The real reason why western students of the Chinese political system are often puzzled to understand it, seems to arise from a false analysis of Chinese society. "The root-idea of the Chinese state is that mutuality of rights and interests between prince and people, as the two terms of one divine order, neither of which can fail of its part, without defeating the whole. The primitive simplicity of this recognition of justice has not unfolded into those practical mediations which political experience has elsewhere devised for correcting the relations between ruler and ruled, and which have ultimately identified the two in pure self-government by the people." (Johnson's *China*.) In China we miss the middle term of *individuality*, which in western forms of government is so powerful a factor. "Unity in the ruling force, multiplicity in the ruled," is the simple antithesis of the Chinese political system. The unit of society is not the individual but the family. "the hundred families" being the collective term for the whole nation. The emperor can not with safety violate ancient custom, or substitute his selfish interest for the public good. On the other hand, among the people, there is an utter absence of caste, of heredity, and of slavery. The foreign term, "coolie," (Hindoo *kuli*), is a misnomer imported by the East India company's people to China, and thence adopted into the English language. There are millions of laborers in China, but not one native of the "coolie" caste in the whole empire. No hereditary rank, honors or titles are known in the empire except in the family of Confucius. Hereditary bondage is unknown, and "involuntary servitude" is confined to prisoners of war, criminals, and persons sold by their parents or for debt. The worst features of "family slavery" are found only in southern China. While thus "liberty" in the radical sense of license to do as one pleases is absent from the Chinese people; while the individual possesses only a portion of the idea and fact of liberty in its Anglo-Saxon sense; it must be admitted that the Chinese commonwealth is a commonwealth of freedom, such as no nation in Asia or ancient Europe has ever shown.—Proofs of the essential autonomy and representative powers of the people are seen by an examination of the Chinese codes of law, and the binary system of education and civil service, the one founded upon the other. Theoretically, the laws of China may be called the constitution of the empire. The penal code, called "The Great Pure [dynasty] Statutes and Decrees," embodies the old national ideas and such practical institutions as experience has proved best suited to the people. It is revised by the imperial counselors every

few years—a process which has brought it into a compact and simple form. It was translated into English by Sir George Staunton, and published in 1810. Its seven principal divisions treat of: 1, General Laws; 2, Civil Laws; 3, Fiscal, including laws relating to land and marriage, public property, customs, private property, sales and markets; 4, Ritual; 5, Military; 6, Criminal, divided under the heads of robbery, homicide, quarreling, indictments and information, bribery, fraud, incest, arrest, imprisonment, trial and punishment; 7, Public Works. (For a brief digest of the code, see Johnson's *China*, pp. 355-365.) Excellent as is the present penal code, which superseded the severer one of the Ming dynasty, yet, as is not denied by the most careful witnesses, the imperial officers often override its provisions with their edicts, reviving obsolete portions, or arbitrarily emphasizing others. Added to the derangements caused by extra territoriality, by opium, by foreign influences and the popular dislike to the Manchu rule, the superstitious reverence, almost amounting to idolatry, of the mandarins for the ancient texts, tends constantly to great cruelty in the administration of justice. Barbarous penalties are described in the *Shu-king* and *Chiu-li* classics, which a certain conscientiousness in the mandarin often compels him, in spite of revised codes, to put in execution. This state of mind is easily understood in Christendom, when one sees how the mere phraseology of the Old Testament profoundly influences devout persons otherwise Christian and humane. Chinese puritanism often transforms the mandarin into a cruel tyrant and debases popular conscience and conduct. Hence, in actuality, the Chinese prisons are horrible gaols, where thousands of prisoners annually rot out their lives. Torture is freely used to obtain confession, and the victims of the cudgel and of incarceration outnumber those of the ever-busy swordsman. Prisoners are kept in cages like beasts, tortured unspeakably by flogging with ropes or beating with bamboo at the word of the mandarin. The five punishments as at present classified are: 1, Bamboozing; 2, Bastinadoing; 3, Banishment; 4, Transportation for Life; 5, Death. The first two punishments comprise five degrees of severity; the second, five degrees of duration; the fourth, three degrees of distance; while in the fifth are two degrees, strangling and decapitation. The ancient forms of revolting punishment under the ancient dynasties of Chow and Han, such as branding on the forehead, cutting off the nose, maiming, castration and death by horrible and studied forms of cruelty, have long since been abolished. Public sentiment has also largely outgrown parental rights over life and liberty as well as slave-penalties, except in a few less civilized provinces, family "slavery," so-called, being confined to the southern part of the empire. Nominally the emperor must sign every death-warrant; practically the high mandarin holds and exercises this power. — After filial piety,

education is the great conserving force of Chinese society. The national culture is a process of evolution whose germs are in the town and village schools, and expand into detailed adaptations to public wants through a graded system of competitive examinations; the ultimate point being the supply of civil and administrative force. This is the motive power of the process. "The government fosters education only in holding out the promise of office to all who are qualified by the test of examination." From the moment the boy enters school the goal of official promotion is before him. "The general and the prime-minister are not born in office," is the familiar line in every schoolboy's mouth, who sees the possible marshal's baton in his knapsack, or the ruby button adorning his cap. Yet the education of the Chinese child can not be said to begin as in Christendom in early childhood. The language of the fireside is not that of the books, nor are nurses and mothers trained in letters. At the age of seven or eight, a lucky day is chosen from the almanac, and the lad enters school, bowing first to the image of the Sage, and then to the living teacher. For several years the whole work of the pupil consists in the use of memory and the ink-brush. He commits the entire contents of the canonical books, so as to know the sound and form of the characters, without reading or understanding a sentence of them, or their dead language. This dead lift of memory is unalleviated by the exercise of any other faculty. It is like an American boy learning to repeat the whole of the *Iliad*, without knowing where *Ilios*, or who *Hector*, was, or the meaning of one line of the epic. This painful system of rote has replaced the ancient Socratic method of questions and answers which was practiced by Confucius and Mencius. The second stage of the undergraduate's work is the translation of the textbooks into the living language of to-day, with lessons in composition. The third stage is *belles-lettres* and the composition of essays. These three periods occupy, in all, from 10 to 20 years. It is next to impossible to master the written language, according to the ordinary Chinese scholar's standard, in less than 10 years, while many take 30 to do it in. The memory, literary judgment and taste are profoundly exercised, and a thorough grasp of the vernacular is obtained, but the range of ideas is very narrow. Elegant composition, or the art of making literary mosaics by deftly joining together the ideas and expressions of the sages and classic writers, is constantly practiced. Invention of new ideas is neither attempted nor desired. A high literary polish is sought and attained as an end in itself, not a means only. The power of the writings of the sages over the literati even of this century springs from the vigorous and chaste style in which their thoughts are clothed, as well as from their wisdom. The three grades of Chinese schools are primary, middle and classical. In the first, memoriter recitation and imitative clu-

rography; in the second, the exposition of the canonical books; in the third, the composition of essays, are the leading exercises respectively. Of national institutions of learning there are none, except one or two in the capital. Connected with government departments, however, there are various special training schools. Education is left to private enterprise and public charity, the government gathering the choicest fruits and encouraging production by suitable rewards. Enlightened magistrates and wealthy gentlemen are often very liberal in establishing or assisting schools. In addition to official influence, the emperor, by bestowing honors upon munificent patrons, secures vast advantage to popular education without the expenditure of a tael from the treasury. Yet after all, popular education does not penetrate to the lower strata. Thousands of Chinese can use the characters necessary to their business or special pursuit, and even keep accounts and write letters, who yet are unable to read a single sentence in a book. Dr. W. A. P. Martin says in his book just published, "The Chinese," from which we have drawn some of our facts: "Of those who can read understandingly, the proportion is greater in towns than in rural districts. But striking an average, it does not, according to my observation, exceed 1 in 20 for the male sex and 1 in 10,000 for the female—rather a humiliating exhibit for a country which has maintained for centuries such a magnificent institution as the Han Lin academy. The system of competitive examinations for appointment to civil service actually dates back to a period anterior to the rise of literature. They assumed the form in which we now find them between the seventh and twelfth centuries. Two resident examiners in each district keep a list of all competing students. In each province is one superintendent of instruction who must, within his three-years term of office, visit every district, hold an examination, and confer the first degree upon a certain percentage of candidates. For the conferring of the second degree, two imperial commissioners, usually Han Lin academicians, are sent out from the capital. The regular degrees which faintly suggest those of our B. A., M. A., and LL. D., are: 1, Sin-Tsai (Budding Talent); 2, Chin-jin (Man Deserving Promotion); 3, Tsin-shi (Able to fill Office). The highest grade in the literary knighthood is to receive membership into the Han Lin Yuan, or "Fo est of Pencils." These degrees are purely the gift of the state, not of any educational institution. Only about 1 per cent. of contestants for the first degree pass the ordeal. The trial for the second degree in the provincial capital requires a strain of nearly nine days of continual exertion. A few of the weak and aged are found dead in their cells at this time, unable to endure the rigors of composing in prose and verse, and answering the questions in Chinese history, philosophy, criticism and archæology. Of the competitors, 1 per cent. is again chosen, but before office is bestowed,

a further ordeal must be gone through in the capital. Of the victors, a score are admitted to the Han Lin, two or three score are added as brevet members, and the remainder are assigned to official positions in the capital and provinces. So intense is the desire for honor and office, that gray-headed men are often found competing even at the district examinations. Grandfather, father and son, occasionally apply at the same time. The unsuccessful men usually become school-masters, authors, writers or clerks, while the government secures the trained intellects for public service. The system serves the state as a safety-valve, providing a career for those ambitious spirits which might otherwise foment disturbances or excite revolutions. It acts as a counterpoise to an absolute monarch by introducing a popular element into the government. In practice, the princes of the blood have great privileges, and to them the ministers may be in a very inferior position; but on the other hand, the ministers who may have risen from the humblest station have predominant influence in affairs of state. The system also gives the government a hold on the educated gentry who are the most influential class in the empire. Civil office is bestowed as a reward of learning, and not of political or military services. Hence the literati are the most loyal of subjects. Occasionally the emperor, to relieve a depleted treasury, has offered for sale the literary decorations, but such a proceeding is rare and dangerous. The punishment for an examiner who fraudulently issues a degree is death. Of late years the range of subjects has been broadened by introducing, to a limited extent mathematics and political economy among the subjects examined upon. That the mandarins are not hopelessly committed to scholastic mediævalism is shown in the fact that nine-tenths of the new books published are written by them, and most, if not all, of the reforms of late years have emanated from their body. A class of men numbering several millions keep their faculties continually bright by constant exercise, possess retentive memories, are ready with the pen, and are intensely interested in public affairs. With many grave defects arising from the abuse of the system, it is yet the most admirable institution in China, and most worthy of imitation by other nations.—Chinese diplomatic relations with the states of Christendom began, properly speaking, after the opium war of 1839–42. Embassies from the Roman emperors and mediæval popes occasionally reached China. In the thirteenth century Marco Polo held office for 25 years under Kublai Khan. The Portuguese began to trade, and the Jesuits obtained a foothold in the empire in the sixteenth century, and the Dutch, British and Russians, after various repulses, secured trade and commerce in the seventeenth century. The East India company had a share in the oppressions that led the American colonies to revolt from Great Britain. After much dissatisfaction in America, caused by the high prices of the

monopoly on tea, the company were authorized to ship the crop directly from China to America without first paying duty in England. The first vessels came to Boston, and the fate of the herb is well known. Chinese tea caused as great an excitement on our eastern borders in 1773, as "Chinese immigration" did a century later on our Pacific shores. No sooner was the revolution over than our people hastened to share the profits of the rich trade with China. The first American ship, "Empress," left New York for Canton, Feb. 22, 1784. Other vessels rapidly followed from Albany, Boston and Philadelphia, carrying the American flag round the world—the Chinese name for the United States being "The Land of the Flowery Flag." Perhaps the first event pregnant with relations between the oldest and the youngest of nations, was the discovery of ginseng in Massachusetts in 1757. The Indians searched out the root and sold it to the Dutch at Albany who exported it to China at a profit of 600 per cent. The Chinese consider this mild aromatic as endowed with almost miraculous curative properties, and immense quantities of the root are still sent to China from Minnesota and the western states. The development of the fur trade of the northwest was stimulated by the Chinese demand for American furs. The first British embassy of lord Macartney in 1793 was well received, but that of lord Amherst in 1816 was not admitted to the presence of the emperor, the British envoy refusing to perform the *kow-tow*, or nine prostrations. From this time forth the subject of "imperial audience" became a sore and bitter one between Chinese and foreign diplomatists until June 29, 1873, when Soyeshima, the mikado's ambassador from Japan, followed by the other diplomatic representatives, obtained audience on equal terms, standing erect, and laying their respective credentials before the dragon throne. The charter of the East India company expired in 1834, and while lord Napier, the British agent, attempted negotiations with the viceroy of Kwang Tung and failed, the Chinese renewed their protest against opium. For five years trade remained in a precarious condition, but opium was still imported. In 1839 the special commissioner Lin demanded the surrender of all the opium in English hands at Canton, received and destroyed it. The English government declared war against China. After two years, during which the British troops occupied various coast cities, the Chinese sued for peace, and paid war indemnities amounting to \$21,000,000, and opened the ports of Canton, Amoy, Fuchow, Ningpo and Shanghai to trade, ceded Hong Kong to the British, and agreed to conduct diplomatic correspondence on equal terms. The success of the British arms stimulated the desire for commerce in other countries. In 1843 president Tyler sent the honorable Caleb Cushing, of Massachusetts, as minister extraordinary of the United States to China with a letter to the emperor. Mr. Cushing succeeded in establishing commercial arrangements, by the

treaty of Wang-hia (near Canton), which being ratified at Washington, the honorable A. H. Everett, of Massachusetts, was appointed minister resident in China. He died at Canton in 1847. By the second war with Great Britain in 1856-7, in which France, Russia and the United States joined, new treaties were gained and new concessions granted to foreigners; that with the United States being signed April 18, 1858. The American minister, Mr. John Ward, arrived in Peking, but refused to *kow-tow* to the emperor, and came away. The allies occupied Peking and punished the treachery of the mandarins by destroying the imperial summer palace—a proceeding intended to wreak vengeance on the government with a minimum of injury to the people. From this time the legations of the treaty nations began to be established in Peking, and the Tsung-li Yamen, or office of foreign affairs, was established by the Chinese government. Mr. Wm. B. Reed was the United States envoy from 1858-61. In 1862 the legation of the United States was established at Peking, and Mr. S. Wells Williams, the accomplished scholar in Chinese and author of *The Middle Kingdom*, was made secretary, a post which he ably and honorably filled until 1875. Honorable Anson Burlingame was our minister from 1861 to 1867, when the Chinese government appointed him special ambassador to the treaty powers of the world, partly as an exponent of profound alteration in the national policy toward foreigners, and partly to forestall further demands expected upon the revision of the treaties then pending. The first official acceptance by China of the principles of international law was in the treaty at Washington, July 28, 1863. Other treaties were made with European powers. The Peking government which had hitherto ignored the existence of Chinese outside of China, now began to look after the condition of their citizens in Peru, Cuba, the United States and other nations. By the influence of Yung Wing, a graduate of Yale college, an educational mission was formed and 120 Chinese lads were sent to New England for a ten years' course of study in American schools and colleges. Legations and consulates were established in various countries, and the rights of China's citizens began to be respected even by the street savages of Christendom. The "coolie" traffic, or involuntary emigration through fraudulent and cruel means, was practically abolished. A demand was made upon Russia for the retrocession of Kulja or Ili, and the lapsed province was restored. The general indications now are that the most enlightened mandarins are fully alive to the necessity and desirability of maintaining friendly relations with western nations, and assimilating the best elements of foreign civilization. Yet in so vast and ancient a nation it is undoubtedly true that for a long time to come, millions of the proud-spirited Chinese will desire to acquire the material forces of the foreigners only to sweep China clear of them. While the odious ex-territoriality clauses are kept intact in

the treaties, there will remain a chronic root of bitterness. The transforming power of education, Christianity, and modern science, are, however, rapidly leavening a nation that must either disintegrate, or accept a new form of national life, from which the old element of willfully blind pride and intolerance will be purged.—*Authorities and Statistics.* We have refrained as much as possible from giving statistics, which may be found in such annuals as "The Statesman's Manual," "Almanach de Gotha," the various Year-books published in the Anglo-Chinese ports, and in the Blue Books of the British, and the consular reports of the United States government. Statistics of a fresh and trustworthy character are difficult to be obtained by foreigners, as the Chinese government does not regularly publish these in exact and detailed form, except in departments and on subjects least interesting to those outside the Chinese official world.—Of the multitude of books on China, those in the following selected list are the best for the student of political science: American—S. Wells Williams' *The Middle Kingdom*, and papers in *The Chinese Repository*; William Speer's *China and the United States*; W. A. P. Martin's *The Chinese, their Education, Philosophy and Letters*; Justus Doolittle's *Social Life of the Chinese*; Samuel Johnson's *Oriental Religions—China*. European—W. F. Mayer's *The Chinese Reader's Manual*, and *Treaty Ports of China and Japan*; Sir G. T. Staunton's *Penal Code of China*; Gray's *China*; Meadow's *The Chinese, and their R bellions*; Dr. James Legge's *The Chinese Classics*; Medhurst's *The Foreigner in Far Cathay*; Parker's *Comparative Chinese Family Law*; Boulger's *History of China*.

W. E. GRIFFIS.

CHINESE IMMIGRATION. The immigration of Chinese in considerable numbers, which began shortly after the discovery of gold in California, early aroused strong opposition in the Pacific states, which has sought expression in numerous attempts to restrict this immigration by local legislation, and—these local measures having been declared invalid by the United States courts—in appeals for federal legislation. No response was, however, made by congress until 1879, when a bill passed both houses, limiting the number of Chinese passengers who could be brought to the United States by any one vessel to 15. This was vetoed by president Hayes on the ground of repugnance to treaty stipulations; but a commission was subsequently appointed, which, proceeding to Peking, negotiated a treaty that gives to the United States the power to limit, suspend or regulate, but not to prohibit the coming or residence of Chinese laborers, and secures to Chinese students, teachers, merchants or travelers from curiosity, together with their servants, and to laborers now in the United States, the right to come and go at pleasure, and all the privileges accorded to citizens or subjects of the most favored nations. This treaty was ratified

by the senate in March, 1881.—The discussion of the propriety of prohibiting or restricting Chinese immigration which is opened rather than closed by the treaty, and which, no matter what legislation is now taken, is apt to recur in the future, ranges over economic, social, political and ethical ground, but begins with a question of fact. On the one hand, it is asserted that the Chinese are an inferior and brutalized race, incapable of understanding our political institutions or entering into our social life; on the other, they are pictured as models of industry, thrift and docility, thirsting for a knowledge of western civilization and religion. The truth lies in about the mean between these extreme characterizations.—Chinese civilization widely differs from ours, and, from a western standpoint at least, is unquestionably lower than ours; but there is no reason for regarding the Chinese as an essentially inferior race. Their civilization had certainly attained a relatively high development when what are now the most advanced of the European races were yet in a very rude state; and although decadence on the one hand and rapid progress on the other have now carried European civilization far in advance of that of China, the possibility of the Mongolian race at some time arousing from its long lethargy and reversing present conditions, is one of those grand questions which can hardly fail to rise in the imagination of whoever considers what this race has accomplished in the past. In natural characteristics the Chinese seem to be in nowise essentially inferior. Physically, those who have as yet come to the United States may be upon the average somewhat smaller and lighter than the Anglo-American, but this immigration has been as yet exclusively drawn from the southern provinces of China, whose people are said to be less robust than those of the north. Nor is there any evidence of natural intellectual inferiority. They are shrewd traders and sharp bargainers, are quick at learning what they care to learn, and it may be more than doubted whether there is anything in our knowledge that could not be acquired by a Chinaman under the same circumstances that a white man could acquire it.—Their standard of morality differs more, perhaps, in kind than in degree. On the filial virtues they set a higher estimate than we do; of the political virtues they seem to have little idea. In courage, either active or passive, they are certainly not deficient. Their religion appears to be practically that materialism which among a people of active intellect seems always to follow the deterioration of creeds, mingled with much superstition, and something of that decorous regard for forms which survives the decay of real belief. They have that habit of patient attention to details characteristic of a country where population is dense and machinery little used, but it would be hard to say that the Chinese are either more or less industrious than our own people. They work steadily when they have an object to work

for; and their "standard of comfort" being much lower than that of our people, they will work, if need be, for a return upon which an American would not deem it possible to support life; but no more than white men do they work because they like it, nor do they idealize industry. Those who are raised above the necessity of manual labor are proud of this fact, and let their finger nails grow long to show it; the fat man is their ideal of the prosperous and enviable man. They are fond of amusements, having a keen taste for theatrical representations, and are greatly addicted to gambling. If less given to the use of intoxicating liquors they are more given to the use of intoxicating drugs.—The fact is that the Chinese seem, in all essential things, to be about such human beings as we are, differing from us only as men of the same race might differ who had been from birth subjected to the influence of widely different social environments. But this is a difference which is of as much practical moment as a difference in natural capacity—a difference so wide as clearly to distinguish Chinese immigration from any which has previously set upon our shores.—Between the various European peoples from whom our population has been drawn, there are differences of race, language, tradition, custom and religion. Yet these differences are trivial as compared with the differences between the Chinaman and the European. The European peoples belong to the same primary subdivision of the human family; their languages are derived from the same parent stock, their religions are but modifications of the same great creed, their civilization is essentially one, and their customs, methods and habits of thought have even in their variations a family likeness. Differences probably nearly as great as those which exist between the Irishman and the German, or the Englishman and the Italian, exist between the people of the various provinces of the great Chinese empire.—Yet as these are indistinguishable to the unpracticed European, so differences between Europeans are as nothing when compared with the wider differences which separate the Chinese from the European. The only immigration we have ever received which in point of difference can be compared with the Chinese, is that which in the early days of American settlement was brought by the slave trade. But the negro as landed from the hold of the slave ship, was merely a naked barbarian. He had everything to learn, but had little to unlearn. The difference between the negro as he came among us, and the Chinaman as he now comes among us, is like the difference between the child ready to imbibe whatever he is taught, and the full grown man whose habits are formed.—The Chinaman is not a simple barbarian but a civilized man, of a civilization to which ours is but a thing of yesterday. The Chinese have a written language, a literature, codes of manners and of morals, national and religious traditions, arts, beliefs, customs and habits of thought which

have been perpetuated for centuries through immense masses of people.—Of all the wrong impressions concerning the Chinese, there is probably none more erroneous than that widely diffused in this country (especially among those who are hopeful of the conversion of the Chinese to Christianity), that they are conscious of their own inferiority, and seek but to learn of us. That those who come among us recognize our superiority in the mechanical arts is doubtless true. But this is not the direction in which Chinese ideals lie, and their feeling toward us is probably akin to that with which the scholar, proud of his learning, might recognize the superior physical strength of a porter or coal-heaver, or the impoverished descendant of a noble family might regard the money-getting ability which had placed wealth in vulgar hands.—It is doubtful, indeed, if the European mind, and especially the American mind, can fairly comprehend that veneration for antiquity which leads the Chinese to regard the "outside barbarian," for all his steamships and railroads and telegraphs and ironclads, as a barbarian still. Western civilization looks to the future for its ideal of perfection; that of Chinese civilization is in the past.—Now it is not merely that the greater the difference in language, customs and habits of thought, the greater the difficulties of assimilation between different peoples brought into contact, but the greater the difference the less powerfully do assimilative forces act, for the greater are the tendencies, both attractive and repulsive, to the formation and maintenance of separate societies in which the peculiarities of each are perpetuated.—In the case of the Chinese this difficulty of assimilation is increased by a remarkable characteristic. Arising probably from the fact that for ages the political institutions of China have been so far gone on the path of decadence as to compel extra legal association for the protection of individual rights and the enforcement of individual obligations, the Chinese show a peculiar aptitude for secret associations and the maintenance of guilds resembling those trade and mercantile guilds so strong in Europe during the middle ages.—By virtue of this capacity for organization, the Chinese in a foreign country really constitute an *imperium in imperio*, really live under a Chinese government of their own—a government which finds ample means to enforce its own laws and regulations.—This is as notorious on the Pacific coast of the United States as it is in every other part of the world to which the Chinese have gone in any numbers. Without the aid of American law, and in spite of American law, Chinese regulations are enforced.—Chinese women are to-day, for instance, as merchantable a commodity in the Chinese quarter of San Francisco, as are hogs or opium. Whether the majority of the Chinese who come to the United States are or are not bound to service, they at least come with certain definite relations, whether of membership, clientage or peonage to the great organizations, the six companies.

—Instead of coming and going upon individual responsibility, as do the immigrants from Europe, they are received and placed upon arrival, by these organizations, and so absolute is this control, and so fully is it recognized by those who do business with the Chinese, that until within a recent time (if not to the present) a Chinaman could not purchase a passage ticket to return to China without a clearance from the companies. Thus the Chinaman, coming to the United States not with the intention of permanently settling, but of returning as soon as he can, and if he dies here of having his bones sent back to his native country—a duty religiously performed by the Chinese organizations—is received upon his arrival in a Chinese society, constantly being recruited by new immigrants, and is affected very slightly, if at all, by assimilative influences.—He may learn something of the languages, something of the laws, and religion and arts and customs, and may adopt some of the methods and habits of the country in which he sojourns, just as the English in India learn and adopt such things of the natives; but as the Englishman in India remains an Englishman and does not become a Hindoo, so does the Chinaman in America remain essentially a Chinaman.—Thus Chinese immigration differs from European immigration in being practically non-assimilable.—That in course of time should their immigration continue, the Chinese would bring their women and permanently settle, just as they have permanently settled in parts of the East Indies, there can be little doubt, but from all appearance and experience this would not be because they had become Americanized but because a permanent Chinese community had been here founded.—This non-assimilability of the Chinese immigration gives a practical importance to all its characteristics, which they would not have if it could be assumed that they would in this country melt away and finally disappear. And that characteristic of the Chinese which is of most practical importance is that they are habituated to a standard of comfort much lower than that of American laborers and much lower even than that of any people whom we receive from Europe. Wages in China touch the absolute minimum that will support life. This at once furnishes a powerful incentive to immigration and enables the Chinese to underbid any competitors in the labor market.—It is from this fact, that the Chinese can, and where necessary to secure employment do, work cheaper than white laborers, that the hostility to their immigration, which shows itself where they have come among us in any numbers, primarily proceeds; and the fundamental difference between those who ask and those who oppose restriction of Chinese immigration will generally be found to be a difference of opinion as to whether cheap labor is an injury or a benefit.—It is urged, on the one hand, that the competition of this cheap labor tends to the degradation of our own people. On the other hand, it is contended that the cheapness with which Chinese labor may be obtained

is an advantage of which it would be foolish for the nation to deprive itself, that the saving in the cost of production which may be effected by the use of Chinese labor is precisely analogous to the saving effected by the use of labor-saving machinery; that we should no more object to the introduction of the Chinaman because he will do more work at a less cost for wages than we should object to an improvement of the steam engine which should increase its efficiency while reducing its consumption of coal; that the effect of utilizing Chinese labor is to permit many things to be done that could not otherwise be done; to reduce the cost of production so as to bring comforts and luxuries within the power of many who could not otherwise afford them, and that the occupation of the lower branches of industry by the Chinese operates to open larger opportunities for white men in the higher.—If the question were of commerce with China, or if the Chinese who came to this country were absolutely confined to occupations in which they could not come into competition with white laborers, then the reasoning of those who thus oppose interference with Chinese immigration as economically unwise would be in the main correct. In either case the community as a whole would stand to the Chinese in the relation of employer. The greater cheapness with which the Chinese in China or the Chinese in America if absolutely confined to occupations (it is hardly necessary to say there are none such) in which they could not come into competition with white laborers, would produce for us, the greater would be the amount of wealth which we as a whole would have to divide, while the conditions of divisions between different classes would be unchanged. In other words, commercial intercourse with them, or their employment here under the conditions assumed, would, so far as our people are concerned, add to the production of wealth without affecting distribution. But this is not the question raised by Chinese immigration. It is a question of the employment here of the Chinese in occupations in which they do come into competition with white labor. They do not remain external to our industrial organization, merely exchanging with it services or commodities, in which case it is evident that the more they gave in the exchange and the less they took, the greater would be our advantage; they enter and become an integral part of it.—Now without going into the theory of wages, or inquiring as to the causes of the fact, it is a fact that under the conditions existing throughout the civilized world the competition of laborers with each other tends to force wages to a minimum which will merely support the laboring class in such condition as under their habits they are able to live and reproduce. So obvious is this under social conditions which now exist, that this point of a bare living is termed by Smith and Ricardo “natural wages” and the standard of comfort of the laboring classes is by Mill considered as the determinator of wages. The effect, therefore, of

the entrance into the labor market of a class of laborers willing and able to work for less than white laborers, is to inaugurate a competition which must displace white laborers or compel them to lower wages.—If such a lowering of wages seems to be an advantage it is only because it is considered from the standpoint of the employer, and not from that of the interests of the whole community.—The highness or lowness of wages does not primarily affect the production of wealth, but merely the distribution. A fall of wages means that in the division of the aggregate product less will go to the laborers, and more to the other parties to the division, but not that productive power is in any wise increased. Here is the fallacy in the analogy which it is so often sought to draw between the effect of a reduction of wages and the effect of labor-saving machinery. So far as the employer is concerned the effect of a reduction of wages may be the same as the adoption of an improved process of labor-saving machinery; but considering the community as a whole the effect is very different. The improved process or improved machinery adds to productive power, and increases the general fund of wealth by enabling the production of more wealth with the same exertion. The reduction of wages in nowise increases productive power; and if it is to the gain of the employer it is in the same or in larger degree to the loss of the employed. If it makes some richer by giving them a larger share in the aggregate production, it only does so by curtailing the share of others.—So with the notion that the cheapening of labor will induce the undertaking of industrial enterprises which can not be undertaken while wages are high. To reduce wages is not to increase productive power, and no matter how much wages are reduced, capital and labor will not be applied to less remunerative occupations while more remunerative occupations are open to them.—But while the primary effect of increase or decrease of wages is upon distribution and not upon production, it is true that there is a secondary effect upon production. This, however, is the reverse of what is presumed in the notion that cheap labor is advantageous to a community. That to increase wages is to increase productive power, and to decrease wages is to lessen productive power, is evident from the fact shown by every comparison that highly paid labor is always the most efficient. The law is universal that wherever wages are highest there is invention the most active, economies the largest, production the greatest, and the growth of wealth most rapid, while ill-paid labor means wasted and wasteful labor the world over. The United States and China furnish good examples for this comparison. In the United States wages are on the whole higher than anywhere else in the world, and nowhere else in the whole world is invention so active, machinery so generally utilized, production so great relatively to population, and the increase in wealth so rapid. In China, on the

other hand, wages are lower than anywhere else, and the industrial arts have been for a long time stationary, if they have not absolutely retrograded, machinery is hardly used, goods are still transported on men's shoulders, production is relatively very small, and though there are large concentrations of wealth, the country is as a whole miserably poor. To apply to the machinery and industrial methods which are in the one country the outgrowth of high wages, the cheap labor which in the other country destroys the incentive to improvement, may for the time result in large profits to those who make the combination, but if the effect be ultimately to reduce the general rate of wages the result in that country is to check invention and lessen productive power. A Chinaman working for the lowest wages may be able to run the machinery which is the latest product of American ingenuity as well as a Massachusetts operative; but it is certain that in a country where the Chinese standard of wages prevailed, no such machinery would ever have been developed, and that just as wages fall toward the Chinese standard so must the spirit of invention and adaptation be checked, and stagnation take the place of progress.—It is thus evident that considering even the purely material interests of a community as a whole, any reduction of wages must result in loss, not gain. A reduction of wages would not in any way increase the power of any of the productive factors. It would merely imply that in the division of the aggregate produce the laboring classes would get a smaller and other classes a relatively larger share; and that this must ultimately lessen the efficiency of labor and weaken the powers of production all experience shows.—And it must be remembered that Chinese immigration does not mean an addition of so many Chinese laborers to the working forces of the nation; but, ultimately at least, rather a substitution of so many Chinese laborers for so many white laborers; for even when in sparsely settled districts the Chinese do not actually displace white laborers, they certainly take the place of those who would otherwise come. That California, for instance, would now have a larger white population had it not been for Chinese immigration can not be doubted by any one familiar with that state. In fact, it can hardly be doubted that had it not been for Chinese immigration the aggregate population of California would be greater than now; for not only do the Chinese not bring their women, but by filling vocations for which women would otherwise be required, and by the conditions which their competition necessitates among the whites in the industrial pursuits in which it is felt, their presence has operated to prevent the attainment of that due proportion of the sexes which is requisite to the freest growth of population as to healthy social life.—The social and political difficulties involved in Chinese immigration are too obvious to need dwelling upon, and are seen when the non-assimilable character of

that immigration is recognized. The healthful life of every social or political organism depends upon the assimilation of its elements.—Even differences in language, religion, customs or tradition, which are as nothing when compared to the differences between the Chinese and our own people, are sources of discord and danger when they perpetuate themselves in the same community.—But the immigration of the Chinese in any considerable numbers into a country like the United States means not only a population separated by the widest gulf, instead of a homogeneous people; it means the attempt to blend two diverse civilizations in the same social and political organization. It means not merely the introduction of a non-assimilable element, with all the jealousies and hatreds and conflicts and dangers which experience shows hence arise; but the introduction of an element which even in its effect upon our own people tends most powerfully to intensify dangerous tendencies.—The social and political dangers with which the republic is already menaced spring from the growing inequality in the distribution of wealth—the same cause, which as the long course of history shows, has everywhere brought destructive conflicts or slow decay, and turned the prosperity born of free institutions into anarchy and despotism.—And the effect of Chinese immigration is to strongly increase the tendency to the unequal distribution of wealth, and at the same time to make remedial measures more difficult. The experience of California already shows that Chinese immigration means the introduction of an element into our political and social life which is as capable of arousing violent passions as negro slavery. Even were there no other objection to the Chinese than the fact that the opposition which their presence arouses among the laboring classes leads them to lose sight of all things else, and to blindly follow demagogues, it would be a sufficient one.—The ethical considerations which are so often urged against any proposition to shut out Chinese immigration have no force when the real character and effects of that immigration are understood. A conscientious individual may fully recognize his duty toward his neighbor, and yet see that to bring under the same roof with his own family, a family of totally different habits, would be to demoralize instead of elevate, and to produce quarrels and ill will where there should be harmony. And so may one fully imbued with that higher patriotism which regards the whole world as its country and all mankind as brethren, see clearly that such an admixture of peoples as is involved in any considerable Chinese immigration to the United States would be to the degradation of the superior civilization without any commensurate improvement of the lower, and that regarded from the highest standpoint it would tend to check the general progress of the race, not to advance it.—It is not merely the supreme law of self-preservation which justifies us in shutting out a non-assimilable

element fraught for us with great social and political dangers, but a regard for the highest interests of the race. It is not that national vanity against which the philosopher should carefully guard, but the obvious fact which it were blindness to ignore, that European civilization as developed on the freer field of the American continent represents the highest advance yet made by humanity, and that upon the great Anglo-Saxon republic of the new world devolves in the era now opening the leadership of the nations.—What civilizing influence she will exert upon other peoples depends on her own civilization, her maintenance of ground already gained, and her solution of problems which grow in gravity with the progress of development and the increase of wealth.—Whatever will introduce into the life of the republic race prejudices and social bitterness; whatever will reduce wages and degrade labor, and widen the gulf between rich and poor, it is our duty to guard against not merely for the sake of the republic, but for the best interests of mankind.—That European civilization has in its westward march reached the verge of that ocean which has for centuries held in the vast human hive of eastern Asia, and that steam navigation, constantly being cheapened, is reducing to a mere ferrriage the distance between countries where the wages of labor are at their highest and at their lowest, may bring about one of those great migrations which change the destinies of the world.—It is easy to hold fast a door which once fairly opened it may be impossible to shut; it is easy to prevent a movement which once it gathers way may prove resistless; and unless we are quite sure that the largest possible influx of Chinese could work no harm, it is the part of wisdom to take the side of caution.—Chinese immigration to the United States has hitherto been held in check by the strong resistance on the Pacific coast, and, I am inclined to think, by the Chinese organizations which have controlled it in the interests of the Chinese already here.—But without governmental action the effect of the first check must steadily weaken. Already powerful forces are becoming interested in Chinese immigration, and this must be increasingly the case as industrial relations adjust themselves to this element, while as the stream becomes larger, and the Chinese over wider areas become used to the idea of emigrating, it must pass beyond the control even of Chinese organizations.—The enormous population of China, which the best estimates do not place under four hundred millions; the intense struggle for existence on the part of vast masses; the peculiar adaptation of the Chinese to that form of production to which our industrial organization now tends in the use of machinery and the minute division of labor, which dispenses with skill in the operation, and the rapid reduction in the cost of transportation, make, should it once gather full headway, the possibilities of Chinese immigration overwhelming.—The fact is, that under modern industrial

conditions the power of working cheaper and living on less may be quite as effective in substituting one population for another as was superior force in any previous age of the world; and that just as the Saxon supplanted the Briton on English soil, or the white race has supplanted the Indian race on this continent, so may the Chinese, if free play be allowed their immigration, supplant the white race. On a small scale this result may be seen in those quarters of San Francisco which have been virtually turned into a Chinese city, where once fashionable residences now swarm with Chinese tenants and Christian churches have been changed into Joss houses! It may be seen in mining camps which have become, in whole or in part, purely Chinese settlements; in Rocky mountain coal mines, where Chinese labor has displaced white labor; and even for a long distance further east, where along the line of the Union Pacific railroad Chinese section hands have displaced the white hands at first employed. Not more certainly does the Indian retire from before the white man than does the white man from before the industrial competition of the Chinese. The process may be observed in those branches of business which on the Pacific coast the Chinese have made their own. First one or two employers begin to engage Chinese; others are by the competition gradually compelled to do the same; ultimately Chinese employers appear where competition is as disastrous to the white employers as was the competition of Chinese workmen to white workmen, and finally the whole business is under Chinese control.—The enormous possibilities of an immigration which with the advance in steam navigation may be drawn from four hundred million people, among whom the struggle for existence is so intense that large numbers perish annually from sheer want, and the fact that these immigrants retain all their essential habits and characteristics, make the question in its final aspects nothing less than that of a Mongolization of America.

HENRY GEORGE.

CHIVALRY. It was not in the middle ages that the word knight made its first appearance in the language of politics. The small cities of Greece and the republic of Rome had their knights. They formed a distinct class in the state, and in some respects had a faint resemblance to the knights of the middle ages. We find the spirit of chivalry, as the unselfish prompter of valiant deeds and of heroism, in the most dissimilar nations and ages. It is characteristic of a certain period in the life of most nations; the period of transition from a barbarous state to a more refined civilization. During this period, while retaining to some extent the savage grandeur of the previous age, nations begin to acquire the graces of the other. For instance, chivalry shed some light on the Arabs before Mohammed appeared. Mr. Ampère calls attention to it in the poems of the Radjastan. Hallam sees in Homer's Achilles

the model of chivalry in its most general form. Heeren finds in Godfrey of Bouillon, the Agamemnon of an army having in Tancred, Raymond, and Boemond, its Achilles, Diomedes and Ulysses. Greece, in the time of its glory, conceived Hercules as a sort of knight-errant and righter of wrongs. But the feudal system alone gave rise to, and has the right to claim chivalry as its own, that is, the perfect development of the spirit of chivalry in an institution peculiar to itself. What then, is chivalry, as Montesquieu calls it, "the marvelous system of chivalry," which according to Hallam, was "the best school of moral discipline that appeared in the middle ages;" and which Mr. Ampère alludes to as "the greatest moral and social event between the establishment of Christianity which produced it and the outbreak of the French revolution which utterly destroyed it"? The question is not easily answered. Many causes, impossible for us to allude to here, have contributed to obscure the subject. There are two kinds of chivalry. First comes primitive, hereditary chivalry. It can not be clearly distinguished from feudalism; or rather it *is* feudalism, armed feudalism. It is the true *militia*, properly speaking, what the French call the *ancien ordre*. It was composed of the old crown vassals, holding their fiefs direct from the crown before the final establishment, of the feudal hierarchy, and all the titled gentlemen from dukes to barons inclusive. They were *militēs per naturam, generositatē sanguinis*. In Spain they existed too. They were the "*Ricos hombres*," "*Ricos hombres de natura*." This chivalry had its esquires, valets and varlets, also esquires by birth, with the name of their fiefs, for which they rendered a special service. They were rear vassals, brought into existence by the large increase in the number of fiefs, nobles provided with the benefices by the great barons, freemen and allodial proprietors who were included in the feudal system when the latter extended to all who owned land.—The other chivalry is the *nova militia*; the *militaris homō*, as opposed to the *genus militare*, the *militiæ cingulum*, the order of chivalry. It is the chivalry of honor, of the accolade, and is personal, not hereditary. As time passed, people came gradually to consider it as the recompense of courage or merit. Its first recruits were from among the vassals already alluded to, the nobles of inferior rank, or esquires, who could thus be made knights without changing the nature of their fiefs, and rose in the feudal hierarchy by personal merit. This chivalry also admitted into its ranks hereditary knights who, however, were not full knights until they were able to bear arms.—It is of this second species of chivalry that we wish to say a few words here. Its cradle, as that of all great institutions, is veiled in obscurity. It first saw the light in "France, the classic land of chivalry." (Hallam.) It grew in the shade, spontaneously, the natural development of various germs planted in modern society. When first noticed it had actually been in existence for a long time. Some elements borrowed

from the manners, traditions and ideas of ancient Germany supplied its military foundation, its very substance, so to speak. Religion soon claimed it as her own, aiming to direct it toward a noble and moral end, and to make it an instrument of order and a means of social improvement. Gallantry, in turn, with the worship of woman, with love and the muses, left its imprint upon it, giving it grace, brilliancy, originality and polish.—Tacitus tells us of an ancient custom which existed in the forests of Germany. When a youth was old enough to bear arms his father, or his next of kin, handed him the sword and buckler in presence of the council of the tribe. The German conquerors never gave up this custom. Under the feudal system the court of the feudal castle took the place of the council of the tribe, the lord paramount succeeded the barbarian chieftain and conferred the new dignity, not only upon his own son, but upon the young vassals brought up in his household, who were proud of receiving it from the hands of the suzerain, surrounded by their companions. The two ceremonies are in fact the same. Such was chivalry.—Knighthood consisted essentially in admission to the rank and honors of the warrior, in the solemn delivery of arms and giving of emblems of warlike life. This was its origin. (Guizot.) From the beginning of the ninth century certain religious rights accompanied the investiture of the knight, and at the end of the tenth century the ceremony was, in its principal features, what we find it later. Chivalry soon received a wonderful impetus from the crusades. They developed all its latent germs and made it a religious institution, especially devoted to the defense of the faith. Chivalry thoroughly organized in the twelfth century, had spread from France to all the states of western Europe, England, Germany, Italy and Spain. Its leading features remained the same in all these countries, but its minor characteristics and its fortunes varied. It even penetrated to the east for awhile, but the conditions being unfavorable, its existence there was of brief duration.—We do not care to enter into all the details of a knightly education. We know that the youthful aspirant was taken from the government of women at 7 years of age. He passed the next 14 years of his life either in the home of his father's suzerain, or in that of some distinguished knight. The first 7 years he spent as a page, the remaining 7 as an esquire. During all this time he performed menial duties, which were not considered any disgrace by the nations of Germanic origin. The esquire, at least in early times, was dubbed a knight at 21 years of age, the age at which noblemen attained their majority. Sometimes high birth, or tried courage, enabled him to anticipate this age. As a rule he postponed assuming the belt until later, or else abandoned the idea altogether, either hoping that some brilliant exploit would shed lustre on his knighthood, or because his poverty made it impossible for him to meet the expense. As we

have seen, there is no doubt that the honor was, at first, almost exclusively conferred, by the suzerain, within the walls of his castle. And the writers of the middle ages liked to compare the investiture of knighthood with that of a fief, or homage, even to the conferring of holy orders. When chivalry afterward loosened the ties that bound it to feudalism, periods of great public solemnity, tournaments, festivity at the coronation of kings, or at the baptism or marriage of princes, were selected for the investiture of knighthood. In accordance with the taste of the time, the ceremonies accompanying the conferring of knighthood had a deeply symbolic character. They pictured, in noble and poetic rites, the tasks and duties of a knightly career. These ceremonies varied, in their details, with the country and the age; but, while they were performed, their leading features remained the same. When the esquire had taken the prescribed bath, and performed the vigil of arms, the weapons he was to carry were committed to his keeping. The lance and sword were the special emblems of his new dignity. Then his sponsor, that is, the person who was to introduce him to the order, struck him on the neck with the flat of his sword. This was the accolade. Henceforth the knight was said to be dubbed. Then the priest performed his part. Suiting his speech to the occasion he reminded the new knight of the obligations he was under. To these the latter, in a solemn oath, swore to remain faithful. He swore to defend the right, to protect the defenseless, widows and orphans, and to succor the oppressed. He was to be "humble to the lowly," valiant, loyal, gentle, courteous, generous and modest; he was to keep his plighted word, to love truth, and to be just in all things. The mediæval idea of a knight was the embodiment of all that was noble and warlike. He united in his person all the qualities, all the virtues, all the graces which constitute the moral perfection of a man of the higher classes. This was of course only an unattainable ideal, and but a few chosen ones ever attempted to attain it. The majority made no effort in that direction. Yet the fact of this ideal being impressed on men's imaginations at that time had a tendency to raise the average of character, and to prevent the sentiment of honor and of right from being obliterated from a society ruled by force and violence. The words with which Renan describes the nations of Indo European origin, apply more particularly to the knights of the middle ages: *A race capable of self-sacrifice, and preferring many things to life.*—Knighthood was not always conferred with such ceremonies as we have attempted to describe. Knights were often, more especially toward the close of the feudal period, created in great numbers on the battle field, either before engaging in battle in order to excite their valor, or afterward to reward it. There the accolade alone sufficed. Little by little this custom gained ground, and, in the fifteenth century, the rites of investiture were dis-

carded.—The education of the knight was not over by any means, when the belt encircled his loins. He completed it in time of war on the field of battle. In time of peace he perfected himself in all those martial exercises which were used in warfare. These exercises were always bloody and dangerous. They constituted in great part the military pageant called a tournament, which Saint Palaye compares to the French *camps de plaisance* in which the knights were alternately encouraged by the example of princes, and hampered by their decrees; but which the church, though in vain, never ceased to oppose with all the influence and spiritual power at its command, as bloody games where cruelty vied with license.—But the tournament was not a mere military school, any more than was chivalry itself a purely military institution. Chivalry was the embodiment of the feelings and customs which left their imprint on the middle ages. The tournaments illustrated this in the most striking manner. They were great feasts, “the drama of chivalry,” as Hallam calls them; and soon became chivalry itself. All the luxury and magnificence of the middle ages were displayed on these occasions. The ladies, though hesitatingly at first, soon attended them in great numbers, excited the valor of the contestants, acted as judges, distributed the rewards, and there exercised their undisputed power. This feature was the crowning glory of chivalry, its brightest ornament, and, in the end, its greatest danger.—Compared with what it was in antiquity, the condition of woman had very much improved in the new society formed by feudalism. Many causes combined to produce this transformation. The German conquerors had only to consult the traditions of their race to find evidence of a profound respect for women among their ancestors. This respect had been strengthened by the isolated life of families living on their estates; and the dignified position held by the lady of the castle. Christianity gave it a character of greater gentleness and tenderness, and the worship of the Virgin, more than anything else, cast around it a halo of mysticism. This tender and austere respect for woman, carried to an extreme, no longer found satisfactory expression, and gallantry, of which more refined and at the same time more dissolute southern France furnished in its manners and customs and in the troubadours who had formed them, the most captivating and dangerous example. Chivalry accepted henceforward the dogma, that the man who was faithful both to God and to his love could count on happiness here below and heavenly joys hereafter. A vigorous aristocratic literature, eagerly devoured in the feudal castles into which it penetrated, contributed largely to the spread of this dubious species of mysticism. How far did people go in the path thus entered on? The character of knightly love has been the subject of much controversy. Perhaps no subject in the history of chivalry is as difficult or delicate. Each side has furnished proofs in sup-

port of its opinion. The testimony is voluminous and contradictory, and varies with the country, the time, and the national character, according as it was warlike and sensual, or chaste and pure. The literature of chivalry was always of a high character as compared to the depraved cynicism and low satire of the stories and the metrical tales of the troubadours. Two powers struggled to control this literature: the church, which, after vainly trying to suppress it, endeavored to make it its own and to use it in the interests of morality; and the world, which sought in it the interpreter of its passions. Whatever may be said on the subject, the prevalent looseness of morals can not be denied. Should the teachings of chivalry bear the undivided responsibility of these disorders? It would be unjust to say so. A portion of them is no doubt due to causes always in action, and another portion to the violence characteristic of that particular age, and which chivalry certainly contributed to temper. It introduced delicacy where it could not introduce purity. But it can not be denied that the amorous scholasticism, professed by poets and romancers, puerile subtlety and inordinate curiosity peculiar to the middle ages aggravated the evil and contributed to the deterioration of morals.—We find chivalry heroic “and even a little barbarous” in the twelfth century; austere in Godfrey de Bouillon, brilliant and ornate in Richard Cœur de Lion. It attained the height of its development in the thirteenth century. Here we find all the graces, all the glories and all the virtues that adorn it combined in noble harmony and proper equilibrium. It began to decline in the fourteenth century. It was doomed, but died slowly. It passed away because it had no longer any reason to exist. It had become a useless instrument, out of harmony with the spirit of the times, not able to meet its requirements. The great national wars which developed a new patriotism entirely opposed to that of chivalry, the predominance of infantry, and the invention of gunpowder, destroyed chivalry. When the knights, beaten at Courtray by the Flemish burghers, and at Crécy by the English infantry, fought on foot at Poitiers, Cocherel, Auray and Agincourt, chivalry had ceased to exist. The military hierarchy, with the king at its head, destroyed the hierarchy of chivalry. When the military organization of knighthood and the feudal system disappeared, the spirit of chivalry based upon them soon followed. The fading lustre of the great institution brightened for a moment before it passed away, and seemed to the inexperienced eye more full of life than ever. But this was a deception. The old rules were ignored. The rude discipline to which the youth had submitted who wished to carry the lance, and the tedious novitiate of knighthood, had long been neglected. The distinguishing badges of rank were no longer worn. Sentiment became false and a pretense for over-refinement. Devotion to the fair sex and gallantry turned to folly. When the great satir-

ists who appeared at the beginning of modern times—Rabelais, Ariosto and Cervantes—treated with scorn or ridicule the beloved heroes of a previous generation, their shafts were aimed more at the degenerate literature of chivalry than at an institution that could never be resuscitated.—But in the last period of chivalry heroes appeared whose great prowess and nobility of character might stand a comparison with any in former ages: Walter Manny and John Chandos, and, later, Talbot and Suffolk in England, Duguesclin and Boucicaut, and Lahire, Dunois, and Xaintrailles in France. With Bayard the list is about ended. Francis I., after just receiving the accolade from the knight “without fear and without reproach,” on the very day of the battle of Marignan, excuses himself to the marshal of Fleuranges for offering to knight him. “I well know,” said the king, “that after the many battles you have been in you do not care to be knighted, but I have been made a knight myself to-day. Please accept the same honor at my hands.” Henry IV. of France, a little later, in 1590, seemed to seek an excuse to make Sully a knight, saying, “I wish to embrace you and declare you a true and faithful knight, not so much with the accolade, which I now give you, nor with the order of St. Michael, or of the Holy Ghost, as with my heartfelt and sincere affection.” What need had a man to ask the king for what he could take himself? Any gentleman of ancient noble lineage who had knights among his ancestors had a generally recognized right to the title. The word knight had gradually come to be used to designate the lowest title of nobility, coming immediately after that of baron. The orders of court chivalry, coming into vogue during the fifteenth century, gradually took the place of the other; and the ribands and crosses which were its insignia, began to be eagerly coveted by the ambitious. We shall not discuss them here. We merely intended to treat of the militant chivalry in its general features.

A. RABUTAUX.

CHRISTIANITY. Christianity is a religious and moral power which, in the course of ages, as history shows, brought about the dissolution of the states of antiquity; a power which has exercised and still exercises an incalculable influence on the public life of the modern world.—To comprehend this power in its essential character, and to trace its development in its effects on the state, is, therefore, a task with which the thinking statesman must needs concern himself, whether he be greatly influenced by that power individually, or not influenced by it at all. A force which makes itself felt so extensively and so powerfully on the masses, as well as on the rulers of nations; whose influence after nearly two thousand years is still spreading; and keeps pace constantly with the achievements of civilized mankind; a force which is so grand a manifestation of the religious spirit, which enters into nearly all the details that make up the public life

of the people, both in Europe and America, at present the ruling continents, and has become one of the fundamental conditions of modern civilization—can not, though misunderstood, be passed over with contempt.—Christianity, viewed in its relation to the state, with that freedom of spirit which the nature of the very subject demands, and with the reverence due to one of the greatest and most important factors in the history of the world, is the subject of the present article. We admit that from the point of view of the state we are unable to fathom the depths of the Christian religion, and to comprehend the magnitude of its power to elevate and satisfy the soul. But this relation of Christianity to the state, its legal and political institutions, though of secondary importance so far as Christianity itself is concerned, is most important in its bearing on political science. Yet, while our limits constantly remind us not to trespass upon the domain of theology, we are aware of the great difficulties of the attempt to condense within a reasonable space, the wealth of thought which Christianity, from every point of view, suggests to the mind of the inquirer; and to comprehend in human thought what surpasses all limits.—I. *The Religion of Jesus.* The religion of Jesus is usually confounded with the Christian religion, i. e., the religion of his disciples and followers; while the term Christianity is now applied indiscriminately to both, and the two expressions are not infrequently used as though they were identical. The statesman, least of all, can afford to overlook this distinction, for he must, from the very beginning, look to the reality of things. It is this very reality which separates distinctly what the mind endeavors to unite in thought. In the religion revealed in the life of Jesus, the primitive idea of Christianity is embodied in its perfect form. The religion professed and practiced by his followers frequently presents but a very imperfect image of the religion of Jesus. It is only by comparing the Christian religion with the religion of Jesus, that the defects and merits of the former as exhibited in its historical development, are seen in their proper light.—If we would truly understand the fundamental idea in Christianity, we must look at the religion of Jesus; if we would comprehend its development among mankind, we must consider the religion of Christians.—The religion of Jesus, as conceived by the founder of the Christian religion, is the immediate spiritual union of the mind with God, while the religion of Christians is the reconciliation with God through the Redeemer. The religious consciousness attained to its fullest purity and clearness in Jesus himself, while in Christians its purity is greatly disturbed by the admixture of foreign elements. The energy of the religious life, both in its relation to God and to man, reached a height in the doings and sufferings of Jesus, which it never afterward attained; a height which some few in a healthy manner and many in a morbid one sought to attain, but which the

greater number have remained far below. The religion which Christ himself practiced ended with his life. The religion of Christians is still in process of development, and it evidently has not yet reached the culminating point in its history. The real primitive picture of the religion of Jesus has frequently been transformed into an unrecognizable caricature, when reflected in the imperfect mental mirror of his followers.—All the religions of antiquity were distinctively national in character; and not only did they stand in a morally narrow relation to the state, but they formed one of its component parts. The Mosaic religion, above all, had preserved this national and political character in the most marked and exclusive manner. It was essentially the religion of the Jews, on which their undying hopes of seeing the universal kingdom of Jehovah established by the expected Messiah were based. It was the religion of the divine law which the Lord had revealed to his chosen servant, Moses, and of the covenant which bound the children of Abraham to God.—When Jesus appeared as the teacher of a religion so unlike theirs, among these people with whom he was connected by birth and education, he must have felt entirely alone. He was conscious of his religious mission to mankind, and he saw himself hampered on all sides by the strong national prejudices of the Jews. He had thoroughly weighed the question whether or not he should encourage the expectations of his people, and with their aid establish the kingdom of God on earth, but only to repudiate the notion as a temptation unworthy of his divine mission. He understood, as no one else ever understood, that religion and politics are things essentially different; that he would violate the sanction of his divine mission, and render its success impossible, if he were to assume, along with it, the office of the statesman and kingly ruler. He drew a clear distinction between the kingdom of God and the kingdom of this world, and undertook to labor in behalf of the former and not the latter. He paved the way leading to the distinction between the state and the church, and their strict separation—a doctrine which, prior to his teachings, was entirely unknown, and but vaguely anticipated by the Buddhist religion in the doctrine inculcating the renunciation of all worldly enjoyments. He did not break loose from the old law of the Jews. Indeed, he even conformed to its petty ceremonial, though he never failed, when an opportunity presented itself, to point out the inadequacy of its application. But he broke up the religion of the law, by setting against it the higher ideal of his religious spirituality, and supplanted it by the religion of love. Though he was aware of his personal superiority which raised him above the religious precepts, laws and civil institutions of Judaism, and of his superiority over Moses and the prophets; and though he publicly expressed his knowledge of this fact at times, on certain important occasions in his life, yet he submitted to the religio-political tribunal of his

enemies, and refused to approve the desire of his disciples to oppose the civil power of the state by the power of the people. Up to the very time of his painful death, he remained true to his purpose, not to defend his religion with the weapons of politics, nor to mix up with his mission, which was that of the religious Messiah, the mission of a political Messiah, of a political deliverer of his people.—Of all his discourses and sayings which have come down to us, there is not a single one which has any direct bearing on law or politics. He expressed himself on the kernel of all morality and moral obligation, leaving little else to be said; while he failed to say anything on the political organization of the people, the system of the state, the problems of politics, the private rights and civil laws governing the conduct of the people. He simply referred to the laws of the Jews, in order to illustrate, by setting his own moral precepts against them, the fact that these laws were not mandatory upon those who conformed their conduct in life to his moral standard. The command, "Thou shalt not kill," he supplemented by the duty of brotherly love. To the law, "Thou shalt not commit adultery," he added the higher moral injunction not to covet one's neighbor's wife, even in thought.—The legal restraint on the granting of divorces he rendered more imperative by the moral injunction against the very act itself, the separating of husband and wife. He rendered unnecessary all penal legislation against perjury and against the violation of an oath, by the moral precept which discouraged the taking of an oath under any circumstances, and preferred the simple statement of the truth—yes and no. He neither proposed nor established rules of law. While often referring to the principle of justice, and prophesying its fulfillment in the sentence to be announced on the judgment-day whose advent was near, and on which he himself would appear as the "Almighty Judge," he had in mind not the laws of man and the administration and execution of the laws by man, but justice before God, and the supermundane tribunal of the Lord who fathomed the hidden motives and thoughts of all men.—It is inconceivable that Jesus should not have considered the nature of human laws and of the state. Since he does not express himself in relation to them, and when questioned concerning them, dismissed the question, we must conclude that he purposely avoided the expression of his thoughts concerning them. He did not wish to appear in the character of a human law-giver, in order to be able to purge and sanctify more effectually the inward motives and sentiments of man. He therefore simply announced the memorable principle, not fully appreciated even in this day, of the separation and mutual recognition of the provinces of religion and the law: "Render unto Cæsar the things that are Cæsar's, and unto God the things that are God's." So far did he go in his abstention from the formality of legislation, that even in his own province he

published no law. He did not embody great religious truths in the cold and definite form of scientific dogmas, but conveyed them in living language addressed directly to his audience. He lighted a light in the world, and blew the flame in order that it might illumine the minds of his hearers. In like manner, he did not choose, in order to enjoin his moral precepts the more forcibly on men, the imposing language of the law, as did Moses, who, from the height of divine authority, spoke to the awe-struck people below; but he went down into the deepest depth of the human soul, and from its chords struck notes that will never be forgotten. He illustrated his precepts practically, so as to render them intelligible to every one who was willing to seize them with a true spirit. The ordinary man, even a child, might understand him by the intuitive faculty common to all men; while the most profound thinker and the man of practical experience has never failed to discover some new points in the inexhaustible wealth of his parables. —The religion which was alive in Jesus, therefore, neither proceeded from the state nor led to the state; it was essentially *non-state*, non-political. But this did not prevent Jesus from fully discharging all his duties as a citizen: his religion was not *anti-state*. In proportion as Jesus recognized the mission of his whole life to be a religious one, the more resolutely did he avoid all interference in matters of a merely temporal or secular character. —II. *The Religion of Christ.* We may now inquire what is the relation of the religion of Jesus to the religion of Christians? The answer to this question differs according to the different epochs in the development of Christianity. Every epoch in that development has a character of its own. It is but in individual cases and in matters of lesser importance that we find traces of previous epochs in the epoch following, while we may sometimes discover in earlier epochs the germs or indications of those which come afterward. —*The original disciples and followers of Jesus, as well as all his apostles, were Jews.* We know how hard it was for them to free themselves from the Jewish law and the political hopes of their nation. During the lifetime of their Master, they clung to the hope that he was their political Messiah as well; and after his death, their expectation of his promised return as the ruler and judge of the world, continued unabated. It was only reluctantly and gradually that they entered into personal intercourse and into full Christian communion with the uncircumcised gentiles. Had it not been for the dreadful though purely political punishment which the Romans inflicted upon Jerusalem, the Judaizing Christians would hardly have freed themselves entirely from the narrowness of the Jewish-Mosaic law, and of their views of the world. It was after the temple of Jehovah at Jerusalem, and the Holy City itself, had been reduced to ruins, that Christianity, more liberal than Judaism, removed from the minds of its disciples the last vestiges of a narrowly national

Judaism. From this time all were Christians, and there were none who could be called Judaizing Christians. —It was only in the case of individuals —often in the case of distinguished Christians of later times, and not always in the case of men in whose veins Jewish blood still flowed, although frequently in such—that the theocratic character which had so forcibly been impressed by Moses upon his people, again became manifest. And now and then we meet, in the history of the church and of the different sects, with repeated attempts at establishing a *legislated* religion, partly Mosaic and partly Christian. —The great, universal empire whose sway the Jews could not resist, was at that time the Græco-Roman empire. The Christian religion took its origin in Asia, but the state by which all the primitive Christians saw themselves surrounded, and which had power over them, was the European state with its essentially Greek philosophy and its Roman law. To this state, with its intellectual culture and its legal institutions, the primitive Christians whose numbers were increasing among the Greeks and Romans, as well as among all nations governed by the empire, were obliged to try to define their position. Within the whole range of this empire, religion was recognized as an institution of the state; its worship formed a part of the public law which the government established by its enactments. —We can attribute to the Romans neither the same narrow feeling of nationality, nor the same spirit of intolerance in religious matters, as to the Jews. Their spirit encompassed the world, and they tolerated the different national gods, provided the Roman Jupiter and the Roman law were duly respected. What chiefly incensed the Romans against the Jews and Christians, was that these monotheists were not willing to take their place in the spacious temple of the state religion so rich in gods, and that the one God of the Jews and Christians could not possibly agree with the many gods of the Romans. —Partly in conflict with the Roman state and its civilization, partly in connection with them, Christianity in the early centuries had its growth. As a new intellectual power based on divine revelation and affording a profounder insight into the deepest truths, while satisfying the “poor in spirit” much more perfectly than the philosophy of the Greeks could satisfy its cultured adherents—Christianity arrayed itself in opposition to the philosophy of antiquity, and gradually wrung from it the supremacy it had enjoyed. Yet, while engaged in this struggle, Christianity adopted from the philosophy of the times a variety of ideas, and attempted to infuse a spirit of its own into them. The schools of learning of Alexandria were, above all, the seats of both this antagonism and connection. The creed of Christianity now took the form of a philosophical system. It was from a fusion of the Christian faith with Hellenic culture, that the dogmatic theology of Christianity took its rise. By this fusion Christianity indeed gained in scientific consciousness and formal dura-

bleness. Yet, in the cold form of dogma Christian charity was lost, and the love of violent controversy and denunciation of the schools was propagated like an original sin in Christian theology. The state of antiquity and the welfare of nations suffered very greatly in consequence of the controversies carried on about the dogmas of Christianity.—Dogmatic Christianity became a religion very different from the non-dogmatic religion of Jesus.—The primitive Christians were naturally opposed to Roman polytheism, and expressed their opposition to it with great zeal, on many occasions. The majority of Christians saw in those pagan deities, not the personification of the external forces of nature, nor of the intellectual faculties considered as infinite, nor the apotheosis and worship of great men after death, nor the mere phantoms of the imagination and the cunning devices of artful priests; but they hated and abhorred those gods as powers of darkness, as wicked demons and devilish beings. Hence it was quite natural that their opposition to paganism should be turned into contempt for the state whose religion was branded as the devil's own work. The marked antagonism between the one God of the Christians and the many national deities of the Romans, turned into bitter animosity. These many gods had to be wiped out completely, in order that the one God might reign supreme.—In spite of the persecution to which, during their struggles, the Christians were now and then subjected, and which a great many of the faithful coveted because they were anxious for the crown of martyrdom, the superior spirituality and truth of monotheism proved triumphant, and the ancient faith of the Romans which had been long cast aside by the educated classes, had finally to make way for the new gospel. But during these struggles and victories, the new religion of the world again took up a great deal of what was peculiar to the paganism which it had overthrown. It tried to inspire with its faith the forms, rites and symbols it had borrowed from the heathen. In the place of the Roman deities, who to them were but demons, they frequently substituted Christian angels and saints. The reverence even, which the Roman world was wont to give its deified emperors, and to which the Christians had been so zealously opposed, that the reverence due to God alone might not be wasted upon man, was replaced in the economy of the Christians, by the worship paid to the head and ruler of their spiritual empire.—Of all this we can find no trace whatever in the religion of Jesus himself. As the union of Christianity with philosophy had changed the spiritual nature of the former, so the contact of Christianity with paganism first changed its outward form, and then exercised its influence on Christian dogma. Much that was heathen passed over to Christianity. We must not absolutely condemn the powerful influence which paganism exercised on Christianity. It was quite necessary that the customs and opin-

ious of the people should, in the beginning, be treated with a certain regard and moderation, in order to win them over; and in the old traditions of paganism there were important educational factors which might be used advantageously by the new church. Christianity, to be a factor in the world's history, had to be ingrafted upon the ancient tree of Græco-Roman paganism. The former might transform the sap which circulated in the latter, but it could not stop its course. The new religion thus gained in sensuous freshness, in beauty, and in corporeality calculated to check its spiritual evanescence. It also gained in extent and popularity. Yet there was danger that the pagan element in the new religion might threaten its deep spiritual life. We know from history, down to our own days even, how far from imaginary this danger has been; how frequently the lower classes especially, though not exclusively, have been exposed to it and have suffered from it.—The attitude of early Christianity to the Roman law and the Roman state, was precisely the same as to Roman heathenism. The extremely selfish character of both, and their leaning toward absolute rule, were strongly opposed to the feeling of brotherhood and the spirit of sacrifice, the ideal of Christian life. The Christians hated this selfishness and love of absolute sway, as embodying the power of evil on earth, a power from which they hoped to be liberated and saved. To a great many of the Christians the kingdom of this world was the kingdom of the devil, which was doomed to destruction, and on whose ruins the kingdom of heaven was at no distant day marvelously and triumphantly to rise. A large number kept as much as possible aloof from all participation in the life of the state. The non-political character which we have seen in the religion of Jesus was at the present period encouraged and strengthened to such a degree, that it soon assumed a character at war with the state. Though not all Christians followed this tendency absolutely, the Roman government was justified in maintaining that their religion weakened the patriotism of the Roman citizen.—Yet, though the ancient government was on the decline, its foundations were too deep and too broad, and its superstructure too solid and firm, to allow it to go to utter destruction. It outlived the philosophies and religions of antiquity; and the new gospel was, after all, willing to accommodate itself to it as best it could. Christianity itself began to imitate its forms. The beginnings of the canon law supposed the law of Rome as a necessary foundation even where it changed and developed that law; and the Christian church, as the organized body of the faithful, formed a new constitutional system which, in many essential points, reminds us of the constitution of the Roman state. Rome, the ancient capital of the emperors, in which the unity of the world's empire had had, down to the time of Constantine, its sole centre, came into the foreground more

and more as the seat of the most venerated bishop whose primacy secured, from the first, the unity of the new spiritual kingdom of the church.—To sum up: The new religion of the Christians whose first zeal tended to excess, sought in vain to break loose entirely from the philosophy and religion as well as from the laws and government, the fruits of Græco-Roman civilization. Violent as the struggle between the old and the new order of things was, and although the latter, in essential matters, overcame the former, the religion of the Christians took in a great many of the elements of ancient civilization; and while it transformed the ancient order of things, it was itself, by way of reaction, internally changed in turn.—The old non-political tendency of Christianity was wholly altered when, with Constantine, the state power which until then had been looked upon with distrust and enmity, went over to Christianity. The old hopes of establishing a purely Christian kingdom seemed now to be realized, although in a different way from what had been expected. The state itself came to be a Christian state, and the religion of Christianity came to be the recognized religion of the state. Instead of being separated from each other, as they formerly were, religion and the law were now mixed up with each other and permeated each other. The transfer of the central government to Constantinople, and the preponderance of Greek culture in the eastern empire, promoted the philosophico-dogmatical tendency of the young church; and the emperors, as the protectors and defenders of the orthodox faith, were ready to enforce political absolutism by religious edicts, and to coerce the people, by the secular power, into unconditional obedience to the doctrines and discipline of the church. From being a people who had been persecuted, the Christians turned persecutors themselves. The paganism of the old world was to be rooted out everywhere, and every sort of heresy, even that newly arisen, was to be exterminated. Dogmatic controversies divided and excited parties against one another. They hated, and waged war upon one another, even to the death, for questions of abstract theology, concerning the solution of which good men might differ, and bad men easily agree, as, for instance, on the *equality* or the *likeness* of the Son and the Father. The wrangles and hatred of philosophical schools were intensified into the wrangles and hatred of theological parties, who thought they could secure the rule of the religion of eternal love by the eternal damnation of their opponents.—The first Christian state was nevertheless an imperfect image of the Christian ideal. In its political character the Christian-Byzantine empire was but the slow decline of the old and more glorious, though pagan, Roman empire. Christianity, indeed, contributed to decrease somewhat its mummy-like torpidity, and to enliven the aged body by new ideas and interests. But this did not prevent death. Christianity itself, in the form of the Greek orthodox state religion,

grew gradually torpid. Its close union with the absolute state, which was at first looked upon as the triumphant development of its empire, was the cause of its destruction. As the Greek empire of the east broke up, and was gradually conquered by the less civilized but healthier people of the east, so Greek Christianity had to give way before the inroads of the creed of Mohammed. The early seats of Christianity were conquered by Islam, in which, as was in keeping with the character of its founder and hence in a more decided manner, the same intermixture of religion and law was found, and which, more disdainfully even than Christianity, rejected all polytheism. It is well known that Mohammed felt the greatest reverence for the person of Jesus, although he failed fully to comprehend him, and that he had a higher opinion of the religious mission of Jesus than he had of his own, though he fully believed in the latter. But his monotheistic feeling rebelled against the religion of the Christians, in the form in which it then appeared to him in the east. He looked upon it as a degeneration of the religion of Jesus, irreconcilable with the unity of God, and as an alliance with paganism which he so intensely hated.—The lesson of history taught Europe by this first Christian empire is a most urgent warning against all Christian-polemical and absolutist-orthodox politics.—Christianity attained a higher degree of development in the west. Rome and the Germans saved the Christian religion for the subsequent civilization of Europe. The principal seat of the Christian religion was transferred from Asia to Europe by Rome and the Germans. It became, in the first place, the religion of Europeans, in order that from Europe it might conquer the world, in the spiritual and intellectual order.—Rome had ceased to be the political mistress of the world, but on the ruins of its political empire there arose, in Rome, the new rule of the church. The old imperial spirit of the holy city, a spirit which encircled the world, called into existence a new form of life. The Roman empire could no longer be governed from Rome, but the Christian church found in Rome its visible head. The city had ceased to be the residence of the emperors, but it became the residence of the popes.—Both the Roman-Christian and the Greek-Christian religion started from the same point; they were, in the main, subject to the same influences and the same changes. In its orthodox doctrine, in its constitution, in its practices and teachings concerning the means of salvation, the former differed at first but little from eastern Christianity. Yet in spite of this close relationship its further progress was essentially different, and it met with a better fate. An exceedingly important advantage it had in this, that it was more independent of the government of the state. Even the distance of the Roman state from the imperial court was of great value in its emancipation. By developing the church into an independent organization, it

brought into relief the principle of the separation of the church from the state; and insured, by insisting upon this principle, its progress and its life. The dualism of emperor and pope was the cause, indeed, of the most frightful contests in the Christian European world. Italy and Germany, in particular, were shaken to their very foundations by these struggles, and at the present day are suffering from their after-effects. And yet it is a fact, that the moral and intellectual superiority of modern European civilization over that of the rest of mankind, is due to the energy with which, for centuries, these two powers struggled to determine their true relation to each other. In the end each asserted its own independence, in all essential matters.—For this reason, the admixture of political and ecclesiastical law, of politics and religion, in the west was not so great as it was in the east; and hence, torpidity was not so much to be dreaded in the case of Roman as of Greek Christendom. Roman Christianity, too, wished to permeate the life of the state. It demanded orthodoxy from the emperor and the meanest subject alike. It persecuted heretics with a hatred no less intense, and inflicted penalties upon them severer even than the Greeks. It was no longer a non-political religion as in the days of early Christianity. But the community of the faithful, in the Roman church, was not a state church as the Greek church had been. The antithesis of the temporal kingdom and the spiritual kingdom, the latter non-political and the former non-ecclesiastical, was, though not always with full consciousness and in all its consequences, maintained; thus giving greater freedom of action to both religion and politics, and a better chance for their progressive development.—Yet this development of Christianity did not reach its height until it came in contact with the Teutonic races. Rome was called to undertake the religious and scientific education of the still rude but morally strong Germans, and the latter in turn were to regenerate and reorganize the old Roman empire. While the eastern empire defended itself with difficulty against the inroads made upon it by the advance of the Asiatic races, and Greek Christianity was obliged to retreat before Islam, Rome won new glory by the series of victories it achieved, and gained new life.—The formal rigor of the Roman system and the unity of Roman authority were necessary to hold together the German tribes, naturally inclined to isolation and independence; and to prepare and qualify them for their great task—the assumption and further development of the civilization of Rome and the religion of Christ. The Teutonic people seemed, at first, more willing to accept the Arian creed which better suited their native spirit of independence and which their understanding could better grasp, than the Roman Catholic creed. But the fact that the latter won the final victory is only another evidence of the surpassing greatness of Rome. To Rome's ancient and unitary power the intelligence of the Teutonic nations had, dur-

ing the middle ages, to submit in order that they might entirely fulfill their mission. If Arianism had continued to govern among the Germanic races, then, considering the general state of affairs existing at that time, neither the Roman papacy nor the Roman-German empire would have attained its full development. And it is very questionable whether, in that event, the Christian religion itself, deprived of the mysterious sanction of divine authority, would have escaped the fate of so many philosophical schools and sects of the past, and whether it would have maintained its supremacy as the religion of the world.—However, the Teutonic races did more than simply receive their civilization and religion from Rome. They, in turn, imparted to Rome safety, power and vitality. All the Teutonic tribes, and the Franks in particular, were very grateful to their Roman teachers. The Christian religion, too, gained in ardor and intensity of faith, in the manly courage of self-sacrifice and in strength of moral purpose. All these qualities were deeply rooted in the minds of the Teutonic people. The sentiments of the Teutonic races were, from the first, more religious than ecclesiastical, and leaned more toward political freedom than toward obedience to the state. After they had become Christians, they bowed in humble submission before the revealed God and his sanctuary, but, at the same time, they felt the vigor and independence of men, and asserted their temporal rights with a degree of firmness and fortitude that even defied the threats of the church. The Teutonic love of freedom yielded, of course, to ecclesiastical authority, but it could not be wiped out or destroyed by it.—During the middle ages all Romanic and Germanic states continued to be Christian states in the sense exclusively of Roman Catholic Christianity. But the authority to which, in religious matters, even the state had to submit, was decidedly external to the state, in the Roman church. The church had been emancipated from the state; but the latter was held in spiritual bondage by the former. This shows the progress made by western Christianity as compared with eastern Christianity; but it also illustrates the intellectual minority of the state during this period, as compared with the states both in antiquity and modern times.—It was against Roman Catholic Christianity in Europe that Islam, advancing aggressively from the east and southwest, had long to fight. But on the soil of Europe Christianity was victorious: it made Islamism retreat forever, and again began to spread over strange countries.—From the heart of the Germanic nations which had conquered Rome and succeeded to the Roman empire, came that vigorous opposition to Rome which for centuries has divided western Christendom. The reformatory movement of the sixteenth century had a religious rather than an ecclesiastical character. Roman Catholic Christianity had become too formal, too external, too much an institution of the law, to suit the Germanic mind; and the

moral sense of the Teuton rebelled against the glaring abuses attendant on its increasing worldliness. The men above all who were strongest in faith and moral conviction turned away, with minds dissatisfied, from the church of that period, and plunged into the purer primitive Christianity. In the holy scriptures they sought and found an authority which seemed to them more worthy of respect than the authority of the pope and the councils of the church. They freed themselves from the supremacy of the canon law. Drawing their inspiration from the primitive source of Christianity, they demanded that the moral and intellectual nature of man should be regenerated and reformed. To them the visible organization of the religious community was of secondary importance. For this reason they more willingly submitted, in ecclesiastical matters even, to the authority and power of the state, in which they revered a divine power whose moral basis they most emphatically insisted on.—The dissension in European Christianity viewed from the standpoint of Christian unity, may be considered the greatest misfortune which ever befell the church; in its effects on the state, the sufferings it brought it are of minor importance when contrasted with the benefits secured to the state by it. By this dissension the state was, for the first time, freed from the unworthy wardship to which the church had morally and intellectually subjected it. The emancipation of the state from the church, in the intellectual order, was acquired for some states, immediately, by the reformation; and the way to it was prepared for others.—All attempts to remove this dissension and to re-establish unity have proved futile; and what men could not change, they were, in the end, obliged to put up with. The anathemas hurled against the new heresy by the old church were as ineffectual as was the passionate fury of the Protestant leaders who stormed against the papacy as against the kingdom of antichrist. The persecution of religious parties, one by the other, caused extreme suffering to individuals, to whole families, towns and districts. The religious civil wars, the most unchristian vindication of Christianity conceivable, devastated whole countries, and brought great states to the brink of destruction. No nation suffered from this more than the German empire. But persecution changed the result as little as the more humane attempts at conversion in later times have been able to change it. In southern Europe and among the Romanic races, the Roman Catholic religion maintained its preponderance; while in the north of Europe, and among the Teutonic nations, Protestantism came into permanent power.—In our days a large number of the theologians on both sides still hope that the power of truth, inherent in their own particular creed, may in the end be able to overcome that of their opponents. How often has it been proclaimed by the one party that the dissolution and end of Protestantism was at hand, while the other asserted that the rotten structure

of the Catholic church could not resist the slightest blast, and would go to pieces in a very short time. History thus far has proved the deceptiveness of all such expectations. Hence there is hardly a thoughtful statesman who still entertains such a belief. Neither the intellectual power nor the outward might of either communion is strong enough completely to overcome the other and keep it in subjection. If, in the history of the future, the whole of Christendom should become again united, it will not be before the incrustated forms have gone through a process of purification, in which the impure elements which have crept into both systems and forms of faith will be cast out, and what is best in both be preserved and combined. Yet our times do not favor such a development. The living generation will have to put up with the opposing Christian bodies as they are. History, however, teaches the important lesson that every effort to renew religious persecution and the religious wars of the past deserve just condemnation, not only because of their evils and terrors, but also because they are irrational and hence can not possibly be successful.—By promoting peace between the different denominations, and thus rising above the mere denominational standpoint, the state maintains its moral and intellectual independence in relation to these denominations, and rewards, in the noblest way it can, the great services rendered by Protestantism and Catholicism in the education of nations and the humanization of politics.—Protestant Christianity introduced no new idea of law, nor did it establish a new power as opposed to the state. In its jurisprudence and organization the old church remained far superior to Protestantism. But in successfully freeing itself from the authority of the canon law, Protestantism taught the state that the government itself was, in matters of law, the highest authority. And even the states, which remained Catholic in all else, began to realize their independence of the authority of the canon law, and asserted their own supreme authority, when necessary, as against the latter. While the Germans took the lead in those innovations which were religious, the French were the first to introduce those which were political.—The Christianity professed during the last centuries by states, was entirely different from the Christianity of the middle ages. Though at first the majority of the states passionately favored denominational exclusiveness, some of them were, from the beginning, obliged to allow different denominations to assert themselves, and all of them learned in time and by experience, that in all confessions there was Christianity, but that in none of them exclusively did Christianity reside. The Christianity of the more modern states thus became more liberal, broader and more tolerant, and the state became less and less willing to draw the sword at the bidding of ecclesiastical authority. Religion was obliged to rely more on its inherent moral power. When we impartially compare this new develop-

ment of Christianity with the religion of Jesus himself, we may confidently say that it corresponds to the real nature of the latter in a greater degree than any of its previous developments.—A new phase of the relation of Christianity to the state and the law began during the course of the last century. The way was indeed prepared for it, in part, by the reformation; but in character it and the reformation are radically different. We may characterize it in a few words, by calling to mind Frederick the Great and the French revolution. Frederick the Great who spared, indeed, the visible form of Christianity, but who, as a philosophical statesman, renounced not only all particular Christian confessions, but the Christian religion itself, and the French revolution which enthroned reason as the goddess of the future, and rejected Christianity as a despicable superstition and persecuted it as an unpatriotic religion.—We may explain some of the closing events of the French revolution, especially the persecution of the Christian priests and the closing of Christian churches, by the state of insanity caused by the revolutionary fever which robbed the French people of their senses. Other events, however, such as the negation of Christianity in the state and the law, were certainly not the mere expression of violent excitement under which the people labored; but had, long before, been proclaimed in well-considered works embodying the sentiment of the age, by the leaders of French literature, by Voltaire, Rousseau, and the encyclopædists. Views like these, tempered sometimes by a poetical or traditional respect, we frequently find in the works of the best German poets. Not only modern philosophy, but all the other sciences asserted their independence of religious authority, and the state which encouraged this tendency shared the benefits of this intellectual freedom in science. People also began to grant political rights to the followers of other creeds. Everything in the olden laws which had assumed a specifically Christian form, was gradually expunged.—There is no denying it: we have here to do, not with momentary impulses and the aberrations of individuals, but with a feature characteristic of the time. An entirely new epoch, in decided contrast with the whole period of the middle ages, toward the close of the latter, and following the reformation, dawned upon the world. And this is a fact which must be fully comprehended before we can judge its true character. Throughout the middle ages, although the church and the state were separated, religion and politics were closely and indissolubly united. The human law of the middle ages was derived directly from the law of God. From Heaven came the sword of the power which the emperor wielded. The unmistakable tendency of modern times, on the other hand, is to effect the separation of religion and politics, and to frame human laws with human freedom and with human consciousness of self. This separation and this giving of a new basis to law have already gone through various

phases of development. It is no easy matter for nations to come to a clear understanding of fundamental principles; and it is still more difficult for them to put their ideas into practice. Hence, it is not surprising that we should meet with a great many errors, a great deal of passionate exaggeration. And we should not mistake extreme phenomena in history, to which the current of events may give rise, for the predetermined cause of history itself.—The extreme hostility of the French revolution to Christianity is now generally understood and duly branded as devoid of all reason, and as highly unjust. But the emancipation of the state and the law from all compulsory authority of religion, not excepting even that of Christianity, continues one of the chief characteristics of all modern politics. The permanent tendency of the age, in the emancipation of the state and of law, is not anti-Christian as it would seem, if we single out certain isolated events which show opposition to Christianity. For this tendency is directed toward the assertion, in both law and politics, of the temporal and human. And to that extent the state is no longer Christian in the sense of the middle ages, though it more fully agrees with the primary idea of the religion of Jesus than the form of Christianity that succeeded it. To the great good of religion Jesus himself had effected that very separation which it is the effort of modern times to effect for the welfare of the state.—The fear of many of the adherents and the hope of many of the opponents of Christianity, that this tendency of the state and the intellectual struggles connected therewith may be injurious to the Christian religion, have already been proved to be without foundation. We do not conceal from ourselves the fact, that among the part of civilized mankind within the pale of Christianity, the differences of denominations and sects is greater than ever before; though this fact is of little importance as compared with the great difference between Christians and non-Christians, which latter difference, since the days of early Christianity, has never been more marked. Yet an impartial view of the more recent development of the religious sentiment will show that the spirit of the Christian religion is strong enough to repel even the extreme dangers which probably might arise from this division, and that it has now more vitality to spread its influence among the nations than ever before.—In consequence of these struggles the dormant energy of the faithful has again been awakened; and the nations of Europe, while they may, perhaps, not have become in the same degree more ecclesiastical, have certainly become more religious than they were about 80 years ago. Even the opponents of Christianity now speak in more respectful terms of its historical importance and its spiritual wealth, than was the fashion during the last and at the beginning of the present century. Though a great many matters of external detail, and other matters of minor importance had to be sacrificed, the religious depth and truth and moral forces of Christianity became apparent

whenever attacked by criticism. And whatever progress the human mind made in other domains, domains peculiarly its own, admit it we must, that Christianity had the moral and religious capacity to keep pace with that progress. The opinion that modern civilization might dispense with Christianity, because it had outstripped the latter, was able for a time to deceive even reasonable and honest men; but it had, in the end, to give way to the evident truth that, in the primitive idea of Christianity there is a wealth and power which, vast as its development may have been, has not yet reached its highest expression, much less been exhausted. Christianity hitherto, from the time of the early churches down to our own day, has, on closer examination, shown itself far below its ideal, the religion of Jesus. This fact has renewed in the minds of a great many the hope that it is not in the present but in the future that true Christianity will be fully realized, and attain its full efficiency.—The Christian population is estimated at about 30 per cent. of the population of the world.—The spread of Christianity still continues through both Catholic and Protestant missions, through the influence of commerce and the political power of Christian nations. The most determined opposition brought against it is, besides that of Judaism—which in recent times, however, has shown some points of resemblance to Christianity—that of the religions of Islam and Brahmin; the former conscious of its intense monotheism, the latter, of its pantheistic, speculative background, of its ancient traditions transmitted for thousands of years by its castes, and of great thought and institutions. But the course of Christianity through history is, after all, one of victory and glory. The fact that the nations enjoying the greatest political power and freedom, and the leaders of mankind, profess it, that they have both the power and the courage to subject all parts of the globe and all mankind to its supremacy—this fact encourages Christian missionaries, religious and lay, to overcome all obstacles, and aids them in raising Christianity above all other creeds, as the supreme and universal religion of the world.—III. *The Christian State.* After this historical survey, we have no difficulty in answering the question which is so much a subject of controversy, concerning the Christian state.—If the meaning of the Christian state be that it is a state whose true lord and sovereign is Christ, and which is to be governed by a hierarchy, according to the teachings of the Bible, or by religious traditions and inspiration, as illustrated in the Anabaptists of the sixteenth century, and the Mormons of the nineteenth century, then this theocratic idea of the Christian state, wholly at war, alike with the ultimate idea of Christianity and the historical development both of the Christian religion and the state, must be absolutely rejected.—The mediæval idea also of the Christian state, which treated non-Christians as beings without rights, and which subordinated its legislation to the authority of the

church, is no longer in keeping with the progress of civilization. The modern state recognizes the civil rights of non-Christians also. Their civil rights it recognizes completely, and it tends more and more to extend their political rights, while it maintains its attitude of perfect independence of all authority outside of it. What Christian governments demand of the Ottoman sovereign, that he should respect his non-Christian subjects as entitled to all the rights of citizenship, they must grant their own subjects who are not Christians. The modern state can, therefore, no longer be exclusively Christian. But, inasmuch as it is more humane, it is more in harmony with the primitive idea of Christianity than the exclusively Christian state. Our logic here, however, must not be pushed to the extreme of rejecting and condemning every traditional deviation from this principle, when that deviation is rooted in the minds or in the circumstances of the people. We can only point out the end toward which the modern state is tending; the way leading to that end is determined by the traditions of history.—If by the expression Christian state is meant simply a state which is conscious that the Christian religion is the religion of its people, of the majority of its people, or of the nobler component part of its people; a state which recognizes, besides, that the Christian religion is a fundamental condition of its own development, and one of the chief elements of progressive civilization, and which lives up to and acts upon this consciousness: then we may unhesitatingly call all states which in former times were exclusively Christian in the narrow sense, Christian states. And in this acceptance, the expression Christian state has an important meaning. But in this acceptance of Christianity to the state, not the direct rule of Christianity in the state, is recognized.—IV. *The indirect influence of Christianity.* This influence on the state is indeed most important and wholesome. The power and purity of this influence are rather increased than lessened, by the fact that Christianity seeks to exert no direct influence in the province of law.—With the dogmatic differences of the different Christian denominations, the state in principle has nothing to do. Their existence is felt by the state, when the internal warfare of the churches and sects begins to threaten the public peace. When this happens, the state interferes, and maintains the order and dignity of the law, as in any other case. But it is of the greatest importance, when the action as well as the welfare of the government and its general relation to its citizens are considered, that the faith in a personal God and his government of the world which Christianity teaches, should be at work as a living agency among the people, and among those interested in the management of public affairs. This faith keeps together by its spiritual bonds what, but for it, would go to pieces. With this faith the unity of the order of the world and its dependence on God

are recognized; without it, the resolving of the whole into its elements, and the anarchy of passion, are the threatening danger in the near future. —Much greater, in many ways, is the direct influence of Christian morals on public law and the state. There are, indeed, certain precepts of Christianity applicable particularly, not to the political but to the religious conduct of the people, which are entirely outside the legal and political province of the state, and which the latter can not possibly acknowledge as rules and conditions by which it should be governed. The counsel, appropriate enough, in the case of Christian missionaries, "Take therefore no thought for the morrow," would be a very inexpedient rule when applied both to the political and private economy of man. The precept directed against the uncharitable condemnation of others, "Judge not that ye be not judged," should certainly not influence the courts, in their administration of public justice. The highest commandment of Christian love and humility, "Love your enemies; bless and pray for them which despitefully use you and persecute you," * * * "But I say unto you, that ye resist not evil; but whosoever shall smite thee on thy right check, turn to him the other also"—can not, though sublime as characteristics of religious sentiment, be made to serve as a principle of public policy or political morality.—The state must gratefully acknowledge its obligations to Christian morality for having purified and ennobled its own life. We would call attention to the following points: 1. It had a great share in awakening and spreading among the people the sense of human dignity and honor. Since it brought men, as the children of the Lord, nearer to the divine Father, the value and dignity of human nature could not so easily be disregarded as it was in antiquity, previous to Christianity. 2. Looking on men as the children of God, Christianity brought to men the consciousness of their equality and fraternity in relation to one another. Acting as a liberating force on all, even on the lowest classes, the slaves, it gave a new foundation to the liberty of all, and where it did not give such liberty a new foundation, it strengthened it. The liberty of Christianity is, indeed, different from that of the French constitutions. It does not do away directly with existing legal relations, but by its moral power it transformed the face of Europe, and had a large share in the progress of European civilization. 3. As it has raised the standard whereby the rights of the subjects in the monarchies of the old world were measured, without revolution, it also limited and refined the outward appliance of the governmental power, without weakening that power itself. And it has effected this by reminding rulers of their accountability to the Supreme Ruler whose judgment they can not escape, and by demanding of them that they should respect their subjects as their brothers in Christ. 4. Finally, it has revealed the affinity of all the races of the earth; and while it has, in opposition to the

narrow spirit of nationality, insisted on the unity of the human species, it has become the source of a purer morality in the international law of the civilized world. In the humanizing process to which Christianity subjected legal institutions and relations, it preceded the state whose governing principle it anticipated and expressed in its religious creed. What the state learned gradually to understand and carry out as a human duty imposed upon it, the religion of Jesus looked upon from the first as a Christian duty. The Christianity of later days may sometimes have forgotten this duty, or may have tried to fulfill it in an improper way. But the consciousness of this duty was never afterward entirely lost.—In all these respects, the purifying and refining influence of Christianity has shone conspicuously. In proportion as nations come to understand human nature, they will respect the religion which has guided them in their intellectual advance and infinitely promoted their civilization. On this account, the state, although now conscious of itself and grown independent, will, in the future, take into consideration the moral demands Christianity may make, and so far as its laws and power permit, try to grant them. The religion of mankind and the politics of mankind—each adhering to its own principles—will continue in close and friendly reciprocal relations, and thus united they will best promote the welfare of the human race.

MAX. EBERHARDT, 7r.

J. C. BLUNTSCHLI.

CHURCH AND STATE. Church and state can occupy with regard to each other but one of these four positions: 1. Where the church governs the state; this is the theocratic régime. 2. Where the state holds religious affairs under its control and regulates them according to its pleasure; this is what may be called *Cæsaropapacy*. 3. When the church and state limit each other by common consent; this is the régime of concordats. 4. When religions, separate from the state, are entirely free, on the same conditions as all other associations.—Let us examine one after another these four forms of relations between church and state.—I. *Theocracy*. The domination of the state by the church constitutes an order of things well known and very frequent in history. In ancient Egypt, in India from the remotest ages down to our time, and in the greater part of Europe during the middle ages, religion was supreme, not only over consciences and in spiritual affairs, but also over all human existence and consequently over civil law and government. In a pure theocracy there is no legislation except the religious code. In the Christian states of the middle ages the theocracy never attained this degree of perfection, notwithstanding all the efforts which it made in that direction; but, imperfect as it remained, it has none the less weighed with a mighty pressure on the governments of western Europe. The canon law held at that time a considerable place at the side of the civil law, and ecclesiastical rules

often took precedence of, and determined ordinarily the laws of the state. It is not without reason that it was possible in those days to compare the religious power to the sun and the civil power to the moon, which, obscure of itself, borrows its light from the sun.—All nations without exception have commenced with this régime. There are none which have not been governed at first by a religious power; a small number only have succeeded in acquiring a social form more or less independent of primitive religious institutions.—That the theocratic régime has always been the first form of civilized nations is easily explained when we consider that religion alone has had the power requisite to wrest nomadic tribes from their wandering life, to fix them to the soil and render them accessible to civilization, or to subject barbarous peoples to the yoke of law and bend them to a civilized life. This fact is beyond all dispute; we know in our day that all primitive governments were theocratic.—They all have this character in common, of treating men like children, as incapable of guiding themselves in the difficult paths of life. In fact, they found them in a state of childhood and were obliged to trace out a detailed scheme of all the duties of civilized life, without leaving anything to their free choice which could not be relied on in the beginning. The chiefs were not treated differently from the multitude. They were as barbarous as their followers, as undisciplined, as little capable of civilized life. Theocratic legislation was obliged to put even them under guardianship, and to trace out for them the duties of each day, of each hour, with as much precision as for all the other classes of society. Diodorus Siculus informs us that the kings of Egypt were bound by ancient laws. The seventh book of the code of Manu is devoted entirely to the enumeration of the duties of sovereigns. In the middle ages, without being subject to such minute rules, the kings and princes of western Europe were watched with jealous and constant care by the popes, who spared them neither counsel, encouragement nor censure.—Theocratic legislation is condemned to immobility by its very nature. It makes this, however, a title to glory. Human laws are modified according to the changes which take place in the ideas of the nation. Theocratic legislation, claiming rightly or wrongly a divine origin, lacks this elasticity; it must remain what it is. How could the scant wisdom of man modify, improve or correct the decrees which come from God himself? This is why laws made for the childhood of nations know no other condition and allow no other, and why their most positive effect is to maintain or seek to maintain forever the primitive civilization to which they relate and for which they have been constructed.—And if, in consequence of certain events, the level of culture among the people submitted to this régime rises, let no one ask legislation to follow the movement. It is not at Rome alone that *non possumus* will be given as answer. This

refusal is the forced result of the principles of theocracy. Since it comes from God it can not be changed. It must be accepted as it is; the concessions proposed to it can only appear to it logically as infidelity to the divine will.—It is scarcely necessary to call attention to the fatal consequences of such a government. It paralyzes life and condemns all progress; it confines the nations which accept it to a very narrow circle, since it embraces only the primitive elements of civilization. Science can not extend beyond the limits of the creed of the ecclesiastical faith; industry, commerce, the arts, social relations are maintained at the point at which they are produced by a nascent civilization; liberty of thought is suppressed; rights of individual reason are not recognized; individuality is smothered by rules which press it down.—At a certain period of social development this régime, excellent so long as it had only to guide the first steps of undisciplined tribes in civilized life, becomes an unendurable yoke. Two methods are presented to render it less crushing or even to shake it off entirely. The civil power, according as it is more or less strong or is more or less subject to ecclesiastical discipline, takes possession of religious authority and declares itself the religious head of the nation, or it seeks to come to an understanding with the ecclesiastical power, and establishes, by a sort of treaty, the limits between the temporal and the spiritual.—In the first case we have what has been called *Cæsaropapacy*; in the second, the régime of concordats.—II. *Cæsaropapacy*. The word *Cæsaropapacy* gives a clear enough description of that order of things in which the prince is both temporal ruler and religious head of his dominion. In ancient times, the kings of Egypt and the sovereigns of India tried repeatedly to overturn the priestly caste which ruled them; but they never succeeded. It is probable that if victory had settled on their side, they would have declared themselves the head of religion, and that religious affairs would have been governed by their administration on the same basis as finance, the army, and all the other branches of government. The emperors of Germany were not more successful in the middle ages against the theocracy of Rome.—At the commencement of the eighteenth century the Tsar got the better of the Russian church more easily. From the end of the sixteenth century the patriarchs of Moscow, supported by the Russian bishops, broke with the patriarch of Constantinople; thenceforth they aspired to obtain supreme power in the church. These attempts disquieted the Tsar. Nikon was deposed in a council held at Moscow, in 1667; this defeat did not prevent his successors from cherishing similar schemes. Peter the Great put an end to all these ambitious views by declaring himself head of the Russian church in 1791. The following year he established for its government a council called the holy synod, composed of archbishops, bishops and archimandrites. But the Tsar reserved to

himself the presidency of this synod and the nomination of all the members; and no act of this assembly is valid until after it has received the approbation of the emperor; the latter is absolute master in everything concerning religious affairs—belief, worship and discipline.—It is easily seen that the emperor has gained by this order of things. His double quality of absolute sovereign and head of the church has given him, in the eyes of his subjects, a prestige which puts him far above any other power on this earth. He has besides all the members of the clerical order at his disposal, docile and submissive instruments who render him service which could not be expected from the other employés of the administration. But it is undoubted that religion has not reaped the same benefits from this régime; it has become neither more enlightened nor more spiritual. Add to this that liberty of thought does not meet with fewer obstacles in this than under theocratic rule. The chief of the state, who is at the same time the head of the church, may, without doubt, be more accessible than a purely ecclesiastical chief to the progress of ideas and the changes which the growth of science introduces by degrees into modes of thinking. But, on the other hand, what can he do for the cause of free thought in matters of religion when his political interests advise him to maintain the established order of things and not yield up so powerful a means of domination as the management of ecclesiastical affairs?—In Protestant states, the course of events at the epoch of the reformation put the management of worship in the hands of princes. But, on account of the principle of free investigation, which is really the essence of Protestantism, men became accustomed to respect the rights of conscience to a greater or less degree; and, at the same time, less through the force of law than of public opinion, a certain independence was established in those states with regard to dogma. It is none the less true that the civil power is the judge of controversies, that it holds religion in its power, and that even without having recourse to violent measures it has a thousand indirect means of acting upon it. This justice, however, must be rendered to the governments of Protestant countries, that they have had the good sense not to abuse their authority in religious affairs.—III. *Régime of Concordats*.¹ Concordats are treaties made between the civil and the religious power concerning ecclesiastical matters. Pacts of this nature can only be made when princes find themselves face to face with a powerful religious authority concentrated in the hands of one man. The count of Lanjuinais is mistaken when he assures us that they are unknown in all history outside of the Catholic church.² The conventions repeatedly concluded between the Dalai-Lama of Thibet and the emperor of China are absolutely of the same

kind as the concordats concluded in Europe in modern times between temporal sovereigns and the popes. Similar agreements were made in Japan on different occasions, from the end of the twelfth century between the adiris, spiritual chiefs of that country, and the djogoons or tycoons who were the temporal chiefs.³—It is a remark not new that concordats are treaties of peace between the spiritual and temporal power. They have been brought about in reality only after long struggles between the papacy, which pretended to establish its rights to universal dominion, and the princes whose interest it was to restrict this action within the domain of ecclesiastical affairs. They had no object but to put an end to these disputes equally dangerous to both powers.—Treaties of this kind can not in any way be reconciled with the principles of the Catholic church. Two powers of the same nature, whatever in other regards their respective importance may be, can of course terminate their disputes by mutual concessions. This can not be the case between the spiritual and temporal powers, because from the point of view of the Catholic church there is no equality between them, since the first was instituted by divine right to govern and direct the second. “If the holy see,” says Gregory VII., “has received the right of judging in spiritual things, why should it not have the right of judging temporal things? Laymen perhaps believe that the royal dignity is above the episcopal dignity. The difference between them may be seen from the origin of the one and the other. The former was invented by human pride, the second established by divine goodness.” Long before, St. Ambrose had proclaimed that the episcopacy is as much superior to royalty as gold is to lead. Such is the Catholic doctrine. It is not a question here of judging, but of stating it.—I know well that there is a large number of persons who create for themselves a fantastic Catholicism, imagining they can rise above the Catholic church itself, and who flatter themselves they can convert the holy see to their theory. If history has not been able to disabuse them, it would be very useless to show them that they are the dupes of an illusion. Catholicism is an historical fact; it must be taken as it is; it is not in the power of any man to make it other than it has been made by a tradition which reaches back beyond the eighth century of our era; it could not itself modify itself, without perishing altogether.—According to Catholic principles, princes and people have but to submit humbly to the decisions of the church, as to orders emanating from God. How under these conditions can the head of the church abandon a part of his rights to the temporal power? How can he let it judge what is good and what is not good for the church? Never, therefore, have the sovereign pontiffs asked for concordats unless to

¹ Under the word CONCORDAT is found an explanation of this question from the liberal Catholic point of view.

² *Encyclopédie de Courtin*, article “Concordat.”

³ Thunberg, *Voyage en Afrique et en Asie, principalement au Japon*, translated from Swedish, 353-355, et *l'oyage au Japon*, translated by L. Langlois, vol. iii., p. 206.

regain, under circumstances favorable to their interests, privileges which the misfortunes of the times had snatched away from them. Such were the motives which caused Leo X. to ask of Francis I. the concordat of the 15th of August, 1516, which abrogated the pragmatic sanction of 1438.¹ They never acquiesced in those unfavorable to them except when constrained by force or by feeling the impossibility of obtaining better conditions for the moment. Thus Pius VII. declared that he would not accept the concordat of July 15, 1801, were it not for the extraordinary circumstances of the time, and in view of the advantages of peace and the unity of the church.²—What is to be concluded from this, except that the holy see observes only those concordats which are advantageous to it, in order to advance to greater conquests, and that it observes those that are burdensome to it only on account of concessions made to it and to which it submits momentarily, waiting for better days and reserving all its rights. Treaties of this kind then have in the eyes of the contracting parties, at least in the eyes of one of them, only a provisional value, and can not constitute an order of things regular and constant.—Would that concordats could, during their more or less ephemeral existence, eliminate the difficulties raised by the varied and sometimes opposing interests of the two powers. But they do nothing of the sort. The struggle continues under the régime of concordats in nearly the same forms as before the establishment of that régime. In France recriminations of parliament against the pretensions of the holy see have not been less lively since the sixteenth century than before it; they have been even more frequent. The opposition of the civil power has even been at a certain time so powerful that it might have provoked a schism. I refer to the declaration of 1682, the execution of which, though the contrary has been asserted, would have created an impassable abyss between the Catholic church in France and the court of Rome.—Germany presents an analogous spectacle; in spite of the concordat of 1447 between Nicholas V. and Frederick III. and all those which followed, the German empire has not always lived on good terms with the holy see; and we have seen in these later times with what rapidity concordats were made and abolished in Austria.—Concordats are not treaties capable of regulating disputes finally, because they never entirely satisfy either of the two contracting parties, each one of which thinks that it makes more concessions than it ought, and strives more or less openly for greater advantages. This takes place not only because they have no sanction and can not prevent one or the other of the two adversaries from obeying the principles on which

its own authority rests, principles which ordinarily are in complete opposition, and which in any case have nothing in common; but still, and above all, because in the order of things which the régime of concordats supposes, and when there is a church in the case which like the Catholic church lays claim to universal dominion, it is impossible to fix the moral limits which should separate the two powers.—This explains why no concordat can be final. In the countries where this régime has been adopted it has been necessary to modify unceasingly existing treaties by successive amendments, or replace them continually by new ones. Since the beginning of this century France has had three different concordats. It is by the twenties that those must be counted which were concluded during three or four centuries between Germany and the holy see. These incessant changes are a decisive proof of the impossibility of giving a fixed and solid basis to this régime. If we examine the relations of church and state from a general point of view we shall be brought to this conviction, that their alliance under any form whatever is an annoyance, a source of embarrassment as well for the state as for the churches.—By putting itself under the patronage of civil government, a religion, whatever it may be, yields up its independence in whole or in part. Thenceforth it can no longer take counsel of itself alone; it commits a part of its interests to a power which has not precisely the same end in view that it has. it wishes in vain to be inspired only with its own principles, to have regard only for its own interests; it must take account also of the interests and the principles of the associate it has chosen, I was going to say of the master under whose protection it has placed itself.—The ministers of religion, therefore, are placed by a concordat in an embarrassing, equivocal position between opposing views and duties. An emergency may arise which the state judges favorable to its interests and which the state church finds dangerous to the interests of religion. Must the wishes of the government be yielded to? Must they be resisted? The danger is perhaps equal on both sides. A decision, however, must be made, and either religious principles be sacrificed to the desire of remaining in the government's favor, or the clergy exposed to the displeasure of a powerful ally by obeying the voice of conscience. The bishop of Baltimore does not run the risk of finding himself in this difficult position. He has to think only of his religion and his flock. He has to take into account only spiritual interests.—Even outside of the contingencies of which I have just spoken, contingencies more frequent than is believed, in the ordinary course of affairs, every state religion is bound to continual sacrifices. It has not the right to modify and extend, as it judges opportune, its rules of discipline and its dogmatic definitions. Almost everywhere the pope's bulls are only published at the good pleasure of the government; and changes of discipline are not per-

¹ Des Odoards-Fantin, vicar general of Embrun, *Dictionnaire du gouvernement, des lois, des usages et de la discipline d'Eglise*, t. 11, p. 238, and following.

mitted if such changes displease it. In France the council of Trent has been received only in so far as concerns faith; all the rest is considered invalid. The state thus becomes in reality the judge of controversies and the head of religious affairs.—The Protestants of France have not been better treated. Far from it. The government itself changed the ecclesiastical organization which was peculiar to them by the organic articles of Germinal, year X., which it imposed without even consulting them. Despoiled of the right of consulting each other on their common interests by the suppression of the national synod which gave offense no doubt to the civil administration, their churches have passed, contrary to their will, from the synodal to the independent régime.—There are many other sacrifices to which every church united to the state must resign itself. It must renounce the right of meeting without authorization and surveillance; the right of forming pious associations whose existence seems to it useful for the maintenance and development of religious feeling; the right of establishing centres of prayer where it thinks it necessary, and of placing ecclesiastical directors where it sees fit, even in the case where it asks no assistance of the state. In one word, it is no longer master at home; it divides an authority which can not be divided, with the government which is not a competent judge in religious matters, and which is guided by other principles than its own.—And what does it gain by all these sacrifices? Bread for its ministers and a protection for itself of which it can scarcely be sure unless in so far as it is not an obstacle in the way of the interests of the state.—On the other hand, a government is deceived in believing itself interested in protecting several state religions. We understand what importance it may attach to giving itself a support in the ecclesiastical power. There are very few princes who have not sought to render it favorable to them by the concessions of great temporal advantages. Is there a single one of them, at least in modern Europe, whose sacrifices have not been followed by the most deplorable disappointments? How could it be otherwise? Every church, no matter what it be, on which the state wishes to lean, looks upon the use of the public power as an instrument to rule if not to oppress its opponents or rivals whom it treats as disturbers of the public peace, as the price of its co-operation. We know in modern times, the hatred which a ruling clergy brings upon itself. When this hatred has penetrated the masses it includes both the clergy whose yoke is odious and the government which supports their cause.—The alliance of church and state has not always had such fatal results for the latter; but we can assert that it is never of any real advantage to it; that it is to it the cause of solicitude which turns the state from the end it should have in view, and which exhausts the living force which it has to dispose of and which obliges it to make more effort to live in harmony with the ecclesiastical power than

it would have had to make for the public prosperity. It is not rare that in the union of church and state each one of the two parties cherishes the secret design of making the other an object of its domination. Under the appearance of an *entente cordiale* there arises between them a silent continuous struggle to deceive each other, and uninterrupted efforts to escape the traps which each side sets for the other. The state would succumb infallibly before an adversary long trained by acquaintance with the subtleties of scholastic theology in the art of overcoming difficulties, were it not, at least in our times, for the powerful support of public opinion.—If we wish to become convinced of the reality of difficulties inherent in the union of church and state, let us look at the epochs of French history when the throne and the altar had the desire and felt the need of supporting each other sincerely. Surely the feelings of attachment which Louis XIV. had for the Catholic church will not be denied; but how often was he obliged to resist the holy see. In 1667 he forbade the publication of the decree of Clement IX. against the New Testament of Mons. The following year he prohibited the nuncio's publishing the papal ordinance of April 9th against the ritual of Alet. In 1673 began the long discussions between this prince and the court of Rome on the subject of the right of the crown to receive the revenues of vacant bishoprics. In 1688 the interdict of the church of Saint Louis at Rome raised a quarrel between France and the pope, a quarrel which led to the seizure of the district of Avignon. When Innocent XI. died, in the middle of the following year, there was a great number of churches in the kingdom deprived of pastors, because, since the assembly of the clergy in 1681 and 1682, the pope had refused his bulls to those who had been named to benefices. This state of things lasted till 1693.—When such quarrels and many others disturbed the reign of a king who carried his condescension for the Catholic church so far as to promise bishops independence of royal justice even in case of the crime of treason,¹ how should harmony between the spiritual power and the civil authority not be shaken many a time under the reign of princes who, however zealous they might be in the interest of religion, could never be supposed to make such astonishing concessions as Louis XIV.? We shall then witness the singular spectacle of a government believing that it ought to make every effort to save the church from its own excesses, or at least from those which seemed to merit that designation, while the church, caring little about being saved in spite of itself, looks upon the government only as on an imprudent friend plunged in profound error, and, consequently more dangerous than an open enemy.—We can understand that as long as a state recognizes but a single church and proscribes all the others, it should bind itself by treaties with that church, and that in return for the pref-

¹ *Abrégé chronologique de l'histoire ecclésiastique* par Marquer, vol. iii., p. 508.

erence which it gives it above its rivals, it should demand certain sacrifices of it, claim the right to take part in its affairs, and interfere partially in its administration. It would run too great a danger if it left complete liberty to this only church which, by the fact itself of representing alone the religious sentiment, exercises an enormous power over consciences still incapable of governing themselves. Whatever difficulty there may be in the way, it is its most pressing interest to exercise over the church a sort of control, endeavoring at the same time not to make it an enemy. But the face of everything changes entirely the moment liberty of conscience is proclaimed and admitted, at least in principle, and that the state recognizes and engages to protect, not a single but several different religions, lately enemies and still arrayed against each other. Such is the present state of things in nearly all the countries of Europe. How is it in countries where there is no longer, properly speaking, a state religion, and where several religions are authorized and protected? Can the government undertake, I will not say, to administer them with an equal justice, but in such a way that this justice itself shall not appear to each one of them an excess of favor to its rivals and a species of injury to itself?—Would it be boldness to suppose that in this case strict impartiality is a pure fiction? I do not doubt the intention of the government to hold an equal balance between the churches. But will it not be drawn by the very force of things, by sympathy, by some public necessity, by some secret pressure of which it is itself unconscious to incline toward one, in preference to the others, probably toward the one which will seem to it the most powerful or the best fitted to favor its tendencies and enter into its views? It will not persecute the others, I admit; persecution is no longer the order of the day; but the government will not show them the same kindness as it shows to the one which seems most useful or the best. And the favors which it heaps on this one will be likely to alienate the others, while it may happen that the simple toleration which it accords them will be enough to displease the church which it wishes to gain over by its benefits.—But let us suppose the state to have the most complete impartiality. Let us carry this supposition even to the point of impossibility, and suppose that all these religions live in peace side by side, that they are converted to the idea of liberty of conscience, that they have learned mutual respect and esteem. Even in this case the position of the state which protects them and administers their affairs would be false, full of embarrassments, if not of dangers, and would poorly serve the prosperity of these religions and consequently not effect the good expected of it. How could it manage them understandingly? How could it have an intimate acquaintance with their different principles often opposed, and accord to each one precisely that which belongs to it? Take an administrator reared a Catholic, an absolute stranger to the

spirit and traditions of Protestantism; how could he manage the affairs of dissenters holding, as he does, opinions directly opposed to theirs; or a free thinker called to direct the different religions in a state. He will promise, no doubt, to set aside his personal opinions in his administration; but how far can he succeed? Will he not come to consider as an enormous demand that which is really but an unavoidable necessity for this or that church? In truth, each church only can understand what is fitted to it. A stranger to a church is lost infallibly in deciding what to do or to leave undone in respect to it. Although his intentions be the best in the world, if he is an administrator of religious affairs, he will make mistakes at every step which will deeply wound the churches committed to his care.—There is against the principle of church and state another consideration, which, though of a lower order, has nevertheless some value. Justice requires that every citizen should contribute only to the church to which he belongs. With what right, unless it be the right of the strongest, will you force him to maintain with his property a church which is hateful to him, which he considers harmful, which is perhaps to him a declared enemy? It is this, however, which takes place when there is a union of religious affairs with the state.—For a long time the Protestants of France have paid, not only the clergy who preached against them but also the dragoons who cut their throats, burnt their houses, violated their wives and daughters and carried off their children. They have to fear these horrors no longer; but they pay for religion much more than the maintenance of their own church demands from the budget.—There is, says Vincent, in Europe, a great people, a living example of the excess to which this injustice may be carried and the evils which result from it: it is Ireland. The distress of this unhappy land, the abyss of misery into which it is plunged, an abyss from which the most expert do not know where to find an escape, its moral degradation and its invincible ignorance, arise far more from this source than from the nature itself of the religion to which its inhabitants are so strongly attached. It arises from the tithes with all their rigor, from the coalition of a fanatical aristocracy with a fawning clergy, which is the great and perhaps the only cause of the desperate suffering with which Ireland terrifies the nations. The Anglican religion appears as a vampire attached to this great body, sucking it unceasingly and leaving it just blood enough to live and go on producing. Thus the substance is devoured and the generous sentiments of this people are perverted to gorge with gold a clergy whom it does not want. The example is extreme, doubtless; it is unique, perhaps, but it exists; and it alone suffices to show us to what length vexation and injustice may go before the clergy will draw back.—IV. *Régime of the Liberty of Worship.* The only régime capable of eliminating all these difficulties and in accordance with all

the principles of liberty of thought, and which answers to the present multiplicity of religions, is that which leaves to all religious societies the care of managing and regulating their own affairs themselves, aside from all interference of the state. This solution is so simple that we can only blame habits and prejudices if it has not been generally accepted before now in all countries where any value is attached to liberty of conscience.—The régime of entire liberty of worship is rejected either in the name of religion, which, it is said, will perish or at least decline as soon as it is left to its own resources, or in the name of the state, which will find itself continually menaced by the spiritual power the moment it ceases to weigh directly upon it and keep it within just limits. These fears, inspired by sentiments which contradict and therefore mutually destroy each other, are entirely chimerical. A few hasty considerations prove this.—People fear that the régime of liberty will be fatal to religion. They think, therefore, that it has no vital force of its own, and that it can only exist on condition of being sustained and protected by the civil authorities. This is indeed a poor idea of religion, and those who admit it seem to me little authorized to plead in its favor. If its case were such as they think, it would be merely a matter of convention, without root in human nature, invented, without doubt, to serve as an instrument of despotism and to lead the people on like a low herd. In such a case its loss should not excite very lively regrets.—But we can not accept this idea. Even a superficial analysis of the spiritual nature of man shows that he has an unconquerable aspiration toward the ideal. This aspiration is exhibited under the most varied forms according to the degree of general culture, under strange forms among nations in their childhood, in pure and noble forms among men who have arrived at the maturity of reason; but it always appears under one form or another. It is an undoubted fact, that there is no nation and no people without a religion. If it is an integral part of human nature, it will not disappear under any régime.—It only remains to seek that which is most favorable to its purest manifestations. It certainly can not be the one under which it is fettered with hindrances, nor where it can not live except through arbitrary rules. Between a regulated religion and a free religion there is the same difference as between trees which the scissiors of a stupid gardener, pretending to be an artist, gives the form of a fan or a vase, and the trees growing in the full liberty of the fields.—Will it be said that we must save it from its own excesses and prevent it from degenerating into superstition and empty formalism? Without doubt; but it is not the hand of the state that will direct it best in its development. Irrespective of its unfitness to judge religious matters, the state is naturally led by its own interests to keep religion in what is called order, that is to say, in a fixed immobility. Governments are not fond of activity of thought and sentiment; they see in

them elements of disorder. They are perhaps right in one sense and from their own point of view. But under this guardianship religion becomes a pure formality, with many ceremonies, few feelings, and still fewer ideas. The statesman is satisfied with this condition; the truly religious man is less satisfied; he prefers life to this state of somnolency.—Add to this that the state which protects a church impels men to hypocrisy, without wishing it. There is no trouble and there may be some profit in professing the religion of the state. Even in France, under the empire, little calculations of this kind were made. What is more general, without being less fatal to religious life, is, that classification by religion becomes fixed in countries where the affairs of religion are in the hands of the government. A man belongs to this or that religion by birth and not by conviction. I know well that in the state of indifference which predominates in religious matters, men fear to appear singular by abandoning the religion in which they were born, to join one which they find preferable. But, besides, this general indifference constitutes a species of hypocrisy, since men continue to belong in fact to a church whose doctrines they reject and whose discipline they do not observe. This is a consequence of the desire of governments, protectors of one or several religions, to maintain that which is established. It may be that in truth these governments are very little concerned whether people are Catholics, Protestants, Jews, Mussulmans, orthodox or rationalists; but changes of religion would trouble the established order in some point, they would establish a bad precedent. Nothing of all this can please a well regulated governmental administration, and we can not find fault with it for this. We should be permitted, however, to blame an administration which of necessity produces such effects whether they are desired or not; and religion, it seems to us, has no reason to congratulate itself on an order of things which is in reality so fatal to it.—To elevate religion, to make it a serious thing, an affair of conscience and not of expediency, make it independent! As soon as there shall be no more profit in belonging to one church rather than another, men will join a church only because they have adopted its principles sincerely. The profession of a religion will be a truth; the members of a church will belong to it in reality. Such a church may see the number of its adherents diminish, but what it loses in quantity it will gain in quality. This change, far from injuring it, will be entirely to its advantage. The lukewarm and unbelieving, which the church drags in its train, are only an inconvenient burden, which hinders its progress and chills the life in its breast.—This condition of independence can alone enable each church to live and develop according to its own principles. Free from all restraint, being no longer bound by the sacrifices imposed on it by its connection with the state, it will have to take counsel only of its beliefs, and will decree doctrines as it

understands them; it will impose on its members the discipline which is the consequence of its doctrines.—The objections raised against the separation of church and state in the name of public order and great social interests, are not better founded than those raised in the name of the prosperity of religion. Far from being a danger to states, religious independence would be a great advantage to them. And first of all, it would free them from the embarrassments without end, brought on by the administration of ecclesiastical affairs. It is needless to insist on this point. It is but too well known how many false measures governments are engaged in, either through the desire to become popular with one or another religious party, or merely through the protection which they think themselves obliged to yield to one church or another.—Let it not be said that even under the régime of religious independence the state will always have an interest in looking after the religion of the majority of its citizens. What is meant by that? That it should protect it to the detriment of others? But that would be to return to the union of church and state once more, and we have supposed this régime abolished. Let it be well understood what it is that the separation of church and state brings with it in the social order, and immediately all the objections will be seen to disappear which do not start from the point of view of the actual state of things. The régime of church independence supposes that the government will not interfere in religious affairs at all, neither to oppress, protect nor guide them. It will be for the churches to provide for their own wants as they understand them, while conforming, however, to the general measures relating to public order. I do not say that the cessation of the protection of religion by the state should not bring with it the cessation of many other kinds of protection, and many regulations which treat citizens as if they were incapable of struggling alone with advantage against the difficulties of life; we can not, however, but congratulate ourselves on this progress.—The opponents of the separation of church and state repeat unceasingly that the result of this system would be to create a state within the state, and to incur a danger menacing to the public peace. Nothing could be more unfounded than these fears. It is not under the régime of liberty, it is under that of concordats, that a church forms a state within the state. The concordat itself is a proof of this, since the concordat is a treaty between two powers. The state, in treating with a church, recognizes publicly that it is a power similar to that which it represents itself. And this power is more formidable since the state lends it arms, puts itself at its service, and endeavors to increase its prestige.—Separated from the state, the church commands only the resources that belong to it, and finds itself confined altogether to religious affairs. Willing or not, it can no longer do anything but practice the medicine of the soul, and if it has any desire to

influence the course of affairs there are no other means of action for it than free discussion and persuasion.—It will be said this is a great error: that a church, and particularly the Catholic church, will always have means of action which can not be possessed by a philosophical school or any other association. Very true, but, without stopping to discover whether in a state of independence it will not have to use all its activity in providing for the needs of worship and church administration, I ask what action it could wish to exercise on a government which has nothing to give it but what it gives all the rest of its citizens, that is to say, security and the opportunity of living without annoyance. Is it wished to consider it as a permanent conspiracy against the state? But why should it conspire? To get possession of the government and change the order of things to its own way of thinking? Let the world be at rest on that point. It is not in this direction that the breeze of modern civilization is blowing. In a state where liberty really exists, and with it education and prosperity, conspiracies are chimeras; no one even dreams of forming them except among an enslaved people. Whatever may be the fickleness of men and the caprices of the crowd, change is neither sought for nor desired where every one is satisfied. There is a preventive, an infallible remedy against conspiracies from whatever side they come—to spread education and well being, to put each citizen in a position to think, to reflect, to judge soundly; and at the same time to encourage labor, to honor it, and to make it loved.—But if a nation placed in these conditions does not know how to appreciate its happiness, and prefers slavery to liberty, ignorance to development of mind, misery to well being, the institutions of the middle ages to those of the age of independence and maturity of reason, I do not see how its loss could be regretted. Let such a nation perish, since it is not worthy to live—These extremes are not to be feared, however. We have not yet arrived at this era of despair. Everything is moving toward liberty, the church and the rest, although it does not seem very much inclined at this moment to follow the general movement. Its independence would give it better counsel than its present position. The régime of separation of church and state will bring about altogether a different order of things from that which has reigned for centuries in most countries. In France the continuous exclusive dominion of Catholicism has accustomed Frenchmen to think of only one church. Men will tell us that there is no other church but that of Rome. In reality there are as many churches as there are ways of understanding Christianity, and the ways of understanding Christianity are very numerous, I was going to say almost infinite. If they have not yet appeared in France, it is simply for want of freedom. There has never been liberty of worship in France, in the true sense of the word. But if religious affairs ever come within ordinary law,

if it comes to pass that every man can express his opinions in religious matters, and preach them publicly, be sure the church will break up into a number of separate churches which will counter-balance each other, and have no more important occupation than to surpass each other in zeal, in morality and learning. In default of this breaking up, which, however, is unavoidable, the dissident religions, reduced to silence to-day, will be able to compete with the Catholic church in a way which will not be without danger for the latter.—It is not that this church would be menaced in its existence by the separation of church and state, and would be unable to endure the régime of liberty. It represents the principle of authority in religion; there will always be men, and many of them, who, distrustful of themselves or little capable for one cause or another of venturing on the examination of difficult religious problems, will feel the need of a support and will be happy to find it in a church which, to the prestige of a pompous ceremonial, unites the prestige, not less imposing to certain minds, of a dogmatism absolute in its affirmations. It may happen, nevertheless, that this of all the different churches should be the one which by reason of the considerable expense of its worship, the princely habits of its high dignitaries, the difficulties in organizing the numerous personnel of the clergy, would lose the most by losing the support of the state; and perhaps this feeling has something to do with the repugnance with which the separation of church and state seems to inspire it.—Men seem alarmed at the division which would naturally take place in religious institutions in consequence of an absolute liberty of conscience, of the discussions which would arise between different religions, and of the troubles which it is supposed would arise from these controversies. Let there be no alarm. Theological discussions become dangerous only when one party can invoke the aid of the secular arm. We do not see the public peace troubled in the United States by the controversies of sects, no matter how excited some of them are.—You will see the door open to all follies, those will be sure to say who only understand order born of constraint. It is possible, indeed, that extravagant opinions may appear, but they will die out of themselves very soon. Follies do not last except where they are persecuted. The American revivals are only transitory, without influence on the public peace and the general course of affairs. The Turlupins, the Beghards and the Flagellants excited storms solely because, instead of letting these feverish movements disappear of themselves, it was held a duty to rage against and repress them. Moreover, attacks of mental delirium are not without compensation. From time to time the youth of Sparta were treated to the spectacle of drunken men, in order to excite in them disgust for debauchery and love for sobriety. Religious follies will cause us to feel the worth of sound doctrines and of a piety sanctioned by right reason.—If we

now draw right conclusions from the considerations which we have just presented we shall be able to establish, it seems to me, the following propositions: 1. The course of affairs itself always leads to the separation of church and state. In the beginning religion rules all human affairs; a second state follows when the state seeks to guard social interests against the encroachments of the church, either by submitting it to its own authority or by restricting it in a circle more or less contracted through an agreement with the church itself. The movement which is made in the sense of limiting the action of the church in the state, should naturally result in separating it altogether from public affairs. 2. The régime of state rule of religion takes away all independence from the religious sentiment, and in that way all dignity and real life. It is an unhappy system, because it completely stifles thought. 3. The régime of concordats is disadvantageous both to church and state. It keeps up a continual struggle between the two contracting parties, a struggle which exhausts without utility the forces of both, and prevents the state from devoting itself entirely to its mission, which is to labor for the increase of public wealth, by occupying it unceasingly with questions which have no relation to this end; which prevents the church from carrying on its work in peace which is to console, to edify and to spiritualize, by turning its attention toward plans of earthly power. 4. The only régime proper to the spirit of our time is the separation of the two powers, leaving to each its proper sphere. The objections brought against this system arise altogether from an erroneous conception of the order of things which it might produce. By placing one's self at the standpoint of this new régime all difficulties disappear, and at once is found, not absolute perfection, of course, which is not to be looked for in human affairs, but a just distribution of functions, a proper liberty left to the expression of religious opinions, the final suppression of importunate cares, such as the administration of ecclesiastical affairs has been to governments for centuries past; in one word, an organization in which the various interests will find all the satisfaction desirable without coming into collision and without injuring each other. MICHEL NICOLAS.

CHURCH, Anglican. (See GREAT BRITAIN.)

CHURCH, Catholic. (See ROMAN CATHOLIC CHURCH.)

CHURCH, Greek. We shall not undertake to explain the origin and different phases of the operation of the Greek from the Roman church, but will confine ourselves to explaining as briefly as possible how the Greek or Oriental church is constituted. The Oriental church is divided into four patriarchates, with sees at Constantinople, Jerusalem, Antioch and Alexandria. Greece, before its emancipation, belonged to the patriarch-

ate of Constantinople; since the war of independence, it has been freed from this subjection, and the constitution of 1844 has converted this fact into a principle. The supreme authority is vested in a permanent holy synod, composed of five members; this synod sits in the capital and is presided over by the metropolitan; the other four members are called counselors. The sovereign is represented in the holy synod by a royal commission, which attends all the sittings, and countersigns all decrees, but has not the right of participating in the deliberations. In what concerns purely religious questions the holy synod acts in the plenitude of its independence; in matters of a mixed nature it acts in concert with the government. It is intrusted with the censorship of books for the young; it sees that the religious holidays are celebrated according to the orthodox rite, and that the clergy take no part in politics. In applications for divorce the bishop declares the dissolution of the marriage, after the sentence of the court has been transmitted to him. The metropolitan's salary is 6,000 drachmas; each of the ten archbishops receives 5,000, but the bishops receive only 4,000. The bishops are named by the king, upon the presentation of three candidates chosen by the holy synod from among the clergy of the kingdom of Greece.—Of the four great Oriental sees, that of Constantinople is the only one that has maintained its importance; the provinces subjected to Turkey and to Austria are subject to its direction in spiritual matters.—In what concerns the Græco-Russian church it is well known that after the capture of Constantinople by the Turks the Russian clergy have considered themselves independent of the supremacy of the Oriental patriarch, and that his influence increased to such a point as to give umbrage to the Muscovite sovereigns. The accession of Peter I. put an end to this state of things; he knew that his clergy were opposed to the reforms which he contemplated. He, by his own authority, deposed Nikon, the patriarch of Moscow (1681). He afterward suppressed this dignity and confided the direction of everything relating to ecclesiastical affairs to a college composed of bishops and civil counselors, called the directing holy synod, which sat first at Moscow, and afterward at St. Petersburg. The members of this synod now take rank immediately after the senators. It is presided over by an archbishop, who can not quit the imperial residence. The sees of the four great dioceses are St. Petersburg, Kiev, Kasan and Tobolsk; but the holy synod has *branches* in Georgia, Imeretia, and Mingrelia, whose chief towns are episcopal sees.

CHOPIN.

CHURCHES AND RELIGIONS, Politico-economical Aspects of. Why place such an article in this work? What can churches have in common with political economy? This question will doubtless present itself to the minds of some readers, who, before examining the question, will censure us for having considered from the point

of view of material utility a side of human life in which, to their thinking, calculation should play no part.—Their censure would perhaps be well founded if, being imbued in regard to churches in general with that philosophic, or pretended philosophic indifference on which radical thinkers pride themselves, we should pretend to weigh the different beliefs in the worldly balance of material interests and assign to economic considerations any influence in the choice of religion by individuals or nations. But such is not our idea. We know very well that a church is adopted from conviction, on account of religious beliefs of which it is the external manifestation, and not in consideration of what it costs, or what it brings in; and we should consider the statesman senseless whose views on the question of public worship should be determined by motives of economy alone.—Let religious men, therefore, divest themselves of prejudice in reading what we write, and they will not be slow in recognizing with us that churches come naturally within the domain of political economy, first as exercising an influence more or less direct upon certain economic phenomena, then as applying a part of the wealth produced to the satisfaction of a social want.—Political economy does not embrace the totality of human interests; it does not undertake to indicate to man, individual or collective, the means of happiness, even here below. Its only object is to explain the phenomena of production, circulation and distribution of wealth, to discover the laws according to which these phenomena take place. Finally, its object is to formulate the general theories which should direct nations in their economic development, that is to say, in seeking the advantages which have wealth for their cause or principal element.—Thus when exact data permit us to compare the economic condition of a country with the productive powers at its disposal, it belongs to political economy to decide in what degree the results of this comparison are in accordance with the general laws which preside over the development of wealth, and indicate the causes which might have accelerated or retarded the progress of this development in the country in question. If, among these causes, it finds certain precepts or certain usages forming part of religious worship; it takes note of them, with no other object than to explain the complex phenomena of which it must render account, without expressing any judgment at all as to the religious, moral or even simply political propriety of the practices or the observances in question.—Now who can deny the influence which certain churches have exercised on economic phenomena at different times, notably on the quantity of productive forces set at work and on the direction which was given them? Must we not seek in the religious beliefs of the people of the east, and in the practices derived from these beliefs, one of the principal causes of the profound difference existing between the material civilization of these peoples and that

of the western nations? Should we not attribute a considerable part, in many economic results in the political and social régime in France, to the precepts and usages of religion then dominant, especially to monastic institutions, to the celibacy of priests, to the great number of holidays, to abstinence in Lent, etc., etc.?—We do not wish, however, to occupy ourselves here with these effects peculiar to certain churches and resulting from variable practices. Among the civilized nations of our time the economic influence of which we have just spoken has become, or tends to become, almost nothing or purely accidental. But between churches and our science there exist relations of another kind, to which we must call the attention of the reader.—Religious beliefs common to a great number of individuals demand an external manifestation, collective and public; in other words, a worship more or less solemn. This is a universal fact in support of which any demonstration would be superfluous.—It is another no less undoubted fact that this social want is one of those which the state is almost always obliged to provide for by means of an organization whose expenses are defrayed by society. From this two questions arise which evidently belong to political economy: 1. Are religious wants better and more completely satisfied by the intervention of the state than they could be by the spontaneous action of society itself? 2. Which of these two possible modes of satisfaction, all other things being equal, imposes the least material sacrifice on society?—Before approaching the examination of these questions let us begin by stating that if we consider the two modes as equally possible, it is because they have both been tried. There exists in our time a great nation, highly civilized and at the same time very religious, in which churches are altogether private institutions. In the United States the state is absolutely a stranger, in law and in fact, to the external manifestation of religious belief. Religious wants are satisfied there, completely and liberally, without any intervention either of the public treasury or of the law. It was almost the same in France before the revolution of 1789, as the Catholic church had its own property at that time which relieved it of the necessity of asking anything from the state, and an organization which did not emanate from the civil power; while the other churches were not recognized.—In political economy those who labor for the satisfaction of a social want are called *producers*, and those who make use of the product intended for this satisfaction *consumers*. When the state assumes the rôle of producer, it arrogates to itself a monopoly: it excludes all competition in the kind of production to which it devotes itself. In the contrary case, that is to say, when the satisfaction of a social want is left to the free and spontaneous action of society itself, or to the parts of society which feel this want, it necessarily happens that the corresponding production is undertaken competitively by several individuals or several private

associations. Sometimes it is manufacturers who thus apply their labor in view of an eventual pecuniary profit; sometimes consumers, who associate together to obtain, by their united efforts or their individual sacrifices, the satisfaction of the want which they feel in common. On both hypotheses each producer, individual or collective, is evidently interested in increasing his product, since he finds, on the first hypothesis, an increase of profit, and on the second, the combination of a greater number of individual efforts and consequently a more and more complete satisfaction of the wants which he intended to satisfy.—Now the producer has two methods of increasing the number of consumers whose wants he provides for, and of outstripping his competitors by increasing his production at the expense of theirs. The first is to improve the quality of his products; the second, to lower their price to consumers. The certain effect, therefore, of competition is to induce producers to improve their products and to furnish them at the lowest possible price.—In the case of an absolute monopoly the stimulant of which we have just spoken does not exist, or, if it does exist, it is in a much lower degree and under certain exceptional circumstances, namely, when it is a question of material products, destined to satisfy the wants of luxury, the consumption of which may be extended or restricted indefinitely. We can affirm, then, that any social want will be satisfied more completely and economically in proportion as the competition of producers fitted to provide for it is freer and more extensive.—Such is the general law laid down by political economy for the solution of the questions which occupy us. Does this law, evident in theory, and confirmed moreover by the daily experience of practical life, admit of exceptions? Are there special social wants which can be satisfied only through the intervention of the state? We do not hesitate to answer affirmatively, and we shall cite at once as special exceptional cases, the wants of security, justice, coinage, ways of communication for persons and things, etc., etc.—Should religious wants be ranged among the exceptional cases or remain submitted to the general rule? This remains to be examined. But we must first establish a distinction which governs our whole subject.—The Christian world from a religious point of view, has for three centuries been divided between two opposing principles, which we shall call the principle of unity and the principle of diversity. Those who admit the first, form but one single church, submitted to one single authority, practicing one and the same rite prescribed by this authority. Those who admit the second principle, form an indefinite number of distinct churches, capable of differing from each other in forms of worship, and, up to a certain point, in their beliefs.—It will be seen that we describe Catholicism and Protestantism by their purely external and in some sense material aspect, because it is the only one, as we have already said, of which our science can take account.—Examined under

this aspect the principle of unity becomes identical with that of monopoly. Catholicism excludes all internal competition. Whether the state interferes or not, there is but one *entrepreneur*, one single producer charged with providing for the religious wants of Catholics. if it is not the state it is the church, a body exclusively monarchic according to some, mixed with aristocracy according to others, but whose will is always one and homogeneous with reference to what we may call *religious production*.—There would be no further question then with reference to Catholicism than to decide which is preferable, the monopoly of the church or that of the state: a great question, which it is our duty to examine here only in its economic aspect, putting aside all political or moral motives which might militate in one sense or another. Now from this restricted point of view, the monopoly of the state appears to us preferable to that of the church for the following reasons: Among Catholics the acting church, the church which administers the worship and which disposes of the material means collected for this purpose, is not confounded, as among Protestants, with the religious community itself; it does not embrace the totality of believers; it is composed exclusively of members of the clergy, that is to say, of an organized hierarchy, which recruits its own ranks and which is consequently animated in the highest degree with the spirit of unity and perpetuity, of unity in time and space. The result of this, in the first place, is that the immovable property which the church has acquired, and the amount of which it is always interested in increasing, to assure its own existence more and more firmly and its means of action in the future, becomes inalienable in its hands and is withdrawn from circulation. Not only does it cease to belong to lay society; but it is withdrawn from its action, withdrawn from that commercial movement which, under the impulse of interest, tends to render the working of productive capital more and more profitable to the general interest, by causing it to pass through hands the best fitted to make use of it. The first consequence produces a second still more disadvantageous.—If to satisfy the personal wants of its members and those of the church with which it is charged, the hierarchy had only the periodical contributions and casual offerings which laymen might voluntarily make, it would, although exercising a monopoly, be interested in arousing the zeal of believers in keeping up among them religious sentiments and habits. Can it be the same when once the church is possessed of considerable property which renders it independent of the zeal of the faithful? Evidently not. The stimulant of interest then becomes weaker, if it does not altogether disappear; and as that of duty, unfortunately, is not always of such constant efficacy, we may hold it for certain that the satisfaction of religious wants will become, under such a régime, more and more imperfect and insufficient for Catholic populations.—The truth of what we

advance was confirmed in a remarkable manner by the experience of France. Before the revolution of 1789, the church possessed one-fifth of all the territory of France and the rest was burdened with tithes for its profit, the annual product of which reached 133 millions francs. In this way a very great part of the soil of the country was either withdrawn from circulation, consequently from the fructifying and improving action of private interests, or weighted with a real burden, which, of all those that land can bear, is the most irrational, the most contrary to the progressive development of agricultural industry.—In saying that all these ecclesiastical estates belonged to the hierarchy, that is, to the clergy considered in their totality as a moral body, we give expression to what was everywhere considered wrongly as of right, rather than what was really the law. We must agree with the greater part of the jurists who have gone to the bottom of this question, notably with the celebrated Savigny, that the subject of these rights of property, the real proprietor of these ecclesiastical estates, was the religious communities, the churches, in the primitive sense of the word (*ekklesiæ*). In the sixth century this had not yet become a question, as is shown by the constitutions of Justinian, in particular the 26th in the code *De sacrosanctis ecclesiis*. But the influence of the canon law was not slow in introducing on this point a confusion of ideas which continued to grow and develop from that time.—The error had become so general and so complete at the time of the first revolution that it formed the only ground upon which the partisans and the adversaries of the confiscation of ecclesiastical property met. When Mirabeau contended that the corporate existence of the Catholic clergy being once suppressed, the property of which this moral being had been the owner was left without a proprietor, and belonged, for want of an heir, by right to the state or to the nation as was then said, the Abbé Maury and other champions of the church opposed to this reasoning nothing but quotations and distinctions without significance. They did not think of disputing the principle, so eminently open to dispute, upon which the legality of the proposed secularization rested.—The confusion in question results, as we have said, from the very essence of the Catholic organization; it is inherent in the institution of a sacerdotal hierarchy, and we think it will be necessarily reproduced to a greater or lesser degree wherever the church organized in this way preserves under any conditions and limits the power of acquiring property.—It is not part of our plan to explain the principles on which the Catholic church has been successively reconstituted in France since the commencement of this century—principles which, to tell the truth, were vague enough in the minds of the legislators and statesmen charged with applying them. All we have to establish is, that the state as a rule undertook to provide for the religious wants of the Catholic population of France, and in

fact substituted its own monopoly for that of the church. The direct grants of the state are not sufficient, it is true, for the entire support of the Catholic church in France; but the remainder is furnished either by subsidies from the departments or the communes; or by the revenues of church property; or by means of real property or capital, composing what several French laws, in consequence of the above mentioned error, very improperly called *dotation du clergé*; or by lands belonging to the state, the departments or the communes; or by property belonging to the congregations and authorized religious corporations. Now this last category of property is the only one really removed from circulation and subjected to ecclesiastical mortmain; all the rest is comprised in the domain of the state or administered under its direct control or by purely civil authorities.—The territory of France, therefore, with the exception of a small fraction, is freed from that mortmain which had formerly covered so large a portion of it, and from those burdensome tithes which hindered the development of agricultural industry at every point.—However vicious the French system of direct contributions may be in principle, it is impossible to compare it in economic results with those two plagues, the tithes and the mortmain which it has replaced. It must be recognized then that the country has realized a great economy in the satisfaction of its religious wants by substituting the monopoly of the state for that of the church.—Are these wants themselves better or worse satisfied than formerly? If there is a fact generally admitted by all at the present time, it is this, that the Catholic clergy are better fitted morally and intellectually for the exercise of their functions, are more worthy in their private life, more zealous in the exercise of their pastoral duties, than they were in the last century. But, without wishing to attribute this amelioration exclusively to motives of material interest, we believe that it might have, in every case, and in the absence even of nobler motives, resulted from the insufficiency of the grants given by the state, the priests finding themselves in this way obliged to count on local assistance, as well as upon the liberality and the offerings of the faithful; that is to say, on resources whose product, essentially variable, must naturally increase and decrease in proportion to the degree of faith and religious fervor with which each minister of the faith may inspire his flock.—Let us now apply the questions proposed above to churches governed by the principle of diversity, and we shall recognize at first that competition may exist in them and exhibit its effects in two ways.—In the first place, as the churches established on this principle do not recognize any common superior, there is no reason to prevent persons professing the same belief and practicing the same rite separating into a number of communities distinct and independent of each other. This has taken place in all Protestant communions in the United States; also in Europe, espe-

cially in England among the dissenters, who are neither recognized nor salaried by the state. Now administrators and pastors of these competing associations would have to cease to be men were this state of things not to arouse among them a spirit of rivalry and emulation eminently fitted to stimulate their zeal and activity.—In the second place, the separation and reciprocal independence of the churches which do not profess the same belief, or which do not practice the same rite, establish among them an inevitable competition the more active and efficacious in this, that the spirit of sect and proselytism adds its stimulating energy to that of simple rivalry.—Are there reasons for thinking that the régime of free competition will not produce its ordinary effect in regard to worship? We do not know of any, and therefore we think we can affirm, that under such a régime the religious wants of a Protestant population will be as well and as economically satisfied as possible.—The interference of the state can only tend to diminish this satisfaction. First, by organizing and paying the churches, the state places the administrators and the pastors of each church in a position which renders them independent, in all their material interests, of the zeal and faith of their flock. The parishes of the different churches being limited by law, the salaries fixed in consequence and subtracted from the mass of public revenue, religious production will in its growth merely increase the burden of producers without adding anything to their profits, or to the importance of their position.—The principal inconvenience of state monopoly here is that, in organizing, at the expense of the entire nation and for all parts of its territory, a very limited number of recognized religions, it hinders, if it does not absolutely prevent, the manifestation of religious beliefs which can not be satisfied by any of the favored religions. Supposing even that dissenters enjoy the most complete legal toleration, it is impossible that their opinions should not labor under a certain disfavor; besides, they find themselves obliged to support alone the expenses of their own church at the same time that they contribute their quota to the dominant religions.—The monopoly of the state, in other terms the system of *established churches*, can assure but a very incomplete and costly satisfaction of the numerous wants which arise from the liberty of examination. Religious production here is, in the case of the greatest number of believers, either of poor quality or too high a price; in a word, insufficient.—The way in which sects multiply under the régime of free competition shows well enough that religious wants are various and tend to become more and more diversified when the minds of men have once shaken off the yoke of authority and broken definitely with absolute unity of belief and worship, of organism and of action, the idea of which, as well as that of liberty, does not cease to have a powerful attraction for the human mind.—We might examine

the case in which the two principles, of unity and diversity, meet among the same people; but we do not see how this circumstance could modify the theory which we have explained. in the countries at least where Catholics form a considerable portion of the population, above all, in those where they are in a great majority, as in France. —In closing this article we think it our duty to insist once more that our readers should not forget the narrow and closely circumscribed province to which we have confined ourselves in the examination of the questions which we had to solve. To conclude from our reasoning that economists, and particularly the writer, are absolute partisans of one system or another in the question of religious worship, would be to make us say something different from what we have said or wished to say. The problems of legislation and politics are always complex. Economic motives should be taken into consideration, without doubt, but together with motives of a nature altogether different; and if the error has often been committed of giving too small a place to the first, it would not be by giving it too great a place that the progress of our science would be favored, and injurious prejudices, which are still entertained by so many statesmen and administrators, dispelled.

A. E. CHERBULIEZ.

CHURCHES, Protestant.¹ The organization of churches is the only thing in religious matters which comes directly within the province of politics. It seems proper, therefore, to begin with a glance at the nature of Protestantism, the organization of a church naturally depending upon the principle on which that church is founded. And as Protestantism has given birth to many communions differing from one another in many respects, and founded upon different systems, it will also be proper to indicate the dogmatic differences which distinguish them from one another; we will therefore indicate, in their general traits, the constitutions which govern the principal among these churches.—I. *The Principle and Essence of Protestantism.* Protestantism is not, like the Greek church, distinguished from Catholicism solely by differences of belief, ceremonies and ecclesiastical institutions. There is a more profound difference between them; it concerns the very principles which are at the foundation of the two religions. Both are equally derived from the teaching of Jesus Christ and the apostles, and consequently, in their final analysis, from the biblical books which contain this teaching. But while in Catholicism the interpretation of these books, and, consequently, all that concerns religious life, belong exclusively to the clergy united in council,² and the faithful are bound to accept simply and without any more ample information, as positive declarations of the

Holy Ghost, the decisions of the ecclesiastical body regularly assembled; in Protestantism, the interpretation of the Bible is of right for all the faithful, who, after surrounding themselves with all the light they may need, determine their own belief according to what they find in the sacred scriptures.—This is the essential difference between the two forms of Christianity, and it is a radical one. It is in religious matters a system of authority in the one case, and a system of liberty in the other. Each has its advantages and disadvantages, and considering them from an historical and philosophical point of view, we may say they correspond to and agree with different states of culture and civilization. One imposes itself by the very force of circumstances upon nations too little developed to be able to direct themselves, as also upon individuals who, not wishing or not daring to accept the responsibility of their acts, their thoughts and their sentiments, invoke assistance to help their weakness; the other is introduced, naturally, at a time when man, more enlightened, aspires to maintain his individuality, and feeling himself capable of freely determining his own resolves, has no longer any need of a strange hand to guide him in the difficult paths of life. Considered from this point of view Protestantism and Catholicism may be compared, the former to a free state in which each citizen participates, in a certain measure, in the legislative power which makes the laws that govern him; the second to a state, monarchical by divine right, whose subjects have but to obey, and be silent.—Hence it follows that Protestantism can not aim at that unity of doctrine, rites and institutions of which Catholicism boasts, and which it gives as a proof of its divine character. Freedom of investigation must necessarily lead to a great variety of opinions, and, as a consequence, give rise to a host of different churches; this is what has occurred within the pale of Protestantism. All Catholic controversial writers have, with Bossuet, offered these variations as a decisive argument against free investigation, and, consequently, against Protestantism, which is based upon it. Protestants themselves have believed in the validity of this objection; many still believe in it. Let Protestants reassure themselves. All the fragile scaffolding of Catholic controversy will fall to the ground the very day Catholics cease to confound, as they have nearly always done, religion and theology, and begin to distinguish the church from the school. Religion is an affair of sentiment; unity of sentiment is all it asks for. Christian sentiment necessarily ought to be common to all Christians. It is the mark by which they are recognized. Dogma, undoubtedly, is not an indifferent matter, since it is a need of the mind, and thus serves to nourish religious sentiment; but the object of our reflections is susceptible, like everything within the scope of our intelligence, of an infinite variety of appreciation and conception; for each man views abstract and metaphysical propositions in

¹ This article is treated from the liberal Protestant point of view.

² More properly to the pope since the declaration of papal infallibility.

a different light —Unity of opinion is far from possessing the value attributed to it. It is also, and even more frequently, the mark of error than of truth. Witness the Mussulmans and Buddhists, among whom it obtains with no less intensity than among Catholics. It is, in all cases, the sign of spiritual death, as variety and versatility of opinion are the sign of spiritual life. As Leibnitz said, long ago, universal peace can be found only in the grave. Diversity of dogmatic conceptions in unity of Christian sentiment; this should be, this would be, in fact, the device of Protestantism if its followers had a clear conception of their own principles —But, be this as it may, to reproach Protestantism for the variety of opinions which divide it, is to reproach it for being Protestantism; to wish to impose unity upon it is to re-convert it into a new Catholicism, or, we should rather say, to suppress it. Without variety in dogma, there would no longer be any liberty in religion, which is the true manifestation of individuality from a religious point of view.—It was not, therefore, for the sake of the mere theoretical principle of private investigation that the reformers rebelled against the Catholic church. In reality they proposed to themselves no other end than the re-establishment of Christianity in its primitive purity; as Zwingli expresses it, by freeing religious truth, such as it is taught in the sacred scriptures, from the alterations introduced by the failings of the church and the errors of tradition. Private investigation was in their eyes but an instrument. They even thought to abandon it when they would have re-established the true doctrine; but from the dogmatic point of view, from which they considered it, they could not imagine that any one could freely study the Bible, and not see in it precisely what they themselves saw. Matters did not, however, turn out as they expected. Most marked differences were discovered upon points which seemed to them to be beyond all question, and instead of admitting that variety of opinion was the consequence of the principle of private investigation which they had appealed to, and that the new dissenters did nothing, in reality, but follow the example which they themselves had set them, and use toward them a right which they had claimed for themselves against the Catholic church, they would recognize in them but perverse and rebellious spirits who must be compelled by the fear of punishment to render homage to truth. The reformation at once changed its language and its conduct. The constraint in religious matters which it had condemned and continued to condemn as an insupportable tyranny, when it emanated from Rome, it exercised immediately after, as a God-given right to itself, over those whom it had called to liberty.—We must say of this inconsistency what a Geneva professor replied to a Catholic who reproached Calvin with the burning of Servetus: *Reliquiæ papismatis*; it was a remnant of the Catholic education of the reformers. Protestantism has been at great pains to free itself of

these remnants, and even to this day it has not entirely succeeded, though it has labored without ceasing to this end. All its internal contests have been, in fact, but one long and constant effort to escape from the equivocal position of half-Catholic, half-Protestant, in which it was placed by the circumstances attending its birth, and to free from the yoke of tradition, which its founders had broken only in part, the religious liberty which they had called all Christians to enjoy. Under one form or another, even where the despotism of confessions of faith seemed most solidly established, Protestants have aspired to individual convictions, and have claimed the right to base their belief upon a personal study of the Bible. This tendency, always the same, and always active, should alone suffice to prove that private investigation is the soul of Protestantism.—It is often said that Protestantism may be summed up in the doctrine of justification by faith. The orthodox sects in particular are pleased to present it in this light; and we must confess that they are in the right: their only fault is that they take a part for the whole. It was by restoring the doctrine of justification by faith, that the reformers combated the Catholic doctrine of justification by works, a doctrine which, as is always the case in the field of religious beliefs, becoming more and more materialized, was scarcely anything more in the sixteenth century than the doctrine of salvation by external observances. To this not very spiritual idea of Catholicism, to this belief that in practicing the ceremonies of religion one acquires mechanically, by a sort of *opus operatum*, a right to salvation, Protestantism opposes the far nobler idea, that salvation is the result of an interior labor of the soul under the influence of Christian sentiments; that is to say, of sentiments which are inspired in the believer by the thought of the love which God has manifested for us by sending us his Son, and allowing him to be sacrificed for us.—But, though this doctrine may be the very heart of Protestant theology, it does not constitute the entire work of Protestantism; it presents but one side of this work, an important side, no doubt, but not the most important. By this doctrine Protestantism speaks only to believers, and acts only in a purely religious field, while, in reality, it speaks to all men without distinction, and exerts a universal influence as well in the moral as in the social world, as well in the domain of philosophy as in that of literature; in a word, in the whole field of activity of the human mind, by making known the rights of individual liberty, and proclaiming private investigation, which, by an inevitable consequence, must extend, and in fact does extend, from religious questions to all that concerns human existence. By the dogma of justification by faith the Christian is freed from that spirit of religious mechanism which constituted Catholicism at the end of the middle ages; by private investigation, man, liberated from the empire of prejudice, of routine, and of every species of

blind and unconscious servitude, is restored to himself, and to the legitimate exercise of his intellectual faculties.—Nevertheless these two doctrines are most intimately connected with each other. Private investigation and the doctrine of justification by faith spring from the same source, and tend to the same end, and are, in reality, but the one same manifestation of the soul in two orders of action, different, yet connected together, like everything which really belongs to human nature. The latter is an internal principle of moral life. Calvin repeats incessantly, and not unreasonably, that justifying faith is at the same time sanctifying faith; the former is an intimate principle of individual intellectual life. It is, in the one case as in the other, my own individual activity, substituted for the state of passivity in which it is held as well by the faith imposed by authority, as by the Catholic doctrine of salvation by works. In the one case, we have the free inspiration of a soul purified by Christian sentiment, in opposition to the direction of consciences, which the Catholic church claims for herself; in the other, we have the individual action of the mind seeking for itself a solution more and more satisfactory of the great problem of human destiny, as opposed to a theory forever fixed, determined, decreed by an authority which allows neither contradiction nor control.—II.

Dogmatic Differences between the principal Protestant Churches. The Lutheran church and the Calvinist church. The opponents of Catholicism, outside the Anglican church of which we have nothing to say here (see GREAT BRITAIN), formed themselves, from the very earliest days of the reformation, into two great communions, that of the confession of Augsburg, so called from the celebrated document which the German reformers presented to Charles V. at the diet of Augsburg in 1530, and that of the Helvetic confession, which owes its name to the confession of faith drawn up at Basle in 1536, by the theologians delegated by the cities of Zurich, Berne, Schaffhausen, Saint-Gall, etc., and adopted by the Swiss cantons which had declared in favor of the reformation. The first is often called the Lutheran church, from the name of the great reformer who was in some sort its father, and who still remains its doctor *par excellence*; it is also styled the Protestant church, from the "protest" which some free cities and some states that had declared themselves for the cause sustained by Luther, entered in 1529 against the second diet of Spire, which placed restrictions upon the liberty of conscience accorded by the diet held in the same city three years before. The second is likewise known under the name of the Calvinistic church, Calvin having been its most eminent theologian, and having expounded its tenets with great talent, in his "Christian Institutions;" it is sometimes designated also the Reformed church, by a sort of opposition to the title Protestant church given to the Lutheran communion.—The church of the confession of Augsburg established itself in the

north of Germany, and in several other parts of the same country; that of the Helvetic confession in Switzerland, France, along the banks of the Rhine, in the Low Countries, and in Scotland.—Of the points upon which they are divided, the most important is that which concerns the sacrament of the eucharist. The Reformed church, breaking away completely from the doctrine of the Catholic church on this point, sees in the sacrament only a symbol of the death and sacrifice of Jesus Christ; this was the belief professed by Zwingli, Bucer, Œcolampadius and Capito; this is more extreme than the teaching of Calvin, who, endeavoring to take a middle course, taught that Jesus Christ is present in the species of the holy communion, not only symbolically or spiritually, but really and substantially for the believer, who thus becomes, in the communion, a participant in the body and blood of the Saviour. The Protestant church, ruled on this point by Luther, approaches still nearer than Calvin to the Catholic theory. For transubstantiation it substitutes consubstantiation, that is to say, it admits that the species of the holy communion, without losing their own proper substantiality to be transformed into the real flesh and true blood of Jesus Christ, as the Catholic church teaches, and still remaining bread and wine, contain really the body of Jesus Christ, just as heated iron contains heat, without, however, ceasing to be truly iron, and without losing the substance which constitutes it. The reformers in vain endeavored to agree upon this point; the difference of teaching continued, and assumed very great importance, especially in the eyes of the Lutherans, who, for more than a century, regarded the Calvinists as nothing else than heretics.—We may add that the separation was also maintained by differences in the forms of worship, which were more pompous among the Lutherans, and characterized by an extreme simplicity among the Calvinists; in the organization of the corps of pastors, who were in a certain sense hierarchical among the former, but absolutely on an equality among the latter; finally, in the administration of ecclesiastical affairs, in which the latter participate to a much greater extent among the Calvinists than among the Lutherans.—Apart from these differences, which do not concern fundamental points, the teaching of the two churches was substantially the same. Identical in the main with that of the Catholic church in what concerns God, creation, Providence, the Trinity, it differed from it in what concerns anthropology, and the means of salvation; upon these points, it differed but very little in any respect from the system which St. Augustine used in combating Pelagianism. The starting point of this system is a profound sentiment of the sinfulness and moral misery of man. With St. Augustine, Luther and Calvin held that man was of himself absolutely incapable of doing good, or even of conceiving the wish to do good. This deplorable state is the consequence of the sin of Adam, which has corrupted morally and

physically the entire human race. Without going as far as Luther, who taught that original sin is substantial, that is to say, that it constitutes a part of man's very essence, Calvin thought that the divine image was completely effaced in us by the fall of Adam, that all religious and moral strength is taken from our souls, and that a radical perversity has invaded our whole nature. Eternal damnation would be the deserved portion of all human creatures, if Jesus Christ the God-man had not suffered in our stead the *punishment* intended for us, and, by his expiatory death, satisfied divine justice. This satisfaction, however, effects nothing of itself as an exterior act, it is of value to the sinner only inasmuch as he applies it to himself by faith. But how can man, in whom all is evil, be able to apply to himself by faith the merits of the Saviour, and thus escape the condemnation he deserves? Even this does not come from him, but from the grace which gives him the desire to be partaker in the faith which justifies and sanctifies. Is this grace given to all men? By no means, but only to those whom God has chosen: as for the others, he abandons them to the condemnation, which is the necessary consequence of their perverse nature. And if you ask the reformers why God has destined some to salvation, and abandoned others to damnation, they will refer you, with St. Augustine, to the will of God, *arbitrio suo*, as Calvin says, adding, however, that the judgments and the ways of God are unfathomable, *investigabilia iudicia ejus, et investigabiles viæ ejus*.—How could a doctrine, as offensive to conscience as to reason, and so opposed to the spirit of Christianity, be adopted by the reformers as the expression of absolute religious truth? Many different circumstances serve to explain their conduct here, to two of which we would for a moment direct the reader's attention.—A task at once so considerable and so full of peril to its authors as the reformation of the church could be undertaken only under the influence of extraordinary religious enthusiasm. Now, of all religious systems, there is none more completely religious, if I may be allowed the expression, than that which does away with man entirely, the more to exalt divine action. If we reflect that religion is after all but the sentiment of our total dependence upon an infinite power which rules us, we will understand that the more profound religious sentiment is, the more ought he who professes religion to regard himself as a mere nothing in the presence of God. This system has been taught by all the mystics of all times and all places without any exception. It inevitably re-appears in all great religious crises. It could not but manifest itself in the great religious revolution of the sixteenth century.—On the other hand, this system just referred to came as a necessary reaction, not so much from the sale of indulgences, which was less the cause than the occasion of the reformation, as from the general tendency of Catholicism, of which this scandalous traffic was, in reality, a consequence, remote

no doubt, but still a logical one. Placed by her principles upon a slippery descent the Catholic church has been too often forced, so to speak, to accord to acts what belonged only to the feelings of which acts are only the internal expression and for which they can not be substituted. It has been too often forced in actual cases, to confound, if not in theory, at least in practice, penance with repentance. It was in view of this tendency, that the reformers protested, in the name of the religious feeling, against the efficacy attributed to acts which frequently had no merit. From the worthlessness of penance they inferred the insufficiency of repentance for the pardon of sins. Divine grace appeared to them the only refuge of the sinner; and, going from one extreme to the other, from opposing the Pelagianism of the Catholic church they denied the doctrine of Augustine.—This system, a veritable metaphysical and religious drama, may be suited to an epoch of strife, or to ardent souls greatly agitated and distressed, to a St. Paul, an Augustine, or a Luther; it has no place in the ordinary course of life. But the doctrine of Luther and Calvin disappeared as rapidly as Augustinianism had, in the fifth century, been transformed into a species of semi-Pelagianism, and as Paulinism had been effaced in the beginning of the second century by a sort of eclectic system. Melancthon had already protested against it in the second edition of his "*Loci Communes*," after having upheld it in his first edition; and the *Formula of Agreement* (1579) held that God wishes to save all sinners who oppose no obstacle to the action of grace, and that those who are to be saved are not predestined to salvation, except inasmuch as God foresees that they will follow the inspirations of his grace, and that those who are to be lost are not predestined to damnation, but inasmuch as he foreknows that they will voluntarily persevere in evil. From that day to this the doctrine of predestination and that of unconditional salvation have never been without opponents in the Lutheran church.—*Arminian Church*. Now it was that strife grew fiercer in the Reformed church. The dogma of absolute predestination had given rise to scruples in the minds of many pastors in Holland, when J. Arminius (who died in 1609) proposed to explain or replace it by a theory which soon won numerous adherents. He held that election and reprobation could not be arbitrary, but that they had for condition the perseverance of the elect in good, and the persistence of the reprobate in evil, which God, from whose eyes the future is no more concealed than the past or the present, knows from all eternity. Moral liberty being thus given to man, there could no longer be any question either of irresistible grace, for those who had received it by way of salvation independently of, and even against their will, as Calvin maintained, or of the unconditional gift of this grace to some, and its equally arbitrary refusal to others. Hence it follows that the Christian has some part in the working out of his own salvation; that he depends

upon his own efforts to maintain himself in the grace which is offered him, as he can also, after having received it, render himself unworthy of it by abandoning himself to evil. Finally, Arminius denied that Jesus Christ died only for the elect, the merits of the Saviour being imputable, according to him, to all who lay claim to them, and render themselves worthy of participating in them.—It must be admitted that this doctrine is far inferior in force and logical sequence to that of Calvin, whose system forms a complete whole. But the inconsistencies with which it abounds are largely compensated for by the humane sentiment which pervades it throughout, and we could scarcely understand how it was that it did not gain the assent of all Christians if we did not know how difficult it is to change belief. The situation of Holland at this epoch opposed new difficulties to the triumph of Arminianism. Religious discussion became entangled with a political question. The partisans of Arminius, called from his name Arminians, and also Remonstrants, from a remonstrance in five articles which they presented in 1610 to the states of Holland and Friesland, as a summary of their doctrine, were sustained by the chiefs of the republican party; while their adversaries, the rigid Calvinists, who were styled Contra-Remonstrants, because they declared themselves against the remonstrance of the Arminians, or Gomarists, after the theology of Gomar, who was the principal antagonist of Arminius, had with them the great majority of both pastors and people, and were supported by the prince of Orange.—The troubles to which this theological quarrel gave rise in Holland are well known. Barneveldt forfeited his life for his attachment to republican principles and Arminian opinions. Grotius would probably have shared the same fate if he had not succeeded in escaping from the prison in which he had been confined. The Arminians were abandoned to the fury of a people blinded by fanaticism. The persecution soon abated, however, and from the year 1625 the Arminians were tolerated in Holland; they there had separate churches and a theological school, at the head of which we find some eminent men, such as Episcopius, Courcelles, Limborch and John Leclerc. Arminianism had many adherents in England, who professed its tenets without separating themselves from the Anglican church. It particularly flourished at Cambridge, where it was taught by Chillingworth, Tillotson, Cudworth and other theologians, whose influence combined to modify very greatly the intolerant spirit of the Anglican church. In France, the theologians of the academy of Saumur in the seventeenth century inclined toward this doctrine.—Arminianism also made its way into Germany. A great number of Arminians, driven from Holland by persecution, took refuge in Holstein, where the king of Denmark allowed them to build a city, since grown into a place of considerable importance under the name of Friederichstadt. From there their principles were diffused over different parts

of Germany. Still it was not to Arminianism that we must directly attribute the reaction which commenced in the first half of the seventeenth century in the churches of the confession of Augsburg, against the scholastic theology founded on the absolute authority accorded to the symbolical books. It was the result of a variety of circumstances, among the first of which we must reckon the syncretic tendencies of a certain number of theologians, especially of Callixtus. A liberal thinker, he, more than any other theologian of his time, undertook to establish between the different Christian communions a true religious peace, and to convert the hatred which they bore toward one another into mutual love and support. It was with this end in view he proposed to restrict the articles essential to Christian faith to the apostles' creed, and leave opinion free upon all other points. He claimed, and not without some show of reason, that the several churches had all preserved enough of Christian truth to enable their followers to attain salvation in them if they led upright lives. Considered from this point of view, they were to him but different members of the true church. This proposition looking to toleration and concord was premature; it was not accepted, but it found supporters, and certainly left its impress on the minds of men.—A little later Pietism urged the same point. It boldly proclaimed that Christianity did not consist in an arid orthodoxy, and that it is less important to engrave dogmatic subtleties upon the mind than to impress Christian sentiments upon the heart. The leader of this party which never formed, as is often imagined, a separate church, did not aim at division, and never, at any time, dreamt of abandoning the Lutheran church. P. J. Spener was not exacting in matters of opinion, but was a very severe judge of acts. He devoted his attention to the cultivation of heartfelt piety, and to removing everything that might serve as an obstacle to its development. While combating the caviling spirit of the Lutheran theologians, he attacked with no less spirit and success the superstitious respect which they had for their symbolical books, and, in this manner, labored in the cause of toleration and freedom of investigation. To-day the denominations Lutheran, Calvinist and Arminian have but an historical existence. The differences in point of dogma, which separated the churches, have disappeared. They together profess a common body of doctrine, which does not differ much from the Arminian theology, and which is designated by the vague but generally adopted name of orthodoxy. Their union goes still further; the Lutheran and Reformed churches are distinguished from one another in France by their methods of administration, which are not precisely alike. But in Germany the two churches are almost perfectly united into one, which goes by the name of the Evangelical church. The duchy of Nassau set the example here. A general synod held at Idstein in August, in 1817, decided upon the union

of the two communions. The king of Prussia, by a circular of the 17th of September of the same year, invited the Lutherans and Calvinists to reunite in one church. There was considerable opposition in different places, particularly in Breslau, but in general the fusion was easily effected. Since that time the union of the two churches has been brought about in the principality of Hanau, in the duchy of Fulda, and in Rhenish Bavaria in 1818; in 1820 in the duchy of Anhalt-Bernebourg; in 1821 in the principality of Waldeck and Pyrmont, and in the grand duchy of Baden; in 1822 in Rhenish Hesse; in 1823 in the principality of Anhalt-Dessau. In the other states it has been adopted in principle; the particular circumstances which are opposed to its immediate realization will disappear, either of themselves or under the pressure of public opinion which is nearly everywhere favorable to the measure.—*Socinians, Anti-Trinitarians, Unitarians.* The reformation was from the beginning more radical in Switzerland and France than in Germany. On penetrating into Italy, it assumed a form more radical still, and immediately and unhesitatingly rejected such of the ecclesiastical dogmas as seemed contrary to reason, among others those of the Trinity, original sin, and predestination. The members of this sect are known by the name of Anti-Trinitarians, their denial of the doctrine of the Trinity being the most marked feature of their belief, as also the one which rendered them odious to all the other churches without exception. They are also called Socinians, Lelius Socinius and his nephew Faustus Socinius having been, if not the founders, at least the most eminent theologians of this sect, and the Polish Brethren, because it was in Poland alone that they were tolerated at first.—The Socinians regarded Jesus Christ as a divine being, as the first-born of God, but not God in the exact sense of the word; and the Holy Ghost they did not regard as a divine person having a distinct existence, but merely as a virtue, an activity of God. Despite their anti-Trinitarian notions they did not desist from offering to Jesus Christ the worship of adoration, as all other Christians are accustomed to do. Faustus Socinius even wrote several treatises against those of the Anti-Trinitarians, who, more consistent than he, maintained that we should adore God alone. This opinion, however, as might have been expected, finally triumphed among them. In rejecting the Trinity they equally rejected, or at least greatly modified most of the other Christian doctrines, among the rest that of original sin, which they did not regard as an actual sin, that is, as an act for which we are responsible, but simply as a proneness to evil, which, however, is not such as to render us absolutely incapable of any good thought or good act, as the Lutherans and Calvinists hold. In conclusion let us add, that they admitted no other symbol of faith than the apostles' creed, and ever professed the greatest toleration for individual opinion.—But this toleration was never practiced

in their regard. Odious alike to Lutherans, Calvinists and Catholics, pursued on all sides as impious, they did not succeed in founding establishments anywhere but in Poland, and in 1658 they were expelled even from there. The only flourishing churches they have to-day are in Transylvania, but their opinions continue constantly to attract to them new adherents. They are actually professed, with some modifications, by the Unitarians, whose influence is constantly increasing, especially among the enlightened classes of America. Like the old Socinians, the American Unitarians prefer the practical side of Christianity to metaphysical speculation; like them too, they wish to be guided in the interpretation of the sacred scriptures by the dictates of sound reason, whose rights they never cease energetically to defend.—Unitarianism also numbers many disciples in England. The English Unitarian Society for the Propagation of the Knowledge of Christianity gave a résumé of its own faith in the preamble to its rules, in 1791. That résumé is substantially as follows: The fundamental principles of this society are that there is but one God, sole creator, preserver and ruler of the universe, the only true object of public worship, and that there is one mediator between God and man, the man Jesus Christ, who received from God the mission of instructing men in their duties, and revealing to them the doctrine of a future life.—The Unitarians have organized churches in England as well as in the United States, and reckon among their number men estimable alike for their character and their talents. The celebrated chemist, Priestley, was one of their ministers in England, and in our times Channing and Parker performed the same function in the United States of America.—Besides the great Protestant churches which we have now considered, there are several others of much less importance, but which however had, at the time of their origin, a reason for their existence. There is not one of them which does not correspond, in a certain sense, to a particular form of religious sentiment, and which has not produced, together with the lamentable disturbances which are inevitable in human affairs, some happy development of religion and even of religious science, although these churches are not specially distinguished in the latter field. We may consider them, in a Protestant sense, as playing a part analogous to that of the different lay congregations, which a devotion, venerable and profound no doubt, but in general puerile and unenlightened, has founded in great number in the Catholic church. It will suffice to mention here those which are the most important, namely, the Anabaptists, the Quakers, the Moravians, and the Methodists.—*Anabaptists.* The Anabaptists date from the earliest days of the reformation. Their doctrine was an exaggeration of the principles of liberty preached by the German Protestants, and, at the same time, a violent, but almost inevitable reaction against the intolerable yoke

which weighed down not only the consciences but the entire life of the lower classes in Germany. Their supporters were drawn mostly from the peasants and the laboring classes. Their history, from 1521 to 1535, is too well known to need to be repeated here. But what is not so generally known is that, after the bloody defeats which they sustained in 1535, they submitted to the reform which a pious and enlightened man, Menno Simonis, began in 1536, to introduce into their doctrines, their discipline and their morals. From that time, they have formed, under the name of Baptists, or Mennonites, a sect animated by a pacific and practical spirit, avoiding controversies, and attaching little importance to science, although they have produced some distinguished writers. They have some communities in Alsace, Holland, England, Prussia and Russia; they are still more numerous in the United States. Disagreeing among themselves on some points of discipline, they all agree in not admitting to baptism any but adults, believing, like the Catholics, that this sacrament has a hyperphysical virtue, that is to say, that it produces in the neophyte an infusion of divine grace, which renders him capable, thenceforth, of performing the good works necessary for the neophyte's salvation. They are likewise unanimous in condemning the taking of oaths, in refusing to bear arms, and in declining public offices. In the doctrines of original sin and redemption their belief nearly resembles that of the Arminians. Finally, they reject all authority in matters of faith, and admit the individual interpretation of the scriptures. — *Quakers*. The Quakers were, at first, but a sect of fanatics. It was founded in 1647 by George Fox, a man devoid of education, but accustomed from infancy to contemplative meditation. His disciples combined the severity of the ancient Montanists with the mysticism of the Fraticelli, and gave themselves up to many extravagances. They were brought back to reason by the wise Robert Barclay (who died in 1690), who systematized their doctrine, and, together with the celebrated William Penn (who died in 1718), contributed to its diffusion. — The system of the Society of Friends (it is by this name that the Quakers delight in styling their church) formulated by Barclay, was strongly imbued with mysticism. He placed by the side of the sacred scriptures the interior illumination, which alone can enable us to understand them. This interior illumination is not a new revelation, but the light of God manifesting itself by Jesus Christ in our hearts, and causing to spring up therein an irresistible inclination to good; this light of Christ in us, which illumines and sanctifies us, is the supreme law of faith. Christian life is all interior; it needs neither dogmatic formulas, nor ceremonies, nor even baptism, nor the holy eucharist: it consists in listening to the spirit, and following its impulses. In such an organization a clergy would be useless. No one presides at their religious meetings; each one

is free to address his exhortations to the members present; it sometimes happens that no address disturbs the meditation to which each one devotes himself. In the system of Barclay, the life of Jesus Christ, as he is described in the gospels, was offered simply as an allegorical representation of the action of Christian feeling. The Quakers of to-day admit the reality of the gospel truths, and accord the Bible a greater importance than they did formerly. The proverbial mildness of their manners is well known. There remains of their primitive excess only a praiseworthy and extremely decorous religious zeal. They are renowned for their probity and philanthropy, and, like the Baptists, avoid public offices, condemn war, and refuse to take an oath. To the Quakers belongs the glory of having inaugurated liberty of worship at the same time with civil liberty in Pennsylvania, a colony founded in 1681 by William Penn. — *Moravians*. Some descendants of the ancient Moravians,¹ persecuted in their own country, took refuge, in 1721, in the territory of the count of Zinzendorf, and there founded the society called *Herrnhut* (Guard of the Saviour), by which name they are sometimes designated. Zinzendorf introduced among them the spirit of pietism, which he had imbibed from Spener, of whom he was an admirer, and, seconded by Watteville and Spangenberg, he made of the Moravian Herrnhuters a sect which he organized very much after the fashion of a monastery, and which soon had establishments in nearly every part of the world. Their tenets differed but little from those of the Reformed church, except that they insisted upon the doctrine of original corruption as the consequence of Adam's fall, and the expiatory sacrifice of Jesus Christ. Nevertheless, they made religious unity consist, less in a conformity of ideas, than in a unanimity of feeling. They appeal, in religious matters, rather to the affections than to reason. They have not a single eminent theologian, and the fact seems to occasion them very little uneasiness. Their piety, simple, but narrow, the uniformity of the education which they give their children, the monotonous rigor of their life, are little calculated to develop the intellect, and will always prove obstacles to any influence they might aim at exercising over modern society. But this is not the point in which they have manifested the greatest activity. Their zeal is particularly devoted to the spreading of religious and moral truths among barbarous peoples. At the beginning of this century, this sect, with comparatively very few adherents, had 29 mission establishments, and something like 150 missionaries. — *Methodists*. The cradle of Methodism was a society of pious young men, who, urged by their religious needs, established among themselves in Oxford, in 1729, reunions for mutual edification. It has many striking points of analogy with the

¹ The Moravians here referred to belonged to the dissenting churches founded in the fifteenth century by John Huss, in Bohemia and Moravia.

pietism of Spener. It has, like him, its conventions (*Collegia pietatis* of Spener), wherein the faithful devote themselves to preaching, prayer, and the chanting of psalms. Like him it insists upon the corruption of human nature, redemption by the expiatory death of Jesus Christ, and salvation by faith. Like him also, it delights in exciting terror in the soul of the sinner by the most material and fantastic pictures of hell. The two can hardly be distinguished except by the disciplinary organization of Methodism, which is much more concise, and more perfect of its kind, than that which governed the *colleges of piety*.—Methodism, as Haag remarks, (*Histoires des dogmes*, vol. i., pp. 124, 125), has not and can not have any scientific tendencies. Even its mysticism has nothing very elevated about it. Its sole merit consists in its indefatigable efforts to improve the morals of the lower classes, by preaching repentance in a tone and in an order of ideas not above the level of their intelligence. The adherents of Methodism are confined almost exclusively to England and the United States. Since 1741 they have been divided into two parties. The disciples of George Whitfield are rigid Calvinists; those of John Wesley are, in point of doctrine, identical with the Arminians.—III. *Different Modes of Organization of the Protestant Churches*. Setting aside the churches of the Baptists, the Moravians, the Quakers, etc., which are not capable of any considerable development, we find in the churches born of the reformation of the sixteenth century only three systems of organization, the consistorial government, which may be regarded as an aristocratic system, adopted by the churches of the confession of Augsburg, and in our time by the Evangelical churches; the presbyterian or synodal government, which might be characterized by the modern name of representative, adopted by most of the Calvinist and Reformed churches; finally, the congregationalist, or independent government, a system of more recent origin in use in several churches of different denominations.—1. *Evangelical Churches*. Luther and Melancthon, as well as Zwingli and Calvin, were of opinion that religious society has the right to govern itself; that the holy ministry belongs to all Christians without distinction (*omnes aequaliter esse sacerdotes*); and that no one can exercise it but by the consent of the community, and by election (*eligite quem et vos volueritis, qui digni et idonei visi fuerint*). But, in practice, it did not seem to them either proper or possible even, to intrust the direction of religious matters to the ignorant and vulgar crowd. "The church," said Melancthon, "ought not to be a democracy. Everybody can not be allowed to come there to agitate dogmatic questions. It must be an aristocracy." (*Corpus Reformatorum*, Melancthon. opera, vol. iii., p. 470.)—But of what elements should this aristocracy be composed? The German reformers here found themselves in great perplexity. They would have wished it were possible to preserve, by divesting it of its character of divine

right, and considering it merely as a human institution, established simply for the maintenance of good order, the old organization, that is to say, the bishops with their council, and their retinue of priests. This was, in reality, what was done in Sweden and Denmark, where the Catholic bishops, having joined the reformation, continued, after changing their religious views, the exercise of their functions. But in Germany the bishops nearly everywhere declared themselves against the new doctrines; their withdrawal brought disorganization into the churches. How was order to be restored? There remained only the authority of the temporal rulers. To this authority it became necessary to resort. Civil authority became also, by the force of circumstances, ecclesiastical authority, and they adopted this direful maxim: *Cujus est regio, ejus religio*, the religion of the ruler is the religion of the land.—Luther and Melancthon do not seem to have been deceived as to the consequences of this system. "Tyranny will, in consequence, become more intolerable than it was before," wrote Melancthon to Camerarius in 1530. These sad forebodings pervade a host of passages in his later writings. Luther expresses himself even still more forcibly: "If the courts wish," he wrote to Cresser of Dresden, in 1543, "to govern the churches in their own interests, God will withdraw his benediction from them, and things will become worse than before." "Either let them make pastors of themselves," he says of the princes and lords, "preach, baptize, visit the sick, administer communion; in a word, let them fulfill all the ecclesiastical functions, or, ceasing to confound the two vocations, let them occupy themselves with civil affairs, and leave the churches to those who are called to edify them, and who must render an account of them to God. Satan still remains Satan. Under the popes he made the church meddle in politics; in our time he wishes to make politics meddle with the church."—As the *jus territorii* combined the *jus episcopale*, and also—as recognized by the peace of Westphalia—the *jus reformandi*, that is to say, the right of the prince to impose his own religion upon his subjects, the sovereign was by right the head of the church, and the ecclesiastical administration was, in Protestant Germany, but a part of the general administration of the country. This continues so even to this day. Fortunately, contrary to what is too often witnessed elsewhere, the German princes have been, as a rule, better than the laws, and real liberty of conscience has obtained in the very countries in which intolerance and constraint in matters of religion were recognized by law.—The direction of ecclesiastical matters was early intrusted to councils called consistories. The first council of this kind was established at Wurtemberg in 1539. It was created to settle the numerous difficulties caused by dissolutions of the marriage tie; but it was not long before its jurisdiction was extended to all ecclesiastical matters. Similar councils were soon established in all the Protestant coun-

tries of Germany. They generally consisted of two theologians, two doctors of law, one public minister, and a secretary. All the members were appointed by the civil power. One of the doctors of law was generally president. In places where there was a general superintendent the presidency was sometimes given to him. Each diocese had its consistory, which was supposed to take the place of the ancient councils of bishops.—Under the consistories, acting as their representative and their agent in the province, was a superintendent, whose special duties were the inspection of churches and schools, as well as the looking after the different edifices used for divine worship, as residences for the pastors, and for primary schools. In Bavaria, the grand duchy of Baden, and some other countries of Germany, these functionaries bore, and still bear, the name of deacons, or elders. In the Lutheran church of France they are styled ecclesiastical inspectors. The superintendents, deacons, or ecclesiastical inspectors, are always the chief pastors of their districts. In some parts of Germany there were, and are still, general superintendents who are above the superintendents, and perform only some of the duties performed elsewhere by them, such, for example, as the conferring of ordination on young ministers. The general superintendents are always members of the consistory, and when they do not hold the presidency, are seated next after the president.—This condition of things has been a little modified in our day, either by reason of the union of the Lutheran and Reformed churches, or on account of the continual complaints raised against a form of government, which, in theory at least, is a lamentable slavery of the church. Not that the Evangelical church has obtained autonomy; it has not ceased to depend upon the civil power; its administration still continues, after all, an affair of bureaucracy in the hands of the ministers of worship; but it has been placed, by the law, in possession of certain liberties, which must inevitably secure for it still others. It is besides helped on by public opinion, which is nowhere so independent in religious matters as in Germany.—The movement originated in Prussia; but it was not there that its most marked results were manifested. In 1819 Prussia, feeling the necessity of allowing the churches a share in their administration, while retaining the supreme control of them all, called together the provincial synods, for the purpose of consulting them upon a plan of ecclesiastical organization, in which it had hoped to unite and conciliate the synodal and consistorial régimes. There was great diversity of opinion. Some of the synods demanded more than the government was disposed to accord, that is to say, the very establishment of the synodal system itself with all its consequences. The government feared the ecclesiastics would aim at forming a hierarchy independent of the state, and confined itself to asking the churches to name councils of presbyters, whose powers

were not definitely determined. The synodal system was allowed only in the duchies of Julich, Cleve and Berg, and in the district of La Mark, where, however, it had been established since the earliest days of the reformation. We should also remark that the nomination of two bishops, in 1816, one for Berlin, the other for Königsberg, worked no change in the former system. This title added nothing to the authority of those who received it, who are but general superintendents under another name. The supreme control of the churches of Prussia, therefore, still remains entirely in the hands of the government, of which the consistories, the bishops and the general superintendents are mere agents.—In Bavaria, where the Protestants form nearly one-third of the population, the Evangelical church has been reorganized by an organic law of May 26, 1818, and the explanatory decrees of the same date. A higher consistory, established at Munich under the minister of the interior, is the organ through which the government exercises its supreme authority over all the Evangelical churches of the kingdom. Under this higher consistory are three consistories, one at Anspach, one at Beyreuth, and one at Spire. Finally, each of these three consistories embraces under its jurisdiction the deaneries of its district.—A diocesan synod is held every year in each deanery. It is made up of two-thirds ecclesiastics and one-third laymen. The latter are appointed by the consistory, from nominations made by the ecclesiastics. A general synod is held every fourth year in the sees of the consistories. Each deanery sends to this synod two ecclesiastics, the dean and one pastor, and one layman, selected by the ecclesiastics.—This organization is a mixture of the consistorial and the synodal systems. But the synods are not a true representation of the churches, since they neither directly nor indirectly elect the members.—This system has undergone some beneficial changes in the district of the consistory of Spire. They there organized councils of presbyters, the indispensable wheel-work of the synodal system, but, at the same time, accorded to the churches the nomination of the lay delegates to the synod. As a consequence of this last modification the lay delegates acquired considerable influence in these assemblies, although they formed only one-third of it. They are the true representatives of the churches; their voice has a great moral weight. This system, founded on a most rational basis, was not slow to produce its fruit. Taken together, the Evangelical churches of Rhenish Bavaria stand pre-eminently first, according to all reports. The consistory of Spire, composed, since 1832, of partisans of the old confessions of faith, has endeavored in vain to instill a different spirit into them; it has not succeeded in destroying the liberal tendencies of the pastors and churches of the province.—In the consistorial circuits of Anspach and Beyreuth also they recognized the convenience of the councils of pres-

byters as the basis of the synodal system, and wished to follow the example of the Palatinate. Unfortunately some pastors, among others Lehmus, dean of Anspach, proposed to give to this council the right of inspection and the censure of the lives of the faithful. There arose one common outcry against an organization which threatened to bring back the old ecclesiastical tyranny. In the face of this general opposition the decree establishing the council of presbyters was suspended. It was afterward determined to leave the churches at liberty to appoint councils of presbyters for themselves, or to follow the old system, as they chose. In the two circuits of Anspach and Beyreuth the churches have remained as they were, without representatives freely chosen by themselves in the religious synodal assemblies; and it is to this cause that Gieseler, in his Ecclesiastical History of the Nineteenth Century, not unreasonably attributes their relative inferiority.—In Wurtemberg there are two annual synods; but they are composed only of the presidents of the consistories, and the six general superintendents of the kingdom. These persons, being appointed by the government, are public functionaries, and not representatives of the churches. Thus all ecclesiastical administration depends upon the government, although article 71 of the organic decrees promises the churches independence in their private affairs. In the diets of 1833 and 1834 it was proposed to grant the Evangelical church a synodal and presbyteral organization; but to the present time these propositions have not been adopted.—In Saxony, from 1831 to 1834, a synodal and presbyteral organization was earnestly petitioned for but without success. What seems most surprising is, that such enlightened men as Bretschneider, Krelli, Rudelbach and Jaspis should declare against the representative system in the church. Superintendent Grossman, on the contrary, undertook to defend the cause of the independence and liberty of the church, both in his writings, and in the upper chamber of which he was a member.—The grand duchy of Baden offers a far different spectacle. When the two communions were united in 1821 they gave the new Evangelical church a presbyteral and synodal organization. Each parish has a council of presbyters. The diocesan synods are made up of all the pastors of the district, and of half as many laymen chosen by the councils of presbyters. The general synod is composed of a certain number of pastors, elected by the ecclesiastics of all the parishes of the grand duchy, and of half as many laymen named by the lay members of the diocesan synods, and besides of two members of the higher ecclesiastical council, a member of the theological faculty of Heidelberg, chosen by the professors, and finally a government commissioner, who is its president.—It is to be regretted, perhaps, that the laymen are not equal in number to the ecclesiastics in the diocesan synods, and in the general synod. But, aside from this defect, this organization is excellent, and accords

with the spirit of Protestantism. At first, no time was set for the meetings of the general synod, but its convocation was left to the arbitrary will of the government; and after the synod of 1831, another was not convoked until 1834. But in this assembly it was resolved that the general synod should convene regularly every seven years.—The ancient duchy of Nassau, which is actually an administrative province of Prussia, has enjoyed, since 1817, a presbyteral and synodal church organization very similar to that of the grand duchy of Baden. The churches there have at their head a bishop, who performs the duties of general superintendent.—In Sweden and Denmark the Lutheran church is episcopal, and organized under a system similar to that of the Anglican church. In the first named country the bishops are reckoned as part of the consistories, which are subordinate to them, and in the second the title of general superintendent is substituted for that of bishop.—The Lutheran churches have a constitution, which scarcely differs in anything from the organic articles of the eighteenth of Germinal of the tenth year, which governed the Reformed churches of France before the decree of March 26, 1852. The most considerable, we might almost say the only, difference is, that the Lutheran churches of Holland have a general synod which meets every two years. It may not be amiss to add that this general synod has the good sense to occupy itself only with administrative affairs, and to leave aside all dogmatic discussions, which, in the actual state of things, can work only discord and dissension.—In France the church of the confession of Augsburg is ruled by the decree of March 26, 1852, and the ministerial decisions of Sept. 10, of the same year. Each parish has a presbyteral council, composed of the pastor or pastors of the parish, and from four to seven lay members, chosen by a general vote, and elected one-half every three years. The consistories extend over several parishes, and look after their general interests. They are made up of all the pastors of the district, the lay members of the council of the principal town, and a certain number of lay delegates from the parishes. The consistories are, in their turn, grouped into various supervisory bodies; at the head of all the churches is placed a higher or general consistory, which constitutes the legislative power, and a directory, which is the administrative power. The general consistory meets at least once a year. It is composed of two lay deputies of inspection, all the ecclesiastical inspectors, one seminary professor and one lay member of the directory appointed by the government, who is, of right, the president of the consistory. The directory is a permanent body, and consists of a president, one lay member, one ecclesiastical inspector named by the government, and two deputies named by the higher consistory.—This condition of things will undoubtedly be modified. Alsace having been taken away from France, there remain to the church of the confession of Augsburg only two

inspection districts, those of Paris and Montbéliard. Will it receive a new organization? Will it unite with the Reformed church? The future must tell.—2. *Reformed Churches.* In principles, the constitution of the Reformed churches is presbyteral and synodal. All their particular churches or parishes are equal. "Let no church pretend," says the ancient discipline of the Reformed churches of France, "to primacy or power over another, nor one province (the combined churches of one province) over another." Their pastors are likewise equal; there is no hierarchy among them. The presidents of the different assemblies, who are always pastors, are either chosen by the votes of the assembly, or owe this honor to their long service in the pastoral function; in some places all the pastors are called to preside, in turn. Each parish has a council, called either by the presbyteral council, or presbytery, or consistory; it is the last named which is used in the ancient discipline of the Reformed churches of France; these same churches now employ the first (presbyteral council). This council is composed of the pastor or pastors of the parish, and of a certain number of laymen, chosen by all the faithful who have attained their majority; the number of these laymen always exceeds, and frequently very much exceeds that of the ecclesiastics. A certain number of contiguous parishes form what is now called a consistory (it was formerly called a colloquy). It is composed of a number of laymen, proportioned to the number of parishes represented, an equal number being allowed to each. The colloquies or consistories of a province, have over them a provincial synod, assembled annually, or semi-annually, at which are present at least one pastor, and one or two elders from each parish of the province, all of them regularly delegated by their consistories. Finally, a national synod or general diet of all these ecclesiastical republics, united, not merely by a common language and national sentiment, but also by a community of interests, memories and faith, crowns the whole edifice. To this assembly, which meets every year or at greater intervals, but always at a fixed time, and which sits in each province successively, each provincial synod sends two pastors and two elders. It is in this assembly that the general interests of all the churches are discussed, and the appeals and questions remaining unsettled in the provincial synods, settled.—As we have seen, the lay element is found represented in every degree, and that element is drawn, in the first instance, from the parishes themselves. This is a true representative government. All the Reformed churches—except the independent churches, which we will consider presently—are, in general, organized after this model. It is adopted by the churches of Holland, by those of Scotland, and by the Presbyterians of the United States. It was in vigor in the Reformed churches of France, before the revocation of the edict of Nantes.

During the persecutions, the national synods were absolutely impossible, but provincial synods were held as often as circumstances permitted. Upon the restoration of religion, the government, which had imposed upon them the organic articles of the eighteenth of Germinal of the eighth year, without consulting them, suppressed the national synod. It allowed, it is true, the provincial synods, and the decree of March 26, 1852, has made no change on these two points. But the provincial synods being but a useless piece of machinery in the absence of the national synod, were almost entirely abandoned; hence, the reformed church of France can no longer be classed among those which have a synodal organization, and are transformed, in fact, into congregational and independent churches, with this difference, however, that they have not the liberty of governing themselves absolutely in all things, and that their direction is in the hands of the minister of worship, although, to tell the truth, they enjoy a great deal of independence in what concerns the private affairs of their parishes.—In Switzerland, where the Reformed churches are divided according to cantons, there is no need of either provincial or national synods; the consistory which meets in the capital of the canton takes their place, and forms a sort of permanent synod.—We should add that, in this system, the parish itself chooses its own pastor or pastors, a right most precious and rational, and conformable in all respects to the spirit of Protestantism. The Reformed churches of France, Switzerland and Holland, and the Presbyterian churches of the United States, have always enjoyed and still enjoy it. It is not so, however, with the Presbyterian church in Scotland; there exists there, as in several countries of Germany also, what is called patronage—a most absurd system, of which it may be well to say a few words in explanation, and which caused in this church, about the year 1840, a division which it is important to know.—At the time of the reformation, in pursuance of a principle founded on the feudal right, and somewhat similar to what in Germany is styled the territorial right (*cujus est regio, ejus religio*), the lords nominated the pastors in the territory which belonged to them, and from that time they have considered these nominations as pertaining to them, of right, turning a deaf ear to the continual complaints of the Scottish church. When the ecclesiastical government was altered, after the expulsion of James II. in 1690, patronage was abolished. It was re-established 22 years later, in 1712, under the reign of Anne, and from that time has continued uninterruptedly. One-third of the Presbyterian churches are under royal patronage; the patronage of all the others is in the hands of particular private individuals, and this privilege is acquired and lost just as any other property.—When a pastorate becomes vacant, the patron presents a candidate. If the presbytery, that is to say, the synod of the district, raise no objection, the candidate preaches before the com-

¹ A general synod was convened at Paris in 1872.

munity. Some days later, a pastor, already exercising his functions, in turn ascends the pulpit and invites the parish to sanction the call of the candidate presented. This act of the assembly, which was, in principle, an acknowledgment of the right of the faithful to choose their spiritual guide, has little by little fallen into disuse. The signature of one single member of the church is made to suffice, and even this formality is not unfrequently dispensed with. It should be noted, too, that this custom of the nomination of pastors by patrons is even more objectionable than that practiced in the Episcopal church, for the Presbyterian pastors of Scotland are thus nominated in great part by men who are strangers to their church.—In 1830 a most spirited opposition was inaugurated against patronage. Thomas Chalmers, professor of theology at Edinburgh, was at the head of this movement. They at once addressed themselves to the house of commons, and demanded from it the repeal of the law of queen Anne. The general assembly (national synod) of 1834 decreed, by a decision known under the name of the act of veto, that the church had the right to reject every pastor presented by a patron. This decision found many upholders. Several parishes rejected the candidates presented by patrons, and would not even listen to their trial sermon, although they had no fault to find with the candidates. The Scotch church was thus divided into two parties, the adherents of the act of veto, or non-intrusionists, and the moderates, who sustained the rights of the patrons.—Some of the patrons and rejected candidates entered complaint in the court of session (the supreme court of justice in Scotland). This tribunal declared in their favor. The general assembly persisted; it suspended a presbytery (synod of a district), which, conformably to the decree of the court of session, had accepted a candidate presented by a patron. Thus it became a contest between the highest ecclesiastical authority and the supreme court of justice. A decision of parliament became necessary. The case was, however, allowed to drag wearily along, with the hope that time would have the effect of calming minds.—The general assembly at length appealed to the queen, complained to her of the attacks of the civil court upon the rights of the church, and demanded the complete abolition of patronage. The address was presented in June, 1842. The government temporized for some time, still cherishing the hope that the movement would die out of itself. But the committee of the general assembly, complaining of this delay, and reproaching the government with a want of consideration for the church, James Graham replied, at last, that the decision of the court of session was perfectly legal. He, at the same time, remarked that the existing organization offered the church every desirable guarantee, since patrons could present only candidates whom it had already approved, and to whom it had accorded the right to preach; that, even after the presentation, the candidates were submitted to the approbation of

the presbytery; and, finally, that the parish had a right to make good its objections before this body, which pronounced definitively upon the admission of the candidates presented.—This did not satisfy the non-intrusionists, who demanded that each parish should nominate its own pastors, and the law sanction this order of things. The government persisting in its support of patronage, the general assembly which met at Edinburgh May 18, 1843, received, at the opening of its first session, the protest of the non-intrusionists. In view, they said, of the pretensions of the civil power to regulate affairs purely ecclesiastical, a legal and free reunion of the Scotch church was impossible. And thereupon the non-intrusionist members immediately retired from the assembly, and founded the Free Presbyterian church, which renounced all the advantages of the National church. More than four hundred ecclesiastics ranged themselves on its side; upward of £250 were subscribed for the foundation of the new church, and it established 687 parishes (free church associations). In many places they encountered great difficulties in erecting church buildings, the land owners refusing to give their land to the new associations; but they were not deterred by these obstacles; they held their services under tents, and sometimes even in the open air. The Free church is now solidly established, and has proved to old Europe, on the one hand, that a religious society can live and prosper without the support of the government, and, on the other, that a free church is in no wise dangerous to the state.—3. *Independent or Congregationalist Churches.* We call by this name all churches that are independent, not only of the state, but also of one another. In them every parish constitutes a body absolutely free, choosing its own pastors, maintaining itself by its own resources, and governing itself by its own laws. Several, even a great number, may have analogous doctrines and similar worship; nevertheless each one of them none the less preserves its independence; there are between them no ties but those of universal toleration and charity. This ecclesiastical form was that of the primitive Christian churches; but it was short-lived. As soon as the churches multiplied and acquired some stability, they established among themselves a sort of hierarchy, in imitation of that of the civil administration of the provinces of the empire. It was not until about two centuries ago that the congregational form of church government reappeared among some of the Protestant sects in the United States.—A great many objections have been raised against this ecclesiastical system; nor can we presume to say they are all frivolous. It may be feared, among other things, that it is not best suited to engender those lofty ideas and sentiments which raise nations above themselves, and urge them toward a new ideal. It seems calculated to retain in men's minds the conceptions which are most readily accessible to the great majority, and which favor narrow-mindedness in religious

matters. It may also engender petty rivalries among neighboring congregations, and make religion, if I may be allowed the expression, a matter of business. It might be possible, in fine, that it would, at certain times, create a state of excitement, not necessarily dangerous, but ridiculous, and therefore fatal to religious sentiment. But, without having recourse to the reflection, that in this imperfect world what is most beautiful is never without some defect, we must acknowledge, on the one hand, that these defects can be removed, at least in part, and, on the other, that they are counterbalanced by the advantages which this system unquestionably possesses.—In places and ages in which a rational spirit of toleration and intellectual progress are found side by side, human thought not confined within the narrow limits assigned to it by a dominant church, would take a flight, the grandeur of which we can not now measure, because our prejudices do not permit us to do so. A complete liberty in religious life would create at once conditions of intellectual existence other than those by which minds have hitherto been surrounded. But let us not dwell upon this view of the question; let us confine ourselves, in conclusion, to indicating some of the practical consequences of the congregational system.—It certainly is the only one which allows a real and unlimited liberty of conscience. Each one unites himself to the congregation whose doctrines, worship and principles best answer the needs of his heart and his intelligence. In this church he brings up his children; but they, when they have reached the age of reason, using the same privilege, may either remain in it, or leave it to join another, according to the promptings of their religious feeling. In this church, where no torture is inflicted upon the conscience, either by the laws, or by public prejudices, there can be no motive to entice one to disguise his opinions; there is no longer any room for that hypocrisy which traffics in holy things, which is inconsistent both with honor, piety and virtue. All other systems offer some temptations of this kind. Besides, where entire liberty reigns, ignorance and superstition, the sad results of the slavery of thought, must soon disappear. In fine, under this system, religious life becomes a truth. One attaches himself to a church because he thinks it the best, or the least defective; and this is the only motive with which one can ever sincerely join a church. This choice being, moreover, rational, men are intelligently religious, and not blindly so, as it happens nearly always in official churches, in which men remain simply because they happen to have been born in them.—It is needless to remark that this ecclesiastical form can not exist except where the churches are entirely distinct from and independent of the state. We would add also, that so far as we can judge, nations are progressing toward a final separation of church and state. We do not indeed pretend that it is the final form of the

manifestation of religious sentiment, nor even the best in an absolute point of view. We merely mean to say that it seems to us the most in harmony with the marked tendencies and inspirations of society as it exists to-day.¹

MICHEL NICOLAS.

¹ The following statistics show the comparative strength of the Protestant denominations in the United States, January, 1881: *Baptist*: 24,794 churches, 15,401 ordained ministers and 2,133,044 members, or 1 minister to each 139 members in the United States.—*Methodist Episcopal*: 16,721 churches, 9,261 ordained ministers and 1,680,779 members, or 1 minister to each 181 members in the United States.—*Methodist Episcopal (south)*: 3,593 ordained ministers and 828,013 members, or 1 minister to each 230 members in the United States.—*Lutheran*: 5,556 churches, 3,102 ordained ministers and 684,570 members, or 1 minister to each 221 members in the United States.—*Presbyterian*: 5,338 churches, 4,920 ordained ministers and 573,377 members, or 1 minister to each 117 members in the United States.—*Christian (Disciples of Christ)*: 4,861 churches, 3,658 ordained ministers and 567,448 members, or 1 minister to each 155 members in the United States.—*Congregational*: 3,689 churches, 3,589 ordained ministers and 323,876 members, or 1 minister to each 100 members in the United States.—*United Brethren in Christ*: 2,207 churches, 2,200 ordained ministers and 155,437 members, or 1 minister to each 71 members in the United States.—*Reformed Church in U. S.*: 1,384 churches, 752 ordained ministers and 154,742 members, or 1 minister to each 206 members in the United States.—*United Evangelical*: 366 churches, 363 ordained ministers and 141,000 members, or 1 minister to each 396 members in the United States.—*Presbyterian (south)*: 1,928 churches, 1,031 ordained ministers and 119,970 members, or 1 minister to each 116 members in the United States.—*Protestant Methodist*: 1,501 churches, 1,120 ordained ministers and 118,170 members, or 1 minister to each 56 members in the United States.—*Cumberland Presbyterian*: 2,474 churches, 1,366 ordained ministers and 111,855 members, or 1 minister to each 81 members in the United States.—*Mormon*: 654 churches, 3,906 high priests and 110,377 members, or 1 high priest to each 28 members in the United States.—*Evangelical Association*: 1,332 churches, 1,340 ordained ministers and 99,617 members, or 1 minister to each 74 members in the United States.—*The Brethren (Dunkards)*: 710 churches, 1,665 ministers and 90,000 members, or 1 minister to each 54 members in the United States.—*Six Principle Baptist*: 20 churches, 17 ordained ministers and 2,075 members, or 1 minister to each 122 members in the United States.—*Independent Methodist*: 13 churches, 14 ordained ministers and 2,100 members, or 1 minister to each 150 members in the United States.—*Shaker*: 17 churches, 68 ministers and 2,400 members, or 1 minister to each 35 members in the United States.—*American Communities*: 14 churches, 8 ministers and 2,838 members, or 1 minister to each 355 members in the United States.—*New Mennonite*: 31 churches, 44 ministers and 2,990 members, or 1 minister to each 68 members in the United States.—*Primitive Methodist*: 121 churches, 50 ordained ministers and 3,370 members, or 1 minister to each 67 members in the United States.—*New Jerusalem*: 91 churches, 81 ministers and 4,734 members, or 1 minister to each 58 members in the United States.—*Reformed Presbyterian*: 41 churches, 31 ordained ministers and 6,020 members, or 1 minister to each 194 members in the United States.—*Seventh Day Baptist*: 87 churches, 103 ordained ministers and 6,606 members, or 1 minister to each 64 members in the United States.—*Reformed Episcopal*: 55 churches, 68 ordained ministers and 10,459 members, or 1 minister to each 154 members in the United States.—*Adventist*: 91 churches, 107 ministers and 11,100 members, or 1 minister to each 104 members in the United States.—*Free Methodist*: 287 churches, 601 ordained ministers and 12,120 members, or 1 minister to each 20 members in the United States.—*Jews* (total pop. 230,457): 269 synagogues, 202 rabbis and 13,683 members, or 1 rabbi to each 68 members in the United States.—*Seventh Day Adventist*: 608 churches, 138 ordained ministers and 14,733 members, or 1 minister to each 107 members in the United States.—*Mora-*

CINCINNATI, Order of the (IN U S. HISTORY), a society founded by the officers of the revolutionary army just before their final separation. The name was taken from Cincinnatus, like whom the members had left the plow at the call of their country, and were now returning to it when their services were no longer needed. Membership in the order was to be mainly confined to the officers, to their eldest male descendants, and, failing these, to collateral male descendants; and this feature stamped the order, in the popular belief, as an imitation of European orders of knighthood and an attempt to create an aristocracy. Ædanus Burke, a South Carolinian, published a pamphlet against the order; the governor of South Carolina denounced it in his address to the legislature; the legislatures of Massachusetts, Rhode Island and Pennsylvania censured it by resolution; and those revolutionary leaders who had not been in the army considered the hereditary principle an unwise one. At the first general meeting, May, 1784, Washington persuaded the order to abolish the principle of hereditary membership, and with this modification it still survives, its membership being recruited by election.—See 3 Hildreth's *United States*, 443; Mattox's *History of The Cincinnati Society*; 6 *Pennsylvania Historical Society's Publications*. ALEXANDER JOHNSTON.

CIPHER DISPATCHES AND DECIPHERMENT. The art of deciphering secret manuscripts has at all times played an important part in political matters. If we are to believe Comiers d'Embrun, the Hebrews were acquainted with cryptography or the art of using ciphers, therefore with decipherment which is its immediate consequence. The early Christians, according to P. Alex. de Rhodes, used conventional signs

to keep a knowledge of their affairs from the curiosity of their persecutors.—Suetonius informs us in his life of the first Cæsars that the emperors wrote to their generals and confidants, transposing the letters of the alphabet. If this be the case, it is quite possible that Julius Cæsar invented the system of ciphers which bears his name. The following is a sketch of the system: A number of conventional signs are made to correspond to the letters of the alphabet, or, better still, with these same letters arranged in a different order, for example:

a, b, c, d, e, f, g, h, i, j, k, l, m,
l, m, n, o, p, q, r, s, t, u, v, x, y,

n, o, p, q, r, s, t, u, v, x, y, z.
z, a, b, c, d, e, f, g, h, i, j, k.

Thus if we wish to write in cipher, "Put a vase of roses on your balcony; I shall see that it is time to march;" we should write: "bgf l hlep aq daepe az jagd mlxnazj; t eslxx epp fsf tf te fty fa yldns." The same result will be obtained by conventional signs corresponding to the letters of the alphabet. It is needless to add that in the first case the letters in changed order, in the second the conventional signs, form the secret of the cipher, which should always be known by the person who wishes to use this mode of writing.—The Japanese and Chinese were instrumental in causing a further development in cryptography without knowing it. The signs used in the writing of these people run vertically from above downward and from below upward; from this originated the idea of the Japanese method, as calculated to puzzle Europeans, whose writing is horizontal.—Here is an example of this method. "The liberty of man imposes on him as many duties as it gives him rights."

t	s	e	a	s
h	o	s	s	t
c	p	o	e	t
l	m	n	i	g
i	i	h	t	i
b	n	i	u	v
e	a	m	d	e
r	m	a	y	s
t	f	s	n	h
y	o	m	a	i

These are simply the letters used in writing the above sentence, placed in order after each other from above downward and from below upward. This cipher becomes, as we see, mere child's play unless it is complicated by some combination.—In the steganography which he published, Scott considers the method of count Gronsfield and that of lord Bacon as undecipherable by any one who has not the key to it. Of these two systems we shall take that of lord Bacon, whose originality strikes us, while at the same time we acknowledge its tediousness of execution. The following is its conventional alphabet, each letter of which answers respectively to the ordinary letters of the alphabet:

vian: 74 churches, 96 ordained ministers and 16,112 members, or 1 minister to each 167 members in the United States.—*Wesleyan Methodist*: 260 churches, 472 ordained ministers and 17,847 members, or 1 minister to each 38 members in the United States.—*Unitarian Congregational*: 342 churches, 394 ordained ministers, and 17,960 members, or 1 minister to each 50 members in the United States.—*Church of God (Winebrennerians)*: 569 churches, 498 ordained ministers and 20,224 members, or 1 minister to each 41 members in the United States.—*Universalist*: 776 churches, 724 ordained ministers and 37,945 members, or 1 minister to each 52 members in the United States.—*Anti-Mission Baptist*: 1,030 churches, 888 ordained ministers and 40,000 members, or 1 minister to each 45 members in the United States.—*Second Adventist*: 583 churches, 501 ministers and 63,500 members, or 1 minister to each 127 members in the United States.—*Friends*: 621 churches, 876 ministers and 67,643 members, or 1 minister to each 77 members in the United States.—*Methodist Episcopal (colored)*: 1,031 churches, 648 ordained ministers and 74,195 members, or 1 minister to each 115 members in the United States.—*Free Will Baptist*: 1,455 churches, 1,286 ordained ministers and 76,706 members, or 1 minister to each 60 members in the United States.—*Reformed Church in America*: 489 churches, 519 ordained ministers and 78,917 members, or 1 minister to each 152 members in the United States.—*United Presbyterian*: 793 churches, 658 ordained ministers and 80,236 members, or 1 minister to each 122 members in the United States.

Aaaaaa.	Nbbbab.
Baaaab.	Obbbba.
Caaaba.	Pbbbbb.
Daabaa.	Qbaabb.
Eabaaa.	Rbabba.
Fbaaaa.	Sbabbb.
Gbaaab.	Tabbbb.
Hbaaba.	Uaabbb.
Ibabaa.	Vaaabb.
Jbbaaa.	Wababa.
Kbbbaa.	Xbbabb.
Lbbaba.	Ybaaab.
Mbbbaa.	Zaabab.

If we wished to write this sentence: "The enemy is there, be on your guard," we would do it as follows: "bbbbb haaba abaaa abaaa bbbab abaaa bbbba abaab babaa babb babb baaba abaaa babba abaaa, aaaa abaaa bbbba bbbab abaab bbbba aabbb babba baaab aabbb aaaaa habba aabaa."—This style of ciphering is surely original. Besides, it has this advantage, that it can be carried on under the appearance of a document not having any importance, the letters of which, marked or not by a conventional sign, indicate whether they represent a or b; thence a grouping by fives, the translation of which becomes easy by the aid of the alphabet. This system has a certain resemblance to that attributed to Julius Cæsar, differing from it, however, essentially by the repetition and mingling of the letters a and b; this mingling is well adapted to puzzle the most careful research.—It is not necessary to say that other signs may be substituted for the letters of the alphabet used in the method we have just mentioned, such for instance, as the Arabic numerals.—Secret writings being of frequent use in political life, it is often important to be able to find the secret of the cipher which hides the thoughts or projects of its author. We can not here give the reader a complete treatise on *cryptology*; we must confine ourselves to placing at his disposition certain linguistic observations which become so many means of arriving at the understanding of the greater part of secret writing; the rest is an affair of sagacity and patience.—*Remarks on the construction of words. The German Language.* The only letter standing alone is *o*; monosyllables are very rare; double letters quite frequent at the end of words; the *e* is often repeated especially in long words; *i* always in the middle of words of three letters; *ck* most frequent at the end of words; *sch* united to *l*, *m*, *n*; *r* united to *e* and *a* to *bb* in the middle of words; *t* united to *ff*, *oth*, *ich*, very often at the end; *ch* frequent; *b*, *l*, *g*, *k*, *p*, *q*, *z*, the rarest of consonants.—*English.* The words of one letter are *I*, *a*, *O*; *y* often appears as final; *o* doubles and shares this peculiarity with *e*, from which it will be easily distinguished if attention be paid to the fact that it is always united to *f* in the word of two letters *of*; it is often found also with *w*; *e* is distinguished in cipher dispatches from double consonants, because it is repeated oftener than any other letter.—*Italian and Spanish.* Italian has a strong resemblance to Spanish, but is distinguished from it by the length of certain words and by the frequency of double letters in the

middle of words. *O* is oftener repeated than any other letter; *e*, *i*, next, the latter sometimes doubled, the same as *o*, *u*. In Spanish, *o* is very often followed by *s*; *u* by *e*; but the latter principally in the middle of words, the other chiefly at the end; the words of one letter are *a*, *o*, *y*.—*French.* French words end most frequently in *e*, which is often followed by *s* or *nt*; *ou* is met in words of four syllables; the vowels, especially *e*, are repeated oftener than any other letter; there is no word without a vowel; a word of one letter is always a vowel, or a consonant with an apostrophe; *q* is always followed by *u*.—It is evident that the process of deciphering without the key differs somewhat in each language, varying with its characteristics.—Let us try to decipher the sentence: "bgt l hlep aq daepe az jagd mknazj; t eslxx epp fsf tf te ftyp fa yldns," according to Cæsar's method. We first make a list of the letters in the sentence, noting how often each recurs, as follows: *b*, once; *g*, twice; *f*, 6 times; *l*, 6 times; *h*, once; *e*, 6 times; *p*, 5 times; *a*, 5 times; *q*, once; *j*, twice; *m*, once; *x*, 3 times; *n*, twice; *z*, twice; *t*, 4 times; *s*, 3 times; *y*, twice; *d*, 3 times. Remembering that *a* and *I* are the only words (except *O* which would be rarely used in a cipher dispatch) of one letter in English, we know that *l* and *t* must be these two. Suppose *l* is *a*, then *t* is *i*; *t* being *i*, *f* must be *n*, *s*, or *t* in *tf* because these are the only letters which can follow *i* in a word of two letters except *f* which is the cipher letter. We shall call it *t*; *e* in *te* may be *s*; *a* in *fa* must be *o*, for only *o* can follow *t* in a word of two letters as may be seen by experiment; *pp* in *epp* is *ee* for *e* and *o* are the only vowels which can be doubled, and *oo* could not form a word after *s*. Now we know that *l*, *t*, *f*, *e*, *a* and *p* are *a*, *i*, *t*, *s*, *o* and *e*. After making the changes the sentence becomes *bgt a hase oq doses oz jgd maxnozj i ssaxx see tsat it is tiye to yadns*. In the word *ssaxx* it is most probable that *xx* is *ll*, for a double vowel could not follow *a*, and by using the *ll* and changing the second *s* to *h* we have *shall* instead of *ssaxx*, and *that* instead of *tsat*. In *tiye y* could in any connection be only *d*, *l*, *m*, *n* or *r*; here it is clearly *m* which gives *time*: *q* in *oq* whatever be the connection would be either *f*, *n*, *r* or *x*; here we shall use *f*: and the *z* in *oz* is either *r* or *n*; call it *n*. In the first word *bgt g* must be the vowel *u*, for we know the others; *b* is either *c* or *p*, let us use *c*; we have now *cut* instead of *bgt* and the word *jgd* becomes *joud*. Now *d* can not be *n* or *t*, for we know these; it is *r*, for this is the only letter left that could follow *ou* here; *j* is either *p* or *y*; let us take *y*. We have now *your*. Knowing or supposing that:

l, *t*, *f*, *e*, *a*, *p*, *s*, *x*, *y*, *q*, *z*, *b*, *g*, *d*, *j* stand for *a*, *i*, *t*, *s*, *o*, *e*, *b*, *l*, *m*, *f*, *n*, *c*, *u*, *r*, *y*,

we make the substitutions and the sentence stands: "Cut a hase of roses on your malcony; I shall see that it is time to marnh." It is clear that *h* in the third word stands for *v*, that *malcony* is

balcony, and *marnh* march; *n* being *c*, *b* can not be *c*, therefore the first word is put, not *cut*.—If we wished to send the following dispatch in French: *Placez un vase de fleurs sur votre fenêtre; nous saurons qu'il est temps de se mettre en marche*, we would write it in this way according to the first cipher alphabet given above: "Bxlnpk gz hlep op qxpgde egd hafdp qpzpfdp zage elgdaze cgtx pof fpybe op ep ypfldp pz yldnsp."—To decipher this we proceed as follows, remarking only that the reader, by study and experience, might find some other way to decipher it. We make a list of the letters contained in the dispatch, noting the number of times each letter is repeated, thus: *b*, twice; *x*, 3 times; *l*, 4 times; *n*, twice; *p*, 16 times; *k*, once; *g*, 6 times; *z*, 5 times; *h*, twice; *e*, 9 times; *o*, twice; *q*, twice; *d*, 7 times; *a*, 3 times; *f*, 6 times; *c*, once; *t*, once; *y*, 3 times; *s*, once. We may remark that *p* occurs 16 times, hence it is very likely a vowel, and probably the letter *e*. Let us see whether this hypothesis is well founded, and take the shortest words: *op*, *ep*, *pz*. If *p* is an *e*, let us suppose, to shorten our demonstration, that *pz* represents *en*, since it is one of the French words of two letters beginning with *e*; then *z* is an *n*; *op*, *ep*, will therefore be one of the words *ce*, *de*, *je*, *le*, *me*, *te*, *se*, the only words of two letters in French ending in *e*. But in the dispatch we see *op*, immediately preceding *ep* which has only two letters, and *de* is the only word that can go before a word of two letters: therefore, if *p* is an *e* in the word *op*, *o* must be a *d*.—Let us now try to find out what *e* is in the word *ep*. It is not a vowel. As *e* is found at the end of many words in the dispatch, we may presume that it is an *s*; *ep* would therefore stand for *se* until proof to the contrary. *Gz* is another word of two letters, the last letter of which we know to stand for *n*, whence we conclude that *g* can be only a vowel, and consequently *gz* must be one of the following words, *an*, *in*, *on*, *un*, the only French words of one syllable ending in *n*. We may reject *in* which means nothing; in French, *an* never occurs after a word so long as *bxlnpk*; therefore, there are left only *on* and *un*. *G* is therefore either *o* or *u*; but which? We can not yet decide. Let us take a word in which it occurs, and select, as far as we can, a word which contains the letters presumed to be known. Say the word *zage*. Substituting in this word the letters already known, we have *naus*; *naus* has a close resemblance to *nous*; we may conclude that *g* is *u*, and we may also add that *a* is *o*.

We know *p*, *z*, *o*, *e*, *g*.
To be *e*, *n*, *d*, *s*, *u*.

—Let us take the little word *egd*: the third letter *d* is either a *c* or an *r*, for only *sur* or *suc* can have this form. We shall see this further on. In *pef*, the first two letters are *es*; we are led to think that the last is a *t*, for the word *est* is the only word of three letters in French beginning with *es*.—Let us now take longer words, say *hafdp*. We know *afdp* which suggests *otce* or *otre*, but

only the latter can be taken. Then the word becomes *h...otre* which has only two analogues in French, *notre* and *votre*. Now, as we have seen, *n* is represented by *z*, therefore *h* is necessarily a *v*. We may therefore add to the foregoing letters, instead of *f*, *d*, *h*, their values *t*, *r*, *v*.—In the word *ypfldp*, *y* is the only unknown letter. Substituting the equivalents already known, we have *y...ette*, which can mean only *mettre* or *lettre*: after *se* "lettre" does not mean anything. Everything leads us to believe that *y* is an *m*.—The word we have just deciphered almost translates *qpzpfdp*, for we find *q...enêtre* or *fenêtre*; in like manner *qxpgde* becomes *frœurs* or *fleurs*; in like manner also *fpybe* stands for *tembs* or *temps*.—We have deciphered the letters *p*, *y*, *o*, *d*, *f*, *z*, *a*, *e*, *g*, *q*, *b*, *h*, *x*; with this key let us try to decipher the whole dispatch. By the substitution of known for unknown values, we find *pllnek un vase de fleurs sur votre fenêtre, nous saurons qu'il est temps de se mettre en marche*. This is not so obscure as it may seem at first. With a little study it becomes apparent that *l*, *c*, *t*, stand for *a*, *q*, *i*. And thus we have: *nous saurons qu'il est temps*. But *pllnek un vase de fleurs*, stands, *a priori*, for *placez*, etc. No great effort of imagination is required to translate "se mettre en marche," into *se mettre en marche*.—What we have just explained will suffice to show the reader the possibility of deciphering. This method is without doubt purely empirical, but it appears to have been sufficient for the cases presented up to our day.—To prevent the deciphering of dispatches, combinations of every kind have been imagined, books of signs, even special dictionaries have been published by means of which the secrecy of a dispatch is guaranteed. One of these dictionaries, which seems well planned, has appeared in Paris, published by Berger-Levrault & Co., under the title of *Dictionnaire pour la Correspondance télégraphique secrète*, by a secretary of legation.¹

HENRI LEGEAY.

CIRCULATION OF WEALTH. The word circulation (of wealth) is one of those politico-economical terms which has been most misused. The framers of systems have often employed it to build upon the data which it expresses airy castles in which nothing was wanting to make the world supremely happy but a basis on which the structure might rest. But the circulation of wealth is none the less an important fact well worthy of being observed, and one which has not been studied, perhaps, as much as it deserves. If utopists, while mistaking its laws, have too often exaggerated its importance, this is no reason for estimating it below its real significance.—The circulation of wealth, says J. B. Say, "is the passage of a thing having value from one hand to another."—The passage of merchandise from one hand to another is the first elementary fact which constitutes, by its repetition, the general phenomenon of the circulation of wealth. But it is nec-

¹ We believe that the author is Mr. Brunswick.

essary to give circulation a broader sense, and J B Say himself, in the sentence which immediately follows that which we have just quoted, gives it a broader one. He says: "Every article of merchandise is in circulation when it is ready to pass into another hand, that is to say, when it is offered for sale." It is evident that here circulation means not merely the passage of merchandise from one hand to another, but the general movement of goods or values. It is even more than this; it is the readiness of merchandise to be moved. Mr. Fr. Skarbek, who has treated this subject at much length and with care in his *Theory of Social Wealth*, understands by circulation the general movement of wealth passing from one hand to another; but he adds that it is less the movement of things than the movement of values.—Circulation, he says, is not a movement of the mass but a movement of the value of things; just as production is not a creation of things but a creation of values. Things which have value may undergo a rapid and continuous movement without circulation taking place. A sum of money, for example, sent by mail may pass through many hands without circulating; for then it is only transmitted or confided to several persons consecutively in order that it may be made to reach the one who has the right to dispose of it. The effect is the same as if the person who sends the money should deliver it to him to whom it is sent. All those who have served as intermediaries to facilitate the transmission of this sum have had no profit from the sum itself, and could not have been able to employ it as a productive force. Value may circulate rapidly and the thing which contains it remain motionless. Such is the circulation of the value of real property, the ownership and the enjoyment of which may pass from one to another, although it is not capable of undergoing any movement whatever. Even personal property may circulate without any change of place. A merchant who has paid a landed proprietor the price of wheat stored up in the granary of the latter, may resell this wheat without moving it. Thus this value will have circulated twice without taking the wheat from one place to another.—In a savage state, when man works only for himself and is limited to the consumption of what he produces himself, there are no exchanges, consequently no circulation, though certain products may sometimes be transported from one place to another by a person who is both a producer and consumer. Circulation begins when men commence to exchange what they possess over and above what they possess sufficient to supply their own wants; but as long as they confine themselves to simple exchange of their superfluities, it is still inclosed within very narrow bounds. It is only really active and great when the division of labor, having become the common law of industry, brings men to exchange not only their superfluities, that is to say, the excess of what they produce respectively

above their own wants, but almost all the values which they produce, for almost all those which they consume.—In the state of civilization to which the greatest part of the peoples of Europe have advanced, division of labor having been introduced everywhere, circulation has become an important fact. There are few values in reality consumed on the spot and by those who produced them. They pass from hand to hand by successive exchanges, and sometimes it is only after a great number of transmissions or migrations of this nature that they arrive at their final destination. It is not only to pass from the hands of the producer to those of the consumers that products are exchanged and circulated. They circulate still and sometimes for a considerable period among their producers, when they need, as is generally the case, several successive preparations before being entirely finished. To say that in virtue of the division of labor each man connects himself with a particular industry the fruits of which he afterward exchanges, is not to say enough. It should be added that there is scarcely a producer from whose hands a finished product comes. Men confine themselves for the greater part to the execution of one or another of the articles which the product requires, turning it over afterward to other manufacturers who are to continue the work or finish it. Through how many changes has cloth passed, through how many hands has it gone, before the tailor converts it into clothing? A bale of cotton does not become printed cloth in a moment. It must first be converted into thread, then into texture, and between these principal manipulations how many intermediate ones there are; each one of these is performed not only by different hands but also in different places. The bootmaker, no matter how simple his work may appear, does not make a boot until the tanner has prepared the leather. A boot then is the result of several kinds of successive labor; it reaches its final condition only after several exchanges. It is the same with the greater part of other products and particularly with manufactured articles, some of which undergo so many different modifications and become the object of so many exchanges before coming to the condition of consumable values that it would be difficult to follow them in their migrations. Thus, in a state of civilization exchanges are multiplied and circulation is widened, not only by reason of the various products which industry gives birth to, but also by reason of the vastly greater number of processes which these products demand.—This circulation, we say then, becomes so important a fact that none of the particulars connected with it should be overlooked.—It is, in the first place, easy to understand how important it is to society in general that this circulation should be carried on without trouble, without confusion, without disorder, and that no foreign obstacle should stop its course. Should its stoppage really take place for a moment, production, one of the essential conditions of which it has be-

come, itself would stop, and society would find its very existence in peril. It is true that an absolute stoppage of circulation is almost impossible, for this reason alone, that it would be fatal; since if any cause should tend to produce it, there would be immediately, on the part of threatened society, such a general and powerful reaction against this cause that the obstacle would recede or at least be half removed. But if it is not to be feared that circulation will ever be stopped entirely, it may sometimes be disturbed or retarded in its course. This happens in practice almost always in consequence of civil troubles, political revolutions, foreign invasions, and all serious disorders, whatever their nature may be. At such times there is generally a twofold obstacle to the easy circulation of products, one physical, the other moral. The first arises from material disorders which prevent products from journeying peaceably toward their respective destinations; the second, more serious and difficult to overcome, arises from the mistrust of producers toward others and the lack of credit which affects every one. In all these cases, if society does not perish it endures at least cruel suffering. Production is retarded for want of nutrition; consumption is narrowed, savings previously accumulated are consumed: in addition to the present evils endured men see the accumulated fruits of several years of labor lost in a few days.—Commercial crises which so often afflict modern nations, and particularly those in which industry exhibits its greatest power, are nothing else, considered in themselves, than checks if not absolute stoppages of circulation. There may be a difference of opinion as to the causes, perhaps yet ill defined, of these calamitous accidents, but whatever their origin they have always the same character at bottom, that of retardation, more or less great, in the exchange and circulation of products. From this, and from this alone, come all the evils which these crises give birth to: so true is it that circulation is the life of modern nations.—Without speaking of the accidental troubles to which circulation is sometimes subject, and which will be particularly treated under the words **COMMERCIAL CRISES**, looking at it only under its ordinary conditions, in that which forms in each country its normal condition, it still gives occasion to a large number of observations full of interest. Its conditions are not the same in every country; it is more or less general, more or less active according as local circumstances are more or less favorable to it; and we should hasten to add that it is the relative activity of circulation which constitutes, more than any other circumstance, the industrial superiority of this or that country.—Under the word **CAPITAL** we spoke of the importance of the increase of capital to the industrial activity of nations; but at the same time we took care to distinguish active from dormant capital by adding, that the industrial superiority of one nation over another depends much less on the sum total of the capital which it pos-

sesses than the relative sum of its active capital. This is the place to insist on this distinction, which most economists have neglected, and which appears to us fundamental.—If capital is useful, it is only in so far as it passes into the hands of those who can put it to work. While it lies idle, or, what comes to the same thing, while it remains in the hands of those who can not make use of it, it is of no real utility; it aids in no way the increase of production. M. Ganilh, going a little further in this direction, says that idle capital is not capital at all, since it is useful to no man, not even to him who possesses it. He was wrong, no doubt. Idle capital is always capital, for it is at least a reserve, which can be of use later; often it needs but an insignificant circumstance to rouse it from its torpor. But it is true that a value at rest renders no actual service, and if there is much of such capital in a country no matter how great the sum of this real capital which the country possesses, labor will show little activity there.—To say nothing of actual stoppages, if it happens that in a given country capital, or values intended for reproduction, occupy twice as much time in passing from one hand to another as would be necessary in a well ordered state of things, it is easy to understand that production would be less by one-half than it might be. It is important, therefore, that circulation be at once general in the sense of embracing all products, and of being active in the sense of causing products to pass rapidly from the hands which possess them to the hands of those who can give them useful employment.—This truth, we say, has not always been adequately understood by economists. It must not be thought, however, that they have entirely misunderstood it. Their only fault is in not having brought out its importance, nor given it all the attention which it merits. This, for example, is how J. B. Say expresses himself on the subject: "Values employed in the course of production, can not be *realized* in money and be employed in a new production until they have arrived at the state of a complete product and are sold to the consumer. The sooner a product is finished and sold, the sooner also can it, as capital, be applied to a fresh productive use. Capital used for a shorter time pays less interest; there is economy in the cost of production. Next it is of advantage that the transaction which takes place during the production should take place quickly. Let us follow the effects of this activity of circulation, in the case of a piece of printed calico. A merchant of Lisbon imports cotton from Brazil. It is of moment to him that his agents in America should make his purchases and shipments quickly; it is also important for him to send his cotton to a French merchant promptly, in order to be reimbursed for his outlay as soon as possible, that he may begin a new and equally profitable operation. Portugal, up to this point, has reaped the benefit of this activity of circulation. Now it will be France; and if the French merchant does not

keep this Brazilian cotton in his storehouse long, but sends it promptly to the spinner; if the spinner, after having made it into thread, sends it promptly to the weaver, and if the latter sends the cloth without delay to the calico printer, and if he sends it to the retail merchant quickly, and the retailer to the consumer, this active circulation will have occupied for a less time that portion of the capital employed by the producers. Consequently there will be less interest lost, less expense, and the capital can be employed in new production."—The utility of an active circulation is certainly indicated in the preceding lines, but we do not believe that it is felt strongly enough; and we are the more authorized to believe so, since the passage just quoted is the only one which J. B. Say has devoted to this important subject, at least in his treatise. There is certainly more to say on such a subject. It is true, that the relative activity of circulation is that which constitutes, more than any other circumstance, the industrial superiority of a people? This should have been examined first of all. Then it should have been inquired what the principal causes are which influence the rapidity or the retardation of circulation.—Mr. Fr. Skarbek, who has treated this subject more at length and with care, is more explicit on all these questions. Instead of a few lines he devotes several chapters to the subject. He concludes the first chapter thus: "What we have stated up to the present concerning social wealth, authorizes us to lay down the principle, that the mass of values and bases or sources of wealth possessed by a nation, do not in themselves constitute its wealth, because they are inert by nature and do not turn into a cause of well-being and improvement of a people, *except in so far as circulation imposes on them a productive movement capable of bringing out all the advantages which society extracts from the values*, before they become objects of consumption."—The lines we have underscored in the preceding are also underscored in the original text, and it can be seen that the author there justly makes the circulation of products the *sine qua non* of their utility. Nothing is truer with regard to industry at the present time when exchanges and division of labor have become universal. It is not enough, however, that products should circulate; it is necessary, also, that circulation be as rapid as the work of production will permit, in order that there may be no interruption in the service they render. This, Mr. Fr. Skarbek brings out with much force in the following passage: "The advantage which society gets from circulation consists, as we have seen above, in this, that by each transfer of value, from one hand to another, a profit is gained by him who disposes of it, and a power of working is attained by him who acquires it. This advantage is all the more considerable in proportion as circulation becomes more extensive and rapid. From the moment that all exchangeable values are put in circulation, and circulate with the greatest

rapidity possible, the inhabitants of a country make as much profit as they can possibly make from them. They are able to give continual employment to all the productive forces which they are able to put to work; and whatever be the mass of value produced by a nation, it is evident that in this case it returns all the advantages and all the services which can be expected of it. This is why *national wealth consists* not only in the great mass of values which can be produced in a country, but *in the general productive movement, continuous and rapid, of these values*."—In the lines which precede, the activity of circulation is presented in all its importance, but it is perhaps still better done in the passage which follows, where the author supports his assertions by an example. We only regret that he has taken as his example the circulation of a piece of money; and we believe it our duty to remark in advance, that the same reasoning would apply to every productive value of whatever nature it might be. "Let us suppose that a one franc piece is given in the morning of the first day, by an inhabitant of the capital, to a milkwoman, in exchange for milk which she is taking to market; that she uses it immediately in buying an ell of cloth; that the cloth dealer lays in with this same piece of money his stock of meat at the butcher's shop; that the butcher spends it at a wine store; that the wine merchant employs it in buying bottles; that the bottle dealer spends it for bread; the baker for wood; and the timber merchant lays it up for future expenses and leaves it without employment during the next day. The difference of the services rendered by this piece of money in the course of two days is very considerable and may be expressed by figures; for it is as 7 to 1. During the first day the one franc piece performed the function of 7 francs because it served to make seven consecutive purchases, whereas on the second day, it represented only a unit in the hands of the timber merchant. If the latter made no use of it in the course of the second day, it might be said with truth that, for society in general, the differences of services rendered by the piece of money in the two days is as 7 to 0, because, having remained inactive in the hands of the timber merchant, it did not fill its office as an instrument of exchange, and the effect is the same as if it had not existed at all. Its value the first day is equal in services rendered to that of 7 francs, and it is easy to become convinced of this by collecting all the products which were bought by its means; for by estimating the value of the milk, the cloth, the meat, the wine, the bottles, the bread and the wood bought consecutively with the same one franc piece, we can easily see that it would be necessary to spend 7 francs in order to buy all these things at once."—This reasoning, certainly exact in reference to a piece of money, is just as exact, as we have said, with reference to any other kind of value. Let us suppose, indeed, that any kind of raw material, iron, for example, which must

pass, we will suppose, through the hands of 20 or 30 different producers, in order to receive as many different modifications before arriving at its final form, accomplishes this series of migrations in one month instead of 12; it is evident that in the 30 days it will have rendered all the services that it could have rendered in a year. It is not less evident, that if all the capital of a nation could be employed in this manner and with this relative activity, that the nation would have an immense advantage over all others. With an equal capital it would create 12 times as much wealth; or even with a much smaller capital, it would still succeed in surpassing them in the labor of production.—But are such great differences in the relative value of circulation possible? Why not? In theory there is nothing simpler. As a general rule, for each producer, the work of production, which, properly speaking, consists almost always in a single modification to be given the material submitted to him, does not take long to accomplish. Generally he requires more time to sell his products than to finish them. The spinner who makes his thread in a few days, keeps it sometimes for several months in his storehouse before selling it to the weaver, who is to make it into cloth, and this is the case with nearly all other productions. Now these periods of stopping and waiting between the finishing and the sale of products being so many accidental stagnations, so many interruptions in the service of capital, it is easy to see that they may be and are more or less frequent according to the country; and in this way is explained in theory the enormous difference which may exist between one country and another in the productiveness of capital. As a matter of fact it is certain that these differences exist, as great at least as we have just supposed them to be. It seems to us beyond doubt, that capital acts more than 12 times as fast, for example, either in the United States, or in England, as in Turkey. Why? Because there are fewer delays in sales, as there is also an incomparably greater rapidity in the transportation or transmission of products; and it is this circumstance which explains, to our thinking, much more than the real abundance of capital, the extreme superiority of the first two countries over the other.—Now what are the two chief causes which influence the activity or the slowness of circulation? Here again we find in the work of Mr. Fr. Skarbek more satisfaction than we have met elsewhere. Among the causes which, according to this writer, contribute to render circulation active may be mentioned the following, which are the principal: the extent of production and the abundance of products; the density of population and the concentration of population in a certain number of cities; the number and convenience of means of communication, such as roads, railways, canals, etc.; freedom of trade under all its forms, as well at home as abroad; security in all transactions; and, above all, confidence and credit,

which alone render possible a rapid transfer of products for sale, and without which even all the other conditions are present in vain.—That the extent of production contributes to hasten the circulation of products, is a truism. But this signifies particularly—and it is a truth which it is well to note—that activity of circulation does not increase simply in proportion to the extent of production, but in a greater proportion still, in the sense that it is always much greater where production is abundant and large than where production languishes. It is true that it is difficult, in this case, to distinguish the effect from the cause. If the abundance of production influences the activity of circulation, which is not at all doubtful, the activity of circulation in turn, and in a very energetic manner, influences the increase of production. The two circumstances are connected; they are at once cause and effect. But all this amounts to saying what is literally true, that products circulate in a more general manner and more rapidly in wealthy countries, provided with large capital, and which work on a large scale, than in poor countries which operate with small means and for medium results.—That the density of population, and above all the concentration of population, in certain cities contribute also to quicken circulation, and consequently to increase the services which products may render, is another truth much less generally understood than the first, and consequently very proper to be mentioned. It is all the more important since it must be taken into account in the theory of population in which it is often ignored. It is beyond doubt, to our thinking, that dense populations, that is to say, those grouped in considerable masses on narrow spaces, have certain great disadvantages in comparison with scattered populations, and this especially that they obtain in less abundance, with less ease and at a higher price, certain products, and particularly raw material. But they enjoy this great advantage which compensates for many drawbacks, that the circulation of products among them is easier, more active, quicker, and that consequently every product which they obtain renders them incomparably greater service. This is rather a new view in political economy, which has not been sufficiently examined by men devoted to the science, and which merits, nevertheless, the most serious consideration. Mr. Fr. Skarbek seems to have realized it more than the greater number of economists before him, but perhaps no writer has thrown more light on it than Mr. H. Carey, of Philadelphia, in an important work published in 1848, (*The Past, the Present and the Future*; by H. Carey, Philadelphia, 1848). In this work the American publicist tries to prove, and in this he has succeeded in a certain measure, that the condensation of population in certain countries, far from creating for the men who inhabit these countries a relative disadvantage, is for them, on the contrary, extremely advantageous, through the facility and multiplicity of relations which it

engenders; and that, taking everything into consideration, a dense population, other conditions being equal, should be richer and better supplied than one which is scattered over a vast space of land. We will not enter here into a minute examination of this question which would require a separate study, but in whatever way it be solved, the influence of the density of population on the activity of the circulation of products is none the less a demonstrated fact. As to the influence exercised by the number and convenience of the ways of communication, it is so easy to understand it that it suffices almost to mention it. Let us merely say that a good system of roads, canals and railways is itself the first fruit of an industry already powerful; that if it contributes to stimulate circulation, it is nevertheless the fruit of a pre-existing circulation, and that it supposes in the country where it is established a well understood public administration, well directed, well managed. It supposes also a great store of wealth previously acquired.—Freedom of trade under all its forms is not less necessary to the activity of circulation than the other conditions.—“No matter what the primitive sources of a country's wealth may be, no matter what its population and its capital may be, no matter how powerful may be the influence of these bases of its wealth on circulation, the latter can be neither extensive nor rapid if there are not in the country circumstances favorable to exchange; or if the power of exchange is limited either by prohibitive regulations or the lack of outlets. For it is this power of exchange which exercises the most potent influence on circulation, since values circulate for the most part by means of exchange. Supposing then in a country a concurrence of circumstances favorable to the production of value, they will not be able to constitute the well-being of the inhabitants if there are causes which limit or hinder the exchange of products.” The causes which may limit or hinder exchange are varied. Restrictive or prohibitive regulations at home and abroad, form one of the most serious. The absence of credit is another, not less powerful though less easy to define.—Finally, we have as the last cause of the circulation of products, confidence or credit, which renders exchange possible whenever it is useful and can be carried on without danger. Let us hear again Mr. Fr. Skarbek, whose ideas on this matter fit in perfectly with ours.—“In order that exchange should become the motor of circulation, it is necessary, other things being equal, that it be accomplished with the greatest facility, that is to say, that all goods should find an easy and instant sale, and that all the inhabitants of a country should sell their goods on the shortest time possible. The sale of goods depends on three circumstances: first, a demand corresponding to the amount of goods offered; in the second place, on the facility and freedom of delivering the goods where they are demanded; and last, the power possessed by the purchaser to give

always the equivalent of the merchandise demanded by him. Demand is more considerable in proportion as there are more purchasers, and as they are richer; the facility of sale becomes greater in proportion as commerce enjoys greater liberty and as there are easier means of transport and communication between the countries which maintain commercial relations with one another. But all this is not yet sufficient to give circulation the extent and degree of rapidity of which it is susceptible, for it is necessary besides that every value offered for exchange should be really exchanged at the moment it is offered and demanded: for this purpose it is necessary that the purchaser should possess a value which the seller consents to receive, in exchange for this merchandise, and that he should be in a condition to give it immediately and as often as he desires to make an exchange. As exchange is generally effected by means of money, it follows that if sale is to hasten circulation, it is necessary that the power of paying should always equal the extent of the demand. Now, as the value of the goods of every country surpass by far the value of the money which is found therein, it may often happen that a man who possesses a considerable fortune finds it impossible to make an immediate payment for the values which these means allow him to demand. The result of this is a species of stagnation which takes place in the circulation of values. The value of the merchandise demanded will remain inert until the person demanding it shall have acquired the power of paying, or he will be deprived of an enjoyment or of a means of employing his productive powers profitably. However, there is always a decrease of activity in the circulation and a loss of time and values to the national wealth. To remedy this drawback, to obviate a default in power of payment which does not come from a lack of revenue and fortune, and to facilitate exchange as much as possible, men have had recourse to a *social virtue, confidence*, which, applied to exchange, has given birth to credit; and credit to-day is the most powerful motor of exchange and the circulation of social wealth.—By a sort of ultra reaction against the exaggerations of the utopists, many distinguished economists are only too much inclined to misunderstand the admirable power of credit. It is well therefore to put it before them whenever a natural occasion presents itself.—Unfortunately these are the same ideas which have been misapplied to build up vain projects. Foreseeing vaguely the power of credit as well as the advantages of an active circulation, but without rendering to themselves an exact account of the nature of these two phenomena, a great number of men have endeavored to inflate credit, if it be permitted to say so, and to hasten circulation by artificial means.—They did not consider, that after all, the practice of credit supposes confidence, and that circulation, no matter how active they may wish to have it, should not and can not run ahead of production. To complete the misfortune they

have never imagined a better way to arrive at their end than to multiply without measure the instrument of exchange, money, or, in default of money, that which they call representative signs of its value, in other words, paper. The general examination of these different projects will find its place under the heads *CREDIT* and *PAPER MONEY*. Let us hasten to say, in a few words, that they rest ordinarily on a two-fold error, in this that, on the one hand, credit, such as they pretend to establish, would crumble quickly for want of a basis, and, on the other, circulation, such as they conceive it, even supposing that it could be established, would be still barren circulation. (See *CRISES, COMMERCIAL*.)

CHARLES COQUELIN.

CITIES, Administration of American.

When the constitutions of the Union and of the several states were framed, but few cities were already in existence the charters of which antedated the revolution. These cities are in this country the only exceptions, historically considered, to the rule of law to which all municipal administration is subject in the United States, and which received the sanction of two successive decisions of the supreme court of the United States—in the cases *United States vs. Railroad Company*, 17 Wallace, 329, and *New Orleans vs. Clark*, 95 U. S., 653—that a municipal corporation is a subordinate branch of the governmental power of the state; it is one of its creatures, made for a specific purpose to exercise within a limited sphere the powers of the state. The state may withdraw its local powers and government at pleasure, and may, through its legislature, or other appointed channels, govern the local territory as it governs the state at large. It may enlarge or contract its powers or destroy its existence.—This doctrine distinguishes American cities very widely, both in theory and in practice, from the cities of other countries. A retrospective glance at the political origin of other cities may be of service.—When men were nomads, wanderers in search of food, their settlements, like those of our Indians, were made with a view to contiguity to fresh water and a hunting ground, located like tourists' camps, at some spot near fish or game. The city, if such it may be called, of the tribes, was not only the seat of government, but the gathering spot of the tribe, and wandered with the tribe when emergency called for its departure. The city, as such, first had its origin and became a permanent fact when agricultural pursuits attached men to a spot of earth for which they would fight and die, and to take them thence was to deprive them of the means whereby they lived. To protect this spot of earth and to provide a refuge, in the event of attack, for the agricultural settlers of the tribe, some elevated spot near their flocks and farms was selected which could be inclosed with a wall, and where cattle could be congregated in a moment of danger, and a common defense made

against the common enemy. In the progress of civilization, whatever was deemed sacred by this community, or whatever was symbolical of its religious belief or æsthetic culture, was permanently inclosed within that wall. There the temple was raised; there the theatre was erected; there the government was administered; there within that wall could the freeman take his part in determining upon the persons who were to wield absolute sway over him. The city was the government, the country around it was tributary to the city. Almost all cities of antiquity had this origin, this extension and growth; and the old republics were city governments which in process of time had become sufficiently formidable to conquer vast territories, both contiguous to the city and situated across seas. But all these territories were tributary to the city and to the institutions of the city. Even the empire of Rome was the government of the world by a city. There was no Latin nation, in the modern acceptation of the term, having its seat of government at Rome; but the Roman aristocracy, originally as citizens and subsequently as equestrians, centurions, senators, consuls and emperors, governed the wide world through the power placed in their hands in the small territory upon which the city of Rome was located. Rome was in no sense the capital of the ancient world, as Paris is of France or London of England.—The cities of the middle ages owe their origin to the mark organization, and to harbor facilities. The location of a minster or cathedral is one of the causes of the origin and development of cities. As the cities of the middle ages grew in size, they became the homes of manufacturing and commercial industry, which in turn developed wealth and which invited attack both from kings and warrior nobles. The guild, which is another term for combination, was the organization of each particular trade, by which the elders of a trade regulated the mode of its conduct and determined upon admissions to its mysteries and the rules which were to govern it. The only analogy between the trades union of the present day and the guild of the middle ages is, that they were both trade organizations for the government of hours of labor and methods of administration; but here the analogy stops. The middle age guild was an organization of employers as well as the employed; indeed, the employed could not become members of the organization until they had served a number of years as skilled workmen: the employers were the governing body and the rules of the trade were determined by them. The several guilds within a community would select eldersmen of their own number for general conference with other guilds; and thus in time the guilds became formidable and powerful bodies of citizens within the cities, to the sturdy arms of the members of which, and their training and skill, the political government of the city, or the bishop of the town, if the origin of the city happened to be a religious seat, was compelled to look in mo-

ments of danger. The trained band of the guilds were the militia of the middle ages, and maintained the integrity of the city, prevented its capture, and repelled attacks instigated by the desire for plunder or territorial aggrandizement. From mixed motives, therefore, of conciliating these guilds and humiliating the nobles, the cities could and did obtain, from time to time, large concessions—in Germany called *freibriefe*, and in England patents—by which a certain amount of local independent government was secured; and they were permitted to establish courts of leet, which had criminal jurisdiction within the borders of the city, and succeeded in obtaining the establishment of civil courts for the adjudication of questions involving smaller amounts, independent of the imperial or regal courts. At the time of Edward I. the ingenious device suggested itself to that politic prince, to obtain the moneys which he needed as a free gift from the cities, boroughs and towns of England. He caused two deputies from each borough within the county to be sent to parliament along with the two knights of the shire, with power to consent to what the king and his council would determine; and this is supposed to be the origin of popular representation. The boroughs derived popular representation from the council called by Simon de Montfort in 1265, in the war with the barons against king Henry III. He also caused the knights of the shire to be accompanied by representatives of the boroughs; these boroughs included the cities, towns and incorporated districts which by that time had already grown to considerable proportions, and which wrested from the kings of England large concessions in the way of local government. London had, as early as Henry I., acquired a patent; many cities of England were chartered before the thirteenth century. The merchants' or chapmen's guilds, which were to be found throughout the towns and cities in the middle ages, were bound to each other by oaths and pledges; they paid a common contribution to the purse of the brotherhood; they built by their joint purse the guild hall, wherein they met to transact their affairs and occasionally to feast together; they punished fraud committed by one guild brother upon another; they assisted each other in times of sickness and adversity. When charters could not be obtained from the fear of kings and lords, they bought them out of the common purse. Being composed of freemen, and including all the more energetic and thriving and able inhabitants, these merchants' guilds became, by successive steps, what were subsequently called a corporation of boroughs. The courts leets were transferred from the barons to them, as an organized part of the community; they were the men who were styled, in charters and public documents, the "burgesses and good men of the town." In the "History of Leicester," by James Thompson, an account is given of the earliest days of these guilds, which opens up to us the functions and details of modern municipal offi-

cers. A meeting of the guild was originally known in the rules by the name of "Morwenspeche." As among the Germans, all consultations were connected with some convivial feast; a common building was constructed, in which the rude banquets and deliberations of the less wealthy freemen were held; and thus the Saxons brought the guild hall with their other customs into England. At their head stood the eldersmen or alderman; at the head of the aldermen stood the mayor or oldest alderman. The form of the oath is preserved by Mr. Thompson, which is interesting as illustrating the fact that the guild is the primitive city government. It runs as follows: "This hear ye, Mayor and Brothers of the Guild: That I lawfully the laws of the guild will keep, and my guild in all respects will follow, whether among my brethren of the guild or whether I scot in the bishop's fee; and that I will warn my mayor and the good people of the commune if I know of any man who merchandises in the franchise who may be able to enter into the guild; and that I shall be obedient and observe all the commands of the mayor and his sons; and the franchises and the good customs of the town according to my power I will maintain. So God and his saints help me! Amen."—The charters of the English cities were as various as their sites, but they all involved local self-government and wide suffrage in the selection of the government. At the time of queen Elizabeth, however, the courts held that, although the right of election was, by the original constitution or charter, in the whole assembly, still from usage, even within the time of memory, the by-laws may be presumed giving the right of election to a select class, instead of the whole body. This decision was extorted from the judges by the crown with a view of establishing its own select classes in the various municipalities, the more readily to control the municipalities, which had by that time become formidable and had answered their purposes of checks against the nobles, but were intended to be shorn of their power to be checks against the prerogatives of the throne. As a result of this, the right of election being conferred upon a select few instead of the whole body, and the numerous changes which were brought about by the revocation of city charters in the reign of Charles II., the English municipal corporations, down to the great reform act of 1835, were close corporations, in which nepotism, wastefulness, ignorance and a considerable degree of venality governed the community; in which there was complete severance between the interests of the governors and the governed. There was no uniformity in their constitution or powers, the corporation was not the town or place, but a corporate body situated within it: and Glover says, in his historical summary of the corporate system of Great Britain and Ireland, as to the condition of the municipal corporations prior to 5 and 6 William IV., chap. 76, that the number of corporators in some of these municipalities

varied from 12 to 5,000, but usually averaged from 50 to 200. The titles to freedom or citizenship generally comprehended those arising from birth, servitude, imperial purchase, gift or election.—The governing bodies were formed by the close and corrupt system of self-election. In a great majority of municipalities the corporate officers, such as the mayor, or the other head of the corporation, the recorder, were frequently unprofessional, and the town clerks were appointed by the self-elected governing body from its own conclave. The most common and most striking defect in the constitution of the municipal corporations was, that the corporate bodies existed independently of the communities among which they were found. The most flagrant abuses arose from the perversion of municipal privileges to political objects. Thus the inhabitants had to complain, not only that the election of their magistrates and their municipal functionaries was made by a special class of citizens whose state in the community was no larger than their own, or by persons unconnected with the town, but also of the disgraceful practices by which the magisterial office was frequently obtained, and wherein those who, by character, residence and property, were best qualified to control its municipal affairs, were excluded from any share in the election or management. The councilors were self-elected and held their office for life. When a death occurred, the remaining councilors supplied the place of the deceased. The commissioners, therefore, who were appointed by parliament to investigate the subject, reported that the municipal corporations of England and of Wales neither possessed nor deserved the confidence or respect of his majesty's subjects, and that a thorough reform must be effected before they could become what they ought to be—useful and efficient instruments of local government. During the same year of the report, lord Brougham succeeded in causing the passage of the municipal corporation act, already referred to. (Dillon on Municipal Corporations, 3rd ed. p. 49).—This act of 5 and 6 William IV. inaugurated a general scheme of municipal government for all the cities therein named, exempting therefrom London city alone; which by reason of its immense size, multifarious interests and vast government machinery, to deal with that corporation—or rather, conglomerate of corporations—made a special act necessary for its government; which was passed in 1849.—The administration of the cities of continental Europe bears no analogy whatever to either English or American conditions. The city is part of the imperial system, or it may be a free city, independent of the imperial system; in any event, it is not what the supreme court of the United States has declared American municipal government to be, a subordinate branch of the state government, exercising, at a locality, in conformity with the American theory of the decentralization of power, the functions of the state government. While we still speak of city charters, it is

clear that the weight of judicial authority in this country has crushed out all charter rights or special privileges on the part of the city; that the laws organizing a city government are precisely like other legislative enactments, subject to modification, change or repeal, as the will of legislatures may direct; and that cities may be created or extinguished, as the legislative body of the several states may determine. This absolute right of the legislature is limited, of course, in many states, by the constitution of the several states imposing restrictions upon the legislature as to interference with local self-government. The constitution of the state of New York and the constitutions of various other states, recognize the county, town and city of the state as regular subdivisions of the state for purposes of government, and thus prevent their extinction. Certain officers are recognized and their election or appointment provided for within the different localities, and thus the legislature can not appoint officers for the localities or authorize their appointment or selection by any but the local authority, nor take away the election of the officers who are to hold sway in the locality from the voters thereof. These are important constitutional limitations upon legislative authority, which, however, as we shall presently see, can be largely evaded and made nugatory for good, by devices but too well known to the members of our legislative bodies.—There is, therefore, no longer any close corporate right on the part of the city, as the middle ages presented to us, nor independent, sovereign existences, such as the cities of antiquity were. We have lost in fact, though not in name, our chartered privileges as binding contracts with the state; and the acts which, from time to time, are intended to secure our municipal self-government, although called charters, are constantly subject to sinister and ill-advised legislative interference. On the other hand, however, we have gained a constitutional polity of state which, to some extent, secures decentralization of political forms of power, and immunity from having a foreign element imposed upon the city government.—We shall briefly examine the New England town system, the forms of administration of American cities, the advantages of these forms of administration, the defects which flow therefrom, and the possible remedies for these defects.—The most succinct account of the New England town system is to be found in the last edition of Dillon's *Municipal Corporations*. He says: "In the New England town proper the citizens administer the general affairs in person at the state or corporate or town meetings, through officers elected by themselves. The towns are charged with the support of schools, for the relief of the poor, the laying out and repairing of highways; and are given power to preserve peace and good order, maintain internal police, and direct and manage generally, in a manner not repugnant to the laws of the state, their prudential affairs. And for defraying these and all necessary and lawful charges,

they may levy and collect taxes. The New England town affords, perhaps, an example of as pure democracy as anywhere exists; all of the qualified inhabitants meet and directly act upon and manage and direct the management of their own local concerns. These meetings are held annually in February, or March, or April, and other meetings at such times as the selectmen of the town may order.—As the town, however, grew populous and large, the system of meetings of the electors in their original capacity became inconvenient and impracticable; and hence, in New England, towns gradually merged into cities, and that which was done by the direct meeting of citizens is subsequently attempted to be accomplished by representatives.—In the case of *People vs. Detroit*, 28 Michigan, 228, we have presented to us a case showing the necessity for a representative system in a populous place. The legislature had provided that an important question should be decided by a vote of the citizens' meeting. Two meetings were held, but the noise, confusion and violence prevented discussion and determination; and this provision had to be repealed.—In the case of *Eastman vs. Meredith*, 36 New Hampshire, 284, the distinctive differences between the New England town—indeed, it may be said the American city—and the English municipal corporations, was clearly and well stated by chief justice Perley, who says: "It is to be observed that municipal corporations in England are broadly distinguished, in many marked respects, from towns in this and the other New England states. There is no uniformity in the powers and duties of the English municipal corporations; they were not created and established under any general public law, but the powers and duties of each municipality depended upon its own individual grant or prescription. Their corporate franchises were held of the crown by the tenure of performing the conditions upon which they had been granted, and were liable to forfeiture for breach of the conditions. They, indeed, answered certain public purposes, as private corporations do who have public duties to perform, and some of them exercised political rights; but they are not like towns (or cities) with us—general, political and territorial divisions of the country, with uniform powers and duties defined and varied from time to time by general legislation. Towns in New England do not hold their powers ordinarily under any grant from the government to the individual corporation, or by virtue of any contract with the government, or upon any condition, expressed or implied. They give no standing, in their corporeal capacity, to the laws which impose their public duties or fix their territorial limits." And referring to the case then before the court, he added: "In all that is material to the present inquiry, municipal corporations in England bear much less resemblance to our own in this country than to private corporations which are charged with the performance of public duties; and for these reasons the English authorities are but remotely applicable

to the present case."—The charters of cities—charters so called, but really mere acts of the legislature of the various states of the Union—are frameworks of government made by the legislature for the city, as a necessity either of the city's growth, or as political party necessity may dictate. The general form is, investing the inhabitants of a particular territorial limit with corporate functions; defining the territory, dividing up the city into wards or districts; fixing the time for holding elections of city officers, setting forth who they shall be and what their functions respectively shall be; enumerating the powers of the city councils, and, with more or less precision, the powers of the respective heads of departments; clothing the mayor, or the mayor and the common council, with power of appointment and removal of heads of departments, sometimes with and sometimes without the consent of the governor, and sometimes with and sometimes without the forms of a trial; clothing the common council with power to punish infringements of its ordinances, and laying down regulations for the grading and opening of streets, and providing a method and machinery of taxation. In many of the states of the Union there are general acts for the incorporation of villages, towns and cities, and in some of the states there are constitutional requirements imposing upon the legislature of the state the passage of such general acts, instead of special incorporations. Ohio, Illinois, Tennessee, Missouri, Indiana, Pennsylvania and Michigan have such general acts for the incorporation of towns, cities and villages. The constitutions of several states make provisions against too arbitrary interference with the rights of these localities, so as to secure decentralization of power. (New York and Illinois.) These provisions have, however, failed to accomplish their end.—Two mistaken roads seem to have been followed in all legislation in this country as to cities, and which have resulted in disaster. Insufficient analysis has prevented our people from seeing that a city is at one and the same time a decentralized portion of the general government of the state and a co-operative organization of property owners for the administration of private property. The mayor, when he enforces an ordinance for the preservation of the public health, or when he sits, as he does in some of the cities, as a civil committing magistrate, punishing those who have committed a crime against the laws of the state and the rights of its citizens, performs a state function at a locality, and is a public state officer deriving his authority from the suffrages of the citizens in whose midst he holds sway. The mayor, when he signs an ordinance for the grading and regulating of a street between certain avenues, involving the payment by the owners of property on such street of an assessment covering the expense thereof, is a mere instrument to make and enforce a contract between property owners for mutual convenience as to such regulation of a street, which by reason of the diversity of interests

and the perversity of some exceptionally ill-conditioned human beings, it is inexpedient to leave entirely in the hands of individual property owners; and therefore the law makes contracts through the instrumentality of the mayor for them. The police department of a city is part of the general governmental function of the state. The department of public works, except so much of the activity of that department as may be connected with the care of docks, water-fronts and the removal of encroachments from public highways, is mainly occupied with this general co-operative work for real estate owners in the city. Almost all the larger expenditures of a city government, the consequences of which are imposed as a burden upon property by way of assessment, were, in times not very remote, borne by property owners without calling upon the government to perform that function for them. Not a century ago most of the cities of Europe were not lighted, and persons who desired to enjoy the luxury of a light at night in the streets, either employed servants to walk before them with torches; or, if they wished to afford easy access to their houses at night, they employed servants to stand with torches or hung up lamps before their houses after sundown. When the desire for lighting became general, the character of this service or function was not changed, only instead of each particular property owner bearing his own expense, the city was uniformly lighted, and the expense borne evenly between the owners of property. At first it was only a few streets that were thus lighted, and the expense borne by the inhabitants of those streets. And thus with paving, sewerage and other matters strictly appertaining to the management of real estate, as contradistinguished from governmental functions. —In applying the doctrine of universal suffrage indiscriminately to the management of mere property interests as well as to governmental functions, a state of affairs has been created in American cities by which the great mass of non-taxpayers and unthrifty inhabitants obtain the control of all these expenditures relating to property, in which they have, it is true, a remote interest, but no direct pecuniary interest, and which puts the tax payers at the mercy of the tax eaters. It gives the handlings of vast sums of money (in the city of New York upward of \$30,000,000 a year) to the political organizations of the cities and state; makes the city offices the largest source of revenue to the various political parties; and makes the possession of the more important municipal offices largely the turning point of success or non-success of one or the other political party in the state. Hence, however carefully may have been framed the constitutional provisions intended to prevent the interference by the legislature or of the state officers with the city government, the American politician has found means to make such constitutional provisions almost wholly nugatory and waste paper. For instance, the citizens of a city elect

a democratic mayor and a republican at the head of its public works, and a republican common council. By the organic law of the city government the mayor is clothed with power to remove the chief of public works, and has a large amount of discretionary power in relation to the other departments of the city government, and he is the dispenser of patronage within the city. The republican legislature, determined to have in the hands of its own party the expenditure of the \$30,000,000 raised and expended in a city like New York, thereupon passes a law amending the charter of the city of New York, by which, without changing in the least the names of the officers or depriving the citizens of New York of the right to elect their officers, they completely redistribute their functions, strip the mayor of all substantial power, place thenceforth the power of appointment and removal of officers in their republican common council, give to the head of the department of public works all the executive power which had theretofore been possessed by the mayor; and while the people still have their mayor whom they have elected, he is a mere shadow, a political form wholly disemboweled, so far as the legislature could effect that result, and his whole vital force transferred to other departments. —A notable instance of these devices was performed by the charter of 1870. A contest was then waged to dethrone the infamous ring which held sway in the city of New York. The ring became apprehensive that the people might, under the leadership of what was called "the young democracy" oust them from power, toward which the first step had been taken by the removal of Mr. Tweed, who was then deputy street commissioner, by the then street commissioner, Mr. George W. McLane. The loss of his office threatened, of course, his political influence. The Tweed charter was immediately thereupon passed by a legislature subservient to the ring, vacating the office of street commissioner, annihilating the Croton department, vesting all the powers in the commissioner of public works within five days after the passage of the act, and requiring Mr. A. Oakley Hall, the then mayor and one of the ring, to appoint that commissioner. The term of the new commissioner was to be for four years, two years, therefore, beyond the time of the mayor's own election. The common council was stripped of all legislative function, the power of the governor to remove city officers on charges was repealed, and all powers of removal were taken away from the city government. Impeachment was restricted by the condition that the mayor alone could prefer charges; a trial could only be had if every one of the six judges of the common pleas were present; the offices of three of the five heads of departments were granted for five years under the form of appointment by the mayor, and of course it was prearranged who the appointees were to be, to Peter B. Sweeney, Thomas C. Field and Henry Hilton, thus superseding Mr. Green and removing Messrs.

Stebbins, Russel and Blatchford. The department of police was remodeled and the terms extended to from five to eight years, with the power of the mayor to appoint; and he accordingly appointed Messrs. Henry Smith, B. F. Manierre, Bosworth and Brennan. The departments of health, fire, excise, charity, taxes and building, by an amendment passed a few days later, were also remodeled. Mr. Connolly and Mr. O'Gorman, who had already been respectively the comptroller and corporation counsel, were re-appointed for terms extending long beyond the period of the mayor's term for which he was elected. Of the men who were thus appointed many of them proved public thieves. The Mayor, Tweed and Connolly were a board of special audit for the purpose of determining the validity of outstanding bills against the city; and the first result of the amendment to the charter was a meeting on the fifth day of May, 1870, at which an order was made for the payment of six million three hundred and twelve thousand five hundred dollars (\$6,312,500) of which only about 10 per cent., as was subsequently shown in evidence in the trials against the ring, had any valid basis whatever. Of these six millions of dollars, Tweed got about 31 per cent., a brother of Sweeney, 10; Watson, 7; 20 went to other parties in the interest of the ring; 33 nominally went to mechanics, but two-thirds of the nominal amount of their bills was inflation and was again subdivided with other knaves. During the year 1870 these public officers of the city of New York stole not less than \$15,000,000 outright, and the amount could not have aggregated less than \$25,000,000 or \$30,000,000. If to the amount stolen outright is added the amount extravagantly and wastefully expended in sinecure offices, the performance of unnecessary work, fraudulent contracts, and what not, it is safe and within the mark to say that one-half of the city debt of \$130,000,000 represents absolute plunder. This would have been largely impossible if the line of demarcation had ever been strictly adhered to, of intrusting to the property owners who were immediately to be affected thereby, the expenditure of public moneys relating to property only. Many of the more mischievous legislative interferences with municipal government would have been impossible had the powers to be wielded by public officials, as well as their mere official names and a description of the locality of the voters who are to elect them, been entrenched and imbedded in the constitutions of the states.—The ills from which New York suffered were borne by other cities of the Union to a lesser extent, but still to some considerable degree. The United States census of 1880 exhibits the startling fact that the total bonded indebtedness of the cities of the United States is \$682,096,460, of which the amount created before 1860 is \$51,222,598; adding to that sum the whole total of \$71,071,140, represented by the refunding of accruing indebtedness during the 20 years, and

we have a total of \$122,293,738 of indebtedness in 1860, as against \$682,096,460 in 1880, "a trembling contribution" not appreciably counterbalanced by either increase of population or increase of wealth during the past 20 years.—The commission appointed in 1877 by the governor of Pennsylvania say, in their report, "that a carefully prepared table, showing the increase of population, valuation, taxation and indebtedness of 15 of the principal cities of the United States, from 1860 to 1875, exhibits the following result: increase in population, 70.5; increase in taxable valuation, 156.9; increase in debt, 270.9; increase in taxation, 363.2." Every increase in population of a city and enlarged area of assessment should normally result in a decrease of debt per capita, and a decrease in taxation; because both the natural increase of the population and the increase in taxable valuation of properties would naturally create economies in all the services rendered to a great city which the municipal administration undertakes to supply.—To cite a few examples of the growth of debt from 1867 to 1875, we shall take such cities only the public works of which were, in the main, already constructed before 1867. The debt of New York in 1867 was about \$33,000,000; in 1875, about \$123,000,000. The public debt of Philadelphia in 1867 was \$35,000,000; in 1877, \$64,000,000. St. Louis, in 1867, about \$5,500,000; in 1877, \$16,500,000. Pittsburg, in 1867, \$3,000,000; in 1877, \$13,000,000. Chicago, in 1867, \$4,750,000; in 1877, \$13,456,000.—In 1876 a commission was appointed in the state of New York to consider the evils incident to city administrations, and to devise a plan for the government of the cities of the state of New York. The commission were unanimously of opinion that some radical change in the method of selecting officers and giving fixity of power in the hands wherein it was lodged for city government, must be made, and that nothing short of constitutional amendments would reach the evil so as to prevent this mischievous legislative interference from year to year. The commission drew attention to the fact that the debt of the city had grown from 1850, when its population was 515,000 and its indebtedness \$12,000,000, to \$18,000,000 in 1860, and to upward of \$100,000,000 in 1871. The expenditures of the city were, in 1853, \$3,230,000; in 1870, about \$30,000,000. Of this debt, the commission says, "the larger part of it represents a vast aggregate of moneys wasted, embezzled or misapplied." The cost of opening and improving highways or for putting sewers in streets is, of course, not included in this vast aggregate of moneys annually levied and debt rolled up, because the cost of those improvements are by way of assessments levied directly again upon the land, and they never figure as part of the ordinary expenditures of the city. The main causes of the existing evils, the commission found to be, first, incompetent and unfaithfully governed boards and officers; secondly, in the introduction of state and national

politics into municipal affairs; thirdly, in the assumption by the legislature of the direct control of local affairs. To prove to what proportions the evil of the multiplicity of laws relating to the city of New York had grown, the commission quoted a remark made by chief justice Church in a judicial opinion: "It is clearly unsafe for any one to speak confidently of the exact condition of the law in respect to public improvements in the cities of New York and Brooklyn; the enactments with reference thereto have been modified, superseded and repealed so often and to such an extent that it is difficult to ascertain just what statutes are in force at any particular time." (62 N. Y. R., 459).—The remedies suggested by the commission were contained in a series of sections of a proposed article of the state constitution, by which the legislature was prohibited from passing any law for the opening, making, paving, lighting or otherwise improving or maintaining streets, etc., and all such authority was conferred absolutely upon the city government; and except by vote of two-thirds of all the members elected to each legislative chamber it could not impose any charge of any kind on any city or civil division of the state. The proposed amendments required that all local work or improvement in and for a city, before it becomes a charge upon the city, shall be passed by the board of aldermen of the city. The legislature was intended to be made powerless to make any change in the organization or in the distribution of powers in the city government or in the terms of tenure of office, unless by an act passed upon the application of both the board of aldermen and of the board of finance, respectively, to be first approved by the mayor; or, in lieu of such application by the city authorities, the act making such a change was to receive the sanction of two successive legislatures. The commission, recognizing the fact that a city administration was in part the administration of private property and in part a government, sought to organize a board of finance, to be elected by payers of upward of \$250 rent a year, or owners of \$500 worth of property on which taxes are paid. This board of finance, however, was to have no initiative as to expenditure, but simply to exercise a veto power on proposed expenditures by other departments of the city government and a confirming power as to the appointment of the two officers only, the comptroller and the corporation counsel, who, by their combined acts of mal- or non-feasance, might heavily charge the city with debt. The commission, recognizing the fact that the passions engendered by the annually recurring party strife for the election of state officers prevented its citizens from calmly considering the merits of city officers who may at the same time be voted for, recommended and framed a section of the proposed article to secure spring elections, so as to separate city politics from state and national politics. Restrictions were imposed on the creation of debt, and an amendment to the state constitution was suggested, by which minority represen-

tation could be fairly tested in city government. This effort at reform failed, because the legislature for 1878 neglected to submit the constitutional amendment to the people. In the interim between the submission of the report, which had been received at the time of its issue with considerable favor, and its proposed submission by the legislature, a demagogic cry of "disfranchisement" had been raised against the scheme, because of the creation of a board of finance; and politicians of both parties were apprehensive that any step taken by them to forward the commission's plan by voting for it in the legislature or aiding in having it submitted to the people might result in harm to them; they therefore united in ignoring the work of the commission in the legislature next succeeding the submission of the report; and it thus failed of adoption.—Other states, notably Pennsylvania and New Jersey, moved by the same pressure, (Elizabeth, N.J., having actually become insolvent in consequence of the load of its public debt), appointed commissions to devise a plan for the general government of their cities. Both these commissions, warned by the cry which had been raised against the plan of the New York commission by politicians and demagogues, refrained from making any recommendation involving a discrimination, if not a limitation, of the suffrage, as to the financial offices of the city, but in other respects dealt with the subject very much in the same spirit as the New York commission, and the labors of which unfortunately met with the same disastrous result.—The other mistaken step which has been taken is, that in changing from the pure democracy of the New England town to the representative system, we have not in the representative system preserved the pure democracy by the representation of the whole community, instead of a mere majority.—The mistaken course here referred to is one from which our representative system suffers as a whole, the most injurious consequences of which are, however, felt where population is most dense. Modern democracies must use the representative system for the taking of the sense of the community, for reasons already referred to. While in the representative body so selected, the majority, of course, should govern, it by no means follows that the majority only should be represented; but, on the contrary, no true majority government can be had by means of the representative system unless all are represented. All the varieties of minority representation which, since the labors of Mr. Fisher in this country, and Mr. Hare in England, have been suggested, the cumulative plan, the list system, the single vote, the preferential plan, etc., with which students of political economy and government are more or less familiar, have in view the representation of the whole of the community instead of a part; so that taking the sense in the representative body is virtually taking the sense of the whole instead of a mere majority. Had, by any accident, such a system prevailed in our cities, so that common

councilmen and boards of aldermen had been elected upon a general ticket, and each voter had been permitted to vote for but one, or each voter to have as many votes as there were persons to be elected which he could cumulate and distribute as he saw fit, the tax payers could at all times, even without exclusive representation, have secured from among their number a proportion of representatives to sit in the board of councilmen or aldermen. This would have injected into the boards of aldermen or councilmen of cities a conservative element sufficiently powerful to have checked the reckless extravagance and speculations which have marked the administration of American cities within the past generation. Such a reform would not create the prejudice and opposition that is awakened by the suggestion of a limitation of the suffrage; indeed, it is more thoroughly democratic than is the prevailing system, and in all probability American cities will have to look to this method of representation as the only practicable way of securing a reasonably adequate representation in the municipal representative bodies of tax payers or men who have a stake in the community. The tentative efforts that have hitherto been made in the way of minority representation, by giving to the majority party two out of three aldermen to be run in a district and the minority the remaining one, is, on the whole, worse than the prevailing majority system; because it makes a nomination equivalent to an election, and makes the party caucus supreme, as they have nothing to fear from the adverse votes of the people. This system has been tried both in Illinois and in New York, without real success, to reach the deeper seated evils of our municipalities. Every sincere advocate of the reform known under the general term of "minority representation," should repudiate such party representation schemes, as in fact minority representation, and refuse to have the failure consequent upon such efforts laid to the door of totality or minority representation.—In the New York charter proposed by the committee of seventy for the government of the city of New York, and which failed of adoption by the interposition of governor Hoffman's veto, the plan of minority representation proposed was to create a board of 40 aldermen, electing eight in each of the five senatorial districts in the city of New York by the cumulative plan, giving to each voter in the district eight votes and allowing him to cumulate them upon one or to distribute them among the eight, as he saw fit. This plan was intended to give freedom of election within party lines and would have enabled, had it been adopted, the tax paying voters in the district, independent of party lines, to get together and secure the nomination of at least two or three aldermen in each district: this result would have so disintegrated the political machines that, in all probability, within a short time after its adoption municipal politics would have been independent of federal and state organizations, by the intro-

duction of a set of independent officers in the administration of the city, whose positions were acquired and held independent of the political machinery of both parties.—The defects of administrative machinery of American cities lies generally, 1. In the appointment of departments not responsible to a central authority. The mayor, though made nominally responsible for the good conduct of the city government, is generally so hampered as to appointments and as to removals from office, that no true responsibility for malfeasance and malversations can be said to attach to him, if the nominally subordinate but really independent officers fail to perform their duty. The objection that is ordinarily raised against clothing the mayor with sufficient power to hold the subordinate officers responsible, is that by means of such power he can secure his own reelection. This evil, formidable as it is, is less mischievous, however, than the one which has been created in its place, the existence of a set of officers elected or appointed without direct responsibility to anybody. 2. The failure to intrust to the legislative body of the city sufficient legislative power. The city of New York is an illustration of this, where the chiefs of any one of the seven principal executive departments have larger discretionary power, greater patronage, and are more important officials than the whole board of aldermen. 3. The arbitrary interference of the legislature with city affairs and city officials, actuated in the main by purely party considerations, or personal interests. This creates such a multiplicity of laws in relation to the city administration that the legal condition of all the departments is one of hopeless confusion, and imposes debt charges one after another upon the inhabitants of a city, upon the assumption or necessity of which they have never had an opportunity to express an opinion.—The course to be taken to reform these evils is: 1. Constitutional limitation upon the power to create indebtedness; 2. Constitutional inhibition on the legislature to interfere with the cities' administration, unless such legislation is demanded by the inhabitants of a city in some formal manner; 3. Remodeling of city charters so as to centre responsibility in the mayor and the board of aldermen, and to subordinate the executive heads of departments to the central executive and to the legislative department of the city; 4. The introduction of minority representation, by which all the citizens may be fully represented in council or aldermanic chambers, or the creation of a board of tax and rent payers in lieu of minority representation, to act as a check upon extravagant expenditure.—In the cities of Australia, where the democratic spirit has had almost as free scope as in the cities of the Union, a plan has been recently introduced by which, although all citizens are permitted to vote, additional votes are given to the larger tax payers in proportion to the amount of their ratable property. In an elaborate report on this plan made by Sir Charles Dilke and Mr. Ware to the Cobden club in 1875,

it is claimed that this system works admirably. It is proper to add, however, that the additional votes arising from increased wealth have been limited to four at most in any one individual, so that the community has no reason to complain of any very serious discrimination in favor of the richer as against the less fortunate citizen.

SIMON STERNE.

CITIES AND TOWNS. I. *How towns originate—Circumstances which determine choice of location or lead to its abandonment.* Towns are aggregations of people and of industries, and they are formed under the natural impulsion of certain wants. Their development is in no way arbitrary. Sometimes rulers have entertained the illusion that they had only to pronounce a magiloquent fiat, to make a new city rise and flourish; but experience has rarely failed to convince them that they had presumed too much on their power. Without doubt, a monarch may, by changing the seat of his empire, as did Peter the Great, for example, create a centre of population and wealth. The public functionaries of all grades and those who aspire to these positions, being obliged to live in the capital and to expend there their salaries or incomes, necessarily attract around them a population of tradesmen, mechanics and menials; but, unless the new city presents a location favorable for certain branches of production (and in this case the intervention of the government is not necessary in order to found it) there will be no considerable development. Here, however, one exception should be made. If the government continually enlarges its functions, if it centralizes power at the expense of the liberties of the country, and, in consequence, increases the number of persons in its employ, the town where it has established the seat of its power will not fail to grow and to acquire wealth: but it is questionable whether the country will have reason for self-gratulation, in this case, at the prosperity of its capital. If, on the contrary, the government has only limited powers, if it has but few persons in its employ, its capital, in case no other industry can be advantageously established there, will be forced to occupy a very modest position in comparison with the centres of manufacturing or commercial production. Such is the case with Washington, the capital of the American Union. J. B. Say has clearly shown in his *Traité* this powerlessness of governments to establish cities and towns and make them prosperous. "It is not sufficient," he says, "to lay out a town and to give it a name, for it to exist in fact, it must be furnished by degrees with industrial talents, with implements, raw materials, and everything necessary to maintain the workmen until their products may be completed and sold; otherwise, instead of founding a town, one has only put up theatrical scenery, which will soon fall, because nothing sustains it. This was the case with Yekaterinoslav, in Taurida, as the emperor Joseph II. foreshadowed, when, after having

been invited to lay in due form the second stone of that town, he said to those around: 'I have finished a vast enterprise in one day, with the empress of Russia; she has laid the first stone of a town, and I the last.'—Nor does moneyed capital suffice to establish a large manufacturing business and the active production necessary to form a town and make it grow: a locality and national institutions which favor that growth are also necessary. There are perhaps some deficiencies connected with the location of the city of Washington, which prevent its becoming a great capital; for its progress has been very slow in comparison with what is common in the United States. While the situation of Palmyra, in former times, rendered it populous and rich, notwithstanding the sandy desert by which it was surrounded, simply because it had become the entrepôt of the commerce of the Orient with Europe. The prosperity of Alexandria and Thebes in Egypt was due to the same cause. The decree of its rulers would not alone have sufficed to make of it a city with a hundred gates and as populous as Herodotus represents it. The key to its importance must be sought in its position between the Red sea and the Nile, between India and Europe. (Treatise on Polit. Econ., by J. B. Say, book ii., chap. 11.)—Let us now attempt to give a brief outline of the necessities which have determined the establishment of towns and the choice of their location. The necessity of providing a place of security must, more than any other cause, have originally prompted men to create towns. They comprehended that by combining together in fortified places, they would be more secure than while scattered over a vast extent of territory. To this necessity, which was felt by mankind in the earlier ages, were joined the special advantages of manufactures and commerce. While agricultural production extends, from its nature, over a considerable surface, most of the branches of industrial and commercial production require, on the contrary, a certain concentration. Let any one examine them in the various civilized countries, and he will find they have collected about a few centres. Thus, in France, the silk industry has its principal seats at Lyons and Saint Etienne; the cotton industry at Lille, Rouen and Mulhouse; the wool industry at Rheims, Elbeuf, Sedan, etc.; and the fashions are at Paris. What particular causes have determined the establishment of any industry in any particular locality rather than another, is of itself an interesting subject of investigation. Sometimes it has been the vicinity of the raw material, or of a market, sometimes the special aptitudes of the people, and again a combination of these various circumstances.—The localization of the industries does not stop here: in the towns where they become established, we see them select certain quarters and certain streets as their centres. This sub-localization by quarters and streets is notably observable in Paris; and one may find some interesting remarks on the subject in the "Investigations (*Enquête*) in regard to Pa-

rian Industries," undertaken under the auspices of the chamber of commerce.—"When the industries are destined to provide for daily consumption," we read in the *Enquête*, "they are located within reach of the consumers; when they contribute their products to commerce, they are situated with especial consideration of the means of production. The industries which supply food are almost all of the former class; those which are devoted to the manufacture of articles known in trade as *Parisian articles*—*articles de Paris*—are in the second. Among the furniture industries there are also certain ones whose work is offered directly to the consumers, and others which are more particularly devoted to manufacture. Consequently we find upholsterers in all parts of the city, while the manufacture of furniture is situated, on the contrary, almost exclusively in the eighth *arrondissement*, as the making of bronzes is located in the sixth and seventh. Of 1,915 cabinet makers, doing a business of 27,982,950 francs, 1,093, with 19,679,835 francs, are in the eighth *arrondissement*. And of 257 makers of chairs, doing a business of 5,061,540 francs, 197, with 3,373,950 francs, are also in the eighth *arrondissement*. To the same *arrondissement* belongs also the preparation of pelts and leather. The tanneries and the places for dressing leather are nearly all situated in the quarter of the Gobelins, on the banks of the little river which takes this name, on entering Paris. Chemical products are not manufactured much in the heart of Paris, but those which are made there and which require space, water and air, come from the eighth and twelfth *arrondissements*. Of this number are starch and fecula, and candles of wax, spermaceti and tallow. The manufacture of pottery is also found there. Work in the metals and in the construction of machinery is found especially in the eighth, sixth and fifth *arrondissements*. As to the manufacture of what are generally known as *articles de Paris*, it extends through the whole of an important part of the city, on the right bank of the Seine, to the north of the streets of Francs-Bourgeois and Saint Merry, and in the belt comprised between the streets Montorgueil and Poissonnière on the west, and the Place des Voges and Roquette street on the east. It is there that are made articles of gold and silver, fine jewelry as well as imitation; there are manufactured the work boxes, reticules, brushes, toys, artificial flowers, umbrellas and parasols, fans, fancy stationery, combs, portfolios, pocket books and all the multitude of various small articles." (*Statistique de l'Industrie à Paris*. Introduction, pp. 43, 44.)—The same fact is observable in civilizations which have little analogy with ours. To cite only one example: a Spanish traveler, Don Rodrigo de Vivéro, who gave, in 1608, an interesting description of Yeddo, the capital of Japan, mentions this distribution of the industries through certain quarters and streets as the most salient feature which had attracted his attention. "All the streets," he says, "have covered galleries, and each one is occupied by persons of the

same business. Thus the carpenters have one street, the tailors another, the jewelers another, etc. The tradesmen are distributed in the same manner. Provisions are also sold in places appropriated to each kind. Lastly, the nobles and important personages have a quarter by themselves. This quarter is distinguished¹ by the armorial bearings, sculptured or painted over the doors of the houses." (Memorials of the Empire of Japan in the Sixteenth and Seventeenth Centuries, edited by Thomas Randall.) With the exception of a few slight differences, is not this description applicable to most of the capitals of Europe? Thus the same economic necessities are felt in the most varied civilizations, and give them a common impress.—Numerous causes, however, are constantly at work, to change the location of industries, and in consequence, of the centres of population supported by these industries. The ordinary result of every industrial or commercial improvement is to change the place of production. When the route around the cape of Good Hope was discovered, Venice lost much of her importance. Later, the invention of machines for spinning and weaving cotton built up the prosperity of Manchester at the expense of that of Benares and other cities of India, which had previously been the centres of cotton manufactures. In like manner we to-day see steam locomotion give rise to new cities or communicate an impulse to old ones which were remaining stationary. The city of Southampton, for example, acquired in a few years considerable importance, because its port was thought well adapted to be a centre to some lines of ocean steamers. Let a new system of navigation appear, and perhaps Southampton will be abandoned for another port whose situation is more in harmony with the particular requirements of the new system. Thus cities and towns experience, to their advantage or detriment, the influence of causes which modify from day to day the conditions of existence and production.—We said above that governments have only in a feeble measure the power to create new towns, and, above all, to render them prosperous. We might add that neither do they possess to any higher degree the power of destroying existing towns or changing their location. In vain did the victorious barbarians employ fire and sword in the cities they had conquered; in vain did they plow up the ground of these proscribed cities and sow salt thereon: as it was not in their power to destroy the natural advantages which had led the people to centre there, in a few years the mischief was repaired and life circulated more freely than ever in the very places that a foolish pride had devoted to eternal solitude. Trammels on the free circulation of men and things have unfortunately been more efficacious than projectiles or incendiary torches, in destroying the centres of population and wealth. Many a flourishing city has been transformed into a veritable necropo-

¹ All this has been rapidly changing since the abolition of the feudal system in Japan.—E. J. L.

olis by restrictions depriving it of its commerce or of a market for its products. In the seventeenth century we find a notable instance of this. The Dutch, jealous of the prosperity of Antwerp, succeeded in obtaining the closing of the Scheldt and this barbarous measure, which was continued in force for two centuries, gave a mortal blow to the commerce of Antwerp and to the industries of the Flemings, of which the Antwerp merchants had been the active intermediary agents. More recently, we have seen the port of Bordeaux, formerly one of the most frequented in France, deserted in consequence of the prohibitory system.—Population and wealth are not alone changed by transference from one town to another; they change from place to place in the same town. New quarters arise within the towns or in their suburbs, while the old are abandoned and fall to decay. These local changes are brought about by causes, manifest or latent, whose action modifies in course of time the necessities or conveniences which had determined the choice of the first location. General advance in security may be considered the most important of these causes.—Let us dwell a moment on this point.—The old towns of Europe were, for the most part, built on elevated plateaus or on hills more or less steep; so that their inhabitants had constantly to ascend and descend, which occasioned a considerable waste of force in the daily transportation. Besides, these towns were usually restricted to a narrow enclosure, the dwellings pressed upon one another like the cells in a hive. Why was it that our ancestors dwelt in a manner so devoid of economy, so uncomfortable, and sometimes so unhealthy? To explain this curious fact we must take into account the condition of Europe after the invasion of the barbarians. Insecurity was then universal. The conquerors had built retreats for themselves in the most inaccessible places, and they darted forth from these vulture nests, over the neighboring regions, to pillage or levy contributions. Too weak to resist, the former inhabitants of the country, who were the victims of their depredations, compounded with them, as one compounds with bandits in countries where the government is without power. They secured the protection of the most powerful bands by paying them a regular tribute, and they had their dwellings as near as possible to their protectors. They generally settled around strong castles, so as to be able to take refuge in them in case of danger. The first houses were situated just below the castle, and the others were disposed lower and lower in succession on the slope, like an amphitheatre. As soon as the inhabitants became sufficiently numerous, they surrounded their city with walls and towers to complete their system of defense. Thus were built most of the towns which originated in the middle ages.—When we consider the necessities of the times, the narrowness of the streets is also explicable. It was due to the fact that the fortifications had been made within as restricted a circle as possible, in order to make

the defense more easy and at less cost. When the population increased, they were consequently obliged to build their houses higher and to diminish the width of the streets, in order to keep within their original limits. Sometimes, indeed, they moved the walls back; but it was only as a last resort that they submitted to a measure so costly.—But by degrees general security increased. The feudal system disappeared, and with it intestine wars ended. Then began a movement which resulted in changing the location of the city population. From the heights to which care for their safety had obliged them to confine themselves, they descended to the plains, where they could dwell more comfortably and at less expense. The *faubourgs* owe their origin to that increase of security which allowed peaceable men engaged in the industries to live henceforth outside of fortifications. This progress has not yet been realized everywhere. The Calabrian peasants,¹ for example, instead of dwelling in the open country, are obliged to remain in the towns, to be safe from the bandits who infest the country. We select the following fact from the correspondence of Paul-Louis Courier: "In Calabria at present," he says, "there are woods of orange trees, forests of olive, hedges of lemon. All these are on the coast and only near towns. Not one village, not one house in the country: it is uninhabitable, for lack of government and laws. But how do they cultivate it? you will say. The peasant lodges in the city and tills the suburbs; setting out late in the morning, and returning before evening. How could any one venture to sleep in a house in the country? He would be slain the first night." (Paul-Louis Courier, *Correspondence*. Letter to M. de Sainte-Croix, dated at Miletus, Sept. 12, 1806.)—Accelerated, moreover, by another cause, which we shall consider later, this displacement of the town population has become generally more and more general: everywhere we see the inhabitants of the old towns leave the abodes they have dwelt in for ages, to occupy new homes, less expensive, more commodious and more healthful.

—II. *Of the proportion between city or town and country population—Causes which determine and modify it.* The foundation and choice of location of cities and towns are determined, as we have just seen, by the state of civilization and of the arts of production. The same is true of the proportion between the population and wealth of towns and of rural districts. This proportion is essentially diverse and variable. It differs according to the countries and the time. When production has made little progress, when men are obliged, in consequence, to employ the greater part of the productive forces at their disposal in procuring for themselves the necessities of life, the industries which provide for less urgent wants can not be developed, for lack of consumers. The towns where these industries centre because of their nature and their special fitness for them,

¹ This is now changed, and Calabria is comparatively secure.—E. J. L.

progress in that case only with extreme slowness. It is then in countries and at times when production, and especially agricultural production, has realized the most progress, that the town population must be, and in fact is, the greatest.—Let us take for examples two countries whose positions in the scale of production are very unlike, viz., England and Russia. In England, where the town population exceeds by far the rural population, the number of families engaged in agriculture was estimated in 1840 at only 961,134, while that of families engaged in manufactures, commerce, etc., was 2,453,041. The 961,134 families engaged in agriculture furnished 1,055,982 effective laborers, who produced enough food to sustain the greater part of the English people. In countries where agriculture is less advanced, two or three times as many hands, relatively, are required to give an equivalent product: and the natural result is that the town population can not be so numerous. The backward state of Russian agriculture is certainly the primary cause of the small growth of urban population in Russia. The peculiar organization of the industries there has also had somewhat to do with the result.—“The manufacture of small articles,” says M. Tegoborski, “such as are made in the various trades, is located, in Russia, in the rural districts rather than in the towns: it is carried on by village communities, which take the product of their labor to the fairs: this is why the fairs in Russia are of more importance than in other countries. In other countries the workmen in the towns, for the most part, supply the demands of the rural districts: with us, it is often the reverse, and the shoemakers, joiners, and locksmiths of the villages provide for the wants of the townsmen. * * * Any one may obtain convincing proof of this lack of artisans in Russia, in most of our towns, by examining the statistics of the trades of other countries and taking some of the most common as a basis of comparison. Thus, for example, in Prussia, the trades of shoemakers, glovemakers, joiners, wheelwrights, glaziers, blacksmiths, locksmiths and braziers numbered, in 1843, 322,760 masters and journeymen for a population of 15,471,765, being 21 workmen to 1,000 inhabitants: and when we take the statistics of the towns, this proportion rises in the large towns, to 40 workmen, masters and journeymen, belonging to these various trades, to 1,000 inhabitants of the total town population, which is three, four, or even more times the proportion we find in the towns of Russia.” (*Etudes sur les forces productives de la Russie*).—In our day improvements which effect an economic change in production result in a rapid increase of the town population. From what has heretofore been said we may conceive that it would be so. “In France, for example,” says M. Alf. Legoyt, “the population increased, from 1836 to 1851, 6.68 per cent. for the entire period, or 0.44 per cent. per annum. In 166 towns having 10,000 souls and over, the increase in the

same interval was 24.24 per cent. or 1.616 per cent. a year. In 10 years the increase of the town population was then 16 per cent., while that of the total population was only 6 per cent. (*Mouvement de la population de la France pendant l'année 1850*, par Alf. Legoyt. *Annuaire de l'Economie politique et de la statistique pour 1852*).—The case is similar in England. According to the tables of the last census, the town population of Great Britain (England and Scotland), which was in 1801 only 3,046,371, attained in 1851 the number of 8,410,031. This is an increase of 176 per cent., while the total increase of the population in the same period, was only 98 per cent. And if we observe in what towns the increase has been the most considerable, we find in the first place the great manufacturing towns and the commercial ports. While the population of the county towns increased only 122 per cent., that of the manufacturing ones increased 224 per cent., and that of the seaports, London excepted, 195 per cent. In the towns devoted especially to iron industries, the increase was 289 per cent., and in the centres of cotton manufacture, 282 per cent. Every improvement in the arts of production can only accelerate this increase of the town population. Should we lament it, or rejoice at it? This is a much contested question, but the economists agree in deciding it in favor of the cities. Adam Smith and J. B. Say, notably, prove that the multiplication and the enlargement of towns are desirable, even looking at the matter with reference to the interests of the rural districts. Adam Smith, who examined this subject with his usual penetration, concludes that the rural districts have derived three principal benefits from the development of manufacturing and commercial towns. “1. By affording a great and ready market for the rude produce of the country, they gave encouragement to its cultivation and further improvement. This benefit was not even confined to the countries in which they were situated, but extended to all those with which they had any dealings. 2. The wealth acquired by the inhabitants of cities was frequently employed in purchasing such lands as were to be sold, of which a great part would frequently be uncultivated. Merchants are commonly ambitious of becoming country gentlemen; and when they do, they are generally the best of all improvers. A merchant is accustomed to employ his money chiefly in profitable projects; whereas a mere country gentleman is accustomed to employ it chiefly in expense, etc. 3, and lastly. Commerce and manufacturers gradually introduced order and good government, and, with them, the liberty and security of individuals, among the inhabitants of the country, who had before lived almost in a continual state of war with their neighbors, and of servile dependency upon their superiors.” (*Wealth of Nations*, by Adam Smith, book iii., chap. 4. How the commerce of the towns contributed to the improvement of the country.)—The development of the town population is not

then a fact at which we need be troubled. Doubtless temptations are greater and bad examples more numerous in towns than in the country; but how much more abundant and within the reach of all are the means of enlightenment and moral improvement! The statistics of criminal justice show, that the town population does not furnish a proportionally greater contingent of criminals than the rural population; and yet it is worthy of note that the police is much more effective in towns than it can be in the rest of the country. —The following are the statistics in regard to this matter, of the administration of justice in France, from 1826 to 1850: "More than three-fifths of those charged with offenses had a domicile; 612 in 1,000 resided in the rural communes; 388 dwelt in the town communes. In the entire population, the proportionate number of the inhabitants of towns is not perfectly ascertained; but approximate estimates put it at only one-fifth of the total population. The preceding proportions differ according to the nature of the crimes. Of 1,000 charged with offenses against individuals, only 566 were inhabitants of the rural communes; 434 dwelt in towns. If we investigate the various kinds of crimes, we find variations still greater. Among those charged with incendiarism, the highest number, relatively, is found to be from the inhabitants of the rural districts; next come those charged with poisoning, infanticide, false testimony, parricide, and obtaining titles and signatures by compulsion. These are probably the only crimes in which the country people have a larger share than they should have, considering their total number in the whole population. The proportion of country people charged with political crimes, abortion, robbery, forgery, counterfeiting money, violation of the person and criminal outrages upon children, is, on the contrary, very small. (Report of the minister of justice, *Annuaire de l'Economie politique et de la statistique pour* 1853, p. 108.)—The same improvements which increase the town population, tend also to improve their dwellings. Under the influence of improved security, we have seen towns descend from the summit of plateaus and the sides of hills, to the plains: we shall see them, according to all appearances, extend over a wider and wider surface, as means of communication become less expensive and more rapid. Great improvements have already been realized in this direction, as well as in the cleanliness and repair of streets, and the internal comfort of dwellings and economy in their management. Who can predict what the future may yet have in store for us?—III. *The administration of cities and towns—What it is, and what it ought to be* Towns have commonly an administration of their own. Sometimes each quarter even has its own. This administration emanates sometimes from a superior authority, in other cases from the inhabitants of the city. This latter mode of choice, which obliges the administrative body to answer for its acts to those under its jurisdiction, is

ordinarily the better. As to the course to pursue in order to govern a city well, it does not differ from that which should be pursued in the government of a nation. A city government, like a national one, should exercise only such functions as can not be left to the competition of private citizens. Now these functions are not numerous, and they become less and less so, as progress causes the obstacles to disappear which either prevent or obstruct the action of competition. In fact, whatever the zeal or the devotion of a municipal administration, it is not in the nature of things that the services which are performed by the common organization of a city should be of as much importance as those which are left to private individuals. Doubtless the desire to merit public consideration should incite those who administer the government to do well: but does this motive ever prove as powerful as the interest which stimulates private enterprise? We may prefer the intervention of municipalities to that of the government for the organization of certain branches of service, and the establishment and maintenance of certain regulations of public utility; but it is well, as far as possible, to dispense with both. — Unfortunately, municipal administrations have the defect of all governments; they like to assume importance, and, with that view, they are constantly enlarging their powers and, in consequence, the amount of their expenses. In our times they are especially possessed with a mania for undertaking public works and buildings. They appear convinced that by demolishing old quarters at the expense of new; by raising edifices upon edifices; by giving, on the least pretext, balls, concerts, and grand displays of fire works, they contribute effectively to the prosperity and greatness of their cities. Need we say that they are going directly away from the end they wish to attain? These public works, these edifices, these sumptuous entertainments, cost dear, and recourse must always be had at last to taxes, to cover the expenses. Then they tax a multitude of things which serve to feed, clothe, shelter and warm the population, among whom exists a class, unfortunately the most numerous, who barely possess the means of providing for the absolute necessities of existence. In a word, the expense of city living is artificially increased. And with what result? Population and manufactures remove as far as possible from a locality where lavish public officers have permanently established high prices: they settle in preference outside the limits where that economic pest rages. And (and it is a point worthy of note) this change of location, so fatal to landowners in the old towns, has become more and more easy. At a time when lack of security forced people to concentrate in localities which nature had fortified and where art came to the aid of nature, when, on the other hand, the difficulty of constructing artificial ways of communication and maintaining them in good condition rendered the natural

ways, such as navigable rivers, more valuable, the number of locations suited to become centres of population, was very limited. At the same time the slowness with which private dwellings and public edifices were constructed, (years were sometimes devoted to the building of a house, and centuries to the construction of a cathedral), condemned the people who changed their location, to endless privations and discomforts. Circumstances combined to give existing towns, considered as places of residence, a veritable *natural monopoly*. But, influenced by the progress already mentioned, this monopoly is disappearing more and more, and as a result, it daily becomes more easy for the people to rid themselves of the burden which a bad administration imposes upon them. Nor do they neglect to do so; for we see them abandoning towns where the expense of living is too great, (commencing in the quarters less favorably situated), and enlarging the faubourgs or creating, farther away, new centres of activity and wealth. Thus, by drawing largely on the purses of tax payers and unscrupulously issuing any number of bills of credit on future generations, prodigal executives, far from adding to the prosperity of their cities, end by precipitating them into inevitable ruin. Economy in expense should be the supreme rule in the government of cities, as well as in the government of nations. By observing this rule, much more than by increased demolitions, constructions, and festivities, municipal administrations may acquire serious and lasting claims to public gratitude.

E. J. LEONARD, 27.

G. DE MOLENARI.

CIVIL ADMINISTRATION. In its broadest sense, in public affairs, administration means the carrying of the government into effect, by the practical exercise of its authority, through the several officials for which it has provided, and in conformity to the constitution and the laws. But according to a usage quite general, administration only refers to those functions of government which are exercised through the executive and judicial departments. "The administration" is a phrase used, popularly, in this country, to designate, collectively, those officials—being the president and the members of his cabinet—who advise together in the conduct of the executive department. In Great Britain the phrase is used in much the same sense, except that there—the members of the cabinet, of which the number is not fixed by custom, having seats in parliament, and the usage being in other respects somewhat different—the administration takes the lead in the most important measures of legislation as well as in executive affairs. And, generally, its members resign in case of an adverse vote of parliament upon one of those measures.—The constitution of the United States vests the executive power in the president alone, and also makes him commander-in-chief of the army and the navy, and of the militia when in actual service. Neither

the constitution nor laws of the United States, or those of Great Britain, make provision for members of a cabinet, or for any meetings of officials, in the nature of the cabinet meetings which regularly take place in both countries. Yet these meetings consider the most important questions, and practically guide the executive policy, both foreign and domestic, of both nations. No official records are kept of these meetings, and they are without formal legal sanction of any kind. In legal contemplation, the paramount responsibility, in matters of administration, with us, rests upon the president alone, and in England upon the king. The constitution of the United States, however, authorizes the president to require the opinion in writing of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, which strongly tends to harmonize efficiency of administration. But, on the other hand, large and varied authority has been conferred by law upon the heads of the respective departments, which such officers exercise directly, if not quite independently of the president: a course of legislation which has tended to impair the harmony and vigor of the administration, and to augment the influence of congress at the expense of the executive.—In the civilized states of modern times public administration is carried forward under three divisions—civil, military and naval—each directly in charge of officials, in legal contemplation at least, selected in reference to their special fitness for their duties. Convenient and salutary as these divisions are proved to be, they have been fully developed only in modern times and as the ripest fruits of political civilization; Greece, Rome, and the other great nations of antiquity, having established them only in a very limited degree. In fact, these divisions are not complete nor can they be made so, in the most enlightened states; the provisions of our constitution, under which the same legislative body makes laws and the same executive gives orders for each of the three divisions, mark their essential limitations and their ultimate union in every country.—The division of civil administration into three great departments—the legislative, judicial and executive—is equally the result of a slow development, which has been made complete only in the most enlightened states of modern times. In no state of ancient times did these divisions exist, except in a very imperfect form; and everywhere at the present time the completeness of these divisions measures the degree of liberty and justice which government secures.—In Russia and Turkey, for example, the separation exists only in rudimentary form; the executive department subordinating both the others. Even in Great Britain the appellate judicial power of the house of lords and the union of judicial and executive functions in the lord chancellor are strikingly incompatible with the principle of separate departments.—Nowhere is this separation theoretically more com-

plete than under our constitutions, both state and federal. Yet we allow several striking exceptions. The consent of the executive, in analogy to that of a king, is necessary to give validity to a legislative enactment, except that the legislature may give the force of law to its acts by a two-thirds vote over an executive veto. The senate and the executive co-operate in the making of treaties and in appointments to office, (see **CONFIRMATION BY THE SENATE**), and the senate, with the chief justice of the supreme court acting as presiding officer, is the judicial body for the trial of impeachments; thus following the analogy of the British house of lords. The legislatures of various states in earlier years were authorized to grant divorces. In the same spirit congress is authorized by the constitution to make rules for the government and regulation of the land and naval forces—a power, perhaps, essentially executive, and easily brought in conflict with the constitutional authority of the president as commander-in-chief. The same observations might be extended to the power claimed and exercised by congress of making rules and regulations—and of authorizing heads of departments to make and enforce them—for the government of the civil service. These rules and regulations may readily be made to impair the essential functions and independence of the executive, and they have constantly tended to that result.—It hardly need be pointed out that all the reasons which, in their creation, required these three great departments in the government, also require that, in the development of the administration, their due proportion and counterpoise should be maintained. Upon the preservation of the equilibrium in which they stand in the constitution the strength and perpetuity of the government depend.—Why there have been no deliberate changes under our system, which have materially affected the relative influence of the departments, the administrative methods, which have prevailed since Jackson's presidency, have steadily tended to subordinate the executive to the legislative department. More and more, members of congress have usurped the control of appointments and removals in the executive departments; and more and more the members of the senate have used their authority in the matter of confirmations, for the purpose of coercing all appointments, for service in the states they represent, in their own interests or that of their political party. (On these points see **CONFIRMATION BY THE SENATE, SPOILS SYSTEM, PATRONAGE, CIVIL SERVICE REFORM**.)—Under no form of government is civil administration, in its principal arrangements, so complicated as under a republic like that of the United States; though the criminal and repressive methods under despotic institutions are far more complicated than under our institutions. The greater liberty enjoyed in a republic is incompatible with those centralized, direct and coercive methods which exist under despotic systems. But beyond these facts, the existence of state governments leads to

a duplication of departments and to administrative methods unknown under other forms of government. Not only is the official force thus vastly increased, and the sources of responsibility multiplied, but all questions growing out of the relations of public offices to political parties are made more complicated and embarrassing. True, party issues are national, and yet there is generally something like a state party; so that both state and national officials are subject to duplicate, if not incompatible claims of allegiance and duty. These facts have also greatly facilitated that partisan despotism and that vicious dealing with appointments and removals which have disgraced our administrative system. (See **SPOILS SYSTEM, CONFIRMATION BY THE SENATE**.)—Regarding civil administration in the United States, even in that limited sense which excludes the legislative department, it falls under three classes—federal, state and municipal; and, in addition, there are the systems of country and town administration.—In each of these classes, three fundamental divisions—legislative, judicial and executive—exist, though in an imperfect form in most municipalities. In each of these classes and divisions, and in dealing with the great variety and vast number of official places, all the perplexing and unsettled questions of administration arise. How far are political opinions of officeholders material? To what extent, if at all, may an officer use his official influence in aid of his party? What qualifications for office should be insisted upon? How shall fit qualifications for office be ascertained? How long should be the official term of the various offices? (See **TENURE OF OFFICE**.) What should be regarded as good causes of removal? (See **REMOVALS**.) Should officials be protected against political assessments? (See **ASSESSMENTS**.) What officers should give security for their good behavior? What claims has a political party, in the majority, to have its opinions represented in official places? To what extent are our administrative organizations and methods the best that are practicable under our constitutions and in the present state of political intelligence and virtue?—The last question is a great and vital issue in administrative affairs, and it raises inquiries as scientific, philosophical and important as any that can arise in politics. Yet it has not been discussed in our literature; a fact which, taken in connection with the diverse tenures of officers having the same functions, and the discordant methods of doing public work of the same kind in the different states and municipalities, furnishes the most decisive evidence of our neglect of administrative problems, and of the need of making them the subjects of our discussions and of the teaching in our institutions of learning. The judges of our state courts, for example—some of them elective and some appointive—hold under a motley variety of terms, varying from a single year in some states to good behavior in others. There is the greatest variety in the organization and methods of our city gov-

ernments, and in their official service; yet the subject has received no thorough or scientific discussion. There is probably no people, equally enlightened, who have given so little thoughtful attention to administrative questions, and no statesmen who have so much neglected them, as those of this country. And, as a natural consequence, the people of the United States, while they are better satisfied, perhaps, than any other with the principles of the government under which they live, yet complain more than any other free people of the character of the administration they tolerate. Our history suggests a belief on our part that republican institutions have saving virtues which supersede the need of the thoughtful attention of statesmen and patriots being given to administrative methods; a belief as delusive as it is foreign to the convictions of our early statesmen. Washington, expressing the views of his contemporaries, felt the need of a national university, of which he declared, in a message, "a primary object should be the education of our youth in the science of government. In a republic what species of knowledge can be so important?" he asks. And in his last will, he left a bequest in aid of such an institution, in which instruction, "in the principles of politics," were to be taught. Such convictions gave birth to the military school at West Point and to the naval school at Annapolis, which have prevented those branches of the public service from becoming the prey of partisans; but the principles of civil administration having never been the subject of instruction, the civil part of the administration has readily become the spoils of party warfare. Our youth inclined to politics have drawn their theories of public administration from the caucus, the convention, and the secret councils of spoils system politics, while our thoughtful men have neglected administrative affairs altogether, holding them to be ignoble or unimportant. In the meantime these affairs have developed a potency and a corruption, which, while almost revolutionizing the character of the government, have deprived character, attainments and true statesmanship of their just influence in political and official life.—As a people we are beginning to comprehend that the practical benefits of a government are far more dependent upon the manner in which it is administered than the last generation believed. We are taking notice, more than ever before, that some great principles underlie the sphere of administration which deserve the attention of statesmen and thinkers, because they involve the conditions of political morality and national safety. The more advanced nations of Europe have earlier apprehended these vital facts. For quite a century—from Burke to Gladstone—nearly every eminent English statesman (and much the same have been the facts in France and the other leading states of Europe,) has given careful study to administrative problems. But in this country, since the framers of the original constitutions, hardly a statesman, except Mr. Jencks of Rhode Island,

has made a study of such subjects. It is therefore a hopeful sign that many thoughtful minds now (1881) turn to them as involving the prosperity if not the life of the nation. Two of the higher institutions of learning—Columbia college, New York city, and Michigan university—have, within the present year, taken measures for opening a course of instruction in political science, in which the methods of good administration are to have a leading place. And, within the last six months, associations for creating a more enlightened public opinion on this subject have been formed by patriotic citizens in as many as fifteen different places, including the larger cities, in eight different states of the Union, beginning with New York, where the greatest abuses have existed.

DORMAN B. EATON.

CIVIL LIST. This expression, by which is meant the sum allotted for the annual expenses of the crown, is of English origin, and goes back to the reign of Charles II., when parliament assigned him a revenue of £1,200,000. The civil list exists only in constitutional states, where financial measures are submitted to the vote and control of the people's representatives. An absolute sovereign has no civil list, and needs none, since he disposes of the public revenues at will. But even absolute governments, when they permit the publication of a budget, have to include a special provision for the private expenses of the prince. The civil list is usually a fixed amount for the whole duration of the reign; and if it is voted every year, this is simply a formality. The prince is not obliged to render any account of the use he makes of his civil list.—The amount of the civil list, or the allowance for the prince, is naturally in proportion to the importance of the state. The relative proportion is, however, not always the same, because, on the one hand, more or less account is taken of the revenues of the national domains or of the crown, which are at the disposal of the sovereign, and on the other, because all countries are not equally rich.—According to calculations made for 19 countries the proportion of the amount of the civil list to the net amount of the budget varies from 0.86 to 18 per cent. For great nations, such as England, Austria, France, Prussia, the Netherlands and Belgium, the proportion does not reach 3 per cent.—The first civil list in France dates from the time of Louis XVI., and was fixed, in 1790, at 25,000,000 francs, this sum being confirmed by decree of May 26, of the following year. Under Louis XIV. the expenses of the court had reached 45,000,000 francs. Nevertheless, Versailles, together with Trianon and Marly, constructed for the pleasure of the king, had cost fully 157,000,000 francs, from 1674 to 1690. Article 10, of the constitution of Sept. 3, 1791, (part III., chap. ii., sec 1) which contains the principle of a fixed civil list, is couched in the following terms: "The nation provides for the becoming maintenance of the throne by a civil list, whose dimensions shall be determined at each change of reign for the

whole duration of such reign by the legislative body." Napoleon, as life consul, had only 500,000 francs per year to defray the *cost of representation*. When emperor, he received 25,000,000 francs, the sum paid Louis XVI., plus 3,000,000 francs for the appanage of his family. These sums do not include the summer residences and other domains of the crown. To the civil list maintained at 25,000,000 francs under the restoration, there were added 8,000,000 francs for the royal family. The law of March 2, 1832, gave Louis Philippe only 12,000,000 francs. The duke of Orleans, heir apparent, obtained an annual allowance of 1,000,000 francs, which was doubled after his marriage. Besides, the law stipulated that in case the private list was insufficient, the allowances of the sons and daughters of the king should be regulated by special laws. In this manner a portion of 1,000,000 francs was given the queen of the Belgians. The civil list of Napoleon III. reached the old figure of 25,000,000 francs, in virtue of a *senatus-consultum*, Dec. 11, 1852. As under the first empire, certain expenses of the civil list may be met by special funds.—Upon the £1,200,000 of England's first civil list, in 1660, the sovereign was obliged to maintain the army both by land and sea, so that there remained to him but £462,115, the amount in 1676. The same system was pursued, with more or less modification, under the following reigns. Since 1831 the civil list, however, has only to provide pensions and relief outside of the regular expenses of the crown. Its receipts during 1855-6 were £396,457 plus the patrimonial revenues of Lancaster and Cornwall, estimated to be £50,000. The allowance of the late Prince Albert, husband of the queen, was £30,000. "It is established by 1-2 Vict., c. 2, that during queen Victoria's reign, all the revenues of the crown shall be a part of the consolidated fund, but that a civil list shall be assigned to the queen. In virtue of this act, which received the royal sanction Dec. 23, 1837, the queen has granted to her an annual allowance of £385,000 'for the support of her majesty's household, and of the honor and dignity of the crown of the United Kingdom of Great Britain and Ireland.' By the same statute the application of this allowance is limited in a prescribed form. The lords of the treasury are directed to pay yearly £60,000 into her majesty's privy purse; to set aside £231,206 for the salaries of the royal household; £44,240 for retiring allowances and pensions to servants, and £13,200 for royal bounty, alms and special services. This leaves an unappropriated surplus of £36,300, which may be applied in aid of the general expenditure of her majesty's court. It is provided that whenever the civil list charges in any year exceed the total sum of £400,000, an account of the expenditure, with full particulars, shall be laid before parliament within 30 days. The queen has also paid to her the revenues of the duchy of Lancaster, which in the year 1879 amounted to £76,186, being £498 less than in the preceding year. The salaries, law charges, taxes, charities

and other disbursements in 1879, amounted to £30,900, and the payment made to her majesty for the year was £41,000, or £3,000 less than in the preceding year. The payment to her majesty in 1867, amounted to £29,000; in 1869-71 to £31,000; in 1872 to £40,000; in 1873 to £41,000; in 1874 to £42,000; in 1875 to £41,000; in 1876 to £43,000; in 1877 to £45,000; and in 1878 to £47,657.—The annual grant of £385,000 to her majesty is paid out of the consolidated fund, on which are charged likewise the following sums allowed to members of the royal family: £25,000 a year to the duke of Edinburgh; £25,000 to the duke of Connaught; £8,000 to Prince Leopold, £8,000 to princess Friedrich Wilhelm of Prussia; £6,000 to princess Christian of Schleswig-Holstein; £6,000 to princess Louise, marchioness of Lorne; £6,000 to the duchess of Cambridge, £3,000 to the grand-duchess of Mecklenburg-Strelitz; £5,000 to princess Teck, formerly princess Mary of Cambridge; and £12,000 to duke George of Cambridge.—The heir-apparent of the crown has, by 26 Vict., c. 1, settled upon him an annuity of £40,000. The prince of Wales has, besides, as income, the revenues of the duchy of Cornwall. Previous to the year 1840 these revenues amounted to between £11,000 and £16,000 per annum; but since that period they have greatly risen. The income of the duchy of Cornwall in the year 1879 was £96,781, the salaries and other expenses came to £28,054, and the sum of £68,727 was paid over for the use of the prince of Wales. In 1867 the sum paid over amounted to £54,927; in 1870 to £62,547; in 1871 to £62,484; in 1873 to £62,515; in 1874 to £65,901; in 1875 to £67,141; in 1876 to £70,375; and in 1877 to £96,860. The princess of Wales has settled upon her, by 26 Vict., cap. 1, the annual sum of £10,000, to be increased to £30,000 in case of widowhood. Both the parliamentary grants of the prince and princess of Wales are paid out of the consolidated fund, which bears a total yearly charge of £156,000 for annuities to members of the royal family."—In the German states, where the feudal system took deepest root, the expenses of sovereigns and their families were chiefly defrayed by the income from allodial estates. These amount to considerable sums, in certain countries, even to-day. In Austria a wealthy nobility, surrounding the sovereign, compose for him a brilliant court at small cost to himself. His civil list is 7,300,000 florins. In 1862 it was 6,127,200 florins, and before 1856, 6,420 623 florins. 1,500,000 florins of the present amount (1872) are for the allowance of the royal family, and nearly 500,000 florins for unforeseen expenses.—In Prussia, as in Bavaria, Wurtemberg and a few duchies, the amount for the civil list is raised almost entirely from the income of domainal estates. In the first of these kingdoms it is 4,495,278 thalers. Any real property that the king may acquire returns to the crown, as in France. Frederic II. himself fixed his civil list at 220,000 thalers, not

Statesman's Manual, 1881.

only for his private expenses, but also for whatever presents he might have to make. In consequence of the creation of the German empire and the annexations of 1866, the allowance of the king of Prussia has been increased by a million since 1871, but for the German emperor no provision is made on this score.—In Bavaria, a law of July 1, 1834, fixed the civil list permanently at 2,350,580 florins. But there are appanages, allowances and dowries, regulated by the family statute of Aug. 5, 1819. The civil list and appanages amount to 3,156,807 florins in the budget of 1873. In Wurtemberg the civil list is 913,059 florins per year (1872). In the kingdom of Saxony the domains of the crown constitute a trust committed by the king to the government in return for a civil list amounting, in 1862, to 864,000 thalers or 23 per cent. more than in 1831; 570,000 thalers constitute the civil list properly so called, and the surplus is composed of 30,000 thalers for the queen's private purse, 235,000 for appanages of the royal family, and 29,000 for the expense of maintaining public collections. In the budget of 1872-3 we find the figures to be only 675,000 thalers.—In the grand duchy of Saxe-Weimar the domain assigned to the crown and directly maintaining it gives the sovereign a civil list of 250,000 thalers, nearly half the budget of the state. The duchies of Saxe-Gotha and Saxe-Altenburg have respectively civil lists of 115,892 and 100,700 thalers. As in the case of the grand duchy of Saxe-Weimar, the grand duke of Oldenburg and the duke of Brunswick are supported by the domains of the crown.—In the budget of 1857 for the grand duchy of Baden, the civil list amounted to 985,419 florins, and in the following year to 1,085,226 florins, whereas we find it reduced to 838,204 florins in 1872. The grand duke of Hesse has a civil list of 777,057 florins (1872). As for the two Mecklenburgs, since there are no budgets in these states there can of course be no civil list.—The civil list of the king of Sardinia was 4,000,000 lire (francs) in 1856, not including appanages and royal residences. After Italy became a kingdom, a law of June 24, 1860, made the king's allowance 10,500,000 lire, augmented to 16,254,000 lire by the law of Aug. 10, 1862, in consequence of the incorporation of the kingdom of the Two Sicilies. It amounted to 12,250,000 lire in 1872, or to 13,850,000 lire, including appanages. The specification of the crown's domain includes, among other things, some 20 royal palaces at Milan, Monza, Cremona, Modena, Reggio, Parma, Colorado, Florence, Pisa, Arezzo, Leghorn, Siena, Lucca, Naples, Caserta, Palermo, and Messina.—Spain's civil list, budget of 1853, was 47,350,000 reals (\$2,377,917). King Amadeus', in 1872, was 6,000,000 pesetas (\$1,205,280). That of Portugal is placed at 590,000 milreis, (1854-5), and at 612,000 milreis, budget of 1871-2, but with a contingent fund of 87,400 milreis.—In Russia the annual revenue of the crown is derived from vast domains, and from patrimonial estates. Conformably to a family law of Paul I., 1797,

always in force, a tax, which weighs upon the peasants of the crown, serves to support the widows, princes and princesses of the imperial family. In the accounts for 1870, the household expenses of the emperor figures for 10,317,000 rubles, and in the budget of 1872, for 8,953,000 rubles.—In Turkey the sultan has a civil list of nearly 18,000,000 francs, besides his private treasure, composed of sums amassed, and objects of great value left by his predecessors. He alone provides for all the expenses of his court, of which the personnel has been greatly diminished. The total allowance presented in the budget of 1873 is 383,353 purses, of 112½ francs each, or more than 43,000,000 francs.—The civil list of Otto, of the house of Bavaria, first king of Greece, was fixed, conformably to article 35 of the constitution, at 1,000,000 drachmas per year, (one drachma equals \$0 16½), for a term of 10 years, and without the appanages. The civil list of the second king (George, of the house of Denmark,) was fixed, in 1864, by the national assembly, at 1,125,000 drachmas, not including: 1, £10,000 per year, which was to be paid by the Ionian isles after their reunion with Greece; 2, £12,000 per year, the sum guaranteed by France, England and Russia, to be deducted from the interest of the Greek loan due these three protective powers, all in conformity with protocol No. 3 of the conference held in London, June 5, 1863.—The two civil lists of the king of Norway and Sweden amount to the following sums, voted in 1860: 630,000 rixdalers for Sweden and 64,000 for Norway, plus the appanages of the members of the royal family (respectively 400,000 and 33,000 rixdalers), the maintenance of the palaces (203,400 and 9,000 rixdalers), and the royal stables (45,000 rixdalers) in Sweden; total, 694,000 rixdalers of the civil list proper, 433,000 in appanages and 257,400 for palaces and horses. The grand total, 1,384,400 rixdalers, shows an increase of 83,000 rixdalers over that of 1857. The figures in 1872 were 1,417,000 dalers riksmyn, (\$0 26 each).—In Denmark the civil list in 1872 was 713,524 rixdalers (\$0.52 each). Besides, the king has at his disposal, for his private use, all the palaces and royal dwellings belonging to the state. The appanage of the princes and princesses of the royal family is regulated by law, and paid from the state treasure.—The civil list of the reigning king of the Netherlands, fixed by the law of Aug 10, 1849, is 600,000 florins (\$0.39 each), plus 50,000 florins for the maintenance of the summer and winter palaces. The allowance of the hereditary prince amounts to 100,000 florins and to 200,000 florins when he marries. The queen-dowager receives 150,000 florins per year.—The civil list of the king of Belgium and the allowances of the princes, his sons, have already been indicated elsewhere (See BELGIUM.) At the marriage of the princess, daughter of the king, to a prince of the imperial family of Austria, the legislature voted her a wedding portion of 258,000 francs.—In Brazil the emperor's allowance (law of Aug. 28, 1840,) is 800 *contos de reis* (2,400,000

frances); with the allowances of the imperial family, the civil list reaches a grand total of 1,083 *contos de reis* (3,249,000 francs).

XAVIER HEUSCHLING.

CIVIL RIGHTS BILL, The (IN U. S. HISTORY), was introduced in the senate Jan. 29, 1866, and passed Feb. 2, by a vote of 33 to 12. In the house it was passed March 13, by a vote of 111 to 38. An abstract of its several sections is as follows: 1. All persons born in the United States and not subject to any foreign power, excluding Indians not taxed, were hereby declared to be citizens of the United States, having the same right as white citizens in every state and territory to sue and be sued, make and enforce contracts, take and convey property, and enjoy all civil rights whatever. 2. Any person who, under color of any state law, deprived any such citizen of any civil rights secured by this act was made guilty of a misdemeanor. 3. Cognizance of offenses against the act was entirely taken away from state courts and given to federal courts. 4. Officers of the United States courts or of the freedmen's bureau, and special executive agents, were charged with the execution of the act. 5. If such officers refused to execute the act, they were made subject to fine. 6. Resistance to the officers subjected the offender to fine and imprisonment. 7. This section related to fees. 8. The president was empowered to send officers to any district where offenses against the act were likely to be committed. 9. The president was authorized to use the services of special agents, of the army and navy, or of the militia, to enforce the act. 10. An appeal was permitted to the supreme court.—There is a curious likeness, *mutatis mutandis*, between some of the sections of the bill and the fugitive slave law of 1850.—The bill was vetoed March 27, and again passed, over the veto, in the senate April 6, and in the house April 9. The constitutional objection to the bill was that the power to pass it could be found nowhere in the constitution except in the 13th amendment (prohibiting slavery), and that this in no way involved the assumption by congress of the duty of protecting the civil rights of citizens, which had always belonged to the states; and, further, that, while the decision in the Dred Scott case stood unimpeached, negroes might be freed but could not become citizens. Various amendments were proposed in February and March, 1866, for the purpose of overturning the Dred Scott decision. April 30, after the conflict between congress and the president had become flagrant, Thaddeus Stevens, of Pennsylvania, in the house, reported from a joint committee that which was afterward modified into the 14th amendment. Its first section contained the gist of the resolutions above referred to. It was passed in the senate June 8, by a vote of 33 to 11, and in the house June 13, by a vote of 138 to 36. (See CONSTITUTION, IV.; RECONSTRUCTION.)—Senator Charles Sumner, of Massachusetts, was

the special champion of an amendment to the preceding act which should prevent common carriers, inn-keepers, theatre-managers, and officers or teachers of schools, from distinguishing blacks from whites; should prevent the exclusion of negroes from juries; and should give federal courts exclusive cognizance of offenses against it. A bill to this effect was offered by him as an amendment to the amnesty act in 1872 (see AMNESTY), but failed by a single vote, 29 to 30. The same bill was introduced in the house Dec. 9, 1872, and referred. April 30, 1874, shortly after Mr. Sumner's death, it passed the senate, but failed in the house. In February, 1875, the bill finally passed both houses, and became a law March 1. (See RECONSTRUCTION, FORCE BILL.)—See 14 *Stat. at Large*, 27; 16 *Wall.*, 36; 92 *U. S.*, 542; 1 *Hughes*, 536; 92 *U. S.*, 90; 100 *U. S.*, 310, 345.

ALEXANDER JOHNSTON.

CIVIL SERVICE REFORM. I. In its general and most comprehensive sense, civil service reform means the removal of abuses in the public service—federal, state and municipal—and the enforcement therein of such just and sound principles and methods as will most contribute to good administration.—This reform, therefore, has a double aspect, and two somewhat separate spheres of duty; the one being destructive and prohibitory, relating to the best means of eradicating existing evils and of preventing their repetition by the exercise of public authority; the other, being constructive and educational, relating to the development of such a public opinion and adoption of such methods for doing the work of public administration as will be effective for purity, efficiency and economy. The principal abuses and evils referred to appearing in the articles on the SPOILS SYSTEM, CONFIRMATION BY THE SENATE, POLITICAL ASSESSMENTS, REMOVALS, PATRONAGE, PROMOTIONS, and TENURE OF OFFICE, it is unnecessary to repeat them here. This article will therefore deal mainly with remedies.—A complete civil service reform would have to deal directly with the abuses connected with our elections, our legislation and our elective and partisan judiciary. Since, however, civil service reform has thus far been treated as specially referring to matters which, with some few exceptions, pertain to the executive department of government, this article will explain it in that sense. In general the offices referred to will be those which are filled by appointment; of which those in the federal service number about 100,000, and perhaps there are a much greater number under the state and city governments. But there are no adequate statistics, the census not having attempted the enumeration of officials.—It should, however, be borne in mind that the same methods and principles, applicable to the selection and promotion of appointed officers in the executive department, are appropriate and should be applied to the selection and promotion of the appointed officers in the houses of congress, in the

state legislatures, in the courts and in the municipal departments; though they can not, from their nature, be applied to the selections of officers by the ballot or any form of election. Still, it should be noticed that a thorough civil service reform, by leaving few offices to be filled by favor or to be won as spoils, would effectively suppress bribery at elections through the promise of places and promotions. It would also leave but little opportunity for members of congress or of legislatures to barter places for votes, or to coerce executive appointments in their own interest. It would, in other words, determine the bestowal of nearly all the official places which have been at once the capital of the partisan chieftain and the fuel of his machine.—Though penal and prohibitory laws are in their nature but imperfect and inadequate agencies of reform, yet with reasonable support from public opinion, they may be made highly beneficial. Intrinsically, there is no reason why a wise law, in aid of good administration, shall not be as effective as any of the numerous wise laws in aid of good morals; and such has been proved to be the fact in Great Britain, where a reform of the civil service, quite as difficult as that needed in this country, has been greatly strengthened by laws upon which several of the following suggestions of those we need are based.—1. The exaction of political assessments from public officials and employes, enforced as they are by fears of losing their places, is a flagrant act of injustice, a degradation of those who submit to it, and an insult and disgrace to the government itself.—If practiced by those in office, it is a corrupting and oppressive exercise of usurped authority, and if by those representing the power of great parties, it is extortion through conspiracy and intimidation; and, in either event, it should be prohibited by law. A prudent bill for that purpose, introduced by Mr. Pendleton, is now pending in the national senate.—2. The use of official authority or influence for controlling elections or coercing political action in any form is both a breach of a public trust and an invasion of private right and public safety, which should be made penal.—3. The willful removal of officials known to be worthy and the willful appointment of those known to be unworthy, for mere personal or partisan reasons—the former of which Madison held would justly subject an officer to impeachment—are despotic and demoralizing abuses of official power, as well as acts of gross injustice to the persons removed or to the people; which, by extending the provisions of section 1705 of the revised statutes of the United States—a law forbidding certain removals without good cause—should be made a criminal offense. In morals, there can be no more right to use the public authority of appointment and removal for selfish and partisan ends than there is to use the public money for the same purpose.—4. Carefully guarded legislation, in the same spirit and sanctioned by the same reasons, might, perhaps, be extended to combinations on the part

of members of congress, in the use of their authority, to coerce nominations or removals, and to the prostitution of the trusts of their offices on the part of senators, in the matter of confirmations in obedience to what is called the "courtesy of the senate." (See CONFIRMATION BY THE SENATE.)—5. The bribery laws, which now only make penal the use or promise of money, or of something of pecuniary value, to induce the violation of official duty, should be so extended as to clearly cover the much more frequent and pernicious abuse of giving, or promising to give, appointments in the public service for votes or influence.¹—6. The laws of 1820 and later statutes, which reduced the constitutional tenure (which was during efficiency and good behavior) of collectors, postmasters, surveyors and various other officers, to a term of four years—and thereby added to the spoils to be won in every presidential election and increased the evils connected with confirmations—should be repealed, and the constitutional tenure be thereby restored. 7. The military school at West Point and the naval school at Annapolis were established to prepare for the public service those who should bring into it mental and physical qualifications of the highest order. Every consideration of duty, justice and public interest requires that selections for these schools should be made on the basis of free public competitions of merit, which are most certain to disclose those qualifications. But members of congress have made nearly all selections for those schools a part of their own official patronage. That abuse should be prohibited, and such competitions be established by law for the selection of military and naval cadets as they are now established by regulations for selecting cadet engineers for the navy.—II. In considering the educational and constructive work of reform, there are some fundamental facts and principles, a clear apprehension of which is important both for the removal of misconceptions and for opening the way to those sound practical methods without which no adequate results are possible. Some of these principles are so simple and elementary that were they not habitually violated in our politics, their statement here could hardly be excused. 1. Public office is a public trust, created only for the common benefit; and there is no more right to exercise the power of appointment, promotion, discipline, or removal, no more right to give salaries or to require or allow the use of the time of officials needed for public work, for any private or party purposes, than there is to take and apply the money in the public treasury for such purposes. And the facts that this rule of duty is very generally disregarded with impunity, and that the great body of the people take little notice of the abuse—while the politicians habitually practice it under the claim of right—are ample evidence of the need of a better political educa-

¹ The instructive British statutes bearing on several of these points may be found collected in Mr. Eaton's work on Civil Service in Great Britain.

tion as one of the conditions of a thorough civil service reform.—2. To appoint by favor a public officer known to be unworthy, to bestow an official place on the condition of work for a party or a chieftain, are higher offenses than to deposit public money in a bank known to be unsafe, or, by deliberate neglect, to allow public property to be destroyed; for, in the first cases, the pecuniary loss may be greater, while the bad example is at least equally corrupting, and it is far more seductive and permanent in its bad effects.—3. In the exercise of the power of appointment, removal, promotion and discipline in the public service, there can be neither honest patronage nor justifiable discretion beyond this: that in every instance, it is the duty of the official to do that which, in his judgment, will most promote the general welfare, irrespective of relatives, friends or parties; and the public opinion which fails to condemn, and the official conscience which fails to feel the guilt of whatever conflicts with this rule, are a part of the causes of our political corruption and of the difficulties in the way of its removal.—4. The acceptance of an official trust, or of a salary for serving the public, imposes upon the official moral and legal obligation as absolute to remain at his post of duty and to devote his time and skill to the public matters in his charge, as can rest upon an officer of a bank, or upon a person employed in any private business. There is, therefore, no more right in the one than in the other to desert his proper place of duty or the cares that need his attention, or to give his time and thoughts to partisan politics; and the marked difference in the conduct which we tolerate in public and private servants—allowing, for example, collectors, postmasters and other subordinates to desert their posts to manage politics—but illustrates a common responsibility for our abuses and the need of a more discriminating and exacting public opinion.—5. It is not true, as president Jackson declared in a message, that every citizen has an equal right to office, but, on the contrary, the just claim of every citizen for a place in the public service is measured by the amount of character and capacity, he may possess for the discharge of official functions. There can be no just discrimination between applicants on any other basis. He, therefore, who is best qualified—who can and will serve the people most usefully—has the highest claim; and it is the duty of those having the authority, to appoint or elect him rather than any other applicant.—6. Experience in official duties increases the capacity to perform them well; and, as a general rule, increases the probability that they will be best performed by the officer so long as his mental and physical abilities remain unimpaired. The right and interest of the people to have the public work well done are paramount to the claim of any citizen to an official place or of any party to have its favorites in office; and, therefore, any theory of short terms or rotation in office, which would turn out experienced and efficient public

servants in order to make places for fresh claimants, is disastrous to the public interests.—7. A stable tenure also strongly tends to bring good men into office, as well as to make them efficient while there; but the public interest requires that the period of holding office should depend upon both fidelity and efficiency; and therefore precludes a life tenure, and requires a right and duty of removal for cause. And, in the case of legislative officers, who represent local interests, and opinions liable to frequent changes, and of presidents, governors and some other high officials, who stand for the principles and policies on the basis of which they were elected, there is a manifest propriety in providing for short terms of office. (See *TENURE OF OFFICE, REMOVALS*.)—8. The existence of such claims and duties, in connection with filling official places, plainly imposes upon the government the obligation of providing the best means practicable for ascertaining fit qualifications for entering the public service and for promotion in all its grades. The man among the applicants having the highest claim to office can only be ascertained by his proper examination in comparison with the others. To refuse that examination is to do injustice to the most meritorious. So long as there were no departments or great offices where the subordinates were too numerous to allow selections to be made by the officers at the head of them upon adequate personal examination as to fitness, no special instrumentality for that purpose was needed. They were so selected in the early periods of the government; but the inability to do so, in later years, by reason of the vastly increased numbers of officials—so numerous in many offices as not to be known by name or sight by those at their head, there being more than 3,000 in the treasury department alone, more than 1,300 in the New York custom house, and more than 1,100 in the New York city postoffice—has greatly facilitated the supremacy of partisan and corrupt interests in their choice. Thus in justice and in sheer inability to avoid them, we find the need and the foundation of those examinations for admissions and promotions in the public service which every other leading nation has made a powerful agency, both for giving efficiency and purity to its public service and for stimulating the education of its people. But there are other elements involved in these examinations which we must consider.—9. Political parties are both useful and inevitable under liberal institutions; and every theory of reforming the civil service is faulty and likely to fail to the extent that it interferes with their true sphere and activity. But parties are not ends in themselves, and can claim no rights or interests paramount to those of the people at large. To arouse, embody and express public opinion and sustain political principles and policies until they are made effective in laws, is the very object and end of a party. Hence, no party should be allowed to control the selection

of any officials except those as to whom it can be shown that their sharing the views of that party will cause them to be better qualified to discharge their official functions and not less inclined to do so. Difficult, and doubtless impracticable as it may be, in the present state of public opinion, to completely enforce this rule, it is yet sound and useful as a standard, and its fit practical application is not difficult to point out.—Members of legislative bodies are selected to represent the interest and opinions of their constituents, and for that reason their political principles are an essential part of their official qualifications. Governors and presidents being a part of the law-making power come within the same reasons. It is also an important part of their duties to carry into execution the policy and principles which the people have approved at their election, and in which, to secure their efficient execution, those high officers need to have faith. From the very nature of government these officers must be held under obligations to be faithful to such policy and principles, and hence to their party which upholds them, in so far at least as is compatible with the constitution and national safety. The spirit of this reasoning would include the members of the cabinet, such of the foreign ministers as may be put under instructions to carry out part of that policy abroad, and, perhaps, a few other high officials should also be included. In that small measure, if any, in which party politics may be involved in municipal affairs, the same reasoning would also include the mayors of cities.—These higher officials have the authority and duty of instructing and securing obedience from all the grades of public servants below them, through whom such policy and principles are carried into effect and the public work is done. The subordinates must obey instructions, and should do the public work in the same way, whatever party may be in power. For these reasons their opinions are not material and are no qualifications for office. It is a mere prostitution of the authority of government and a plain usurpation and oppression for a party, or its leader, to require that every postmaster, collector, bookkeeper, lighthouse tender, washerwoman and errand boy, in the service of the government, shall accept the opinions of the party in power or leave his place. There are very few among the vast numbers of subordinate officials—federal, state and municipal—who would not serve the people better if they recognized no party allegiance whatever, and, as a rule, they are bad public servants in the same degree that they are active partisans. For these reasons, no tests of political opinion are justifiable, in the selection, promotion or removal of these subordinates, but tests of personal fitness alone should be applied, irrespective of partisan politics. Such a rule would leave the true and honest sphere of parties undisturbed. They would still control the high affairs of the nation and guide all its great activities; their majorities enacting all laws, electing

presidents and all governors, carrying their policy and principles into execution in every official place where they should be felt; commanding obedience from every servant of the government through the whole range of official life. All the strength and all the honor which can be the fruit of statesmen brought into high places, of wise laws and sound principles everywhere enforced of pure and vigorous administration everywhere exhibited before the eyes of the people—all these any party would, under such a merit system of office, be free to gain. Nothing would be lost to a party but partisan spoils—opportunities of removals without cause and of appointments without merit—money pillaged from the servants of the people, and voters bribed by the promise of places. If in some quarters there would be fewer inducements to partisan work and a less feverish political activity, it would not be on the part of those who act from a sense of duty or seek office by worthy means, but among those whose exertions, as things now are, are measured by their hopes of corrupt gain and their fear of losing places held at the mercy of others. The portion of our accustomed partisan work which might be left undone would be just that which is most useless, oppressive and corrupt; while true party vitality and efficiency would be strengthened rather than enfeebled, as the example of Great Britain has abundantly shown.—10. There is, therefore, nothing in the just relations of parties which should prevent the test of personal fitness for the public service being made by examinations wherever examinations would be intrinsically appropriate. Now, examinations are by far the most important of all the special instrumentalities by which civil service reform may be advanced and the spoils system overthrown. They are, we repeat, manifestly inappropriate either in the case of elected officers or for the selection of any others whose political opinions are as we have seen material. And the need of examinations is manifestly much the greatest in those offices where the appointed officials are the most numerous and partisan pressure is the most formidable. They are also highly just and useful in most cases of promotions.—After all proper limitations have been made, a vast body of the civil servants of the government, federal, state and municipal—those holding nearly all those official places which have been treated as spoils of partisan warfare—may be selected on the basis of qualifications which have been tested by thorough and just examinations. We have space for but the merest outline of their history; and it is quite impossible to give even a summary of the evidence which has demonstrated their great utility.—It has been more than 40 years since they were found indispensable in Great Britain and in all the most enlightened European states. The abuses in the administration of Great Britain had, for the most part, been of the same nature as our own; but there, as in the other European states, they had been in various ways far more aggravated than with us. The kind and conditions of

the first examinations, then provided for, were in several particulars defective and inadequate. Though from the first, as in all subsequent examinations, the object had been to secure such answers and information as would show not mere literary attainments, but whether, in capacity, information and character, the applicant was competent for the official place he sought, it was never the aim of those examinations to test personal accomplishments or knowledge not important in the public service. The original defects were of quite another sort. The first examinations were made independently, in each office, and but one person was examined at a time. This limited kind of examinations, which afforded no opportunity of comparing the merits of one applicant with another, were known as *pass-examinations*. The examiners had little direct support from high authority and were left separately exposed to the joint pressure of all those seeking office, backed by partisan members of parliament, patronage mongers, great politicians and great lords, who were hostile to every person and every method which stood in the way of the favorites and henchmen whom these champions of the British spoils system pushed for the vacant places. And what was yet more important, there were, at first, no provisions connected with the examinations, which prevented these same spoilsmen from selecting all the persons who were allowed to be examined, and, consequently, from excluding from all chances of entering the public service every one who was not among their favorites and henchmen. These causes were not only sufficient to keep the grade examinations far below the standard essential to thorough competency for the public work, but they allowed a monopoly of appointments. The old monopolists, therefore, still had it in their power to decide upon every person who should get an appointment, the examinations only serving to exclude a portion of the incompetents who had formerly freely entered. Yet even such examinations, in a few years, so greatly improved the quality of those who got places in Great Britain, that the examinations not only gained strength there, but they attracted attention in this country, and were made the basis of our federal statutes of 1853 and 1855, (now Rev. Stat. U. S., § 164), under which these defective examinations have since been required and conducted in the principal departments at Washington. Owing, however, to the rapid development of partisan supremacy and machine politics in this country, such examinations have been even more inadequate here than in Great Britain. Still they have excluded many of the most unworthy who were pushed upon the examiners, and have prevented yet more, who were office-seeking incompetents, from being presented at all. But they have allowed that despotic monopoly under which no man or woman, however worthy, could secure an examination without the consent and recommendation of some great politician or member of congress or other high

official. And, generally, the potent monopolist granting the favor has been able to push his man past the members of the local board of examiners; the loss of whose place might be the consequence of rejecting a strongly backed dunce or henchman. For these reasons, partisan politicians have made very little objection to mere *pass-examinations* thus conducted.—In Great Britain the *pass-examinations* speedily tended to make the old patronage and monopoly more conspicuous and consequently more odious. The high executive officers began to see and the people to feel that a great injustice was thus being done both to the public and to the most worthy applicants for office. They plainly saw that if the gates of the examinations were but freely opened and the spoils system gate tenders were ejected, the government could have its choice from among the great numbers who sought examinations for its service, and that the monopoly would at the same time be broken up. These causes soon led to the introduction of *open competition*, as it is called—that is, to examinations for the public service *open and free to every applicant of proper age and apparent capacity*, as the regulation should provide. To this rule of freedom and justice, making the consent of no official or party a condition of being recommended, there was added the provision that the appointments should be made from those showing the highest qualifications in the competition.—These open competitive examinations began, in a very limited way, about 1850, and from the first their great superiority was manifest. Many persons were examined at the same time; and as the examinations were public, and the first and highest prizes would be gained by those showing the highest qualifications in the competition, and all who fell below a certain standard were to be excluded, the rivalry was naturally intense.—In 1854-5 the British government made a thorough investigation and report concerning the best means of improving its civil service, which resulted in the appointment of a permanent *civil service commission* in 1855, with a duty of taking direct charge, under the executive, of the whole subject of examinations for admission to the public service and promotion therein; to which other analogous duties have been since added. Under that commission (which is still in vigorous operation, and one of the most vigorous and respected agencies of British administration), open competition was extended, uniformity and regularity were given to the examinations, and an authority was brought to their support which politicians could not overawe. Ample testimonials of good character, the truth of which could be investigated, were made the condition of being examined. But it was soon found that the publicity of the examinations, and the fact that *every man, in the scale of the merit marks gained in them, was interested in exposing any defects in the character of any man above him*, rarely failed to be sufficient to deter all persons of bad character from entering the competitive contest.—

It was made a rule that no person should receive a formal appointment until his practical capacity and disposition had been tested by a *probationary* trial of six months, at the end of which, if not satisfactory, he was dropped.—It hardly need be said that the new system encountered the fierce opposition of all partisans and patronage mongers, and especially that of members of parliament, whose long enjoyed patronage it threatened to take away. Wherever the new system was applied it was fatal to the old monopoly. Any young man or woman could go and be examined without the favor or consent, or even the knowledge, of any officer, politician, nobleman or bishop.—The reform was also powerfully opposed for reasons which do not exist in this country. For it enabled the sons and daughters of the common people to work their way to places in those parts of the public service which had for centuries past been monopolized by the sons and dependents of the aristocracy. It said a man's right to an office depended on merit and not on birth or opinions. Open competition is in spirit and principle thoroughly democratic and republican; because it rests on character and equal rights; and to allow it to bring the promising sons of the middle and humbler classes into the subordinate places, from which, through competition for promotion, they might rise to the higher, would soon develop a dangerous element in an old aristocratic monarchy. These fears have been shown to be well founded; for the great body of those whom competition has given places in British service, have been the worthier and more intelligent sons of the middle and lower classes, whose education had been obtained in the public schools and academies.—But even this kind of resistance, united with that of the partisans and the patronage mongers, was overcome in less than 20 years. Superior men entered the public service. The public mind appreciated the justice and utility of the new merit system of office holding, and rejoiced. It gladly saw the old spoils system undermined, and aristocratic and partisan monopoly broken up. Members of parliament lost their patronage, and became ashamed to battle against open competition as they had formerly done. Lords and bishops could no longer get places for their sons except through victory in open competition. Popular education was greatly stimulated. A demand for free, open competition throughout the public service, and for popular education sustained by general taxation, grew vigorously together; and in the same year—1870—both these results were achieved in Great Britain. In no decade in our history has popular education so rapidly advanced as in Great Britain since 1870. Since that date there have been no partisan politics and no monopoly of the privilege of examination in her public service, but open competition for appointments, and in all proper cases competitive examinations for promotion also. There is now hardly more politics in the customs, internal revenue or consular services of the Brit-

ish empire, than in the regular army or in the colleges. The new system has also been extended to her naval and military schools, to the militia, and is now being applied to banks and great business corporations.—The great postoffice has long applied the same competitive methods which so greatly aided Mr. James in reforming the postal service at New York city. The expense of revenue collection is far less than with us. The consular service is greatly superior to that of this country. Subordinate places in the public service no longer depend upon the result of an election. Removals are made only for cause; except that the fate of the cabinet and that of a few other high officers—hardly 50 in all—are involved in the elections. Beyond the selection of his private clerk, not even the head of a department, or a member of the cabinet, can make an appointment, except from the most worthy, among those who have openly competed before the civil service commission. As a consequence the public service has taken a far higher place in public estimation, and the abuses which had prevailed are almost unknown.—It is worthy of special notice that these results have been attained without injuring the vigor or utility of political parties, or lessening the interest which all good citizens take in the party to which they belong. On the contrary, since 1870, party contests have been as vigorous and absorbing in Great Britain, as in any period in her history, and more than ever before they have turned upon great principles and been decided by appeals to the reason and to the conscience of the people. In that time the elective franchise has been repeatedly extended, and more voters have gone to the polls than ever before. Yet hardly more than 50 official places, except seats in parliament, but only the triumph of great party principles, depended on the result of the election.—The *merit system* of appointments and promotions thus established in the British civil service, and a more vivid sense of the peril of our spoils system, and of the inadequacy of mere pass-examinations to remove them, led to an enactment in March, 1871, which authorized the president to cause the proper means to be taken for ascertaining the fitness of candidates in respect of age, health, character, knowledge and ability for entering the public service; to make rules for its regulation; and in effect, to create a civil service commission to take charge of the examination and aid the work of reform under the president's discretion.—Under that law president Grant appointed such a commission, which still exists. Through that commission he instituted open, competitive examinations in the departments at Washington at the beginning of 1872; although there had been a competitive examination conducted in the city of New York (by Silas W. Burt, Esq., the present naval officer at that place), in March, 1871, the earliest example of the kind in this country.—Such examinations were, soon after their introduction at Washington, but in a most faulty and imperfect

manner, conducted at the custom house in New York city. It hardly need be said that they were fiercely opposed by the machine politicians of that state; yet collector Arthur officially reported their useful effects. This new method of getting into the public service, and of promotion in it, which here, as in Great Britain, allowed any man or woman of proper age and apparent capacity to be examined, without the consent of a politician or a patronage monger, had no sooner begun to be efficient at Washington, by taking away patronage and spoils and securing appointments for the most meritorious, than all the old monopolists, every member of congress who had promised places for votes, party leaders whose control of patronage is their strength and their hope—all the partisan mercenaries whose chances of selling themselves were in peril—united to embarrass, misrepresent and overthrow it. The experience of England was repeated in the nature of that opposition; except that president Grant, having little of the spirit of a reformer, did not, like lord Palmerston and Mr. Gladstone, stand firmly by the new system; but after considerable resistance, yielded to the opposition of members of congress and the great politicians. He had prohibited political assessments, but failed to take any fit measure for enforcing his regulation. It is but justice to president Grant, however, to say that he repeatedly requested appropriations for carrying on the work under the commission, which the partisan and patronage-mongering members of congress refused to make, though they had neither courage to conduct a debate or to record the ayes and nays upon the question. He informed congress that the new methods had "given persons of superior character and capacity to the service," * * and "that they had developed more energy in the discharge of duty"; and he finally declared in his last message on the subject that "it would be a *source of mortification* to himself and those associated with him in enforcing the civil service rules," if congress should refuse to make the further appropriation which he asked in aid of the work. His request (opposed by Mr. Conkling) was in vain. Congress refused all appropriation after 1874, and president Grant suspended the rules early in 1875 (thus apparently suppressing the reform). This action of congress is in humiliating contrast with that of the British parliament, under analogous circumstances, ten years earlier, which voted the appropriation requested by the British executive and has continued them without a dissenting vote within the last eight or nine years. It, however, soon became apparent that the demand for reform had all the time been gaining strength among a thoughtful class in both the great parties. The example of competitive examinations encouraged the responsible executive officers, in self-defense, to make the old pass or limited examinations—to which the government had reverted in 1875—somewhat more efficient. Public opinion speedily forced the civil service

question into the foreground of politics. The national conventions of both parties, in 1875, made strong pledges in favor of reform, however reluctantly or insincerely that portion of their platforms was adopted. — During the term of president Hayes the cause of reform made considerable progress, though it was very unequally sustained. In various particulars, for which he deserves the gratitude of the country, he resolutely and persistently exercised his authority for the removal of abuses and for the enforcement of better methods of administration. His messages on the subject of reform are of permanent value. Little was done, practically, under him for suppressing political assessments, though they were strongly condemned in his message. Contrary to the first conditions of reform and to the spirit of the act of 1871, already cited, each head of a department was, apparently, allowed to have his own way as to examinations, promotions and removals; and the competitive methods were applied only in the office of the secretary of the interior, where they contributed to the great success with which Mr. Schurz administered his department.—A well intended order of president Hayes for preventing interference with elections and party politics on the part of federal officials, through being too sweeping and radical and not being vigorously supported, in great measure failed of useful results. In a subsequent message he laid down the true rule on the subject. President Hayes gave open and steady support to Mr. James and to the reforms which were carried forward in the postoffice at New York city, where the method of open competition was pretty thoroughly tested and with the most salutary results. — In consequence, that postoffice has ceased to be a political office. At a less cost, within the past few years, a third more business has been done than under the last years of the partisan spoils system. Mail deliveries have been made a third more frequent, scandals have ceased, and the office gives a public satisfaction never known in former years. Its administration has become as good as that of the best British post-office and superior to every other in this country. Mr. James has won a national reputation which has made him postmaster general under president Garfield. But the greatest administrative work for which the country is indebted to president Hayes has been the reform instituted in the custom house at New York city. The principles of this were at the same time extended to the naval office and that of the surveyor and appraiser at that place. The obstructions interposed by Mr. Conkling, the republican senator from New York, through appealing to the courtesy of the senate, delayed the appointment of a new collector, and consequently the enforcement of open competition, until the beginning of 1879, when it was established, and continued to the end of Mr. Hayes' administration. Our space does not permit any detailed statement of the results, but the improvement of the administration was very

great. Abuses and scandals rapidly subsided. The revenue was collected at less expense and with more satisfaction to the public than ever before. Custom house officials gave more attention to their business and less to partisan politics. Superior men were brought into the customs service, and promotions in it, as well as admissions to it, were made on the basis of a competition of merit. The questions asked on the examinations covered the practical qualifications for the public work, and caused nearly all the appointments to fall to those who had the common education of the intelligent citizen united with aptitude for business. No removals were made but for cause; being about 50 in all in two years; yet the party whose president resolutely sustained the reform, carried New York in 1880, though it had been lost in 1876, after the relapse of the spoils system under president Grant. The national conventions of both parties, in 1880, again declared the duty of reforming the civil service. But up to this date (July, 1881) the administration of president Garfield has done no act and made no declaration which makes its policy on the subject of civil service reform very clear. The interior department has not followed the example of Mr. Schurz. The collector, the naval officer and the new postmaster at New York have gone steadily forward enforcing the *merit system*, with open competition at their respective offices. It is not possible yet to say whether the appointment of Mr. Robertson, the new collector at that city, is to be favorable or unfavorable to the cause of reform, or what record president Garfield's administration is likely to make on the subject. But, in the meantime, the resignation of the two senators of New York, because their claim to control appointments from that state was not admitted, and the attempt, by a disappointed office seeker, to take the life of the president, have made a profound and painful impression upon the public mind which can hardly fail to lead to important results in favor of administrative reform in the not remote future; there being, at this time, more attention given to the subject of reform than ever before in this country.—In estimating the utility of competitive examinations in the service, these two considerations should be kept in mind: first, that they substitute a public competition of capacity, attainments and character for an otherwise secret and inevitable competition of partisan and official influence, of solicitation, of threats, and of selfish interests. And second, that while on the only true foundation of equal rights in the matter of office, they reduce the whole matter of getting into the subordinate public service to a procedure of great simplicity and justice in which capacity and character are decisive. Any one wishing to enter the public service can have his qualifications tested by a fair public method. From among a few of those shown to be the most worthy, the selections are to be made under fixed rules. The official having the appointing power can say to every importu-

nate applicant and to his backers: Go into the examination; if you show yourself among the most worthy, you may get an appointment in due time. If you are not among them, you deserve no place. That is all I can do for you. Office seeking is thus defeated by being made futile. The merits of the applicant, and not his begging, his threats or the pressure of his backers, is what must give him a place. Hence the new system has been fitly called the *merit system*, as contrasted with the spoils system.—If the applicant is defeated, the causes clearly appear in the records of his examination, which are preserved and may be any time referred to. Any man who may complain of partiality or corruption can have the truth of the charge at any time investigated.—The enforcement of the *merit system* presents the government before the people as seeking and rewarding the most worthy; as rejecting intrigue and refusing to be overborne by threats or persuasion; as encouraging education and inviting young men and women to seek places in its service on the strength of their own qualifications and not through subserviency to great politicians.—We have no space for citing any part of the overwhelming evidence at hand—both English and American—which proves that such a system not only gives the most reliable and efficient public servants, but enables the public administration to be carried on with far greater purity and economy than under the old system. The six months' probation before actual appointment excludes the applicants—if any shall have passed the competition successfully—who are found wanting in practical ability for work. Men, who thus win their places by their own merits, are not servile partisans, nor have they incurred in securing them any obligation to chieftains, members of congress or partisan bodies, for the discharge of which they need to pledge a part of their salaries or to prostitute the authority of their offices, as is more or less the case with nearly every official who gets his position through favor, solicitation and subserviency. An experience of about 25 years in British India, where the highest executive capacity is essential, and of more than half that period in the British departments at home, has proved that open competitive examinations with probation, as explained, secures the *best practical talent* and fills the lower places with men worthy and sure to rise, by promotion, to the higher, with immense gain both to the efficiency and economy of the administration. DORMAN B. EATON.

CIVILIZATION. Civilization is the aggregate of the material and moral progress made and still making by man. The source of this progress is to be found in the faculty which has been given to man of knowing himself and the world in which he lives, and of accumulating and transmitting information, as well as of combining the different branches of his knowledge. Thus material progress is the result of the more and more extended knowledge which observation gives us of

the natural resources of our globe, and of the means of developing them; moral progress likewise is developed by means of the more and more exact and complete ideas which observation suggests, of our nature, our destiny, and the society in which we live.—Man's wants are the powerful stimulants which urge him to increase his observation and to accumulate knowledge. Nature furnishes him the material necessary to satisfy these wants, but this material he must collect and fashion for his use. None of his appetites can be satisfied without exertion and labor. Now, this exertion, this labor, by the very nature of his organization, implies suffering. It is his interest, consequently, to reduce his labor as much as possible, while increasing his gratifications; it is his interest to obtain a maximum of satisfaction with a minimum of labor. How can he reach this end? By one means, and by one only—by applying more and more perfect processes to the production of the things he needs. And how can he discover these processes? Only by observation and experience.—Urged by hunger, primitive man attacked the animals that were least able to defend themselves, and devoured them. He discovered that the flesh of some of these animals was fit to appease his hunger, and agreeable to the taste; but it was hard for him to procure a sufficient quantity of it regularly, for most of these animals were swifter of foot than he was. Spurred on by want, he endeavored to overcome this difficulty, and succeeded. A savage more intelligent than the rest, noticing the property in certain kinds of wood which allowed them to be bent without breaking, and to straiten out again with a violent recoil after being bent, thought of utilizing this force to hurl projectiles. The bow was invented. It at once became easier for man to subsist. He could now turn his thoughts to observation in another field and combine his observations so as to increase his enjoyments and diminish his pains. At the same time his moral wants, awakened by a multitude of mysterious phenomena, urged him onward in this direction, as well as his physical wants. Must not the terrible phenomenon of death, for instance, by filling his soul with curiosity, dread, and sometimes with grief, have incited him to penetrate the secret of his destiny? Thus, incessantly urged onward by the increasing and irresistible wants of his nature, man has never ceased, since the beginning of the world, to pile observation on observation, one kind of knowledge on another, and thus to improve his material and moral condition.—Civilization, therefore, seems to us a natural fact; it is the result of man's very organization, of his intelligence and wants. Its source is in *observation* stimulated by *interest*, and it has no limit but that of the knowledge which is given to man to accumulate and combine under the pressure of his wants. Now, this limit we can not see; whence it follows that it has been possible to say with truth that progress is indefinite.—Civilization, however, although inherent in human nature, has not equally developed among all

nations. Certain peoples have remained, even to our day, plunged in the darkness of primitive barbarism, while at their very side we find civilization arrayed in all its power. To what is this inequality of development to be attributed? We must attribute it to the inequality of the physical and moral faculties of the different races of men; we must attribute it also to the surroundings in the midst of which each race is developed. We must attribute it, to use the language of economists, to the amount of natural goods, both external and internal, which the Creator has bestowed upon each people. Now, these raw materials of civilization are very unequally distributed: between the stupid Botocudo and the Anglo-Saxon, who has become his neighbor, the distance, from both a physical and a moral point of view, is immense, and between these two varieties of the human species, who seem to form the extreme links in the chain of the varieties, of man, we find a whole multitude of races all unequal, all different; just as, between the sands of the Sahara and the alluvial soil of Senegal there are many degrees of fertility.—We must carefully examine how these natural inequalities have acted upon civilization. If two nations, unequally favored with natural gifts, be placed in similar environments, it is evident that the one best provided with this natural capital, will develop more rapidly and more completely than the other. It is also clear that if two nations, equally favored with internal gifts, be placed amid unequal environments, their development also will be unequal. The influence of internal gifts, and of their unequal distribution upon civilization, has not as yet, we believe, been sufficiently studied and appreciated. On the other hand, the influence of external surroundings has been much better recognized and more attention has been called to it. Jean Bodin, Montesquieu and Herder, clearly demonstrated its importance. They might even be accused of having exaggerated it.—However this may be, by taking well into account these natural elements of civilization, we can readily understand how certain races have reached a very high degree of civilization, while others have remained plunged in barbarism. If, for instance, we but study the natural history of the various races of men who inhabit the archipelagoes of the Pacific ocean, and their physical surroundings, we will comprehend why they have remained the most backward of the human species. In the first place, these tribes are generally of very weak intellect; they have but a small share of that faculty of observing, and of accumulating and combining their observations, which constitutes the essential motor of civilization. In the second place, the mildness of the climate and the natural fecundity of the soil enabling them to satisfy, without labor, their grossest wants, leaves their intellect without any stimulant to action. Finally, their topographical situation, by isolating them from the rest of mankind, has restricted them to the development of their own resources,

to their own limited elements of civilization. To obtain other resources or elements of civilization, they would have had to cross the abyss of the ocean. But to traverse the ocean, they would have had to know the art of navigation, to be acquainted with the compass, etc., a knowledge beyond the reach of their intellect. These tribes of men, lost in the immensity of the ocean, were thus condemned to languish for a longer time than the rest of mankind in the darkness of barbarism. In all probability they would still be plunged in this darkness had not light come to them from without, had not nations already advanced in civilization begun to visit them.—But suppose that these tribes, instead of being separated from civilization by the depths of the ocean, had lived on or near the main land, their condition certainly would have been very different. In the course of time they would have communicated with one another, they could have intermingled, they would have exchanged their discoveries and their products. This contact and this intermingling of tribes differently endowed, would have resulted in a civilization, coarse and incomplete, no doubt, but which would have produced a social state far superior to that of all the isolated tribes of the Polynesian archipelagoes. This is one example of the influence of natural gifts, internal and external, upon civilization. Let us give another illustration. At the opposite extremity of the scale of civilization is Great Britain. The inhabitants of Great Britain are a composite people, the product of six or seven races, which successively invaded British soil, whose different aptitudes united and combined to develop it. The natural conditions of the soil, climate and topographical situation of Great Britain, admirably seconded the work of civilization. The soil is fertile, but its fecundity is not exuberant enough to allow those who cultivate it to become the victims of indolence. The climate, although not exceedingly rigorous, renders clothing and shelter necessary to man. Lastly, Great Britain is separated from the continent by an arm of the sea, which, while it protects the inhabitants from foreign invasion, allows them easy communication with other nations abundantly provided with the elements necessary to progress. Favored by such a concurrence of natural advantages, civilization could not but develop rapidly. Let us suppose, however, that the inhabitants of Great Britain had been cast upon the shores of New Zealand; that, consequently, they could not intermingle with such people as those who successively came to settle beside them, nor communicate with a continent on which civilization had already shed its light, is it not likely that they would to-day differ very little from the natives of New Zealand?—Now that the influence which the distribution of natural gifts, both internal and external, exercises on civilization is clearly recognized, let us see what influence the state of the relations which men bear to one another may exercise on their progressive activity; under what

social circumstances they are most stimulated to utilize the elements of progress at their disposal. —If civilization be a product of the human intellect, stimulated by human events, it is evident that it will develop more rapidly in proportion as man may more freely employ his faculties in channels suitable to them, and in proportion as he is himself certain of enjoying the fruit of his endeavors. If I have an aptitude for mathematics, and am forced, without any regard for my talent, to devote myself to painting, the most active and powerful part of my intellect will remain almost inactive. I might have been able to solve a number of mathematical problems; but as I was forbidden to devote myself to this work, for which I was naturally fitted, the problems which I might have solved will not be solved at all, or at least they will be solved later, and civilization will be thereby retarded by so much. On the other hand, I may paint, but, as I have little talent for the art of painting, I shall contribute nothing to its progress. A good mathematician has been spoiled in me to make a bad painter. To interfere with the liberty of labor, therefore, is to nullify and to suppress the forces which would have stimulated human progress; it is in some sense to do away with that part of human intelligence which would have contributed most effectually to the advancement of civilization. The progress of civilization is permanently hindered by the restrictions which close the ranks of certain professions to men who might excel in them, or when admission to them is rendered expensive and difficult, when immutable rules prescribe for each the career he must follow. All attacks on the right of property are another cause which retards civilization. Why does a man condemn his intellect to the labor of accumulating, combining and applying observations to the satisfaction of his wants? Is it not because this labor procures him enjoyment or spares him trouble? He has no other aim. But if he be deprived of this enjoyment, in whole or in part; if the fruit of his self-imposed labor be consumed by others, what reason would he have left to labor intellectually or otherwise? If, for instance, another compels this man to work for him, to cultivate his field, to grind his corn, and leaves him barely enough of the fruit of his own labor to subsist upon; if, in a word, he be a slave, what interest can he have to improve the cultivation of his land or the grinding of corn? What will it avail him? Does he not know that the fruit of his laborious research will belong entirely to his master, that is, to his natural enemy, to the person who each day robs him of his legitimate wages to appropriate them to himself? Why, then, should he add to the gratification of a man who unjustly deprives him of his own? Slavery, therefore, which is, however, but one of the innumerable forms of spoliation, appears as one of the most serious obstacles that impede human progress; in like manner, every arbitrary or legal act which injures or menaces property, natural or

acquired, delays the progress of civilization, by weakening the incentive which urges men to extend the circle of their knowledge and their acquisition.—Liberty, which allows every man to draw the utmost possible benefit from the gifts with which nature has endowed him, and the right of property, which entitles him to the absolute enjoyment of these gifts, and of the fruit which he can derive from them, are the necessary conditions of human progress. Spoliation, under the multitude of forms which it assumes, is the great obstacle that retards, and has, from the beginning of the world, retarded the development of civilization—This being the case, it would seem that men should have, from the very beginning, contrived some means of maintaining inviolable their rights of liberty and property. Unfortunately they have learned only after a long and rude experience, how essential respect for liberty and property is to their well being. If we try to leave this experience out of consideration, and examine the natural conditions in which men were placed in the beginning, taking into account their instincts, their wants, and the means which they had of satisfying them, we will be convinced that they could not begin except by spoliation.—Ignorant men, fresh from the hand of nature, with no other guide than their instincts, no acquired experience either of the world or of themselves, were obliged to supply wants felt anew every day, and which had to be satisfied under pain of death. Unprovided with the instruments and knowledge necessary to assure them a regular subsistence, they were incessantly exposed to the hardship of extreme hunger. When one of these ignorant and famished beings met one of his fellowmen, who, more fortunate than he, had succeeded in getting some prey, a struggle for it was inevitable. Why should not a starving and destitute man attempt to possess himself of the booty which came in his way? Not scrupling to rob the bee of its honey and to devour the sheep, why should he respect man? There is undoubtedly a natural instinct which prompts beings of the same species not to injure one another, but must not this instinct, whose intensity varies in different individuals, have yielded before the all-powerful pressure of want? Let us picture to ourselves what would happen even in our day, notwithstanding the great progress we have made, notwithstanding our acquisitions in the physical and moral order, if there were no superior power established to suppress individual cruelty, and society were abandoned to anarchy. The most frightful disorder would inevitably result from this condition of things. Robberies and assassinations would increase in a frightful manner, until such time as men had reorganized a repressive force. For still stronger reasons must not the result have been the same in the first ages of the world?—History proves, moreover, that abuse of power was general in these first ages, whose innocence has been so loudly vaunted by the poets. The liberty and property of the weak were always

at the mercy of the strong. Every one was thus incessantly exposed to be robbed of the fruit of his labors. Consequently, no one took any interest in increasing his possessions or accumulating property. Progress was impossible under this system. What was the result? The *experience* of the evils of anarchy led men to combine together in order to better protect their liberty and property. Societies were formed everywhere, and in them assassination and robbery were forbidden and punished. Still the pacificatory action of these societies of mutual protection was at first very limited: if men appreciated clearly enough the necessity of living at peace with their immediate neighbors, the inconveniences of a war with men a little farther away did not impress them so forcibly. They often even believed it to their interest to conquer and plunder them. Experience had gradually to extend the domain of peace, that is, the systematized and organized respect for liberty and property. Little by little, nations dwelling in close proximity to one another, and nearly equal in strength, became convinced, by the results of their various encounters, that they lost more than they gained by making war. They, therefore, agreed to suspend their hostilities, to make truces, particularly, if they were employed in agriculture, especially during seed-time and harvest. They finally entered into mutual alliances offensive and defensive. Between these nations who had declared truces or concluded treaties there was regular communication. They imparted to each other the knowledge they had acquired and accumulated. Exchange of products and exchange of ideas took place at the same time. Thus we find that civilization developed in proportion as the experience of the evils of war enlarged the sphere of peace. The same result was obtained when a nation extended its dominion over other nations, for the conquerors soon perceived that it was to their interest to maintain peace in the countries submitted to their rule. Under Roman rule, for example, the most civilized nations of the world ceased to make war on one another, and magnificent roads united these nations which had so long been strangers and enemies. The progress made by each of them in its isolation extended to all. The Christianity of Judea, the philosophy and arts of Greece, the legislation of Rome spread to Africa, Spain, Gaul and Germany, and reached even to Great Britain. At the same time commerce was developing, and the useful plants, together with the art of cultivating them, passed from one country to another: the cherry was imported from Asia Minor into Europe, the vine was transported into Gaul; in a word, civilization under all its forms progressed from the east to the west—Nevertheless, in these first ages of humanity, peace could be neither general nor lasting: in the midst of peaceful nations, slavery in all its degrees appeared as a permanent cause of conflict. From without, hordes of barbarians coveted the wealth accumulated by these civilized peoples. All the early

centres of civilization, Persia, Egypt, the Roman empire, after a thousand intestine struggles, became, as is well known, the prey of barbarians.—The great invasions which occupy so large a place in the history of the world had not everywhere and always the same results. They were, according to circumstances, favorable or disastrous to the progress of humanity. In order to appreciate the influence they exercised from this point of view, we must ascertain first, what amount of material and immaterial capital was destroyed in the course of the invasion; we must examine also whether, the conquest once completed, the victors and the vanquished gained by their contact with each other more liberty and security; whether they increased their means of progress. Anarchy, slavery and war are the great obstacles in the way of civilization; but frequently these obstacles either destroyed or weakened one another. Sometimes slavery put an end to anarchy, and sometimes war to slavery. There was retrogression wherever the result of the conflict was a diminution of the liberty or security acquired, and, on the other hand, there was progress whenever the sum total of liberty and security in the world was increased by the conflict: at least whenever the destruction of capital caused by the conflict was not great enough to counterbalance the gain made.—We can not say, for instance, whether the invasion of the Roman empire by the barbarians of the north hastened or retarded the progress of civilization; whether or not the immense destruction of material and immaterial capital occasioned by this cataclysm was compensated for by acquisitions of another nature; whether or not, if the Roman empire had lasted, the different varieties of men who to-day inhabit Europe would have been so advantageously intermingled; whether or not slavery would have continued for a longer time. We have not the data necessary to solve this historical problem. We can, however, conjecture that, if the establishment of Roman domination over nations, most of which had adopted slavery, could still serve the cause of civilization by causing peace to reign among these nations, by increasing, consequently, the amount of security which the world enjoyed, without sensibly diminishing the sum total of its liberty; in like manner, the establishment of the barbarians upon the ruins of the Roman domination contributed to the progress of civilization by hastening the abolition of slavery, and thus increasing the amount of liberty possessed by the human race.—Be this as it may, liberty and security have been making constant progress ever since the downfall of the Roman empire, and especially since the end of the feudal barbarism which was substituted for it. This progress, whether quickened or not by the invasion of the barbarians who overran the old civilized countries, wonderfully aided the development of modern civilization. Thenceforth, as man had greater liberty to employ for the increase of his well-being the

elements of progress at his disposal, and felt more assured of being able to preserve the fruit of his labors, he gave greater scope to his activity. He explored the material and the moral world with a power and a success of which he before had no idea. He discovered all at once the means of better preserving his old acquisitions, and of multiplying and propagating new ones more rapidly. Some of these discoveries have exercised such an influence upon the march of civilization that we must dwell upon them for a moment.—We will mention first the invention of gunpowder. The immediate effect of this discovery was to change the proportion between the labor and capital necessary to the exercise of what we may call the military industry. It required less labor and more capital, fewer men and more machines. One piece of cannon served by eight men took the place of a hundred archers. What was the result? Civilized nations acquired an enormous advantage over barbarous peoples from the point of view both of attack and defense. The superiority of their implements of war, together with their superiority in the capital necessary to put this costly machinery in operation, assured them predominance. Thenceforth new invasions of barbarians coming to destroy the previous acquisitions of civilization were no longer to be feared. Moreover, now that they were freed from the corruption of slavery, which might in time render invasions useful, the civilized nations acquired in this respect a security which they did not enjoy in ancient times. Instead of being subjugated anew by the barbarians, they everywhere began to subject the barbarians to their rule.¹—Thus were the accomplished results of civilization permanently assured, while a process was soon after discovered whereby to propagate, at small expense and with marvelous rapidity, the knowledge accumulated by the human mind: we refer to the invention of printing. But a short time ago, the diffusion of the immaterial capital of humanity was difficult and costly; sometimes even a part of previously acquired knowledge was lost. Thanks to the printing press, it became possible to reproduce indefinitely the same observation, the same thought and the same invention, and to send it thus multiplied through the immensity of the ages.—Nor is this all. Civilization in ancient times was local. Each nation, separated from neighboring nations, either by physical obstacles, or by the hatred or prejudices of centuries, had its own narrow and isolated civilization. Thus, in the first place, a more and more extended experience of the evils of war, together with the progress of moral and political sciences, began to draw nations together by showing them that it

¹ "Force will probably be found in the future on the side of civilization and enlightenment; for civilized nations are the only ones which can have enough wealth to maintain an imposing military force. This fact removes, so far as the future is concerned, the probability of the recurrence of those great upheavals of which history is full, and in which civilized nations became the victims of barbarians." (J. B. Say, *Traité d'Economie Politique*, liv. 3, ch. 7.)

was to their interest to dwell together in peace, and exchange with one another the products of their industry. Thus, again, the application of steam and electricity to locomotion, by annihilating space, so to speak, renders more and more practicable this exchange, which is now recognized as useful. Thus, thanks to this material and moral progress, local civilizations, formerly isolated, hostile, and without regular communication, began to unite, preserving in a general civilization their own peculiar characteristics.—But if we seek out the origin of this great progress which has assured and accelerated the march of civilization, we shall find that it comes, like all other progress, from the employment of the human intellect in the observation of the phenomena of the moral and physical world; an employment which has become more general and more fruitful in proportion as men have been more interested in engaging in it. The men who have systematized the method of observation, and first among them chancellor Bacon, have been objects of great laudation, and surely this is but just. We must not, however, forget that this method was known and practiced from the very beginning of the world, since it is to observation, and to experience which is but another form of observation, that all human progress is due. If it was less fruitful in ancient times, it was, primarily, because the aggregate of anterior knowledge which could be used to acquire new knowledge was less; it resulted also from the fact that, as liberty and property were less generally guaranteed than now, fewer men were interested in observing and in utilizing their observations. The material arts, for instance, which were abandoned for the most part to slaves, remained of necessity at a standstill. What interest would the slaves have had in improving them? But must not this lack of progress in certain essential branches of human knowledge in turn weaken the spring of all the others? Do we not know that all progress is connected, and that discoveries made in any part of the domain of industry lead to others, frequently in an opposite extremity of this domain? There is certainly little connection between the manufacture of glass and the observation of celestial bodies; and still, how much has the progress in the art of glass-making advanced the progress of astronomy! In ancient times the lack of progress in the material arts, which slavery had degraded, deprived men of the ideas and instruments necessary to enlarge the circle of their knowledge. In consequence, the method of observation was less effective in their hands, and sometimes even remained sterile. What was the result? Men, pressed for the solution of certain problems, and not perceiving how to solve them, declared the method of observation powerless, and built, upon the fragile basis of hypothesis, systems to which science was destined to do justice at a later day. The method of observation was discredited, especially when certain classes believed themselves interested in maintaining the solutions

given by hypotheses; but this discrediting of the method of observation which had its first source in slavery, was inevitably bound to disappear with it. In proportion as slavery disappeared, and the gap in the progress of the material arts began to be filled up, the method of observation, provided with new instruments, acquired a range which no one would before have imagined it capable of. Its efficacy in solving problems which had before been regarded as above human intelligence, then became manifest to all. The honor of being the first to recognize this fact belongs to Bacon; but does not the credit of popularizing and universalizing the method of observation belong still more to liberty than to Bacon? Did not observation increase its endeavors and obtain its most marvelous results, after and from the very day that it acquired liberty as an all-powerful auxiliary; increase these efforts and obtain these results in proportion as liberty was greater? Since the advent of industrial liberty, for example, has not the domain of civilization extended more, in one century, than it had in twenty centuries before?—By becoming more general, under the influence of the progress we have just described, the power of civilization has increased in an incalculable degree. Formerly, each isolated nation was confined almost exclusively to its own resources to develop its knowledge and increase its prosperity. Now, as the aptitudes of men are essentially different, according to race, climate and circumstances of place; as the qualities of the soil are no less so, and the same piece of land is not equally well adapted for all kinds of crops; each isolated civilization necessarily remained incomplete. Only certain privileged individuals could use for the satisfaction of their wants, products brought from other parts of the globe. The mass of the people were obliged to content themselves with the products of the country, and the small extent of the market proved an insurmountable obstacle to the progressive developments of these products. The lack of communication was to a certain extent compensated for by artificially increasing the number of national industries, by learning the industries of foreign nations. Unfortunately, this assimilation, useful when restricted within certain limits, was carried too far. Countries wished to produce everything, even those things which cost less when bought from foreign countries; and in this they partially succeeded by interdicting the use of imported goods. But they still failed to attain the desired result, which was to increase the amount of things calculated to satisfy the needs of their inhabitants. Instead of increasing the number of their satisfied wants, they diminished them. Instead of advancing in civilization, they relapsed into barbarism. We must add, however, that observation and experience are constantly endeavoring to do away with this error, as they have already done away with so many others. The more enlightened nations begin to perceive that it is their interest to obtain

the greatest possible amount of satisfaction (the word satisfaction is here used in its politico-economical sense), for the smallest amount of labor, and that they can never attain this end by barricading themselves against the cheapness of goods. The time will come when they themselves will tear down the artificial barriers with which they have surrounded themselves in place of the natural barriers which the steam engine had broken down. On that day the elements of civilization which God has placed at the disposal of the human race, and the material and immaterial capital which man has accumulated in the course of the centuries, will be best and most fruitfully employed; on that day also will the natural division of labor among the different nations, now impeded by artificial restrictions, be fully developed. We do not know, and it would be superfluous to conjecture, to what height civilization thus universalized will rise, and to what degree it will increase man's moral and material satisfactions, while diminishing his labor and his suffering. All that we can say is, that considering the progress which civilization has already made, human intelligence, provided with a capital which increases so much the more rapidly the more it accumulates; provided with all the instruments necessary to preserve and propagate what it has required; urged on by wants which have never yet been satisfied, and which seem insatiable, will continue incessantly to advance with a more rapid and a surer step until it reaches the undefined limit beyond which it is not given to it to go.—Nevertheless, some minds are still in doubt as to the future of civilization, and present various objections on this point which it will be well to answer. Their principal objection may be thus stated: if civilized nations have no longer to fear the invasions of barbarians from without, are they not, on the other hand, daily more and more exposed to be overrun by the barbarians in their own household? Do they not run the risk of falling back into barbarism, or at least of remaining a long time stationary, by becoming the prey of those men who have not ceased to wallow in primitive ignorance? Doubtless civilization may be retarded in a country by ignorance, or, what amounts to the same thing, by the mistaken interest of a dominant class. Nevertheless, this cause, antagonistic to civilization, has not so much influence as is attributed to it. If it is a multitude, imbued with chimerical ideas, that seizes upon the government of society, *experience*, or even the simple discussion of these theories, readily proves to them their emptiness, and, as the multitude is most interested in the good government of society, a reaction takes place in its midst; it divests itself of its dangerous illusions, and civilization at once resumes its onward march. If society is, on the contrary, under the domination of a class attached to the maintenance of old abuses, the evil caused by these abuses—after a greater or less delay, according to the more or less advanced state of intellectual

communications—finally becomes manifest to every one. Then the pressure of public opinion puts an end to it.—A grave question here presents itself incidentally. Is it well to crush, if necessary, the resistance of the class attached to established abuses, to resort to revolutions to destroy these abuses, or is it better to wait till they disappear of themselves under pressure of the progress made outside the range of their baneful influence? This question plainly admits of two solutions, according to the circumstances of time and place. It may be affirmed, however, that in our day the peaceful solution is generally the better. Think, indeed, with an unprejudiced mind, of the results of certain events of but recent occurrence, the enormous amount of capital they consumed, the active forces they absorbed, the dire calamities they produced; take into account, at the same time, the progress made since the invention of printing, and the application of steam to locomotion, and be convinced that revolution is too high a price to pay for progress in our day, and that it is best, therefore, to abstain from it, even in the interest of civilization.—A second objection, no less frequently urged, is the following: material prosperity is not developed except at the expense of public morality; men become morally more corrupt, in proportion as their condition improves materially, and their civilization, so brilliant on the surface, is only a whitened sepulchre. Nothing could be more false. In the first place, the history of civilization proves that the branches of human knowledge which concur in improving the moral nature of man, do not develop less rapidly than those which tend to develop his material prosperity. Religion, for instance, has never ceased, in the course of ages, to grow in perfection and purity, and to exercise, for this very reason, a most effectual influence over human morality. How far superior is not Christianity to Paganism in this respect! And can we not easily perceive a progress in Christianity itself? Is not the Christian religion of to-day a more perfect instrument of moralization than it was in the days of the St. Dominics and the Torquemadas? Do not the philosophical sciences also, and political economy in particular, labor more effectually every day to improve men's morals by showing them every day more clearly that the observance of the laws of morality is an essential condition of their existence and well-being? In the second place, ought not material progress of itself, far from being an obstacle to the moral development of the human race, contribute, on the contrary, to sustain it? By rendering man's labor more fruitful, and his existence easier, must it not tend to diminish the force and frequency of the temptations which impel him to violate the laws of morality in order to satisfy his material appetites? Experience, moreover, confirms these deductions drawn from the observation of our nature. The criminal records prove that the poorer classes commit, other things being equal, a greater number of crimes than the

richer classes; they prove also that crime decreases and morals improve in proportion as the comforts of life are extended to the lower ranks of society. This objection, based upon a pretended demoralization of nations occasioned by the development of material prosperity, is therefore at variance with observation and experience.—The third objection pretends that the progress of industry has increased inequality among men. It holds that the tendency of industrial progress is to agglomerate, on the one hand, masses of capital, and, on the other, multitudes of men whose condition becomes every day more miserable. Historical facts give the lie to this assertion. Compare the social inequality which exists in our day with that which existed in the time of the Roman empire; contrast with the slaves of the *latifundia* and the powerful head of a patrician family, the poorest workman with the richest of our bankers; and say whether the extremes of the social scale, far from having become more widely separated, have not come nearer together! Progress favors equality, or at least its continual tendency is to reduce social inequalities to the level of natural inequalities. We notice, in fact, that liberty and property are better guaranteed in proportion as civilization gains ground, and that the progress made in guaranteeing liberty and property, is the essential condition of all other progress. Now, if each man is obliged to depend upon his own industry for a livelihood; if there is no longer any spoliation, open or secret, to give to one man the fruits of another's labor; if, in a word, the most powerful and active causes of inequality disappear, must not social differences inevitably end by coming down to the level of the differences which nature has made between men? The only cause that could maintain and even aggravate these inequalities, by attributing to those who control the means of subsistence and the instruments of labor an unwarranted predominance, is the permanent excess of population. Fortunately, the multiplication of the human species does not depend solely upon man's prolific power; it depends also upon his foresight. Man has the power to control the production of beings like himself; he can quicken or slacken this production, according as he foresees that his own condition and that of the beings whom he brings into the world will be improved or impaired thereby. But this foresight, which puts a beneficial limit to generation, naturally acquires greater strength and greater control in proportion as man becomes more enlightened.—In his *Esquisse d'un tableau historique des progrès de l'esprit humain*, Condorcet demonstrated that there would be less and less reason to fear an excess of population, owing to the natural development of foresight under the influence of civilization. "Suppose," he says, "the limit (at which population pressed on the means of subsistence) reached, no dreadful consequences would result, either to the well-being of the human species, or to its indefinite perfectibility; provided we suppose that be-

fore that limit was reached the progress of reason kept pace with the progress of the arts and sciences; * * * * men would then know that, if they had duties to beings not yet in existence, these duties consist, not in giving them existence, but happiness; these duties have for their object the general well-being of the human species, or of the society in which those who are bound by them live *of* the family to which they belong; and not the puerile idea of loading down the earth with useless and unhappy beings. There might, therefore, be a limit to the sum total of the means of subsistence, and consequently to the possible maximum of population, without its resulting in the premature destruction of a portion of living beings, which is so contrary to nature and social prosperity."—We see that the different elements of our nature, and of the world in which we live, are so disposed that civilization appeared as an inevitable and irresistible fact. There is nothing, however, of fatality about it, inasmuch as it continually feels the influence of our free will. If it is not in the power of any one to stop it, or cause it to retrograde, each one can nevertheless exert an influence over its progress, and perhaps also over its definitive extent. Raise your hand against the liberty and property of others; do not utilize as much as you might the productive forces at your disposal; be indolent, ignorant and prodigal; and you will retard civilization. On the contrary, set an example of moral virtue, of respect for liberty and property, of the spirit of research, of ardor and assiduity in labor, and you will contribute your share toward advancing it. Each individual acts upon civilization for good or for evil, within the more or less extended sphere of his activity. Only, each one being more and more interested to act in such a manner as to contribute to its progress, the number of the acts which advance it surpass every day more and more the number of those which retard it. The general impulse given to civilization depends upon the aggregate of the faculties and wants of man, and upon the natural resources which have been placed at his disposal; but it remains, on this account, none the less subject, in the accidents of its course, to the influence of man's free will. Civilization is the creature of Providence, not of fate.—Now that we have described the elements of civilization, and have shown with the aid of what material and moral instruments the great work is carried on, how it can be accelerated and how retarded, let us sum up in a few words the economic marks by which civilization is recognized, and the end toward which it tends.—Civilization is seen to be the development of the power of man over nature. Now, there is an external sign by which this development may be recognized: the division of labor. The country in which labor is most divided in all its branches, where, for this very reason, social relations are most developed, is therefore evidently that in which civilization is most advanced.—Civilization has for its end the

better satisfaction of our material and moral wants. It leads us, by progressively ameliorating the conditions of our existence, toward the ideal of the power and of the beauty adapted to our nature and the resources which the Creator has placed at our disposal.—The idea of an indefinitely progressive civilization is modern. In ancient times, when material progress was impeded by slavery, men could not conceive of any other progress than that of the sciences and the fine arts. Still the sight of the dangers to which civilized people were exposed, the destruction of so many local civilizations by the invasion of barbarians, must have eradicated all ideas of general and uninterrupted progress. This idea could hardly appear until after the invention of gunpowder and of printing. Its germination was slow. Vico prepared the way for it by collecting, in a systematic manner, the observations which he had made upon the development of civilized nations; but Turgot was the first who enunciated it, supporting it by positive data (in his *Discours en Sorbonne*, and in his *Essais de géographie politique*). Condorcet, with some differences, amplified the ideas of Turgot. In Germany, Kant discovered civilization in the spread of human liberty; Herder studied, somewhat vaguely perhaps, its natural elements; the economist Storch undertook to propound the theory of it. Although incomplete, and faulty in certain respects, this theory is still worthy of study. At a later period Guizot drew a picture of the progress of civilization in Europe, and especially in France; but the insufficiency of his economic knowledge is seen in his work, which is otherwise one of the most remarkable of the French historical school. Lastly, civilization has also had its romances. Taking no account either of the nature of man, nor of the conditions of his development, as observation and experience reveal them to us; the socialists have built up imaginary civilizations, as false or incomplete as the data upon which they rest. Observation, which is the first instrument of civilization, is also the only instrument we can use to recognize and describe it. G. DE MOLINARI.

CLAY, Henry, was born in Hanover county, Virginia, April 12, 1777, and died in Washington city, June 29, 1852. He was admitted to the bar in 1799, was a senator from Kentucky 1806-7 and 1809-11, and was a representative almost continuously 1811-25, being chosen speaker of the house six times. He was secretary of state 1825-9, and was again senator from Kentucky 1836-42, and from 1849 until his death. His first prominence was as one of the war leaders of the dominant party, (see DEMOCRATIC-REPUBLICAN PARTY), 1811-15. In 1825 he took part in the "scrub-race for the presidency" (see DISPUTED ELECTIONS, II.), out of which grew a charge of having sold his influence in the house to Adams in return for the position of secretary of state, which was commonly considered the stepping

stone to the presidency. The reader will find the charge very fully considered in Colton's *Life*, referred to below. It never was supported by any proof; its only declared authority repudiated responsibility for it; and yet it was a considerable item in political argument for 25 years. Upon the formation of the whig party, whose distinctive principles of protection and internal improvements he had announced very clearly and ably in 1818-20, he became its beloved leader. He was nominated by the whigs for the presidency in 1831 (see WHIG PARTY, I.), and 1844 (see WHIG PARTY, II.), and in other years the party unwillingly adopted other candidates, Harrison, Taylor and Scott, from considerations of political expediency. With the exception of Jefferson, no party leader in the United States has ever received such enthusiastic and devoted support as Henry Clay. The story, generally believed, that John Tyler, while a delegate to the whig national convention of 1839, could not restrain his tears at the failure to nominate Clay, may serve to show the intensity of the party's feelings toward its leader. Even in 1851 his private correspondence shows that active preparations were being made to bring him up again as a candidate in 1852. His name is most closely connected with the Missouri compromise and the compromise of 1850 (see COMPROMISES, IV., V.), which were both mainly of his contriving. (See DEMOCRATIC PARTY, III.; INTERNAL IMPROVEMENTS; ADMINISTRATIONS. X.; DISPUTED ELECTIONS, II.; WHIG PARTY. COMPROMISES; CONSTRUCTION, II.; CONGRESS.) —See Mallory's *Life and Speeches of Clay*; Prentice's *Life of Clay*; Greeley's *Life of Clay*; Colton's *Life and Times of Clay* (to 1846), *Private Correspondence of Clay*, *Last Seven Years of the Life of Clay*, and *Life, Correspondence, and Speeches of Clay*; Ormsby's *Whig Party*; Von Holst's *United States*, 412.

ALEXANDER JOHNSTON.

CLEARING, AND CLEARING HOUSES.

Clearing is the settlement of mutual claims by the payment of differences. The total of the claims to be settled is the *clearings*, and the differences are called *balances*. *Clearing house* is a place where clearing is done.—The greatest use of clearing is to facilitate the daily payment of the checks held by the banks of a city against one another. Clearing is used in Great Britain to adjust the complicated accounts of the through traffic of connecting railroads, and to simplify the fortnightly deliveries of stock on the London stock exchange. England has three bank clearing houses; France, one; Austria, one; Australia, one, and the United States, 28. There are two railway clearing houses, one in London for the English and Scotch railroads, and one in Dublin for the Irish railroads. The only stock exchange clearing house is in London.—*Clearing* between banks is a simple process, done in substantially the same way in all the clearing houses. At a certain hour in the morning every bank sends a

clerk and messenger to the clearing house, where each bank has its desk. Its clerk sits at this desk and receives from the messengers of all the other banks in turn, all the checks, or "exchanges," held against it for payment. As the messengers deliver their exchanges they take receipts. When all the messengers have made the tour of the room each bank will have received through its clerk all the checks held against it by the other banks in the clearing house, and will have delivered through its messenger to every other bank all the checks, or "exchanges," it holds for payment. If it receives more than it has delivered, it is a "debtor" bank, and has a balance to pay; if it delivers more than it has received, it is a "creditor" bank, and must be paid a balance. In the New York clearing house this process of delivering "exchanges" and taking receipts usually consumes about ten minutes. Without the clearing house, the messengers would need six to eight hours to do the same work. Proof sheets are made, under the supervision of the manager of the clearing house, to see that everything balances, and no clerk is allowed to leave until any error made has been discovered and corrected. At a later hour—before 1.30 in New York and 12.30 in Chicago—the debtor banks must pay to the clearing house for the creditor banks the balances due. It sometimes happens that, at the clearing, checks are delivered to a bank which it does not consider itself bound to pay. For these the clearing house makes no allowance. Balances must be paid as if the checks were all good. Claims arising from disputed checks are adjusted directly between the banks interested.—In the London and Philadelphia clearing houses no money is used for the payment of balances. Every clearing house bank in London, and the clearing house itself, keep accounts with the bank of England, and differences are settled by transfers from one account to another. In the Philadelphia clearing house the debit balances are paid either by certificates issued by the assistant treasurer of the United States for legal tender notes deposited, or by certificates issued by the clearing house association for gold deposited in their safe. Thus no loss can possibly occur in paying balances to the clearing house; the banks give their due bill for the odd amount under \$5,000. These due bills the manager deposits in a bank and gives his checks to the creditor banks for the odd amounts due them. The manager who has had charge of the Philadelphia clearing house for over 23 years, Mr. George E. Arnold, has received and paid out over \$3,000,000,000, and is not bothered with one cent of money. In the New York, Chicago, and other clearing houses generally, balances are settled in legal tender paper or coin, and to some extent in clearing house certificates.—London originated the clearing house. It was formed spontaneously by the clerks of the London private bankers, who, to save themselves the trouble of going about to each bank, got into the habit of meeting in a

room to settle their mutual claims. A similar practice arose among French merchants, in old times, of making their bills payable at the great annual fair at Lyons, where they met to balance their debts, and pay the differences. In this way, says Boisguillebert in his *Dissertation sur la Nature des Richesses*, transactions to the amount of 80,000,000 francs were settled without the use of a sou in money. Edinburgh bankers claim the credit of having established the first clearing house. It was formed to put a stop to the malicious practice that had grown up among the rival banks of suddenly presenting large amounts of notes on each other in the hopes of forcing a suspension. An agreement was made to meet twice a week to adjust their respective claims, and no demands were to be made at any other times. In 1775, after the London bank clerks had cleared among themselves for some years, a common centre of exchange was agreed upon by the bankers—then all private—in Lombard street, in the City. Bankers in the West End cleared through the City banks, and this practice still continues. For 20 years after the joint stock banks had been formed, the jealousy of the private banks excluded them from the benefits of the clearing house, and they were not admitted until 1854, after the intolerable inconvenience to which they were subjected for the lack of clearing house facilities had driven them to plan a clearing house for themselves. The bank of England has never been admitted to the London clearing house. In 1810 the London clearing house numbered 46 members; in 1840, 29; and lately, but 26. In 1858, on the suggestion of Sir John Lubbock, the operation of the clearing house was extended, to include country bankers.—Besides the London clearing house there are, in Europe, clearing houses at Manchester, (which Prof. Jevons thinks has a better method than is used at London), Newcastle, Vienna and Paris. At Paris, owing to the limited use of banking facilities and to the large proportion of settlements made through the bank of France, the clearings are no larger than in Cincinnati, St. Louis, or Baltimore. Melbourne, Australia, has a clearing house which ranks with the St. Louis clearing house in amount of clearings. Liverpool, though one of the greatest centres of commercial exchange in the world, has no clearing house proper, and the use of checks has been almost unknown there until within the last five years.—The largest clearing house in the world is in the United States, and that country has the greatest number of clearing houses.—New York now surpasses London, the oldest clearing centre, in the amount of its average daily clearings. In 1880 the total clearings of the London clearing house were, in dollars, \$28,197,659,227; those of New York were \$38,614,448,223.06. But the largest clearings in one day up to the end of 1880 were those of Nov. 17, at London, which amounted to \$302,900,000. The transactions of the New York clearing house in 1880 were the

largest ever made in any room on earth, and exceeded the sum of the payments (\$18,334,854,202) and the receipts (\$18,570,348,647) of the United States government since its foundation. All this immense business was done without the loss of a cent, and with no errors. The largest clearings made in New York, before 1872, were \$35,541,088,264, in 1869, when one-third of them were due to gold speculation. London's largest clearings were \$29,544,268,442 in the year 1873. The New York clearing house was founded Oct. 11, 1853, with 52 banks. This number was reduced after the panic of 1857, to 47; rose to 60 in 1873; in 1880 was 57; and in June, 1881, was 59, at which time the capital of the clearing house banks was \$60,875,000. New York does 78 per cent. of all the clearings made in the United States.—“The American,” Mr. Ellis said, in his paper on ‘The Clearing House System,’ read before the English Bankers’ Institute, Feb. 16, 1881, “seems to be the character most suited to the adoption of centralizing and clearing principles.” There is a clearing house in every important city in the United States, and the smaller cities are rapidly adopting this financial labor-saving device. In 1853 the first American clearing house was started in the United States. In 1877 there were 23 clearing houses in the country, including 409 banks; and in 1880 there were 28 clearing houses, of which 26 contained an aggregate of 394 banks, with a capital and surplus of \$336,895,432. Twenty-three of these reported their clearings, which footed up, in 1880, \$50,724,616,647. The American clearing houses that report are those at New York, Boston, Philadelphia, Chicago, Cincinnati, St. Louis, Baltimore, New Orleans, San Francisco, Louisville, Pittsburg, Milwaukee, Providence, Indianapolis, Kansas City, Cleveland, Hartford, New Haven, Columbus, Worcester, Springfield, Lowell, and Syracuse. Those that do not report are at St. Joseph, St. Paul, Norfolk, Memphis, and Portland. The total clearings of all the American clearing houses since the establishment of that at New York, in 1853, down to the end of 1880, are, as far as reported, \$701,127,832,344. Clearings not reported are estimated by Mr. Dudley P. Bailey at \$9,000,000,000; making the grand total, \$710,127,832,344.—Clearing saves time, trouble and money. Mr. William A. Camp, manager of the New York clearing house, states that when it was formed, the banks were able to close 2,500 bank ledger accounts, in each of which numerous daily entries had to be made. The London and Westminster bank stated in evidence before the house of commons, that before they joined the clearing house they were obliged to keep in hand £150,000 in notes for negotiating their exchanges. The Bullion Report of 1810 records that 46 bankers in London made average daily clearings of £4,700,000, with a payment of only £220,000 in bank notes. Mr. Babage shows in the Journal of the Statistical Society for March, 1856, that the clearings were made with the use of less than 4 per cent. in cash.

In the New York clearing house, in 1880, the average daily exchanges were \$121,000,000, and the average daily differences, or “balances,” paid in money, were \$4,900,000, equal to $4\frac{1}{10}$ per cent. of the settlements. The gold coin actually paid through the clearing house in 1880 weighed 598 tons. Had all the payments made during the year been in gold coin, without the aid of clearing the gold used would have weighed 74,000 tons. (*The Public*.) The ratio of balances paid in money to the clearing houses in different cities for a term of years were as follows: Boston, 11.8 per cent.; Philadelphia, 9; St. Louis, 20; Cincinnati, 14.5; New Orleans, 11.2; Milwaukee and Pittsburg, 18. Dudley P. Bailey calculates in the Bankers’ Magazine for June, 1881, that since the establishment of the clearing house system in this country it has effected exchanges amounting to the enormous sum of \$710,000,000,000, with the use of only about \$48,000,000,000, or 6.8 per cent. in money or certificates. All business movement is quickened by the clearing house. Before it was established in New York, the banks on account of the enormous labor involved, made their settlements but once a week. The clearing house makes settlements possible every day. Since the use of money has been discontinued in the London clearing house, two or three dozen clerks clear every day, without the use of a coin or note, checks and bills to the average amount of \$100,000,000. If gold were to be used instead of the clearing house machinery the weight to be moved every day would be 200 tons, over distances varying from yards to miles.—Something more than the economy of time, trouble and money is gained by the clearing house. It is developing a new economic and social force that will have mighty consequences. The clearing house establishes a fellowship between banks that has already proved in more than one crisis to be of great importance to the community and themselves. When the war of the rebellion broke out in the United States in 1861, the united action of the New York clearing house banks enabled the government to raise the funds with which to maintain its credit, and, as its manager, Mr. Camp, claims, the regularity and exactness of the clearing house machinery, and the union of the banks in the clearing house, were great factors in tiding over the financial embarrassments of those dark days. The New York clearing house banks, encouraged by their experience during the war, checked the demoralization of the panic of 1873 by combining their entire resources by the issue of loan certificates to the extent of over \$25,000,000. Banks in the clearing houses have a disciplinary power over each other. One of the banks in a large American city was compelled by its associates to withdraw, in 1881, from the clearing house, on account of fraudulent returns of taxable deposits, made to the United States internal revenue commissioner. The constitution of the clearing house of New York city provides that for sufficient cause any bank whatever may be expelled from the clearing

house by a majority of its associates, and at the same time vests a still more summary power of instant suspension in a standing committee. Similar provisions are found in the constitutions of the clearing house of Chicago and other cities. In Philadelphia each member of the clearing house is required to make a full statement of its condition every day for the information of its associates, and in New York similar reports must be made weekly. Clearing houses usually have an arbitration committee to determine all disputes between banks submitted by both parties.—Not less important is the effect of the publicity given,

especially in America, to the clearing house returns, which are published daily in most of the cities.—Every week a summary of the statements of the American clearing houses that make reports is prepared and telegraphed, with explanatory remarks, over a large part of the United States, by the associated press. These statements are looked for by business men and capitalists with as much interest as the weather reports. They are financial weather reports. This work of collation and explanation is done by Mr Wm. M. Grosvenor, editor of *The Public*, of New York, whose statistical genius was the first

BANK CLEARING HOUSES OF THE WORLD.

to see the application that could be made of these representative figures which reflect the changing conditions of business as closely as the barometer measures the pressure of the atmosphere. Bank clearings at London, New York, Chicago and elsewhere rose with the swelling tide of prosperity before the crash of 1873, sank with the industrial ebb that followed, and are now steadily rising all over the world. Mr. Grosvenor's weekly and yearly analyses of the American clearings show that they register the growth of cities, the rise and fall of speculation—in stocks at New York, of grain at Chicago, and of cotton at New Orleans. Clearings are affected by such episodes as the gold speculation in New York in 1869, with the collapse of Black Friday and the yellow fever in Memphis in 1879. Extraordinary winters like that of 1880-81, the cessation of navigation on the American lakes, the approach of the holidays, the condition of the money

market and of general trade, such a shrinkage of prices in merchandise and stocks as took place in the spring of 1880—all these modify the figures of the clearing house. Declining yield in the great bonanza mines of Nevada affects the clearings of San Francisco; and a break in wheat, like that of December, 1880, the clearings of Milwaukee. Pittsburg clearings show the recovery of its great iron industry. The wheat corner in Chicago increases the clearings of July 1, 1881. When stock speculators, to produce a break in Wall street, flood the country with rumors of disaster to all business interests, the weekly reports of rising clearings disprove the false assertion and act a great part in the maintenance of confidence.—The fullest compendium of clearing house statistics yet made may be found in Mr. Dudley P. Bailey's article on "The Clearing House System," Bankers' Magazine, New York, June, 1881. Consult, also, the files of *The Public*;

Mr. Arthur Ellis' paper on "The Clearing House System applied to Trade and Distribution," read before the London Institute of Bankers, Feb. 16, 1881; Sir John Lubbock, in the *Journal of the Statistical Society*, September, 1865; Mr. Babbage, in same journal, March, 1856; Geo. H. Ellery's "The Banks of New York, and the Panic of 1857"; article "Clearing House" in *Johnson's Encyclopædia*, by W. A. Camp, manager New York clearing house, and the following in periodicals: "Clearing House of New York," (J. S. Gibbons), *Bank. Mag.* (N. Y.), 14:41; "Clearing House," *Bank. Mag.* (N. Y.), 8:344,445; 9:409; 32:341; *Internat. Rev.*, 3:395; "Clearing Houses in 1857-8," *Bank. Mag.* (N. Y.), 13:6; "Clearing House Associations," *Bank. Mag.* (N. Y.), 18:217; "Clearing House Methods," *Bank. Mag.* (N. Y.), 30:10; "Clearing House System," *Bank. Mag.* (N. Y.), 13:882; 29:929; "Clearing Houses of the U. S.," *Bank. Mag.* (N. Y.), 31:332 — *The Railway Clearing House*. This is the most complex of all clearing houses. It determines the amount due each one of the many connecting railroads of Great Britain and Ireland for its part of the through freight and passenger business. It is independent of each company, but under the control of all. There are four main departments: merchandise; passengers and parcels; mileage of rolling stock; lost luggage. Employ's at each station forward every week to the railway clearing house at London the through passenger tickets taken up, and every month make reports of the weight, destination and payment of through freight. At every railroad junction the clearing house has its agents, who make weekly reports of the number, condition and destination of every car that passes from one line to another. All these returns and the passenger tickets forwarded are cleared by the clearing house, which ascertains the balance due by or to each company. Balances on passenger business are payable within 5 days, and balances on freight business within 23 days after the receipt of the clearing house advices. These are sent out monthly to the companies. The railway clearing house arbitrates between the companies on claims for damages to rolling stock, or in cases of disputed liability on freight or passenger business. The processes of the railway clearing house are simple, but the vast amount of detail to be attended to requires the employment of a large central staff to check accounts, determine balances, and settle them. There are two railway clearing houses in Great Britain and Ireland, formed under the provisions of the railway clearing act of 1850. Ninety-three English and Scotch railways clear in London, in a building in Seymour street, near Euston station. The Irish railways have a clearing house in Dublin — *Stock Exchange Clearing House*. The stock exchange, London, has the only stock exchange clearing house. Only a part of the members of the London stock exchange belong to it, and it clears for them alone. In the settlement of securities not transferable to bearer, it has caused

little short of a revolution. Each broker who belongs to the clearing house submits a statement, and all but the balance of stock deliverable or receivable is canceled. The clearing house keeps a record of intermediate liabilities in case of dispute. The stock exchange clearing house system is not as perfect as that in other clearing houses, but it saves an immensity of trouble, and in departments of the London stock exchange where clearing is practiced, complaints of the onerousness of settling the half-monthly accounts are not as frequent as in those where it is not used.

H. D. LLOYD.

CLERICALISM. This new word, used only in religious and political discussion, is said to have been first employed by Belgian journalists, about the year 1855.—The words "clerk," "clerical," "clergy," suggest ecclesiastical functions. "Clericals" and "clericalism," suggest the abuse of those functions.—Abuse of priestly power is manifested, either by a tendency to an unlimited control of the faithful, or by encroachments of the clergy in the domain of civil and political authority. These usurpations of the clergy are possible only in churches which recognize the authority of a priesthood. They are dangerous only in those churches, which, united to the state, are really *political* establishments, whose only object, as such, is to increase their privileges, and whose aim, consequently, is to transform the government into a theocracy pure and simple. Those among the laity who declare themselves partisans of this religious mysticism, are termed "clericals" and accused of "clericalism." Religion, however, must be carefully distinguished from clericalism. If we compare the tendency of clericalism with that of Christianity, it seems to us that the salutary influence of the latter on modern civilization is much more beneficial when acting independently of any church establishment, which, following the example of Rome, puts itself in opposition to the liberal tendencies of evangelical doctrine, with its respect for the sovereignty of conscience. This tendency of Christianity, broad, tolerant and humanitarian, affords us the glorious spectacle of an interminable struggle against ignorance and superstition, and of its efforts to restore to conscience the feeling of individuality and liberty by the assimilation of the religious truth which propagates itself unaided by any external power. It is only by persuasion, unassisted by force, that Christian truth can influence morality and effect a moral reformation. In that way truth may prevail, even against those who arrogate to themselves the right to hold the exclusive monopoly of truth, and to propagate truth among the nations.—The policy of clericalism, on the other hand, is sectarian and intolerant. In spite of the evidence of facts, priestly power persists in maintaining that, existing by divine right, itself and religion are identical, and that it is the church in all its original purity and integrity. By means of this confusion of the

ideas of the temporal and spiritual power, of the times of the primitive church, and the time of the decay of its ecclesiastical institutions, clericalism troubles and demoralizes the timid, weakens character, and attracts to itself the weak by saving them the necessity of distinguishing between right and wrong, truth and falsehood. For the authority of the priest is ever present to the conscience of the true believer. It becomes a sort of artificial substitute for conscience itself, assuming to be an infallible criterion of religious truth.

C. HUMANN.

CLIENTÈLE AND CUSTOM. The word *clientèle* is used to designate a number of persons having confidential relations with a counselor, an attorney, a notary, or a physician. A *clientèle* may be considered capital. It grows gradually by industry, and once obtained, it yields, to speak in the language of political economy, a certain product.—The counselor, for instance, endeavors to extend his acquaintance by writing good works on law. He pleads in the courts, and strives to convince those who may need his services, of his merits. As soon as he is retained in a case he devotes to it all his attention, studies it with care, and if he displays talent in pleading it, he secures a client, that is, a person who has confidence in him and will always return to him in case of need. One client brings another, the lawyer's name becomes known, his fame spreads, a greater number of people intrust their business to him, and thus his *clientèle* is formed. From that time he possesses an amount of capital, so to speak, which he can use and which repays him for all his past trouble, with interest. It is true that he can not convey it to another, for he alone can use the labor he has, as we may say, saved. But he can turn it to account, and this fact proves its value. The young lawyer whom another and older one has trained to the bar, and to whom he intrusts the simple cases which he has no time to attend to himself, who will perhaps succeed his teacher in public favor, and is perhaps as diligent and painstaking, has, let us suppose, the same talent and eloquence. What he has less than his teacher is a *clientèle*.—In like manner, and by hard work, a physician or a surgeon makes a name for himself. He serves in the hospitals, and devotes himself to the care of the sick during epidemics. He gradually inspires confidence and obtains a *clientèle*. What has he more than another who has just commenced his career, and has the same learning and skill? A *clientèle*.—A *clientèle* in any form, whether transferable or not, is the result of an accumulation of services rendered, of labor past. It is capital. Like all other capital, but in a greater degree, this kind of capital tends to extinction by inaction. To maintain it in its full value, it is necessary to devote to it a large share of the care which was taken to form it. Otherwise, clients depart one after another; confidence is lost; the name of the lawyer or physician relapses into

obscurity, and the *clientèle* is gone.—*Custom* is, in commercial and industrial pursuits, what *clientèle* is to the liberal professions. The custom of a store or shop is the aggregate of those who patronize it. In such custom there is a value which the manufacturer, for instance, has created by unremitting work, and by a long course of honesty. The public has confidence in him, and goes to him. If a merchant sells out his business he will be paid not only for the value of the material, the stock and the fixtures, but for something more, for his custom. The value of this custom is sometimes considerable, though very uncertain. The patronage of a business always depends upon real merit. It arises from favorable location, good faith and low prices. Although more easily preserved than acquired, it must always be deserved.—To resume: *Clientèle* and custom are capital, since those who possess them derive from them a revenue which other persons of equal talent can not obtain without a *clientèle* or custom. Besides, in many cases, the value of this capital may be so exactly determined that it may be purchased for a definite sum.

LÉON SAY.

CLIMATE. We have, after a struggle of thousands of years, broken away from the ancient belief in fatalism. Inexorable fate has been laid in the quiet graveyard of human institutions. When the European hears the eastern fatalist murmur his formula of blind submission to "that which was written," he smiles, and congratulates himself on having been born after Voltaire's time. But this does not prevent the same European from admitting that the laws which govern matter govern man; that the Oriental is, was, and will be, a polygamist; that for many reasons, excellent in themselves, southern nations will always be governed by arbitrary rulers, while republicanism will flourish in the north. The European rests his argument on the authority of the "spirit of laws." The more he rejects religious fatalism, the more likely he is to accept, at least in theory, the doctrine of the materially inevitable.—It is, indeed, true that climate exercises on organic and inorganic bodies an influence extending even to man, whom it modifies from the physical, the moral and the intellectual points of view. For our vices and our virtues, our weakness and our strength, are so closely connected with our physical constitution, that one can not be altered without change or modification of the other. Climatology, notwithstanding the numerous and noteworthy treatises written on it, is still in its infancy. It is so many sided; its points of contact with other subjects are so numerous; facts so often refute theories which had been constructed with the greatest labor, that the synthesis of the science can not be formulated. The reader must not expect here a treatise on climatology. He will find the subject treated ably and at length in the works of Humboldt, Michel Lévy, Toissac, Virey and Wilson.—Our business is only to consider

to what extent climate influences political institutions; which is equivalent to asking, "can man break the chain that binds him to the soil; or does the fact of his being born within a certain degree of latitude necessarily and definitively limit his social condition?" In other words, the object of research is the relation of climatology to sociology. Let us confine ourselves to facts. Humboldt, who by the study of the isotherms laid the true foundation of climatology, defines this science as "The aggregate of all those atmospheric modifications which sensibly affect our organs of sense, such as temperature; moisture; the variations of barometric pressure; the stillness of the air; the effect of the winds; purity of the air, or its admixture with more or less unhealthy gaseous exhalations; the degree of usual diaphaneity, the brightness of the sky, so important in its influence, not only on the fertility of the soil, the development of organic tissues in plants, and the ripening of fruits, but also in its effect on the aggregate of the moral sensations which men feel and which differ from day to day."—Climate exercises a direct influence on the moral and physical characteristics of the individual, by the necessities to which it subjects him, the habits it gives rise to, and the advantages it procures him. Vegetius expressed this fact when he wrote *El platu coeli non solum ad robur corporum, sed etiam animorum facit*. (Climate contributes not only to the strength of the body, but to that of the mind.) Before him, Hippocrates, in his treatise on water and air, noticed the influence of climate on the character of nations, and therefore on their destiny. Modern science has not belied this testimony. Its classification of climates, and the different moral and physical effects which they cause are the following. We, of course, concern ourselves with the greater divisions.—Climates are: the warm, temperate, or cold. The inhabitant of the north is generally tall and strong.¹ His fine, white skin reveals the color of the blood circulating beneath it. The severity of the work which imperative necessity compels him to perform involves a considerable expenditure of force. The need he feels of restoring his strength when exhausted, engenders material appetites. As, in cold countries, labor is the prime condition of existence, the love of gain and the means of satisfying man's many wants, is almost universal. The sexual appetite is developed only late. The individual, whose entire activity is taken up in the production of wealth, finds in woman an assistant and a companion. In making her a participant in his labors he learns to consider her his equal. Besides, woman here grows old at about the same rate as man. Monogamy is the rule. The slowness of organic functions explains the longevity of the inhabitants of northern countries. Their leading mental characteristics are thoughtfulness and precision. They must have invented the me-

chanical sciences and been the first to apply them.—In warm climates, on the contrary, man is small in stature, and his muscular development not great. The relaxation of the tissues gives rise to apathy. The earth produces without toil, the wherewithal to satisfy his hunger and thirst. There is no struggle with material obstacles, and hence no industry. Man seems to follow nature in its prodigious fecundity. Sexual desire is developed early and reaches a degree of violence unknown elsewhere. Woman's consent is not asked there. Rather is she overpowered; she becomes an instrument of pleasure, and the number of wives may be increased at will. Woman is nothing; man is everything. The foundation of the family is paternal tyranny. The ignorance maintained in the family circle gives rise to superstition in society. People live fast, and die young. In southern climates the activity of the passions takes the place of the physical activity of men of the north.—If we are to believe the learned Mr. Virey, who expatiates, not without a certain complacency, on the advantages and merits of the climate of Europe, the temperate zones are most favored. We quote his exact words: "In the temperate climate, the happy equilibrium of muscular vigor and nervous activity has united in the same people the gifts of body and of mind. In countries where such a climate exists, courage has been able to ally itself to moral sensibility, mental culture and the fine arts have not excluded warlike ardor and physical training. The base flattery, perfidy and servility of the south are as much abhorred as the ferocity, rudeness and outrageous excesses of the arrogant and reckless north. Delicacy of sentiment is associated with masculine energy. The mind takes a bolder flight. The arts and sciences give to the nations that cultivate them an immense superiority over all other nations. Puberty not so early developed as in the south, nor so late as in the north, evokes the most delicate feelings of love, without exaggerating or weakening them."—These are the main physiognomical features of the inhabitants of the different climates. We must not, however, lose sight of the fact that man comes into the world with certain idiosyncrasies, which explain how the inhabitants of the same climate vary so much in character. It is clear that certain faculties are developed more especially under the influence of certain climates. Manners and customs which are nothing but the frequently repeated exercise of the faculties peculiar to a certain aggregation of men, must certainly feel the influence of climate. Religious forms, if not religious faiths, depend on manners and customs, as manners and customs depend on climate. For, as Voltaire tells us, "the lawgiver to whom the Indians listened when he bade them bathe in the Ganges, would have been badly received if he had given a similar command to the inhabitants of the Arctic regions." Voltaire says further: "Climate has some influence; government a hundred times more; religion, united to government, more still"—After

¹ Except in the polar region. It is a known fact that the Laplanders, Esquimaux and Samoeds are undersized.

Jean Bodin, who led the way in the fifth book of his "Republic," came Montesquieu, who does not hesitate to make climate the sole cause of all the effects which, in any way, influence mankind. This theory would tend to deprive man of all moral freedom.—The north has scarcely any fauna. Vegetation breaks with difficulty its prison of ice and snow. Domestic animals are rare, and their species are but few. Here, according to Montesquieu, man, whose wants as above mentioned, are in inverse ratio to the resources at his command, attempts to obtain what he is in need of by the integral development of his activity.—In the south the fertility of the soil fatally entails the dependence of the race as a consequence. Tyranny prospers in fertile lands, while other countries, by the same law, select the form of government best suited to their needs. Montesquieu's theory, violently combated at the time of its first appearance, has found more convincing opponents among the moderns to whom the advance in the arts and sciences has furnished many serious arguments. Mr. E. Toissac, while recognizing the influence of climate on national character, thinks that Montesquieu, in maintaining absolutely that a positive relation exists between climatology and forms of government, did not sufficiently take into consideration the teachings of history. Besides, events which have occurred since the death of that great writer have completely overturned his theory. Mr. Toissac calls our attention to the fact that in little sequestered Europe every form of government has found a place. Greece, where the climate has not changed, has very much modified its institutions. Turkey has a government almost identical with that of Russia, and yet it is situated in the same latitude as Greece, Italy or Spain. "Forms of government," says Mr. Toissac, in conclusion, "seem to depend more or less on the degree of enlightenment in a nation. Therefore, to dispel ignorance is to destroy despotism; to enthrone intellect is to establish the rule of liberty and law."—"We think that man, whatever latitude he may be born in, whatever be the color of his skin, is advancing toward a goal that recedes and grows greater as man advances toward it, to wit, physical and intellectual liberty. In some places he goes on step by step, scarcely ever stopping or looking back. He is working out the problem of his own development. In another degree of latitude man goes forward with great bounds, remains stationary for long periods, and then advances again. We believe that climate determines the nature of man's advance, but not the goal which is the object of his aims. Material progress, which we can not think of as separate from intellectual progress, is a means of emancipation from first influences. Again we say, it does not show us the goal, but it traces out the road, removes the obstacles, fills the ravine, and unites ocean to ocean. Is it necessary for us to call attention to the extent to which machinery, railways, and electricity, have already, in many places, lessened

the influence of climate?—As regards forms of government, which are in themselves but means to hasten or retard the progress of nations, experience shows us that climate has but a meagre influence on them. In all the countries of the world those in authority seek to extend the limits of their authority, while the governed strain every nerve to conquer freedom. Cold has no more to do with it than heat. The matter must be decided between the principle of authority and the principle of liberty. (See CIVILIZATION.)

HECTOR PESSARD.

CLIMATE, Politico-economic Aspects of.

From an economic point of view the influence exercised by the different climates deserves considerable attention. Up to the present time human industry has made constant and increasing progress only in the temperate regions; outside these regions it has remained stationary, or acquired but a feeble development. These facts prove that the same conditions of development are not met with in all temperatures, and to seek out and state the causes of the differences is by no means unimportant.—Evidently the greater or less abundance of the natural elements of wealth does not determine the different degrees of prosperity reserved to a people; for the equinoctial countries, which certainly possess these elements in greatest abundance, are among the poorest and most backward. That a people may flourish, it is not enough for them to have within their reach abundant means of production; they must, besides, be incited to make good use of these means. In the success which they achieve everything depends principally upon their progress in intelligence, activity and wisdom in employing the fruits of their labor; and it is because local circumstances do not everywhere equally favor this progress, that it has not everywhere been equally sure and rapid.—The temperate zones enjoy a superiority in this respect. There everything combines to recommend to the inhabitants the active and vigorous use of their productive faculties. Numerous and various wants incessantly beset them; they have to defend themselves in turn from the scorching heat of summer and the prolonged severity of winter. They require clothing suited to the most opposite atmospheric conditions, appliances for heating, houses securely closed, and built solidly enough to bear the weight of the snow and withstand inclemencies of every kind. It is only by means of labor, of ingenious inventions, and of experiments upon the most different materials, that they are enabled to resist the extreme severity of the climate; and hence the necessity for them of the mental and bodily activity, the habit of which they acquire, and which becomes the very life of their continued prosperity.—On the other hand, everything combines to form in them habits of economy and foresight. The harvests they reap are slow to mature, and require long continued care. They must be husbanded so as to serve

for the consumption of the entire year. Woe to him who would forget in the summer season the needs of the winter that is to follow, and neglect to provide for them! Now there is nothing so rouses and develops the spirit of industry; nothing so surely leads to the reproductive employment of acquired wealth, as the necessity of reckoning with the future, and including it in the combinations and preoccupations of the present.—The climatic conditions of countries which lie within the tropics or are contiguous to them, are far from acting thus happily upon the ideas and inclinations of the population. Changes of season are almost unknown, and a perpetually serene sky spares men the greater part of the sufferings against which they have to contend in climates of a changeable temperature. A hastily constructed cabin affords all the shelter they require either against the rays of the sun, or against the storms which occur at rare intervals; the least covering serves to preserve them from the inconveniences resulting from nudity, and as soon as they have provided themselves against suffering from hunger, they can enjoy the sweets of repose.—Nor is there anything in the nature and succession of the labors which they are obliged to perform which is calculated effectually to remove the inconveniences resulting from the simplicity of their wants. Even agriculture requires of them but very little labor. The land hardened and dried by the excessive ardor of the sun, can be worked only during the five or six weeks which follow the rainy season each year; and the long season of idleness which it forces on those who cultivate it, does not fail to nourish their inclination to indolence. Nor is this all. There is no very evident necessity to calculate for the future. As the difference between the various seasons is but a difference of temperature scarcely appreciable, they have not to prepare in one season the resources and provisions which the other will require, and their from-hand-to-mouth subsistence is easily obtained. Thus, nature has in vain lavished the means of production upon the soil on which they dwell; she has not given them the only thing which could teach them to make good use of these means, that is, numerous wants for which they would have to provide under pain of severe privation.—The effects of a diversity of climate manifest themselves also in the more or less useful direction given to the industrial arts. In countries subject to extreme climatic differences, everything, in the habitual use of wealth, concurs to give to labor a direction useful to all. Among the expenditures of the wealthiest there are few that have not for their object the satisfaction of real wants, or the increase of the well-being acquired; and even the seeking after the improvements of which articles of luxury are susceptible, becomes the source of a number of discoveries, which, in proportion as they come into general use, add to the effective power of the labors destined to supply the wants of general consumption. It is not thus in countries

where the rigors of cold are not experienced. Life is there of a sweetness which one little cares to increase. Wealth is employed chiefly to gratify a taste for ostentation and display, and the puerile enjoyments of vanity; and the industries which its expenditures encourage are lamentably sterile. The princes and grandees of the east cover themselves with pearls and diamonds, and gold glitters even on the trappings of their horses; they are surrounded by a host of servants. But their palaces, though covered with the most costly ornaments, contain scarcely any furniture, and were it not for contact with Europeans, they would still be unacquainted with the use of our carriages and the possibility of eating otherwise than with their fingers.—It is not the absence of imperious and varied wants which checks the development of wealth in the more northern latitudes. On the contrary, man's wants are nowhere so numerous; but nowhere either are there more obstacles to oppose his efforts. Beginning with the sixty second degree, the very short summers do not allow the cereals to mature, and the races whom the thankless soil compels to live upon the fruits of the chase and fishing can not possibly attain to a high degree of prosperity and civilization. In like manner where a less severe climate begins to render cultivation possible the meagreness of the crops, and the immense amount of land that must be reserved for forests to supply fuel, hinder the population from concentrating, and their dissemination deprives them of instruction, desires and emulation, without which men lack the stimulants essential to the energetic use of their resources and faculties.—The excessive duration of the winters is another obstacle to the progress of labor. In northern countries the earth remains for six or seven months buried under the snow, and the extreme duration of this period inevitably leads those who cultivate it to form habits of idleness, which they can with difficulty abandon when the time for labor returns. Not that they do not endeavor to make use of the time of leisure which they are forced to accept. Far from it: they employ this time in making most of the things they use. Their furniture, clothing, shoes, household utensils, implements of labor, almost everything they need is the work of their own hands. But no matter how natural or conformable to their interests such a development of domestic industry may be, it always has the ill result of keeping a great many of the arts in a sort of infancy. There is little occasion for commerce in a country in which the rural families themselves produce nearly all the objects of their consumption. In like manner the large manufactories, those which, by means of the division of labor and the employment of machinery, besides the advantage of considerably reducing the cost of production, possess the additional recommendation of collecting the information most profitable to the application of human forces, have not sufficient room for their establishment and suc-

cessful operation.—These are the causes which, in countries that are subjected to extremes of climate, have to this day prevented the progressive increase of wealth and of the industry which produces it. The privilege of conferring upon the peoples which inhabit them all the qualities which the continued success of human activity requires, seems to have been reserved for the regions which we call temperate. It is these peoples who now collect all the discoveries of science and apply them practically; it is to their efforts that we are indebted for all the improvements which contribute to make labor more fruitful; it is they alone, in fine, who forge and collect all the arms which humanity needs to extend its conquests over the material world, and force it to supply more ample means of triumphing over the misery of its original state.—We must, however, bear in mind that things were not always thus. The plains washed by the waters of the Euphrates and the Tigris, India and Egypt, and the shores of ancient Phœnicia, witnessed the birth and earliest developments of the arts. Later on, Greece acquired a knowledge of them, and gave them a new and more brilliant flight; later, Italy and the banks of the Mediterranean became their principal home. Only during the last three centuries have the countries in which industry is now most richly rewarded begun to carry it to a degree of power and activity of which the world had had no example.—These facts are easily explained, and, far from weakening, serve to confirm what we have said of the influence of climate. In the beginning the nations which found the least difficulty and met with the fewest obstacles in obtaining the necessities of life were, despite their ignorance, the only ones which had the leisure which is indispensable to the progress of the human mind. Hence it was that those parts of the world where there was the greatest abundance of spontaneous productions of the soil, added to a warm temperature, became the cradle of industry and the arts. Men could there devote their entire attention to the few wants which absolutely demanded to be satisfied, and they soon found means to avoid suffering from them. But the very circumstances which in extremely warm countries most favored the first impulse to discovery, afterward became an obstacle to its advancement. As the climate added no formidable requirements to those which hunger made, as soon as a certain amount of prosperity was acquired by these nations, they no longer actively applied themselves to increase it.—It is possible and even very probable that, without the aid of the light which came to them from the countries upon which civilization had shed its first rays, the nations which were weighed down with numerous wants would have been much slower in shaking off the overwhelming burden of their ignorance. But history clearly proves that, once in possession of the means of production discovered by other nations, they have made use of them with an activity hitherto unknown.

Animated by the desire and hope of escaping from the sufferings which continued to pursue them, they brought to their work a spirit all the more inventive the more prosperity they had to achieve, and they imparted to the very arts, a knowledge of which they had just received, an impulse which rapidly increased their fecundity. Thus it is that industry multiplied and improved its appliances in proportion as it advanced from the south toward the north. If to become acclimated in the regions wherein such aggraudizement was reserved to it, industry required forces which perhaps it could not find there, it is at least certain that it met with conditions of development which had hitherto been wanting, and there extended more and more the circle of its conquests.—May we infer from these facts that industry will eventually acquire, in the climes in which it has hitherto remained undeveloped, a degree of development to the attainment of which nothing is contributed by the climates in which it makes the most rapid advancement in our day? This would be to deceive ourselves. If it be possible that north of the line where it now shines with its greatest brilliancy, industry is to overcome many of the obstacles which have opposed its progress, it is evident that there will still remain enough others to limit its progress. As to the countries in which the simplicity of their wants retains the masses in a state of indolence opposed to their development, the influences at work there are not such as yield entirely to the action of time. Thus everything goes to prove that those nations upon whom is imposed the two-fold task of protecting themselves in turn against the inconveniences of summer and the rigors of winter, will continue to open to the rest of mankind the ways to work and to wealth, and to advance toward this goal with a most firm step.

H. PASSY.

CLINTON, De Witt, nephew of George Clinton, was born at Little Britain, N. Y., March 2, 1769, and died at Albany, N. Y., Feb. 11, 1838. He was graduated at Columbia, in 1786, practiced law, was United States senator (democrat) 1802-3, and thereafter remained in the politics of his state (see *NEW YORK, BUCKTAILS*), of which he was governor 1817-22, 1824-7, holding other offices in the state and city of New York in other years. He was the anti-Madison candidate for president in 1812 (see *FEDERAL PARTY, II.*), and his wing of the democratic party thereafter maintained a general, though tacit, alliance with the federalists, which developed into the national republican, afterward whig, party, though Clinton personally preferred Jackson to Adams in 1828. One evidence of Clinton's peculiar federalist-democratic tendencies was his devotion to internal improvements, but as a measure for the benefit of the state, not of the nation. To him New York is indebted for the successful completion, if not for the original idea, of the Erie canal, which was at first contemptuously called "Clinton's Ditch,"

but which developed New York's domestic commerce.—See 1 Hammond's *Political History of New York*; Hosack's *Memoir of Clinton*; Renwick's *Life of Clinton*; Campbell's *Life and Writings of Clinton*; Jenkins' *Governors of New York*; S. L. Mitchell's *Discourse on Clinton*; 4 W. H. Seward's *Works* (Biography of Clinton). A. J.

CLINTON, George, was born in Ulster county, N. Y., July 26, 1739, and died at Washington city, April 20, 1812. He was governor of New York 1777-95 and 1801-4, and was head of one of the three great families which controlled the state. (See NEW YORK.) He opposed the constitution, hoping to make New York the most powerful of thirteen separate commonwealths, was defeated for the vice-presidency in 1789 and 1792, and was vice-president 1804-12. (See DEMOCRATIC PARTY II., III.; ELECTORAL VOTES.)—See 1 Hammond's *Political History of New York*; Jenkins' *Governors of New York*. A. J.

CLÔTURE. (See PARLIAMENTARY LAW.)

COASTING TRADE, the trade or intercourse carried on by sea between two or more ports or places in the same country.—Much doubt has, for a considerable time, been entertained in regard to the policy of the monopoly of the coasting trade, and, in England, in 1849, it was proposed that it should be thrown open. It is not easy, indeed, to see any grounds on which this monopoly could be satisfactorily vindicated. In considering this question it is needless to refer to countries destitute of a commercial marine, for without the aid of foreigners they could have no coasting trade. And the shipowners of countries that have such a marine, and which also have any considerable facilities for carrying on navigation, have so many advantages on their side, that it is difficult to imagine that they should ever be superseded, in any considerable degree, by foreigners, in carrying on the coasting trade. But while the admission of the latter to the privileges of engaging in that trade hinders the native shipowners from availing themselves of any peculiar circumstances to charge oppressive rates of freight, it at the same time subjects them to that wholesome competition by which alone their inventive energies can be fully developed. The probability consequently is, that the introduction of a free system will be as advantageous in all that respects shipping and navigation as in most other things. J. R. M'C.

COCHIN CHINA. The empire of Anam forms part of the peninsula beyond the Ganges. It extends from 9° to 22° north latitude, and from 100° to 107° east longitude. It is bounded on the north by China, on the east and south by the sea, and on the west by the kingdom of Siam. It is composed of three grand political divisions: Tong King in the north, Cambodia in the centre, and Cochin China proper. Between Tong-King

and Cambodia is a vast stretch of territory called the kingdom of Laos, which is tributary both to Cochin China and to the kingdom of Siam. A chain of mountains, beginning in the lofty peaks of Thibet, runs north and south parallel with the sea. Several rivers water the different parts of the country. The most important of these is Mekong, which, rising in the Chinese province of Yun-nan, runs through Laos, Cambodia and lower Cochin China, and empties into the sea by several different mouths. It was opposite one of these mouths that Camoëns was shipwrecked about the year 1561, returning from Macao to Goa, and saved the manuscript of his poem. The *Lusiad*, by holding it above the water with one hand, while with the other he swam toward the banks of the Mekong.—We have no exact information as to the number of inhabitants in the Anamite empire; we only know that the country, especially in the interior, is relatively much more thinly settled than China. The people of Cochin China very closely resemble the Chinese: they possess almost the same characteristic traits, the same manners, the same customs, the same written language, though with a different pronunciation. The greater part of them profess Buddhism.—The country is fertile, especially in the provinces of lower Cochin China. Rice, sugar-cane and the mulberry grow there in abundance; still the population is generally poor and miserable. There is scarcely any foreign commerce, and very little progress has been made in industry.—At the beginning of each reign the new emperor sends an embassy to Peking; this is rather the rendering of a traditional homage than the solicitation of official investiture. Although, in the proud language of the court of Peking, the empire of Anam is still numbered among the states tributary to the Celestial empire, the bond of vassalage has been gradually weakened, and to day the destiny of Cochin China is independent of that of China. Nevertheless, the similarity of their institutions and manners, and their repugnance for all contact with Europeans, have served to maintain between the two countries a sort of political solidarity, Cochin China experiencing the consequence of the conflicts which disturb its old suzerain. In Cochin China, as in China, the government, founded on despotism and served by a powerful hierarchical organization, has witnessed the gradual exhaustion of its principal resources, and seems to be hurrying with mighty strides toward dissolution. If we may judge of the condition of the country from the accounts left us by the Catholic missionaries who penetrated into Cochin China in the seventeenth century, it then showed signs of prosperity and almost a certain air of grandeur. Even allowing for the pleasing illusions of these first apostles, we may believe that such was the case. All these oriental countries have had their days of splendor and civilization. Judging them such as they appear to us to day, stripped of the prestige of remoteness, and so easily penetrated by European conquest, we can

discover in them nothing but symptoms of decrepitude.—The annals of Cochin China date back to a period anterior to the Christian era. But we may say that this is a fact of scarcely any importance. Notwithstanding the care with which some learned men have endeavored to compile a chronological list of the different dynasties, no great reliance can be placed on the discoveries of such oriental erudition. Cochin China has sometimes been directly subject to the Chinese empire, sometimes separated from it; it has been frequently at war with the kingdom of Siam, with Cambodia and Tong-King; it has had its periods of revolution and insurrection: this is, in brief, what we can glean from the historical recitals relating to this country. In the second half of the thirteenth century, Marco Polo directed his steps toward some provinces of Cochin China, especially Tsiampa; but his very incomplete account throws only an uncertain light on the political state of the empire of Anam. We do not receive any more exact notions of the country until the period when the Catholic missionaries, first those from Portugal, then from France, penetrated into Cochin China. These first communications date from the end of the sixteenth century. Europe had no direct relations with the empire of Anam except in the second half of the eighteenth century, which was owing to the influence that the bishop of Adran had acquired at the court of the emperor Gya-long, an influence which he endeavored to use for the advancement of the political interests of France.—Gya-long had had to contend, from the very commencement of his reign, against a formidable insurrection, which had for a time deprived him of his crown. Following the counsels of the bishop of Adran (Monseigneur Pigneaux), he resolved to invoke the support and protection of France, and for this purpose he sent an embassy to Louis XVI. This embassy, which was accompanied by the bishop of Adran, was favorably received at the court of Versailles. Independently of the Catholic religious interest it was greatly to the political interest also of France to cultivate relations with the countries of the extreme east, in which she was outstripped by England, Spain and the Low Countries. A treaty was therefore signed at Versailles Nov. 28, 1787, by de Montmorin, then minister of foreign affairs, and by the bishop of Adran as the representative of Gya-long, in virtue of which the emperor of Cochin China ceded absolutely to France the port of Tourane, and the island of Poulo-Condor, on condition that the French king would send without delay a squadron and a body of troops to assist Gya-long in reconquering his states. Orders were immediately issued to the governor of the French establishments in India for the carrying out of this agreement; but the revolutionary disturbances which broke out soon after in France and throughout Europe interrupted the preparations for the projected expedition. Some officers, and a small number of volunteers, recruited by the

bishop of Adran, went to Cochin China, where they disciplined the small army of Gya-long after the manner of European armies, and enabled that monarch to subdue the rebels. The emperor ever remembered the service they had rendered him; and the bishop of Adran and the French officers, raised to the dignity of mandarins, enjoyed the highest favor at his court. To the end of his reign (1820) Gya-long protected Europeans, and favored the propagation of the Catholic religion.—His example was not followed in this by his successors, Ming-Mang (1820–41), Thieu-tri (1841–7) and Tu-duc. The Europeans were driven from the country, and the Christians were subjected to the most cruel persecution, inspired not by religious fanaticism, but, as in China, by political feeling. Ming-Mang feared that Catholicism might lead to European conquest, and he meant to absolutely forbid all entrance of strangers into his kingdom. At different intervals, from 1820 to 1855, France and England sent ships of war into the bay of Tourane, either to open commercial negotiations in an amicable manner, or to protest against the ill-treatment inflicted on missionaries and on the Christians. These attempts, sustained at times by the voice of cannon, were of no avail. Shut up in his capital of Hué-fou, the emperor felt that he was beyond the reach of European vengeance, and did not trouble himself about the destruction of the miserable town of Tourane.—Nevertheless this state of things could not continue. The number of martyrs increased; several French priests, and a Spanish bishop, Mgr. Diaz, having been put to death, the French and Spanish governments combined to send an army corps into Cochin China. This expedition, under the command of vice-admiral Rigault de Genouilly, took possession of Tourane in 1858, and of Saïgon in 1859. Tourane, a very unhealthy seaport, and of no commercial importance, was soon evacuated, and all the efforts of the allies were directed against Saïgon, the situation of which, at the mouth of the river Mekon, seemed to have great natural resources. The Cochin Chinese were successively driven out of the provinces adjoining Saïgon, and, in June, 1859, the emperor Tu-duc consented to sign a treaty of peace, which ceded to France the provinces of Bién-hoa, Saïgon and My-tho. The French colonies now seem firmly established in this part of Cochin China. The commercial situation between India and China is a favorable one; the soil is fertile; the native population, to whom are added a great number of Chinese immigrants, furnish the labor for its cultivation; finally, the revenues of the new colony are increasing. The government of Cochin China, after having endeavored to disturb the new French establishment by insurrections, seems to have become resigned to the loss of its southern provinces.—Thus has the empire of Anam been forced to bow before Europe, and been drawn, like China, into a political movement entirely new to it. Will its contact with strangers and the contiguity of a French colony

instill new life into it, or will they deal it its death blow? This is a question we may ask to-day of all the old nations of the extreme east, into which European civilization has at last determined to enter and to extend its rule.—BIBLIOGRAPHY: Veuillot, *La Cochinchine et la Tonquin*, Paris, 1859; Pallu, *Histoire de l'expédition de Cochinchine en 1864*, Paris, 1864; Aubaret, *Histoire de la Basse Cochinchine*, Paris, 1867; Taillefer, *La Cochinchine, ce qu'elle est. ce qu'elle sera, Deux ans de séjour dans ce pays, de 1853 à 1855*, Périgueux, 1865; Bouilleaun, *L'Annam et le Cambodge*, Paris, 1875.

C. LAVOLLÉE.

COINAGE. Coinage is fashioning pieces of metal and impressing them with suitable devices to fit them for use as money.—The necessity of some convenient measure or representative of value must have been apparent to mankind as soon as mutual dealings and exchanges were undertaken.—While values at first, especially among barbarous tribes, were estimated by taking such articles as beads, feathers, shells, salt, cattle, and even the perishable products of the earth, for standards, at a very early date metals seem to have been selected for that purpose by every nation whose records have been preserved in history.—On account of their greater convenience, durability, beauty, or desirability for use or ornament, gold, silver, copper, tin pure or alloyed, and even iron, and, at later periods, nickel and platinum, have been used for money; and gold and silver are now universally preferred to all other substances.—It is generally supposed that previous to the invention of coined money the metals subsequently used in coinage had already been adopted as standards, and that a given weight of the metal had become the unit of value, the coins being pieces of the metal conforming to such weight or multiples of it.—This supposition is in harmony with the fact that the names of many early coins are identical with denominations of weights, as the pound, livre, mark, ounce, talent, shekel, drachma, toel, etc.—The earliest writers and historians also give values in definite weights, of bronze, copper, iron, silver or gold, at periods prior to their mention of coined money.—Upon his invasion of Great Britain Cæsar found the ancient Britons using bronze and iron bars adjusted to a certain weight. (DeBello Gallico, liber v., cap. 12.)—The invention of coined money has been claimed for the Lydians by Herodotus, and the coins of Sardes, B. C. 800, are thought to entitle them to the honor. It has also been attributed to the Persians and Ionians, but is more frequently ascribed to Pheidon, the ruler of the island Ægina, a dependency of Argos in Greece, 750 B. C.—The Chinese, however, assert a still higher antiquity for their coins of copper and iron, of which one collection in the United States (Lake Forest, Ill.) contains genuine specimens of the issues under every dynasty from B. C. 250 to the present time. But the national archives of their government contain catalogues not

only of these coins but descriptions of others issued by previous dynasties commencing with Fuh Hi, B. C. 3289. Visual evidence of such early coinage is not accessible at this day, and the existence of many of the emperors who are said to have issued them is considered somewhat mythical. Williams, however, who from long residence in China, was able to obtain very valuable information, in an address delivered by him on Chinese coins, describes those issued from the time of the Yaon dynasty, B. C. 2356, to the Wing dynasty, A. D. 1642, at which time the emperor Kangleh made a catalogue of his collection, which claims to embrace coins of all the subsequent dynasties commencing with the Yaon dynasty.—To make delivery of the exact weights of metal used or referred to in buying and selling, it became necessary to cut or mould and adjust the pieces, so that they would be of the precise weight and in convenient form for handling. The shape was not material, and the earliest rude pieces of metal used as money were of a great variety of shapes—square, hexagonal, octagonal, round, oblong, flat, discs, solid or perforated, circular rings, etc. Those found more portable and convenient and best adapted for use, gained greater currency, gradually superseded others and finally became recognized by custom or law, as definite weights of metal and current money. The mechanic or person fashioning these better forms began to impress them with some characters, names or devices to certify their weight and indicate their proper name. And thus probably coins came to be made and stamped at first by private individuals, and finally by the state or royal authority.—“Coinage,” said Jefferson, “is peculiarly an attribute of sovereignty.” The interests of the people require that the right to coin money should be reserved as a governmental prerogative, for the public faith is the best guarantee of its honesty. The coins of empires and monarchies bear the likeness of the sovereign reigning at the date of their issue, while those made by republics or free cities have usually some device, emblematic, or indicative of the people or state authorizing their coinage.—The devices upon coins are of varied character, from simple letters or figures stamped or punched in the rudest manner to the most graceful lines and beautiful forms that can be impressed upon metal by the highest skill of the engraver's art.—Coins may very properly be divided into two classes, ancient and modern, although some writers distinguish a third, the mediæval.—Ancient coins comprise the coinage of Europe, Egypt and western Asia, to the period when the barbarians invaded Europe and put a stop to all the arts, including that of coinage. Among the ancient coins, the most noted for their beauty and excellence are: 1, Those of Greece, her colonies and others having Grecian inscriptions; 2, Roman and all coins having Latin inscriptions to the time of the Eastern empire, which forms the 3rd class, or Byzantine coins; and 4, All with Arabic or other

inscriptions.—The Greek are the oldest coins extant, and were first struck in gold and silver; they were issued by upwards of 500 kings, and by free cities numbering about 1,600. They are of various designs and styles of execution, from the rudely struck didrachm of Ægina, bearing upon one side a crude representation of a tortoise and on the other the mark of the punch with which it was driven into the die, to the highly finished and perfect gems coined 400 to 200 B.C., with raised devices upon both sides and long and elaborately worded inscriptions.—The earliest Roman coins were struck in bronze about 400 B.C. Silver was introduced about 250 B.C., and gold a half century later. The “as” was the unit of value, was upward of three inches in diameter, and was equivalent to 12 ounces. The emperor Augustus Cæsar commenced the imperial series of gold, silver and copper coins, which lasted nearly 500 years, and included about 300 emperors with their wives and children. Colonial coins were struck in many provinces of the Roman empire, and in nearly the same lands as those of the Greek class.—The Byzantine coins, so called from Byzantium, the Greek name of Constantinople, formed the greater part of the currency of the middle ages; the gold coins are the most noted, and are termed “bezants;” the copper pieces are large in number and possess but little interest. The oriental coins are very numerous in types, and extended from Persia and Hindostan on the east to Spain and Morocco on the west.—Among modern coins those of England form the longest continuous series, and exhibit a gradual improvement in artistic designs and mechanical execution.—In tracing the advance in the art of coinage it will be instructive to contrast Roman coins and methods of manufacture in their best days with the coins and processes employed at the present time. A coin, to best fulfill the purposes for which it is intended, should be of the most convenient form for counting and handling; it should be of an alloy of the metals in such proportion as will make the hardest metal for resisting wear compatible with being struck by dies; it should bear engraved devices of such a character as guarantees the fineness and value, and the devices should be properly protected from abrasion by a raised rim, which also enables a number of single pieces to be arranged in piles of uniform height. The engraved devices should be sufficiently elaborate to render counterfeiting difficult, but not so minute and delicate that the coins will soon become smooth from abrasion.—Under the Roman empire, even at the time when the art of coinage was brought to its highest development, the process of manufacturing coins was a laborious operation and required many artists and workmen. First was the *optio*, or director; then *exactores* or *nummularii*, assayers; *scalptores* or *calatores*, die engravers; *cenarii*, refiners; *fusarii* or *flatuarii*, melters *equatores*, adjusters; *signatores*, who certified the same; *suppostores*, who placed the pieces

on the dies; and *malleatores*, who struck the blow. The metal was assayed, refined and cast into bullet-shaped pieces. This was necessary to bring out the high relief, the busts on Roman coins being very prominent. The bullets were placed between the dies which were struck by hammers. As the edges were unprotected, or not confined by a collar, they spread out into an irregular circular form; such pieces could not be piled, and the high relief of the devices rapidly became abraded, while the irregular outline afforded opportunity for fraud by clipping off portions of the metal.—This rude and imperfect mode of coining continued without any improvement of importance until about the middle of the sixteenth century, when the screw press was employed for striking coins. This consisted of a screw carrying the upper die and worked by a revolving arm or lever, the lower die being firmly fixed beneath. The edges of the coin were, however, still left in a ragged, unfinished state, and the collar was introduced to confine the piece at the time the impression was made. The collar also imprinted upon the edge of the piece, as it expanded under the blow, whatever devices or legends were engraved upon the inside.—The next improvement in the art of coinage was the invention by M. Castaing, in 1685, of the milling machine. This not only placed upon the edges the intended devices, but raised them so as to protect the face of the coin from abrasion.—The use of steam for coinage machinery, and the invention of the toggle joint press, left nothing to be desired in rapidity of execution of the coins and uniformity in the blow or pressure given to the planchet. The method of receiving, melting and coining gold bullion, as conducted in the United States mint, or that of any other well appointed mint, will show the greater superiority in accuracy, mechanical skill, and rapidity and economy of manufacture, attained at the present day, in contrast with that in vogue among the Romans and Grecians.—Gold bullion as received at the mint is weighed in the presence of the depositor, and a receipt or certificate of the weight of the deposit is given him. The bullion is then melted and cast into a bar. In this process the base metals contained, if any, are, by the use of oxidizing fluxes, to a greater or less extent removed. A sample is cut from the bar for assay, and from the fineness thus ascertained and the weight after melting, the value is calculated and paid from the bullion fund to the depositor, less the mint charges for parting, refining and toughening, or for such of these operations as are required to fit the bullion for coinage, and also the charge for the amount of copper alloy required to bring the bullion to standard fineness.—The deposit now becomes the property of the government, and if containing partible silver is sent to the refinery, in order that the silver and gold may be separated. In the United States mint this operation is conducted by means of acids which have no effect upon the gold, but unite with and hold in solu-

tion the silver and such base metals as remain after melting and fluxing. After the solution containing the silver has been drawn off, the gold which remains in the form of a fine powder is washed and pressed by hydraulic pressure into cakes, which are dried, melted, cast into bars and assayed, preliminary to manufacturing the ingots for coinage. In some foreign mints the separation is accomplished by passing a current of chlorine gas through the metal while in a melted condition, converting the silver into a chloride, which is decanted or otherwise removed from the gold. The result obtained by either operation is the same, procuring ductile gold, nearly or quite pure, to be alloyed with copper in the proper proportion to make standard metal. Sufficient copper is added to the gold to reduce its fineness to 900 thousandths, and the metals are melted, thoroughly stirred, and poured into moulds, which form it into ingots of from 10 to 12 inches in length, $\frac{3}{8}$ of an inch to $1\frac{1}{8}$ inches in width, and $\frac{3}{16}$ to $\frac{1}{2}$ of an inch in thickness, the size depending upon the denomination of coin that is to be made. After the metal has solidified in the moulds the ingots are removed, cooled in water slightly acidulated with sulphuric acid, the edges filed smooth, and the sunken tops cut off with shears.—Each melt of ingots is carefully assayed, and if the fineness is not safely within the legal tolerance, it is remelted.—Rolling is the next step in the process. The ingots are passed several times between heavy rolls of chilled iron or steel, until the strips produced are brought nearly to the proper thickness for the desired coin, the distance between the rolls being adjusted and reduced each time by screws and an index guide.—After rolling, the strips are annealed by being heated to redness and plunged in water; one end of each is tapered by the “pointing rolls,” and the pointed end is introduced between two fixed dies of hardened steel on the draw bench; it is grasped by iron jaws which connect with an endless chain and the strip is forcibly drawn between the dies. The result is that all irregularities left by the rolls are removed and the strip is rendered uniform in thickness. This operation requires the most delicate adjustment of the draw bench dies, for the nearness to standard weight of the pieces cut from the strips depends upon the accuracy of the machinery as well as the skill and judgment of the workmen.—The strips are then taken to the cutting press, in which a punch of steel of the same diameter as the desired coin descends into a steel bed, and the strip being introduced between the punch and bed, at every stroke a blank or “planchet” is cut out and falls into a catch box below. The blanks are then cleaned, and, in the case of those for the gold coins and standard silver dollar, each one is weighed on a delicate balance; those found too heavy are filed to the proper weight, while those too light are returned, together with the strips from which the planchets were punched, called clippings, to the melting pot.—Subsidiary silver and minor

coins are not adjusted by hand, reliance being placed upon the accuracy with which the draw bench does its work, to bring the blanks within the legal limits for weight.—To protect the engraved surfaces of the coin from abrasion, the blanks are now “milled,” which consists in raising the edges. The milling machine is a steel disc with grooved edges revolving horizontally, and a cheek of steel also grooved, that can be fixed by set screws at a distance from the disc slightly less than the diameter of the blanks, which are placed in an upright tube and carried one by one between the cheek and disc, and as the latter revolves the piece is rotated and finally delivered into a suitable receptacle. The pinching rounds the sharp edges left by the cutting punch and thickens the whole circumference at the expense of the diameter.—The milled planchets from the various operations of rolling, annealing, etc., have become discolored by the oxidization of the copper alloy, to remove which they are heated in an annealing furnace to a red heat and immersed in a bath of sulphuric acid and water, which removes the oxide of copper and leaves the pieces bright and clean; they are then dried in sawdust containing no resinous matter and are ready for the coining press.—In the United States mint the coining press used is what is known as the “toggle joint” press. The blanks to be struck are put into an upright tube on the press, from which they are successively taken by the feeders, two pieces of steel which clasp the lowermost blank in the feeding tube and carry it forward and deposit it in a circular ring or collar in which it is struck; the collar not only prevents the blank from expanding in diameter under the force of the blow, but on the inside is fluted or grooved, which gives the finished coin its grooved, or, as it is termed, the “reeded” edge. At each revolution of the press the upper die descends and strikes the piece within the collar; the lower die then ascends and pushes the coin out of the collar, and it is carried forward by the feeders, as they bring another blank to the collar, and it drops into a box placed below the press. The dies with which the coins are struck are made of steel engraved with the devices and inscriptions in intaglio, which appear upon the coin in relief.—*American Colonial Coinage.* During the early days of the American colonies the metallic circulation consisted chiefly of foreign coins. A coinage, authorized by the colonial assembly of Massachusetts, was commenced at Boston in 1652, and continued for 34 years, consisting of shillings and of six and three pence pieces. At first they were irregular in shape, with the denomination stamped on one side in Roman numerals and the initials N. E. on the other. These pieces being little better than planchets afforded opportunity for fraudulent clipping of the edges, and the designs were soon changed; on the obverse was a pine tree in a double ring, containing the inscription “Massachusetts in,” and on the reverse the date and denomination in the centre and “New England

An. Dom." between the rings—In 1722, during the reign of George I., coinage of pieces known as the "Rosa Americanas" was made by authority of the British government for circulation in the American colonies; and in 1773, in the time of George III., a copper coinage was executed for Virginia. From 1778 to 1787 the congress of the confederation had the sole and exclusive right and power of regulating the alloy and value of coin struck by their own authority or by that of the respective states. In June, 1785, Vermont granted to Reuben Harmon, Jr., the right to coin copper money for that state. Connecticut, on the 20th of October, 1785, authorized Jas. Hillhouse, Jos. Hopkins, Samuel Bishop and John Goodrich to coin copper pieces to an amount not exceeding 10,000 pounds. In June, 1786, New Jersey also issued a grant to Walter Mould, Thos. Goodsby and Albion Cox to coin 10,000 pounds; and on the 22nd of October authorized Thos. Goodsby and Albion Cox to coin two-thirds of the same amount. Massachusetts, on Oct. 17, 1786, passed an act establishing a mint which coined cents and half cents.—The earliest coins struck by authority of the United States are known as "Fugios." The following resolution of the congress of the confederation, adopted July 6, 1787, authorized their coinage and specified the devices and inscriptions: "*Resolved*, That the board of treasury direct the contractor for the copper coinage to stamp on one side of each piece the following device, viz., thirteen circles linked together, a small circle in the middle, with the words 'United States' round it; and in the centre the words 'we are one;' on the other side of the same piece the following device, viz., a dial with the hours expressed on the face of it; a meridian sun above, on one side of which is to be the word 'Fugio,' and on the other the year in figures, '1787,' below the dial 'mind your business.'" Besides these, a variety of copper pieces were coined by private enterprise both in this country and abroad.—*Coinage of the United States.* The constitution of the United States (Art. 1, Sec. 8) vested in congress power to coin money and regulate the value thereof, and of foreign coins. Shortly after the organization of the general government a mint, for the purpose of national coinage, was established by the act of April 2, 1792, to be situated and carried on at the seat of government of the United States, then at Philadelphia.—Upon the removal of the seat of government to Washington it was provided that the mint should remain in the city of Philadelphia until March 4, 1801. By similar provisions in subsequent acts, the period was extended from time to time until 1828, when its location in that city was made permanent until otherwise provided. All the coinage of the United States, prior to 1835, was executed at Philadelphia. By the act of March 3, of that year, branch mints were established at Charlotte, N. C., and at Dahlonega, Ga., for the coinage of the gold mined in the vicinity of those places; and at New Orleans, for the coinage of

silver imported from Mexico. Shortly after the discovery of gold in California, by the act of July 3, 1852, a branch mint was authorized to be established at San Francisco, Cal.—The discovery of gold in the Colorado placers secured a mint for Denver in 1862, and the rich deposits of the Comstock lode induced congress, in 1863, to authorize the establishment of a mint at Carson, Nev. Although a coiner was appointed, no machinery for coinage was purchased, and no national coins have been struck at the Denver mint.—By the coinage act of 1873 the Denver and Charlotte mints were changed into assay offices. Coinage was suspended at New Orleans from the commencement of the war in 1861, until 1878.—Besides the mints mentioned, assay offices for the accommodation of the mining and commercial interests of the country have been established at New York, Boise City, Idaho, Helena, M. T., and at St. Louis, Mo., where gold bullion is received and its net value paid to the depositor, less the charges, as at the mints. At the New York assay office silver as well as gold bullion is received for manufacture into fine bars and for separating the gold and silver. Neither of these operations is carried on at the other assay offices or at the Denver mint.—The coinage act of 1792 established the silver dollar as the unit. It contained $371\frac{1}{2}$ grains of pure, or 416 grains of standard, silver; this proportion made a fineness of about $892\frac{4}{10}$ thousandths, and was deduced from the supposed average contents of the Spanish milled dollar as then current. This act fixed the relative value of silver to gold in the coinage as 1 to 15, and the fineness of the gold coins at 11 parts pure gold and 1 part of alloy. This fineness corresponded to the standard of British gold, $916\frac{2}{3}$ thousandths: the eagle contained $247\frac{1}{2}$ grains of pure, or 270 of standard, gold.—The act of June 28, 1834, reduced the amount of pure gold in the eagle to 232 grains, and fixed the weight at 258 grains; the consequent fineness, therefore, was $99\frac{2\frac{2}{3}}{1000}$.—The act of Jan. 18, 1837, established 900 as the fineness for both gold and silver, but did not change the standard weight of the eagle, which therefore increased the pure gold contained to 232.2 grains. This act also reduced the standard weight of the silver dollar to $412\frac{1}{2}$ grains; but as the fineness was increased proportionate to the reduction in weight, the amount of pure silver contained remained the same.—By these changes 25.8 grains of gold and $412\frac{1}{2}$ grains of silver could each be coined into a dollar, and the relative value of silver to gold in the coinage became as 25.8 to 412.5, or 1 to 15.98 nearly. As France was then coining silver and gold at a relative valuation of 1 to 15 $\frac{1}{2}$, and other European nations at a valuation of silver also higher than that of the United States, an ounce of French or English gold taken to the United States would buy 15.98 ounces of silver, of which silver taken to France but 15 $\frac{1}{2}$ ounces would be required to purchase another ounce of gold, leaving .48 of an ounce, or

3 per cent., for profit and expense of transfer. In consequence of this the full-weight silver coins were exported, causing a scarcity of United States fractional silver coin, so that the silver circulation consisted mostly of smooth, abraded Mexican and Spanish silver coins. In order to prevent exportation of United States fractional silver coins the act of Feb. 21, 1853, reduced their weight to 384 grains of standard silver to the dollar's worth, and further provided that no deposits of silver bullion should thereafter be received for coinage into fractional coins, which were to be manufactured solely on government account from silver purchased for that purpose. The coinage of silver dollars, though commenced in 1794, amounted, up to 1840, to but \$1,501,822, having been wholly suspended for 30 years originally in 1806 by executive order. They continued to be coined for depositors of silver bullion until discontinued by the coinage act of 1873, which authorized the coinage of the trade dollar of 420 grains in its stead. This coin was not intended for circulation but for export to oriental nations; 35,959,360 were struck, of which 27,089,877 were exported. When, however, from the decline in the value of silver, 420 grains became of less value than a dollar, it was profitable to owners of silver bullion to have it coined into trade dollars for circulation. Their coinage was therefore limited by joint resolution of congress, of July 22, 1876, to the actual export demand. Since April, 1878, their coinage, except for specimen pieces, has been suspended.—The coinage act of 1873 created the mint bureau as a special division of the treasury department, with the director of the mint as the chief officer, under the general direction of the secretary of the treasury. Prior to the passage of this act the chief officer was the director of the mint at Philadelphia, and the other mints were branches of that institution; they are now independent of each other, and each is in charge of a superintendent who reports to the mint bureau.—The coins authorized by the coinage act of 1873 are; in gold, the double eagle, eagle, half eagle, quarter eagle, three dollar and one dollar; in silver the trade dollar, half dollar, quarter dollar and dime; and in base metal, the five, three and one cent pieces.—The act of Feb. 28, 1878, authorized the coinage of the silver dol-

lar of 412½ grains, and made it an unlimited legal tender.—All United States gold and silver coins are of the standard fineness of 900 parts of fine metal and 100 parts of copper alloy, of which, in the case of the gold coins, not more than one-tenth may be silver, and in the silver coins consists wholly of copper. The unit of coinage is the gold dollar of a standard weight of 25.8 grains, and the other gold coins are multiples of this weight. The trade dollar weighs 420 grains, the standard silver dollar 412½ grains, and the divisionary parts of the dollar—the half, quarter and dime—weigh, respectively, 12½, 6¼ and 2½ grammes. The minor coins are as follows: the five and three cent pieces, composed of an alloy of three-fourths copper and one-fourth nickel, weigh, respectively, 77.16 grains and 30 grains; the one cent weighs 48 grains, and is 95 per cent. copper and 5 per cent. tin and zinc.—It being impracticable to make every coin rigidly conform to the prescribed standard, a deviation is allowed in the fineness of gold coins, of one thousandth, and in silver coins of three thousandths. The legal tolerance for weight for the double eagle and eagle is one-half of a grain; for the half eagle, quarter eagle, three dollar piece and dollar, one-fourth of a grain; and for each silver coin one and a half grains. The minor coins can not deviate more than twenty-five thousandths in the proportion of nickel, nor vary in weight from the standard more than three grains for the five cent piece, and two grains for the three and one cent pieces.—The gold coins of the United States are a legal tender in all payments at their nominal value, when not below the standard weight and limit of tolerance provided by law for the single piece. The standard silver dollar has unlimited legal tender, and the silver coins of lesser denominations are legal tender in all sums not exceeding ten dollars, in full payment of all dues public and private. The minor coins are legal tender at their nominal value for any amount not exceeding twenty-five cents in any one payment.—The total coinage of the United States mints, from their organization to the close of the fiscal year 1881, amounted to \$1,545,508,866.65.—The following table shows the amounts coined, during the different periods named, at the various standards of weight and fineness:

COINAGE OF THE UNITED STATES MINTS BY PERIODS OF CHANGES OF STANDARDS.

PERIOD.	Gold.	Full Legal Tender Silver.	Subsidiary Silver.	Trade Dollars.	Minor Coins.
1792 to 1834.....	\$ 11,823,890	\$30,273,077 90	\$ 638,591 58
1834 to 1853.....	224,965,730	42,938,294 00	787,885 81
1853 to 1871.....	544,864,921	5,538,948 00	\$57,443,719 20	9,979,361 16
1871 to 1881.....	430,180,615	91,372,705 00	50,455,249 50	\$35,959,360	2,262,438 45
Total	\$1,211,837,186	\$176,135,024 90	\$107,899,018 75	\$35,959,360	\$13,688,277 00

HORATIO BURCHARD.

COLFAX, Schuyler, was born at New York city, March 23, 1823. He became a newspaper editor in South Bend, Ind.; was a representative in congress, 1855-69; was speaker of the house 1863-9; and was vice-president of the United States, 1869-73.—See Martin's *Life of Colfax*; Moore's *Life of Colfax*. A. J.

COLONIZATION SOCIETY. (See ABOLITION.)

COLORADO, a state of the American Union. It was organized as a territory, Feb. 28, 1861, about two-thirds of it being taken from Utah and Kansas territories, and the remainder from Nebraska and New Mexico. An enabling act was passed March 21, 1864, and a state constitution formed under it was rejected by popular vote. In September, 1865, a second constitution was ratified by popular vote. Under it two acts for the admission of Colorado as a state, May 15, 1866, and Jan. 29, 1867, were vetoed by president Johnson. March 3, 1875, another enabling act was passed, and a state constitution formed under it was ratified by popular vote, July 1, 1876. Aug. 1, 1876, as directed in the enabling act, the president, by proclamation, announced the admission of Colorado to the Union. Its boundaries were as follows: "Beginning at the intersection of longitude 25° west from Washington and latitude 37° north; thence north to latitude 41° north; thence west to longitude 32° west from Washington; thence south to latitude 37° north; and thence east to the place of beginning."—The governor was to hold office for two years, and the capital was fixed at Denver. Provision was made that electors in 1876 should be chosen by the legislature, and, as this body proved to be republican, the vote of Colorado really decided in advance the presidential election of 1876. (See DISPUTED ELECTIONS, IV.) The state has since been republican in politics.—*Governors*: John L. Routt (1877-9), F. W. Pitkin (1879-81).

ALEXANDER JOHNSTON.

COLOMBIA. (See NEW GRANADA.)

COMMERCE. If we examine, in detail, the operations of commerce, while some impress us by their grandeur the greater part seem insignificant and commonplace. But they appear in a totally different light when we consider them in the aggregate, and in their results. The exchange of products and services is, in the last analysis, the very foundation of human society. The diversity of products and productive faculties is the bond which unites to one another the inhabitants of the same locality, the city and the country, the provinces of the same country, different nations, and even the most widely separated parts of the globe.—Virgil expresses this idea in beautiful verses, and Addison in prose, no less classical. But what was true in their time is still more so in ours. The products by the means

of which commerce brings nations into close relations are, in the "Georgics," a few articles of luxury, perfumes and ivory. What brings them together in the "Spectator" is the toilet of a fashionable woman—her arsenal of coquetry, supplied by a hundred countries.—We might say that the effect is produced in our day by the same articles, but there are others of much more general consumption. The breakfast of the most humble inhabitant of our temperate zone is furnished him by the torrid, to which Providence has allotted the production of tea, coffee, cacao and sugar. A filament, cultivated some thousands of miles from Europe—cotton—forms an important part of the clothing of all Europeans, rich and poor; while, on the other hand, Africans, Americans, Asiatics and Australians wear for the most part cottonades, woollens, linens and silks from the factories of Europe. Such is the close solidarity which the commerce of our age has established among all parts of the world.—The history of commerce is not, properly speaking, that of civilization—not even of purely material civilization; it does not especially treat of industry, nor of agriculture, finance or public administration. It comprehends, nevertheless, all of these, more or less. We can not describe the operations of commerce without speaking at least briefly of the condition of the agriculture and manufactures which sustain it, as well as of the governmental measures which encourage or paralyze it. The history of commerce is scarcely distinguishable in some respects from that of our entire civilization. What, then, are the chief principles and essential result of commerce? First, the division of labor between the inhabitants of the same place; then the division of labor between neighboring places; finally, that between all the different countries of the earth. Exchange of products has its origin in the diversity of products and occupations. Becoming more active, and increasing in the course of centuries, in turn it promoted this diversity. Under its influence different places, different countries, found it to their advantage to produce certain articles by way of preference, and to purchase others. This harmony, the proper equilibrium of productions, is not yet realized in the world; to bring it about, tentative and protracted effort is still necessary. But it is a fact to-day that the progress of commerce corresponds to, and is identical with, that of the division of labor. But the progress of the division of labor is the progress of civilization itself. This fruitfulness of the division of labor, asserted by political economy, is not confined to workshops and factories; it extends to all the works of man; it is found in the sciences and the fine arts, just as in industry. And so we can not give a history of commerce without at the same time giving somewhat of the history of civilization itself.—The history of commerce is interesting on account of the lessons we may draw from it. It furnishes a refutation of that spirituality which disdains or reproves commerce,

and in general that material labor without which commerce could not exist, and which could not exist without it. Argument shows that material labor is a work of the intellect; that far from degrading it, it gives the mind control over matter; that without the ease and leisure that it guarantees, nations could never have cultivated letters, science and the fine arts. History shows, moreover, that wherever commerce has prospered, letters, science and the fine arts have flourished. We know nothing of their cultivation in Tyre or Carthage, but what were the most brilliant centres of ancient Greece, if not the busiest commercial centres—Ionia first, then Corinth and Athens, and, in latter times, Alexandria? The genius of the Arabs, aroused by religious enthusiasm, appeared with equal splendor in the material and the moral order. It was the commercial prosperity of Venice, Genoa and Florence that prepared the Italy of the Medicis. The Flemish and Dutch schools had their origin among the merchants of Bruges, Antwerp and Amsterdam. Under the general impulse received from Louis XIV. and Colbert, France has already enjoyed three centuries of commercial and industrial, as well as scientific and literary grandeur. The French, the Anglo-Saxons in Europe and America, and the Germans, are to-day the most commercial, the most industrial and the richest nations in the world; they are also the most enlightened.—The history of commerce shows what are the conditions of this prosperity. From it we learn that nature has done much for commerce; for not only has she distributed her gifts among the different countries, as irresistible magnets to attract their inhabitants toward each other, but she has distributed land and water over the globe in such a manner as to facilitate and incite them to intercommunication. She has disposed the islands in certain seas like the links of a chain; she has regulated the currents; she has detached the peninsulas from the continents, and formed isthmuses between them; she has established ways of communication in the interior of countries, by hollowing out the beds of streams and rivers. She has studded the deserts with oases, and prepared roadsteads and ports on the coasts. She has created those living vehicles, the ox, the ass, the horse and the camel. She has endowed certain races of men with a taste for traffic, the Semitic race, for instance, which produced the Phœnicians, the Carthaginians, the Arabs and the Jews; and she has invited and even forced into commerce and navigation those dwelling on the banks of rivers, and on the seacoast. But history teaches that all these gifts of nature would have been sterile, if men had not known how to make use of them, and that commerce could flourish only under certain conditions which depend upon their wisdom and their will.—If commerce were to reserve its gains for the most fertile soil and the finest climate, it would never cease to vivify this region of western Asia, which has lost nothing of its

natural magnificence since ancient times, since it was made famous by the Arabs. If commerce exhibited any such favor, it would prefer to-day the sun of Spain to the mists of England. Events of greater importance may, undoubtedly, cause it to abandon the parts which it once frequented and enlivened the most, thus Italy can no longer be, by itself, what it was from the time of the crusades to the discovery of the cape of Good Hope. But, in the end, it is the intelligence and the labor of man that attract and retain it. Civilized man draws wealth from the most ungrateful soil; he accumulates treasures on a rock, in lagoons or marshes, the possession of which he obstinately disputes with the sea. He transplants from one country to another the vine and the silkworm, and makes wine and silk important articles of European commerce; he constructs highways and canals; he excavates basins and builds docks; he braves the frost of the polar regions, and the heat of the tropics. With the compass and the sail, he fearlessly crosses the ocean; with steam, railroads, and the electric telegraph, he annihilates time and space.—The labors of man whereby commerce lives and increases, suppose security as a fundamental condition. Commerce flourishes only when, as in the time of king Solomon, each one reclines without fear under his own vine and fig tree.—This security, which the individual could not alone obtain for himself, is the fruit of association; it depends upon the good order and power of the state. Within the state, it is destroyed by anarchy, or by those silly despotisms, such as exist in our day, which do not even know how to protect persons and property. From without it is menaced by war and barbarity. During the greater part of the centuries that have elapsed, commerce has been constantly exposed to their threats, and has escaped them only by infinite pains. In many countries religion has taken it under its protection; it became a pilgrim, and established its markets and bazaars near the sanctuaries of Meccæ, the mosques of Mecca, or the pagodas of Benares. In order to preserve itself from pillage or piracy, it made use of caravans, convoys and military escorts. When warlike hordes ravaged the mainland, islands, or points naturally fortified, afforded places of shelter. In the middle ages the cities leagued together and maintained an obstinate struggle against brigandage and feudal exactions. In our day, thanks to the political system of modern Europe, and to the progress of international law and of enlightenment, the security of commerce is perfect, or disturbed only by accidental causes, throughout all the vast domain of modern civilization.—But there are other conditions necessary. The question is asked, which is the more favorable to commerce, authority or liberty; or, to speak more clearly, an enlightened despotism or a wise political liberty? The reply which history furnishes varies according to the temperament of the people under consideration, their progress in civilization, and other circumstances.

Aside from the security which both equally guarantee, an enlightened despotism in the hands of a Cromwell, a Louis XIV., a Peter I., or a Frederic II., imparts a vigorous impulse to commerce. It may degenerate into blind and violent tyranny; but liberty also degenerates into license. The prolonged rule of despotism leads, however, to stagnation, inertness and decay, as is witnessed by the Roman empire and the kingdom of Spain. Liberty preserves the life and progress of commerce, and has its great citizens, as authority has its great monarchs. Under the two-fold excitement of religious and warlike zeal, the Arabs, though subject to caliphs possessed of absolute power, were regenerated, and became a great commercial race. But most wonders of commercial prosperity have been the work of liberty. It was liberty that gave prosperity to Tyre, Carthage, and the principal cities of Greece. It was liberty that, in the middle ages, animated the mercantile republics of Italy, as well as the communes of Flanders and Germany. It is to liberty that Holland is indebted for its extraordinary prosperity two centuries ago. The three great commercial powers of our times, England (since the year 1688), the United States (since 1783), and France (since 1815), are the offspring of liberty.—The history of commerce admits of the same division as political history, into ancient, mediæval and modern. The first period extends from the earliest times to the fall of the Roman empire in the year 476 of the Christian era. The second embraces the centuries from 476 to 1492, the year of the discovery of America. The third period begins with 1492 and extends to our own time. We shall endeavor, successively, to run over, or, to speak more correctly, to give a simple outline of the history of these three periods as well as the restricted limits of our present work will permit.—We need not here begin with the night which preceded the earliest dawn of civilization, nor go back to the primitive times in which exchange alone, in the restricted sense of the word (*barter*) was practiced among men, and when the division of labor, by causing the creation of money, gave birth to commerce properly so called. Commerce was originally restricted to the land, and practically remained so during the first and even to the end of the second period, that is, until the discovery of America. The earliest homes of commerce were Asia and Africa; its invigorating influence was not felt in Europe until somewhat later. In Asia and Africa, it was gradually developed by the aid of caravans or troops of merchants, who combined their forces to defend themselves against the common dangers of the journey. Thus regular routes were marked out through the deserts; stations, markets, and afterward more or less important commercial centres, were established. In the midst of these often barren solitudes the camel was of great service as a beast of burden. The special objects of commerce were things easy of transportation but of great value, such as spices, perfumes and pre-

cious stones. The three continents of the old world form one compact whole, whose different countries could communicate with one another without the aid of navigation. Navigation, however, came in its turn. It originated on the coasts of Asia and Africa. It was for a long time confined to the coasting trade, and men were very slow to overcome the fear with which the sea inspired them. The Mediterranean, on which all three continents border, affording, at a relatively moderate distance a multitude of islands, bays, sounds, peninsulas and projections of land, became, from the pillars of Hercules to the Black sea, the principal theatre of the maritime commerce of the ancients. Its domain was afterward extended to the Persian and Arabian gulfs, and then to the Indian ocean.—In the beginning, commerce was naturally timid and uncertain. It had to contend against rebellious elements, it was paralyzed by incessant wars, and fettered by a defective social state, which was lacking in security; in some countries castes existed, and slavery was found everywhere. Capital was rare, credit unknown. The merchant always traveled with his merchandise, and his profession was generally held in contempt. Still, notwithstanding all these obstacles, we find noble efforts of human intelligence in the way of commerce, and memorable results achieved by them.—The first nations to engage in commerce were the Hindoos, the Arabs, the Chinese, the Babylonians and the Egyptians. In India, which is ruled by castes, the merchants, farmers and artisans form the lower classes. The great pilgrimages near the holy places, such as Benares, Ellora, etc., concentrated the commerce of the interior around the temples and bound it to the worship of the country. Possessed of immense natural wealth, and of remarkable industry, India was in no way dependent upon other countries. In her exterior commerce, therefore, she left the fatigue and perils of long voyages to the strangers who came to her frontiers to buy her products with gold, and still more with silver. But because of certain products which the west could not raise and which it could not do without, such as spices, dye-stuffs, cotton, steel, precious stones, ivory and fine woods, India offered irresistible attractions to the merchants of the west. The inhabitants of India were not navigators. The foreign merchants who visited them landed at a certain point on the western coast.—The direct commerce with India was controlled mainly by the Arabs. While the Arab of the desert was a nomad, the Arab of the coast became a navigator. Confined within a narrow province bordering on the desert, he turned his eyes toward the sea, and the country lying beyond it. While other nations brought silver into India, but rarely any merchandise, the Arabs possessed in their spices and perfumes the richest elements of an active commerce.—It was not with the west alone that India cultivated commercial communication. It also had important relations, though less is known of them, with

China from that country it imported silk for use in India, where the great and the rich were clothed with this material. There were several commercial routes uniting the two countries.—In the fertile country of Asia also, we should mention Babylon, situated between the two great rivers, the Tigris and the Euphrates, which, at an epoch when Europe was still plunged in obscurity, was a rich and populous city, a grand commercial metropolis, and the emporium of all western Asia, with which it communicated by several well-built roads.—In Africa, Egypt—civilized in ancient times, though submitted, like India, to the system of castes—had, thanks in particular to the Nile and its canals of every kind, a most active internal commerce. But its mariners navigated only the streams of the interior; for down to the time of Psammetichus and of Necho, superstitious Egypt had a horror of the sea. She abandoned her maritime commerce and her foreign exchange to the Phœnicians, and in part to the Arabs. Her commerce by land followed two principal routes in the interior of Africa, one of which crossed the desert of Barca, and the other followed up the Nile, and then shaped its course by the great and the small oases toward Ethiopia, and the eastern coast of Africa. In the seventh century before Christ foreign influence, particularly that of the Greeks, began to make itself felt in Egypt. Up to that epoch the suspicious policy of the Pharaohs and the intolerance of the priests had hermetically sealed the entrance to the country against them. King Psammetichus, in 656, was the first to put an end to this isolation, and their maritime commerce was developed, but through the intervention of the Phœnicians and the Greeks, because the country had no wood fit for ship-building.—The people of antiquity most skilled in commerce and navigation inhabited a narrow strip of territory which formed part of Syria. The history of the Phœnicians seems to date back to 1800 years before Christ. It comprises three periods. In the first, Byblus, Berytus (Beyrout) and Aradus extended their operations along the eastern part of the Mediterranean. In the second, from 1600 to 1200, the Phœnician cities, with Sidon as their capital, extended their sphere of operations, and their ships passed the pillars of Hercules. Finally, in the third, from 1100 to 750, the supremacy passed to Tyre, and the commercial grandeur of Phœnicia attained the zenith of its glory; but it declined little by little, and was eclipsed after the Persian conquest.—The geographical position of the country, the possession of the woods of mounts Libanus and Anti-Libanus, the sterility of the soil, and the vicinity of the opulent continent of Asia, led the Phœnicians to engage in ship-building and commerce; they began by piracy. Sidon is mentioned several times in the Old Testament. The prophet Isaiah calls Tyre "the city which distributes crowns and whose merchants are princes." Homer likewise often speaks of the commercial operations of the Phœ-

nicians, and of the cunning which they displayed in them. The Phœnicians had founded colonies in Africa as early as the twelfth century before Christ. Carthage, the most celebrated of the cities established by them, dates from the year 818, and in Solomon's time, about the year 1000, the route along the southeast coast of Spain was quite common. The Tyrians occupied the island of Cyprus near by, which, independently of its importance as a commercial point, became, by the wealth of its products, the great supply market of a barren coast.—The geographical discoveries of antiquity may, almost without exception, be attributed to the Phœnicians. In truth, from their expeditions down to those of the Portuguese and Spaniards, the chart of the eastern hemisphere, at least so far as its coast was concerned, did not undergo any perceptible change. Did they penetrate as far as the Baltic sea for the trade in yellow amber? Whether they did or not, they navigated south along the entire Arabian gulf and the west coast of India, as far as the island of Taprobane (Ceylon). The routes overland passed by way of Damascus and Palmyra, until they joined the great commercial route which extended from these cities to Babylon, Persia and the interior of Asia. They communicated with Egypt by a route which extended as far as Memphis. But their greatest progress was toward the west. They did not fear to brave the high seas in this direction. In all probability the island of Madeira and the Canary islands (the Fortune islands) were not only visited but colonized by them. Their establishments along the western coast of Africa extended to cape Blanco, if not to cape Verde, and the Carthaginians only followed in their wake. The voyage of Hercules (who was their principal divinity) around the ancient world, is the poetic picture of the immense expansion of their navigation and commerce.—With the history of Phœnicia, that of Carthage, the most powerful and most noted of its colonies, is intimately connected. There was but little mention of Carthage during the first centuries of its existence. From the time of the subjugation of Tyre by the Persians, it rapidly increased in wealth, territory and influence. Most of the Greek and Phœnician colonies on the northern coast of Africa were forced to recognize its power, and it soon passed the straits of Gibraltar, acquired fixed stations in Spain, occupied the Balearic isles, Corsica and Sardinia, closing with Sicily and Malta the circle of its dominions. The principal theatre of its mercantile activity was the west of the Mediterranean, where it regarded itself as the legitimate heir of Tyre. Of all its possessions, Spain was, especially after the loss of Sicily, by far the richest and most important. The rich mines of silver that were discovered and worked by the Phœnicians were the powerful magnet which attracted the Carthaginians thither. They possessed themselves of all the ancient commerce of the Phœnicians beyond the straits of Gibraltar, and increased it. They also traded

directly with the interior of Africa overland by means of caravans — We come now to the Greeks. Inhabiting a country washed on three sides by the sea, indented by numerous bays, and surrounded by numerous islands, this people early and successfully applied themselves to navigation. The Greeks were not as skillful and enterprising merchants as the Phœnicians; but the extent and versatility of their genius were manifested even in their commerce. From the point of view of progress in civilization, the commerce of the Greeks among themselves, though confined within a comparatively small radius, is by far the most interesting of antiquity. The spectacle presented by the southeast of the Mediterranean between the shores of Asia and Greece, and in the numberless islands of the Archipelago, is unique of its kind. The commercial intelligence of the Greeks is attested by their regulations concerning insurance, loans on bottomry, freighting, etc., which originated in Athens, and by the maritime laws of Rhodes, which remained the accepted maritime code down to the middle ages.—Attica, and the neighboring isthmus of Corinth, form the chief theatre of the traffic of continental Greece. The most important object of the commerce of Athens was the grain necessary for the consumption of that city, for the soil of Attica does not seem to have been much more fertile at that epoch than it is now. This grain came from the countries bordering on the Black sea, particularly from the Tauric Chersonesus, or Crimea, which were, twenty-two centuries ago, as they are to-day, inexhaustible granaries. Corinth also deserves special mention. Its commerce was even more extended and more varied than that of Athens. It was the great warehouse of Greece.—The commercial domain of Greece comprised, moreover, not only Hellas, Thessaly, the Peloponnesus and the islands of the Archipelago, but also Asia Minor, lower Italy or greater Greece, Sicily, and the numerous colonies on the coast of the Black and the Mediterranean seas. Among the cities which commerce rendered flourishing in these different countries at different epochs, we should mention Miletus, which ranked after Tyre, Phœcia, Rhodes, Marseilles, and Alexandria under the Ptolemies.—We shall not here dwell long upon the Romans, for they can not be ranked among the commercial nations. Still, they should be mentioned in a history of commerce, because of the immense extent of their empire, which created a vast market, and because of their grand system of communication, which, although established for military and administrative purposes, served also for the transport of merchandise. Under the empire, Rome and Italy, whose agriculture were ruined, could not subsist but for the importations from the provinces, especially of their grain. After the devastations of war and the rapine of proconsuls, labor and commerce, protected by a regular administration, served again to restore the wealth of the civilized countries of the east, at the same time that, under the domina-

tion of Rome, they gave life to the hitherto barbarous nations of the west. Alexandria was one of the richest commercial cities of this period, the great storehouse of the trade with India, and indispensable to the commerce of the Romans. But, by the continuous weakening of the empire, commerce languished and perished gradually, until the invasion of the northern tribes finally destroyed it.—The fall of the empire of the west left after it, in the west of Europe, the barbarism of the middle ages; but the empire of the east preserved ancient traditions and commerce in the east. Constantinople which, thanks to its admirable situation, had already enjoyed great prosperity under the name of Byzantium, replaced Rome both as the commercial and political metropolis. Not that commercial activity animated its degraded population; for, without foreigners, Constantinople never would have become a great commercial centre. The trade in the products most necessary to human life were declared a monopoly of the state, and the other branches of internal commerce were no less obstructed. But the Italians, Arabs, Germans and Slaves made a rendezvous of this great market, and made of it quite a business centre. The Byzantine commerce may be divided, according to the routes which it followed, into three branches: the eastern, the western and the northern commerce. Its relations with the east were of great importance. During the reign of Justinian, two monks brought from India to Constantinople silk-worms' eggs carefully inclosed in a cane or staff, and introduced into Greece that new industry, which was not slow to prosper there. The manufacture of silk was begun at Constantinople, Athens and Corinth, and from thence it passed into Italy.—At this epoch, a people, composed in great part of nomadic tribes, but on whose shores navigation and commerce had long flourished, extended their dominion with unheard-of rapidity; on one hand to the Atlantic ocean, and on the other to the frontier of China. At the same time it extended its commerce over this immense space. The Koran recommends commerce and industry as occupations pleasing to God. Thus each conquest made by the Arabs was also a conquest for commerce; wherever they penetrated they carried with them life and progress. Caravans were allowed to travel unmolested in the midst of their armies. The association of religion and commerce, which had existed in antiquity, especially among the Hindoos and Egyptians, was restored among the Arabs on a still larger scale. In the principal places of the provinces mosques were erected and schools established. This served to increase the population of these places, and they became religious and commercial centres. Pilgrims came from a distance, as well to fulfill their religious duties as to exchange their merchandise. The most celebrated of the pilgrimages was that of Mecca. Various wise regulations afforded the caravans the assistance which was so necessary in Asia and Africa, which were the principal thea-

tres of the commerce of the Arabs. Thus the government contributed considerable sums for the construction and improvement of roads. It caused wells to be sunk and caravansaries to be built, and erected mile-stones to mark the distances.—The most prosperous period in Arabian history is that of the Abbasides, from the eighth to the tenth century. This was almost the entire length of time during which their vast commerce lasted, and during this time it constituted almost the entire commerce of the world. Spain, Sicily, Sardinia, and part of the southern coast of Italy, were subject to the Arabs. In Africa their dominion was more extensive than that of any other people before or since. They explored the interior of the country with greater care and success than the Carthaginians and the ancient Egyptians. In Asia the standard of the prophet stopped only before the natural barrier of the great steppes, inhabited by nomadic tribes. Following the Indus, extending to the Himalayas, and thence to lake Aral and the Caspian sea, the empire of the Caliphs embraced, besides the Greek provinces of Asia Minor, the whole historic zone of that part of the world. In this immense domain, what a diversity do we find in the productions of the soil, as well as in the faculties, the tastes and the wants of the inhabitants! What grand conditions for exchange! The connecting link between the two extremities of the old world, the Arabs have brought us the compass from China.—During this time western Europe was buried in darkness, which Charlemagne endeavored in vain to dispel; it only increased after his death, and the feudalism which he established proved fatal to commerce. But the commercial spirit still survived in a race possessed of rare tenacity. Deprived of their nationality, the Jews play a very important part in the history of commerce. There is no state in Asia, Africa or Europe, known in the least to commerce, in which Jews are not to be met with. Persecuted, often with cruel intolerance, the objects of public contempt, they resisted, notwithstanding the fewness of their numbers and the fact of their being so scattered, and exhibited great mercantile activity. This activity they applied by preference to loaning operations, which, being for a long time interdicted to Christians, were monopolized by the Jews, loans which, because of the scarcity of money, were effected under exorbitant conditions. The Jews are credited with the invention of bills of exchange, as a more convenient and a surer means of settling their credits and their debts in distant places, than sending the coin. But recent research proves that the real inventors of bills of exchange were the papal tithe-gatherers in foreign countries.—The crusades succeeded in rousing western Europe from its lethargy, and indirectly exercised a most powerful influence upon commerce. The west was brought again in contact with the east, appreciated its productions, and thus conceived wants which commerce alone could satisfy. Customs

and the manner of living were changed; the consumption of spices and silk stuffs increased. In the cities, especially, fortunes were amassed with rapidity, and worked a complete change in the condition of the middle classes.—The commercial advantages of the crusades were first manifested in Italy. Although it had been the most devastated of all the countries invaded by the barbarians, this country was already re-invigorated by the emancipation of its cities, and it had not lost the advantage of its geographical situation. When the east had resumed its relations with the west, the Mediterranean and the Black seas exhibited the animation of ancient times. These seas, with their gulfs, their islands and their shores, were the principal theatre of the exchange established between the three parts of the then known world, and they so continued until the discovery of a new hemisphere had entirely changed the aspect of the globe, and created an entirely new state of things.—Venice, Amalfi, Pisa and Genoa were then illustrious in Italy. The prosperity of this country began with the end of the twelfth century, and attained its zenith at the middle of the fifteenth. The crusade, in which Constantinople was taken in 1204, becoming for fifty-six years the seat of the Latin empire, assured to Venice, which had, by the aid of its fleet, taken an active part in this conquest, the almost absolute monopoly of the commerce of the Levant. Genoa, which had long been the rival of Venice, was at last obliged to yield her this territory. In the Italian cities which we have mentioned, to which we must add Florence, industry soon increased, and manufactories were established. They adopted commercial laws and regulations, whose authority was recognized at a distance. The importance of the bourgeoisie grew; the omnipotence of the landed proprietors was destroyed; the brilliant prosperity of the cities relaxed the bonds of feudalism; commerce, hitherto treated with contempt, obtained consideration.—Commerce ceased, little by little, to be the monopoly of the south and the east, and extended to the north and west. On this new territory, deprived of all precedent, it had to educate and form itself. The old military routes of the Alps became commercial routes, by which the merchandise of the Levant, imported by Venice and Genoa, was carried into Germany, France, the Low Countries and England. At points on this side of the Alps, where the roads crossed each other or reached a river, old Roman colonies began rapidly to flourish, or new cities sprang up. Such were Basle, Strasbourg, Ulm, Augsburg, Ratisbonne, Nuremberg and many others. The maritime cities of Italy had branch establishments in these places, which afterward became independent houses, acting on their own account. Industry prospered by the side of commerce; and here, as in the communes of Italy, well-being engendered the spirit of independence and liberty.—Venice and Genoa had established important commercial centres in the Low Countries; and Bruges and Antwerp were, during

three centuries, the greatest markets of Europe. All the articles then known were brought thither from all countries, and the stores which received them afforded the richest assortments. The Italians sent there the merchandise of the east, and took in exchange the products of the north, among other things the renowned woollens of Flanders and Brabant. This exchange of products with so many nations, rapidly developed the material prosperity of the country, and served also for the furtherance of enlightenment. Commerce enjoyed in the Low Countries a liberty which did not exist elsewhere: nowhere else was it so little burdened with taxes, privileges and monopolies.—It is to the crusades, likewise, that the northeast of Europe is indebted for its civilization.—They had given birth to the Teutonic order, which, to convert the pagans, conquered Prussia in the thirteenth century. The order of the Porteglaive knights, who were closely allied to the Teutonic order, pursued the same object in Livonia. These two institutions which were of German origin, helped to enliven German commerce. The best-known products of these countries supplied material for the export trade to the west and south, where other merchandise, adapted to the wants of the north and east, was advantageously given in exchange. Cities of importance were founded on the German coast of the Baltic; they were speedily peopled, and devoted themselves to commerce and navigation. They often combined together for enterprises in common, aided one another, and thus prepared the way for that powerful commercial league, which, under the leadership of Lubeck, soon extended over a vast domain. The Hanseatic league is a glorious monument of the spirit of association in Germany. The principal theatres of its activity were the islands and coasts of the North and Baltic seas. Their favorite ports were those of England, from which they exported wool, which they brought back turned into cloth by the German weavers. But not one of their ships ever ventured out upon the ocean.—England and France occupy places of but secondary importance in this period of the history of commerce. In France, however, we should except Marseilles. Marseilles is, after Cadiz, the oldest commercial city of Europe; and, during an existence of two thousand five hundred years, its name has never ceased to figure with more or less splendor in the annals of commerce. It seems to have been the only French port which then entertained direct relations with the Levant. Its incomparable situation preserved to it, through the greatest disasters of the invasion, all the commerce indispensable to the barbarians themselves; and it is probable its traffic with the coast cities of France, Spain and Italy and the neighboring islands was never interrupted. As a great part of the crusaders took passage at Marseilles for Palestine, it was an easy matter for this city to renew its relations with the east, its cradle.—Toward the end of the crusades, under Charles of Anjou, its glory was eclipsed, inasmuch as the city of

Montpelier, which was the centre of the operations of Jacques Cœur, Aigues-Mortes and Avignon surpassed it in commercial importance and in wealth. The import and export trade of the south of France was, moreover, principally in the hands of the Italians, who, since the transfer of the holy see to Avignon, had established themselves there in great numbers. Under the name of Lombards, they, conjointly with the Jews, carried on important banking and monetary operations. They instilled new life into industry, especially that of Languedoc and Lyons, whose products were carried to the markets of Beaune.—The proximity of Flanders exerted a similar influence on the north of France, to that of Italy on the south, but with less energy. The fairs of Troyes, the capital of Champagne, were frequented. The maritime activity of the port of Dieppe deserves special mention. The merchants of Dieppe seem to have been the first navigators of the middle ages who visited the west coast of Africa. The wine trade of the maritime cities of the southeast, particularly in Bordeaux wine, was very active.—We must not omit to mention the busy port of Barcelona, on the Mediterranean, the commercial centre of Christian Spain.—The middle ages had seen the development of commercial intelligence in Europe. Commercial and maritime codes, bills of exchange, loan and discount banks, and the use of the compass, do it honor. Still, its operations had not extended beyond the limits of the commerce of antiquity: they were always confined to commerce by land and to mere coast trade.—The modern period of commerce was inaugurated by the discovery of a new world, which Christopher Columbus made, believing that he had landed on the eastern coast of India. Since then, the new continent became daily better known: it was named America after Amerigo Vespucci, who first gave a description of it to astonished Europe.—Mexico was conquered in 1521; Peru and Chili, from 1529 to 1535. Toward the middle of the sixteenth century the coasts of South America were known throughout almost their entire extent. About the year 1500 the Portuguese navigator, Cabral, on a voyage to the East Indies, was carried to the west by a tempest, and landed on the coast of Brazil. In 1520 Magellan discovered, at the southern extremity of the continent of America, the straits which bear his name, passed through them, and then, traversing the Pacific ocean, and discovering on his way the Marianne, the Ladrone, and the Phillippine Islands, completed the first voyage around the world.—While the Spaniards were making discovery after discovery, and conquest upon conquest in America, the Portuguese were not idle in the east. They had for a length of time been advancing along the coast of Africa; in 1487 Bartholomew Diaz had, without knowing it, doubled the Cape of Good Hope; but the circumnavigation of Africa, and the direct passage from Europe to the Indies, were not accomplished until ten years later, under Vasco de Gama. The

Portuguese extended their explorations in the Indian sea more and more, and joined to them the expeditions sent toward the west. They doubled Cape Cormorin, visited Ceylon in 1506, sailed along the coast of Coromandel, and, crossing the gulf of Bengal, reached India beyond the Ganges, Malacca in 1509, the Sund islands in 1512, the Moluccas in 1513, China in 1516, finally Japan in 1542.—This is not the place to enumerate the discoveries which followed; suffice it to state here that by them the earth was made double what it had been in ancient times and in the middle ages; and this fact marks a capital revolution in the existence of commerce. Since navigation has quitted the coasts, which it had timidly followed hitherto, and now braves the high seas and skims under full sail over the element which establishes the swiftest and easiest communications between the most distant points, there really exists an international commerce, and this commerce has acquired a universal character.—Two characteristic traits distinguish ancient from modern commerce. The former was the age of coast trading and transport by land—the latter is that of long sea voyages and maritime transport.—The enormous increase in the importation of tropical products has extended the consumption of them to the lower classes, and very much changed the manner of life of those classes. In proportion as the Indies became better known, men discovered there a multitude of products hitherto unused, or even entirely new, which were well fitted to increase a commerce which had depended almost exclusively on spices, precious stones, pearls, dye stuffs and cloth of very fine texture. Rice, sugar and sago were known; the Italians had brought small quantities of them into Europe: but these articles were so bulky, and relatively of so little value, that they did not pay the expense of a long transportation by land and water and numerous transshipments. As to sugar, it was cultivated by the Moors in Spain and Sicily, but was not exported. Honey still continued to be generally used in sweetening food. But, after the establishment of continuous navigation, the transportation of these products into Europe was recognized as profitable; and the capacity of vessels was more and more increased. Freight charges were lowered, and sugar in particular became one of the principal staples of transatlantic navigation, especially when the culture of the cane, transferred into the American colonies, had there acquired so vast a development. Tea is an entirely modern article of commerce. Acquaintance with many other products, such as drugs, medicinal substances, dye stuffs and woods, was also acquired at this epoch, or at least they were brought directly from the places where they are produced, without having recourse, as formerly, to numerous intermediaries. In the production of sugar and coffee for the use of Europe, America had surpassed Asia by the end of this period. Various other products, moreover, such as cocoa, tobacco, potatoes, vanilla and certain dye woods,

were indigenous to her soil.—The importance of commerce increased immensely; a greater number of countries and cities engaged in it. A centre like Bruges, to which all European commerce might resort as to a common rendezvous, was no longer possible, since they could import their merchandise directly from the country in which it was produced. Men more and more preferred these natural roads to the artificial ways of indirect importation; and the mere fact of the foundation of colonies by nearly all the maritime powers could not fail to develop the commerce of each of them and maritime navigation generally. At the same time the different operations of commerce were more distinctly separated one from the other: there were, as before, different specialties, the import and the export trade, banking and commission, ship building, insurance, the carrying of merchandise, and the carrying of specie.—One great difference between the two epochs is that of the theatre upon which international commerce was displayed. The new world was situated in the west; it was discovered from the western coasts of Europe, and all transatlantic voyages had their point of departure and their point of arrival on these coasts. Hitherto the southeast had possessed commercial as well as political dominion. From Phœnicia to Venice, the Mediterranean, including its numerous bays and the seas bordering it, had, with the overland routes which connected it with the Arabian and Persian gulfs, constituted the narrow limits within which the international commerce of the old world was restricted. At the end of the present period, in the short space of three centuries, how the scene changes! Asia, with the exception of India, is plunged in the most profound lethargy, and barbarism has extended as far as the southeastern extremity of Europe. Without having been subjugated like Greece, Italy had also lost her power and her prosperity. The two great meteors of the grand period of the Mediterranean, Venice and Genoa, are now but mere souvenirs of their departed grandeur. On the contrary, what a wonderful creative activity is displayed by western Europe, what an unheard-of development of power and wealth all its maritime countries attain, one after another. The west of Europe has become the centre which receives and dispenses all the currents of the new life; and its situation on the very shores of the vast sea that now connects the countries which it formerly separated, assures it a decided advantage over the east.—Political and social influences concur with these geographical causes. We find them in the strong constitution of the great states on the basis of nationality, with absolute power and a centralized administration in the hands of a monarch. The essential characteristic of the middle ages was the predominance of individualism, the predominance of nationalities is that of modern times. The most powerful nationalities were formed in western Europe: Spain, after the reunion of Castile and Aragon; France, after the

reign of Louis XI.; and England, after the accession of the house of Tudor. Later appeared the republic of Holland. Powerful and centralized states could alone enter successfully on the new career of discovery and ultra-marine operations, and satisfy the wants of a world which had been so immensely enlarged. Commerce became a national affair. The government intervened as regulator by its laws and institutions, and national politics produced commercial systems. What had hitherto interested only a class or a corporation, now occupied the attention of the state. Each nation believed itself the chosen people, and labored to achieve greatness and prosperity. Antagonism was inevitable; commercial jealousy, which had existed at all epochs, now acquired the energy of national hate; states sought, by means of monopolies, to paralyze each other's trade, and hold one another in check; they promulgated commercial interdicts against one another, and these led to declarations of war. Customs duties served as offensive and defensive arms.—Monopolies are another distinctive feature of the present period. The government assumes the right to regulate all the industrial and commercial movements of the country. The concession of privileges to large companies for the carrying on of ultra-marine commerce, originated at a time when commerce was so new, so difficult and so expensive as to exceed the resources of private individuals. In countries which were far removed from any considerable establishment, a number of men, and often an armed force, were necessary to secure the beginnings of trade. Companies were then of great service: they gave solidity to international commerce. But, after having been an instrument of progress, they became a hindrance, and, at the end of the eighteenth century, were generally on the decline.—In the regulation of commerce, ignorance and arbitrariness committed many faults. Men professed the maxim that the profits acquired by one nation in foreign commerce were losses to another. They established the principle that exchange with other nations was advantageous only inasmuch as the exports exceeded the imports, and the difference was paid in money. They misunderstood the mission of gold and silver. They did not understand the solidarity of foreign commerce; and, led astray by its brilliant results, gave it a blind preference. However, we must not judge this epoch by the ideas of our own; and, in the protection of industry particularly, it is proper to distinguish between wise and efficacious measures and those which are senseless and unproductive.—The means of communication which are so necessary to commerce by land, remained far behind the progress of navigation. This period, however, produced the canals of the Low Countries of France, and, later on, of England. On the other hand, commercial and maritime rights were perfected; maritime insurance was greatly developed; and similar progress was made in credit and banks, as is proved by the banks of Eng-

land, of Holland and of London. Law's enterprise in France should not be cited except as proof of the ignorance of the epoch. Another commercial institution, that of the "exchanges," originated in the Low Countries.—The commercial spirit of the present period finds its most energetic expression in the colonial system, which has been defined as the monopoly for the benefit of the mother country, of the production and consumption of the colonies. This system was founded by Spain. The Spanish colonies were nothing else than domains of the crown; and this idea of a supreme right of ownership which the crown always preserved over them, serves to explain all the commercial restrictions which were imposed. The colonial population of other states was governed by the same principle, applied with more or less consideration. We must, however, except the colonies of the East Indies, where a large native population, an acquired political development and a comparatively advanced state of civilization, prevented the mother country from arrogating to herself a similar right of ownership. The commercial interest of the colonies consisted in the difference between their products and those of the mother country. Without the colonial products there would have been no colonial system. Under colonial products, not only coffee, tea, cocoa, sugar and spices were understood, but also cotton, dye stuffs, certain kinds of wood, drugs and medicinal substances, none of which were cultivated in Europe. Most of them came only from tropical countries, as most of the colonies were in the torrid zone. We may say that all the great maritime commerce of Europe at this epoch was colonial commerce; for the principal commercial countries, Portugal, Spain, England, Holland and France, had colonies. Italy and Germany alone had none; and this fact compelled them to have recourse to foreign markets, both for their importations of ultra-marine goods, and for the export of their own products to those countries.—The exploitation of the colonies restored an odious traffic, which had been one of the most considerable of ancient times, and which had not been unknown to the middle ages; the traffic in slaves. The negroes of Africa, whose strong arms were soon recognized as eminently well fitted for the cultivation of plantations, supplied the material for this vast trade, the horrors of which are well known.—We shall terminate this general exposé by mentioning the development of the great fisheries on the coast of Spitzbergen and along the shores of North America.—The different nations who took part in the commerce of this period were successively the Portuguese, the Spaniards, the Dutch, the English and the French. We shall take a rapid glance at each of them.—Called to navigation by her geographical situation, the mission of Portugal was to realize what the centuries had predicted of her. She had the good fortune, at this epoch, which is called her golden age, to be

governed by a line of princes, among whom we may mention Henry the Navigator and Emmanuel the Great. From the first years of his reign Emmanuel attained the end toward which his predecessor had gradually approached. Vasco de Gama made the voyage to India by water, and landed, May 18, 1498, on the coast of Malabar. The king then took the title of master of the navigation and commerce of Africa, Arabia, Persia and India; and his subjects were possessed of an enthusiasm which conquered everything before them. In 1505 Francis Almeida, with a fleet of twenty-two sail, the largest ever equipped up to that time, set out as viceroy of India, charged to destroy the commerce of the Arabs. From this time there is unrolled before our eyes a tableau of commercial history which seems like a romance; for the most brilliant feats of arms and religious proselytism are mingled with mercantile speculations. Almeida and his successor, Albuquerque, acquired immortal glory. The latter, after a long and difficult siege, carried by assault, Nov. 25, 1510, on the coast of Malabar, the city of Goa, which soon acquired extraordinary prosperity as a commercial centre. In a few years the entire coast, from Ormuz to Ceylon, acknowledged the authority of the Portuguese, whose dominion also extended even beyond cape Cormorin as far as the Moluccas.—Then began for Portugal a maritime commerce, placed under the direction of the government, but open to all Portuguese. Fleets, starting at regular intervals, made the voyage between Goa and Lisbon, which latter city attained a high degree of splendor.—In 1500 chance had led to the discovery of Brazil by the Portuguese Admiral Cabral. This country was at first made a penal colony. Then it acquired commercial importance by the cultivation of sugar, which at this epoch was first introduced into the ports of Europe in considerable quantities. Later, the gold and diamond mines of Minas Geraes and Cerro da Rio were discovered. During the whole of the sixteenth century Portugal enjoyed the monopoly of the commerce of India, and Lisbon was the great centre of this trade. But the decay of this power began when Portugal was submitted to Spanish rule. The Spanish decree which, in 1594, closed the port of Lisbon against the Dutch, founded the empire of this latter nation in India, as well as their commercial preponderance, and commenced the ruin of the Portuguese.—The Spaniards, though not possessed of the commercial spirit, had however been called upon to play an important part in its history. The Catalonians are about the only ones among the inhabitants of Spain who can be said to have any aptitude for commerce. Two ingenious races, the Jews and the Moors, gave life to the Peninsula; but Spanish fanaticism drove them from it. On the other hand, the chivalrous and heroic spirit, which they had acquired in their conflicts with the Moors, led the Spaniards to do great things in the new world, whither they had been led by Christopher Columbus. Their exploits here resulted in

the conquest of Mexico and Peru, the occupation of the greater part of South America, and, consequently, in the foundation of an imposing colonial system. But the thirst for gold was almost the only motive of these enterprises; and the most fertile country, blessed with the most beautiful and healthy climate, was disdained when it did not show traces of gold and silver. The extraction of the precious metals was not without its advantages for Spain itself; but, above all, it exerted a considerable influence on the commerce of the world.—A colossal aggregate of countries situated in the most different climates, and increased, besides, under Philip II., by the Portuguese possessions, opened to Spanish commerce the richest and most extensive market that can be conceived, yet it profited but little by it. Two royal squadrons went every year, or at least every two years, to America; one was called the fleet; the other, the galleons. The galleons carried on the commerce with Chili and Peru; the fleet, that with New Spain or Mexico and the adjacent provinces. The squadrons were escorted by ships of war. The vessels were chartered by the merchants of Seville and Cadiz. Soon after the arrival of the galleons the South-American merchants brought by water to Panama, and thence by land to Porto Bello, the products of their mines, and other precious objects to be exchanged for manufactured articles. The city, abandoned and deserted at other times, was then filled with an innumerable crowd, and the market remained open for forty days. But it was not open to free competition: everything was foreseen and regulated in advance. The prices were fixed by delegates appointed by the merchants of the two hemispheres, on board the admiral's vessel, in the presence of the governor of Panama. During this time the fleet had arrived at Vera Cruz, to proceed, in New Spain, with the same operations and under the same conditions. After dispatching some ships to trade with the islands, the squadrons met at Havana, and thence returned to Europe. Under Philip II. their cargoes comprised, besides the precious metals, indigo, cochineal, sugar, vanilla, logwood, cinchona and tanned hides. But, afterward, these products were more and more disdained, and the cargoes were composed almost exclusively of gold, silver, Panama and California pearls, and precious stones. The chief products imported into the colonies were woolen and linen stuffs, furniture, agricultural implements, works in metal, objects of luxury of all kinds, oil and provisions.—The commerce of the Spanish colonies, though submitted to all the rigors of the colonial system, was soon invaded by the smuggling trade, whose operations were carried on on a grand scale, and which the government was compelled to tolerate. This smuggling was systematically practiced by Holland, England and France; and nine-tenths of the merchandise used in the colonies was of foreign manufacture. Soon, however, beginning with the reign of Philip II., despotism

gradually enervated commercial activity in the whole Spanish monarchy which had undergone only a slight improvement in the eighteenth century, under the Bourbons.—When the Dutch constituted themselves a republic, under the name of the Republic of the Seven United Provinces, at Utrecht, Jan. 23, 1579, they had not only shaken off the Spanish yoke, but they had laid the foundations of extraordinary commercial greatness. They had already acquired the preponderance in the Hansatic trade in the northeast of Europe. Their fisheries were flourishing. Possessed, by reason of their commerce with the northeast, of the best material for ship building, and, by their fisheries, of the best sailors, their power on the sea soon surpassed that of other nations of Europe; and it was this superiority that enabled them to resist Spain, and finally to overcome her. They found, in the element which surrounded them on all sides with its terrors, and frequently invaded their fields and their cities, the palladium of their independence and the source of their wealth.—It is a remarkable fact, that, in order to become the first commercial power of the world, it was necessary that they should have for an enemy the king of Spain, on whose vast dominions the sun never set. If they had not conquered the Spanish and Portuguese colonies, their commerce and navigation would have amounted to but very little more than that of the Hansatic towns; the sphere of their activity would have been confined to Europe, and, on the most favorable hypothesis, they would have been nothing more than intermediaries between the northeast and the southwest.—After the downfall of Antwerp its commerce passed to the already prosperous city of Amsterdam. This city, as the heir of Antwerp, sought above all things to preserve the advantages of the commerce with India, by keeping up relations with Lisbon, the only port which then received direct importations from that country. Spain, which was then at war with the rebellious provinces, used every endeavor to destroy this traffic, but without effect. As long as Portugal preserved its independence, it took no part in the struggle between Spain and Holland, and the merchants of the Dutch republic were made perfectly welcome to the market of Lisbon. But when, in 1580, it passed, with all its transmarine colonies, under the dominion of Spain, Philip II. believed he could not better punish the hated republic than by depriving it of the products of India, which its ships came to buy at Lisbon. In 1594 he caused fifty Dutch vessels to be seized in this port, and forbade his new subjects, under the severest penalties, all intercourse with the revolted provinces. This blow, apparently so terrible, was the foundation of the commercial prosperity of the Dutch. They understood that there was no other means of extricating themselves from the difficulty than to import the products of India from India itself. The perils of remote navigation did not frighten the enterprising genius and persevering energy of this

little nation. After some abortive attempts, they finally succeeded. The route to India was opened by a Dutchman, Cornelius Houtman, who had already made several ultra-marine voyages in the service of Portugal, and who was liberated from a prison in Lisbon, where he was detained for debt. After a few years the commerce of Holland, incited by her accumulated hatred of the Portuguese, controlled the shores of the sound. The commerce with India was centralized and declared expressly a state affair by the creation of a large company, which began its operations March 20, 1602.—It was necessary, first of all, to find a suitable centre of operations in India itself. The Dutch manifested great wisdom by casting their eyes from the first upon the Indian archipelago rather than upon the continent, and by choosing an island. Among the products of India then most sought after in Europe, spices were the most important. The Dutch conceived the desire of possessing themselves of this commerce, and to this end took possession of the Moluccas. But the Moluccas were too remote to serve as a commercial centre; for this purpose they chose Java, which they conquered from the English, and there founded Batavia, the seat of a general government and of a central administration, which, by its commercial prosperity, won for itself the title of the pearl of the east. By a rapid series of successes, the dominion and commerce of Holland in the East Indies reached their zenith at the end of the seventeenth century.—The commercial genius of the Dutch was too universal to allow the east to make them lose sight of the west. A great West India company was formed, and this company effected the conquest of Brazil, which, however, was soon after retaken by Portugal. Among the other possessions in America which the Dutch retained were some of the Antilles, particularly Curaçoa, besides Guiana, where their most important establishment was Surinam.—The extraordinary extent of the maritime navigation of Holland enabled the Low Countries to secure to their flag a large proportion of the intermediary commerce. The products of India re-exported from Amsterdam, were reputed products of the metropolis, and obtained free access into all the states which were without colonies. Even the states which had them were obliged to admit at least spices, of which Holland had the monopoly. The products of the industry, the agriculture and the fisheries of Holland furnished material for transportation, in large proportion. She everywhere found return cargoes: the wants of Holland, especially in grain and northern products, had increased immensely, and foreign markets were ready to receive what she did not need. Her commercial superiority rendered her indispensable even in those states whose legislation was most exclusive against her. Such were, in the first place, Spain and Portugal; but England and France could not, any more than they, dispense with Dutch navigation; and the insufficiency of their own marine obliged them, despite

their restrictive tendencies, to give her their freight. England was freed from this necessity by the navigation act, but France continued subject to this servitude some time longer.—Independently of its commerce in merchandise, Holland was the centre of the money and credit markets. Banks of deposit and transfer were established at Amsterdam and Rotterdam. The commerce of the world had accumulated so much capital in the country that money was nowhere at a lower price than in Holland; and the stock exchange of Amsterdam was the general market for the titles to all the loans of the time, and for the shares of all commercial and industrial enterprises, both home and foreign.—But this commercial greatness of a small state, undermined by terrible and ruinous conflicts, began to decline at the beginning of the eighteenth century, when France, and more particularly England, with their much greater resources, devoted themselves to commerce.—The commerce of England, beginning with the time when it first acquired some importance, may be divided into three periods. The first begins with the reign of Elizabeth. At home it, an adult nation, frees itself from the commercial guardianship of the Hanseatic towns, and acquires a commerce of its own: abroad it triumphs over the Spanish armada, vindicates the liberty of the seas, and founds colonies. This first period shows but a very small amount of progress. The second, which begins with the navigation act, and creates the maritime power of England, is more remarkable; but the most fruitful is the third, which, dating from the peace of Utrecht, shows an equal energy at all points and in every sense, in the metropolis and in the colonies, in commerce as well as in industry, in agriculture as well as in navigation.—The manufacture of woollens was a natural employment for a country which then abundantly produced the raw material. Edward III. had encouraged it as early as the fourteenth century. Its progress, however, was slow. The nobility preferred to sell their wool abroad, and the English manufacturers found rude competitors in their brothers of the Low Countries. The English were, on the other hand, aided by the Hanseatic towns, whose interest it was to create a rivalry for Flanders, because they realized greater profits by exporting from England unbleached cloths, which they afterward dyed and dressed themselves, than upon articles entirely finished in Flanders or Brabant. English industry was thus gradually extended; but its shipments consisted exclusively of cloths of a common quality. To free the country from the mediation of the Hanseatic traders, and export cloths fully finished, was the special object of the society of merchant adventurers. This object was not attained until the reign of Elizabeth. After she had restricted the exportation of unbleached cloth, and suppressed the Hanseatic competition, the queen sought to introduce other industries into England. A decree of 1563 prohibited the im-

portation of arms, saddlery, needles, thread and various articles of metal and leather. Attention was turned to mines, and skilled miners were brought from Germany. Commercial enterprises were conducted by companies, and their relations were with the Low Countries. The commercial greatness of London was foreshadowed. Elizabeth also endeavored to encourage the merchant marine. The great explorations in the north and the voyages of Drake and Cavendish around the world, in 1581 and 1586, aroused in the people a taste for navigation, and extended their nautical knowledge. If the plans of colonization attempted by Walter Raleigh failed, at least the first stone of the grand edifice of the English dominion in the East Indies was laid in the last years of Elizabeth's reign. Philip II., by closing the port of Lisbon against the English as well as the Dutch, had forced them to establish direct communication with India. At the close of the year 1600, the society of London merchants for trading with the East Indies was established, and obtained of the crown, for the space of fifteen years, the privilege of the commerce with all the countries of Asia, Africa and America, from the cape of Good Hope to the straits of Magellan.—In the epoch which follows we find the prohibition of the exporting of wool, the manufacture of cotton cloth at Manchester—which are first mentioned in 1641—the first attempts at the manufacture of iron, and the extraction of coal.—The navigation act, promulgated by Cromwell in 1651, confirmed and completed in 1660 by Charles II., which so long remained the maritime charter of England, built up her navigation upon the ruins of that of Holland. About the same period the conquest of Jamaica was accomplished. The revolution of 1688 soon after, by establishing public liberty, gave a lasting foundation to the commercial supremacy of England, and the union of Scotland with England made Great Britain a great market. Then, after some groping, the final East India company, for which so grand a destiny was reserved, came into being, and credit was established by the creation of the bank of England.—The eighteenth century presents, in England, under the rule of the constitutional monarchy, a remarkable development in agriculture and manufactures, by reason of the commerce and navigation which they supported. This was the age that saw the inventions of the Watts, the Hargreaves, the Arkwrights, the Wedgewoods, and others. This was also the age of the foundation of the Anglo-Indian empire, due to the genius of Clive and Hastings. It was this century, too, that witnessed the rapid development of the colonies founded by the successive immigrations to North America during the preceding century. But these colonies, in consequence of dissensions with the mother country, rebelled, and achieved their independence, under the name of the United States, recognized by the peace of Versailles, in 1783.—The civil wars which dis-

tracted France during the first century of modern times could not but prove discouraging to her commerce and industry. The accession of Henry IV to the throne revived them by restoring peace and concord to the country. During the reign of this prince the Briare canal was completed, and the cultivation of the mulberry was encouraged. But the active participation of France in the commerce of the world dates only from the time of Colbert.—“Colbert,” as Henry Martin has said, “thought that a great nation, a complete society, ought to be at once agricultural, industrial, and sea faring, and that France had received from nature, in a most eminent degree, the conditions of this triple function: his whole life was spent in seeking the realization of this thought.” From this point of view, this great minister conceived and executed, at least in part, the plan of suppressing tolls in the interior of the country, of transferring the custom houses to the frontiers of the kingdom, of uniting all France under one and the same tariff system, and of adding economic centralization to the political centralization which it already possessed. In order to develop national industry, Colbert had taken for the basis of his customs tariff, “to reduce the export duties on provisions and merchandise produced in the kingdom, to lessen the import duties on all raw materials, to oppose, by raising the duties, the importation of the products of foreign manufacture.” To this programme was added the plan of a close and strong organization of the industrial corporations, and of a permanent and rigid state surveillance over labor. Notwithstanding some lamentable acts of violence against the liberty of labor, French industry made undeniable progress under his influence. Colbert employed considerable sums of money to restore languishing industries and to establish new ones: at great expense he induced foreign manufacturers to come into the country. Five hundred Dutch cloth weavers were established at Abbeville, in Picardy, and introduced there, as well as at Sedan and Elbeuf, the manufacture of the finest woolens. By establishments such as those of the *Gobelins* (tapestry manufactories), and of extensive glass works, Colbert, while flattering the tastes of his master, assured the future of French manufacture of articles of luxury. The empire of France in objects of taste dates from this period. Her products of this kind were more and more sought after by foreign nations, in proportion as Louis XIV. extended his influence.—The French marine had already been freed, under Mazarin, from the preponderance of the Dutch marine, by the differential tax of fifty sous per ton. Colbert maintained this tax, and by the system of maritime inscription, he created the military and merchant marine of France. Languedoc is indebted to him for its canal. The reform of the consulates, and a treaty of commerce concluded with the porte in 1673, instilled new life into French commerce with the Levant.—Unfortunately, after the death of Colbert, the

revocation of the edict of Nantes, which deprived France of so many industrial hands, with the disasters which marked the close of Louis XIV.'s reign, and the follies of the regency, arrested the development of the great minister's work. But they did not destroy it entirely; after a lamentable eclipse, the industry and commerce of France gradually regained their splendor in the course of the eighteenth century.—Colbert also did much for the colonies. The French had taken but little part in transatlantic navigation. We find mentioned only some private adventures in the beginning of the sixteenth century, especially that of James Cartier, to whom is really due the credit of discovering Canada, or New France. In spite of Holland and England, this country had remained French, and Quebec and Montreal were established in 1606. Colbert took measures to assure the existence of the colony, and to improve its material condition. The French domination extended as far into the interior as Louisiana. Among the Antilles, which were colonized by freebooters, Colbert obtained for France, Martinique and Grenada, and established there a form of government in conformity with the ideas of the epoch. It was under Louis XIV., and above all at his special desire, that a large company was formed to carry on the commerce with the East Indies. France thus possessed the elements of a vast colonial empire; but she allowed herself to be deprived of them one after another. At the peace of Utrecht, Louis XIV. ceded to England the Hudson's bay country, Newfoundland and Acadia. In the treaty of Paris, in 1763, Louis XV. abandoned Canada to the same power. In the Indian ocean, about the middle of the eighteenth century, La Bourdonnais wrought wonders in the island of France, and Duplex in Pondicherry; but, in consequence of the jealousy that sprang up between these two men, and the prodigious success of the English, the colonial empire of the French almost disappeared from India. The Antilles, at least, were prosperous, especially St. Domingo, and supplied a vast commerce of produce.—The peace of Versailles ends the first part of modern times, and commences the second, which extends to our own day. This second part is subdivided into two sections, separated from each other by the general peace of 1815. The first of these periods is, properly speaking, the eclipse of commerce, while the second forms the most brilliant period of its history.—We shall only mention the first period, filled throughout with wars, in which England is the almost absolute mistress of the seas, and in which Napoleon opposes her with the *continental blockade*; but we shall endeavor to sketch the wonders of the second.—In this epoch of rare fecundity the territory of commerce increases enormously. Already, in the previous period, the emancipation of the United States had added a great part of North America, and the separation of Brazil from Portugal, a vast country in South America. Then Mexico and all Spanish South America, throwing

off the yoke of the mother country, abolished the restrictions of their old colonial system, and were thrown open to the commerce of other nations. France, by conquering Algiers, substituted a safe market for a nest of pirates. England extended and consolidated her rule in India, and opened up China; while the United States obtained access to mysterious Japan, which is now open to all the world.—Throughout this vast domain, which recognizes no limits, commerce enjoys a security heretofore unknown, the precious fruit of universal peace. This peace has been several times disturbed by wars more or less destructive, but whose limits are always circumscribed. It has been shaken, also, by revolutions. But its majestic course has, in reality, experienced but little interruption. Thus it is seen to multiply at all points, the benefits of which it is so prodigal. Human activity is applied to agriculture and manufactures; the spirit of invention increases industry; production, as well as consumption, is immensely augmented; and commerce henceforth assumes grand proportions.—The improvement of the ways of communication and of the means of transportation powerfully contributes to its extension. But the ordinary roads and the numerous and well-built canals are not all. Fulton applies steam power to navigation, which had hitherto employed nothing but sails. Steamboats appear on rivers, streams and lakes; they cross straits, they steam along the maritime coasts, and end by making the longest voyages on the high seas. To transatlantic steam navigation is added, for the security and rapidity of maritime commerce, a profound acquaintance with the different currents which furrow the ocean. Another invention that transforms commerce by land, and assures it an importance which it had never before known, is the marvelous invention of railroads, over which locomotives impelled by steam put in motion trains of innumerable cars, and whose immense network covers the soil of all countries. Finally, the electric telegraph annihilates distances both by land and sea.—While, at the commencement of modern times, the precious metals of the new world came to aid in the development of a trade which had greatly increased in proportions, the gold of California and Australia helped to supply the necessities of a commerce which was increasing every day. At the same time, moreover, the institutions of credit, whose paper supplies the place of money, are developed on a grand scale.—The different nations successively establish the unity of their home market. The revolution of 1789, completing the work of Colbert, had thrown down the barriers which still subsisted in France, and created its custom house territory. Already, at the beginning of the century, Great Britain is commercially united with Ireland. In the epoch of which we are writing, this movement was imitated throughout Europe. The various small states of Germany were united into a fruitful association of customs (the Zollverein) before they were formed into an

empire. Spain had overturned the barriers which isolated its northern provinces; and Austria those which separated the eastern from the western portion of her territory. Switzerland, after accomplishing her political centralization, centralized her commerce also, by substituting for her numerous cantonal tolls one single tariff for all her frontiers. Italy, after attaining political unity, confirmed it by commercial unity, under one tariff of duties.—The commercial policy toward foreign nations long retained its restrictive features. England, the ablest among nations, in commerce, industry and navigation, was the first to perceive that the impediments created by the protective system must disappear. She gradually accomplished, in this direction, the reforms that were connected with the names of Huskisson, Cobden, Robert Peel and Gladstone. England, now retains only her fiscal rights. These reforms attracted the attention of the other states to their own commercial systems; and many of them also reformed them, if not in the same proportion as England, at least to a greater or less extent. It is the commercial treaty between France and England that seems to have hastened the movement. Prohibitions have been removed, and ever-increasing facilities are granted to commerce. Some countries, however, particularly the United States, still persist in maintaining a strong system of protective duties; but the desire of paying its debt has much to do with this action on the part of the American republic. The protective system, moreover, is there made the incessant object of attack. Commerce is now no longer, as in other times, the special occupation of a few; it is more or less engaged in by all. But it is mainly in the hands of peoples belonging to Christian civilization. Eastern nations are, for the most part, inactive, passive; and their commerce is carried on by the merchants of the west. Among the various Christian nations the share is more or less brilliant. The first place must unquestionably be ceded to England: after her, setting aside the United States, a high rank is due to France, with the small states along her eastern frontier, and to the German empire, which has absorbed Hamburg and Bremen. The chief commercial centres of the world are London, Paris and New York. HENRY RICHELOT.

COMMERCIAL CRISES, disturbances of the course of trade at given times, arising from the necessity of re-adjusting its conditions to the common standard and measure of value. The common standard of value is money, and the conditions of trade which require to be adjusted to it are the prices of commodities, and contracts and obligations of all kinds. Contracts and obligations are almost always expressed in money. They call for the payment of dollars, pounds sterling, francs, etc., which signify a certain weight of gold or silver. Contracts and obligations are entered into on the basis of the scale of prices prevailing at the time, which may be too

high or too low. Prices are susceptible of great elasticity. If they are too high at a given time as compared with the cost of money (*i. e.*, the cost of producing gold and silver), it follows that the person who is obligated himself to pay money at such a time has not actually received an equivalent in return, and that he is in danger of loss or failure. This he may avoid by selling the commodities he has purchased for money sufficient, or more than sufficient to meet his obligation, or by taking the obligation of another person for an equal or greater sum. In the latter case it is evident that the situation of the community is not changed by substituting A in the place of B as the obligor who undertakes to deliver a certain number of grains of gold in exchange for a certain amount of cloth or iron, or a certain piece of land, or a certain amount of labor. If the element of equivalency is wanting between the money agreed to be paid and the thing received in exchange, there must be eventual loss, and possibly such loss as to cause bankruptcy. It does not alter the state of the case that the obligation to pay money may be lawfully discharged with paper, even irredeemable paper, since such paper must be resolvable into gold at some ratio.—Contracts and obligations, agreements to pay money at a future time for something presently received, are the “credit system” of modern commerce. Innumerable phases and complications arise under the credit system, but analysis will show that they all resolve themselves into the agreement of A to sell goods, houses, lands, labor, etc., to B for money to be paid at a future time. If B, instead of borrowing goods, houses, etc., from A, borrows money from C, it is only to buy the goods, houses, etc., from A. The only difference is that C, instead of A, is the payee when the obligation matures. Inability to meet the obligation constitutes bankruptcy, and a great multiplicity of bankruptcies occurring simultaneously constitutes a commercial crisis. A commercial crisis may be confined to one country, or it may extend to the whole commercial world, but it can not extend to places where there is no credit system. If all persons were in the habit of paying immediately for everything received, there could be no debts, consequently no failures, no money panics, no crises. In proportion as debts are few and small and of short duration, so will bankruptcies be infrequent and commercial crises brief and inconsiderable. Those nations among whom the credit system has received its widest development, and where consequently the spirit of commercial adventure and speculation is most rife, are most exposed to the ravages of recurring periods of bankruptcy. It is an observed fact that nations of Teutonic origin (including the English, American, German, Dutch and Scandinavian) are those most frequently and severely afflicted with commercial crises. These nations are also noted as the most enterprising of all, in the commercial sense. They habitually assume greater risks for the sake of expected

profit than their neighbors, and consequently are more exposed to periodical disaster.—Since the introduction of the credit element into trade, which began to assume a systematic character early in the seventeenth century, commercial crises have been of frequent occurrence among civilized nations. The symptoms by which they are preceded, and which always give fair warning of their approach, are a rapid advance of prices and wages, great activity of trade, a multiplication of new enterprises of every sort, such as factories, buildings, banks, railways, mines, shipping, colonies—what is termed, in short, a period of general prosperity. Fortunes are made, or appear to be made, in a day. A spirit of speculation pervades all the trading classes. Everybody is buying, in order to sell at a higher price. All who have capital are seeking to place it where it will gain the highest possible return. These periods of alluring prosperity generally run a course of ten years in England, *e.g.*, 1816, 1825, 1837, 1847, 1857, 1866, 1875, in each of which years there was a commercial crisis in that country. In the United States the periodical return has been less regular and less frequent, the most noted crises having been those of 1819, 1837, 1857 and 1873. Each period of abnormal and exciting prosperity is followed by a violent collapse, whose phases are a money panic, a sudden rise in the rate of interest, a run on the banks, and most frequently a suspension of cash payments; then a fall of prices of commodities, securities and real property; failures of mercantile and manufacturing houses and corporations, a partial suspension of industry, a fall of wages and the enforced idleness of great numbers of laborers, often culminating in riots and social anarchy. The money panic is generally of short duration, but the crisis is frequently protracted through a series of years, being marked by a continued and inexorable “shrinkage of values,” general stagnation and lack of confidence, dearth of employment for labor and capital, and an abnormally low rate of interest. It has become a maxim among business men, that in such a period more profit can be made by locking money up in a close vault than by investing it in anything whatsoever; which signifies merely, that, when prices of all things are declining, it is best not to buy till they reach their minimum. The pendulum will swing back in time.—These undulations of trade, of alternately high and low prices, of alternate activity and depression in business, have their root in the mental and moral constitution of mankind. The price of a thing is the amount of gold it sells for in a free market. The prices of commodities generally—*i. e.*, the scale of prices prevailing at a given time—are the ratio existing between commodities in general and gold bullion, in a free market. We know, as a matter of fact, that general prices are subject to great variations within comparatively short periods of time, as, for instance, between the years 1873 and 1877, the conditions of gold production and the annual output

remaining substantially the same. The cause of these rapid variations must be sought for in something else than the gold supply. Some writers seek an explanation in bank issues and bank credits. Excessive issues and excessive credits are invariable concomitants of the swelling gale of prosperity which precedes and ushers in a crisis. They are part and parcel of the speculative fever which pervades the community, but are no more to be accounted the cause of it than the excessive multiplication of spindles and of railways going on at the same time. The true cause of advancing prices is the competition of buyers in the market: the true cause of declining prices is the competition of sellers. When there are more buyers than sellers, prices will rise: when there are more sellers than buyers, prices will fall. The love of gain causes the competition of buyers; the fear of loss, the competition of sellers. The former is a state of speculation; the latter of panic. Now, it is demonstrable from history, and, indeed, obvious to all persons of adult age, that there are times when the whole community are buying this, that and the other sort of property, with the purpose and expectation of selling it at a higher price. There are other times when they are selling with like unanimity, in order to avoid an apprehended loss. Such a period of general speculation prevailed in the United States during several years prior to 1873. A corresponding period of panic and depression prevailed from 1873 to 1879. The pendulum has now (1881) begun to swing back, and there are many signs that the country has started on a new career of prosperity, to be succeeded by another crisis, another period of commercial depression, revulsion, stagnation. Prices and wages are advancing, employment for labor and capital is abundant, fortunes are made rapidly, new railway enterprises are multiplying on every hand. But the ordinary channels of trade are not yet choked with debt to any considerable extent. The debts of 1873 have been pretty generally wiped out, but the credit system has not wholly recovered from the shock of that year. Both borrowers and lenders are still cautious. So long as this spirit of caution prevails, the community will be in no danger of a commercial crisis, although there may be stock panics and "Black Fridays" now and then, affecting particular classes of traders and speculators. When this spirit yields, as it probably will, to the enticing prospect of large profits and rapid gains, and when rising prices and increasing liabilities are observed to be moving hand in hand, the ingredients of a new crisis will be gathering explosive force. Those who are able to discern the real conditions of trade hidden under the guise of general prosperity, and able to resist its fascinations, will get out of debt while they can, and content themselves with such profits as are to be made without borrowed capital. Then, when the storm comes, they will escape. They may meet with losses—people who owe them may be unable to pay—but the gale will pass by and leave

them standing. The "shrinkage of values" will signify nothing to them but a marking down of prices, while to those who are much in debt it will mean bankruptcy, sheriff's sales, and a sudden descent from affluence to poverty. Unfortunately, neither prudence nor foresight can avail to any great extent to protect the wage-working classes from the effects of these fearful visitations. They are powerless to resist the advance of prices, they are impelled by necessity and by the competition of employers to demand higher wages for their labor, and higher wages again necessitate higher prices for commodities. When the tension of prices against the standard of value can no longer be borne, and a crisis supervenes, the worst horrors of the calamity fall upon them in the loss of employment. What savings they have accumulated during the period of prosperity, to shelter themselves in sickness and age, are generally consumed during the succeeding period of depression, and they begin again the battle of life with no other resources than their hands, and not seldom with bitterness in their hearts against the social order which allows such sore distress to fall upon them.—It has been remarked that commercial crises have their root in the mental and moral constitution of mankind. The love of gain is the foundation stone upon which political economy builds itself as a science. This motive is more nearly universal than any other in the whole category of human impulses. The greatest amount of gain with the least amount of effort is what all but an imperceptible fraction of mankind are striving for. It is this omnipresent desire which incites people to buy whatever they think they can sell at an advanced price, and to buy on credit, or with borrowed capital, when they can not command sufficient means of their own. Buying with one's own means, however imprudently, would never bring on a commercial crisis, because nobody could fail. The competition of buyers would cause prices to advance exactly as under the credit system, and the reaction would come as surely. The elasticity of prices would enable speculation to run its course for the usual period, until the strain could be borne no longer, *i. e.*, until the difference between the prices of commodities generally, and the cost of dollars and pounds sterling at the gold mines, became too great to admit of further speculation. Then there would be a decline of prices resulting from a common desire to sell and avoid loss, but the marked and distinguishing feature of the modern commercial crisis, bankruptcy and total ruin, would be wanting. The credit system supplies this ingredient. It furnishes the explosive material of which the great crises of the past two centuries have been mainly composed, *viz.*, contracts, obligations, debts, piled upon each other mountain high, contracted upon a fictitious scale of prices, a scale which the whole community has for the time being conspired to make fictitious, but payable in matter of fact dollars and pounds sterling, or their true equivalent, and not other.

wise.—One of the earliest crises mentioned by Dr. Max Wirth, in his *Geschichte der Handelskrisen*, is the tulip mania of Holland, in the years 1634–8. This celebrated speculation in the products of horticulture bore all the marks of a genuine commercial crisis. A delusion difficult now to understand, though not more absurd than many others which have at times infected an entire people, gradually led the inhabitants of the Netherlands to consider the tulip plant to be worth its weight in gold, while certain varieties were esteemed much more valuable. The whole population, merchants, farmers, nobles, politicians, sailors, day-laborers, serving men and serving women, joined in an eager and exciting trade in tulips. There was a tulip exchange in Amsterdam, with a board of brokers, presenting all the features of a modern stock exchange. The price of tulips rose from a mere trifle, or about the price of onions, to 5,500 florins each, the latter being the quoted value of the variety called “Semper Augustus.” The rage lasted four years. Contracts for the purchase and sale of tulip plants at these extravagant figures, plastered the whole country, and were so numerous when the collapse came that the courts of justice were unable to adjudicate a tithe of them. A tulip bulb was intrinsically worth no more then than it is now; that is, a few pennies for common varieties, and a few shillings for the rarer. It was inevitable that a time would come when they must sell for their intrinsic value in coin. That time did come, and the nation was plunged at once into a whirlpool of bankruptcy. Panic terror swept all the market places. Misery, madness and ruin entered thousands of Dutch homesteads. The country was strewn with every species of commercial wreckage. The consequences of the disaster afflicted a whole generation, and the memory of it revives with every recurrence of a commercial crisis in any part of the world.—The tulip crisis of Holland was of the same breed as the modern commercial crisis, differing in size, but not in ferocity. The crises of different periods and different countries have distinguishing features in this, that there is generally some form of speculation more rampant than any other at a given period, although it frequently happens that the leading rage begets other varieties equally pernicious. In the French crisis of 1720, it was John Law’s Mississippi scheme around which the speculation gathered. In the contemporary English crisis it was the South sea bubble, which also produced a progeny of lesser bubbles so numerous and ludicrous that the period has ever since been known as the “epoch of the bubble companies.” In the American crisis of 1837, land speculation was the principal craze. In the English crisis of 1847, it was railway building. But in these and all the others, the features of the tulip mania are discernible—a whole community betting that certain kinds of property are worth more gold and silver than they are really worth, and entering into contracts and obligations based upon erroneous

estimates of value. It generally happens during the speculative period, that the prices of some commodities are pushed up to a higher point, relatively, than others, speculation being particularly directed into those channels, thus attracting an undue investment of capital and labor in particular trades, as in the cultivation of tulips in Holland at the period mentioned. This was the case in the iron and coal trades and in many branches of manufacture in the United States prior to the panic of 1873. The equilibrium of labor is disturbed; and, when the crisis comes, the greatest distress falls upon those branches of industry which had formerly been the most prosperous. An immediate glut of the market is felt because an abnormal production had been stimulated. Neither the laborers nor the capital employed in particular lines of trade can change their vocation suddenly. But change they must sooner or later. The equilibrium of industry must be restored; prices must fall back to the level of *equivalency* between money and goods; superfluous mills and mines and factories must close, or work on half time, till a re-adjustment takes place. If the prevailing rage has been for foreign trade, as it was in England in 1825, there will be a mushroom growth of manufactures and shipping, and when the collapse comes, weavers and sailors will be out of employment. If it is for new railways, as in the United States in the years prior to 1873, iron furnaces will go out of blast, coal companies will fail, puddlers and miners will be brought to dire distress, and it will be wonderful if riots and public disorder do not follow in the train of idleness and misery. It results from the view here taken, that the displacement or misplacement of labor, so often noticed as a feature of commercial crises, is a consequence and not a cause of the temporary delusion or *entraînement* of the public mind, which is the real origin of the trouble.—What causes this *entraînement* has been partly answered already. Anything which acts strongly upon the imaginations of traders, always keenly alive to the prospect of gain, is sufficient to set a general speculation on foot. There can be no doubt that the gigantic war indemnity collected by Germany from France stimulated the imaginative powers of the former in the highest degree, and led to the extravagant speculations which ushered in the crisis of 1873 in that country. The English crisis of 1816 was due to a misconception founded upon the overthrow of Napoleon and the re-opening of the continent of Europe to British trade. It was assumed that the continent was bare of goods, and that an unlimited demand would spring up as soon as trade restrictions were removed. The imagination of the British merchant was fired. Great quantities of manufactures and colonial produce were accumulated to meet the expected demand, and prices rose rapidly in consequence. No account was made of the fact that those countries, impoverished by long wars, were unable to pay for the commodities they would gladly purchase. When the ports

were opened, English goods were crowded upon the continental markets in such quantities that presently "they were selling for less in Holland and Germany than in London and Manchester, while in most places they were lying a dead weight on the market, without any sale at all." (Lord Brougham, quoted in Tooke's History of Prices.) In consequence of this miscalculation, 6,616 failures took place in the agricultural, commercial, manufacturing, mining and shipping interests of Great Britain, and so many laborers were thrown out of employment, that the country seemed for awhile to be on the eve of revolution. The commercial history of both Europe and America is sprinkled with commercial crises from 1799 to 1816, having their origin in the distempered imaginations of traders unduly excited by military events and the commercial regulations of governments. The Hamburg crisis of 1799 was caused by the French occupation of Holland in 1795, which threw into the lap of the former the continental trade which had previously belonged to the latter, causing such a tremendous speculation and rise of prices and extension of credit in Hamburg during the succeeding four years that presently a crash came, in which 82 houses failed, with liabilities amounting to 29,000,000 marks. Thus the very event which seemed likely to contribute to the prosperity of Hamburg, serving to inflame the greed of her capitalists and obscure their vision, ended in her impoverishment. It is needless to multiply instances showing that every great speculative movement has an ascertainable starting point. Referring to the last one which afflicted our own country, there can be little doubt that the most potent contributing cause was the unwise liberality of congress in offering immense grants of land to corporations as a free gift on condition that they would build railways through them. No less than 170,000,000 acres were flung out to the cupidity of capitalists after the close of the war. Such an alluring bait had never been dangled before the eyes of a whole nation, not of one nation merely, but as many as chose to participate, for capital knows no boundary lines. England, Germany and Holland are believed to have invested \$250,000,000 in our railway bonds between 1865 and 1873, which afterward defaulted, not to mention those which managed to pay their interest and keep out of bankruptcy.—We will now consider some of the theories which have been advanced on the subject of commercial crises, more or less in conflict with the one here outlined. The one most commonly accepted ascribes all the mischief to paper money, to bank agencies of various sorts; to irredeemable paper, where such paper is current; to the medium of exchange, rather than to the things exchanged. Interminable statistics have been compiled to sustain this view, all going to confuse the reader and darken counsel. The bank is so necessary a part of modern trade, it is so great an object of interest in a financial panic, its system of loans, issues and

deposits is so great a mystery to the general public, that it answers all the purposes of a witch when a commercial distemper sets in. As the issue of circulating notes is no necessary function of a bank, we will first consider it without that function. Banks were first established to keep people's money in places of safety. Their sphere of duty was afterward enlarged, in order to assimilate the various sorts of money brought to them, so that their customers could deposit dollars, pounds sterling, livres, florins and ducats, some of full weight, others of short weight, and draw out one particular kind of money, as for instance, dollars always of full value, thus furnishing a sure basis for trade, and enabling buyer and seller to make their bargains understandingly. In point of principle the modern bank differs but little from the ancient one. It receives people's money in order to keep it safely and pay it back on demand. It also undertakes to melt down and hold in a state of "solvency" all the instruments of exchange that experience has found useful in facilitating the transfer of property, such as bills of exchange, checks, drafts, etc., so that its customers depositing such instruments, secured by commodities or otherwise, can draw out their equivalent in money as occasion requires. Bank deposits consist for the most part of these written instruments, which are merely the title deeds of property circulating between buyers and sellers, producers and consumers. The amount of cash kept on hand by a bank is usually a very small part of its deposits, since in practice the deposits offset and counterbalance each other through the instrumentality of checks and clearing houses. Experience has shown that a certain average amount of the deposits will always be on hand, and that it will be safe and profitable to lend these at the current rate of interest, a capital being provided by the bank itself as a safeguard and guarantee against sudden and unexpected demands from depositors. It is obvious that a bank has no power to create property; therefore, it can not cause drafts, bills of exchange, etc., to be drawn; therefore it can not cause deposits to be made. Nor can it lend more deposits than the average amount which it has on hand. It may unduly trench upon its own capital. It may put beyond its immediate reach more of its means than prudence would dictate. Bankers frequently make this mistake, but not oftener than other men. They are subject to the same influences and motives as other members of the trading community, they breathe the same atmosphere, they are as ready to make hay while the sun shines. If others are making unusual profits, they are not slow to participate, and when their customers are habitually taking large risks, they are apt to take large risks also. If we expect them alone to be prudent and conservative, while everybody else is enterprising and dashing, we shall expect too much. The community will always find bankers to their liking. In times of prosperity all croakers are unpopular, and bank-

ing croakers most of all. The popular banker at such a time is the one who accommodates most liberally and is not too particular about his securities. He will draw the largest train of customers and make the greatest profits, while his croaking neighbor will have only a constituency of curmudgeons and old fogies. A banker's risks are somewhat greater than a merchant's, because his liabilities are payable on demand; therefore bankers ought to be more prudent than merchants, and, as a general rule, they are so. But they are liable to become infected by their surroundings, and to lend more of their capital in good times than they ought, in exactly the same way and for the same reason that a merchant extends too much credit to his customers, and borrows too much money from his banker. In short, bankers are not sinners above others in paving the way for a commercial crisis. They have no occult power to swell their own deposits or to force loans upon the community. Their contribution to the general mischief is precisely similar to that of other people, attempting to do too much business on a given capital.—When a bank, in addition to the function we have been considering, is vested with the power to issue notes, it merely displaces an equivalent amount of gold from the circulation. No more notes will circulate than are needed to pass from hand to hand among buyers and sellers. Any excess will come back to the bank's counter for redemption: any deficiency will be supplied by gold from the mines or from foreign countries. Banks are powerless either to add to or subtract from the circulation of the country. Nor is the case different when their notes are redeemable in government notes, which are themselves irredeemable. So far as the banks are concerned, all the principles which govern when gold is the standard, govern when greenbacks are the standard. If more bank notes are out than are really wanted, and therefore servicable to the public, the surplus will come back to them in spite of all their efforts to the contrary. It is an observed fact, that, at times immediately preceding a panic—that is, during a favoring gale of high prices, large profits and active speculation—there is an abnormal increase of bank note issues; whence it has been concluded that the bank issues have caused all the trouble. *Post hoc, ergo propter hoc.* Bank issues are large at such times, because business is active, because prices are high, because the conditions of trade demand and require and *will have* an augmented circulating medium. If they can not have paper they will have gold; and their having gold instead of paper would not stave off the crisis. A commercial crisis has no better appetite for one kind of money than for another; nor does one kind of money favor the oncoming of a crisis more than another, with a single exception to be noted hereafter. This is abundantly proved by the history of these disasters, which have fallen with perfect impartiality upon countries having an exclusively metallic currency,

upon those having a mixed currency, and upon those having an exclusively paper currency. The tulip crisis in Holland came at a time and place where paper money was unknown. There was a genuine crisis in England in 1692, two years before the bank of England was established. (Bagehot's *Lombard Street*, c. 6.) The crisis of 1873 in the United States came during a protracted suspension of specie payments, as did also the English crises of 1811 and 1816. These facts prove that the kind of currency prevailing is not necessarily the producing cause of a crisis. It may have its influence one way or another, but there are no facts to show that the adoption or rejection of any particular medium of exchange would banish the phenomenon from the commercial world.—The single case where a crisis may be produced by a vicious currency is that of irredeemable legal tender paper. When government commences issuing such paper the experience of mankind suggests that the first issue will probably be followed by a second, and the second by a third, and so on. It is a necessary consequence that prices of commodities and real property should rise, there being no foreign outlet for the excess of notes forced upon the community by the government's disbursements. This is sufficient in itself to incite speculation. Most commonly there is a further incentive furnished by the government's heavy purchases of the goods it stands in need of, and general speculation takes its start in the branches of trade which supply these articles. A commercial crisis may or may not ensue. The legal tender notes may become utterly valueless, as our continental currency, the French *assignats* and the notes of the southern confederacy did, or they may be restored to gold value, as bank of England notes were in 1821, and as our own greenbacks were in December, 1878. Whatever may be the disasters consequent upon such pernicious meddling with the standard of value, it is obvious that they do not belong to the category of the true commercial crisis, which is a disturbance due to commercial causes alone without extraneous influence of any kind. It is hardly necessary to add that all the ingredients of a commercial crisis can be gathered under a *régime* of irredeemable paper, as readily as under a metallic or mixed currency. The quantity of such paper afloat always has some limit; and, as long as it possesses the character and requisites of a currency at all, it must have some value quotable in gold. Prices of commodities will be reckoned in paper, contracts and obligations will be payable in it, and the undulations of trade as previously described will move on for all the purposes of crisis-breeding, in the same way as under the *régime* of metallic money.—Another theory, which has the support of respectable authority, assumes that the improvident investment of capital during a period of general speculation is the cause of commercial crises. Improvident investment is, for the time being, the same thing as total loss, and it is contended

that the aggregate of losses becomes so great eventually that the fabric of industry can not support the burden, and is crushed beneath it. This doctrine seems to be open to a short *reductio ad absurdum*. Let us suppose that mankind have accumulated a year's stock of goods, and that everybody starts, as most people do start after one commercial crisis has spent its force, measurably free from debt. Then, if all the surplus products of a country or of the world—that is, all the wealth produced beyond annual consumption and seed—were collected together and burned on the last day of every year, would any commercial crisis be produced thereby? The world would merely remain *in statu quo*. Wealth would be neither increased nor diminished, since only the surplus of production had been lost; but, as nobody would owe more than he could pay, there would be no crisis. This is another instance of the argument, *post hoc, ergo propter hoc*. The conversion of circulating capital into fixed capital goes on rapidly in "good times." As the production of wealth is rapid, means must be found for investing the surplus—the portion not consumed in the process of production—and such seasons of prosperity are always marked by the multitude of new enterprises, such as railways, mines, factories, buildings, ships, and the bringing of new land under cultivation. A great part of these enterprises turn out to be premature and improvident, perhaps wholly wasteful, and for all present purposes the capital invested in them might as well have been burned at the outset. But if it had been burned at the outset, no commercial crisis would have resulted. It is contended, however, that the conversion of circulating capital, (wheat, cloth, iron, etc.) into fixed capital has gone on at such a reckless and headlong pace that there was not a sufficiency left for the requirements of trade. Hence the distress. The answer is, that nature has provided abundant checks against the too rapid conversion of circulating into fixed capital, for, if too much food and clothing are thus withdrawn from the market, a portion of the community must starve and go naked; if too much iron and timber are withdrawn, the requirements of everyday life will impose such obstacles, in the shape of enhanced prices, to the further conversion that it will be sharply arrested. Finally, it is an observed fact, that a rapid increase of fixed capital is always accompanied by a great increase of circulating capital. J. S. Mill doubts if a single instance can be found to the contrary. (Political Economy, book i., c. 6).—A third doctrine, which has found more or less support, assumes that commercial crises proceed from a sudden and spasmodic want of confidence, and that if confidence could be restored as suddenly as it was destroyed, all the evil consequences would disappear. The want of confidence which upsets commercial calculations and brings on a crisis is the disturbance or rupture of a commonly received opinion that fifty cents' worth of goods are equal to a dollar in

gold. This opinion, which finds its expression in high prices of commodities, labor and real property, is gradually undermined by the departure of gold to countries where it is rated at a higher value. The exportation of the precious metals is signalized by a rise of the exchanges and of the rate of discount; and general uneasiness ensues. The outflow of gold continues, money becomes scarce, and the rate of interest rises, till the weaker and more venturesome traders fail. Then the public discover all at once that their "confidence" in the value of property was misplaced. Everybody will rush to his banker to draw out money, lest others should get the start of him and break the bank. It is not necessary to recount the usual features of a panic. Like other stampedes they are cruel and destructive, and not amenable to argument, but they are likewise of short duration. Banks and other depositories of money are either broken at once by the onset of depositors, or they are relieved from the pressure in a few days or weeks. But "confidence" is gone. People no longer believe that fifty cents' worth of goods are equal to a dollar in gold. Nor is it possible that they should so believe when once their eyes have been opened to the real facts. "Want of confidence" at such a time is mere inability to believe an exposed falsehood. People have been confident at certain times and places that clipped shillings were equal to whole ones, and that brass money was equal to silver. When they discovered the contrary, they were perhaps upbraided for their want of confidence, but history does not mention that any efforts to restore confidence in this particular ever met with much success. When want of confidence is well founded, as it always is in a commercial crisis, there is no cure but a re-establishment of the true par of exchange between money and goods.—Money is the pivot around which the vast mechanism of exchange revolves. As already shown, money is either gold coin and bullion or something referable thereto and deriving its potency therefrom. Every commercial act, whether for present or future execution, every business transaction, from a government loan to the purchase of a jackknife, is expressed in money, is enforceable in money, is computable in money, and not otherwise. It is not our purpose to consider whether any better system can be devised and agreed upon by mankind for gauging and estimating their dealings with each other. No other has yet been suggested that would not entail more evils and inconvenience than it would cure, and it is extremely doubtful whether any other (Mr. Poulet Scrope's Tabular Standard of Value, for instance) could command the assent of a sufficient number of people at one time to serve the purposes of experiment. What we have to consider here is the fact that goods and money must be equivalent to each other in a healthy state of trade, and that any wide divergence from equivalency is a state of disease, which, when sufficiently prolonged and aggravated, ends in convulsions.—Much has

been written about the remedies for commercial crises. There is no remedy except in the concurrence of mankind to keep out of debt and to avoid all temptation to make gain without equivalent labor. Civilization is so interlaced with the credit system that it is idle to talk of abolishing it. The interests of mankind require that it should continue, even at the cost of its abuses and of the miseries of an occasional crisis. The desire for gain without labor, or of much gain with little labor, is so universally diffused and firmly planted in the human breast that it is equally idle to think of uprooting it. Nor is it, upon the whole, a thing which ought to be uprooted. Nine-tenths of all the inventions and discoveries that have advanced mankind from the stone age to the age of steam and electricity have had their origin in this desire. But while we may not hope, and should not wish, to eliminate from the mental and moral constitution of mankind those motives which drive the commercial world now and then into a state of crisis, much may be done to lessen and mitigate the evil by diffusing correct knowledge of the principles underlying these painful phenomena. When the public shall be well instructed as to the genesis, growth and external indications of an approaching crisis, each captain of an industrial craft will be moved to take in sail before the storm strikes him; and, if all captains take heed in time, little mischief will be done. Speculation will be checked, prices will recede, losses may be felt; but the cataclysm may be avoided. At present, it must be admitted that economists themselves are not sufficiently agreed upon the fundamental principles of commercial crises to command strict attention from the unprofessional classes.—The literature of our subject is not extensive. Among the works most worthy of examination may be mentioned Max Wirth's *Geschichte der Handelskrisen*, 2nd ed., Frankfurt, 1874; *Le Marché monétaire et ses Crises*, by Emile de Laveleye, Paris, 1865; *The Commercial Crisis of 1847-8*, by D. Morier Evans, London, 1849; *History of the Commercial Crisis of 1857-8*, by the same author, London, 1859; *Les Crises Commerciales*, by Clément Juglar; and the article by the same author in Block's *Dictionnaire de la Politique*, Paris, 1880; *the History of British Commerce*, by Leone Levi, London, 1872. Tooke's *History of Prices* is a mine of information, and the contributions of his co-laborer and literary executor, Wm. Newmarch, in the *London Economist's Annual Review*, are extremely valuable. James Wilson's *Capital, Currency and Banking* (London, 1847), contains important suggestions; indeed, nowhere else can be found a more rigid analysis or sounder conclusions upon the relation between prices and the circulating medium. Mr. R. H. Patterson's *Science of Finance* (Edinburgh, 1868,) gives a good account of the London crisis of 1866, but the views advanced by the writer are misleading. Since the crisis of 1873 there has been an active discussion of the subject in magazine articles. The most important contribution of this kind is

that of Maurice Block (*La Crise Economique*) in the *Revue des Deux Mondes*, March 15, 1879. Mr. Robert Giffen's article in the *Fortnightly Review*, entitled "The Liquidations of 1873-6," (republished in his volume of *Essays in Finance*), and a recent article on "Over-Production," by Mr. George Chesney, in the same periodical, are also noteworthy. The house of commons' report on the commercial distress (1848), and other parliamentary inquiries, contain a great mass of undigested material, as does also the evidence taken by the house committee on depression of labor and business in the United States (1878-9).

COMMUNE, Paris. The municipal authority in the city of Paris has been twice usurped—once in 1792, and again in 1871, by an insurgent power known under the name of the *Commune de Paris*.—On Aug. 10, 1792, while the mob was invading the Tuileries, several chiefs of the movement, presenting themselves as delegates of sections, occupied the *Hotel de Ville*, and there constituted themselves into a commune, with all the political and administrative attributes of a government. The commune notified the national assembly of its revolutionary existence, demanding powers without limit, and the creation of an extraordinary tribunal authorized to pass judgment without appeal on the "crimes committed on the 10th of August, and on other crimes and circumstances relative thereto." The commune of Paris became all powerful under the influence of Danton, Robespierre and Marat.—In vain did the assembly try to break its tyranny. It passed a decree dissolving the insurrectionary commune, and providing for the election of a new municipal council. The commune was the stronger: it issued decree after decree; "it ordered that the bells should be turned into cannon, and iron railings into pikes; that the silver of the churches should be melted down, and that wages and arms should be given to the indigent; that domiciliary visits should be made to discover arms and arrest suspected persons." During this time the enemy had crossed the frontier; in Paris, exasperation had reached its height, and the leaders of the commune took advantage of this to arouse the vengeance of the people against the assembly and the royalists. After hearing the news of the capture of Verdun, on Sept. 2, the crowd rushed to the prison and massacred about a hundred captives: priests, nobles, sextons, guards of the king, whom the commune had arrested as suspected persons.—The national assembly, which was about to make way for the convention, was pow-

erless to repress those crimes. The convention itself was obliged to reckon with the commune, and to endure, side by side with itself, in the capital in which it was in session, this revolutionary power which knew no government but that of terror. The clubs, the feeling in which found expression in the stormy meetings of the convention, urged men on in the way of folly and disorder. The commune, after having destroyed, under the pretext of liberty, the political and administrative hierarchy of the city, could not fail to attack religion, which it looked on as a creation of the old régime. It closed the churches, turned Notre Dame into the "temple of reason," and even published a decree providing for the demolition of steeples, "which, because they towered over other buildings, seemed to be in conflict with the principles of equality." This lasted till July 27, 1794 (9 *thermidor*). The commune fell at last in consequence of a reaction, which could not but be bloody. Robespierre, Couthon, Saint Just and eighty-two of their colleagues, most of them obscure men, whom blindness and revolutionary caprice had brought into the commune, perished on the scaffold. The commune of Paris left in history a memory so odious that no one could have imagined it would come to life again, with its name, its doctrines, its terror and its blood. And yet it re-appeared and reigned anew in 1871. Our own generation has looked on the Paris commune.—In 1871, as in 1792, the commune was born of a political revolution, under the pressure of a great national defeat in the presence of invasion. It took advantage of popular exasperation, and we may say that it was guilty of every species of crime as well as every species of folly. It had its clubs, its proclamations, its vagaries, its suspected persons, its massacres of prisoners, its hatred of religion, and the liberty, equality and fraternity practiced in 1793. Perhaps, during its shorter reign (from March 18 to May 24), it was still more cruel without being less stupid. The history of this lamentable period is written in the memories of men as well as in tombs and ruins. It is useless to retrace its details; but it seems important to note the starting point of the commune of 1871, to seek in written documents the thought which inspired its acts, and bring into bold relief the pretended belief which it appealed to.—The fall of the empire, on Sept. 4, 1870, left France and Paris without a regular government. From that moment revolution, ill restrained by improvised authority, had free rein. Paris was soon besieged by the Germans, and cut off from all communication with the rest of the country. History will pay a proper tribute to the patient energy with which the whole Parisian population endured this rude trial; but it will also tell with what ease the seeds of anarchy and disorder were scattered about during the four months of the siege in the great capital. The amnesty was far from calming the passions of the multitude, embittered by the physical sufferings of hunger and cold. The

people would not admit that they had been conquered; they accused the signers of the capitulation—which, however, was delayed as long as possible—of incompetence or treason. The entry of a part of the German army into Paris was a bitter humiliation to them. Later, however, when intercourse with the provinces had become free, and especially when the results of the elections to the national assembly at Bordeaux were made known, elections which seemed opposed to Parisian opinion, a great part of the population thought, that, after having been abandoned in their distress, they were again betrayed in their political aspirations. The decision by which the national assembly established its seat at Versailles also exasperated Parisian feeling, not only among the lower classes, too easily given to excitement, but also among the middle classes, who thought their interest sacrificed and Paris decapitated. The regular army had been disarmed, almost dissolved; the national guard had preserved its arms, and, under the direction of daring chiefs, the battalions of the suburbs had taken possession of the cannon which they had collected at Montmartre and Belleville. Disorder had paved the way for revolution. In vain did the scarcely formed government try, on the 18th of March, to recapture by force the artillery which threatened the city. The troops sent against Montmartre were repulsed, or laid down their arms in the face of the revolution; and two generals were assassinated after a sham trial. In the evening the whole government, and whatever regular troops remained, removed from Paris by the order of Thiers; a necessary measure, no doubt, but one which gave up the peaceful population to the mercy of the insurgents, and which could only fill the measure of general discontent. In short, Paris, barely freed from the Prussians, was about to be attacked by the army re-organized at Versailles. A civil war began. By what series of criminal instigations and deplorable misunderstandings was Paris again put in the condition of a besieged place? How was it that a considerable part of the population allowed itself to be induced to join the revolutionists, or endure them? The story of this very complicated situation is a long one. The commune of 1871 was, in a certain way, the result of a really marvelous accumulation of events and incidents, of a combination of the most diverse elements, and, as has been said, of a psychological state which at that moment defied good sense and reason.—We might believe, at first sight, that the commune movement was determined by a desire to preserve the republican form of government, attacked, as it was said, by monarchical manœuvres, and to acquire municipal independence in administration as in politics. These are merely pretexts and poor excuses: the republican form of government was not threatened at all in March, 1871; and, at that very moment, the national assembly was preparing to revise the legislation relating to the condition of the communes, in a liberal

sense. Moreover, the character of the men who had taken possession of the Parisian movement showed, that, under an apparent modesty there was hidden something very different. These were the men who since 1830 had figured in revolutions, in disturbances, in secret societies that were organized to overturn every government, the republic included. To these veteran conspirators were added the orators of clubs, some literary men of broken reputation, preachers of socialistic doctrines, the chief members of working men's associations, and, to complete the list, a whole army of foreigners, cosmopolitan revolutionists, who simply came at the call of disorder. Communal liberty was, for the greater number, merely a word devoid of meaning, a good word to inscribe on a banner to draw the crowd after them. In reality these men were seeking to seize upon governmental power at any cost, not only in Paris, but in all France, where the chiefs of the commune had numerous confederates. These men wanted power for its own sake alone, and endeavored to obtain it by the most violent means, guided by no rule but the principle that the end justifies the means. It was necessary to subvert the government, whatever it might be, and to overthrow everything which stood in the way—religion, laws, labor, the army, regular administration. It was, indeed, a universal revolution, masked at one time under the simple title of communal reform, at another appearing under the pompous title of social regeneration.—In 1871 the same arguments and shibboleths were used as in 1792. But, from 1792 to 1794, France was on the eve of a real revolution, a revolution which had abolished not only royalty, but also caste privilege, the remnants of feudal rule; and extreme parties might with some show of reason fear the return of the old régime. This was not the case in 1871. At that time there was neither privilege nor caste; and no party dreamed of restoring what had been destroyed since 1789. The revolutionary faction did not need to fight against what no longer existed. But it summoned to its aid the new interests which had been created in consequence of the emancipation of the *bourgeoisie*, and which were personified in manual labors. It claimed that the working classes had remained in a state of oppression, that their day of emancipation had come, and that they, too, had to win their rights. Such had been, for more than 30 years, the theme of socialistic preachers and political adventurers. The commune of Paris was, under a vague term, merely the expression of a revolutionary feeling, more developed in France than elsewhere, through the inflammable temperament and the ignorance of the people, by the premature granting of universal suffrage, and by the very frequency of revolutions, which, rightly or wrongly, have succeeded. Yet, we must know in what consisted the autonomous commune, of which the Paris commune claimed to be the type, and which served as a rallying cry

for the revolutionary attempt of 1871. We here give a description inserted in a programme of the commune, dated April 19: "The absolute autonomy of the commune, extended to every locality in France, assures to each one of them the entirety of its rights, and to every Frenchman the full exercise of his faculties and his powers as a man, a citizen and a workman.—The autonomy of the commune should have no limit, but the equal right to autonomy of all the other communes which adhere to the contract, the association together of which communes shall assure the unity of France.—The inherent rights of the commune are to vote the communal budget, receipts and expenses; the determination and apportionment of the taxes; the management of local administration; organization of the magistracy and local police; education; the administration of property belonging to the commune; the choice by election or competition of communal magistrates and functionaries of every kind, with the permanent right of controlling and dismissing them; the absolute guarantee of individual liberty, of liberty of conscience and liberty of labor; permanent intervention of citizens in communal affairs, by a free expression of their ideas and by a free defense of their interests; the organization of local forces and the national guards, who, electing their own chiefs, alone watch over the maintenance of order in the city" * * * * "The communal revolution," added the programme, "inaugurates a new era of experimental, positive and scientific politics. It is the end of the old governmental and clerical world, of military and bureaucratic rule of spoliation, stock jobbing, privileges, monopolies, to which the proletariat owes its serfdom, and the country its misfortunes and disasters."—Thus every commune in France was to form a complete autonomous whole, dependent only on itself. Men did not stop at legislative reform which is really capable of giving municipal unity more or less of the attributes of liberty, according to circumstances and the progress made in course of time. To attain this end a revolution was not necessary. Men went further: it was a question of making the commune absolutely independent. Nationality was therefore suppressed. The fatherland existed no longer; and really, in the eyes of these revolutionists, assembled from every point in Europe and the world, the idea of fatherland had had its day. The fatherland was replaced by the universal republic, baptized with strange sponsors, some of them unknown; others too well known, who had selected Paris as their place of rendezvous, to commit, with deliberate purpose, monstrous acts which no party would avow, or excuse, even by a state of war.—The commune thought, that, to establish the universal republic, all means were good, even murder. Princes might be an obstacle in its way. they were merely to be done away with.—"Society has but one duty toward princes: death; there is but one formality to ascertain

their identity." This is how a functionary of the commune expressed himself in an article which the commune published, with approval, in its official journal, March 27, 1871. In 1792 the commune of Paris admitted, at least, the preliminary formality of a trial: it wished the execution of Louis XVI., but intended that the king should first be condemned as a criminal. In 1871 the title alone of king or prince was a crime to be punished with death.—By suppressing conscription by its decree of March 29, the commune suppressed the army, which it replaced by the national guard, to which all able-bodied citizens were to belong. What use was there really for an army when there was no longer a country to defend? This abolition, moreover, was merely the result of declamation which had been heard for years, in the clubs, and even in the legislature, against military organization.—While proclaiming liberty of conscience, the commune closed or profaned the churches, caused the emblems of Catholic worship to be removed, imprisoned the archbishop of Paris, and shot him; and while wishing to make everything the common property of all, the commune decreed confiscation, the destruction of several public monuments, and even private houses. It revived the ancient law concerning suspected persons, and rendered it more grievous by a decree concerning hostages; and the victims were chosen from all ranks of life, and destined to death. It violated individual liberty daily, by forcing citizens to take up arms against the regular government, and by resorting to compulsory enrollment. It showed no more respect for the laws governing the constitution of the family. One of its decrees put illegitimate children on the same footing with legitimate children, and consecrated, so to speak, the free union of the sexes, which had been preached in the clubs.—Several members of the international society of working men formed a part of the commune, in which they had very great influence. They controlled a large army of workmen already well disciplined through strikes. The moment had come to put in practice the combinations which were to suppress wages and replace them by association. The commune created a labor committee which was commissioned with carrying out the high-sounding promises, by the aid of which the revolutionary politicians had led astray the minds of the laboring population, and introduced disorder into the workshops. They merely succeeded in drawing up some decrees in which the principles of the association were explained in vague terms, but there was nothing that could be applied, and in this matter the commune failed miserably.—In a word, if we review the different measures taken under the reign of the commune, we find no practical idea, no serious plan, no useful reform. Nothing could result from it but insensate and criminal acts, as in 1793. For a second time the commune of Paris gorged itself in blood. To the horrors of a foreign it added the disgrace of a civil war, and did not even

know how to meet defeat with honor; its crowning effort was to burn Paris. Unfortunate indeed are the nations which witness such scenes and forget them.

C. LAVOLLÉE.

COMMUNISM. We here propose to discuss communism both in itself and from an historical point of view. Such a plan is broad enough without introducing into it the various social utopias. We are here concerned exclusively with avowed and consistent communism, and not with what in our day goes under the vague name of socialism.—Communism is the system of doctrine which, in the name of the general interest and of absolute justice, most frequently sees the type of social perfection in a putting in common of persons and things. We purposely say persons and things. The distinction which certain communists pretend to establish between the two is in reality an empty one. The thing possessed is here the person, or at least a part and an extension of the person, who has put his labor into it and placed upon it the seal of his liberty. It is impossible to respect the producer and deprive him of his product. This first usurpation involves all the others, and ends in the complete monopoly of the human person.—Thus communism, whatever amount of logic it may have (and we shall see that it has not been lacking in this regard), is forced, inevitably, to speak to humanity in nearly the following words: "I shall first take possession of all material products in order to distribute them in accordance with the general interest; but that there should not be an over-abundance of some things, dearth of others, and consequently the impossibility of a just distribution, I shall direct production, which can not be done unless I dispose of the producers themselves as I think best. I shall, therefore, assign to each man his task; and to satisfy myself as to how he accomplishes that task, and that he does nothing else, I shall oblige him to *work in common*. And then, that he may not be suspected of depriving his brethren of any portion of the social part which comes to him, he shall also *consume in common*." Here we have the *family* transferred to the public square. But why let the family itself exist? Are we not acquainted with the jealous activity and watchful foresight of the father and mother for their children? To uphold the family is to create a permanent conspiracy against communism in the bosom of communism itself; it is to condemn communism to witness soon, under the deceitful names of liberty, emulation, economy, of conjugal, paternal, maternal and filial attachment, all the competition, saving, jealousy, favoritism, preference of self or of one's own to others, in one word, the wretched retinue of *individualism* and *familyism*. This is not all. There are evil inclinations in the bosom of every individual which resist communism by tending to persuade him that communism, or a community of goods, is not for the best. Hence, a love for communism must be instilled into him, of course in his own interest,

at an early day, by *education*, which consequently must be in common.—“Moreover we know how much religious systems, which pretend to concern themselves only with heaven, influence earthly affairs. What sources of division and struggles, beliefs and ideas are! Hence, no sects, no heresies, no individual opinion! *Religion* must, therefore, be a common religion for all, at least if we [communism] judge proper that there should be such a theory as religion, which is not very certain. Now, as all this can not be accomplished, and a certain number of individuals not think they have a right to complain, the state must be charged, on the one hand, with the task of carrying out this plan, and, on the other, with putting down the malcontents, unless speedily and completely converted. Hence, the state must be the sole producer, the sole distributor, the sole consumer; it must teach, preach, pray and carry on the work of repression; it must be the great agriculturist, the great manufacturer, the great merchant, the great professor and high priest; it must be spirit and matter, dogma and force, religion and the police—everything.” This all shows how chimerical is the disposition which it sometimes pleases certain adherents of communism to make of things and persons, of property and family, of the action of the state, and of individual initiative. Properly speaking, communism knows nothing of persons. It knows only things. The forfeiture of property which it declares strikes at the last principle of liberty in its vital part. Communism drags into its sphere the moral and intellectual as well as the physical life; and man from whom it pretended to take but a single faculty and one order of products only, passes soul and body under its complete control. It is evident, then, that when communism says it wishes to destroy individualism, it means that it wishes to destroy the individual himself. To destroy liberty is, in fact, to destroy the individual in his very essence. A writer has defined man as an intelligence served by organs. From the economic point of view, it would perhaps be more correct to say: “man is a *liberty* served by organs;” and these organs include intelligence itself, physical power, land and capital. To liberate the organs, is to liberate the man; to reduce them to slavery, is to enslave the man himself.—Liberty is the moral basis of political economy. Now, what we find at the bottom of all communistic parties and systems is an attack on liberty. Communism is, therefore, directly opposed to political economy. Let us first say a word on the fundamental error of communism. It may, we think, be summed up in the preference which it gives to equality over liberty.—Now communism fails to insure equality for the very reason that it has a preference for equality.—Equality supposes something anterior to itself, something which may admit of equality. But in what are men equal? In intelligence? Take two men at random: they are different both in the degree and in the nature of their aptitudes. And so it is in the mental and physical, in the moral

and material order. Do you wish to find the type, the basis, the rule of equality? Turn to liberty. The liberty of every man recognized and guaranteed, is true equality. We are equal in and through liberty. This truth is the absolute rule, the only source, in fact and in law, of equality between the members of the great human family. Outside of equality through liberty everything is chimerical and deceptive. To profess to put equality above liberty is therefore nonsense. To pretend to secure one by the suppression of the other is a monstrous contradiction. This contradiction is the starting point of communism.—Let us glance at the declivity which leads communism to the abyss.—Communism not knowing how to find equality where it exists, is led to place it where it is not. For the idea of equality is inherent in the mind of man, an imperative want of his heart, a necessary law of his development. Not having found equality in liberty where alone it exists, communism tries to enforce an equality of passions, ideas, wants, things; in one word, of everything which does not admit of equality. Moreover, having misunderstood the true nature of liberty, it plays the tyrant with it, when it meets it, as an obstacle in its way. It is the general tendency of false systems to suppress violently whatever stands in their way, and to replace it by arbitrary equivalents.—False ideas of equality and liberty are the starting point of communism; all the rest results from those false ideas.—Communism ignores and destroys both liberty and equality, and by this very fact sacrifices real rights to chimerical ones.—As a free being I have the right to dispose of my faculties, the right to work, with all that that right involves; such a right is nothing but the recognition of general liberty, and therefore it is evident that it oppresses no man. According to communism I have the right to labor, and all the other rights which are necessarily involved in this one right: that is to say, I may *demand* work, and force *others* to give me work. Here, then, we have a portion of human ity, not only obliged morally, but constrained physically, obliged by the authority of the law to furnish work to others. When I assist a poor man I merely pay him a debt which I owe him; to give him nothing when I can afford to give him something, is to be not only hard-hearted but wicked; it is to be a thief. I deserve then to be treated as such, that is, to be imprisoned or hanged.—Communism endows the individual with lying rights; and to satisfy these rights it burdens the state with impossible duties. A double germ of anarchy and despotism, this, which leaves no alternative to society than a desperate war of all against one, and of each against all, or the most grinding slavery.—The economic and moral consequences which are so closely connected with one another in the communistic system, flow no less logically from its erroneous premises. How can there be *merit* where individual liberty is sacrificed, where suc-

cessful effort is counted for nothing? Communism itself feels what a stranger to it *merit* is, and how fatal it would be to it. For the hallowed formula: *Each one according to his merit*, it substitutes the following, borrowed from the pretended holiness of instinct: *To each one according to his wants*. So that, whether a man works little or much, produces with more or less zeal, care, or in greater or less abundance, it does not matter. Does communism destroy the abuses which it pretends to radically abolish? It is easy to prove that it only aggravates them and renders them more general. We know how furiously it attacks *competition*, that is to say, liberty. But in the place of the legitimate, industrious, enlightened competition of interests which is profitable to all, it puts the blind, barren and disorderly competition of appetites. It complains of robbery in human society, and decrees universal spoliation in order to suppress it. It groans over prostitution, and makes a law of the promiscuous intercourse of the sexes. It is angered at seeing a number of men who, to enjoy themselves, had only to take, as it says, the trouble of being born; and the taking of this trouble, it claims, entitles them to a share in every social advantage! It impeaches slavery and exploitation of the proletariat, and it makes of every man a slave to be exploited by the state. Let us add that the slavery which it establishes is not merely a political and economic one, but a moral slavery which must perpetuate, indefinitely, both political and economic slavery. When free will and personal dignity, care for the future, the calculations and affections which make existence worth having, flights of imagination and innocent fancies, are abolished in men; what is there to replace these broken springs, or to compensate for the loss?—Communism, by enervating all the motives which constitute the essence, the health, the energy of the moral being, at one blow exhausts all the sources of wealth.—Communism has sought the principle of liberty, by appealing to *love*. With instinct as its basis, it seeks in instinct the means of correcting the evil effects of instinct. This twofold pretension is evidently chimerical. Instinct can not be tempered by its own excess. As to making *love* and *fraternity* the only springs of production, it is the most impossible of utopias. It is madness to suppose that a man will work, manufacture, sell, etc., with the perpetual enthusiasm which religion itself does not always produce.—Never has the saying of Pascal: "The man who wishes to imitate the angels becomes a beast," been better justified than by communism, which commences by supposing angelic virtues in man, and ends by always showing him gross and brutal in practice. What an illusion it is, then, to suppose that the individual will love everybody, will devote himself to everybody, when he is prohibited from loving his own family and devoting himself to it! Sympathy, like all other faculties, has need of practice and food. Men do not begin by loving the human

race, but end there. And how much enlightenment, how much philosophical or religious elevation of mind, is supposed by so complicated a sentiment! It is a fact which has not escaped the most superficial observer, that affection becomes more intense by being restricted to a narrower circle; more sublime perhaps, but less energetic, in proportion as it extends to a greater number of objects. Communism, by opposing this elementary law, drowns, so to speak, sympathy and devotion in the depths of the limitless ocean called the human race, and buries the individual in the immense and vague abstraction which it calls society.—We have seen communism, considered as a system, plunging into every error and contradiction; aggravating the evils of which it complains by letting new ones loose on humanity; rousing the appetites and finding nothing to create the immense amount of capital it would need to carry out its plans, except the unproductive principle of fraternity; and rendering this very fraternity impossible by inviting each member of the community to seize a quantity of products which must necessarily grow less and less; or to bow under the hard law of a state which can live only by the skillful distribution of wretchedness. We may well be astonished that such a doctrine should find adherents. Still communism can appeal to a long tradition continued through all the centuries, through revolutions of every kind. The explanation of this strange phenomenon is instructive in more ways than one; and we are astonished to find that communism has often been but the logical development of the principles adopted almost universally by the nations which stigmatized it. Nothing is truer of ancient nations; and as to those which followed them, especially up to 1789, was not the principle of the right to landed property changed by conquest and civil legislation to such a degree, disregarded in law to such an extent by the doctrine that all property in land was held from the state, that communism became, if not justifiable, at least perfectly explainable? As a symptom, if not as a theory, communism still has an importance not to be underrated. Like all social utopias, it has its source in the imperfections of the social state; some of which are susceptible of amendment, others unavoidable; and is explained by a feeling of pity for human misery and by base passion.—Communism has been at work in the world, and it may be judged by its fruits. To begin with, it is an ugly thing that a doctrine held up as a charter of emancipation of the human race, should always appear in history based on and supported by slavery. How can we speak of communism without mentioning Sparta; and how can we mention Sparta without recalling what was most odious in ancient slavery? The régime of communism and labor are two things so incompatible that wherever the former has been established it has been necessary to condemn whole classes to forced labor. Thus the communism of the citizens of Lacedæmonia

could be maintained only by making helots of those engaged in agriculture and the useful arts. Sparta reached the ideal of communism better than any other city, unless it be perhaps Crete. Sparta was not guilty of the error of making movable property and material products common property. It also made education and women common property. But, by one of those concessions which the reality always makes to logic, and which we meet everywhere in the history of practical communism; by one of those inconsistencies which make the existence of communism possible and its destruction inevitable, it retained something of individual property by providing that lands should be divided into equal portions. But how great the practical superiority of Spartan communism over the communism of the nineteenth century! It did not promise the members of the association wealth and enjoyment in common, but poverty and abstinence. It spurred the children onward, not by making labor attractive, but by the whip. By these means it was able to exist for a time. Their principles of morality, moreover, debarred the Spartans from the sortening influence of the arts—a privation which their economic principles would have been sufficient to effect. The fine arts are impossible where there is not an excess of the wealth produced over the wealth consumed; and such an excess is impossible where communism prevails. The master work of Spartan legislation was to inspire the fanaticism of self-denial and a devotion to this state of things. Spartan morals were not the best. The Spartan, living on coarse food, trained for war, without luxury, without commerce, without a corrupting literature, was no less debauched than savage. Their rude power yielded at almost the first contact with civilized Greece, and could not withstand the wealth acquired after the war of the Peloponnesus. The people, who had rejected the institution of property, were famed for their rapacity, their avarice, and the venality of their magistrates. The people, who had sacrificed all to military prowess, fell to such a degree of weakness that they were forced to recruit their armies from among the helots, among whom they found their last great men. Occupied, like all ancient legislators, with the sole idea of doing away with revolution by destroying inequality, Lycurgus forgot that for states there is a worse danger than revolution—dissolution; and this is how Sparta ended.—The genius of Rome ignored communism. Everything vague, undetermined, is in keeping with the doctrine of communism, which in religion adores the all, in morality denies the person and sees only humanity, and in political economy absorbs individual property in the collective possession of the community. At Rome everything was well defined, the gods, virtue, the laws. Rome witnessed flourishing side by side stoicism which exalts the liberty and the dignity of the person, and property which assures that liberty and dignity. The institution of property might

be abused without the right of property being denied, in Rome. That right was extended, under the rude authority of the father, not only to the slaves, but to the family. Usury appeared there without compassion. As to agrarian law, so frequently confounded with communism, we know that it was merely a claim (*revendication*) by the poor plebeians who had taken part in the conquest, for lands retained exclusively by nobles and knights. The Gracchi did nothing, said absolutely nothing, incompatible with the right of property. As to the revolts of slaves, what connection had they with communism? These unfortunates revolted not to have everything in common; they fought to own themselves.—We know how powerful an organization the family spirit and property received from the Mosaic law in Judea. Nevertheless, it must be remarked that if the law of the jubilee, which brought back to the same family alienated lands, was a sanctioning of the right of property, it was also an attack on that right: it sanctioned it by keeping it intact in the hands of the same families; it attacked it because it trammelled individual liberty and hindered the natural course of transactions between man and man. Each one lived "under the shadow of his vine and fig tree;" but for that very reason each one was, so to speak, made a parcel of the soil of his own patrimonial estate. Industry, commerce, the sciences, the arts, which have need of a certain surplus, and the activity which results from the frequent relations between men, remained foreign to this intelligent and energetic people. As where there is no right to property whatever there is no civilization, so an incomplete civilization is the result of every curtailment of the right of property, which can only show its full effects on condition of remaining an individual right.—Essenianism was the communism of Judea. In this country of religion communism was associated with the religious principle, as in Greece, the country of philosophy, it was associated with the philosophic idea, with Pythagoreanism, which was its partial realization. The school of Pythagoras was a community of sages living in accordance with the severest prescriptions of spiritual life, in self-denial, friendship, and the cultivation of the sciences, especially mathematics and astronomy. Their austerity and their labors suggest to us that it was a sort of pagan Port Royal, while their eagerness for rule and their political activity, which drove them out of most of the cities in which they had founded their establishments, remind us of the celebrated society of the Jesuits. In contrast with the Pythagoreans, who constituted, as it were, monasteries of philosophers, and whose political ideal was an aristocracy of enlightenment guiding and governing the obedient masses, the Essenes exhibit to us a little people, forming a kind of fraternal democracy; not that hierarchically was not respected among them, nor that ranks were not known and even sharply defined; but all were admitted among them *on*

the single condition of a pure or repentant life; and everything was held in common by the chiefs and the subordinates. It must be said to the honor of the Essenes that they looked on slavery as an impious thing, an exception, however, which means nothing in favor of communism. The Essenes were in reality a very limited and entirely voluntary association; they were like a small tribe of monks; and Pliny said of them, "They perpetuate themselves without women, and live without money. * * * Repentance and distaste for the world are the fruitful sources which keep up their number." Communism, thus understood, was only a form of free association; the community received only those who agreed to form a part of it. Labor was carried on among them, moreover, by men reared in the habits and teachings of the upper society; and like all religious communities, it was founded not on the principle of unlimited satisfaction of human wants, but on that of rigorous abstinence. We can say as much of the Therapeutics, a Jewish sect of Egypt, whose members lived in isolation, and had little in common but their practices of religion.—Christianity put an end to the old world. Was it favorable to communism in the time of its Founder and the first apostles? This is a question which has been much discussed in our time, and which the communists, anxious to have the greatest authority of the civilized world on their side, unanimously answer in the affirmative. This claim has been refuted to our thinking, with an array of reasoning which amounts to demonstration. To begin with, if Christ had intended to extol communism, he would not have maintained the most profound silence on the subject. Then the texts of the gospels, appealed to in favor of communism, have a meaning altogether different from that attributed to them. Jesus Christ recommended almsgiving, the *giving away* of one's goods, which is a *use* and not the negation of property. In a word, he makes charity a religious duty, not an act of constraint, which abolishes all virtue and all charity. He repeats the precept of the divine law: "Thou shalt not steal," which is a sanction of the right of property. He preaches the inviolability of the family so far as to condemn divorce, one of the few laws relating to civil life which he laid down. The language and conduct of the apostles are none the more on the side of communism. The spontaneous putting of all their goods in common by the first believers, was as much a means of resistance in their hands, and an instrument of propagandism, as a picture of Christian brotherhood. Liberty and the laws of morality and political economy find nothing contrary to their principles, in this free community of a religious sect pretending in no way to set itself up as a model of social organization nor to change the general conditions of the production of wealth. The example of the small Christian family, at Jerusalem, after the death of Christ, an example not followed to any extent by the other churches,

has no weight as an argument.—We have to reach the second century and turn to a heresy severely condemned by Christianity, to see an instance of practical communism authorized by religion. The Carpocratians, who were confounded with the Gnostics, revived, a little earlier than two centuries after Christ, the infamy of the bacchanals that Rome had seen a little less than two centuries before his coming. The Christian communities, which were established with an ascetic object, had nothing to do with the history of communism. It is even certain that they could not have supported themselves in a communistic society, because they obtained their resources not from among themselves, but from outside. Moreover, these communities and the communists differ in every respect. Men came to join them, but were not born in them. Their object was almost always purely religious. The sexes, far from being together, lived separately; where marriage was permitted, its laws were strictly observed. The association of Herrnhuters, or Moravian brethren, is the sole exception to the above remarks. It was upheld by its evangelical spirit of humility, self-denial, hope in a future life, which rendered it less exacting in this one; in a word, by the very spirit most opposed to that of communism. While recognizing their virtues and their negative happiness, it must be recognized also that their narrow feeling of sect, their stationary condition, their want of arts, their proscription of everything lofty in science and all philosophical speculation, do not agree with the general character and the most necessary conditions of modern civilization.—When we follow the history of heresies in the Christian church, we find that communism was a stranger to most of them. Ecclesiastical authors, in order to brand them more surely, have been somewhat lavish of this reproach against them; and communistic writers have eagerly granted the truth of the reproach in order to gain for themselves a more imposing family tree. Bossuet, in his "History of the Variations," has not been sparing in this accusation against the heretics of the eleventh and twelfth centuries, especially against the Waldenses and Albigenses, whose innocence, in this respect, has been established, it appears to us, by the historian of communism, Sudre. The same is the case with the Lollards and some other sects more theological than political. It needed all the partiality of contemporary history, written from the communistic point of view, to make a Wickliffe and a John Huss apostles of social fraternity. The germs of communism were developed, nevertheless, in certain sects, such as the Brothers of the Free Spirit in the thirteenth century, and perhaps among some others. But communism broke out with the Anabaptists in a bold and most terrible form. It does not enter into our plan to relate this tragic episode in the history of communism in which it appeared with all the retinue of false theories which it advocated and evil passions which it roused. "We are all

brothers," said Muncer, the chief of the Anabaptists, to the listening crowd, "and we have a common father in Adam; whence comes this difference in rank and possessions which tyranny has set up between us and the great ones of the earth? Why should we groan in poverty and be overwhelmed with misery while they are swimming in delight? Have we not a right to equality of goods, which, by their nature, are made to be divided among all men? Give up to us, rich men of the world, covetous usurpers, give up to us the goods which you keep unjustly; it is not as men alone that we have a right to an equal distribution of the advantages of fortune, but also as Christians." Spoliation, polygamy, the destruction of statues, of paintings, of books, with the exception of the Bible, followed these preachings, especially at Mulhausen and Münster.—After having shown how sensual and fierce it can make men, of itself, it remained for communism to show by the example of Paraguay how moral, mild and happy it may make them when joined to the religious principle. This last experience of which it boasts, does not appear, any more than the others, very brilliant or very enviable. The crowning work of the Jesuits in their colonies was to change a colony of men into a flock of obedient and timid children, without any ideas of their own, without vices, but at the same time without virtues. The Jesuit fathers had established a system of absolute rule; they directed the production and distribution of wealth with that despotism without which communism is not possible. The happiness which they procured their flock was not, however, protected from the storm; and it is stated that the news of their departure was received with shouts of joy. The state of primitive innocence and even happiness under a superior authority can not be, at all events, the ideal of a civilization which prefers struggle, with its inevitable failure and the progress consequent on it, to this inert and stupid state of impeccability.—We must come down to our own time and to the New Harmony of Owen to find a fresh example of practical communism. The illusions of the modern reformer, who made irresponsibility his principal dogma, need not be recalled. It may be said that, on the whole, communism has done nothing considerable since the time of Paraguay, where it was able to survive for a time, owing solely to the change and modifications made in it by the religious spirit. Since then, it has appeared in the form of aspiration or conspiracy. Babœuf and his accomplices met the same fate as Muncer and John of Leyden, without having had the same success; and the records of the doctrine since June, 1848, and recently, have been only those of its defeats and disappointments.—To complete the review of communism it only remains to cast a glance over the utopias which it has produced, limiting ourselves to pointing out the chief trait of each, and the conclusions to be drawn from them all.—The type of all the communistic utopias has justly

been found in the Republic of Plato. It is important, however, to distinguish carefully the communism of the Greek philosopher from the doctrines with which it is confounded. Plato has been too frequently thought of as a modern utopist who aims at reforming the world. The republic of Plato is a purely ideal application of his philosophy to society. As a philosopher he paid too little attention in his analysis of man to the moral fact of liberty. This defect appears with all its deplorable consequences in his imaginary society. As a philosopher he understood the idea of justice admirably as far as it can be understood when detached from liberty; and with a geometrical precision concealed under the freest and most brilliant forms he arrives at absolute equality, interrupted no longer by individual differences of effort and merit, but by the personal differences of intelligence and moral energy. In this way he reaches an aristocracy of philosophers and warriors. Let us not forget, either, that Plato, far from looking toward the future had his eyes constantly turned toward the east, a country of (more or less) collective property and theocracy. Except in a few views purely moral, as sublime as they were new, which contained in them the future of the human race, we may say that Plato in his Republic wrote simply the Utopia of the past. Let us observe also that, in this work itself, property and the family seem forbidden only to one class, that of the warriors. Do not European armies recall some of the traits of this organization, supported by the other classes of citizens? Have the soldiers a family? have they land to cultivate or a table apart? The republic attests with none the less force the irresistible inclination of communism, which, whether it takes its starting point in the brutal appeal to the instincts, or has its source, as here, in the principles of abstract justice shorn of the idea and the feeling of the freedom of the will, reaches the same result, and derives the negation of the family from that of property. But the smile of Socrates while exposing this impracticable system, is perhaps the refutation best suited to this brilliant play of dialectics and imagination combined, a logical and poetical deduction of an idea, and not a serious plan of social reform.—What could a regular explanation of the systems of Thomas More and Campanella add to what we have already said? It matters little that the Utopia and the City of the Sun differ in certain regards; but it is important to remark that they agree in some of the great negations brought about by that of liberty and property. More wishes the institution of the family might remain, but he wants slaves for great public works and to fill the voids left in production by the utopists. Campanella abolishes the family. Both make the state sovereign master of labor and sole distributor of products.—Communism assumed in the eighteenth century an exclusively philosophical form; it very nearly renounced allegory and symbolism to make use of analysis and reasoning. We do not doubt that

the constitution of the institution of property which communism had before its eyes was vicious, and that philosophy and political economy were to labor for its reformation; but if the excessive and unjust equalities of eighteenth century society explain communism, how can they justify a system which moved in opposition to the general aspirations for liberty and civilization? Rousseau was not a partisan of this doctrine though he gave it weapons. In his "Discourse on Inequality," as well as in his "Social Contract," he recognizes the close solidarity of property and society, and while deploring the existence of the latter he declares it indestructible. In basing property on the law he fell into an error, general in his time, and from which Montesquieu himself was not free. Mably, who carried the principles of Rousseau to absurdity, and who changed his tendencies into systems, asks humanity to return to its natural state. In his *Legislation, or Principes des lois*, in his *Doutes sur l'ordre naturel et essentiel des Sociétés* opposed to the Physiocrats, in his *Entretiens de Phocion*, he is scarcely more than the servile commentator of Rousseau and Lycurgus. Labor in common, distribution by the state, abolition of arts, intolerance in matters of religion: these ancient consequences of the doctrine are deduced by Mably with a rigor which leaves little to be desired. The obscure Morelly goes farther yet, if possible, in his tedious *Basiliade* and in his hateful *Code de la nature*, which became the code of revolutionary communism. The boldness of Brissot de Warville, who, anticipating a celebrated saying, assimilated property to theft, and the inconsistent eccentricities of Necker and Linguet, could only repeat or extenuate these anathemas and theories. They were continued through the French revolution which deprived them of their *raison d'être*. A disciple of Rousseau, Robespierre was not a communist, though his principles put society on the incline which leads to communism. Babœuf, on the contrary, was. Morelly became a man of action. Philosophic and dreamy communism appeared only with Cabet, author of the *Voyage en Icarie*, and with the more advanced editors of the *Humanitaire*. These latter are much more consistent. In his communism founded on fraternity, and repeating all the arguments restoring the use of all the habitual methods of communism varied but little in its nature, Cabet, nevertheless, wished to retain the family. *L'Humanitaire* opposed this. We have shown on which side the logic was. Let us add also, in order to be just, that Cabet deceived himself with the fond delusion that each one would retain his cottage and his garden. He allowed his Icarians, after having well served the state which oversaw them strictly all the week, to be absolutely free every Sunday. This is far too much. A single Sunday in freedom would be death to Icaria. With these exceptions we recognize under the honey of the form the inevitable spirit of communism, that is to say, the purest despotism regulating industry, science, religion, etc.—Of what use is it to

know that there are several varieties of communists in France in the nineteenth century? Some of them in a minority wish to act with mildness, just as if when property is once recognized as an obstacle to all progress, it is not necessary to destroy it at once. Some deny a God, the soul, responsibility; others mean to admit them, which is perfectly useless, since they conduct to the same practical materialism. There are others who wish to retain the fine arts, as if their economic system permitted the retention. Some are in favor of having towns, while others find it better to destroy them and force all to live in the country. These differences are of little interest. In reality there is only one and the same communism: consistent communism.—And now, if communism as an aspiration is a real disease of the social state, and if communism as an economic doctrine is merely a disease of the human mind, what are the remedies? After good moral training and instruction, to which we assign the first place, we know of but two: as to society, to apply in it more and more the great principles of economic science which indeed can not destroy its evils, but may gradually diminish them; as to minds, to imbue them continually more and more with the truths of political economy. Such is the best or rather the only real antidote against the threatening progress of communism.

HENRI BAUDRILLART.

COMPETITION. The word competition has been thus defined by a French lexicographer: "The aspiration of two or more persons to the same office, dignity or any other advantage." This is, indeed, in harmony with its etymological meaning. Two or more individuals aspire at the same time to the same position, to the same dignity, to the same advantage, no matter what; they vie with each other to obtain it; there is competition between them for its possession. But after thus giving the general meaning of the word, this same lexicographer attempts to give what he calls its commercial meaning, and here he seems to us less happy. He calls it: "The rivalry which exists between manufacturers, merchants, etc., whether concerning the quality of their products, their merchandise, etc., or concerning prices, with a view to sharing the profits of the same branch of commerce, industry, etc." What is rivalry concerning the quality of goods or their price? It is not true that in commerce and industry, competition always has these characteristics; and even if it were, they would not constitute its essence. The writer confounds the substance with the form, the principle with the changeable circumstances under which it is produced. Our lexicographer here seems to us misled by the desire to establish between commercial competitions and competition in its ordinary acceptation an essential and generic difference, which does not really exist. In reality they are the same thing. In commerce, as in everything else, by the word competition is meant the struggle of two or more

individuals who aspire to the same advantage, and vie with each other to obtain it; the end to be attained is different, and in many respects, the means of attaining it are different also. For instance, what a man is in search of in public life is an employment or dignity, from which he hopes to derive honor or profit; in industrial or commercial pursuits, it is the sale of his products from which he expects a profit. There is a difference in the manner, in the circumstances, but not in the principle. There is a still greater difference in the means employed to obtain the end proposed, because the positions are different. Whoever aspires to a public office which another man disputes with him, lays stress on his personal merit, his talent, and the services which he has rendered. He carries favor with the ministers, in whose gift the offices are; he obtains recommendations to them from some of his supporters; and it is thus that he endeavors to defeat his rivals. In commerce or industry the competitors no longer court power, because it is not on power that the sale of their goods depends. They court buyers, and the means they employ consist, less in proving their personal merits, than in laying stress on the cheapness or the quality of their products. Aside from this, all competition is the same. The endeavor always is to obtain an advantage which is disputed by competitors. To say that commercial competition is a rivalry between merchants as to either the price or the quality of their products, is as if we were to say, that competition in public life consists in the rivalry which exists between aspirants to office, in respect to either their personal qualities or the services which they have rendered. We have from the beginning of this article endeavored to establish the identity of commercial competition with that general competition which is found in all human activity, because there is in them a common principle. In whatever way it may be produced, competition has always the same point of departure, the same motive, although it has not always the same mode of action, nor the same effects. It is universal competition among men which, everywhere and in all the ways of life, prompts men to vie with one another to obtain advantages which are not equally and superabundantly given to all. This competition results everywhere from this fact alone, that mankind have not at their disposal a fund of inexhaustible wealth, a fountain of happiness, fortune and honor, from which each individual may draw at his pleasure, without ever exhausting it. In public life, as the number of offices, especially of easy and lucrative ones, is not as great as the number of men who aspire to them, there is naturally a competition among these men for their possession. In commerce, likewise, as the number of buyers never equals the number of things to be sold, there is competition between the sellers to obtain the preference in the market. Who does not clearly perceive here the identity of principle? In both cases competition is caused by the insufficient quantity of the goods wished for,

and the natural desire of each one to obtain as many as he can of them. It is born with men, and it will not cease to exist until men discover the means of infinitely increasing all the objects of their desires.—But competition, as we have already seen, proceeds differently according to the course it follows and the end it has in view. In all cases, and in whatever manner it appears, it has its useful effects, to which, considering the imperfections of human nature, are attached certain inevitable inconveniences. Because of the competition which exists between those who aspire to public offices, they vie with one another in making themselves more deserving of them, by rendering better service to the government which employs them. If there were always only one man fit to fill each of the offices dependent upon the government, we may be sure that this one man would take his ease, and that public duties would, in general, be very badly performed. It is because each employé feels that he has competitors, either actual or possible, that he endeavors to perform his duties well, and especially to furnish no just cause of complaint. In commerce, likewise, it is because of the competition among sellers, that each one of them endeavors better to satisfy the public, by giving them products of a better quality, or at a lower price. If there were but one producer of each of the objects of human consumption, this one producer would also take his ease, and would hardly dream of improving either the conditions of his production or the quality of his products. This is but too often the case wherever there exists a monopoly. Competition is, therefore, here as elsewhere, a necessary condition that industry may be kept up and the public well served.—Connected with these advantages there are inconveniences, some of which are inevitable, because they result from the very nature of man, while others, sometimes more serious still, result accidentally from the unfavorable circumstances in which certain countries are placed.—In the case of government employés it sometimes happens that the competitors, instead of vying with one another solely in talent, merit or services rendered, make use of deceit and intrigue, striving to obtain by favor, or by means still less reputable, what should belong to merit alone. They strive to win over, to overreach, and to deceive the men who control the patronage; they seek to influence them by recommendations they have obtained by begging, and sometimes even to bribe them. In like manner, in commerce or industry, intrigue, imposition and fraud too often usurp the favor which is due to real merit. The public are deceived by gaudy sign-boards or by fallacious announcements; they are attracted by the bait of cheapness, and are cheated with adulterated products. Nor are they deceived in the quality of the merchandise only, but sometimes in weight and measure as well. Thus it is, that in this common pursuit of public favor, the most crafty, the most intriguing, the most deceitful,

frequently get the better of the most skillful or the most deserving. If there be any difference to be made in this regard between commercial competition and that which occurs in public life, it is all in favor of the former; for the public, who, in the purchases they make from merchants, always act on their own account, and with a view to their own most immediate interests, are much less easily deceived than a government which never acts but through the medium of its chief agents, who have no direct interest in the selection which they have to make, and with whom petty considerations of vanity or personal ambition frequently take precedence of the public interest, which it is their duty to serve.—Although the disadvantages which attend competition are, to a certain extent, inevitable, since they proceed from the imperfection of human nature, and, in this sense, are almost the same everywhere, we must admit that they are more or less serious, more or less apparent, according as society is in an embarrassed or a prosperous condition. When society is prosperous, when there is abundant employment for labor, so that every individual easily finds an opportunity to use his faculties, competition, without being entirely stripped of its excesses, is everywhere more moral and keeps more within proper bounds. As every man is almost sure of receiving his share of prosperity, and of obtaining in return for the performance of his duties toward society a share of the goods which it distributes, he is less severe upon his competitors. Each one still strives to obtain as much as he can of social advantage, and competition never ceases to be earnest; but, after all, it is only a question of more or less; competition is generally confined within its proper limits. If a person has the least feeling of his dignity as a man, he disdains to resort to dishonest means; it is by real merit that he endeavors to excel his competitors. This is no longer the case in a society that is disturbed, constrained, and ill at ease, and that can give employment to only a portion of those who crave it. In this society, as there is no longer enough for all, competition between individuals, whether in public life or in commercial pursuits, is no longer a simple question of pre-eminence; it is oftener a question of life and death. A man then must get the better of his rivals or perish. Here it is that competition becomes, at one time fierce and cruel, at another immoral and perfidious, and that we find everywhere, as well in public life as elsewhere, a great number of men, to whom all means seem good. In these critical situations, competition, under whatever form, and in whatever way of life it appears, often presents, we must admit, to the eye of the philanthropic observer, a very distressing spectacle. Nor must we judge too severely those men of a weak and unphilosophic spirit, who, witnessing these scandals, the causes of which they could not fathom, conceived the senseless, and besides impracticable project of suppressing competition itself. They

did not see, blinded as they were, that, even if they had succeeded in their plans, they would not have destroyed competition; they would merely have removed it, without in the least correcting its abuses. Still less were they in a condition to understand to what degree this simple removal would have been, in other respects, unfortunate for the human race, all of whose resources it would have lessened, and all of whose labors it would have disorganized.—We would not have the reader imagine that in what we have just said our object was to defend industrial or commercial competition against the puerile attacks which have so frequently been made on it. It has always seemed to us as ill becoming economists to stop to defend such a principle; it is too entirely inherent in the primary conditions of social life; it is, at the same time, too great, too elevated, too holy, and, in its general application, too far above the attempts of the pigmies who threaten it, to need any defense. We do not defend the sun, although it sometimes burns the earth, which it should only illumine and warm, neither is there any need to defend competition, which is to the industrial world what the sun is to the physical world. The economist's task is merely to explain its action in the industrial sphere, and to show its marvelous effects. This is the best defense of it we can offer, and it is the only one which becomes it.—If industrial competition does not differ in principle from the competition to be found everywhere else, and especially in public life, it signally differs from it in its consequences which are far richer in results. Looking at it in the first instance only as a necessary stimulant of general activity, although it acts, in this sense upon government employes as well as upon merchants and those engaged in industry, it has incomparably greater effects upon this latter class.—The task of public officials generally consists in obeying, to the best of their power, the instructions they have received from those above them. They move in a circle traced out for them in advance, and which they can not leave, even to do more or to do better. The only effect of competition among them is, therefore, to render them more punctual, more exact in the performance of the orders given them by those above them. They can perform them, it is true, with greater or less intelligence, but they can not, as a rule, add anything to them of their own accord, nor, consequently, invent or change anything for the sake of improvement. Besides, in spite of this competition, of which we were just speaking, the administration of all the governments of the world are in their nature stationary, and almost inaccessible to progress. Their accepted forms and methods, no matter what vices they may conceal, are almost inviolable. Hardly anything less than a revolution can change them. If a change in the way of progress is sometimes made, which rarely occurs, it can come only from those who are intrusted with the general direction of the government, and who inspire its entire policy. It is unnecessary to add,

that innovations fertile in results are at all times very rare.—It is not so with industrial pursuits, in which every individual, or at least every man of enterprise, acts on his own account and with entire independence. Here competition no longer appears merely as a prompter of activity, exactness, punctuality and order, although it produces these useful results here as well as elsewhere; it here appears also and especially as the principal agent of progress. And all these manufacturers, masters of their actions and responsible for their works, stimulated as they are by the incessant competition of their rivals, contrive how they may more and more simplify labor, improve its methods, perfect known processes and invent new ones. One man invents a machine to lessen labor and diminish the cost of production; another invents a chemical compound to improve the quality of his products; a third, a form of the division of labor so as to simplify its workings; a fourth, a system of accounts more convenient than the old ones; a fifth, a quicker or better way for transporting and distributing products; and so on. The question is, which one will surpass his rivals by the abundance and usefulness of his improvements. In this way, besides, application of these improvements generally follows close upon their invention, which is different from what is remarked in other pursuits: because here competition always makes itself felt. Progress, therefore, is here uninterrupted and lasting. If in the sphere of governmental administration useful improvements can come only from those in power, and occur but rarely; in the industrial sphere they come from all sources, and occur every day in all branches of labor. And what is it that prompts them? Always the same cause—competition. It is the first, we might say the only, cause of this upward march of mankind, and of the continued progress so visible in history, which would have continued ever uninterrupted were it not for the grave political disturbances which have at times broken its course.—Competition is, therefore, in fact, the true motive power of progress in human society. Suppress this necessary stimulant, and at once the movement slackens, activity dies out, progress ends. Much could still be said to bring this great truth into full relief; but it has been often explained, and is generally admitted by every one who examines and reflects. It is better, therefore, to insist upon another truth, no less important and much less generally understood, namely, that competition is, in the industrial world, which embraces the entire, or almost the entire social world, the principal cause of order. It here plainly takes leave of that other competition of which we spoke above. In the world of governmental administration everything moves, everything is regulated and ordered in obedience to the decisions of superior authority. In industry there is nothing of the sort: there are no orders to be received from higher authority. What then takes the place of this superior absent authority? Who governs this industrial world, in de-

fault of a directing power? Chance, some say. It is not chance but competition, which is here the one sovereign regulator. Men often believe they have said everything in favor of this immortal principle when they have recognized that it is a necessary stimulant for producers; but even then they are far from understanding its marvelous effects. Competition is the supreme guide, the infallible regulator of the industrial world; it is the first source of the providential laws by which this world is directed and governed; it is, if we may be allowed to say so, the legislator, invisible but always present, who introduces order and rule into industrial relations so extended, so varied, so multiplied, where, without it, would be but confusion, disorder, chaos.—Let us picture to ourselves this industrial world in its multiple and complex organization, as it has existed since the exchange of product for product and of service for service became its general law, and since the division of labor was everywhere established. In virtue of this division of labor no one in this industrial world produces, for himself, that is, to consume the fruits of his own production. Each man in it, on the contrary, chooses a special branch of production to which he applies himself, and which, taken in itself and isolated from the rest, would answer frequently to a very small proportion of his needs. In the savage state every man labors directly for himself, and consumes what he himself produces: he pursues a wild animal; he knocks it down with weapons which he himself has made; he tears it up with instruments which are of his own workmanship: he roasts it, with wood which he has gathered with his own hands, and devours it. The entire labor of production is performed by the same hands, and, moreover, the producer and the consumer are one. This savage may, it is true, associate himself with others in his work; but even this association does not effect unity of production, nor the identity of the producer with the consumer. This is no longer the case in our more or less civilized condition, which, thank God, is not of yesterday. In it each man works for his fellow men; he takes his products or his services to the general market; he offers them to all who ask for them, and counts only upon exchange to obtain in return the different objects he requires for his own consumption. One man is a boot maker, and produces boots only; another is a hatter, and makes nothing but hats. This man is a butcher; that one a baker; another is a smith, a distiller, a lamp maker, or a druggist. Of the thousands and thousands of things which human consumption constantly demands, each man produces but one, and adheres to that. He gives his services to whoever demands them, relying, for his own personal consumption, upon what he will obtain by means of exchange from all other producers. Still it rarely happens that any of these different individual labors produces a complete product. There is scarcely a product which is not the result of several successive elaborations, and generally each of those who have concurred

in making it can claim but a small portion of it; not to speak of those who never put their hand to any special production whatever, and therefore concur only in an indirect manner in general production. In this state of things, as is readily seen, each man is dependent upon the rest; as a producer, he is bound to an immense chain, of which he forms, so to speak, but one link; as a consumer, he expects everything from his fellow-men, and can obtain the satisfaction of his wants only by a great many exchanges. It is this division of labor which constitutes the strength, the wealth and the greatness of civilized nations, and raises them so far above the savage tribes of the new world; but from it also flow infinite social complications—complications such that it would be impossible for human foresight to unravel them, if they did not unravel themselves, in virtue of a higher pre-existing principle. What is this principle? Competition, which is, in this, truly the light, the guide and the providence of the civilized world.—And, first of all, since there is in the industrial world as it exists, a necessary, universal and constant exchange of products and services, all these products, all these services must be weighed and measured in some way, in order that we may know on what terms an exchange of them can be effected. Who can weigh them? Who can determine their measure? When we consider the infinite variety of the products which are every day displayed in the great market of the world, all different in their form, in their texture, and in the conditions of their manufacture; when we consider, besides, how many different hands have concurred in such unequal proportions, and in a thousand different places, in the manufacture of each of these products; when we take into account the still greater variety of services rendered which have not resulted in any material product whatever, and which must, nevertheless, be exchanged for real products; when we reflect that we must compare and measure all these products, all these labors, all these services, in order to establish an equivalence among them, we ask ourselves by what superhuman prodigy can this equivalence ever be determined? Is there a human power which would dare, we will not say to establish it, or even to undertake it, but merely to conceive the idea of formulating its laws?—We are told that men dared to do it at the time of the French revolution. They dared to do it, but under what conditions, and at what price? It was established, in the first place, only for a limited number of the commonest products, and those whose value seemed easy to estimate, without entering into the detailed appreciation of the thousand different kinds of labor which had contributed to their production. And even for these products they did not establish any precise value, but only a maximum, determined from their former value as fixed by competition. Besides, who does not know the results to which these senseless measures led? Incomplete as they were, and al-

though scarcely ever carried into execution, they were none the less the cause of frightful disorder in all commercial relations. If they had been pushed any further, they would have plunged all society into chaos.—In spite of the inevitable failure of these disastrous endeavors there are still in the world, we know, some discontented spirits, some crazed brains, which dream from time to time of a fixation of relative values by governmental regulation; but even those who cherish these chimerical projects in their unfortunate moments, would recoil, we may be sure, before the difficulties of the task, if they were ever bound by law to accomplish it. Every man possessed of common sense must clearly perceive that it is an undertaking far above the endeavor of any human power, to determine the relative value of all the products and of all the services which are daily exchanged in the world's markets. Who then will establish this regulation? Who will work this wonder? Who? Competition, which alone is able to accomplish it.—“It is competition,” says Montesquieu, “which puts a just price upon goods.” It is competition, and competition alone, which can put upon goods their just price. But it does this, not only for goods properly so called; it does it also for the thousand different labors which have contributed immediately or remotely to the production of these goods, as well as for the innumerable services which have not entered into any product whatever.—We should perhaps remark here, in passing, that when economists explain the laws by means of which the prices of everything that is bought and sold are determined, they do not ordinarily point to competition; they point to the principle of *supply and demand*, and we would by no means find fault with them for doing so. But the principle of supply and demand, as it is here understood, presupposes the action of competition; it supposes this action both in the sellers and in the buyers; for if we leave competition out of consideration, the principle of supply and demand has no longer any meaning; it ceases to produce any of the good results which are justly attributed to it.—The price which competition puts upon merchandise is, in general, equivalent to the cost of production, in which we must include the necessary profit of the producers. What is the cost of production? Of what does it consist? It consists of the sum of all the expenses, small or great, which have been incurred in a thousand different ways by a thousand different hands, and perhaps in as many different places, to bring a product to the point it reaches at the moment of sale. Who can compute exactly the cost of production? Nobody, not even the seller, who will give you, at most, an exact account of the expenses which he has personally incurred on account of this product, but who will never be able to tell you what it cost, before coming into his hands. If it were necessary to determine, in an official manner, the cost price of only one of the products which are daily offered

for sale in the market, a pretty thing it would be to see all the officers of the various governments at work! In vain would they assemble for this purpose the wisest statisticians, the most expert merchants, the most skilled manufacturers, and the ablest administrators; in vain would they add to these a re-enforcement of real economists: all these lights united could not accomplish such a task; there would necessarily occur a great number of errors in their calculations. But, what all the science of such a council could not do for one single product, competition does without an effort for the millions of products in circulation. It does it so well, according to principles so sure, and with a precision so infallible, that there is not anywhere, where competition exerts its full power, a single product which sells regularly either for more or for less than it really cost from the time of its first formation to its entire completion.—Not that it has not, in this respect, inequalities and variations, some accidental, others permanent. But even these inequalities have also their *raison d'être*. They are not determined by chance; far from it: they are governed by laws and rules, and all tend to the better ordering of this industrial world, which we have described.—When there are—as is usually the case, and as it is even essential that there should be—a certain number of producers who are engaged in the same kind of production, the price which competition puts upon their merchandise is not determined for each one of them by the cost price of the merchandise to him, which may and almost always does vary with different producers. The price which competition puts upon their merchandise, is the common or medium cost price. If there are among them some more skillful than the rest, who have been able, by means of better processes or greater attention, to economize more or less in the cost of production, these gain a little more by selling at the same price; they grow rich, and it is only just that they should; it is the legitimate reward of their skill. It is, at the same time, an incentive to all other producers. If there are, on the other hand, producers who, less attentive or less skillful, have allowed their cost price to exceed the medium, they suffer loss and ruin; it is the necessary penalty of their carelessness or their incapacity. Most producers keep their cost price at the ordinary level, and these maintain themselves; these do not grow rich, but then they are not ruined.—Besides these inequalities between producer and producer, which are a necessary stimulant to the activity of all, there are others consisting in variations of the selling price, which frequently occur without any corresponding change in the cost price. These variations are the *fluctuations of the market*. There is no product which is not subject to fluctuations of this kind; the difference between them, in this regard, is merely a question of more or less. Some are, it is true, for the convenience of consumers, marked at fixed prices in the stores where they are sold at retail, but they have,

nevertheless, in the general market and at wholesale, prices which vary more or less according to times and circumstances. Why, it will be asked, these fluctuations in the selling price which should always be regulated by the cost price? Is not this a game of chance which destroys the equilibrium of things, and overturns the general law we have just stated? Is there not at least an *inaccuracy*, a defect in the picture? It is not a game of chance, there is no inaccuracy or defect; it is, on the contrary, one of the simple but providential means which competition employs to regulate the world. But to make this clear we must consider another phase of the marvelous order which it establishes.—It is something great to determine the relative value of products. Without it, as we have said, the industrial world would not last a day. But it is not enough to determine this value. If it is necessary that products be exchanged according to stated conditions, it is no less necessary that producers or workmen be regularly supplied to the innumerable sources of production; in other words, that labor producers be distributed exactly in proportion as they are needed. Here is another problem, as grave and important as the first, and which human wisdom would find itself powerless to solve, if there were not always present this mysterious power, which guides men without their knowledge. If in the industrial world products are innumerable and of infinite variety, the different kinds of labor which concur in the formation of these products are neither less varied nor less numerous. All these labors are, besides, necessary, and in almost the same degree. Their dependence one upon another is such that no one of them can be neglected without the others suffering thereby. How, for instance, could the baker make his bread if the miller had forgotten to grind his wheat? And how could the miller give the baker his flour, if the farmer had forgotten to sow, to reap, and to thresh his grain? How could the farmer, in turn, give the miller his grain, if the plowwright and the blacksmith had not made in time the necessary implements for plowing, harvesting and threshing this grain? The work of the blacksmith is no less dependent upon that of the miner who takes the iron from the mine, than that of the plowman is upon the work of the blacksmith. In addition, all are equally dependent upon the work of the carrier, who transports their respective products, as well as upon the services of the public agents who provide for the security of these products while being transported. Human industry is like an immense chain, all the links of which are united. Let one of these links be broken, and the whole chain gives way. It must, therefore, be so arranged that none of its works will ever be abandoned or omitted; that they will all be accomplished exactly at their proper time, and in proportion to the needs of every day. Who is charged to provide for such a want in society? Nobody; and we may add that nobody could do it. The different employments

of industry, the labors of all kinds which are performed in all the different degrees of production, are so numerous that no person could even count them, much less provide for them. To see that every one of these innumerable forces is kept daily at work, is a task so far above all human foresight that it would be absurd to dream of intrusting it to man.—It has, however, been dreamt of at times. Under the pretext that the satisfaction of the wants of society was abandoned to chance, it was seriously proposed to confide to a self-styled social power the duty of regulating the different employments, and methodically dividing all available forces among them. But before disposing of these forces, and apportioning them, let this power determine to attempt merely to name them exactly or completely; the sight of the insurmountable difficulties of this first task, will perhaps convince it that it has hardly understood, until the present moment, the incalculable extent of what it has dared to undertake.—Some have compared the organization of industry to the organization of an army, and thought that, as men had succeeded perfectly in regulating the movements of an army, they could, in like manner and just as easily, regulate the movements of industry. How pitiable a comparison! As if the organization of an army, where their occupations are all alike, and vary, at most, from one branch of the service to the other; which has but one object for all; which can and must be divided regularly and systematically into regiments, battalions, companies, etc.; which always resides in certain chosen places, and under the control of chiefs: as if the organization of such an assemblage, we say, could be for an instant compared to the organization of industry, whose employments are so numerous; which uses different processes and instruments in each of these employments; which must be divided among an infinite number of different places, so as to be at all the sources of production, and distribute its forces everywhere in unequal groups, according to the needs and resources of the respective localities; which, by its very nature, refuses all regular division and uniform movement; and for which unity of direction would be death. To compare these two things, is to compare an atom to a whole world.—We repeat, therefore, there is no human power which can foresee and know all the work to be performed in the different channels of industry, or which, for a still stronger reason, can provide for its doing. What then will do it? The same mysterious and sovereign power that has already regulated the relative value of exchangeable products, competition—a power much more enlightened, and much more active and vigilant than any of those to which the care of public interests is ordinarily confided.—The means which it employs are, moreover, very simple. The first is, to keep all its particular interests constantly on the alert, by according the favors of fortune in all things only to the most vigilant, the most active and the

most skillful. The second is, to direct the particular interest of each man to the satisfaction of the wants of his fellowmen. As long, in fact, as competition acts alone, and violence or fraud do not interfere, the only way for a man to get the better of his rivals is to provide better than they the means of satisfying in a more prompt, more suitable and more complete manner the wants of those around him. Thus, by the aid of competition, if there are in society such as civilization has made it for us a million different wants, there are also several millions of eyes incessantly open to discover these wants, several millions of minds incessantly occupied in studying and understanding them, and several millions of arms ever eager to supply them. The duties to be performed in the various branches of industry are very numerous, it is true; but the eyes which watch them are still more numerous. There is no danger that any necessary or even useful employment will escape this active and general vigilance; no sooner does a branch strike or languish, than a crowd of competitors offer to take its place. Thus it is that in this long and multiple chain of industry, which coils about itself in a thousand different ways, and which is made up of innumerable links, there is never any break or gap. Thus it is that this incredible prodigy, before which human nature must bow, is accomplished in a manner so natural and so simple that we are no longer even surprised at it.—But it is not enough, however, that all the occupations of industry be filled continuously and completely, they must also be filled in the proper proportion, that is, the number of men who labor at them, and the amount of energy or capital consecrated to them, must always be proportioned to the real extent of the work to be done. Here again we propound ourselves this eternally recurring question: Who in the world could furnish this just proportion? And we are forced to reply once more: No one, not even the producers. Competition alone can do it, and competition alone does do it, competition alone instructs the world in this regard, beginning with the workmen themselves, who could not determine, without its aid, the amount of labor necessary even in the special branch of production in which they are engaged. And how does competition instruct them? By increasing or diminishing the mean profits in each branch of production, according as the labor applied to this branch more or less fully corresponds to the extent of its wants. If there be too much labor applied to any certain production, at once, thanks to competition, wages decline, and the laborers are thereby warned to seek employment elsewhere. If, on the contrary, there be a scarcity of labor, wages go up, and this is a warning to those who are engaged elsewhere to betake themselves in greater numbers to where the scarcity exists. Thus, by the sole influence of high or low wages, labor is distributed and divided with an almost infallible precision among the different branches of production, according to the measure

of their needs, and equilibrium is always maintained between the work to be done and the labor assigned to it. Here it is that we most recognize the necessary and providential effect of those fluctuations of the market of which we spoke above.—The wants of society are not ever the same; on the contrary, they vary from day to day, in regard to most objects of consumption. Suppose, therefore, that by a marvelous effort of some public power, the equilibrium of the different branches of labor had been exactly established to a given day, so that, for each piece of work to be done there would be at hand a corresponding amount of labor; still nothing would have been done, if allowance had not been made for the fact that this amount of labor varies for each occupation, according to the variable measure of its wants. To day, for instance, a capital of 10,000,000 francs and a force of 1,000 workmen are applied to a particular branch of production, and they are nearly the exact measure of what it needs at present; but to-morrow its needs change; the product which this branch of industry supplies is most in demand where there is least of it. this is what happens every day, not only for articles of fashion, but for many others. The capital and labor devoted to this kind of production find themselves, therefore, all at once either insufficient or superabundant; they must be increased or diminished in order to preserve the equilibrium. Who will regulate these frequent and rapid variations? Sometimes, even without the wants being diminished, production may, with the same amount of capital and labor, become all at once superabundant, simply because the processes of manufacture have been simplified. Who will restore it to its proper proportion? Always the same principle, competition; and the means which it employs for this end consist precisely in these variations in price, in these fluctuations of the market of which we are speaking.—They are necessary and daily warnings for the producers. If prices rise, they understand that the merchandise is becoming rare, and that they must hasten to supply themselves with more of it; if, on the contrary, prices fall, they understand that the market is overstocked, and that they must slacken production. Thus production is constantly kept within bounds, and taught to limit itself in all its branches by the extent of man's wants. Hence that marvelous equilibrium of disposable resources and wants to be satisfied, which is the normal state of civilized societies, and at which we might well be surprised if we could experience surprise at anything we see every day. When the changes in the extent of the demand are considerable and sudden, as sometimes happens, it is not always possible, it is true, to reduce or increase the production instantly in the measure desired, and hence some accidental disturbances occur here and there; but in this case the change in the selling price, which continues as long as the derangement exists, does not cease to warn and

annoy the producers, and to urge them to reduce or increase their labor to the desired proportion.—Economists generally say too little about competition, at least in express terms. They rarely even pronounce its name. They are incessantly invoking the principle, however, in disguised terms. It is impossible, in fact, to establish or to carry out any of the laws which political economy has produced, without the intervention of competition, for all these laws are based upon it. In the work of production, as in the distribution of wealth, competition appears throughout, not as an accidental fact, but as the sovereign regulator. It is competition that regulates the price of goods; determines salaries and profits; that fixes a ground rent when there should be one; which, in a word, establishes the rate of remunerations and values of all sorts. They say, and say truly, that it stimulates producers; but it does much more; it distributes, classifies and arranges them. If it is the stimulant of production, it is also its check. It is a light and a guide still more than an incentive. We may truly say that industrial order, as it exists, is its work. Imagine, if you can, even one economic truth, even one of the rules and laws which the science promulgates, of which it is not the source. Economists, it is true, invoke it incessantly, but they do so nearly always without naming it.—In some respects this matters but little. Whether they appeal to this principle by name, or designate it by the circumstances it implies, by its action and effects, it is ever in reality the same thing. It does not on this account lose any of its essential truths. In consequence of this reserve or forgetfulness of the masters of the science of economy, however, competition has not in their works the place, which is due to it; this immortal principle is not as clearly manifested as it should be, nor is its grandeur sufficiently understood. It is this, perhaps, which has given a certain credit to the puerile declamations of those who attack it; and this also explains how even the adepts in the science have sometimes dishonored it by the unworthy capitulations to which they have submitted it, or by the incredible feebleness of the arguments which they have used in its defense.—It has sometimes been said that industrial competition was a new principle, inaugurated in 1789, and one of the fruits of the French revolution. As if humanity could have reached the point of civilization, which it had reached at this epoch, without knowing this powerful lever, this sovereign guide, so necessary to the development of its activity. After what we have just said, it seems to us superfluous to demonstrate the error of such an hypothesis. Competition was not born in 1789; it was born in the very cradle of human society, which it has led step by step, from its state of primitive barbarity to the point of civilization which it has now reached. The truth in the case is, that competition, although it has never ceased to enlighten and govern the world, has been submitted at all times to restrictions of more than one kind, the sad effects of

the errors or evil passions of men; these restrictions were more numerous previous to 1789, at which period some of them were suppressed, though they did not, alas, entirely disappear.—If competition had always reigned without opposition, if it had been able to develop itself in all its plenitude in the midst of human society, such is the virtual strength, the power and inexhaustible fecundity of this principle that humanity would have marched from progress to progress, and with unceasing rapidity, toward a future, of prosperity, wealth and general well-being, of which at present, perhaps, it has not the least conception. We can judge of this from the progress it made in certain countries during the intervals, always too brief, in which it enjoyed a satisfactory, if not complete, liberty. But this liberty was needed in the past, and is needed in the present. The action of competition supposes the liberty of man at least in his industrial relations. In fact, it supposes, first, absolute spontaneity and freedom between the contracting parties, between the seller and the buyer of an article, between him who offers a product and him who accepts it; for if one of the parties can impose his conditions on the other there is no longer any competition, there is no longer even a contract. It supposes, moreover—and this is also an essential condition—that each one be free to go to a third party, when he is not satisfied with the conditions offered him. Now, who does not know to how many obstacles this twofold liberty has been subjected at all times? These obstacles arise sometimes from the spirit of anarchy and disorder, and from the absence of a tutelary authority able to protect the contracting parties, and sometimes from abuses of this authority.

CHARLES COQUELIN.

COMPROMISES, (IN U. S. HISTORY). I.—III.

COMPROMISES OF THE CONSTITUTION.—I. No census had been taken in America when the convention of 1787 met, but its debates were based on the following estimates of population, which the census of 1790 showed to be fair approximations: 1, Virginia, 420,000; 2, Massachusetts, 360,000; 3, Pennsylvania, 360,000; 4, New York, 238,000; 5, Maryland, 218,000; 6, Connecticut, 202,000; 7, North Carolina, 200,000; 8, South Carolina, 150,000; 9, New Jersey, 138,000; 10, New Hampshire, 102,000; 11, Georgia, 90,000; 12, Rhode Island, 58,000; 13, Delaware, 37,000. In the five southern states the entire population was slightly larger, only three-fifths of the slaves being included in the above list. Of the thirteen states New Hampshire was not represented in convention until July 23, 1787, and Rhode Island not at all. Of the remaining eleven states, a "large state" majority and a "small state" minority were formed almost from the convention's first meeting, the large states being Virginia, Massachusetts, Pennsylvania, North Carolina, South Carolina and Georgia, and the small states, New York, Maryland, Connecticut, New Jersey and

Delaware. However greatly the votes varied on minor points, on the great and essential question of a national or a federative form for the new government, the vote was usually six to five as above given.—Had the two parts been strictly "large" against "small" states, according to the population above given, of course the vote would have stood three to eight; but North Carolina, South Carolina and Georgia, either from ambitious hopes of the future growth of their vast western territory, or from a desire to gratify the larger states and draw them into a union which should afford effective national protection against the southern Indians, habitually voted with the larger states, and made them a majority, since each state was entitled to one vote in the convention. Between the two parts of the convention the main question at issue was, whether the new government should be one in which each state's influence should be proportioned to its population, or one in which each state, however small, should have an influence equal to that of any other state, as under the confederacy. The large states naturally preferred the former, or "national" system, and the small states the latter, or "federative" system.—May 29, Edmund Randolph, of Virginia, offered the "Virginia plan" (see CONVENTION OF 1787), which formulated the demands of the large state majority. It consisted of 15 resolutions, whose main features were, that congress should consist of two branches, the representation in *both* based on population, that the representatives should be chosen by the people, the senate by the representatives, and the president by the senate and representatives together. The senate would have had 28 members, as follows: Virginia 5, Pennsylvania and Massachusetts 4 each, South Carolina, North Carolina, Maryland, New York and Connecticut, 2 each, and the other states 1 each. The three large states would thus have had nearly one-half (26 out of 65) of the house of representatives and nearly one-half of the senate, and, if united, could have controlled the appointment of the president and the policy of the Union. June 13, the committee of the whole reported the "Virginia plan" to the convention. June 15, Patterson, of New Jersey, offered the "Jersey plan," the ultimatum of the smaller states. It consisted of 11 resolutions, mainly intended to retain and amend the articles of confederation, to retain the congress of a single house and the equal vote of each state in congress, to give congress the powers of raising a revenue, of controlling commerce, of coercing any state which should refuse to pay its quota or obey the laws, and of electing an executive. June 19, the committee of the whole reported adversely to the "Jersey plan," and again in favor of the "Virginia plan." Two plans had thus been proposed, whose terms in almost every point were entirely incompatible. Before the rejection of the Jersey plan, Dickinson, of Delaware, had proposed to consolidate the two plans, if possible; and, June 21, Johnson, of Connecticut, had touched the vital point by proposing to give the

states an equal representation in the senate and a proportionate representation in the house. This proposal of a compromise he repeated and emphasized, June 29; and on the same day, Ellsworth, of Connecticut, formally moved that such provision be made. July 2, the motion was put, and lost by five small states to five large states, and one (Georgia) divided. The convention had now "got to a point where it could not move one way or the other," and the whole business was referred to a select committee of one from each state. This committee, July 5, reported Ellsworth's compromise, with two additional features: the house, which the larger states were expected to control, was to originate money bills, and three-fifths of the slaves were to be included in the population as ascertained for representation. The first proposal was intended to placate the large states in general, and the second to secure the votes of North Carolina, South Carolina and Georgia.—At first the compromise hardly found a favoring voice in the convention. The committee was declared to have exceeded its powers, and so moderate a delegate as Madison "only restrained himself from animadverting on the report, from the respect he bore to the members of the committee." Nevertheless, as step by step its items were brought up for debate and decision, the whole was adopted and became an integral part of the constitution, with the addition of the power given to the senate to propose amendments to money bills. The senate, therefore, whose conception has received warmer admiration than that of any other feature in the constitution, owes its existence, in its present form, entirely to an unwilling compromise of the conflicting demands of the large and the small states.—II. One of the incurable evils of the confederacy was that the states which had formed it, after withholding from congress any power to control commerce, had provided that their articles of association should only be amended by a unanimous vote. The commerce of the country was therefore the commerce of 13 separate states, each of which could levy any duties it saw fit upon exports or imports, provided it did not interfere with existing treaties, or touch the property of the United States or of any other state. The state of New Jersey, before ratifying the articles of confederation, had warmly objected to this feature, as one which might involve "many difficulties and embarrassments," and most of the delegates from the commercial states had entered the convention with an intention to give the new federal government this essential and absolute power of controlling commerce. Against this intention the delegates from other states were not disposed to array themselves, except upon one point. In several of the states a single article made up the mass of the exportation, as was the case in South Carolina with rice, in North Carolina with ship stores, and in Virginia and Maryland with tobacco. Should the new federal government be given the power to lay export duties

on these, a hostile majority in congress might easily cripple or annihilate the whole wealth of a state at one blow. Before the question came to be considered, C. C. Pinckney, of South Carolina, had twice given notice that his state would not enter the new Union unless the power to tax exports was withheld. The Virginia plan, as originally offered, made no direct reference to commerce, but only proposed that congress should be empowered "to legislate in all cases to which the separate states are incompetent, or in which the harmony of the United States may be interrupted by the exercise of individual legislation." Chas. Pinckney's plan, which was introduced also May 29, and whose "Powers of Congress" are very closely followed in the constitution, as finally adopted, distinctly proposed to give congress the power "to regulate commerce with all nations, and among the several states." But neither these plans, nor that of Hamilton, offered June 18, contained any restriction on the power of congress to tax exports: this first appears in the draft of the constitution as reported Aug. 6, in the words, "No tax or duty shall be laid by the legislature on articles exported from any state." With the omission of the words "by the legislature" this was adopted, Aug. 21, by a vote of 7 states (Massachusetts, Connecticut, Maryland, Virginia, North Carolina, South Carolina, Georgia) to 4 (New Hampshire, New Jersey, Pennsylvania, Delaware). New York's delegates, with the exception of Hamilton, had already left the convention because of the success of the first compromise. By this, the second, compromise congress was given complete control over national or inter-state commerce, with the exception of a restriction upon its power to tax exports.—III. The two days following the adoption of the second compromise were taken up by a stormy debate on the question of the slave trade, ending in an emphatic refusal by Georgia, South Carolina and North Carolina, to enter the new Union unless its Congress should be forbidden to prohibit this traffic, or to tax it more highly than the trade in other imports. Here again the convention was brought to a stand-still, and again the whole question was referred to a select committee which reported the third great compromise of the constitution. It consisted in forbidding congress to prohibit the importation of slaves, when allowed by state laws, before 1808, but permitting the imposition of a tax of \$10 per head on such importations. The slave trade was thus brought at once under the revenue power of congress, and, within 20 years thereafter, under its commercial power also. As a make-weight for the northern states, a provision in the draft of Aug. 6, that "No navigation act shall be passed without the assent of two-thirds of the members present in either house," was stricken out, thus giving to a congressional majority complete control over commerce; and, as a make-weight for the southern states, it seems (from C. C. Pinckney's language to the South Carolina convention) to have been a

general understanding, though not a part of the compromise committee's report, that provision would be made for a fugitive slave law. That part of the report relating to the slave trade was adopted by a vote of 7 states to 4, Virginia, Delaware, Pennsylvania and New Jersey voting in the negative. The rest of the report, and the provision for a fugitive slave law a few days after, were adopted without any opposition.—No part of the constitution has been more warmly condemned than the two "compromises of a moral question," (I. and III.). Those who so regard them forget that to the members of the convention slavery was not a moral question at all; that in but two northern states, Massachusetts and New Hampshire, unless we include the *quasi* independent republic of Vermont, (see ABOLITION, I.), had public opinion advanced so far as to abolish slavery entirely; and that the erection of two or more separate nations on this continent, with their certain attendants of standing armies and international wars, was an evil which it was the convention's imperative duty to avoid. If the whole future history of the country, even through and including the war of the rebellion, had been laid open to the view of the convention, its present and pressing duty would still have been to make the compromises as cheaply as possible, to make South Carolina, North Carolina and Georgia permanent members of a union, and then to leave the question of slavery to the decision of events. It seems beyond question that, without all the three compromises just given, the formation of a single national government for the territory between the Canadas and Mexico, the Atlantic and the Pacific, would have been an impossibility; that two, or more probably three, confederacies would at once have been evolved; and that the present republic would never have existed even in imagination.—IV. MISSOURI COMPROMISE. The question of slavery was at first of only incidental interest in the political history of the country. The convention of 1787, whose work and plans were mainly confined to the fringe of states along the Atlantic coast, had really joined two nations, a slaveholding nation and one which only tolerated slavery, into one; but the union was physical, rather than chemical, and the two sections retained distinct interests, feelings and peculiarities. As both spread beyond the Alleghenies to the west, the broad river Ohio lay in waiting to be the natural boundary between the states in which slavery should be legal and those in which it should be illegal. When the tide of emigration began to pour across the Mississippi and fill the Louisiana purchase, the dividing line was lost and conflict became inevitable.—The territory of Missouri, formerly the district of Louisiana (see ANNEXATIONS, I.; LOUISIANA; MISSOURI), was organized by various acts of congress, 1812-19. Slavery had been legal by French and Spanish law before the annexation, had been continued by the laws of the territories of Louisiana and Missouri, and had not been prohibited by any

of the organizing acts of congress. The territory was therefore in the straight road to become a slave state, as Louisiana had already become. March 16, 1818, a petition from Missouri for permission to form a state constitution was offered in the house, and April 3 a committee reported an enabling act, which slept until the following session. Feb. 13, 1819, the house went into committee of the whole upon the enabling act, when Tallmadge, of New York, offered the following amendment to it: "*And provided, also, That the further in reduction of slavery or involuntary servitude be prohibited, except for the punishment of crimes whereof the party shall be duly convicted; and that all children of slaves, born within the said state after the admission thereof into the Union, shall be free, but may be held to service until the age of 25 years*." The Tallmadge proviso was added to the bill by an almost exactly sectional vote, the northern members voting for it and the southern members against it. The bill then passed the house. In the senate it was amended by striking out the proviso, but the house refused to concur in the amendment, and in the resulting disagreement the bill was lost. At the close of this congress, March 3, 1819, Missouri was therefore still a territory.—The Tallmadge proviso, in the eyes of most of the northern politicians who supported it, was merely an attempt to maintain the balance of power between the two sections. Kentucky had been offset by Vermont, Tennessee by Ohio, Louisiana by Indiana, and Mississippi by Illinois. The territory of Alabama had applied for authorization to form a state government, which, indeed, was granted at this session; and the Tallmadge proviso was a demand that Missouri, as a free state, should now offset Alabama. Accordingly, before the meeting of the next congress, the legislatures of Delaware and all the northern states (except those of New England, whose unpopularity as federalists would have made their open support of doubtful value, and Illinois, whose early settlers were largely southern) had warmly approved the Tallmadge proviso, and stamped it as emphatically a northern measure. In most of the legislatures the vote was unanimous, former party lines being entirely dropped. But, inextricably complicated with this sectional question, there were very many other fundamental questions, so that a full discussion of the Missouri case would almost involve a treatise on American constitutional law.—1 Even granting that congress had the power to govern the territory of Missouri absolutely, what power was there in congress to forever prohibit the future state of Missouri from permitting slavery within its own limits if by its own laws it should see fit to do so? While other states enjoyed the privilege of permitting or abolishing slavery at their discretion, was Missouri, while nominally entering the Union on equal terms with the other states, to be debarred the right of choice? On the other hand, if congress had the power to legislate for the territory, what power could prevent con-

gress from controlling and laying conditions upon the organization of the territory into a state? What right had Missouri to object to the absolute prohibition of slavery to which Ohio, Indiana and Illinois had submitted without a thought of complaint or objection? (See ORDINANCE OF 1787, TERRITORIES, STATE SOVEREIGNTY.) 2. The treaty by which Louisiana, including Missouri, had been acquired (see ANNEXATIONS, I.) stipulated that the ceded territory should be at once incorporated into the Union and that its inhabitants should be given *all* the rights of citizens of the United States as soon as possible. From this clause it was argued that any attempt to impose any such limitation upon the admission of Missouri was a breach of good faith and of treaty obligations. To this it was answered that the contracting powers to the treaty must have been aware that the treaty power could not in any way control the admission of new states, which must be by concurrent action of both branches of congress and the president. 3. A broader ground was taken by some southern members. They held that the compromise which gave the slave states representation for three-fifths of the slave population (see COMPROMISE, I.) had recognized slavery as a fundamental feature of their society; that the control of slavery was therefore one of the powers reserved to the states; and that congress could not constitutionally assume that power in the case of either a new or an old state. On the other hand, if this was really a compromise by which certain states were to be brought into the Union, why should Missouri now claim as a right that which had been originally granted only to a different and distinctly marked territory? Was it not enough that the southern states which were included in the bargain had received their stipulated fictitious representation for slave population, but must the same advantage be given to an indefinite number of new states in the future? 4. The above comprises, very briefly, the main arguments for and against the admission of Missouri as a slave state. A deeper feeling was at work among the people of the north, and is apparent in the speeches of some of the northern members, though not often referred to openly. Slavery, as an institution, seemed moribund everywhere in 1789, and could be safely left, it was imagined, to the process of gradual abolition in the several states. (See ABOLITION, I.) In the following 30 years it had really died in all the northern states, though it was not yet quite buried in some of them: in the south it had grown stronger, instead of weaker. Its hands had reached across the Mississippi into territory to which it had no title by the organic law on any interpretation. It had seized Louisiana, had organized Arkansas as a slave territory, and was now grasping after a new state, with the prospect of obtaining others in the near future, since the newly organized territory of Arkansas comprised the rest of the Louisiana purchase. Here was the place to make the final stand, to demonstrate that, even

though a slaveholding population might settle a territory, its admission as a state was within the control of congress, and it must enter as a free state or not at all. Only one answer to this was attempted. Clay appealed to the northern members, as friends of the negroes, to allow them also the benefits of migration to the fat and fertile west, and not to coop them up in the starved lands of the older states; it seems not to have occurred to him that these territories, if left free, were the nearest and best location for the colonization society. (See SLAVERY; ABOLITION, I.)—A new congress (the 16th) met Dec. 6, 1819. Alabama was at once admitted as a state, Dec. 14, and the number of free and slave states was thus equalized. Missouri, through her territorial legislature, again demanded admission as a state. Maine, whose democratic majority wished to separate from federalist Massachusetts, had already formed a state constitution and now applied for admission also. The Maine bill passed the house, Jan. 3, 1820. In the senate, after a month's debate, Jan. 16—Feb. 16, the Maine bill was also passed, but with a "rider," consisting of the Missouri bill without restriction of slavery. This attempt to compel the house to accept the Missouri slave state bill, or lose both, was passed by a vote of 23 (including 3 from the north) to 21. Feb. 17, Thomas, of Illinois (pro-southern), offered as an amendment to the bill the compromise afterward adopted, which had been suggested in February, 1819, by McLane, of Delaware, and which consisted, in effect, of a division of the Louisiana purchase between the free states and the slave states; and the senate adopted the Thomas amendment by a vote of 34 to 10. Although the affirmative vote in this instance contained the votes of most of the northern senators, this was not the first symptom of weakening in the northern vote; the organization of Arkansas as a slave territory (see ARKANSAS) had already shown that the slavery restrictionists had not learned the rule of *obsta principiis*, without which they could make no successful constitutional fight. (See DEMOCRATIC PARTY, III., V.) The southern vote was better disciplined, and had never wavered.—The senate passed the bill, with the Thomas amendment, by a vote of 24 to 20.—Feb. 18, the house disagreed to the senate bill as amended, the Thomas amendment having only 18 votes to 159. Both houses, by strong votes, adhered to their position, and the senate asked and was granted a conference committee, which reported, 1, that the senate should give up its union of the Maine and Missouri bills; 2, that the house should give up the Tallmadge proviso; and 3, that both houses should unite in admitting Missouri, with the Thomas amendment, as follows: "*And be it further enacted*, That in all that territory ceded by France to the United States, under the name of Louisiana, which lies north of 36 degrees 30 minutes north latitude, excepting only such part thereof as is included within the limits of the state contemplated by this

act, slavery and involuntary servitude, otherwise than in the punishment of crime, whereof the party shall have been duly convicted, shall be and is hereby forever prohibited." A proviso for securing the return of fugitive slaves from the territory in general was added. The whole compromise was then passed by the house, the second part of it by a vote of 90 (76 from the south, 14 from the north) to 87, and the third part by 134 to 42, 35 of the nays being ultra-southern members, who refused to approve any interference by congress with slavery in the territories. (See STATE SOVEREIGNTY.)—The approval of the president was still necessary to make the bills law, and Monroe demanded the opinions of his cabinet on the questions, 1, whether the prohibition of slavery was constitutional; and 2, whether the word *forever* was a territorial "forever," or applicable also to states formed from the territory in future. The cabinet was unanimously in the affirmative on the first question, but divided on the second; but by an adroit suggestion of Calhoun the two questions were joined into one—was the Thomas amendment constitutional? To this every member promptly responded in the affirmative, and the bill was signed March 6, 1820.—The Missouri compromise of 1820, of which Thomas, of Illinois, was the father, and Henry Clay, of Kentucky, the active, zealous and successful sponsor, was thus completed in all its parts. At first sight it seems unfair, if any arrangement, with which both parties to a controversy are content, can be called unfair. In a territory, acquired by national action without the consent of its inhabitants, and therefore under national control, it is impossible to make out a case for the establishment of slavery, any more than of a territorial church, without the express action of congress; but the south, by persistently claiming this right as to the whole of the Louisiana purchase, had successfully established it as to a large, and the only present useful, part of it. There is, however, another view of the matter to which attention must be directed. For nearly 20 years congress had utterly neglected to assert or enforce its power over slavery in the territories. It had shut its eyes to the existence of slavery in the Louisiana purchase; it had admitted Louisiana as a slave state; it had allowed the territorial legislatures to legislate in favor of slavery; so late as 1819 it had organized the territory of Arkansas without restriction of slavery; and those who had brought slavery into the territories might, with considerable show of fairness, claim that congress had now no right to suddenly assert a power over their property in the case of Missouri which it had not claimed in that of Louisiana. The claim is so far well founded that it is difficult to deny the parallelism between Louisiana and Missouri. The north, therefore, in order to secure the rest of the Louisiana purchase in its normal condition of freedom, was compelled to pay for its 20 years' laches by surrendering the modern states of Missouri and Arkansas to the slaveholding

settlers whom it had allowed to enter and possess them. It can not, however, be too strongly insisted that what Randolph called the "dirty bargain" had two sides, that the south had formally abandoned all future claim to establish slavery in territories north of 36° 30'; that the north had tacitly pledged itself not to exert the power of congress to abolish slavery in the Louisiana purchase south of that line; and that both sides had recognized the absolute power of congress over slavery in the territories, without which the compromise could never have been made. In 1836, when admitting Arkansas as a state, the north was strongly tempted to break its agreement, but refused to do so, even John Quincy Adams insisting that the admission of Arkansas as a slave state was "so nominated in the bond," and must be punctually fulfilled. In 1852-4 (see KANSAS-NEBRASKA BILL; DEMOCRATIC PARTY, V.), the southern leaders broke the agreement which their section had made.—Attention should also be called to the evil effects of the Missouri compromise. 1. It recognized by law that which every effort should have been made to blot out, the existence of a geographical line which divided the whole people into two sections, and it thus went far to establish parties on this geographical line. Jefferson's eye was quick to recognize this fact. In his letter of April 22, 1820, to John Holmes, he says: "This momentous question, like a fire-bell in the night, awakened and filled me with terror. I considered it at once as the knell of the Union. It is hushed, indeed, for the moment; but this is a reprieve only, not a final sentence. A geographical line, coinciding with a marked principle, moral and political, once conceived and held up to the angry passions of men, will never be obliterated, and every new irritation will mark it deeper and deeper." From this time parties were to be really national only so long as the question of slavery was kept under cover; when that question came to the surface, the whole controlling intelligence of the south spoke in the language of Dixon, of Kentucky, in 1854: "Sir, upon the question of slavery I know no whiggery and I know no democracy—I am a pro-slavery man." 2. In this compromise, however faithfully kept by both sides, lay the elements of future conflict. A comparison of the western territory of the United States with the country's steady rate of increase in population should have shown the statesmen of 1820 that the southwestern boundary was so abrupt a barrier to the movement of migration that it could not endure. When it should be broken down, and when new territory, not covered by the Missouri compromise, should be added to the United States, it was not to be expected that the south should then submit to a restriction upon slavery which it had successfully resisted in 1820. Bonds which can not restrain a child will not be very effective when he has grown to be a strong man, and, this principle of a division of territory once admitted, it was plain that future acquisitions of

territory would be for the benefit, not of the whole nation, but of a partnership of two, whose southern member would be certain to claim a full share.—The above is usually considered the Missouri compromise, though there were some few difficulties still to be settled. 1. In the presidential election of 1820, Missouri, though not yet admitted as a state, chose presidential electors, and many of the southern members sought to have their votes counted. This difficulty was avoided by counting the votes in the alternative. (See ELECTORS, STATE SOVEREIGNTY.) 2. The constitution of Missouri was found to discriminate against free colored persons, who were citizens in many of the states. The joint resolution of March 2, 1821, therefore, admitted the state on condition of the abrogation of this discrimination. (See MISSOURI.)—V. COMPROMISE OF 1850. The principle of the Missouri compromise, the supreme control of congress over the territories, even in the regulation or abolition of slavery, remained undisputed for nearly 30 years. It had been recognized in 1820 by 34 out of 44 in the senate (the vote on the Thomas amendment), by 134 out of 176 in the house, by president Monroe, and by all his cabinet, which included John C. Calhoun and Wm. H. Crawford from the south. It received a new indorsement in the joint resolution for the admission of Texas in 1845 (see ANNEXATIONS, III.), whose third paragraph forever prohibited slavery in states to be formed from the new territory north of 36° 30' north latitude. The affirmative vote in this instance included such representative southerners as Armistead Burt, Howell Cobb, Cave Johnson, Rhett, Slidell, A. H. Stephens, Jacob Thomson, Tucker, and Yancey, though their vote was prompted, not by any desire to make any territory free, but by a determination to divide the new territory by the geographical line which Jefferson had so much dreaded, and thus by implication to extend slavery to the southern portion of it.—The Mexican war brought a new addition of territory (see ANNEXATIONS, IV.), and, from the first prospect (in 1846) of its acquisition, many northern delegates renewed the claim that it was normally free soil, and must not be opened to slavery. (See WILMOT PROVISO.) The Wilmot proviso was essentially the same as the Tallmadge proviso above mentioned, and was defended on the same ground, the normal freedom of national territory. Additional argument in its favor was drawn from the undisputed fact that the territory just acquired was already free by the organic law of Mexico; but this reasoning was unnecessary, unless as cumulative, for the case was strong enough already. (See SLAVERY; TERRITORIES; DRED SCOTT CASE, IV.) For three years, (August, 1846—December, 1849), the struggle over the Wilmot proviso continued, regularly taking a sectional form. The new territories were repeatedly organized by the house, with the Wilmot proviso, and as regularly the bills were lost in the senate, where the southern vote was always aided by a

sufficient number of northern senators to form a majority. But, though the south thus stood strictly on the defensive, the northern democrats had in the meantime elaborated a new party dogma, popular sovereignty, or squatter sovereignty, by which they hoped to retain in the party both its northern and its southern vote. As at first enunciated it declared only that congress ought not (as a matter of policy) to interfere with slavery in the territories, as elaborated in the Kansas-Nebraska bill in 1854, it went to the further ground that congress had no constitutional right to do so. During this period of contest the free soil party began its brief existence. (See also DEMOCRATIC PARTY, IV; WHIG PARTY, II.)—In the south the excitement among the controlling body of slaveholders had grown so intense that its culmination marks the year 1850 as the point where the theory of secession first began to shade into possibility. The people of the still unorganized territory of California, whose population had been suddenly and enormously increased by the discovery of gold, had formed a state constitution, June 3, 1849, expressly prohibiting slavery. During the year the excitement was increased by the action of the people of New Mexico, to which Texas asserted a territorial claim, in forming a state constitution, May 15, 1850. This was interpreted as an effort to add another to the growing column of free states, and an army was at once raised in Texas to extend the jurisdiction of that state over the disputed territory. A convention of slave state delegates met at Nashville, Tenn., June 2, 1850, and declared any exclusion of slaveholders and their property from the new territories to be an injury and an insult to the south; and the various southern legislatures had instructed their governors, in the event of the success of the Wilmot proviso, to call state conventions in order to secure concert of action against a common danger.—A new congress met in December, 1849 (See CONGRESS, SESSIONS OF) The senate was strongly democratic; in the house the free soilers held the balance of power between the democrats and whigs, so that there was no party majority, and the speaker was only elected on the 63rd ballot by a plurality vote. It was not until Jan. 11, 1850, that the house succeeded in choosing all its officers, and became ready for legislation. Ten days afterward a message from president Taylor announced that he had advised the new territories to apply for admission as states, and that California had already formed a state constitution. Southern members objected to the admission of California, ostensibly because of the unreasonably large amount of territory claimed by the new state; but California was only about one-third as large as Texas claimed to be, and the objection really lay to the anti-slavery clause in the California constitution. Many of the southern members were determined to compel California to become a territory before becoming a state, and a bill to organize "the territories of

California, Deseret (Utah) and New Mexico" was introduced, Jan. 16, in the senate. Jan. 29, Clay introduced a series of eight resolutions, the basis of the final compromise of 1850, which were in substance as follows: 1. The admission of California, "with suitable boundaries," and without any restriction as to slavery. 2. The organization of territorial governments in the rest of the Mexican annexation, without any reference to slavery, since "slavery did not exist by law, and was not likely to be introduced" into them. 3. That Texas should not include any part of New Mexico. 4. That Texas should be paid \$—— for giving up her claim to New Mexico. 5. Non-interference with slavery, and 6. abolition of the slave trade, in the district of Columbia. 7. A more effectual fugitive slave law. 8. Non-interference with the inter-state slave trade.—These resolutions were debated for two months after Feb. 5, and the debate ended, April 19, by their reference to a compromise committee of thirteen, of which Clay was chairman. May 8, the committee reported the following propositions, which finally made up the compromise of 1850: 1, the admission of any new states properly formed from Texas, with or without slavery, as the people of the new state should decide; 2, the admission of California on similar terms; 3, the organization of New Mexico and Utah territories *without* the Wilmot proviso; 4, the passage of the last two measures in one bill; 5, the payment to Texas of an indemnity of \$10,000,000 for the abandonment of her claim to New Mexico; 6, the passage of a more effective fugitive slave law; 7, the abolition of the slave trade, but not of slavery, in the district of Columbia.—Many senators desired to consider these measures separately, but the committee had decided to embrace them all in one bill, of four parts, commonly called the omnibus bill. Part 1 was in 39 sections: §§ 1-4 for the admission of California; §§ 5-21 for the organization of the territory of Utah, with a prohibition against the passage of laws "in respect to African slavery" by its legislature; §§ 22-38 for the organization (with the same prohibition) of the territory of New Mexico; and § 39 for the fulfillment of proposition 5 above. Parts 2 and 3, in three sections, carried out proposition 6 above, and formed the celebrated fugitive slave law. Part 4, in two sections, carried out proposition 7 above.—The omnibus bill was debated until the last day of July, when it was discovered that successive amendments had cut out all its provisions except the Utah bill, which was passed Aug. 1. By this time the martial preparations of Texas, backed by offers of aid from other southern states, had shown some compromise to be necessary, if war was not to follow. The other bills, which had failed together, were now passed separately by the senate: the Texas bill, Aug. 10, 30 to 20; the California bill, Aug. 13, 34 to 18; the New Mexico bill, Aug. 14, 27 to 10; the fugitive slave bill, Aug. 23, 27 to 12; and the District of Columbia bill, Sept. 14, 33 to 19. In the

house the Texas and New Mexico bills were passed together, Sept. 4, 108 to 97; the California bill, Sept. 7, 150 to 56; the Utah bill, Sept. 7, 97 to 85; the fugitive slave bill, Sept. 12, 109 to 75; and the District of Columbia bill, Sept. 17, 124 to 47. All the provisions of Clay's scheme of compromise were therefore finally successful.—The gist of the compromise, as stated by Clay himself in debate, July 22, was, on the one hand, forbearance by the north to insist upon the application of the Wilmot proviso to Utah and New Mexico, and, on the other hand, forbearance by the south to insist upon the express introduction of slavery into those territories; all the other measures were only feathers to fly the arrow. The north was to obtain the effectual application of the Wilmot proviso to California, by its admission as a free state, and also the abolition of the slave trade in the District of Columbia; the south was to obtain an effective fugitive slave law, and an indemnity to Texas, of whose bonds many of the Southern leaders were holders. There was no application of popular sovereignty to the new territories, for their legislatures were forbidden to pass laws on the subject of slavery; nor was there any settlement of the status of slavery there, for the committee's bill, as stated by Clay on introducing it, did not decide whether slavery did or did not exist in Utah or New Mexico, only forbidding the legislatures to prohibit it if it existed, or to introduce it if it did not exist. Clay's own belief, as he then stated it, was that slavery did not exist there, having been abolished by Mexican law. The whole arrangement was evidently a mere make-shift, intended to avoid the question of slavery in Utah and New Mexico, in the hope that these territories would soon form state governments and decide the matter for themselves. There is not the slightest perceptible evidence, either in the omnibus bill or in the debates, of any intention to repeal, directly or indirectly, the Missouri compromise or its prohibition of slavery north of the parallel of 36° 30'; nor did the Texas bill make any repeal of the prohibition of slavery in new states to be formed from Texas north of the Missouri compromise line, which had been first imposed by the joint resolution admitting Texas. Had the compromise of 1850, as it was understood by its framers and by the two parties which formally indorsed it in 1852, been maintained, there seems to be very little doubt that the United States might have prolonged for many years the desperate effort to "endure one-half slave and one-half free." The Kansas-Nebraska bill was really as much a repeal of the compromise of 1850 as of the compromise of 1820.—VI. CRITTENDEN COMPROMISE. In 1860 senator John J. Crittenden, of Kentucky, introduced a proposition to amend the constitution by dividing the territories between the two sections on the line of the Missouri compromise. His amendment was approved by the legislatures of Virginia, Kentucky, Tennessee and New Jersey, in their instructions

to their delegates to the peace conference in 1861 (see CONFERENCE, PEACE), and was vainly urged by him throughout the session of 1860-61. In the house, Jan. 14, 1861, an attempt to substitute it for the report of the committee of thirty-three was lost by a vote of 80 to 113, in the senate it was brought up March 2, and lost by a vote of 19 to 20. Had it been adopted it would have been, in substance, as follows: XIII. *Section 1.* Slavery is abolished in all territory, present or future, north of latitude 36° 30', south of that line it shall be recognized and protected by every department of government, and never interfered with by congress. When the territory becomes a state, its people shall settle its condition, slave or free. *Sec. 2.* Congress shall not abolish slavery in forts and other federal territory in slave states. *Sec. 3.* Congress shall not abolish slavery in the District of Columbia so long as Virginia or Maryland permit slavery, nor in any event without consent of the inhabitants, and compensation. Congressmen and federal officeholders at Washington shall never be prohibited from bringing their slaves thither. *Sec. 4.* The inter-state slave trade, by land, river or sea, shall never be prohibited. *Sec. 5.* The United States shall pay the owner the full value of any fugitive slave rescued by violence or intimidation; the United States may sue the county where the rescue took place, for the value paid; and the county, in like manner, may sue the wrong-doer. *Sec. 6.* No future amendment shall ever affect the five preceding sections, nor article I, § 2, ¶ 3, nor article IV, § 2, ¶ 3, of the constitution; and no amendment shall ever give congress power to abolish slavery in a slave state.—To this were added four resolutions: 1, asserting the constitutionality of the fugitive slave law; 2, earnestly requesting the repeal of the personal liberty laws; 3, promising the amendment of the fugitive slave law by making the commissioner's fee the same whether his decision was for or against the claimant, and by restricting the use of the *posse comitatus* to cases of resistance or rescue; and 4, promising the stringent suppression of the African slave trade. ALEXANDER JOHNSTON.

COMPULSORY CIRCULATION, the obligation imposed upon citizens to accept, as the equivalent of coin money, the paper uttered by the state or by the banks. As applied to banks compulsory circulation means that the banks are not obliged to redeem their notes, or exchange them for specie at sight.—Compulsory circulation may be, at certain times, a measure of public safety for a country; but it is a very dangerous one, and should be abandoned as speedily as possible.—Compulsory circulation, being almost always the result of an extraordinary issue of irredeemable notes, leads to a depreciation of the paper, which no legislation can prevent. The commercial public avoid the difficulty with the greatest ease: they raise the price of goods in proportion to the depreciation of the paper. There is but one way to restore to the notes their former value, and that is, to diminish their number by specie resumption or by consolidation.

COMPULSORY EDUCATION. (See EDUCATION.)

CONCESSION. By concession is meant the privilege which the government grants to an individual, or to a particular body of individuals, to undertake a certain work, or to carry on a certain industry, dependent by its nature upon the public power, or to enjoy which, in virtue of existing laws, a previous authorization must be obtained. Thus, the construction and operation by private corporations, of railroads, canals, bridges, and some other public works, are objects of concessions made by governments. The working of mines, in like manner, may be the object of a concession.—The system of concessions has been pushed very far in France, because the carrying on of a great

many industries which are left perfectly free in other countries, is there made dependent on governmental authorization. This system has frequently led to scandalous abuses.—In his *Traité de la propriété* Charles Comte expresses the opinion that concessions, instead of depending solely upon the good pleasure of the government, should always be made to the highest bidder. This, in his opinion, would put an end to the abuses, scandals and prevarications which are now but too often witnessed in connection with them. He advances some very powerful reasons in support of this proposition. But it would perhaps be better, if not to do away with the system of concessions entirely, at least to restrict it within just limits, by according full liberty to industry, in everything that does not essentially depend upon public power. CH. C.

CONCLAVE. Conclave is formed of two Latin words, *cum*, with, and *clavis*, a key. The name conclave was given to the assembly of cardinals charged with the election of a pope, because they were kept under lock and key until they came to an agreement.—In 1049 pope Nicholas II., in a synod, caused to be conferred on the cardinals, alone, the right of conducting the election of the pope. The college of cardinals, which figures as a body since the eighth century, were obliged to ask the consent of the people and the clergy of Rome to the election of a pontiff. The popular vote, the vote of the clergy of Rome, and the consent of two-thirds of the members of the conclave, were necessary to the election of the pope. With these conditions the election of the pope had rather a broad basis; but several elections gave rise to dissension. Influences from abroad were brought to bear; and, on this account, the clergy and people of Rome were deprived of all participation in papal elections.—This revolution was accomplished under Gregory X., who, by new regulations, had the right of election conferred on the cardinals alone. Foreign influences, however, did not cease on that account; they were not less active although lessened. The conclave had in its body members belonging to the dioceses of every part of the Catholic world; the elections often took a long time; and, to force the cardinals to decide more quickly, coercive means were resorted to. If the cardinals, after three days of deliberation, did not agree on the choice of a pope, they were allowed only one dish for a meal and were kept in close confinement.—Later, a part of the usages of the ancient rule were modified. They were fixed as follows: before beginning their deliberations, the members of the conclave took an oath, of which the following is the formula: "I take to witness Our Lord Jesus Christ, who is to be my Judge, that I shall vote for him whom I should vote for before God." As soon as two-thirds of the votes are united on the same person, the election is accomplished. The signatures of the electors are verified, the new pope takes a name, and is *adored* (this is the

word used) by his former colleagues. Then he is announced to the people collected outside, and is carried and enthroned on the altar of Saint Peter, and the work of the conclave is over.—Thus, as we have seen, it is the cardinals alone who elect the popes. On this account their office has great importance; for it is evident, as well from the history of the past as of modern times, how necessary it is that a pope should be elected in the interests of peace and conciliation. Every state is interested in this, and its cardinals can not, or should not, neglect the interests of their country.—In a conclave for the election of a pope, France, Austria and Spain can each demand the exclusion of one cardinal; but they can make use of their right of veto only before a majority of votes is assured to some one of the cardinals.

MAURICE BLOCK.

CONCLUSUM, a diplomatic note which recapitulates the demands of the power from which it proceeds. A *conclusum* admits of discussion. It is often merely a point of departure for negotiation. It is distinguished, therefore, from an ultimatum, which scarcely admits a reply. (See **ULTIMATUM**.) M. B.

CONCORDAT, a treaty concluded between the papal see and the government of a Catholic nation, to regulate, within the limits of the latter, the relations between the Catholic church and the state. This term is not applied to conventions between the pontifical government and any other power for objects purely political; such, for instance, as the treaty of Tolentino, in 1797. These conventions are ordinary diplomatic acts. In concordats the pope makes stipulations as sovereign pontiff, as the head and representative of Catholicity. Agreements *de rebus ecclesiasticis* between the papal see and a non-Catholic power are called simply *conventions*.—*General considerations.* The equitable adjustment of the relations between church and state, the reconciliation of the rights of conscience and the necessities of government, is one of the most difficult problems that can be presented for the speculation of philosophers or the solution of experienced statesmen. Three very different ways of effecting this adjustment may be imagined; and each way finds expression in a system of its own. In the first, the state is governed by the church; sovereignty belongs to the spiritual power and the temporal power is merely its instrument. In the second, on the contrary, the state governs the church, and the temporal power absorbs the spiritual. In the third, "the church is independent in the state, unheeded by it; the state has nothing to do with it, and the temporal power no right to take cognizance of religious belief; it permits them to live and govern themselves as they please; it has neither a right nor a legitimate motive to interfere in their concerns." So says M. Guizot. (Civilization in France, 3rd lecture.) In this last system, the state recognizes natural religion only,

and, professing a serene indifference to all forms of positive religion, it allows them to develop, unhindered and unhelped by government.—We do not think that absolutely any one of these three systems is practicable, at least in Europe. No matter what be done, unless worship is suppressed altogether, we find, in Europe, in the relations between church and state, three classes of matters which must be taken into account: matters purely temporal, which belong exclusively to the government, such as imposts, the army, etc.; matters purely spiritual, which belong exclusively to the church, such as dogma, worship; lastly, matters of a mixed nature, in which the church and state are constrained to meet, and in which both have certain rights to assert; for instance, public worship, the budget of public worship, and marriage.—All of the systems just mentioned are defective, because they fail to take into consideration one or other of these three matters. The first ignores the rights of the temporal power; the second, the rights of the church; and the third forgets that there are matters of a mixed nature, pertaining both to the church and the state. It would be useless to concern ourselves here with the first two systems: one of them has too few chances of being put in practice; the other is incompatible with the Catholic church. It prevails, it is true, in England and Russia, and the Christian communions which have accepted it are able to tell what they have gained by it.—As to the third, it deserves more attention; because, under the seductive formula, *a free church in a free state*, it has for some time past been often lauded, and because it has borrowed a rare prestige from the true principle of which it is an exaggeration. Both church and state can only gain from being free. The Catholic church particularly, would be benefited by the maximum extension of liberty in the world; because, by taking advantage, like every other church, of an unlimited power of expansion, it would, perhaps, be the only one that could stand the test of such a great expansion without losing anything of its cohesive power and unity. But the formula cited above does not truly describe the third system. It is not the *free church*, but the *separated church*, which should be spoken of here. But, if we admit complete liberty, we do not think it possible to have absolute separation in practice. The ideal proposed above could not be reached unless religion were restricted to a purely spiritual domain, unless worship were carried on only in the inner temple of the soul; in a word, unless matters of a mixed nature did not exist. But, made for men, that is for beings composed of soul and body, religion addresses the senses in order to reach the heart. Hence external manifestations of the religious sentiment; hence worship, properly speaking. Men are the ministers of religion; and these men can not live by prayer alone. Lastly, there are acts, such as marriage, over which the church extends her empire, and in which the state itself is too much interested to

abdicate the right of regulating them by law. These are what we mean by matters of a mixed nature, and it is because they exist necessarily and will always exist, that it seems impossible to assign to the Catholic church and the state regions so distinct that these two powers should move in parallel lines, ignoring one another and never coming into collision. The freer a government becomes, the fewer, in truth, will be the points of contact between church and state. But, no matter how free it may be, it can not, at least in Europe, preserve on all points the indifference compatible with absolute separation of the state from the Catholic church.—It is of the essence of religion to bring its adherents together for the outward manifestation of their feelings. But what government has been, is, or promises to be, indifferent to meetings of the people. Worship must be supported; the state must needs provide this support or leave the faithful at liberty to provide it. Those who admit neither of these alternatives “forget one thing,” says Jules Simon, “that the liberty of worship is a liberty just like any other, and should therefore be sacred even to those who do not believe in the legitimacy of any worship. To grant liberty and withhold the means of enjoying it, is simply to add hypocrisy to tyranny. It should also be taken into consideration that a shabby ceremonial and a needy clergy are at once a scandal and a public peril. It is a fault, both in policy and logic, to tolerate religion in a state, and to condemn it to misery and shame.” Now, if the state furnishes the budget of worship, it must know to what use its money is put. If, on the other hand, the faithful furnish it, numberless questions arise full of interest to the state concerning its details, its collection, its distribution. Into these it is difficult to avoid entering. The state and religion have clashed no less frequently on the question of marriage, a matter essentially of a mixed nature. One creed admits divorce, another preaches polygamy. Ought the state to respect their precepts? Can it ignore them? It is said sometimes that the United States has solved the problem which occupies Europe. Is this absolutely true? Have not federal troops been sent (in 1871) to put an end to polygamy among the Mormons, where its practice is raised to the dignity of a dogma? Further, because a system works well in a new country, in the midst of free institutions, to conclude that it would be in place in the old states of Europe, whose machinery is so complicated, and which for the most part admit of such moderate doses of liberty, would be, as Jules Simon remarks, “*tabula-rasa* philosophy, not practical philosophy, and, above all, not legislation.” “The church and state in Europe therefore must needs come to some agreement on matters of a mixed nature. This admitted, how shall the agreement take place? Sometimes the state, of its own motion concedes certain rights to the church, leaving it sufficient liberty, as in the United States. In this case, of course, a concordat is not required; but one is a bad judge in his

own cause, and so are governments in theirs. Moreover, governments change, or are modified, and with them the measures they have taken. Hence, oppressive or ill-considered laws, uncertainty and conflict. Out of this situation of affairs a régime for the Catholic church arose, a régime created by the force of circumstances, and which has been in operation for several centuries: the régime of *concordats*. The Catholic religion has a supreme head whose authority is recognized by all its churches, and who, if need be, has the right to represent them all. In virtue of this right and this authority, this head treats, whenever he wishes, with temporal governments as equal with equal. The chiefs of the two powers determine by positive conventions the limits of their respective domains, fix the rules to be followed on points most likely to occasion disputes, settle or anticipate existing or approaching differences, make mutual concessions, and endeavor to establish on the most lasting basis the state of things best fitted to assure peace in the spiritual and temporal order. This régime is not incompatible with any amount of liberty either in the church or state; for, in a concordat, the separation of the priesthood and the state may be stipulated for, as well as their union, and it has for the church the two-fold advantage not only of being feasible in free states, which are very rare, but of giving the freedom of spiritual interests in each country the solidity of a mutual contract, instead of the fragile and narrow foundation of a simple royal or popular concession." (De Broglie, *La souveraineté pontificale et la Liberté*).—Sometimes the system of concordats has been accused of striking a blow at the liberty of conscience, by destroying the liberty and equality of forms of worship. This charge is ill founded. A concordat may contain intolerant provisions; but such are not an inherent condition of concordats, their essential object being only to assure the Catholic church a sum of liberty more or less great according to the country with which negotiations are made, but in every case sufficient liberty. It is an assertion of the right of the freedom of religion in favor of the Catholic church; and how could this be the negation of that freedom? As to the equality of creeds, one should not forget, that, liberty being a right, the creed which obtains it merely enters upon its rights. But it may be said, if this right does not exist for all, the one which obtains it enjoys, by that fact, a privilege above all others. This is true; but, then, it is not the suppression, but the extension of this privilege which should be demanded. To reason otherwise would be as if one should, in the name of equality, demand, in a country where serfdom existed, not that the bound should be set free, but that free men should be made slaves.—*History*. In the early ages of Christianity the conventions which settled the disputes between bishops and abbots of religious communities were called concordats. Later, the name was reserved to pacts concluded with the holy see. The quarrels of

the popes and the emperors of Germany gave rise to a number of transactions of this kind. Among them may be mentioned the concordat of Worms, concluded between Calixtus II. and Henry V., which regulated the question of investitures. (1123.)—At the end of the thirteenth century, the history of Portugal gives an example of a concordat which is interesting by reason of its peculiar nature. In this case the contracting parties were, on the one hand, the king of Portugal, and, on the other, the Portuguese clergy. The pope appeared in it, less as a party than as an arbitrator, and to give his sanction to the agreement. A serious dispute had arisen between the king, Don Alfonso III., and the clergy of the kingdom, which continued under the reign of Don Diniz, his son. The pope intervened, the kingdom was under interdict, and the king excommunicated. Don Diniz resolved to put an end to this state of things. In 1284, in an assembly, preliminaries of agreement were arrived at, after which both parties had recourse to the pope. The king sent two deputies to Rome "with full powers to conclude a treaty by the authority of the pope, and to have it confirmed." The church of Portugal, on its part, was represented by an archbishop and three bishops. The case was laid before a commission of three cardinals, delegated by pope Nicholas IV. to examine the affair. When all parties had come to an agreement, an act was drawn up by the commission, stating this fact, and a papal bull confirmed the concordat (1289).—Four concordats were concluded with France: in 1516, 1801, 1813 and 1817. The first lasted till the French revolution: the second is still in force. The other two did not live long. Before discussing the concordat of Francis I., it is necessary to mention two previous acts concerning the rules followed by France in her relations with Rome. Until the time of Saint Louis, there had existed on this subject merely rules, or, rather, traditions, not yet united into a code of doctrine. But between the crusade of Egypt and that of Tunis a grave conflict arose between Louis IX. and Pope Clement IV. on the subject of vacant benefices. The king, after this difficulty, wishing to avoid similar ones in future, published, as it seems, an edict known as the pragmatic sanction.—The first article maintains intact, for the churches of the realm, the right of collation and the jurisdiction of the ordinary; the second maintains with equal force the free elections of cathedral, and other churches; the third proscribes the crime of simony; the fourth relates to the rules taken from the common law, the councils, and the holy fathers, for the collation of dignities and ecclesiastical benefices; the fifth (wanting in some versions) prohibits the exaction or levy of money by the court of Rome unless sanctioned by the king, and unless for a pious and urgent reason. Article 6 confirms the liberties, immunities and privileges accorded to persons and places in the kingdom belonging to the church. The authenticity of

this ordinance, sometimes disputed, is more generally admitted. It is certain, at least, that the doctrines laid down in this document are those which Saint Louis took as a rule of conduct, and which he made it a duty to apply. (Boutaric, *France sous Philippe le Bel*.) At all events, the pragmatic sanction must have been forgotten after the reign of its author; for we find it mentioned only in documents posterior to Charles VII.—This prince issued a pragmatic sanction also, which occupies a much greater place in French history than the foregoing. It is well known what laxity there was in the church, and what trouble and scandal in Christendom were born of the schism which marked in so deplorable a manner the end of the fourteenth and the beginning of the fifteenth century. A double consequence was the result. The reformation so long needed, and which Saint Bernard had already called for so eloquently, had become still more urgent: *Satis constabat res in deterius flexisse, et in tanto schismate magis magisque in pessum ire*. (Bossuet.) Then the rivalry of opposing popes had rendered the authority of the holy see at once more encroaching in its nature and less respected. Yielding to the various exigencies of the struggle, the two rival sees strove to obtain subsidies from the nations which acknowledged their jurisdiction; and, to increase the number of their partisans, they made free use of the power of dispensation. For this reason the whole church desired to see the end of schism, and to engage quietly in the work of reformation. Each separate church wished in future to regulate its relations with the papacy. Hence the various concordats elaborated at the council of Constance, for the nations which took part in it, and published by Martin V. after the close of the council (1418). That intended for France was refused as contrary to Gallican liberties. But, when the council of Basle, wishing to restrict the pontifical power, engaged in a struggle with Eugene IV., and the schism was on the point of breaking out anew, France, inclined thereto by her traditions, and prepared for it by the assemblies of 1394 and 1406, undertook in the midst of the conflict to regulate her own affairs alone. Charles VII. convoked an assembly at Bourges, which, says M. Henri Martin, partook of the nature both of the states general and of the national council. Princes and peers, archbishops and bishops, abbots, doctors, representatives of chapters and universities, were there. The council of Basle sent deputies to solicit this assembly to adopt its decrees. Eugene IV. was represented in like manner; but the assembly issued a declaration by which it appropriated, while it modified in certain points, most of the decrees of the council. Letters patent of the king (July 7, 1438), registered in parliament the following year, gave the force of the law to these resolutions.—This pragmatic sanction is too lengthy a document to insert here. It proclaimed the principle that a general council is superior to the pope, and restricted the jurisdiction of the

holy see. This law, therefore, so dear to the parliament, struck a severe blow at the pretensions of the papal see. It curtailed both its revenues and its authority. It is not hard, therefore, to understand why, ever afterward, it was the object of incessant complaints on the part of Eugene IV. and his successors. Charles VII. upheld it vigorously; and, while the emperor and German princes, abandoning the neutrality which they had observed during the struggle between the fathers of Basle and those of Florence, between Felix V. and Eugene IV., concluded with Nicholas V. the German concordat (1447), the Gallican church continued to be ruled by the pragmatic sanction. Pius II., apparently more fortunate, obtained of Louis XI. its solemn abolition. But the parliament refused to register these new letters patent, and Louis XI. whose relations with Rome had grown cool, was very little concerned to secure this registration. As long as he lived this crafty prince appears to have held the pragmatic sanction as abrogated or in force as best suited his whims for the moment. The preamble of the concordat of 1516 mentioned another concordat, concluded with French negotiators under the pontificate of Sixtus IV., but which does not seem to play any part in history. The pragmatic sanction observed under Charles VIII. was confirmed, on the accession of Louis XII., by a solemn act. Julius II., throughout his struggle with this king, endeavored to secure the condemnation of this document before the council of Lateran; and all its supporters, whoever they might be, kings or others, were summoned to appear before the council in its defense.—The death of Julius II. and, after him, that of Louis XII., put an end to personal animosity, and rendered an agreement more easy. Francis I. and Leo X. met at Bologna, and agreed to replace the pragmatic sanction by a mutual agreement, whose conditions the chancellor, Duprat, was commissioned to discuss with two cardinals delegated by the pope. When the negotiations were at an end, Leo X. had the agreement presented to the council, and sanctioned, by his approval, the bulls revoking the pragmatic sanction and publishing the new concordat.—The first title of the new concordat is merely an account of the negotiations had, and of the motives of the concordat. The second and third titles deprive the chapters of cathedral and metropolitan churches of the privilege of the election of bishops, and declare, that, in six months after the see becomes vacant, the king shall present to the pope a candidate satisfying certain conditions. If the king has not named a capable person, he shall name another three months after having been advised of the fact. If he fails, the pope will make the appointment. The nomination to bishoprics vacant *in curia*, that is, whose incumbents died while in Rome, belongs to the holy see. The royal nomination is also substituted for elections in elective monasteries, without derogating from the special privileges of certain chapters and monasteries. *The expectant*

favors, (*graces expectatives*) and the reservations (*reserves*) are abrogated (IV.), as they had been by the pragmatic sanction. Title V. regulates the rights of persons obtaining benefices. There is a *devolutio ad sedem apostolicam*, if the ordinary of the diocese violate the established order. The four following titles relate to the apostolic mandates which the pope might issue in the matter of benefices. Titles X. and XI., *de causis et appellationibus*, contain almost the same provisions as the pragmatic sanction; and the following titles (XII. to XVII.) are identical. The concordat bears the date of Aug. 18, 1516. The last title, the date of which is posterior, contains only the confirmation of the council and the letters patent of the king. Nothing is said of the number of cardinals, which the pragmatic sanction pretended to limit, nor of annats, which were re-established by this very silence, the act which had suppressed them being itself abolished.—Such, in its essential provisions, is this celebrated concordat which has been exposed, both at the time of its appearance and since, to the most violent and even contradictory criticism. One party considered it as a most brilliant victory of the papacy, attributable to the frivolity or the weakness of Francis I. and Duprat. Others, on the contrary, see in it a triumph of royalty, a daring step toward universal dominion, which was then the object of its ambitious aspirations; and they accuse the pope of having sacrificed the spiritual to the temporal, the elections to the annats. This last accusation is not serious, for the annats were certainly not worth the sacrifice. M. de Pradt, who is not suspected of good will toward the papacy or the concordat, estimates, that, in the eighteenth century, they might produce annually 170,000 livres. Admitting that, in the sixteenth century, this income was greater, it could not have been of sufficient importance to influence the holy see. The object which Rome pursued was rather the abandonment of the principles of the council of Basle. The abandonment of the right of election is explained by the serious difficulties met in their application. Many abuses had crept into the practice, and it was not this innovation that roused the most lively complaints of contemporaries. But, justice done to the unmerited attacks, and justice done to the questions of fact which caused this change, it must be confessed that the substitution of royal appointment for elections opened a wide field to the interference of the state in the government of the church, a fact to be regretted from so many points of view. We should also add that the concordat had been prepared, discussed and signed without any participation of the church of France, while the pragmatic sanction had been drawn up with its co-operation. It was not, however, among the clergy that this convention met with the liveliest opposition. The resistance came more particularly from the parliament, which refused to enroll the letters patent giving it the force of law, and which did not yield till constrained thereto, and

which, even after the enrollment, continued to judge according to the rules of the pragmatic sanction. To issue from these difficulties, it was necessary that the declaration of Sept 6, 1529, should turn over to the grand council the cognizance of all the disputes to which the application of the concordat might give rise.—From the concordat of Francis I., in 1516, to the concordat of Bonaparte, in 1801, there is a long stretch of time, nearly three centuries. The revolution found the concordat of Francis I. still in force, and shattered it, as it shattered everything connected with Catholicism. It would have crushed Catholicism itself, if the enemies of that religion had had power enough to annihilate it. It is certain that a violent hatred of the ancient national religion, a hatred which often rose to the pitch of delirium, characterized the revolutionary movement, and was common to the different parties which composed that movement. It is proper to indicate here the causes of this hatred. The Catholic religion had been the religion of the state under an absolute monarchy and at a time when religious toleration was little understood and still less practiced, not more in Protestant England than in Catholic France. The church, therefore, found itself, by the force of circumstances, connected with a system of intolerance, and compromised in acts of despotism, against which the revolution was bound to react with a despotism more intolerant, more violent still. The clergy were a privileged body, and their privileges had become odious to the nation. The clergy possessed great estates, and it was the impoverished state of the finances that caused the revolution. These were the causes which might be called intrinsic; but there were others. The philosophy of the eighteenth century had made the church appear a partner in all the wrongs of the ancient régime. Now it was a breath of this skeptical philosophy that raised the revolutionary tempest. To the zeal of philosophers was joined, in the constituent and legislative assemblies, the low-voiced but stubborn hostility of a large number of Jansenists. And then, as if these old enemies were not enough, there arose in the wake of the revolution whole classes of men bound by passion or their interest to complete the ruin of the old church—the apostate priests, and those who had acquired the national property.—And still, at the dawn of the revolution, when all division seemed to die out before the first rays of nascent liberty, there were moments when impulse was so pure and enthusiasm so honest that men might have hoped for better things. But we know what followed. religious liberty was proclaimed in every successive constitution from 1789 to the year VIII., but, although thus always proclaimed it was never respected. The law which placed the property of the clergy at the disposal of the state, initiated the division between the revolution and the church. Nor did men stop there: the essential laws of the church were soon violated by the civil constitution of

the clergy, which "proves incontestably," says M. Jules Simon, "that, in the eyes of the constituent assembly, religious liberty had no existence whatever;" and from that day the rupture was complete. The civil constitution gave birth to schism, and soon after to persecution. The sad history of this persecution is known, and we shall not try to present it to the world anew. The reign of terror was followed by a régime less violent, which allowed men to draw breath, without, however, restoring freedom to religion or security to its ministers. But the faith which, in its infancy, did thrive under the whips of pagan anger, had, during long centuries, taken firm hold on French ground; and, the moment that lassitude in the governing powers, or a change in public opinion allowed the expression of religious feeling, striking proofs of its vitality became evident. "Numerous petitions are addressed to you," said Robert (*of the coté d'or*) to the five hundred, "from all parts of the republic; from all sides men ask you to restore religion." (Session of the 27th Prairial, year V.) At the same time Camille Jordan became the interpreter of the religious movement, and his report on religion produced a profound sensation. He demanded that religious liberty should cease to be a dead letter, and become a law. The generous words of Jordan found an echo in the councils, which the elections commenced to fill with new men; and the law of the 7th Fructidor, year V., abolished the laws punishing priests who had not taken the oath. But the directory and the greater part of the men in power who were the children of the revolution, had, as regards Catholicism, remained faithful to the tendencies of the convention. Rigorous measures, suspended for a time, were resumed after the *coup d'état* of the 18th Fructidor, and were continued until the 18th Brumaire. The régime born of this last day put the whole government in the hands of a single man. The genius of this man was so vast, and his will so mighty, that nothing could escape his all powerful action. On him, then, and on him alone, was to depend the régime to which the church was to be submitted. He, too, a child of the revolution, had, before he strangled it to his own advantage, defended it in a masterly manner against enemies from without and from within. He had been the protégé of Robespierre the younger, and of Barras. His ideas could not have been very favorable to Catholicism, judging from his celebrated proclamation of Alexandria, and yet in the face of this, whether it was by reason of his involuntary respect for the faith of his childhood, or through greatness of soul, or a presentiment of his future destiny, he had more than once broken completely with the traditions and views of the revolutionary government.—It only depended on him, in the year V., whether he would overturn the government of the pope; the directory wished it; the road to Rome was clear; and Miot, ambassador of the republic at Florence, strained every nerve to destroy the

temporal power. (*Mémoires de Miot*, I. 91.) Still, Bonaparte took upon himself to sign the treaty of Tolentino, which, while despoiling the pope of a part of his dominions, respected the principle on which his power was based. He even showed himself on this occasion prodigal of demonstrations of respect for the person of Pius VI. Some days beforehand, he had assumed the protection of the priests who had not taken the oath, and whom the French armies had found in the Roman states, and he obtained of the directory a decision authorizing the priests in France who had not taken the oath to seek an asylum in the possessions of the holy see.—The spirit of wise and humane policy which had guided the commander-in-chief of the army of Italy, was seen again in the acts of the first consul. On his advent to power transportation ceased, and the prisons were thrown open. A certain number of churches were restored to the use of religion, and a simple promise of fidelity to the constitution replaced all the odious oaths which had been repeatedly exacted from the clergy. Under the shadow of this newly granted liberty the church was seen to rise slowly from its ruins. But the designs of the future emperor reached far beyond these measures of reparation. It was not his purpose that religion should rise up anew by its own strength alone, and by degrees. He wished it to be restored at once by a brilliant, and as it were, providential act. He wished the restoration to be his work. He had powerful and varied motives for proceeding in this way. He desired to have some religion restored to France, because, having religious instincts himself, he felt the need of religion to a great nation. He wished this religion to be the Catholic, because it was the religion of the greatest number, that which a long alliance and ancient memories identified with the destinies of the people. He wished this restoration to be immediate, because his genius, essentially an organizing one, could not see with indifference the state of trouble which reigned in men's consciences, and because it agreed with his tastes as well as his plans to astonish men by brilliant strokes. To sum up, he wished the restoration to be his own work. Looking on religion as a means of government, he made it a point not to leave it outside his circle of action; and he thought to secure for himself in this way the gratitude of the devout, and the docile concurrence of the clergy. Such were the secret feelings of the first consul, of which he gave the earliest public indications in a discourse addressed to the clergy of Milan, June 3, 1800.—The following passages were noticed in it, "Persuaded that the apostolic Roman Catholic religion is the only one capable of securing real happiness to a well ordered society, and strengthening the basis of good government, I assure you that I shall devote myself to protecting and defending it at all times and with all means. * * * A society without religion is like a vessel without a compass. * * * France, made wise by misfortune, has

opened her eyes at last. She has recognized that the Catholic religion was as an anchor, which could alone steady her in agitation and save her from the power of the tempest; she has, therefore, called it back again to her bosom. I can not deny that I have contributed much to this good work. * * * Some days later Napoleon, the victor of Marengo, felt his glory sufficiently dazzling and his power sufficiently great, to brave the ridicule of his generals and break the resistance of his environment. In an interview with Martiniani, bishop of Vercelli, he threw out some brief words on the possibility of a reconciliation with the church; and these words, transmitted to Rome in all haste, formed the point of departure for the concordat.—At that time more than two years had elapsed since the directory had taken possession of Rome, dragged the pope into exile, there to die, and ordered the dispersion of the sacred college. It seemed as though no conclave could be assembled, and that the papacy could not survive this shipwreck. Nevertheless, after the death of the prisoner of Valence, the conclave met at Venice, and in this assembly the best means for restoring peace to the church were adopted, and the envoy of cardinal Martiniani found the new pope at the threshold of Rome, into which he made a solemn entrance, July 3, 1800.—To understand the feelings with which Pius VII. must have received the overtures made to him, it is necessary to picture to one's self the state of religion at that time in France. At that very period the return of quiet rendered the wounds made by schism more visible. Two and even three kinds of clergy stood face to face. The constitutional clergy were generally despised, but the ex-revolutionists protected them out of hatred to the clergy who had not taken the oath. These pastors, without congregations, retained many churches, however; and, although their number was diminished through apostasy, death and retraction, the most zealous of them, united in council, showed themselves intriguing enough and sufficiently infected with the spirit of sect to be an occasion of scandal and an obstacle to the progress of the faithful clergy. The latter were themselves divided. The greater number of priests who had not taken the oath did not think they were lacking in duty by taking advantage of the toleration of the government and promising submission to the laws. But others, yielding to excessive scruples, or blending political with religious faith, refused adhesion to an act which, in their eyes, implied recognition of the new state of affairs and adhesion to the crimes of the revolution. The number of clergy divided in this manner, was also considerably reduced: the scaffold, massacres, the sufferings of transportation, the miseries attendant on a wandering life, had more than decimated them. Most of the bishops had taken refuge abroad. Many were living there yet, and corresponded as best they could with their dioceses. Those who had died could not be replaced, and the misery of the time did

not permit the chapters to provide regularly for the administration of the vacant sees. Those priests alone who had promised submission to the laws were able to officiate in public in a limited number of churches, which they were often obliged to share with the constitutional worship and the ceremonies of the revolutionary decade. The others could celebrate worship only in a state of concealment in forests or private dwellings. Among laymen, several had felt their faith grow strong under persecution; but others, in great numbers, lost the habit of the practice of religion, from want of help from the clergy. The church was no longer called upon to baptize children, or to officiate at marriages and funerals. Many were even hostile to the church. To say nothing of the decay of religious edifices, and the want of things indispensable in the practice of religion, the clergy had nothing to live upon. Nothing remained to them of the patrimony which the devotion of past centuries had accumulated for the support of the church and the poor.—Pius VII. therefore received with joy the message of peace which caused him to hope for improvement in a state of affairs which was sad enough. But if a prompt remedy was necessary, it was difficult of application. "At Paris," says M. Thiers, "there was a party of scoffers, of sectaries of the eighteenth century philosophy, of old Jansenists turned constitutional priests, and generals imbued with vulgar prejudices. These were the obstacles on the French side. At Rome there was fidelity to ancient precedents, fear of violating dogma by interfering with matters of discipline, distrust of everything born of the revolution, and a sympathy for the royalist party with which the church had experienced so much suffering and had so many memories in common. * * * These were the obstacles on the side of the holy see." But if it be true that the spiritual and temporal powers had never been confronted under more serious circumstances, it is also true that "they were never more worthily represented."—"This young man, of such good sense, the governor of France, so profound in his views, so impetuous in his desires—this young man was placed by a strange design of Providence on the world's stage in the presence of a pontiff of rare virtue, of evange ical face and character, but endowed with a tenacity capable of martyrdom if he believed the interest of the faith or the Roman court compromised."—The negotiator sent by Pius VII. was Monsignor Spina, archbishop of Corinth, who had shared the captivity and closed the eyes of Pius VI. With him, as an assistant, came father Caselli, general of the Barnabites, a consummate theologian. The first consul had chosen the abbé Bernier, the able and fortunate pacificator of the Vendée, to treat with the representatives of Rome. Spina and Caselli arrived at Paris in the month of October, 1800, and negotiations commenced at once.—According to M. Thiers the original plan of the first consul was essentially the same or nearly the same, as that embodied

in the concordat: removal of all the old titular bishops, new formation of dioceses, 60 sees instead of 158, a new clergy, formed of ecclesiastics of all parties, nomination of bishops by the first consul, confirmation by the pope, nomination of pastors by the bishops, promise of submission to the state, payment of the clergy by the state, renunciation of church property, complete recognition of the sale of this property, etc.—The court of Rome accepted certain of these provisions and rejected others, allowing itself sometimes to be guided by its traditions which it could hardly forget (thus, it insisted on obtaining for the church the title of state religion), but more frequently listening to a higher voice, as when it forbade despoiling old bishops of their sees, when they would not resign. It forbore to strike venerable prelates, who, through persecution and poverty, had shown an inviolable fidelity to the church; and it is doubtful if it thought it had the right to do so. As to the constitutional clergy, apart from a lively repugnance to intrust them with sees, Rome made a point of obtaining from them a complete retraction of their errors. As to the nomination of bishops by the chief of the state, Rome demanded a reservation in case one of the successors of the first consul should be a Protestant. With regard to the sale of church property, the Roman negotiator, while renouncing the recovery of what had been sold, opposed every formula implying moral approbation of what had been done, or the recognition of the right of selling. He demanded the restoration of property not yet alienated, and the power of acquiring new property.—The negotiations were long. The agents were full of good will; but Spina could not take it on himself to make certain sacrifices; and Bernier, an instrument of the first consul, full of dexterity, had not the authority necessary to modify the ideas to which his chief was attached. Notwithstanding marvelous sagacity and a penetration of unexampled keenness, Napoleon was a stranger to ecclesiastical questions, and could not appreciate at their value all the difficulties which he met. His imperious will, though still accessible to the voice of reason, was irritated at a resistance which he could not always account for. Moreover, there was no one at his side with authority and learning sufficient to clear his mind. The minister of foreign affairs, Talleyrand, alone could have done it; but, according to M. Thiers, Talleyrand showed himself, by reason of his personal situation, little inclined to assist in restoring the altars which he himself had forsaken. The end was hastened by an incident which at first appeared menacing. Impatient of delay, the first consul summoned the negotiators together, rebuked Spina for the assumed bad intentions of the court of Rome, threatened to cut off all negotiations, and sent to M. Cacault, his ambassador at Rome, an order to quit the city if the proposal which he sent should not be accepted within three days. Cacault, an honest and clear sighted

minister, a warm admirer of the first consul, and sincerely devoted to the holy see, was stricken down by the news. It was no more possible for the pope to accept the project in its entirety than for the ambassador to disobey the orders received. In this extremity, Cacault, while retiring to Florence, prevailed on cardinal Consalvi, the prime minister, to depart with him and visit Paris to follow up the negotiations. He thought justly that this step would satisfy the first consul; and, on the other hand, he believed that Consalvi had, beyond all others, the ability and authority necessary to terminate the great work. The cardinal arrived at Paris very much disturbed, and greatly impressed by the task which had been assigned him; but at last, after three weeks of labor, discussion and painful struggle, it seemed that an agreement had been reached, and a decree of 23rd Messidor, year IX., appointed Joseph Bonaparte, Cr  t  t, minister of the interior, and abb   Bernier to sign the concordat on behalf of France. The "first consul," wrote Maret, in sending a copy of the decree to Joseph, "desires this negotiation to be ended within 24 hours. He greatly desires that the coming convention should bear the date of July 14." In spite of this desire, the concordat could not be signed on that date, an incident related in the memoirs of cardinal Consalvi (Cretineau Joly, *l'Eglise romaine en face de la R  volution*, vol. i., p. 282) having reopened the discussion. Finally, at 2 o'clock in the night between the 26th and 27th Messidor, the concordat was concluded and signed, thanks partly to the honorable initiative of Joseph Bonaparte. Cardinal Consalvi set out almost immediately for Rome; and one month later a special courier arrived bringing the ratification of the holy father. On the demand of the first consul, cardinal Caprara was sent as a legate to watch over the execution of the concordat; for there were many details yet to regulate the dismissal of old bishops, the making out of new sees, the choice of new bishops. Portalis, minister of public worship, and the abb   Bernier, did what they could in these questions, but whenever their master had fixed ideas they were powerless. Thus it was, that, in spite of the legate and even of Portalis, the first consul gave the constitutional clergy a large share in the new appointments. Two motives, entirely political, guided him in this. He did not wish to appear to repudiate altogether the heritage of the revolution, and, insisting on the dependence of men, he was much more sure of these clergy than of the priests who had not taken the oath. These negotiations, the preparation of the organic articles, and certain absurdities of opposition, which appeared in the bosom of the assembly, delayed the publication of the concordat. It was at last submitted to the chambers in an extraordinary session held in Germinal of year X. At the same time a law was presented on the organization of worship, known under the name of organic articles, and to which we must refer directly. A statement of

the reasons for this law, drawn up by Portalis, accompanied the law, which met with no serious opposition. The wish of the first consul was well known. The two bills became law on the 18th Germinal, year X. (April 8, 1802). The first consul assisted at the *Te Deum* solemnly chanted at Notre Dame, in honor of the fact of general peace and the reconciliation with the church.—We can not describe here, even in an abridged form, the struggle which the ambition of Napoleon, impatient of resistance, brought about between the empire and the papacy—a struggle which followed quickly after the friendly relations of the period of the concordat, and Napoleon's consecration. The person and the states of the pope came quickly and easily under the control of the all-powerful emperor, but for a long time all this power was broken by the passive resistance of the holy father. At last, a captive, weakened by moral and physical suffering, isolated from his counselors, beset with all kinds of suggestions, Pius VII. yielded to the personal ascendancy of the emperor, and signed the concordat of 1813 (Jan. 25). This act involved a complete abandonment of the temporal power; and, as to the spiritual, it narrowed down the authority of the pope. In the matter of canonical institution, it limited the pope to a delay of six months, after which the right of confirmation devolved on the metropolitan. But after Pius VII. had regained his courage, in the presence of his counselors, and taken advice of Consalvi, Pacca, di Pietro, and others, he recalled the consent he had given in a moment of weakness (March 24, 1813); and, the fall of the empire coming soon after, the concordat of Fontainebleau was never carried out.—The restoration, in its first years, adhered to the concordat of 1801, but the number of dioceses created had become insufficient. The need of establishing new ones, and remodeling the old limits, brought about lengthy negotiations with the holy see. M. de Blacas concluded (June 11, 1817) a new convention, which re-established the concordat of Francis I. That of 1801 ceased to be binding, and the organic articles were abrogated in everything contrary to the doctrine and laws of the church. An endowment of real property and an income was to be as-sured to the sees already existing, as well as to those to be newly created, also to seminaries, parishes and chapters. The opinion of the chambers, strongly expressed before the discussion, caused the withdrawal of the proposed law, and the holy see was forced to renounce the carrying out of the new concordat. The law of July 4, 1821, was used as a supplement, which authorized the king, in accord with the pope, to establish 30 new archbishoprics or bishoprics. The concordat of 1801 remained in force, and is yet the law by which France is governed.—*Concordat of 1801* A short preamble recalls the fact that the apostolic Roman Catholic religion is the religion of the state and the religion of the great majority of Frenchmen, and that the consuls have

made a "special profession" of it. It is further stated, in article 1, that it shall be "freely practiced" in France, and its celebration shall be public, in accordance with the police regulations which the government shall judge necessary for public tranquillity. Articles 2, 3, 4 and 9 relate to the new boundaries of dioceses and parishes, to the dismissal of old incumbents, and the appointment of new bishops whom the first consul shall nominate, and whom his holiness may confirm according to the rules established in relation to France before the change of government.—By article 5 the nomination to bishoprics which shall become vacant hereafter shall be made by the first consul, and the canonical confirmation shall be given by the holy see, in conformity with the preceding article. Articles 6 and 7 relate to the oath of obedience and fidelity to the established government to be given by the bishops, and clergy of the second order; article 8, to the form of prayer to be recited for the government, at the end of the religious offices. According to article 10 "The bishops shall appoint the priests to parishes. Their choice must fall upon persons accepted by the government." By article 11 the bishops may have a chapter in their cathedrals, and a seminary for their diocese; but the government shall not be obliged to endow them. Article 12 treats of the restitution of churches not alienated; and 13, of purchasers of national property, whom his holiness and his successors will not in any way disturb. By article 14 the government promises to assure a decent maintenance to the bishops and priests; and by article 15, that Catholics may make donations in favor of the churches. In article 16 his holiness recognizes in the first consul of the French republic the same rights and prerogatives which the previous government enjoyed. In case one of the successors of the first consul should not be a Catholic, the rights and prerogatives mentioned in the above article, and the nomination to bishoprics, shall be regulated, as regards said successor, by a new convention.—This act gave rise to two grievances. It was said that the pope had exceeded the limits of his power by instituting new incumbents when the old ones had not thought it their duty to submit, and in promising, for himself and his successors, not to seek the restoration of church property. This opinion, held by a small number of ecclesiastics, and even by laymen, as devoted as they were obstinate, gave birth to a sect known under the name of *petite Eglise*, which did not wish to recognize the concordat. On the other hand, it was set forth that an excessive latitude in canonical confirmation in the case of bishops had been left the holy see, and that, in the right of refusal, it should have been limited to a fixed period. This is the modification which Napoleon wished to have sanctioned by the council of 1811, and which we have seen introduced in the convention of 1813. De Pradt, yielding doubtless to personal resentment, long sustained this thesis. M. Thiers answered him in these terms: "To fix

a delay of some months, after which the papal confirmation should be considered as made, would be to deprive the pope of his spiritual authority, and raise nothing less than the memorable question of investitures." Admitting that the religious authority of the holy see might at times systematically refuse institution, in order thus to obtain concessions from the government, this could only be a transient abuse, and less dangerous than if the choice of bishops were left absolutely to the civil power.—The organic articles raised more serious disputes, which are not yet terminated. They have been the object of protests from the holy see, and French Catholics have combated them on many occasions. As the greatest of these, we must cite the eloquent discourse delivered by M. de Montalembert before the chamber of peers, April 16, 1844, and a charge of Mgr. de Bonald, archbishop of Lyons, Nov. 21, 1844, which was suppressed afterward by royal command, in consequence of being challenged as an abuse of power. The anonymous author of a remarkable pamphlet, entitled "Religious Liberty and Present Legislation," has criticised it severely from a liberal point of view. The organic articles found also zealous defenders, among whom Dupin showed himself the most ardent. He makes them the foundation of public ecclesiastical law in France, and claims that the state would renounce itself could it ever renounce them. M. Thiers defended them also. He maintained that this law was, for the French government, an internal act altogether, which concerned it alone, and on this account should not be submitted to the holy see. It is enough that they contain nothing contrary to the concordat to deprive the court of Rome of a reasonable ground of complaint. It is true that subsequently these articles became one of the grievances of the court of Rome against Napoleon, but they were rather a pretext than a veritable grievance. They had, moreover, been communicated to cardinal Caprara, who did not appear shocked on reading them, if we are to judge by what he communicated to his court. He made certain reservations and counseled the holy father "not to be troubled by them, hoping the articles would not be executed rigorously." There is much to be said on this judgment. It seems certain that the legate, Caprara, had knowledge of the organic articles, but that, beset by difficulties and annoyances of every kind, he opposed them only feebly. At Rome, however, the matter was estimated differently. In an allocution addressed to the sacred college on Ascension day, 1803, and published immediately after, Pius VII., while announcing that the concordat had just been promulgated, declared, at the same time, that the "joy he felt at the restoration of religion in France, was embittered by the organic laws which had been drawn up without his knowing anything of them, and, most important of all, without his having approved them." At the same time representations were made to the French government to

modify the articles. A decree of Oct. 28, 1810, redressed some of the grievances of the church. Thus the prohibition to ordain an ecclesiastic under twenty-five years of age, or without property yielding at least an annual revenue of three hundred francs, was repealed, as well as the law providing that vicars general of vacant sees should occupy their places even after the death of the bishop, and until the appointment of their successors. As to the provisions which still remain, it is evident that many of them do not in any way violate the principles of the concordat, and that some of them provide for its execution; such are the articles relative to the boundaries of dioceses, and the salaries of the clergy; but this is not true of all. If we agree with M. Thiers, that the government alone had the right of itself to make every home regulation, not contrary to the concordat, Catholics and friends of religious liberty ask how one can reconcile article 1 of the concordat, "the apostolic Roman Catholic religion shall be practiced freely in France," with the organic articles, which require the bishops to obtain a government authorization if they wish to meet, at home, or with the rest of the church in council, and which forbade ordination in any case without the consent of the government—an arrangement which enables the state to force the church to self extinction, and which puts dogma itself in the hands of the state, because no bull, no letter, no rescript or decree, either of the pope or a general council, can be received or printed in France without the permission of the government, and because on certain points, it forced in the seminaries the teaching of the doctrine most acceptable to itself. The defenders of the law of Germinal answer, on the one hand, that this same article 1 accords to government the right of framing "such rules as it shall deem necessary to public tranquillity," and, on the other, that the provisions said to be oppressive are nothing more than "the ancient maxims, traditions and usages of the church of France."—They do not consider that the restriction of this article is not applied in the text, as in reason it can not be applied, except to the *publicity* of worship, and not to its *liberty*, which can not depend on police regulations. Therefore there is no ground of complaint against article 45, which prohibits religious ceremonies outside the church, in towns where there are temples, devoted to different kinds of worship. As to the traditions and maxims invoked, it can be shown that, if they are attributed to the church, they form part of an order of ideas and facts at present destroyed, and outside of which they have no reason to exist.—They are the veritable ruins of the ancient régime, without right of survival. However it be regarded, the law of Germinal, year X, embracing the concordat and the organic laws, is still in force in its entirety, in spite of the protestations of the church.—*Concordats with other countries than France.* We here confine ourselves to saying something of the principal

concordats concluded since the beginning of the century. There existed, before 1859, various concordats between the holy see and several states of the Italian peninsula, notably with the kingdom of Sardinia (at different times), with the kingdom of the Two Sicilies (Feb. 16, 1818), and the grand duchy of Tuscany (April 25, 1851). It is known how the unity of Italy was brought about, and what are the present relations of that kingdom with the holy see. In this violent and provisional state of affairs it is useless or impossible to give the facts of the different treaties, or the régime which has succeeded them, or that which the future reserves for the church in that country.—Spain was governed by a concordat passed March 16, 1851, according to which the Roman Catholic apostolic religion shall continue, to the exclusion of every other, to be the only religion of the Spanish nation, and is to be maintained, so far as his Catholic majesty has the power, "in all the rights and prerogatives which it should enjoy according to the law of God and canonical sanction." Education in all the colleges, universities, etc., must conform to the Catholic doctrine, and the bishops, "whose duty it is to watch over the education of youth in regard to morals and faith," shall meet no obstacle in the performance of that duty.—The bishops, and the clergy under them, shall enjoy the same rights in all else that regards their functions, especially in what concerns the sacred office of ordination. The government shall assure the respect due them, and lend its aid, "notably in preventing the publication, introduction or circulation of immoral and harmful books." That concordat changed the boundaries of dioceses, regulated the affairs of territories dependent on military orders, ecclesiastical jurisdiction, chapters, benefices. The right of presentation to certain of the latter was reserved to the pope; others were left to the queen. Religious orders of men or women, who to contemplation add some work of charity or public utility, as education, care of the sick, missions, etc., are retained or re-established. An income is guaranteed to the bishops, the priests, the churches, and the seminaries. The right of the church to own and acquire new property is recognized in its integrity. As to property of which it had been previously despoiled, whatever has not been alienated was to be restored; but whatever the state has taken may be sold, and the price invested in government bonds, for the benefit of the rightful owner. The holy see renounces its right to property already alienated. With regard to unforeseen points, the concordat refers to the canons and the discipline of the church. The execution of this concordat was suspended for a short time by the difficulties which sprang up between the holy see and the Spanish government in 1855; but this dispute was settled, and the concordat re-established. The revolution of 1868 intervened to suspend anew the execution of the Spanish concordat.—On Feb. 21, 1857, a concordat was signed

with Portugal, on the question of the right to presentation to sees in China and the Indies. This was ratified April 15, 1859, by the Portuguese chambers. In virtue of this right the crown of Portugal has the privilege of presentation to the sees of Goa, Malacca and Macao—Catholic, and even Protestant, Germany has a large number of these treaties. The Bavarian concordat is dated June 5, 1817; that of Prussia, July 16, 1821, those of the ancient ecclesiastical provinces of the Rhine, Aug. 16, 1821, April 7, 1827; that of Hanover, March 26, 1824.—A concordat dated Aug. 18, 1855, had put an end to the difficulties which the policy of *Josephism* had caused between Austria and Rome. This document, and the complementary articles added to it, are too lengthy to find a place here. They may be found in the ecclesiastical annals which form a supplement to abbé Rohrbacher's "*Histoire de l'Eglise*," (Paris, 1861, Gaume). The right therein mentioned of the priest and people "to communicate freely with the holy see in spiritual and ecclesiastical affairs," may be referred to. The right of the church to hold property is recognized. The emperor has the presentation to bishoprics and benefices. On account of the modifications in Austria, in its form of government, it became a question to revise the concordat in agreement with the holy see; but, not being able to come to an agreement, the Austrian government freed itself, purely and simply, from the provisions of the concordat. The rules, however, regarding the nomination of ecclesiastics continued to be practiced. Wurtemberg concluded a concordat June 22, 1857, and the grand duchy of Baden, June 23, 1859; but this last, rejected by the Baden legislature, never came into force.—The government of the Netherlands concluded a concordat June 18, 1827. It was not put into execution. Then followed the revolution which separated Belgium from Holland. In 1841 king William II resumed negotiations with Gregory XVI., but the state of men's minds caused them to be postponed.—At length, in 1853, a papal bull established, with the acquiescence of the government, the Catholic hierarchy in Holland, although the tendency of Dutch legislation is to separate the state and church as much as possible.—It is known what persecution the Roman Catholic church has suffered in Poland since the conquest of that unfortunate country. Pope Gregory XVI. published, July 22, 1842, a statement detailing his efforts "to remedy the ills of the Catholic religion in Poland and Russia," a document which made a sensation in Europe. Some years later Russia signed a concordat which relieved some of the grievances of the holy see (Aug. 3, 1847). The other points were to be settled by a subsequent convention, but this treaty, once signed, was laid aside, and, during the life of the emperor Nicholas, was not even published. It was made public only in 1856, and then but partially. An account of this publication and the manner in which the concordat was carried out may be found in the work of the priest Louis

Lescoeur, *L'Eglise catholique en Pologne*. Swedish legislation has, up to the present, been too much opposed to liberty of conscience for the Catholic church to have its existence in that country guaranteed by a regular treaty. There is no concordat in England, but, thanks to the freedom that there reigns, the Catholic church is now able to raise its head, so long bent under the weight of proscriptive laws.—The republic of Costa Rica concluded a concordat Oct. 7, 1852. The bishops have the right of supervising education, and the publication of books relating to the dogmas of faith, to the discipline of the church, and the public purity of morals. The bishops, as well as the clergy and the people, may communicate freely with the holy see. Compensation is assured the church in lieu of the tithes which were abolished by authorization of the holy see. The government has the right of presentation to the church of St. Joseph, and the greater part of the dignities of the chapter. The charges of parish churches are granted, according to the prescriptions of the council of Trent, through the agency of public examination or competition. All civil suits of the clergy are within the jurisdiction of lay judges, as well as criminal cases. But for the latter, the quality of the culprit involves certain special measures. Thus, the bishop must be informed at once of the arrest of an ecclesiastic. The right of the church to possess property is recognized. No obstacle to the establishment of religious houses shall be raised. The holy see renounces the recovery of ecclesiastical property which has been sold.—This convention was the first of the series of concordats concluded with the American republics of Guatemala (1853), Hayti (1860), Honduras (1861), Ecuador, Venezuela, Nicaragua and San Salvador (1862).—BIBLIOGRAPHY. GASTON DE BOURGE.

CONFEDERATE STATES, The (IN U. S. HISTORY), a government formed in 1861 by the seven states which first seceded. Belligerent rights were

accorded to it by the leading naval powers, but it was never recognized as a government, notwithstanding the persevering efforts of its agents near the principal courts. This result was mainly due to the diplomacy of the federal secretary of state, Wm. H. Seward, to the proclamations of emancipation in 1862-3, which secured the sympathy of the best elements of Great Britain and France for the federal government, and to the obstinate persistence of the federal government in avoiding, so far as possible, any recognition of the existence, even *de facto*, of a confederate government. The federal generals in the field, in their communications with confederate officers, did not hesitate, upon occasion, even to give "president" Davis his official title, but no such embarrassing precedent was ever admitted by the civil government of the United States. It at first endeavored, until checked by active preparations for retaliation, to treat the crews of confederate privateers as pirates; it avoided any official communication with the confederate government, even when compelled to exchange prisoners, confining its negotiations to the confederate commissioners of exchange; and, by its persistent policy in this general direction, it succeeded, without any formal declaration, in impressing upon foreign governments the belief that any recognition of the confederate states as a separate people would be actively resented by the government of the United States as an act of excessive unfriendliness. (See SECESSION, EMANCIPATION PROCLAMATION, ALABAMA CLAIMS.)—The federal courts have steadily held the same ground, that "the confederate states was an unlawful assemblage, without corporate power;" and that, though the separate states were still in existence and were indestructible, their state governments, while they chose to act as part of the confederate states, did not exist, even *de facto*.—Early in January, 1861, while only South Carolina had actually seceded, though other southern states had called conventions to consider the question, the senators of the seven states farthest south practically assumed control of the whole movement, and their energy and unswerving singleness of purpose, aided by the telegraph, secured a rapidity of execution to which no other very extensive conspiracy of history can afford a parallel. The ordinance of secession was a negative instrument, purporting to withdraw the state from the Union and to deny the authority of the federal government over the people of the state; the cardinal object of the senatorial group was to hurry the formation of a new national government, as an organized political reality which would rally the outright secessionists, claim the allegiance of the doubtful mass, and coerce those who still remained recalcitrant. At the head of the senatorial group, and of its executive committee, was Jefferson Davis, senator from Mississippi, and naturally the first official step toward the formation of a new government came from the Mississippi legislature, where a committee reported, Jan. 19, 1861, resolutions in favor of a

congress of delegates from the seceding states to provide for a southern confederacy, and to establish a provisional government therefor. The other seceding states at once accepted the proposal, through their state conventions, which also appointed the delegates on the ground that the people had intrusted the state conventions with unlimited powers. The new government, therefore, began its existence without any popular representation, and with only such popular ratification as popular acquiescence gave. (See DECLARATION OF INDEPENDENCE.)—The provisional congress met, Feb. 4, at Montgomery, Ala., with delegates from South Carolina, Georgia, Alabama, Louisiana, Florida and Mississippi. The Texas delegates were not appointed until Feb. 14. Feb. 8, a provisional constitution was adopted, being the constitution of the United States, with some changes. Feb. 9, Jefferson Davis, of Mississippi, was unanimously chosen provisional president, and Alexander H. Stephens, of Georgia, provisional vice-president, each state having one vote, as in all other proceedings of this body. By acts of Feb. 9 and 12 the laws and revenue officers of the United States were continued in the confederate states until changed. Feb. 18, the president and vice-president were inaugurated. Feb. 20-26, executive departments and a confederate regular army were organized, and provision was made for borrowing money. March 11, the permanent constitution was adopted by congress. It generally follows the constitution of the United States (see CONSTITUTION), substituting "confederate states" for "United States," "confederacy" for "Union," and (in Art. VI.) "provisional government" for "confederation." The other changes are as follows. (*Preamble*): "We, the people of the confederate states, each state acting in its sovereign and independent character, in order to form a permanent federal government, establish justice, insure domestic tranquillity, and secure the blessings of liberty to ourselves and our posterity—invoking the favor and guidance of Almighty God—do ordain and establish this constitution for the confederate states of America." (ART. I.): In § 1, "delegated" is substituted for "granted." In § 2, ¶ 1, the words "be citizens of the confederate states, and" are added after the words "the electors in each state shall." In § 2, ¶ 3, "fifty thousand" is substituted for "thirty thousand"; "slaves" is substituted for "other persons"; and the following change is made in the conclusion: "the state of South Carolina shall be entitled to choose six, the state of Georgia ten, the state of Alabama nine, the state of Florida two, the state of Mississippi seven, the state of Louisiana six, and the state of Texas six." In § 2, ¶ 5, there is added: "except that any judicial or other federal officer, resident and acting solely within the limits of any state, may be impeached by a vote of two-thirds of both branches of the legislature thereof." In § 4, ¶ 1, the words "subject to the provisions of this constitution" are added after the word "thereof"; and there is substituted "times and

places" for "place." In § 6, ¶ 1, the word "felony" is omitted. In § 6, ¶ 2, there is added: "But congress may, by law, grant to the principal officer in each of the executive departments a seat upon the floor of either house, with the privilege of discussing any measure appertaining to his department." In § 7, ¶ 2, there is added: "The president may approve any appropriation and disapprove any other appropriation in the same bill. In such case he shall, in signing the bill, designate the appropriations disapproved; and shall return a copy of such appropriations, with his objections, to the house in which the bill shall have originated; and the same proceedings shall then be had as in case of other bills disapproved by the president." In § 8, ¶ 1, there is inserted "for revenue necessary," before the words "to pay," and instead of the words "and general welfare of the United States; but" there is substituted the following: "and carry on the government of the confederate states; but no bounties shall be granted from the treasury, nor shall any duties or taxes on importations from foreign nations be laid to promote or foster any branch of industry." In § 8, ¶ 3, there is added: "but neither this, nor any other clause contained in the constitution, shall be construed to delegate the power to congress to appropriate money for any internal improvement intended to facilitate commerce; except for the purpose of furnishing lights, beacons, and buoys, and other aids to navigation upon the coasts, and the improvement of harbors, and the removing of obstructions in river navigation; in all which cases, such duties shall be laid on the navigation facilitated thereby, as may be necessary to pay the costs and expenses thereof." In § 8, ¶ 4, there is added: "but no law of congress shall discharge any debt contracted before the passage of the same." In § 8, ¶ 7, there is added: "but the expenses of the postoffice department, after the first day of March, in the year of our Lord eighteen hundred and sixty-three, shall be paid out of its own revenues." Instead of § 9, ¶ 1, there are substituted two paragraphs as follows: "1. The importation of negroes of the African race, from any foreign country, other than the slaveholding states and territories of the United States of America, is hereby forbidden, and congress is required to pass such laws as shall effectually prevent the same. 2. Congress shall also have power to prohibit the introduction of slaves from any state not a member of, or territory not belonging to this confederacy." ¶ 2 thus becomes ¶ 3, and ¶ 3 becomes ¶ 4, inserting in it "or law denying or impairing the right of property in negro slaves," after "*ex post facto* law." ¶ 4 becomes ¶ 5, and ¶ 5 becomes ¶ 6, adding thereto "except by a vote of two-thirds of both houses." ¶ 6 becomes ¶ 7, omitting the last sentence "nor shall vessels, etc." ¶ 7 becomes ¶ 8, and ¶ 8 becomes ¶ 11, two new paragraphs being inserted, as follows: "9. Congress shall appropriate no money from the treasury except by a vote of

two-thirds of both houses, taken by yeas and nays, unless it be asked and estimated for by some one of the heads of departments, and submitted to congress by the president; or for the purpose of paying its own expenses and contingencies; or for the payment of claims against the confederate states, the justice of which shall have been judicially declared by a tribunal for the investigation of claims against the government, which it is hereby made the duty of congress to establish. 10. All bills appropriating money shall specify in federal currency the exact amount of each appropriation and the purposes for which it is made; and congress shall grant no extra compensation to any public contractor, officer, agent, or servant, after such contract shall have been made or such service rendered." Amendments I.-VIII. of the constitution are inserted as ¶¶ 12-19, and a new paragraph added, as follows: "20. Every law, or resolution having the force of law, shall relate to but one subject, and that shall be expressed in the title." In § 10, ¶ 1, the words "emit bills of credit," are omitted. In § 10, ¶ 3, there is inserted, after the word "tonnage": "except on sea-going vessels, for the improvement of its rivers and harbors navigated by the said vessels; but such duties shall not conflict with any treaties of the confederate states with foreign nations; and any surplus of revenue, thus derived, shall, after making such improvement, be paid into the common treasury"; and there is added, at the end of the paragraph, "But when any river divides or flows through two or more states, they may enter into compacts with each other to improve the navigation thereof." (ART. II.): In § 1, ¶ 1, instead of the second sentence, there is inserted: "He and the vice-president shall hold their offices for the term of six years; but the president shall not be re-eligible. The president and vice-president shall be elected as follows." Instead of ¶ 3 of § 1 are inserted, as ¶¶ 3, 4 and 5, the three paragraphs of amendment XII. of the constitution. ¶¶ 4-8 thus become ¶¶ 6-10, inserting in the new ¶ 7, at the beginning: "No person except a natural born citizen of the confederate states, or a citizen thereof at the time of the adoption of this constitution, or a citizen thereof born in the United States prior to the 20th December, 1860, shall be eligible," etc., and adding at the end: "as they may exist at the time of his election." Before ¶ 3 of § 2 is inserted a new paragraph, as follows: "3. The principal officer in each of the executive departments, and all persons connected with the diplomatic service, may be removed from office at the pleasure of the president. All other civil officers of the executive department may be removed at any time by the president, or other appointing power, when their services are unnecessary, or for dishonesty, incapacity, inefficiency, misconduct, or neglect of duty; and when so removed, the removal shall be reported to the senate, together with the reasons therefor." ¶ 3 thus becomes ¶ 4, adding to it: "But no per-

son rejected by the senate shall be re-appointed to the same office during their ensuing recess" (ART. III.): In § 1, ¶ 1, "supreme" is changed to "superior." The latter part of ¶ 1 of § 2 is changed to read as follows: "between a state and citizens of another state, where the state is plaintiff; between citizens claiming lands under grants of different states, and between a state or the citizens thereof, and foreign states, citizens, or subjects; but no state shall be sued by a citizen or subject of any foreign state." (ART. IV.): In § 2, ¶ 1, there is added: "and shall have the right of transit and sojourn in any state of this confederacy, with their slaves and other property; and the right of property in said slaves shall not be thereby impaired." In § 2, ¶ 2, there is inserted: "against the laws of such state," after "other crime." § 2, ¶ 3, is altered to read: "No slave or other person held to service or labor in any state or territory of the confederate states, under the laws thereof, escaping or unlawfully carried into another;" and the words "to whom such slave belongs; or" are inserted after "on claim of the party." In § 3, ¶ 1, instead of the first eleven words there is substituted: "Other states may be admitted into this confederacy by a vote of two-thirds of the whole house of representatives and two thirds of the senate, the senate voting by states." In § 3, ¶ 2, the last twenty-three words are omitted, and there is substituted: "concerning the property of the confederate states, including the lands thereof." A new paragraph is added, as follows: "3. The confederate states may acquire new territory; and congress shall have power to legislate and provide governments for the inhabitants of all territory belonging to the confederate states, lying without the limits of the several states, and may permit them, at such times and in such manner as it may by law provide, to form states to be admitted into the confederacy. In all such territory the institution of negro slavery, as it now exists in the confederate states, shall be recognized and protected by congress and by the territorial government; and the inhabitants of the several confederate states and territories shall have the right to take to such territory any slaves lawfully held by them in any of the states or territories of the confederate states." § 4 is altered to read: "to every state that now is or hereafter may become a member of this confederacy." ART. V. is altered to read as follows: "Upon the demand of any three states, legally assembled in their several conventions, the congress shall summon a convention of all the states, to take into consideration such amendments to this constitution as the said states shall concur in suggesting at the time when the said demand is made; and should any of the proposed amendments to the constitution be agreed on by the said convention—voting by states—and the same be ratified by the legislatures of two-thirds of the several states, or by conventions in two-thirds thereof—as the one or the other mode of ratification may be proposed by the general convention—they shall

thenceforward form a part of this constitution. But no state shall, without its consent, be deprived of its equal representation in the senate." (ART. VI.): For § 1, ¶ 1, a new paragraph is substituted, as follows: "1. The government established by this constitution is the successor of the provisional government of the confederate states of America, and all the laws passed by the latter shall continue in force until the same shall be repealed or modified; and all the officers appointed by the same shall remain in office until their successors are appointed and qualified, or the offices abolished." ¶¶ 1-3 thus become ¶¶ 2-4, and amendments IX. and X. of the constitution are added as ¶¶ 5 and 6. (ART. VII.): In this article "five states" is substituted for "nine states," and the following is added: "When five states shall have ratified this constitution in the manner before specified, the congress, under the provisional constitution, shall prescribe the time for holding the election of president and vice-president, and for the meeting of the electoral college, and for counting the votes and inaugurating the president. They shall also prescribe the time for holding the first election of members of congress under this constitution, and the time for assembling the same. Until the assembling of such congress, the congress under the provisional constitution shall continue to exercise the legislative powers granted them; not extending beyond the time limited by the constitution of the provisional government."—This constitution was ratified in all the states by the still existing state conventions, not by popular action. An examination of the changes which it introduced will divide them into two general classes, executive, and political. Of the executive changes, intended to amend the administration of government, there are a number fairly open to discussion, some which have since been proposed for adoption by the United States, and some which have been already adopted by several state governments. The political changes were evidently not merely declarative, intended to guard against false constructions of the constitution of 1787, but were actively remedial, intended to revive the state sovereignty of the confederation by withdrawing complete control over commerce and internal improvements from the central government, and, further, to rest the foundations of the new government (to quote vice-president A. H. Stephens), not upon Jefferson's "fundamentally wrong" "assumption of the equality of races," but upon "the great truth that the negro is not equal to the white man; that slavery, subordination to the superior race, is his natural and normal condition." The confederate constitution is, therefore, itself a public confession that southern democratic politicians were consciously in error from 1840 until 1860 in claiming the constitution as the palladium of slavery; that, under the constitution's fair construction, slavery was in truth protected by the states, not by the nation; and that "We, the people," of 1787, must be changed by violence, and not by construction, into "We, the

states," of 1861.—The internal legislation of the provisional congress was, at first, mainly the adaptation of the civil service in the southern states to the uses of the new government. Wherever possible, judges, postmasters, and civil as well as military and naval officers, who had resigned from the service of the United States, were given an equal or higher rank in the confederate service. Postmasters were directed to make their final accounting to the United States, May 31, thereafter accounting to the confederate states. April 29, the provisional congress, which had adjourned March 16, re-assembled at Montgomery, having been convoked by president Davis in consequence of president Lincoln's preparations to enforce federal authority in the south. Davis' message announced that all the seceding states had ratified the permanent constitution; that Virginia, which had not yet seceded, had entered into alliance with the confederacy, and that other states were expected to follow the same plan. He concluded by declaring that "all we ask is to be let alone." May 6, an act was passed recognizing the existence of war with the United States. Congress adjourned May 22, re-convened at Richmond, Va., July 20, and adjourned Aug. 22 until Nov. 18. Its legislation had been mainly military and financial. Virginia, North Carolina, Tennessee and Arkansas had passed ordinances of secession, and been admitted to the confederacy. (See the states named, and SECESSION.) Although Missouri and Kentucky had not seceded, delegates from these states were admitted in December, 1861.—Nov. 6, 1861, at an election under the permanent constitution, Davis and Stephens were again chosen to their respective offices by unanimous electoral vote. Feb. 18, 1862, the provisional congress (of one house) gave way to the permanent congress, and Davis and Stephens were inaugurated Feb. 22. The cabinet, with the successive secretaries of each department, was as follows, including both the provisional and permanent cabinets: *State Department*—Robert Toombs, Ga., Feb. 21, 1861; R. M. T. Hunter, Va., July 30, 1861; Judah P. Benjamin, La., Feb. 7, 1862. *Treasury Department*—Charles G. Memminger, S. C., Feb. 21, 1861, and March 22, 1862; James L. Trenholm, S. C., June 13, 1864. *War Department*—L. Pope Walker, Miss., Feb. 21, 1861; Judah P. Benjamin, La., Nov. 10, 1861; James A. Seddon, Va., March 22, 1862; John C. Breckinridge, Ky., Feb. 15, 1865. *Navy Department*—Stephen R. Mallory, Fla., March 4, 1861, and March 22, 1862. *Attorney General*—Judah P. Benjamin, La., Feb. 21, 1861; Thomas H. Watts, Ala., Sept. 10, 1861, and March 22, 1862; George Davis, N. C., Nov. 10, 1863. *Postmaster General*—Henry J. Ellet, Miss., Feb. 21, 1861; John H. Reagan, Texas, March 6, 1861, and March 22, 1862.—As has already been said, the provisional congress held four sessions, as follows: 1, Feb. 4–March 16, 1861; 2, April 29–May 22, 1861; 3, July 20–Aug. 22, 1861; and 4, Nov. 18, 1861–Feb. 17, 1862. Under

the permanent constitution there were two congresses. The first congress held four sessions, as follows: 1, Feb. 18 - April 21, 1862; 2, Aug. 12 - Oct. 13, 1862; 3, Jan. 12 - May 8, 1863; and 4, Dec. 7, 1863 - Feb. 18, 1864. The second congress held two sessions, as follows: 1, May 2 - June 15, 1864, and 2, from Nov. 7, 1864, until the hasty and final adjournment, March 18, 1865. In the first congress members chosen by rump state conventions, or by regiments in the confederate service, sat for districts in Missouri and Kentucky, though these states had never seceded. There were thus thirteen states in all represented at the close of the first congress; but, as the area of the confederacy narrowed before the advance of the federal armies, the vacancies in the second congress became significantly more numerous. At its best estate the confederate senate numbered 26, and the house 106, as follows: Alabama, 9; Arkansas, 4; Florida, 2; Georgia, 10; Kentucky, 12; Louisiana, 6; Mississippi, 7; Missouri, 7; North Carolina, 10; South Carolina, 6; Tennessee, 11; Texas, 6; Virginia, 16. In both congresses Thomas S. Bocock, of Virginia, was speaker of the house.—The only noteworthy feature of the political history of the confederate states was the insignificance of the legislative. The original revolutionary, or provisional, government was not the result of popular initiative, but was directly due to the energy of a senatorial clique, actively assisted by a few leading men in each state. The demoralizing influences of a great civil war, which even the solidest and most firmly based form of popular government can only imperfectly resist, were almost instantly fatal to the inchoate political character of the confederacy. The strongest and most self-assertive spirit of the senatorial clique, having been chosen president, at once began to quarrel with his associates, and to drive them from his counsels; there was no popular strength in the provisional congress to resist him; and even before the inauguration of the permanent government, the confederacy had become a military despotism of the executive. The sittings of congress were almost continuously secret, and its acts, generally prepared in advance by the executive, the cabinet having seats in congress, were made conformable to his known wishes, or were interpreted by him to suit his own pleasure. As the war became more desperate, and the most capable leaders went into the army, the *morale* of congress further decayed, and this process was increased by the presence of a cohort of members from states which had never seceded, or had since been conquered, who represented no constituencies and were to a great degree dependent on the executive for their political future. The business of congress thus grew to be mainly the registering of laws prepared by the executive, the passing of resolutions to continue the war to the end, the debate of resolutions to retaliate or to fight under the black flag, and the preparation of addresses to their constituents, whose earnestness of tone may

be estimated from the following sentence in one of them: "Failure will compel us to drink the cup of humiliation even to the bitter dregs of having the history of our struggle written by New England historians."—Outside of the ordinary powers conferred by the legislative, the war powers openly or practically exercised by the executive were more sweeping and general than those assumed by president Lincoln. The confederate treasury was held subject to executive drafts to any extent, and without audit or account, the state governments were expected to act, and state judges to decide, in conformity with the president's wishes in small or great matters, under penalty of presidential displeasure and punishment; not only individuals, but whole communities (as in East Tennessee), were held liable to summary military execution by the mere warrant of the executive; and his dictatorial meddlesomeness in the management of the army was so notorious and so uniformly unfortunate that Foote, of Tennessee, did not hesitate to declare, in the house, in December, 1863, that "the president never visited the army without doing it injury—never yet, that it has not been followed by disaster." The interferences of the committees on the conduct of the war in the federal congress often seemed unwarrantable or unfortunate; but they justly represented the feeling of a people bent not only upon fighting but on keeping to themselves the control of the fighting, a feeling of which there is not a trace in the brief legislative history of the confederate states. The rout of Bull Run, and the expected advance of the triumphant enemy upon Washington, only extorted from the federal congress the resolve to vote every dollar and every man which the president might find necessary in suppressing the rebellion; a similar state of affairs in Richmond, early in 1865, drew from the confederate congress an angry vote that Davis' incompetency was the cause of the disasters, and a substitution of Lee as commander-in-chief with unlimited powers. This final and spiteful exposure of its own nullity was the only known instance of entirely independent action or initiative in important matters by the permanent congress during its three years of existence. The government was merely a military despotism, very thinly clothed in the forms of law, in which parties and party politics could have no existence. ALEXANDER JOHNSTON.

CONFEDERATION. If this word be taken in its broadest sense, every association of peoples or of states formed in virtue of a treaty (*cum fœdere*) is a *confederation*. As among private persons, the nature, the object, the form and the duration of associations agreed upon are susceptible of being varied to infinity, so among nations; there is no form which international engagements resulting from treaties may not take. Alliances, leagues, coalitions, and political, religious, commercial or customs unions, are simply various kinds of confederations. Some of these are permanent, others temporary; some include many peoples at the same time, others comprise but a small number of states; there are even some limited to a single people, as when the confederation concerns the internal relations of the different provinces which together form one state, as regards foreign powers.—Before examining these distinctions we shall say a few words on the general principle which governs them. The mutual independence of nations is without doubt the fundamental basis of international law, but it would be a great mistake to suppose that this independence could have the effect of placing one nation or another in a sort of absolute isolation. Nations, as well as individuals, are made to live in society, and, so to speak, in the family. If they come in contact by their boundaries, they are still more closely drawn together by a thousand interests, by a thousand common wants, which put them, however independent they may be, in a kind of necessary and natural dependence upon each other. A theory of nationality which would suppress these mutual relations, would be not less contrary to nature than a theory of individual liberty which would suppress family or civic ties. Far from destroying, civilization increases and develops international bonds, but at the same time it regulates and harmonizes them; it evolves out of them that beautiful order which produces at home the harmony of liberty and authority, and abroad, union of force with pacific and moderate tendencies. From this point of view, the different modes of confederation concern at once public law and the law of nations. It is for the former to say how many states have gradually arisen from the successive aggregations of confederate provinces to show what were the advantages of these associations of many directing toward a single point elements of various kinds, without coming to a

social revolution obliterating differences by a temporary or permanent fusion. If there is, in the unity of government in a vast empire, a force of more dominating influence in peace, and a vigor of enterprise more irresistible in war, the federal form is perhaps better adapted to preserve without display, liberty at home and peace abroad.—Among the various forms of confederation the Germans draw a sharp distinction between a federal state (*bundesstaat*) and a confederation of states (*staatenbund*). The former constitutes, like the United States or Switzerland, an absolute unity in relation to foreign states; the second preserves to its members, as did the Germanic confederation, a certain amount of independence and the essential attributes of sovereignty. But these are not the only forms which history has recorded—*History*. If we limit ourselves to the examples of antiquity, it would appear that this form was especially adapted to the government of small peoples, among whom the individual power of confederate cities was not capable of the sustained effort of violent struggles, and sought rather an equilibrium through a balance of social powers. The history of ancient Greece offers, in brief, examples of most of the combinations possible in *federal government*. A delegation of all or a part of political power to assemblies whose members represent each fraction of the confederate state, is of the essence of this form of government; and by this very fact it was destined to lead to that other form of government called, in our modern times, *representative, constitutional or parliamentary*; but, in the representative governments of modern times, the different assemblies often represent, either distinct categories of national interests, or different strata of the same people. This is a more advanced and scientific form than that of those assemblies, those diets, those federal congresses, in which each member represented only a territorial fraction of the country.—We have said that it was in the nature of federal governments to be organized for resistance rather than for attack, for peace rather than for war, or at least more for defensive war than for war of conquest. The history of ancient as well as modern times teaches this. It was by heroic resistance to the aggressions of the Persian kings, that confederated Greece began to win a name in the world; but when these cities, whose union had been their strength, were arrayed against each other, they wasted in a hundred battles, without decisive result and almost without glory, their genius, their blood and their treasure. Macedonia became conqueror, in turn, only after having subjected Greece itself to the sceptre of Philip, and then of Alexander. It was by confederating to shake off this domestic yoke that what was left of ancient Greece, under the name of the Achaean league, found some little energy afterward to resist the Romans, and not to succumb without glory. This leads us to define more closely the difference between confederations which belong

to public law and those which belong to the laws of nations. There is no policy in the world which invoked treaty rights oftener, and made more frequent mention of confederations and alliances, than the Roman policy, even in the very midst of its wars of invasion and conquest. Can we, nevertheless, say that this policy, even in a nominal sense, ever admitted the principle of reciprocal independence and equality, on which the confederations recognized by international law are founded? Doubtless not; for, instead of this equality, they laid down as a principle the supreme authority of the Roman senate, to finally decide on the fate of kings and peoples. The different kinds of confederations or of alliances which it distinguished with scientific minuteness and subtlety, were merely the successive stages through which foreign nations had to pass in order to reach gradual absorption into the great Roman nationality. The alliance proposed to them under pompous names was merely an invitation to slavery.—We must go back to ancient times, to the establishment of the Amphictyonic council, to discover the earliest origin of those diets to which the sovereign states sent their representative deputies to come to an understanding as to certain common interests, such, for example, as respect to be shown sacred things, and the settlement of quarrels between different tribes. From the point of view of international law, as well as that of moral philosophy, we certainly find in Greece more facts which seem to approach the civilization of modern times than in any other country. But to the Christian era belongs the honor of having developed, and, so to speak, fixed, this great principle of the union of nations, under the influence of mutual sympathy, acquired above all from a community of morals and religious beliefs, and capable of producing a political equilibrium between states. The advent of this new law is connected with the great religious movement of the crusades; and it is a remarkable fact that this first confederation of Christian peoples took place without preliminary agreement and without a treaty. The same feeling of faith, the common danger with which the encroachments of Islamism threatened Christianity, sufficed to unite so many different peoples under the banner of the cross, which was the banner of civilization and liberty. The crusades might resemble aggression, but they were in reality only resistance; for it was to prevent the invasion of Europe that they carried the war to the shores of Asia or Africa; and the recapture of the holy places was, in the eyes of Catholics, no more than a getting back of their legitimate territory. The councils, in which bishops representing the states of the whole Catholic world sat with an equal title, inaugurated the régime of collective deliberation which followed the reign of military force. This equilibrium and concert could, in the period we mention, be found only in religious society; for, in the political order, feudalism developed every-

where the opposite principle, that of antagonism and war.—The *feudal régime* constituted, it is true, a species of confederation, but one founded on a hierarchy of vassalage, that is to say, of subordination and dependence, and not on the principle of parity or equality of rank and power. And still, as at each degree of this hierarchy there existed a legitimate share of rights which, by its expansive force, tended to increase its authority and assure its independence; as there was, also, at the summit of every feudal system a suzerainty which tended to reduce, under its absolute authority, all its vassals, by decreasing or suppressing their respective rights—there resulted from these conflicts of rights certain transactions which, in time, created in Germany a political confederation, in which parts unequal in territory and in power co-operated in a federal diet for the direction of certain affairs of common interest.—The *Helvetic confederation* is one which, on a territory as narrow as that of the ancient republics of Greece, seems to reproduce best a certain image of them, by the glorious conquest of its independence; by the hereditary bravery of its troops; by its political attitude, ordinarily calm and dignified, though sometimes agitated by the ardor of democratic passions; finally, by that delegation of a part of the central authority to a diet, long since removed from Lucerne to Berne and Zurich, as the Amphictyonic council was transferred from the temple of Delphi to the little village of Anthela. (See SWITZERLAND.)—Like Switzerland, the *United Provinces of the Netherlands* have shown the power of a system of confederated states, either in establishing its own independence, or in defending it against concerted and violent attacks. Each province in the Netherlands was seen to constitute a state, with its own administration and government. although, in their relations with foreign nations, the states general of the United Provinces were considered as a single power, enjoying sovereign honors; and this separation of individual states, united only by the bonds of political confederation, continued even when the union had given itself a hereditary chief under the name of stadtholder.—The *Hanseatic league* resembled a commercial association rather than a political confederation, and still it has played a part in history to be compared with that of a power of the first order. In this regard this power had some resemblance to that great *English East India Company*, which we have seen even in our days, organized as a state, accomplishing great deeds in peace and war, and conquering for England one of the vastest empires of the world. But the East India company was only a national institution holding its privileges from the crown of England, under the form of a government, which, having created this powerful organization, finally absorbed it in the state itself. The Hanseatic league, on the contrary, at a time when the governments of Europe were not sufficiently well organized for the defense of private interests,

presented a strange assemblage of cities, only a few of which belonged to themselves, and the greater number of which formed portions of various states. These cities, united by an agreement based on a similarity of interests, had derived their rights, real or alleged, not from their own governments, but from their own initiative. These rights, which in the beginning had been only those of mutual assurance, or petition to obtain from foreign governments guarantees of protection or privileges of commerce, were extended so far as to make war on states which refused to submit to their commercial exactions; but the ties which united the heterogeneous parts of so complex a whole, were loosened under the pressure of interests contrary to those which had created them; and this great artificial body dissolved of itself, according as the governments with which the various groups of Hanseatic towns were connected acquired more force, and obliged them to return, as subjects, to the duties of dependents. Three self-governing cities (Hamburg, Bremen, Lubeck) alone preserved the name of this great federal league, without retaining any of its power.—Although at the same period the maritime cities of Italy appeared to present the spectacle of diminutive states divided from each other by rivalries and hatreds, there was, nevertheless, a common tendency which caused the greater number of these cities to understand the necessity of uniting against the ambitious enterprises of the emperors. The sentiment of national independence gave birth then to the party of the Guelphs, “who,” says Ancillon, “beheld with pleasure the spiritual power of the pope checking the progress of the temporal power of the emperor.”—We have seen that in antiquity the federal form seemed better adapted to small republics than to great states; but, in modern times, the history of America furnishes a proof of the vast proportions which a federal government may take, especially if it is formed of successive additions of new colonies, which, in proportion as they are born to political life, have only to attach themselves to a ready-made government, whose framework seems fitted to receive them, with their most marked inequalities. The same example is sufficient to make us appreciate the distance which separates a federal but unitary state from a confederation of distinct states. This distance may appear small in terminology, since the same word, that of state, designates the collective or central state and the particular states of which the body politic is composed; but, no matter how much that portion of the powers retained in common is weakened by the subtraction of that part reserved to each of the states united under a federal government, the very violence of the civil war of which America was the theatre during four years shows what power the federal bonds possess, since they supported, without breaking, the tension of a struggle the greatest and most envenomed ever seen in the new world, and because, in issuing

from this terrible crisis, resources which had served to maintain so many armies could be employed for the active reparation, during peace, of the ruins and disasters of the war.—Former Spanish America, like English America, has had its examples of confederate states, either to shake off the yoke of the mother country, or to work at organizing themselves into regular governments under various republican forms, recognizing the common authority of a congress, a president, or a dictator. The most celebrated were the confederation of *Central America* and that of the *United Provinces of Rio de la Plata*. But these aggregations of provinces, already many times modified in their composition and their elements, have more resemblance to a transitory than a definite form of government. We can not find in them either the cohesion, the force, or the permanency, of the United States of North America.—*General Considerations.* Above these special confederations, destined to uphold in the bosom of a composite state, what George de Martens calls individual equilibrium (*équilibre particulier*), should there not be, among civilized nations of the modern world, other confederate ties contributing to maintain the general equilibrium of peoples? It is in Christian Europe that, for the first time since the establishment of human society, we find realized on a large scale a system of states connected together, not by bonds of dependence or of subordination, but by their independence itself, their sympathies, tendencies and common interests, and, above all, by a conformity of religious beliefs and moral doctrines borrowed from the same divine source, the gospel. This union has been called the European system, political balance, etc. Ancillon would have liked to call it a system of counter-forces. The name of Christian confederation, which George de Martens gives it, would seem more appropriate; for evidently this system tends already to pass beyond the boundaries of Europe, since great Christian and independent states have been formed in the other hemisphere. Will there not be later only one equilibrium, only a single system? or will there be formed beyond the Atlantic an American equilibrium, as there has existed a European equilibrium since the sixteenth century? Without entering on the discussion of these questions of the future, let us say, that, in this great European system, based on an equality of rights, there is still, by the force of things, an inequality of position, of power and of influence. The title of *great power*, which at first was but the enunciation of a fact, has become almost a hierarchic degree at the summit of the Christian confederation. The admission of a new power into this sacred number, which for half a century seemed to constitute a sort of European pentarchy, has been spoken of and treated as a privilege. The secondary powers have doubtless, in principle, the same right to have their independence respected, but, in practice, this right has succumbed more than once before the ambition of great

states. The partition of Poland is one of the saddest examples of this. However it be, this system, resting on mutual independence, may be accidentally disturbed by war. Further, the greater part of European wars have as pretext or object the re-establishment of the system whenever the ambition of a single people threatens to destroy it in the interest of that people. The formation of leagues of attack or defense enters, then, as an indispensable element, into such a system, and the composition of these leagues should be modified according to the nature of the danger to be ward off.—If it is merely a question of resisting the ambitious projects of a power desiring disproportionate increase through conquest, the confederation of other powers menaced by these projects would assume, above all, the character of a political struggle. Thus, the first European league to which is referred the origin of a system of forces balanced by war in case of need, is that which was formed against France when Charles VIII. attempted the conquest of Italy (1495); as the object of the last coalition was to repress the encroachments of Russia on the Bosphorus (Anglo-French war, terminated by the treaty of 1856). In the interval, which comprises more than three centuries and a half, how often have the states of Europe entered into successive coalitions in groups variously composed, either to reduce the power of Venice (league of Cambrai, 1508), or to oppose the conquering enterprises of Louis XIV. (triple alliance of 1663; league of Augsburg, 1686), or to prevent Charles XII. from invading the European continent for the benefit of Sweden (great alliance of the north, 1697), or to combat the military preponderance of France under the first empire (European coalitions of 1806, 1807, 1809).—Again, to the political interests in restoring the material equilibrium of states, has been added the moral interest of maintaining or giving preponderance to the principle of justice or liberty. It was thus, in the name of religious liberty, that the league of Smalkalde (1530) was formed against Charles V., and that up to the nineteenth century those bloody struggles were renewed or continued, the political result of which was to weaken the power of the house of Austria, and to create a counterpoise to it in the rivalry of Protestant Prussia.—It was in the name of liberty of the seas that the neutral powers agreed at different times to resist the maritime preponderance of England (league of armed neutrality of 1780 and of 1800).—On the contrary, it was in the name of monarchic interests that the sovereigns of Europe made a coalition, in 1791, against the French revolution (coalition of Pilnitz); and, later, they adorned with the name of holy alliance (1815) that remodeling of Europe in which the victorious monarchs did not take sufficient account of the power of these principles which had excited so many wars and which must grow still stronger in times of peace. (See CONGRESS; ALLIANCE, THE HOLY).—By the side of the armed leagues

which, for the purpose of restoring the compromised equilibrium, often subjected it to new perils, there are others altogether pacific in their organization and in their object, these are commercial unions, or customs unions. The *Zollverein* is a remarkable instance of these in our day. It has shown what may be expected from the development of internal industry and commerce, in drawing neighboring states together, giving victory to uniformity of interests over rivalries of every kind, and, through certain lines of custom houses, suppressing many causes of conflict and war. Instead of banding together to increase their territory by means of conquest, we could wish that states might associate to develop, through the power of national industry, their internal resources! Everything is benefit and profit in these conquests of peace, while those of war exhaust the finances of the state as well as the blood of the people. (See ALLIANCE, THE HOLY.) E. CATCHY.

CONFEDERATION, Articles of, (IN U. S. HISTORY). Nov. 15, 1777, the continental congress adopted *Articles of Confederation and Perpetual Union* between the thirteen colonies which had united in the declaration of independence. These were as follows, the more important being given in full. ART. I. "The style of this confederacy shall be 'The United States of America.'" ART. II. "Each state retains its sovereignty, freedom and independence, and every power, jurisdiction and right, which is not by this confederation expressly delegated to the united states in congress assembled." ART. III. "The said states hereby severally enter into a firm league of friendship with each other, for their common defense, the security of their liberties, and their mutual and general welfare, binding themselves to assist each other, against all force offered to, or attacks made upon them, or any of them, on account of religion, sovereignty, trade, or any other pretense whatever." ART. IV. secured to the free inhabitants of each state the privileges and immunities of free citizens in the several states, and provided for the mutual extradition of fugitives from justice. ART. V. related to the organization of congress. It was to consist of one house, whose members were to be appointed annually by the state legislature, and were to be liable to recall by the legislature at any time. Each state was to have not less than two or more than seven delegates, paid by the states, but each state was to have but one vote. ART. VI. prohibited the states from alliances or treaties with any foreign state, or with any one of the United States without consent of congress; from granting titles of nobility; from laying imposts or duties which should interfere with treaties already proposed to France or Spain; from keeping vessels of war or soldiers, excepting militia; and from engaging in war unless declared by congress, or unless imminent danger should arise. ART. VII. allowed the states to name the army

officers except those of the rank of general. ART. VIII. directed congress to make requisitions upon the states for their respective quotas of the money necessary for national expenses, and ordered the state legislatures to levy the taxes necessary, "within the time agreed upon by the united states in congress assembled." ART. IX. gave congress the right to make peace and war, treaties and alliances, and prize rules, to grant letters of marque and reprisal, and to constitute admiralty courts; but no treaty was to restrain the state legislatures from laying prohibitory duties, or such duties as should be binding upon their own citizens. It made congress a court for the trial of territorial disputes between the states. It gave congress power to regulate the value of coin and the standard of weights and measures; to manage Indian affairs subject to the legislative rights of the states; to control the postal service, and direct land and naval forces and their operations; to borrow money; to make requisitions upon the states for their quotas of men and money; and to appoint a "committee of the states," consisting of one delegate from each state, and any other executive committees or officers as might seem necessary. But the more important powers, such as making war, peace, treaties, or requisitions, borrowing, coining or appropriating money, forming an army or navy, or appointing a commander-in-chief, were not to be exercised without the affirmative vote of nine states; nor should any other power, except that of adjournment from day to day, be exercised without the affirmative vote of seven states. ART. X. authorized the "committee of the states," nine of their number being present, to act for congress in its recess, except in the more important points above mentioned. ART. XI. authorized Canada to join the confederacy; but no other colony was to be admitted without the vote of nine states. ART. XII. "solemnly pledged" the public faith of the states for the payment of the money borrowed or appropriated by congress. ART. XIII. "Every state shall abide by the determinations of the united states in congress assembled, on all questions which by this confederation are submitted to them. And the articles of this confederation shall be inviolably observed by every state, and the union shall be perpetual; nor shall any alteration at any time hereafter be made in any of them; unless such alteration be agreed to in a congress of the united states, and be afterward confirmed by the legislatures of every state."—These articles were ratified, upon the order of the state legislatures, by their delegates in congress, who "solemnly plighted and engaged the faith of their respective constituents" that the articles should be obeyed both by the state governments and by their people, and went into operation March 2, 1781. (See CONGRESS, CONTINENTAL.)—The relative viciousness of the articles above given is difficult to determine. Perhaps the palm in this respect should be awarded to the theory of article II., exemplified in practice by article IX. By article

II. the new government was made in every sense a league, formed by state legislatures, ratified by state legislatures, and checked, controlled and dominated by state legislatures. Whence the legislatures derived their authority to form, *priori vigore*, any such general league can not be known, for the question was never mooted at the time. They had never enjoyed any such authority under the British constitution, for there (see STATE SOVEREIGNTY) the treaty power was a royal prerogative, and not in the legislature at all. But the root principle asserted and maintained in the revolution was "the right of the people to alter or abolish" their governments, and to assume the royal prerogatives. It was the part of the people, then, and not of the state legislatures, to establish the new government, and, had the people framed these articles, the act, however unwise, would have been perfectly legal. But the seizing of the royal prerogative, in the confusion of war, by the state legislatures, was evidently usurpation, extra-legislative, and to be palliated only on the assumption that popular acquiescence gave popular consent. (See CONGRESS, CONTINENTAL.) The whole system must therefore be considered, in our political history, as a period of interregnum, covering the time between the downfall of royal authority under the British constitution in 1776-80, and the final establishment of the popular will in its place in 1789 under the American constitution.—Of the practical application of the general theory to the other articles it is difficult to speak temperately. Congress had no power to prevent or punish offenses against its own laws, or even to perform efficiently the duties enjoined upon it. It alone could declare war, but it had no power to compel the enlistment, arming or support of an army. It alone could ascertain the needed amount of revenue, but the taxes to fill the requisitions could only be collected by the state legislatures at their own pleasure. It alone could borrow money, but it had no power to repay. It alone could decide territorial disputes between the states, but it had no power to compel either disputant to respect or obey its decisions. It alone could make treaties with foreign nations, but it had no power to prevent individual state legislatures or private citizens from violating them at pleasure. Even commerce, foreign and domestic, was to be regulated entirely by the state legislatures. The complete nullity of congress was further assured by the provision which required the vote of nine states to pass important measures, for, the absence of a state delegation being as effectual as a negative vote upon matters affecting the interests of a state, the state legislatures, in order to avoid the expense of maintaining delegates, might safely take refuge in neglect to choose members of congress. The only guarantee for the observance of the articles was the naked *promise* of the states, and this was almost immediately found to be utterly worthless. The two essential requisites were supplied by the con-

stitution, which, first, provided that the supreme law of the land, above and beyond state laws or constitutions, should flow from it, and, second, created a system of United States courts, extending throughout the Union and empowered to define the boundaries of federal authority and to enforce its decisions by federal power. (See JUDICIARY.) The United States thus lost its facitious character of a league, and took on that of a national government based on popular will. The period of gestation, beginning in 1776 with the theoretical assertion of popular will as the basis of government, ended 12 years afterward with the birth of the constitution.—The short and inglorious history of the confederacy, covering a period of less than eight years in all, is a dismal record of requisitions by congress for money, of neglect or refusal of payment by the states, of consequent default in the payment of the principal and interest of the federal debt, of treaties violated with impunity by state legislatures, private citizens, and foreign nations (see JAY'S TREATY), and of foreign aggressions on American commerce, intestine disorders in the states, and Indian depredations on the western frontier, against which the impotent congress could give no protection. The public debt amounted, Jan. 1, 1783, to \$42,000,375, the annual interest charge being \$2,415,956. Seven years afterward, by Hamilton's report, it had increased, through fresh loans, lapsed principal and unpaid interest, to \$54,124,463. In October and November, 1781, congress made requisitions for \$8,000,000; in January, 1783, \$500,000 had been collected. During the next four years, 1782–6, congress made requisitions for \$6,000,000 to pay the interest on the public debt, and received \$1,000,000. In 1787 the first installment of the principal of the foreign debt was to fall due, and as a preparation for this new demand the state legislatures of New Jersey and Rhode Island, in 1786, made their own paper currency legal tender for federal requisitions. Congress was justified in the declaration, in 1786, that any further reliance upon "requisitions" would be no less dishonorable to the understandings of those who entertained such confidence than dangerous to the welfare and peace of the Union.—The needful remedy, the grant of a permanent federal revenue, was very apparent. Feb. 3, 1781, before the final ratification of the articles, congress appealed to the states to give congress power to levy an *ad valorem* duty of 5 per cent. to pay the interest and principal of the debt. Rhode Island refused, and Virginia, at first consenting, afterward withdrew her consent. The second of Rhode Island's three objections, that the plan "proposed to introduce into that and the other states officers unknown and unaccountable to them, and so was against the constitution of the state," marks with singular clearness the utter lack at the time of even the conception of a real national government. March 15, 1783, after mentioning the "delay and repugnance" of the states in paying

the public debt, the French minister informed the federal superintendent of finance that "without a speedy establishment of solid general revenue, and an exact performance of the engagements which congress has made, you must renounce the expectation of loans in Europe." April 18, 1783, congress again appealed to the state legislatures, this time for a grant of power to congress to levy duties for only 25 years, through officers appointed by the states but accountable to congress; and also for the establishment by the states of special taxes for the payment of \$15,000,000 annually of the debt already due. The latter request proved so unpopular that it was very soon abandoned, and every effort was made to gain the necessary consent of *all* the states to the former. In 1786 New York, all the other states having consented, accepted the plan, but reserved the power of levying and collecting the duties, and appointing and removing the officers. Such an acceptance was of course a refusal, and New York's veto seemed for the moment to destroy all hope of the continuance of the Union. Congress, which was then in session in New York, twice appealed to the governor to re-convene the legislature, and the governor twice refused, on the ground that he had no right to do so except on "extraordinary occasions." It had become evident that some power stronger than the persuasions of congress was needed to wrest from the reluctant legislatures the control over the revenues and commerce of the country.—That the unpaid, half-fed and half-clothed continental soldiers should have disbanded at the close of the war without any attempt to obtain their dues after the manner of the Spanish regiments in the Netherlands, by forcible levy upon a portion of the country, is attributable rather to their own patriotism, and to the commanding influence of Washington and his lieutenants, than to the gratitude of the people or the fair dealing of the states. In 1778–9 provision had been made for half pay for the officers of the army; the soldiers had not even been paid since 1777, when their arrearages had been settled in continental money, the dollar being "worth about four pence." After the adoption of the articles in 1781, when the vote of nine states became necessary for appropriations, all prospect of liberality, or even of common honesty, toward the army disappeared. March 10, 1783, while the army was encamped at Newburgh, an anonymous address called a meeting of the officers, rehearsed their grievances, and advised, in case of further refusal of justice by congress, that "courting the auspices and inviting the direction of your illustrious leader, you should retire to some unsettled country, smile in your turn, and mock when their fear cometh on." Washington, by personal influence and entreaty, averted the danger, but his urgent representations induced congress, March 22, to make the army creditors of the United States to the amount of \$5,000,000. With this act of doubtful liberality the army was perforce

content, and was disbanded with no further token of gratitude from the states whose independence it had won. Most of the states disapproved of the prodigality of congress, and the Massachusetts legislature solemnly protested against it as tending to "raise and exalt some citizens in wealth and grandeur to the injury and oppression of others." (For the retention by Great Britain of military posts in the west, see JAY'S TREATY; for the loss of the navigation of the Mississippi, see ANNEXATIONS, I.)—In April, 1783, before the formal conclusion of peace, but after the actual close of the war, the British parliament intrusted the regulation of commerce between the United States and Great Britain to the king in council. The council's design was to disregard congress, treat the several states as independent republics, and conclude consular conventions with each on England's own terms. In July, by orders in council, all American commerce was excluded from the West Indies, and, in trading with Great Britain, American ships were to carry only the produce of their respective states. April 30, 1784, congress asked the state legislatures to grant to congress power for 15 years to prohibit the entrance into the United States of vessels belonging to a foreign nation not having a commercial treaty with the United States. This grant was also refused, except on conditions, by ten states, and entirely refused by three. Apparently the states preferred to be subject to Great Britain rather than be subject to their own creature, the "federal" congress.—SHAYS' REBELLION. The close of the war found the people of Massachusetts with no money and little property, manufactures, fisheries or commerce, and distressed not only by state taxes but by suits for long dormant debts. During the autumn of 1786 tumultuous gatherings of people in western Massachusetts, roused by "the extortions of the lawyers," surrounded the court houses and stopped the operations of the courts. Congress, under the subterfuge of levying 1,300 men in New England to take part in a mythical Indian war, made a feeble attempt in October to sustain the state government; but, before the levy was made, governor James Bowdoin had borrowed money in Boston and sent a militia force under general Lincoln against the insurgents, who were now mustered into an army of about 2,000 men under Daniel Shays, lately a captain in the continental army. In February, 1787, Lincoln succeeded in scattering Shays' force, and driving the leaders into New Hampshire. No extra-political event had so strong an influence in compelling the formation and adoption of the constitution as this rebellion, for it showed that the state legislatures severally could not enforce that public order the care of which they had refused to intrust to the central government. (See INSURRECTION, DOMESTIC.)—A full congress would have consisted of 91 delegates. In practice the presence of 30 was an unusual event, and these were not the first rate men of the country. With some exceptions the state

governments were most attractive to the able and ambitious. In June, 1783 (see CAPITAL, NATIONAL), Congress was driven from Philadelphia by a handful of dissatisfied and insubordinate militiamen. Dec. 23, 1783, by resolution congress informed the states that less than 20 delegates, representing seven states, had been present since Nov. 3, and that at least two more states must be represented to ratify the treaty of peace. The treaty was at last ratified Jan. 14, 1784, 23 delegates, representing nine states, being present. During the summer of 1787, while the convention which was to change the form of government was in session, (see CONVENTION OF 1787), congress passed the ordinance of 1787, which secured freedom to a large part of the country and furnished a model for the organization of future territories. July 14, 1788, congress announced the ratification of the constitution by nine states, and made arrangements for the day and place of its formal inauguration, at New York, March 4, 1789. After Jan. 1, 1789, congress was kept in formal existence by the presence of one or two delegates who adjourned from day to day. March 2, it flickered and went out without any public notice. During its existence as a continental and a confederate congress the American people had suffered distress great in comparison with the periods before 1775 or after 1789, but it had at least maintained the union of the states and prepared the way for a union more intimate than would have been practicable in 1776. The hand could not have been altogether nerveless which caught the sceptre as it dropped from the hands of the king, and transferred it in safety to a government of the people. (See UNITED STATES, REVOLUTION, DECLARATION OF INDEPENDENCE, CONTINENTAL CONGRESS, STATE SOVEREIGNTY, CONVENTION OF 1787.)—See 3, 4 *Public Journals*, and 1 *Secret Journals of Congress* (Confederacy), 10 Bancroft's *United States*; 3 Hildreth's *United States*; 2 Pitkin's *United States*; 2 Hamilton's *United States*; H. ALEXANDER JOHNSTON

CONFEDERATION, GERMANIC. (See GERMAN EMPIRE.)

CONFERENCE. It is difficult to give a complete definition of this term, since it is not always applied to the same thing. In general, conferences are understood to be diplomatic deliberations, either between members of a congress or between the ministers of several powers accredited to the same court. Conferences differ in their jurisdiction according as they have the power of deciding questions, or have merely a consulting voice. It is in the first case only that they can receive the name of congress. It would be difficult, however, to make a clear distinction between a congress and a conference; for a congress has been often made simply a succession of conferences, having no positive result, and conferences have frequently assumed the character of congresses. For example: if the congress of Münster had not resulted in the peace of 1648, it would have received merely the generic term of conference given to congresses which fail of their object. Historical examples justify the different meanings which we have noted. Among celebrated conferences is that of Moerdyk in 1709, and of Gertruydenberg in 1710, which preceded the treaties of Utrecht, and, later, those of Vienna in 1855, intended to prevent the Crimean war. In these meetings, held while war was raging, cabinets strove to establish a basis of future peace. But this kind of conference always succeeds with difficulty, for the resolutions of plenipotentiaries are necessarily influenced by news from the theatre of war. Nevertheless, it is necessary most frequently to commence thus in a more or less ostensible way, unless military success takes from events their doubtful character. The treaties of 1648, 1713, 1763, and others, were preceded by negotiations carried on during the course of hostilities. Negotiations are less complicated when the conference, having reference to a special question, takes place in time of peace. In our own century conferences of this nature have been most frequent, owing to the improvement in diplomatic relations, and, above all, to the custom of submitting to the arbitration of the great powers difficulties pending between states of second rank. When a case of this kind presents itself, and the chief cabinets of Europe believe their moral intervention to be necessary, or when their arbitration is requested by the parties interested, it is agreed that the ministers of the great powers accredited, near one of the great courts, shall unite to decide on some course of action. It depends upon special circumstances of the dispute whether the states interested shall be represented in the conference or not. The conference then takes the name of ministerial conference. It is by such conferences that the affairs of Greece have been settled, those of Belgium and Holland, those of the east on many occasions, those of the ancient principality of Neuchâtel, and those of the Danish succession. The term *ministerial conference*

is also applied to reunions composed of representatives of states of the second and third rank, having in view only the special interests of these states. It was by ministerial conferences, composed of representatives from the states of the Germanic confederation, which ended in the final act of May 15, 1820, that the internal organization of Germany was completed. Many other reunions, having a particular object in view, have taken place between the delegates of confederate states, similar to those of Germany, or between states foreign to each other. These conferences concern themselves either with political reforms, economical improvements or commercial interests. The more the life of modern nations develops, in the sense of a solidarity of interests, the more frequent and diversified do these conferences become. It would be too tedious to attempt their enumeration here.—The term *conference* is so elastic that it has been given even to the reunions of ministers of the same power. It is sufficient to cite the famous conference of Ostend, in which the ministers of the United States accredited to the courts of London, Paris and Madrid, met to define more clearly the meaning of the Monroe doctrine. But one may doubt the propriety of employing the term conference in this connection. If the term conference is to be applied to all kinds of diplomatic deliberations, it is only on condition that the ministers composing such conference shall belong to different states. (See CONGRESS, PROTOCOL.)

JULES GRENIER.

CONFERENCE, CONVENTION, or CONGRESS, Peace (IN U. S. HISTORY), met at Washington, Feb. 4, 1861, and finally adjourned Feb. 27. Ordinances of secession had been passed by several gulf states, and active efforts were making to force the border states into similar action, when Virginia, by resolutions adopted Jan. 19, 1861, invited all the states of the Union to appoint delegates who should meet at Washington and endeavor to arrange some equitable adjustment of the national difficulties. At the first meeting delegates were present from New Hampshire, Vermont, Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, Kentucky, Ohio, Indiana and Iowa, 14 states. During the conference delegates arrived from Maine, Massachusetts, New York, Tennessee, Missouri, Illinois and Kansas, making 21 states in all. Virginia had recommended the adoption of the Crittenden compromise (see COMPROMISES, VI.) in a slightly modified form, and this was agreed on by all the southern delegations and that of New Jersey in the north. Massachusetts and Rhode Island appointed delegates without comment, but the other republican states of the north agreed in refusing in advance to assent to the Virginia proposition, and in the assertion that the constitution, fairly construed and faithfully obeyed, was still fully competent for all the needs of the country. In the proceedings each state was

given one vote, to be determined by a majority of its delegates. As a result of its deliberations the peace conference presented to congress the following proposed amendment to the constitution "ARTICLE XIII.: SECTION 1. In all the present territory of the United States, north of the parallel of thirty-six degrees and thirty minutes of north latitude, involuntary servitude, except in punishment of crime, is prohibited. In all the present territory south of that line, the status of persons held to involuntary service or labor, as it now exists, shall not be changed; nor shall any law be passed by congress or the territorial legislature to hinder or prevent the taking of such persons from any of the states of this Union to said territory, nor to impair the rights arising from said relation; but the same shall be subject to judicial cognizance in the federal courts, according to the course of the common law. When any territory north or south of said line, within such boundary as congress may prescribe, shall contain a population equal to that required for a member of congress, it shall, if its form of government be republican, be admitted into the Union on an equal footing with the original states, with or without involuntary servitude as the constitution of such state may provide. SECTION 2. No territory shall be acquired by the United States, except by discovery, and for naval and commercial stations, dépôts and transit routes, without the concurrence of a majority of all the senators from states which allow involuntary servitude, and a majority of all the senators from states which prohibit that relation, nor shall territory be acquired by treaty, unless the votes of a majority of the senators from each class of states hereinbefore mentioned be cast as a part of the two-thirds majority necessary to the ratification of such treaty. SECTION 3. Neither the constitution nor any amendment thereof shall be construed to give congress power to regulate, abolish or control, within any state, the relation established or recognized by the laws thereof touching persons held to labor or involuntary service therein, nor to interfere with or abolish involuntary service in the District of Columbia without the consent of Maryland and without the consent of the owners, or making the owners who do not consent just compensation; nor the power to interfere with or prohibit representatives and others from bringing with them to the District of Columbia, retaining and taking away, persons so held to labor or service; nor the power to interfere with or abolish involuntary service in places under the exclusive jurisdiction of the United States within those states and territories where the same is established and recognized; nor the power to prohibit the removal or transportation of persons held to labor or involuntary service in any state or territory of the United States to any other state or territory thereof where it is established or recognized by law or usage; and the right during transportation, by sea or river, of touching at ports, shores and

landings, and of landing in case of distress, shall exist; but not the right of transit in or through any state or territory, or of sale or traffic, against the laws thereof. Nor shall congress have power to authorize any higher rate of taxation on persons held to labor or service than on land. SECTION 4. The third paragraph of the second section of the fourth article of the constitution shall not be construed to prevent any of the states, by appropriate legislation, and through the action of their judicial and ministerial officers, from enforcing the delivery of fugitives from labor to the person to whom such service or labor is due. SECTION 5. The foreign slave trade is hereby forever prohibited, and it shall be the duty of congress to pass laws to prevent the importation of slaves, coolies, or persons held to service or labor, into the United States and the territories from places beyond the limits thereof. SECTION 6. The first, third and fifth sections, together with this section of these amendments, and the third paragraph of the second section of the first article of the constitution, and the third paragraph of the second section of the fourth article thereof, shall not be amended or abolished without the consent of all the states. SECTION 7. Congress shall provide by law that the United States shall pay to the owner the full value of his fugitive from labor, in all cases when the marshal or other officer whose duty it was to arrest such fugitive was prevented from doing so by violence or intimidation from mobs or other riotous assemblages, or when, after arrest, such fugitive was rescued by like violence or intimidation, and the owner thereby deprived of the same; and the acceptance of such payment shall preclude the owner from further claim to such fugitive. Congress shall provide by law for securing to the citizens of each state the privileges and immunities of citizens in the several states."—Section 1 was passed by a vote of 9 states to 8, and 3 divided; section 2, by 11 states to 8, and 2 divided; section 3, by 12 states to 7, and 2 divided; section 4, by 15 states to 4, and 2 divided; section 5, by 16 states to 5; section 6, by 11 states to 9, and 1 divided; and section 7, by 12 states to 7, and 1 divided. Iowa, Maine, Massachusetts and New Hampshire voted against every section, except that New Hampshire voted *aye* on the 5th and 7th, and Massachusetts *aye* on the 7th. New York was divided on all but the 5th (*aye*), and Kansas on all but the 5th, 6th and 7th (all *aye*). Each section was thus carried, but no vote was taken on the amendment as a whole. A resolution denying the right of any state to secede was laid on the table by 10 states to 7, and 1 divided. —The amendment of the peace conference was brought up in the senate, Feb. 27, 1861, by Powell, of Kentucky. It was unsatisfactory to the republicans, who objected to it on the ostensible ground of the incompetency of the conference to prepare amendments for congressional action, and to the southern senators, who preferred secession to any amendment without a

formal acceptance by republican votes, and was satisfactory only to the union-loving democrats of the middle and border states. On the last day of the session an effort made to substitute the conference amendment for senator Douglas' amendment, as contained in the house resolutions (see CONSTITUTION, III.), was voted down by a vote of 34 *noes* to 3 *ayes*. In the house various attempts were made from Feb. 27 until March 3 to introduce the conference amendment, but all were unsuccessful.—The proceedings of the conference are collected in Chittenden's *Report of the Debates and Proceedings in the Secret Sessions of the Conference Convention for proposing Amendments to the Constitution*. They are even more interesting and valuable than the congressional debates of the time, for all the delegates were not only able but moderate, and the irreconcilable ideas of even the moderate men in the opposing sections show clearly the impossibility of a peaceful settlement of the national difficulties.

ALEXANDER JOHNSTON.

CONFIRMATION BY THE SENATE, the action of a senate by which it expresses its approval of a nomination submitted to it by the president or by a governor. The usage is for the senate to refer a nomination to a committee, unless there be an exception made in cases where the nominee is a senator. If the nomination is approved, notice to the president is usually delayed for three days, during which a reconsideration can be moved. The provisions of the state constitutions upon this subject are generally closely analogous to those of the constitution of the United States. It will be sufficient, therefore, to refer to the latter, which declares that the president "shall nominate, and, by and with the advice and consent of the senate, shall appoint ambassadors, other public ministers and consuls, judges of the supreme court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but congress may by law vest the appointment of such inferior officers, as they think proper, in the president alone, in the courts of law, or in the heads of departments."—The theory of the constitution is to separate legislative and executive authority; all legislative powers granted being vested in congress, and the executive power being vested in the president. But to this general rule there are three great exceptions: 1, this requirement of senatorial confirmation of nominations; 2, the making of treaties by the executive by and with the advice and consent of the senate; and 3, the provision requiring the president's approval of a congressional enactment to give it the validity of law; unless re-enacted by a two-thirds vote, over a president's veto.—The appointment of officers, especially for service in the executive department, is an executive function of the most emphatic character. It being the paramount duty of the president to see that the laws are faithfully

executed, he can only do so through executive officials subordinate and responsible to himself. To require the assent of one branch of the legislature, to these appointments, obviously gives that body a great influence within the executive department.—The fear of a dangerous centralization of power in the executive, and the hope that the scrutiny of the senate would tend to the selection of worthy officials, appear to have been the main reasons for conceding this share of executive functions to that body. There was much diversity of opinion on the subject in framing the constitution. In the form in which it was first completed, the senate was allowed no participation in appointments, except that the senate itself was to appoint both ambassadors and judges of the supreme court, without any act on the part of the president.—Congress has vested the appointment of a large number of subordinate officials in the heads of departments, and in the courts, as authorized in the language cited; leaving, however, those of the higher grade subject to confirmation by the senate. The latter number several thousands altogether; there being about 550 (including, for example, 112 collectors of customs and 126 collectors of internal revenue) in the treasury department alone, and 1,840 postmasters and several of the higher officials in the postoffice department, who are subject to confirmation. All postmasters who have a salary of \$1,000 or over are nominated by the president and confirmed by the senate. Foreign ministers and consuls, judges and governors of territories, are an important portion of the nominations requiring senatorial confirmation. No small portion of the time of the president and of the members of the senate is absorbed by these nominations, and the debates and contests which grow out of them. The causes which gave this power to the senate, as well as the language in which it is conferred, make it plain that, in the theory of the constitution, the authority and duty of that body are little more than to take care that the nominees of the president are competent for the places for which they are selected. It would be a manifest abuse for the senate to use its authority to dictate executive policy or to compel the executive to yield to the political views of the majority of the senate or to the personal wishes of its members. The principles and policy which a president and an administration represent, have been approved by the people at his election; and, plainly, it was not intended that a majority of a senate, holding over under a six-year tenure, should use its power over nominations to defeat that policy or to coerce the president in the matter of taking care that the laws are faithfully executed.—"The senate has but a slight participation in the appointments to office. The senate is called upon merely to confirm or reject. The president is to nominate, and thereby has the sole power to select for office; but his nomination can not confer office unless approved by a majority of the senate. His responsibility and theirs are

complete and distinct. He can never be compelled to yield to their appointment of a man unfit for office; and, on the other hand, they may withhold their advice and consent from any candidate who, in their judgment, does not possess due qualifications for office." (Story on the Constitution, §§ 732, 1531.)—"Having no agency in the nomination, nothing but simply consent or refusal, the spirit of personal intrigue and personal attachment must be pretty much extinguished, from the want of means to ratify it." (Kent's Commentaries, 288.)—At the time Chancellor Kent wrote (1826), there had been comparatively little in the action of the senate to discourage his hopeful view; but in judge Story's work, published seven years later, the author appears to have seen reason to think there may be cases in which the senate will act from 'party motives,' but, "that they will be rare." He had seen Jackson's administration.—The question arose, in 1792, whether, in acting upon the nomination of a foreign minister, the senate had a right to go behind the question of his personal fitness and consider the policy of the president in instituting the mission and making the appointment; and it was decided by the senate that it had not; but, at a later period, it was decided the other way in reference to missions to Turkey and Prussia.—When, in 1832, the question of the confirmation of Mr. Van Buren as minister to England was before the senate, that body, in rejecting him, went quite beyond the authority of the constitution as expounded by Kent and Story; arraigning Mr. Van Buren's policy as disclosed in his instruction which he had prepared as secretary of state, and his political theories as to appointments and removals. He was charged with bringing the New York spoils system to Washington, and enforcing it in the federal administration. In defending him, Mr. Marcy, a New York senator, in answer to Mr. Clay, used this language about New York politicians, which has become celebrated: "When they are contending for victory, they avow their intention of enjoying the fruits of it. If they are defeated, they expect to retire from office. If they are successful, they claim as matter of right the advantages of success. *They see nothing wrong in the rule that to the victor belong the spoils of the enemy.*"—This new theory—that parties contend as enemies, and that the public offices are to be won and divided as spoils of the victor, and may be regarded as such by senators in voting on confirmations—was slowly developed. There was very early evidence that the senate would not long act, as a body, upon the merits of the nominations as contemplated by the constitution, but would be governed by the personal or partisan reasons which might influence its members from the states where the nominees were to serve. Within six months after Washington was inaugurated, his nomination of a naval officer for the port of Savannah was rejected—the first rejection made by the senate—not because the nominee was an unsuitable person for the office,

but because he was unacceptable to the senators from Georgia. In a special message, dated Aug. 6, 1789, Washington set forth further evidence of the fitness of his first nomination, but at the same time submitted a new nomination for the office. This was the beginning of the practice which, in later years, has been designated as *the courtesy of the senate*. Practically, it treats all nominations of officers to serve within any state as matters to be submitted to the senators of that state (or, if there be but one senator belonging to the senatorial majority, to that senator), whose wishes on the subject are, as a rule, to be conformed to by the senate. To make these wishes effective, it is not understood that they need, as a rule, to be, nor are they usually, supported by reasons. It is generally decisive against the nominee, if he is objectionable to those senators. The fact that the senate shrouds its proceedings upon confirmations in secrecy makes it all the more easy to give effect to this pernicious courtesy.—How powerfully this courtesy appeals to the ambition, and the selfish and partisan interests of every senator hardly need be pointed out; for it is plain that each senator, by conceding a controlling influence to the wishes of the other senators, secures for himself a despotic authority over all nominations for his own state. Indirectly, but not less surely, the courtesy extended to another is an act of self-aggrandizement.—This method of dealing with the subject has obviously defeated the purpose of the constitution, which was to secure the disinterested judgment of the senate, as a body, upon the merits of the candidate. All that is secured, under this rule of courtesy, is the favor of the local senators. By giving them directly the control of all the higher federal appointments for their state, and as a consequence, substantially, the control of the subordinates of their appointees, the senators have become more and more the dictators of state politics. They have become the great dispensers of patronage, and in a corresponding degree, have lost their independence and disinterestedness as legislators. In New York there are 191 postmasters, in Pennsylvania 168, and in Illinois 135, whose nomination must be confirmed by the senate, and whose places are, therefore, a part of the patronage of the senators from those states.—It was but a natural result of such a system that the senators, whose wishes would be decisive of the fate of a nominee, should attempt to dictate to the president the nomination he should make. And, since the president must see that to nominate a person objected to by senators, was likely to result in the defeat of his candidate and in hostility, if not in acts of retaliation, on the part of the senators, he is put under a dangerous temptation either to yield his authority altogether or to make his constitutional functions matters of barter and compromise with members of the senate. In this way, matters of legislation and of appointments have been drawn into demoralizing relations, the efficiency of the executive has been impaired; senators have attained a

mischievous influence in the departments, and have become a controlling power over patronage, to the great detriment of the federal administration throughout the Union. While the president nominally retains the right to designate the persons to serve the government in the states, their selection is, potentially, in the hands of the state senators, to whom those officials very generally recognize a paramount responsibility. In this way senators have acquired great control, not only of the means of their own re-election, but over all the local elections of the states; the subordinate officials dependent upon their favor being forced to give a part of their time and their salary to carry on the work of partisan politics.—This prostitution of senatorial authority has been forcibly illustrated in the late proceedings (1881) of the senators from New York.—Giving paramount importance to their usurped control of appointments rather than to their proper duties as legislators, these senators resigned their seats, in May, 1881, by reason of their dissatisfaction on account of the policy pursued by the president in regard to nominations of federal officers to serve in that state. He declined to make nominations in conformity to the wishes of these senators. They left their seats in the senate before that body acted on the nominations, and applied themselves to the New York legislature for their own re-election, which would approve the long continued usurpation of the senate, a usurpation tending to reduce the nation to little more than a confederacy of states.—There seems to have been but little forecast of the disastrous results which might flow from the abuse of this power of confirmation. John Adams, however, exhibited a remarkable prescience on the subject. In a letter to Mr. Sherman, written about the time the constitution was adopted, he gives clear warnings of the evils we now suffer. He says the senate will usurp executive functions. "Senators will be solicited by candidates for office. A senator of great influence will be ambitious of increasing his influence, and will use it to get out his enemies and get in his friends, perhaps his instruments." "He will naturally be tempted to make use of his whole patronage, his whole influence, in advising to appointments." "This defect of our constitution will have a tendency to introduce corruption of the grossest kind, both ambition and avarice, into all our elections." "Officers, instead of having a single eye to the executive branch, will be factious, with the factious, partisan senate." * * * "You will find that the whole business of this government will be infinitely delayed by this negative of the senate on treaties and appointments."—There seems to be no power under the government, except the voluntary action of the senate itself, by which such evils can be averted. When, in 1834, president Jackson made the most vigorous protest against the arbitrary refusal of the senate to confirm his nominees for national bank directors, against whose fitness no objections were made, he expressly disclaimed all pretension of right on his

part to inquire into or call in question the reasons of the senate for rejecting a nomination, and the senate refused to give any reasons. Its reasons and its action, save the final result, are its own secrets.—It is only a high and a formidable public opinion, therefore, which will be sufficient to bring the action of the senate into harmony with the spirit of the constitution and the safety of the country.—There have been occasions when the proceedings of the president and the senate in the matter of nominations and confirmations have been marked by the most intense partisanship and the most lamentable want of dignity. During Mr. Tyler's administration, there were instances in which the same nomination was made and rejected three times within a single day; and during the administration of Mr. Johnson, there were proceedings in much the same spirit. During the latter administration, tenure of office acts (of 1867 and 1869) were enacted which materially increase the power of the senate in the matter of appointments. These acts provide that every officer who gained his place through an appointment confirmed by the senate shall be entitled to retain it during the term of his appointment, unless removed by the consent of the senate; except that, during a recess of the senate, the president may suspend any such officer, other than a judge, and fill his place until the end of the next session of the senate. It hardly need be pointed out that these acts give senators a still more disastrous influence throughout the executive department, and greatly embarrass and weaken the efficiency of the executive. (See CIVIL SERVICE REFORM, SPOILS SYSTEM.)

DORMAN B. EATON.

CONGREGATIONS. Monastic life had its origin in the east, but the monk, properly speaking, was not introduced there by Christianity. A love of contemplation, a disposition to solitude, a willingness to sacrifice self which hesitated at no bodily mortification, had peopled the deserts long before Christ, with ascetics and hermits. Cenobitism was the sole creation of the new religion. But if, in the east, desire for retirement, love of contemplation and the clat of an open rupture with civil society, were the principal motives which led to monastic life, it was the horror excited by the state of public affairs that created the monks of the west. In the corrupt society of the Roman world, in its decline, when the most shameful exaction dried up the fruitful sources of labor, weariness and disgust drove into exile some of the men who still nourished in their hearts the love of liberty.—The beginnings of monastic life were strange. All those, men or women, who revolted against the abuses of the old Roman world, sought refuge either in isolated places or in a kind of fortress. Those proscribed or fugitives, the malcontent, philosophers, slaves who had broken their chains, —all sought, in these solitudes, refuge from the fury of the barbarians, an oasis where they might think and live in peace. Fixed rules of life were

not followed by these first members of a monastic community. A common belief and a common hatred for society in its decay, were the bond of union between these men.—St. Pachomius, who lived in the fourth century, was the first to establish regular monasteries for men and women, where they could abide under the authority of a superior. Later, St. Basil drew up monastic rules which became the law of all the eastern monasteries until the time of St. Benedict.—The monks at this period were not ecclesiastics, but laymen, who did not form a part of the clergy. Although sheltered from the numberless dangers of the civil life of that time, they did not keep entirely aloof from social action; and they took a willing part in the intrigues which disturbed the corrupt and almost barbarous courts of the last Merovingian kings. Their hands assisted in the overthrow of Brunehaut, while they cleared the road to rule for Pepin of Heristal. Even in the bosom of the monastery there was neither calm nor order. Obedience was a thing unknown. The most worthless monk turbulently intrigued for the most important position. Ancient Roman society had crumbled, but nothing new had taken its place, and the monastery was a reflex of the disorder which was destroying the last remnants of social order. Such disorder would have been certain death to the system, if a fixed rule had not rescued the monasteries from inevitable ruin. St. Benedict, born in Italy, in 480, gave to the world, about the year 529, the famous rule which soon after governed all the monasteries of the west, and became so universal that, toward the end of the eighth century, “Charlemagne,” says Guizot, “had inquiry made in the different parts of his empire if there existed other monks besides those of the order of St. Benedict.” Among other laws, St. Benedict imposed labor on his followers as a religious duty, and, of all kinds of manual labor, he particularly recommended agriculture. There was in this a social reform. The order of St. Benedict replaced the labor of slaves by the labor of free men. “The Benedictine monks,” says Guizot, “became the clearers (*défricheurs*) of Europe by the association of agriculture with preaching.”—In turn inventors, laborers, writers, painters, or artisans, the Benedictines were the civilizers of five centuries.—We shall pass rapidly over the events which illustrate monastic life from the seventh to the fourteenth century, and call attention to the founding of military orders in the Christian world at that time. The templars were the most celebrated of the monks who put the sword in the place of the missal. It was upon them that civil authority in France made the first trial of its strength. The knights of the temple, who were numerous and powerful, had become a formidable body at the service of the aggressive despotism of the sovereign pontiffs. Civil right triumphed when the jurists of Philip the Fair sent Jacques Molay and his knights to the stake. Among the most celebrated military orders we ought to mention the

Teutonic knights, in the north; the Calatrava knights in Spain; and the knights of St. John of Jerusalem, who afterward became the knights of Malta.—To the military orders succeeded the mendicant orders. *Franciscans* and *Dominicans*, in the name of equality and poverty, attained, the former, the extreme limits of human folly, and the latter, the limits of the most monstrous cruelty. The inquisition, as is known, was the offspring of the Dominican order. The creation of the mendicant orders was considered as a necessity, both political and religious. “Gregory IX.,” says M. Theophile Lavallée, in his *Histoire des Français*, “wished to dip the clergy in the plebeian source from which they had come, and founded the mendicant orders of St. Francis and St. Dominic. These monks of a new species were supposed to lead, not a contemplative but a practical life, in order to replace the secular clergy in all their functions. They were to put themselves in the lowest of social conditions, to recall evangelical poverty and humility. They were to have no superiority except that of knowledge and devotion. They were to travel, and have no country. To crown all, they were to have but one master, the pope, and, devoted completely to him, were to be his missionaries and his messengers.” By an inconsistency, to say the least, strange, the princes of Europe at first extended their protection to the mendicant monks. The reason was, that the nations of Europe had then had a touch of liberty and revolution, and that, cost what it might, it was imperative on kings to put a damper on the aspirations of their subjects, the realization of which would have been attended by all the dangers of the unknown in politics. And who better than the mendicant monks could perform this rude task? “Enemies of the national clergy,” adds M. Lavallée, “withdrawn from episcopal jurisdiction, intrusted with the education of the common people, the mendicant monks were a formidable body of militia recruited from the people, who always mixed with them, wore the same coarse garments, ate the same black bread, and shared with them their joys and sorrows. Unrestrained, cynical, austere, popular, apostles of grace, theologians, clever and popular orators; full of mystic exaltation, of humility, and a spirit of penitence, they regenerated the church in the estimation of the people, and silenced their just murmurs against the wealth, the pride, and the debauchery of the clergy.”—But Rome was threatened with the loss of her power which she had thus strengthened; and, from the seclusion of a German monastery, the reformation went forth full armed. Luther attacked monastic institutions in that which is most essential to them. The reformation extended to the north. It won England and Germany. The Theatins, and, later, the Jesuits, come forward to take up the defense of orthodoxy.—*The society of Jesus* is admirably adapted to the requirements of modern society. Jesuitism, the art of easy salvation, yet of moral restraint, alone

was capable of keeping within the bounds of belief men who were quite willing to be saved but only on condition of not surrendering the material advantages of this world. The Jansenists, a species of Benedictines, rose up against the worldly doctrine of the Jesuits; and these last, the chief defenders of the absolute power of the popes, did not surrender without a fierce fight. The society of Jesus had great vitality, since it was able to recover from the blows inflicted on it by the popes themselves.—It remains now for us to say to what legal restrictions religious congregations have been and are still subjected in France.—It was an invariable principle under the ancient régime, that no religious association could exist in France except in so far as it had been formally authorized. After the edict of Nov. 21, 1629, came that of August, 1790, ordaining that no religious establishment could be founded without the express authorization of the king, an authorization evidenced by letters patent, sealed with the great seal, countersigned by a secretary of state, and registered in the parliaments after investigation *de commodo et incommodo*. This authorization was always revocable. The constituent assembly, in virtue of a right sanctioned by usage, declared, Feb. 13, 1790, that it no longer recognized solemn monastic vows, and consequently suppressed the orders and regular congregations. The secular congregations, lay brotherhoods and confraternities, which, properly speaking, constituted mere corporations, were only affected by the law of Aug. 18, 1792, which suppressed all associations, no matter what their origin or aim. The concordat brought no amelioration to the state of religious congregations. Nevertheless, the decree of the 20th Prairial, year X., which suppressed the regular congregations in some departments, spared the establishments devoted to public education, and care of the sick.—Under the protection of this authorization, the regular orders made no delay in reorganizing. The decree of 3rd Messidor, year XII., brought back the orders to respect for the law. The decrees of Feb. 18, 1809, Jan. 3, 1812, and Jan. 23, 1813, had the same object in view.—In spite of the favor which the religious associations enjoyed under the restoration, the law of May 14, 1825, reserved to the legislative power the right to authorize religious orders of men; those of women might be established by royal ordinance, and continue to be recognized by decree. The civil law of France does not recognize perpetual vows. It does not annul, it simply ignores them.—The following words, spoken June 12, 1845, by president Portalis, sum up completely the opinion of the French government on the law in the matter of religious congregations. "It is asked if the laws at present in force do not give the government the power, and impose on it the duty, according to the urgency of the case, to dissolve non-authorized religious associations, when, originating outside, they endeavor to impose themselves on the country, and make themselves

recognized independently of the laws. The answer can not be doubtful: Live in the interior of your own houses as you like. "Obey, while living under the same roof, the rule which you have chosen: that is for you legal and permissible: the state will not seek to know what it has no interest in knowing: public authority will supervise, but not trouble a pious and retired life: matters touching only conscience are sacred for the government: public demonstrations alone provoke, alone justify, its intervention.—But, if you wish the public informed of your existence; if you pretend to make your action felt, to exercise a collective influence without the influence of an association; if you proclaim yourselves connected with another religious order known and existing outside our borders; if you correspond openly and hierarchically with other houses similar to your own in France; if you acknowledge publicly regular administrative organization which embraces all the territory and forms it into a province of a religious order; then, if you can not produce a legal authorization, you fall under the prohibition of the law."—M. Billault, in 1861, interpreted the law as M. Portalis had done in 1845. The law has never considered the decree of the year XII. as abrogated. The government enforced it, in July, 1830, against the congregation of missions in France; in 1831 against the Trappists; in 1839 against the Capuchins of Lyons; in 1842 against the Trappists of Tarn; and in 1861 against the Capuchins of Hazebruck and the Redemptorists of Douai. More recently still, the society of St. Vincent de Paul was subjected to the necessity of authorization.

HECTOR PESSARD.

—The necessity of asking for an authorization imposed on religious communities by the laws of France and most other countries, has been frequently attacked. The arguments brought up as weapons to combat this restrictive measure are very imposing. It is in the name of liberty, and liberty of conscience, that the opponents of the measure speak. But as the congregations are reproached, either rightly or wrongly, with a tendency to aggressiveness, monopoly, and even undue influence, many are of the opinion that the weak should be protected against these influences, as they are, for instance, against excess of labor in manufactures. To protect men liberty of discussion would suffice. It might still be objected that convents for women, authorized or not, are not the only establishments which increase in a manner astonishing at an epoch decried as irreligious. These are very delicate questions, and many persons would prefer not to touch them if the religious feeling which founds convents were not intolerant (see SYLLABUS), and did not threaten those who are of a different way of thinking. The latter feel simply obliged to act in self-defense.

MAURICE BLOCK.

CONGRESS (IN INTERNATIONAL LAW). By congress is understood a meeting of ministers plenipotentiary or sovereigns of different states, having the power and mission to conclude a treaty of peace, determine the consequences of a treaty concluded, or settle undecided points of international law. The following are the most celebrated congresses: 1641-8, a congress at Münster and Osnabrück, which brought about the peace of Westphalia; 1659, the congress of the Pyrenees; 1663, the congress of Aix-la-Chapelle; 1681, the congress of Frankfort; 1712-13, the congress of Utrecht; 1748, the congress of Aix-la-Chapelle; 1797, the congress of Rastadt; 1802, the congress of Antwerp; 1808, the congress of Erfurt, the first congress of sovereigns ever held; 1813, the congress of Prague; 1814, the congress of Châtillon; 1814-15, the congress of Vienna; 1818, the congress of Aix-la-Chapelle; 1820-21, the congress of Troppau and Laybach; 1822, the congress of Verona; 1856, the congress of Paris; 1878, the congress of Berlin. We see by this simple enumeration, that a distinction must be drawn between *congresses* and *treaties of peace*. All congresses do not lead to treaties. And, although there is reason to connect these great meetings with the acts which have defined the territorial distribution of Europe, they must not be confounded with them. The dissolution of a congress without result has been frequently witnessed in modern times, and instances of such are easily cited. Among the number are the congresses of Cambrai, 1721-5; of Soissons, 1729; of Breda, 1747; of Focsani, 1772; of Bucharest, 1793; of Lille, 1797; of Rastadt, 1799; of Ghent and Châtillon, 1814. In our time a greater importance has been attached to congresses than in former ages. These great assemblies of diplomates or sovereigns first took place in the nineteenth century. In the middle ages gatherings of princes were frequent, especially in the time of the crusades, and on the occasion of the German diets. They became rare from the time that the intricate affairs of monarchs could no longer be discussed without the agency of ministers and ambassadors. The wars of the empire, by shaking states to their foundation, renewed direct relations among princes. Napoleon, at the height of his power, established the first precedent of this kind of meeting, so much in favor during the restoration. Still, the congress of Erfurt, in spite of the secret agreement of Oct. 12, 1808, which strengthened the ties of Tilsit, between France and Russia, was more a display made by the master of the west than a meeting for the transaction of business. The guests at Erfurt, with one exception, met at Vienna in 1815, but they alternated their negotiations with the splendor of the feast, and crowned heads appeared there attended by the chiefs of their cabinets. The international law of Europe, inaugurated by the treaty of Vienna, was reaffirmed in the congresses of Aix-la-Chapelle, Troppau, Laybach and Verona, which, like that of Vienna, but on a limited scale, were assemblies

of sovereigns attended by their ministers. The restoration was, and endeavored to seem, in its principles and methods, the opposite of the French revolution. "The successive coalitions," says Wheaton in his "Elements of International Law," "formed by the great monarchies of Europe against France, after the revolution of 1789, were caused by the dangers with which the revolution threatened, both the social order of Europe by the dissemination of its principles, and the balance of power by the development of its military ascendancy. Such was the principle of intervention in the internal affairs of France, acknowledged by the allied courts. France demanded non-intervention as a right, on the basis of the respective independence of nations. The final result of these coalitions was the establishment of a permanent alliance between the four great powers, Great Britain, Austria, Prussia and Russia, an alliance which France joined in 1818, at the congress of Aix-la-Chapelle. According to the powers which had already taken part in the alliance known under the name of the holy alliance, viz., Russia, Austria and Prussia, the object of this new alliance was to found a perpetual system of intervention among the different states of Europe, in order to prevent all change in the internal form of their respective governments, whenever such change should be considered as threatening to the existence of monarchic institutions under the legitimate dynasties of the houses reigning at the time. This general right of intervention has been used sometimes in times of popular revolutions, when the change in the form of government had not its origin in the voluntary concession of the reigning sovereign or been confirmed by him, under circumstances which excluded all idea of violence against him. In other cases the allied powers extended the right of intervention to every revolutionary movement which might be considered as endangering, by its immediate or remote consequences, the social order of Europe in general, or the individual security of neighboring states."—The preceding lines characterize the four congresses which took place from 1818 to 1822. The object of that of Aix-la-Chapelle, in 1818, was to deliver France from military occupation, which had been imposed on it in 1815, and to receive it into the agreement of the five powers. The contribution to be paid by France was reduced from 700 to 265 million francs, and its readmission into the European Areopagus was confirmed by protocol of 15th of November. Those of Troppau and Laybach, in 1820 and 1821, had for their object the establishment of an understanding between Austria, Russia and Prussia, as to the means necessary to put down the Italian revolution at Naples and Turin. England and France were represented at these congresses by ministers plenipotentiary. It was during the congress of Laybach that Great Britain, by a circular note of Jan. 19, 1821, raised the first protest against the system of intervention of the holy alliance. The congress of Verona, in 1822, un-

dertook to continue the war against the revolution in Spain; the Spanish constitution was overthrown by the army of the duke of Angoulême. England's protest was more energetic than in 1821, and Canning's note of Sept. 27, 1822, against the Spanish war, was one of the most important historic monuments of the period, though it was unable to prevent the restoration of Ferdinand VII. by a foreign army. The attitude of England contributed greatly to put an end to the use of congresses under the restoration. The advantages gained in France by the liberal opposition aided also in preventing their renewal. Although frequent interviews between sovereigns have taken place since then, we can only mention the meeting at Warsaw, Oct. 20, 1860, between the emperor of Russia, the emperor of Austria and the prince regent of Prussia, or that of Sept. 6, 1872, between the same sovereigns, the prince regent of Prussia having become the emperor William of Germany, as having any analogies with the sovereign assemblies of the restoration. This resemblance is remote, however, for the congresses of 1818 and 1822 rested on an evident principle, and had a definite object, while in 1860 the interview had an accidental character, which it continued to retain, since it had no consequences and resulted in no system of alliance, while the interview of 1872, if not accidental, had no avowed political object.—Mention should perhaps be made here of the congress of German princes which met at Frankfort in 1863, under the presidency of Austria, to reform the Germanic confederation, but which failed because Prussia refused to assist.—The congress of 1856, which put an end to the Crimean war, is celebrated on account of its declarations regarding *neutrality*.—As a general rule, every state has the right to bring about the meeting of a congress, and it is proper to receive the representatives of all the states interested in any way in the questions to be debated at such congress; but the initiative belongs to the great powers, and those of the second order interested are not always received. In order that a congress may take place it is essential that the parties should agree on the principles by which the negotiations are to be guided. Consequently, there should be a general preliminary understanding between the powers as to the method of solving the questions. The congress which was to regulate the affairs of Italy at the end of 1859, was not able, as we know, to assemble, on account of inability to reconcile opposing interests. The method pursued by congresses in their work is not uniform, and depends upon the more or less general character of the meeting, the number of states represented, and their reciprocal relations. The congress of Paris in 1856, did not embrace, in the decisions it had to take, the total of European politics, as did the congress of Vienna. Therefore it did not follow the same course. At the congress of Paris only seven states were represented, and the number of questions to be solved were limited. Questions,

therefore, were not subdivided among different committees, whose sole work was to report to the assembly of the great powers. At Vienna all Europe was assembled, and everything had to be remodeled. To facilitate the transaction of business the work was divided among a number of special commissions, which reported to the great powers. The latter accorded or withheld their assent. Most frequently the decision was made in advance, in consequence of a preliminary exchange of notes. This method of action was favorable to the influence and the independence of the middling and small states.—The choice of the city where the congress is to meet is not without importance, for it is essential that no one of the interested parties should be able to exercise a predominant influence on the members of the congress. Therefore the custom of choosing cities in neutral, or at least disinterested, states, such as Belgium or Switzerland, is a good one. In case of failure to agree in this respect, the place in which the congress is held is declared neutral during its deliberations. Since, generally speaking, a congress is only convened for important purposes, each state chooses as its representative its ablest negotiators, and its officials of highest rank. When the sovereign does not appear in person at the congress, he sends his minister of foreign affairs, or at least an important person enjoying his special confidence. He takes care, besides, that his representatives at the congress be in possession of the necessary qualities and learning to succeed; and, as it rarely happens that these qualities and this learning are in the possession of a single man, the chief of the state constitutes the embassy of as many persons as are necessary for a full representation. He sends one with a talent for winning men, with insinuating manners, a great name, accustomed to great state entertainments; another, with a knowledge of history and international law, to act as a support to arguments; the third, a ready writer; and so on to the end of the chapter. It is the more necessary to provide beforehand, for everything, even for the unforeseen, since difficult questions may suddenly arise, and since problems for solution are numerous, and the time between sessions is occupied in preparing a favorable basis for future discussions. Questions of etiquette do not delay business as formerly. The congress of Utrecht is famous in this regard, as is well known. For the last 50 years questions of form have been simplified, and an unforeseen difficulty is avoided in one way or another. After the congress has met, the representatives of the different powers begin by making the customary visits; then the congress proceeds to the choice of a president. If the meeting takes place under the mediation of a neutral state, or on the territory of a great power interested in the negotiations, it is customary to elect as president the representative of the mediating state, or that of the interested power on whose territory the negotiations take place. This custom is purely one of

courtesy, and in no way deprives the plenipotentiaries of their right of selection. This operation is followed by an exchange of credentials and fixing the order of the day. Questions of secondary importance are usually decided by an absolute majority of votes; those of prime importance, unanimously. We must not omit to state that unanimity is the rule, for each state is sovereign and free in its decision. The decisions of other states can not be imposed on it against its will. An exact report of each session (called a protocol) is drawn up, which is submitted to the plenipotentiaries for approval, and signed by them. If one of them finds that his views have not been correctly or completely reported, he may have his vote recorded in the protocol. Each minister gives an account of the deliberations and decisions of the congress to his government; and, thanks to the telegraph, he can at present be in continual communication with his chief. The electric telegraph tends more and more to modify ancient usages, and very naturally, to restrain the power of diplomats, since each report of a session may be immediately followed by new instructions.¹

JULES GRENIER.

CONGRESS (U. S.). "The congress" is the term used in the constitution of the United States to designate the legislative body of the nation. But, in popular usage, and in the later statutes, this body is called *congress* without the use of the definite article. While the continental congress and the congress of the confederation had but a single chamber, a congress of two chambers, elected for various terms and by a different constituency, was provided for by the constitution of 1789. The debates in the constitutional convention upon the formation, the numbers, the modes of election and the relative powers of the two branches of congress, are full of interest; and to them the reader is referred for details. The principal difficulty that arose concerned the relative power of representation of the larger and the smaller states in congress; the less populous states claiming equal representation, while the larger states insisted on representation in proportion to numbers. This was compromised by giv-

ing to all the states equal representative power in the senate, while the representation of each state in the house was graduated strictly in proportion to the number of its inhabitants.—This guarantee to the smaller states of a political power in the senate equal to that of the largest, is permanently fixed by the 5th article of the constitution, which provides that no state without its consent shall be deprived of its equal suffrage in the senate.—The constitution having fixed the term of two years for the duration of each congress, the times of meeting, as well as the length of the sessions, are left to the legislative body, except the requirement in the constitution that they shall assemble at least once in every year, and on the first Monday in December, "unless they shall by law appoint a different day." The fixing of the 4th of March in every second year as the period of expiration of the congressional term (as well as the 4th of March for the quadrennial term of the president, and the six years' term of the senators) has no foundation in the constitution. It originated simply in an act of the congress of the confederation (September, 1788), providing the first Wednesday in March of the ensuing year as the time for putting in operation the new government created by the constitution. This day happened to be March 4, 1789; though, in fact, there was no organization of the 1st congress until April 6, 1789, owing to lack of a quorum. The usage of December sessions closing the 4th of March following in the odd years, and some time between June and September in the even years, has become established, although frequently varied in former years by earlier, and, in later years, by extra, sessions. Its chief disadvantages are, 1, that there is an interregnum of nine months every other year, from March 4 to the first Monday in December, during which congress is unorganized; 2, that, for the same long period, there is no speaker of the house of representatives, who is by law one of the officers that may be required to assume the office of president of the United States; 3, that the whole legislative business of every alternate year is crowded, by the holiday adjournment, etc., into about 60 days, with pernicious results to the character of the legislation; 4, that the house of representatives, elected more than a year before taking their seats in congress, do not reflect the popular will as if fresh from the people. It has been suggested that all difficulty might be removed, were each congress to be organized (like most of the state legislatures) early in January following the November in which they were elected—Congress may be convened at any time when not in session by proclamation of the president "on extraordinary occasions;" and this power has been ten times exercised since 1789. (See CONGRESS, SESSIONS OF.) He has no power to adjourn or to prorogue congress, except in case of disagreement between the two houses.—The sessions of congress are open to the public, except the executive sessions of the senate, which are secret. The senate also sat

¹ Attention should be here called to the congress of Berlin, held July 13, 1878. The treaty of Berlin contains the following stipulations: The principalities of Roumania (proclaimed a kingdom in 1881), Servia and Montenegro, to become independent states, Roumania to cede to Russia Bessarabia, and receive the Dobruzscha in return. Servia obtained Nish, Tirot, and almost the entire northern territory of the Morava. Montenegro received Nikschitz, Podgorizza and Antivari. Austria-Hungary was to occupy Bosnia and the Herzegovina. Russia obtained the largest part of Armenia, with Ordahan, Kars and Batum. The land between the Danube and the Balkan to be constituted into a Christian principality, Bulgaria, which, however, remains under the suzerainty of the porte. South of the Balkans a province of Roumelia, under a Christian governor, is to be formed. Turkey was thus left with 4,800,000 inhabitants, and a territory of about 170,000 kilometres in Europe; while in Asia it retained 1,890,000 square kilometres, with 17,000,000 inhabitants.

with closed doors during the first five congresses, and no report of its debates prior to 1799 has been preserved. Since that time the right of the public to witness or to report both the proceedings and the debates in congress, has been recognized; and for nearly 30 years past congress has furnished full verbatim reports by official stenographers. Moreover, the journal of the proceedings of each house is published by constitutional requirement. Though one of the rules of the house of representatives provides for secret sessions to consider confidential communications, there is no instance in which the house has excluded the public from its debates.—Both houses of congress meet at 12 o'clock M., the sessions continuing, when business is prepared, from four to six hours. But toward the end of each session, earlier hours of meeting and much longer sessions (including evenings) are customary.—Congress is, by the constitution, a salaried body, the present compensation of senators and representatives being \$5,000 per annum, with \$125 annual allowance for stationery and newspapers, and mileage allowance of 20 cents per mile of travel each way from their homes at each annual session. Absence without leave entails deduction from compensation. A majority of the whole number of members is in each house necessary to constitute a quorum to do business. The debates and proceedings may go on with a less number, but only by unanimous consent.—The seats to be occupied by members are drawn by lot in the house of representatives at the beginning of each congress. In the senate there is no drawing for seats; but the custom prevails of individual selection or pre-emption of seats about to become vacant.—Both houses of congress, by requirement of the constitution, meet in joint convention to count the votes for president and vice-president. There is no instance of the meeting of the senate and house in one body, except for this purpose, and for occasional ceremonial observances.—The concurrence of a majority of both houses present and voting is necessary to pass any law, joint resolution or concurrent resolution. Special resolutions, however, are often passed by each branch separately (more frequently by the house of representatives). But these have no validity except as expressions of the sentiments of the house in question.—Congress has a library of 400,000 volumes, and a librarian, who is also made by law register of copyrights of the United States. Each house elects a chaplain and from four to six principal officers, who have the appointment of a large staff of clerks, messengers, pages, etc. The total annual expenses of congress vary from five to six million dollars, inclusive of printing.—The members of congress must take an oath to support the constitution, and the principal officers must take the same oath, together with one for the faithful discharge of their duties.—Nearly all the legislative business of congress is prepared by standing committees, numbering (in 1881) 47 in the

house and 32 in the senate, besides 10 select committees in the house, and 12 in the senate. The reports of committees are, in general, confirmed, but the most important measures undergo extensive amendment in both houses. The most potential committees are those on appropriations in both houses, the finance committee of the senate, and the ways and means of the house. These have the privilege of the floor to the exclusion of all other business, unless overruled by a heavy majority. All bills passing both houses must be signed by the president of the senate and the speaker of the house, and laid before the president of the United States in person, by one or more members of the joint committee on enrolled bills. If signed, they become laws, if retained by the president over 10 days (unless congress meanwhile adjourns), they are also laws, upon a note of the fact registered with the bill in the state department. If vetoed, a majority of two-thirds of both houses present and voting¹ is required to make them laws.—Those powerful organs of congress, the standing committees, are, by a rule of the senate, required to be elected by ballot, *unless otherwise ordered*. In fact, however, the senate committees have long been chosen by a caucus of the party having a majority, and elected *en masse* by a single yeas and nays vote in the senate. In the house the rules provide that the speaker shall appoint all committees, unless otherwise specially ordered. This vast power and responsible duty usually occupies the speaker long after the organization of each congress.—Each house of congress acts under a system of rules, the original basis of which was Jefferson's Manual of Parliamentary Practice. But the present rules—numbering 78 in the senate, adopted in 1877, and 45 in the house, adopted 1880—enforce a multitude of regulations as to the conduct of business, differing widely in either house. Thus: 1. Petitions and memorials are presented in open senate, and referred to committees; in the house, they are not publicly presented, but handed to the clerk for such reference as the member indorses thereon. 2. In the senate one day's notice must be given of a bill before it can be offered, unless by unanimous consent; in the house, any member may offer bills without limit, on every Monday. 3. In the house every Friday is set apart for private bills; but there is no such usage in the senate. 4. A house rule restricts debate within very narrow limits, first, by limiting set speeches to one hour; second, by giving the motion for the "previous question" (the effect of which is to close debate) precedence over all others. In the senate there is no one-hour rule, no previous question, and no limitation of debate, except that no senator can speak more than twice on the same question the same day without leave of the senate. 5. Both houses have very stringent rules excluding from

¹ So decided in the 1st congress, in contravention to the claim that the constitutional majority of two-thirds implies two-thirds of the whole number of members.

the floor all but certain privileged persons. In the senate, however, this rule is systematically disregarded; while in the house, it is of late years enforced with exemplary rigor.—The joint rules of the two houses, 22 in number, which were in force at the end of the 43d congress (1875), were pronounced, by a resolution of the senate, Aug. 14, 1876, to be no longer in force. The last of these rules provided a method of proceeding in counting the electoral vote for president.—Disagreement between the two houses on details of legislation is a constant occurrence, sometimes involving political questions, when the majority in each house represents a different party, and leading to a protracted dead-lock; more frequently the differences relate to new legislation, increased appropriations, etc., the senate being usually for larger, and the house for diminished expenditure. These differences are compromised by committees of conference (composed of three senators and three representatives), who exercise enormous powers, keeping in and thrusting out bills, vital measures of legislation, or appropriations amounting to millions. These conference reports, agreed to without amendment or discussion, under high pressure, in the expiring hours of the session, through fear of losing the important bills needed to carry on the government, virtually suspend some of the most important functions of the members of congress considered as a deliberative body.—The senate was designed, by the framers of the constitution, not only to secure to each state an equal voice in legislation in the body constituting half of the law-making power, but also, by the greater length of the term of service, to afford a check upon hasty legislation by a popular body subject to biennial changes. A persistent attempt to give the senate a life tenure of office was defeated in the constitutional convention. It consists (1881) of 76 senators, being two from each of the 38 states of the Union. Elected for six years, and endowed, in addition to the law-making power which they share with the house of representatives, with the sole power over treaties with foreign nations, and all the more important nominations to office, the senate holds the highest and most responsible rank in the national legislature. Constitutionally elected by the legislatures of the states, instead of directly by the people, the choice of senators is frequently effected or retarded by party controversies and intrigue. Notable instances of partisan unfairness have occurred in various states, where a democratic senate has refused to meet a whig house, and a republican senate has refused to meet a democratic house, thus defeating a senatorial election. This led to the enactment of the law of July 2, 1866, which first prescribed the manner and time of electing senators, by a uniform rule in all the states.—The vice-president of the United States is the presiding officer of the senate (having no vote, however, except in the case of a tie), and he is charged with no other duties. (For list of vice-presidents, see ADMINISTRATIONS.) The senate

elects (usually at the beginning of each session) a president *pro tempore* (though this office has frequently been left vacant for some time), who presides in the absence of the vice-president. The presiding officer may name any senator to perform the duties of the chair, but such substitution must not extend beyond an adjournment for the day. (For the powers of the senate as a separate body, see CONSTITUTION.)—The house of representatives has as its presiding officer a speaker, elected at the beginning of each congress, for two years, by *viva voce* vote. This is the first business in order, presenting a question of the highest privilege, and is proceeded with immediately upon the roll of members having been called by the clerk of the last house of representatives, who is charged with the duty of calling the unorganized house of representatives to order, and of deciding all questions of order, preceding the election of a speaker. The title and many of the functions of the latter officer are borrowed from the usage of the house of commons. Several instances of protracted parliamentary "dead-lock" through the inability of the house to elect a speaker, owing to a peculiar distribution of parties, have occurred; the most notable having been in 1857 and in 1859, when the house remained for weeks unorganized, the clerk presiding. The speaker of the house possesses unprecedented and enormous powers, not only in wielding the sole authority to appoint all standing and select committees, with their chairmen, by which the whole legislation of congress is virtually shaped, but also in his ability to construe the rules, to award the right to the floor to any member, and to give the preference to this or that measure in the consideration of public business. (For list of speakers of the house, see CONGRESS, SESSIONS OF.)—The general conviction may be said to exist, that, under the great control over legislation and current business by the speaker, and by the powerful committee on appropriations, combined with the rigor of the rules of the house of representatives, there is less and less opportunity for individual members to make any influential mark in legislation. Independence and ability are repressed under the tyranny of the rules, and the practical power of the popular branch of congress is concentrated in the speaker and a few—a very few—expert parliamentarians.

A. R. SPOFFORD.

CONGRESS, Continental (IN U. S. HISTORY).

When the attempt of George III. to govern his American dominions through his British parliament had become patent, it was evident that separate resistance by the individual American assemblies would only result in failure, and that some representative body for all the colonies was a necessity for united resistance. Such a union had been attempted for other purposes in 1754 (see ALBANY PLAN OF UNION), and Franklin, who had then been a leading advocate of union, now first renewed the suggestion in a letter of July 7, 1773, to the assembly of Massachusetts,

of which colony he was the agent in London. The first step was taken by the Virginia assembly in May, 1774, upon receipt of news of the passage of the Boston port bill. (See REVOLUTION.) Its members advised the local committee of correspondence at Williamsburgh to suggest to the other colonial committees the calling of a continental congress, that is, a meeting of delegates from all the English colonies on the continent, for the hope was long cherished that the Canadian colonies would make common cause with their brethren south of the great lakes and the St. Lawrence. June 7, the Massachusetts assembly named a time and appointed delegates to the proposed congress. Other colonies followed the example, and the result was the meeting of the first continental congress (see STAMP ACT CONGRESS), "the delegates appointed by the good people of these colonies," which met at Philadelphia, Sept. 5, 1774, Georgia alone being unrepresented, though it took part in succeeding congresses. The North Carolina delegates did not arrive until Sept. 14.—In calling any such deliberative assembly of their own volition, and without the previous assent of him whom they still ingenuously acknowledged to be "their sovereign lord, the king," the colonies evidently took the difficult first step on the straight road toward rebellion and revolution. Neither the delegates nor their principals, however, thought of such a result. The powers given by the colonies were all alike advisory, and limited to the recommendation of such measures as would restore harmony between Great Britain and the colonies. The action of this congress was therefore confined to a declaration of the rights and wrongs of the colonies, the recommendation to their colonies of an agreement not to import British goods after Dec. 1, 1774, and not to export goods to Great Britain, Ireland, or the West Indies, after Sept. 10, 1775, unless their wrongs should be righted (see EMBARGO), and the preparation of addresses to the king, to the British people, to their own constituents, and to the people of the province of Quebec. But the germ of measures of a stronger nature may be seen in a resolution commending the people of Massachusetts for their temperate resistance to the objectionable measures of parliament, and declaring that if these acts "shall be attempted to be carried into execution *by force*, in such case all America ought to support them in their opposition."—The first congress recommended the immediate selection of delegates to a second congress, to be held at Philadelphia, May 10, 1775. Surely every man who, personally or by his acknowledged representatives, ratified the action of the first congress by choosing delegates to the second, with the resolution just cited staring him in the face, did so with the full consciousness that the proposed second congress was, in case of the application of force by the British parliament, to be a different body from the first, a revolutionary assembly, plenipotentiary in its nature, and empowered by its constituents, to use, if necessary, every means of

resistance. The delegates, therefore, when first appointed, though nominally retaining allegiance to the British crown, were potentially members of a national assembly; and the first shot fired at Lexington, April 19, 1775, crystallized thirteen of the king's American colonies into a separate nation, with their own full concurrence previously and advisedly given. The new nation, it is true, was still bound to the old by the frail tie of allegiance to a common king, but the great appanages of sovereignty, the power to make peace, war, treaties and foreign alliances, to send ambassadors, to control commerce, and open the ports of the nation to all the world, to raise and equip armies and navies, to issue national currency, to authorize letters of marque and reprisal, to create a national postal system, many of which were never enjoyed by the rival parliament of Great Britain, were exercised by the second continental congress with the hearty acquiescence of the people at large, who thus continually re-confirmed their former grant to congress of temporary but unlimited power. Indeed, the impatience of the people outran the moderation of the congress. Provincial congresses called upon the continental congress for advice, direction and complete national action; and even when the king had proclaimed the American people out of his protection, and had declared war against them by land and sea, only a strong outside pressure at last impelled congress to assume before the world the station as a national assembly which it had held for more than a year in reality, to renounce allegiance to a tyrant, and to make the United States foreign soil forever to the king and people of Great Britain. (See ALLEGIANCE, I.; DECLARATION OF INDEPENDENCE.) The scission between the two nations was thus final; the union between the constituent units of the American nation on the one hand, and of Great Britain on the other, remained undisturbed and complete as before.—The appointment of the delegates to both these congresses was generally by popular conventions, though in some instances by state assemblies. But in neither case can the appointing body be considered the original depositary of the power by which the delegates acted; for the conventions were either self-appointed "committees of safety" or hastily assembled popular gatherings, including but a small fraction of the population to be represented, and the state assemblies had no right to surrender to another body one atom of the power which had been granted to them, or to create a new power which should govern the people without their will. The source of the powers of congress is to be sought solely in the acquiescence of the people, without which every congressional resolution, with or without the benediction of popular conventions or state legislatures, would have been a mere *brutum fulmen*; and, as the congress unquestionably exercised national powers, operating over the whole country, the conclusion is inevitable that the will of the whole people is the source of national government in the

United States, even from its first imperfect appearance in the second continental congress.—The power to select delegates to what might perhaps be called the third continental congress, Dec. 20, 1776, and to succeeding sessions until the adoption of the articles of confederation, was appropriated by the state legislatures. No such right could be drawn from the articles, for they were not binding until ratified by all the states in 1781. In eight of the ten states, by which constitutions were adopted in 1776–7, the power to appoint delegates to congress was vested in the legislature. But no such power was given by the new constitution of New Jersey in 1776; no such power was given in Massachusetts until 1780, or in New Hampshire until 1784; and Connecticut until 1818, and Rhode Island until 1842, remained under the royal charters, which of course gave no such power to the legislature. And yet the legislatures of these five states continued to exercise a power of delegation to congress to which they had no claim by the organic law of state or nation. In this respect, indeed, they were only imitating their sister legislatures, most of which had actually seized the power of delegation before it was formally granted by the state constitutions; and this whole course of legislative appropriation of ungranted powers is of interest and importance as explaining the manner in which the continental congress was becoming the creature of the state legislatures even before the close of the year 1776, and the underlying cause of the peculiar character of the confederation which follows. (See STATE SOVEREIGNTY.)—The “first” and “second” continental congresses have been so called, but after the first meeting of the second congress it is impossible to specify any other distinctive congresses. The state legislatures, from their first appropriation of the right to choose delegates, chose them for varying times, and recalled them at pleasure, so that congress became a body, theoretically in perpetual session, subject to perpetual change, but with no distinct period of renewal. From the first meeting of the first congress, the delegates of each colony had but one vote; not because the collective body of delegates from each colony were the ambassadors from a sovereign and independent state, but because, as the first congress was careful to specify, there was no present means of ascertaining the relative number of citizens in the separate colonies. By usage this mode of voting soon hardened into custom, and the smaller states finally claimed as a right, and embodied in the confederation, that which was originally due only to the lack of a census, and of which the constitution retained a remnant in the senate. (See COMPROMISES, I.) A comparison of the machinery and functions of the old Germanic diet with those of the continental congress would very plainly show the marked differences between an assemblage of ambassadors and the true, though imperfect, national government of the American revolution.—It has just been said that the revolutionary con-

gress was a true, though imperfect, type of national government. It was imperfect in that it never ventured to claim three important functions of a national assembly: 1, it never attempted to lay general taxes, or control individuals, being content with recommendations to the states to lay the taxes and make the laws necessary for each case as it arose; 2, it made no attempt to regulate the mode of election or term of service of its members, leaving those matters also to the discretion of the states; and 3, it did not lay claim to the allegiance of the citizens of the whole country, but yielded that badge of sovereignty to the states. (See ALLEGIANCE, I.) On the slender foundation of these three omissions, which passed into the frame of the confederation, has been erected the whole argument against the national nature of the revolutionary government; and the mere statement of the basis of this objection, as compared with the mass of national power actually exercised by the continental congress, is sufficient to show the weakness of the argument. But it is necessary to notice, further, that the continental congress, to which the power of the sword had been confided by the will of the people, had an unquestionable right, by the laws of war, not only to regulate these three unregulated matters, but even to abolish slavery, to order a general draft, and to confiscate the last dollar in the country, so long as the country remained the theatre of a war which the people were bent upon continuing. The doctrine is harsh, but it is the recognized law of war, and controls, by the necessity of the case, the laws and constitution of every civilized nation in which war is flagrant. (See WAR POWERS.) Of course it does not apply to a country which is waging a war beyond its own limits; only the right of self-preservation can thus stand above the laws. The few omissions of the revolutionary government, then, to do that which it had a right to do, can not militate against the evident intention of the people to establish and support a national government.—Apart from its assumption of such national powers as the poverty of the country, the difficulties of communication, and the lack of material left feasible, the most important political work of the continental congress was its long continued effort to transform itself from a revolutionary assembly into a representative body limited by law. June 10, 1776, the day on which the committee was appointed to prepare a declaration of independence, a committee of one from each colony was appointed “to prepare and digest the form of a confederation to be entered into between these colonies.” Its report was made July 12, debated until Aug. 20, and dropped until April 8, 1777. It was then resumed, debated and amended, and was finally adopted Nov. 15, and recommended to the state legislatures for ratification in a circular letter of Nov. 17. By instructions from the state legislatures the articles were signed by the delegates of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Con-

necticut, New York, Pennsylvania, Virginia and South Carolina, July 9, 1778; of North Carolina, July 21; of Georgia, July 24; of New Jersey, Nov. 26; of Delaware, May 5, 1779; and of Maryland, March 1, 1781. The delay of the last three states in signing was due to the omission of the articles to make any provision for dividing the western lands among all the states (see TERRITORIES), and they only signed at last in the full confidence that those states whose nominal boundaries extended indefinitely west would resign their pretensions to the lands which were conquered by the common exertions of all the states. New Jersey interposed the further and more farsighted objection that the articles were defective in not giving the general government the control of commerce. March 2, the revolutionary congress changed its basis of existence, and began its short-lived career as the congress of the confederation. (See CONFEDERATION, ARTICLES OF.)

—Most of the state legislatures, as has been said, originally usurped the power to choose delegates to congress. When we come to the further question of the right of the legislatures to ratify and make valid that which their new servant, the continental congress, had offered for their ratification—a scheme of government which was professedly a league or treaty between sovereign and independent states—the usurpation becomes yet more glaring. Whence did the legislatures derive those “competent powers” with which the congress invited them to invest the delegates of their states for signing the articles of confederation? They can not be found in the state constitutions, not one of which authorized its legislature to form any league or treaty with other states; nor in any claim of a revolutionary and unlimited character for the legislatures, for they were all expressly limited by the organic law of the states, their charters or constitutions; nor in the undefined boundaries of legislative power, for the treaty power is essentially an executive, not a legislative, power, except so far as the legislative is admitted to it by the organic law. If, then, we are not to consider the articles of confederation as the extra-legislative and usurping action of state legislatures, we must look for their basis in the revolutionary character of the congress which framed them and which chose to offer them to the state legislatures for decision; and thus we are forced back again to the will of the whole people as the source even of the clumsy national government of the confederation. [The many instances in which the particularist bias of the American people caused their actions, and those of their representatives, to swerve from the straight line of theory, are considered under DECLARATION OF INDEPENDENCE, and STATE SOVEREIGNTY.]—Appended is a summary of the successive sessions and locations (see CAPITAL, NATIONAL) of the continental congress, before and after the adoption of the articles of confederation. After Oct. 21, 1788, the congress was nominally kept in existence in New York city by

occasional meetings of a few delegates for the purpose only of adjournment, until the inauguration of the new federal government under the constitution. Sept. 5, 1774–Oct. 26, 1774, Philadelphia, Pa.; May 10, 1775–Dec. 12, 1776, Philadelphia, Pa.; Dec. 20, 1776–March 4, 1777, Baltimore, Md.; March 4, 1777–Sept. 18, 1777, Philadelphia, Pa.; Sept. 27, 1777, Lancaster, Pa.; Sept. 30, 1777–June 27, 1778, York, Pa.; July 2, 1778–June 21, 1783, Philadelphia, Pa.; June 30, 1783–Nov. 4, 1783, Princeton, N. J.; Nov. 26, 1783–June 3, 1784, Annapolis, Md.; Nov. 1, 1784–Dec. 24, 1784, Trenton, N. J.; Jan. 11, 1785–Nov. 4, 1785, New York city; Nov. 7, 1785–Nov. 3, 1786, New York city; Nov. 6, 1786–Oct. 30, 1787, New York city; Nov. 5, 1787–Oct. 21, 1788, New York city. (See UNITED STATES; STAMP ACT CONGRESS; CONFEDERATION, ARTICLES OF; REVOLUTION; ORDINANCE OF 1787; ANNEXATIONS, I.; STATE SOVEREIGNTY.)—See 8 Franklin's *Works*, 63; 1 Pitkin's *United States*, 282; 3 Burk's *History of Virginia*, 379; 1 Gordon's *History of the Revolution*, 239; 1 Marshall's *Washington*, 29; 7–9 Bancroft's *United States*; 3 Hildreth's *United States*; 1 von Holst's *United States*, 1–30; 1 Schouler's *United States*, 1–56; 1 Curtis' *History of the Constitution*, 1–137; Story's *Commentaries*, §§ 198–228; Frothingham's *Rise of the Republic*; Niles' *Principles and Acts of the Revolution*; Greene's *Historical View of the Revolution*, 78–135; 2 Adams' *Works of John Adams* (notes of debates in Cont. Cong.); 1–4 *Public Journals of Congress* (to March 3, 1789); 1 *Secret Journals of Congress* (domestic affairs, 1774–88); 1 *Stat. at Large* (Bioren and Duane's ed.) 1–60; 1 Stephens' *War Between the States*, 52–81; 1 Calhoun's *Works* (disq. on government); Pollard's *Last Cause* (cap. 1); Poore's *Political Register*, and *Federal and State Constitutions*; and authorities under CONSTITUTION, IV.

ALEXANDER JOHNSTON.

CONGRESS, Peace. (See CONFERENCE, PEACE.)

CONGRESS, Powers of, (IN U. S. HISTORY). Many of the powers given to congress by the constitution, such as the power to provide and maintain a navy, fall necessarily outside of the limits of party and political discussion. But there are others, such as the power to regulate commerce, which constantly provoke party contest; and on these the law, so far as it has been settled by the courts, is given below (see CONSTRUCTION, III.), the principles being necessarily given in very general terms. 1. As a preliminary it must be laid down that the powers of congress are enumerated, not defined, in the constitution; that those powers were granted, not by the states, but by the people; that any power not enumerated among those granted to congress or prohibited to the states is reserved to the states or to the people; but that, in the exercise of the powers which have been delegated to congress, its powers are plenary,

absolute and unlimited, and it is "as omnipotent as any other supreme legislative body within its own sphere." (See 4 Wheat., 316; 9 Wheat., 1; 27 N. Y., 400; 12 Wheat., 419; 1 Wheat., 304; 12 Wall., 457.) The manner and extent of the exercise of its powers are questions of party contest, not of constitutional law.—II. Congress has power (under Art. I., § 8, ¶ 1) to lay taxes to any extent, and in its discretion: except that 1, direct and capitation taxes shall be apportioned; 2, that duties, imposts and excises shall be uniform throughout the United States; and 3, that no duties shall be imposed upon articles exported from any state. If the taxes are oppressive, congress is responsible not to the courts but to the people. But as the federal and state governments are never to interfere with one another, congress can not tax state officials, state institutions, or the agencies employed by state executives, legislatures or judiciaries in the proper performance of their duties. (See 7 How., 283; 7 Wall., 433; 5 Wheat., 317; 15 Wall., 112; 8 Wall., 533; 22 Ind., 276; 11 Wall., 113; 1 Bush, 239; 17 Wall., 322.)—III. Congress has power (under ¶ 1) to borrow money on the credit of the United States, and implied in this is the power to issue securities or evidences of debt, such as treasury notes. To increase the credit of the United States congress may make such evidences of debt a legal tender for debts, public or private, and may restrain the circulation as money of any notes not issued by itself. (See 27 N. Y., 400; 8 Wall., 533; 39 Barb., 427; 2 Duval, 20; 22 Ind., 282.)—IV. Congress has power (under ¶ 3) to regulate commerce, including in the word commerce every variety of intercourse for purposes of trade, by land or water, external or internal, the carrying of passengers or of freight, the ships, seamen and officers, railroads and telegraphs, and the individuals or corporations owning them. (See 9 Wheat., 1; 17 Johns., 488; 4 Johns. Ch., 150; 7 How., 283; 91 U. S., 275; 4 Denio, 469; 15 Wall., 232; 31 N. J., 531; 3 Wall., 168; 8 Cal., 363; 12 How., 299; 2 Story, 455; 16 Wall., 557.) The term includes also the control and improvement of navigable rivers, salt or fresh, employed in foreign or inter-state commerce. (See 4 Wash. C. C., 371; 3 Wall., 713; 10 Wall., 557; 1 Brown, 193; 20 Wall., 439; 93 U. S., 4.) But it does not include the intercourse of citizens within the limits of a single state, which remains under state control, so long as it does not affect general commerce. (See 20 How., 84; 9 Wheat., 1; 19 Wall., 581; 61 Mass., 53; 28 Ind., 257; Newb., 241, 256; 23 N. J., 206, 4 McLean, 286.) Nor does it prohibit the exercise of police power by the states, when not aimed at the regulation of commerce. (See 11 Pet., 102; 6 Cow., 169; 16 Grat., 139; 19 How., 71; 4 Wash. C. C., 371; 6 McLean, 237.) In the exercise of its discretion congress may so regulate commerce as shall best conduce to the general interests of the country. (See 2 Am. L. J., 255; 9 How., 560; 10 Wall., 557; 1 Brown, 193.) What regulations it shall make is a question of party

contest, not of constitutional law.—V. Congress has power (under ¶ 4) to establish a uniform rule of naturalization, and uniform bankruptcy laws throughout the United States. The former power is, not to naturalize, but to lay down a uniform rule by which the states shall naturalize. (See 19 How., 393; 5 Cal., 300; 50 N. H., 245.) The latter power, when exercised, supersedes and suspends all state insolvent laws. (See 4 Wheat., 122; 2 Ired., 463. See also, 12 Wheat., 213, and Webster's argument, 6 Webster's Works, 24.)—VI. Congress has power (under ¶ 5) to coin money, and by this is plainly meant metallic money. (See 27 N. Y., 400; 39 Barb., 427; 2 Duval, 20.) But this does not exclude the war power of congress to make treasury notes a legal tender. (See 12 Wall., 457; 22 Ind., 282; 27 N. Y., 400; 13 Wall., 604; 15 Wall., 195; and authorities under WAR POWER.)—VII. Congress has power (under ¶ 11) to declare war and to prosecute it by all the legitimate methods known to international law. It may suppress rebellion, confiscate the property of public enemies, foreign or domestic, may emancipate their slaves, may prohibit intercourse with them, and (see cases last above cited) may make treasury notes legal tender. (See 7 Wall., 700; 2 Black., 635; 11 Wall., 268, 331; 1 Blatch. Pr., 119; 2 Sprague, 123; 63 N. C., 131; 25 Ark., 625.) It may acquire territory, by conquest or treaty. (See 1 Pet., 511; 9 How., 603.) For the further power, as a result of civil war, to reconstruct rebellious states, see under XII.—VIII. Congress has power (under ¶ 12) to raise armies, and this includes the power to do so by draft or conscription, as well as by volunteering. (See 23 Wis., 423; 45 Penn., 238; 3 Grant, 465; 32 Conn., 118; 45 N. H., 544.) When congress (under ¶¶ 13 and 16) proceeds to call forth and organize the militia, it is no longer state but national militia. (See cases last cited, and 5 Wheat., 1; 80 Mass., 548; 27 N. Y., 400; 7 Wall., 700.)—IX. Congress has power (under ¶ 18) to make all laws which shall be necessary and proper for carrying its powers into execution. This carries permission for congress to legislate on the vast mass of incidental powers implied in the constitution. (See 4 Wheat., 316; 2 A. K. Marsh., 75; 9 How., 560; 2 Cranch, 358.) But it does not operate to limit or restrain the powers of congress; any law which is either indispensably necessary, very necessary, or simply necessary, may be passed under it. (See cases last cited, and 12 Wall., 457; 27 N. Y., 400; 16 Pet., 539, 16 Barb., 268; 10 Wheat., 51.) The governing principle is that assigned in *McCulloch vs. State* (4 Wheat., 316), that a government which has a right to do an act, and has imposed upon it the duty of performing that act, must, according to the dictates of reason, be allowed to select that means which seems to it necessary and proper. (See also BANK CONTROVERSIES, II.)—X. Congress alone, not the president or any of his subordinates, has the power (under § 9, ¶ 2) to suspend the privilege of the writ of *habeas corpus*. (See 21 Ind., 370; 16

Wis., 359; 1 Deady, 233; 1 Abb. C. C., 212; Tane, 246; 3 Mart., 531.) But congress, by statute, may authorize the president to suspend the writ. (See cases last cited; 17 Wis., 681; and authorities under HABEAS CORPUS.)—XI. Congress has power (under Art. IV., § 3) to govern the territories, either by forming a territorial government, or directly by its own laws. (See 19 How., 393; 14 Pet., 526; 6 McLean, 517; 11 Mart., 309; 1 Pet., 511; 6 Cranch, 332; 1 Oregon, 418.)—XII. Congress has power (under § 4) to prescribe the terms on which a rebellious state shall be again recognized as a member of the Union, and when such a state has accepted the terms, and been recognized by congress, it is forever estopped to deny their validity. (See 7 Wall., 700; 7 How., 1; 39 Geo., 285, 425; 43 Ala., 469; 41 Mo., 63; 13 Wall., 646, 39 Geo., 306; 16 Wall., 46)—XIII. Congress has power (under Amendment XIV.) to interfere to prevent any denial of equal rights to all citizens which springs from state laws, or from the general conflict between the white and black races, but not to punish or prevent those crimes which spring from the ordinary felonious or criminal intent of individuals. (See 1 Woods, 308; 92 U. S., 542; 16 Wall., 63; 100 U. S., 265, 310, 345, 385.) XIV. Congress has power (under Amendment XV.) to prevent the states from withholding the franchise on account of race, color, or previous condition of servitude, but not to prevent the states from withholding it for other reasons. (See cases last cited, and 7 Kans., 50; 3 Oregon, 568; 92 U. S., 214; 43 Cal., 43; 14 A. L. Reg., 105, 238; 95 U. S., 470.)—See, in general, Bump's *Constitutional Decisions*, and the copious notes of decisions on the separate sections of the constitution in Smith's *Manual of the House of Representatives*, taken from the *Revised Statutes*.

ALEXANDER JOHNSTON.

CONGRESS, Sessions of, (IN U. S. HISTORY).

The first two sessions of the 1st congress were held at New York; until the end of the first session of the 6th congress, all the sessions were held at Philadelphia; since that time congress has met at Washington. (See CAPITAL, NATIONAL.) Below will be found the dates of the meeting and adjournment of each session of each congress, together with the names of the successive speakers of the house. Democratic speakers are printed in Roman; federalist, whig and republican speakers in italic. The presiding officer in the senate is the vice-president (see ADMINISTRATIONS). I.: 1. March 4—Sept. 29, 1789; 2. Jan. 4—Aug. 12, 1790; 3. Dec. 6, 1790—March 3, 1791. F. A. Muhlenbergh, Pa.—II.: 1. Oct. 24, 1791—May 8, 1792; 2. Nov. 5, 1792—March 2, 1793. Jonathan Trumbull, Conn.—III.: 1. Dec. 2, 1793—June 9, 1794; 2. Nov. 3, 1794—March 3, 1795. F. A. Muhlenbergh, Pa.—IV.: 1. Dec. 7, 1795—June 1, 1796; 2. Dec. 5, 1796—March 3, 1797. Jonathan Dayton, N. J.—V.: 1. May 15—July 10, 1797; 2. Nov. 13, 1797—July 16, 1798; 3. Dec. 3, 1798—March 3, 1799. Jonathan Dayton, N. J.—VI.:

1. Dec. 2, 1799—May 14, 1800; 2. Nov. 17, 1800—March 3, 1801. *Theo. Sedgwick*, Mass.—VII.: 1. Dec. 7, 1801—May 3, 1802; 2. Dec. 6, 1802—March 3, 1803. Nathaniel Macon, N. C.—VIII.: 1. Oct. 17, 1803—March 27, 1804; 2. Nov. 5, 1804—March 3, 1805. Nathaniel Macon, N. C.—IX.: 1. Dec. 2, 1805—April 21, 1806; 2. Dec. 1, 1806—March 3, 1807. Nathaniel Macon, N. C.—X.: 1. Oct. 26, 1807—April 25, 1808; 2. Nov. 7, 1808—March 3, 1809. Joseph B. Varnum, Mass.—XI.: 1. May 22—June 28, 1809; 2. Nov. 27, 1809—May 1, 1810; 3. Dec. 3, 1810—March 3, 1811. Joseph B. Varnum, Mass.—XII.: 1. Nov. 4, 1811—July 6, 1812; 2. Nov. 2, 1812—March 3, 1813. Henry Clay, Ky.—XIII.: 1. May 24—Aug. 2, 1813; 2. Dec. 6, 1813—April 18, 1814; 3. Sept. 19, 1814—March 3, 1815. 1. Henry Clay, Ky. 2. Langdon Cheves, S. C.—XIV.: 1. Dec. 4, 1815—April 30, 1816; 2. Dec. 2, 1816—March 3, 1817. Henry Clay, Ky.—XV.: 1. Dec. 1, 1817—April 30, 1818; 2. Nov. 16, 1818—March 3, 1819. Henry Clay, Ky.—XVI.: 1. Dec. 6, 1819—May 15, 1820; 2. Nov. 13, 1820—March 3, 1821. 1. Henry Clay, Ky. 2. John W. Taylor, N. Y.—XVII.: 1. Dec. 3, 1821—May 8, 1822; 2. Dec. 2, 1822—March 3, 1823. Philip P. Barbour, Va.—XVIII.: 1. Dec. 1, 1823—May 27, 1824; 2. Dec. 6, 1824—March 3, 1825. Henry Clay, Ky.—XIX.: 1. Dec. 5, 1825—May 22, 1826; 2. Dec. 4, 1826—March 3, 1827. John W. Taylor, N. Y.—XX.: 1. Dec. 3, 1827—May 26, 1828; 2. Dec. 1, 1828—March 3, 1829. Andrew Stevenson, Va.—XXI.: 1. Dec. 7, 1829—May 31, 1830; 2. Dec. 6, 1830—March 3, 1831. Andrew Stevenson, Va.—XXII.: 1. Dec. 5, 1831—July 16, 1832; 2. Dec. 3, 1832—March 3, 1833. Andrew Stevenson, Va.—XXIII.: 1. Dec. 2, 1833—June 30, 1834; 2. Dec. 1, 1834—March 3, 1835. 1. Andrew Stevenson, Va. 2. John Bell, Tenn.—XXIV.: 1. Dec. 7, 1835—July 4, 1836; 2. Dec. 5, 1836—March 3, 1837. Jas. K. Polk, Tenn.—XXV.: 1. Sept. 4—Oct. 16, 1837; 2. Dec. 4, 1837—July 9, 1838; 3. Dec. 3, 1838—March 3, 1839. Jas. K. Polk, Tenn.—XXVI.: 1. Dec. 2, 1839—July 21, 1840; 2. Dec. 7, 1840—March 3, 1841. R. M. T. Hunter, Va.—XXVII.: 1. May 31—Sept. 13, 1841; 2. Dec. 6, 1841—Aug. 31, 1842; 3. Dec. 5, 1842—March 3, 1843. John White, Ky.—XXVIII.: 1. Dec. 4, 1843—June 17, 1844; 2. Dec. 2, 1844—March 3, 1845. John W. Jones, Va.—XXIX.: 1. Dec. 1, 1845—Aug. 10, 1846; 2. Dec. 7, 1846—March 3, 1847. John W. Davis, Ind.—XXX.: 1. Dec. 6, 1847—Aug. 14, 1848; 2. Dec. 4, 1848—March 3, 1849. Robert C. Winthrop, Mass.—XXXI.: 1. Dec. 3, 1849—Sept. 30, 1850; 2. Dec. 2, 1850—March 3, 1851. Howell Cobb, Ga.—XXXII.: 1. Dec. 1, 1851—Aug. 31, 1852; 2. Dec. 6, 1852—March 3, 1853. Linn Boyd, Ky.—XXXIII.: 1. Dec. 5, 1853—Aug. 7, 1854; 2. Dec. 4, 1854—March 3, 1855. Linn Boyd, Ky.—XXXIV.: 1. Dec. 3, 1855—Aug. 18, 1856; 2. Aug. 21—30, 1856; 3. Dec. 1, 1856—March 3, 1857. N. P. Banks, Mass.—XXXV.: 1. Dec. 7, 1857—June 1, 1858; 2. Dec. 6, 1858—March 3, 1859. Jas. L. Orr, S. C.—XXXVI.: 1. Dec. 5, 1859—June 18,

1860; 2. Dec. 3, 1860—March 3, 1861. *Wm. Pennington*, N. J.—XXXVII.: 1. July 4—Aug. 6, 1861; 2. Dec. 2, 1861—July 17, 1862; 3. Dec. 1, 1862—March 3, 1863. *Galusha A. Grow*, Pa.—XXXVIII.: 1. Dec. 7, 1863—July 2, 1864; 2. Dec. 5, 1864—March 3, 1865. *Schuyler Colfax*, Ind.—XXXIX.: 1. Dec. 4, 1865—July 28, 1866; 2. Dec. 3, 1866—March 3, 1867. *Schuyler Colfax*, Ind.—XL.: 1. March 4—30, July 3—20, Nov. 21—Dec. 2, 1867; 2. Dec. 2, 1867—July 27, Sept. 21, Oct. 16, and Nov. 10, 1868; 3. Dec. 7, 1868—March 3, 1869. *Schuyler Colfax*, Ind.—XLI.: 1. March 4—April 10, 1869; 2. Dec. 6, 1869—July 15, 1870; 3. Dec. 5, 1870—March 3, 1871. *Jas. G. Blaine*, Me.—XLII.: 1. March 4—April 20, 1871; 2. Dec. 4, 1871—June 10, 1872; 3. Dec. 2, 1872—March 3, 1873. *Jas. G. Blaine*, Me.—XLIII.: 1. Dec. 1, 1873—June 23, 1874; 2. Dec. 7, 1874—March 3, 1875. *Jas. G. Blaine*, Me.—XLIV.: 1. Dec. 6, 1875—Aug. 15, 1876, 2. Dec. 4, 1876—March 3, 1877. 1. *M. L. Kerr*, Ind.; 2. *S. J. Randall*, Pa.—XLV.: 1. Oct. 15—Dec. 3, 1877; 2. Dec. 3, 1877—June 20, 1878; 3. Dec. 2, 1878—March 3, 1879. *S. J. Randall*, Pa.—XLVI.: 1. March 18—July 1, 1879; 2. Dec. 1, 1879—June 16, 1880; 3. Dec. 6, 1880—March 3, 1881. *S. J. Randall*, Pa. (See CONTINENTAL CONGRESS.)—See *Poore's Political Register*, 4-204.

ALEXANDER JOHNSTON.

CONKLING, Roscoe, was born at Albany, N. Y., Oct. 30, 1829, practiced law in Utica, N. Y., was a representative in congress (republican) 1859-67, and United States senator 1867-81. He was one of the candidates for the republican nomination for the presidency in 1876, and is at present (1881) one of the leaders of the republican party.

A. J.

CONNECTICUT, a state of the American Union. Its first or provisional government was formed under a commission from the Massachusetts legislature, March 3, 1636, to eight of the settlers on "the river of Connecticut." Jan. 14, 1636, there was formed a quasi constitution, directing all magistrates, including the governor, to be chosen annually by popular vote, a tenure continued until 1876 in the case of the governor though efficient officers have been usually re-elected. In 1876 the governor's term was lengthened to two years. Hartford and New Haven remained separate colonies until their acceptance of the charter of 1662, and the memory of the division was retained in the two capitals of the state, Hartford and New Haven, until 1875, when Hartford was made sole capital. April 23, 1662, Charles II. granted the colony a charter, which continued the popular election of governors and legislatures and gave to the colonial government the appointment of judges. The boundaries assigned were as follows: "Bounded on the East by Narraganset-River, commonly called Narraganset-Bay, where the said River falleth into the Sea; and on the North by the Line of the Massa-

chusetts-Plantation; and on the South by the Sea; and in Longitude as the Line of the Massachusetts-Colony, running from East to West, That is to say, From the said Narraganset-Bay on the East to the South Sea on the West Part." (See TERRITORIES, NEW YORK, MASSACHUSETTS, RHODE ISLAND.) This very democratic charter was made the constitution of the "free, sovereign and independent state" of Connecticut in 1776 by statute. Oct. 5, 1818, by a close vote (13,918 to 12,361), a new constitution was adopted, whose main political change was an extension of the right of suffrage, which had hitherto been in those made freemen by the towns, to all white males, 21 years old, of good moral character, having a freehold of \$7 annually or paying a state tax. The property qualification has since been abolished, and an educational requisite (ability to read) has been added, but the character qualification is still in force. (See CONSTITUTIONS, STATE. For the disputed title to Wyoming, see WYOMING, PENNSYLVANIA.)—In national politics the course of Connecticut has been almost unwaveringly anti-democratic. It has cast its electoral vote for the federalist, whig or republican candidates at every presidential election except four: 1820, 1836, 1852 and 1876. After the downfall of the federal party in 1800, Connecticut and Delaware were the only states which, so long as there were federalists to vote for, voted for federalists at every election. In 1820 these two states at last joined with all the others in voting for Monroe, but at the first opportunity, in 1824, both returned to a broad constructionist candidate, John Quincy Adams. In 1836 Van Buren's majority over Harrison was but 768 out of a total of 37,700 votes. In 1852 the state went to Pierce through the defection from the whigs of about 3,000 free-soil votes. In 1876 Tilden's majority over all was but 1,712 out of a total of 122,156 votes. But, notwithstanding this almost constant vote against the democratic party, the majorities have generally been proportionally very small, and the democratic organization in the state has always been strong and active. In 1818, after a struggle of many years, it forced from its federalist opponents the new constitution above referred to, with an extension of the suffrage. Since that time its existence in the state has been maintained by the almost even balance of success between the two parties in the annually recurring state elections. The state may therefore be classed in general as republican (in 1881) in national politics, and extremely doubtful in state politics. In one year (1868) the state chose republican electors and a democratic governor.—The name of the state was taken from the name of its principal river, an Indian word meaning *Long River*. The popular name is either *The Nutmeg State*, or *The Land of Steady Habits*. —GOVERNORS (since 1776): Jonathan Trumbull (1776-83), Matthew Griswold (1784), Samuel Huntington (1785-95), Oliver Wolcott (1796-7), Jonathan Trumbull (1798-1808), John Treadwell

(1809-10), Roger Griswold (1811-12), John Cotton Smith (1813-16), Oliver Wolcott (1817-26), Gideon Tomlinson (1827-30), John S. Peters (1831-2), H. W. Edwards (1833), Samuel A. Foote (1834), H. W. Edwards (1835-7), W. W. Ellsworth (1838-41), C. F. Cleveland (1842-3), Roger S. Baldwin (1844-5), Clark Bissell (1846-8), Joseph Trumbull (1849), Thomas H. Seymour (1850-53), Henry Dutton (1854), W. T. Minor (1855-6), A. H. Holley (1857), W. A. Buckingham (1858-65), Jos. R. Hawley (1866), Jas. E. English (1867-8), Marshall Jewell (1869), Jas. F. English (1870), Marshall Jewell (1871-2), Charles R. Ingersoll (1873-5), R. D. Hubbard (1876-8), Charles B. Andrews (1878-80), H. B. Bigelow (1880-82) — See Hildreth's *United States*; Barber's *Connecticut Historical Collections*; Hollister's *History of Connecticut*; *Connecticut Registers* (annual); *Tribune Almanac* (1838-81); *Connecticut Democratic Year Book* for 1880; Carpenter and Arthur's *History of Connecticut*; Dwight's *History of Connecticut*; Trumbull's *History of Connecticut*; Bushnell's *Work and Play*; and authorities under BLUE LAWS; WYOMING; Croffutt and Morris' *Civil and Military History of Connecticut during the War*.

ALEXANDER JOHNSTON.

CONQUEST is a fact which has its place and its marked significance in the growth of humanity, and which, among civilized nations, is subject to certain rules. It has its philosophy as well as its rights, and should therefore be examined as well in its historical manifestations as from the point of view of international law.—I. Historically, conquest has demonstrated its *raison d'être* in all the grand phases through which humanity has passed. Whether it be a fatality inherent in the nature of man, or merely a transitory fact, as the disciples of the abbé St. Pierre hope, it is unfortunately not to be denied that it is through blood and ruin that great political and social changes are effected. Every nation forms its own code of laws by which it is governed as long as it endures; but above this code, formal and transient as the society which it serves as a rule, towers the great law of endless human progress. Nations are sometimes delayed in the performance of the mission with which they are charged. They finally accomplish it, but are unable in time to see that their task is over. Their regeneration is then effected by the intervention of another race or of a rival nation, which comes to occupy the vacant place, and to employ the ruins of the old in the building of the new, until such time as it itself disappears in one of the ceaseless evolutions of growing humanity. It is undoubtedly sad to be forced to admit that peace does not always attend the march of progress, and that a moment comes when the internal vital principle of nations no longer suffices for their development, and when conflict becomes a necessity in order to preserve the creative power of thought; but, on the other hand, there is a philosophic consolation in acknowledging that these violent struggles of one

people with another, of one race with another, are almost never fruitless, and are beneficent in their final consequences. The wars of the Greeks against the Persians were among the most powerful agents of civilization in antiquity; and it is enough to recall the magnificent chapter of Montesquieu on Alexander the Great (*Spirit of Laws*, book x., chapter 14) in order to see how narrow is the view of those who find in the expedition of the Macedonian hero the mere caprice of a young man thirsty for praise and glory. Alexander was the apostle of Hellenism; but, at the same time, he initiated the west into the mysterious teachings of the east. He was the founder of that mixed society in which Greek, Egyptian, Jew, Phœnician and Persian, by blending their sacred mysteries, their philosophic and religious doctrines, prepared the world for the advent of Christianity. Alexander's empire brought men to see their moral unity and their common ties; and for this reason there are no more fruitful events in history than the triumphs of this man. But there was in his work, as in general there was in all the work of Greece, more genius than persistent force. With her sovereign grace and her youthful generosity, Greece sowed everywhere along her passage germs of marvelous fecundity, but she left their free development to the future; she created worlds, but she did nothing to reduce them to order. Organizing genius fell to the lot of Rome. From conquest to conquest, Rome forced the ancient world into the *orbis Romanus*, and stamped upon the nations so profound an imprint of her power that it is visible to the present day. The Greeks had brought together, and to a certain extent had blended, the east and the west: the Romans, although heirs of Greece, had as their special mission the founding of the western world. Their gift of command, their vocation to conquer and absorb, had so absolute a character, that, in spite of the numerous and indelible traces of their action, it is still debated whether their mission was a benefit to humanity or not. Rome assimilated the conquered nations to herself, but she did so only after she had crushed them to the earth.—She had received rich and populous countries under her administrative yoke, and depopulation extended by degrees over the provinces of the empire. But, notwithstanding her enervation, Rome did not dream of changing the motive principle of her policy, which consisted in absorbing the world into herself, and in consuming wealth without producing it. In the midst of her agony she went on further and further regulating and exhausting the provinces, but she did not cease to reign till after she had established the unity of Europe. It is during this period of exhaustion which marks the end of ancient society, that the third conquerors of the civilized world appeared. The Germans entered the deserted lands of the last of the Cæsars, as much in the character of colonists as of conquerors. With little of civilization about them, they allowed

themselves easily to be guided by that portion of Roman society which still stood erect, but they changed it none the less, by inoculating it with a principle unknown to Greeks and Romans, that of individual liberty. Although it appeared under the form of a privilege, this fruitful principle held within its bosom the whole future. It breathed life into Christianity, which had lost in the ancient world its regenerating virtue, because it had none to speak to but souls debased and trained in slavery. Charlemagne, by compromising between the genius of Rome and that of the German race, extended by his conquests the reign of Christian civilization over countries and peoples unknown to the ancient rulers of the earth, and laid the foundations of modern society. The middle ages lived on Carolingian ideas, vibrating unceasingly between the instincts of liberty placed in their hearts by the infusion of German blood and the principles of authority represented by Rome, as well in imperial legislation as in the spiritual domain.—After having shaken off the spiritual yoke of Rome, in the sixteenth century, Germany remained subject to the yoke of *servitudes* created by the middle ages, or, in the course of time, by the doctors of Roman law. It was reserved for a nation whose universal mission was not yet known to do away with the antiquated forms of the middle ages, and to show what were the logical conclusions from premises laid down by preceding centuries. Unit- ing the dash and spiritualism of the Gauls to the organizing genius of Rome and the pride of the Germans, France, by her prolonged struggles in the sixteenth century, had saved the principle of intellectual freedom. Preserved in this way from the spiritual death of Italy and Spain, she presented to the world the new and astonishing spectacle of a society beginning its own regeneration by virtue only of its internal power. Until then, nations had perished rather than change. France inaugurated a new era by showing that the modern epoch possesses in itself the power of a second birth. This lesson, the first and greatest taught by the French revolution, did not prevent that revolution from passing beyond the borders of France, thanks to foreign aggression. During a war which lasted 20 years, all Europe was in convulsion, and the name of Napoleon was added to the names of Alexander, Cæsar and Charlemagne. In pushing the conquests of France beyond the limits traced by her in her most ambitious dreams, Napoleon became an instrument to spread the principles of the revolution. It matters little that his immense and numerous enterprises attracted the hatred of subjugated peoples as much as they did their admiration. The same measure can not be applied to grand and terrible characters like him as to other men. It remains true, in spite of every adverse denial, that the Napoleonic conquests were triumphs of modern civilization over an effete society; that everywhere they gave the death blow to the middle ages, shook up everything in Europe; and

that the impulse they gave Europe continues yet. —This brief sketch shows that there are civilizing wars and conquests; but, unfortunately, there are others which bring no compensation. It is possible to find an historical significance in the conquests of Attila. In his wanderings he drew all the north in his train, and was at least an incident in the great invasion of the empire. But the mind is bewildered at the sight of the conquests of oriental despots, of Gengis Khan, Tamerlane or Bajazet. Why did these men cross a part of the habitable globe like a lightning flash, piling up ruins and heaping up victims, and yet do nothing, as Montesquieu expresses it, "toward paying the immense debt they had contracted toward humanity"? When Bajazet was brought, a prisoner, into the presence of Tamerlane, the latter, after looking at him for a moment, began to laugh. Bajazet, having reminded him of the instability of fortune, reproached him for not pitying his distress. "I know what you wish to say," said the conqueror, "and I have no desire to insult you in your defeat; but I say that all the kingdoms of the earth must have little value in the eyes of God or in themselves that they should be given up to a wretched one-eyed man like you, or to a wretched cripple like me." The contempt of humanity which these words breathe, the absence of an ideal which they denote, enable us to measure the distance which separates the barbarian from the civilized hero. The Turkish and Tartar conquerors, descended from the highlands of Asia, have exercised no influence on the history of humanity. By taking possession of China, India, Asia Minor, and even of a part of Europe, Gengis Khan, Othman and their successors simply drew near to civilizations relatively superior, which, at most, they assimilated only partially. When they did not destroy them, they added nothing to them. The only Asiatic conquerors whom it is proper to place on a higher level than this, and who during a certain period represented a special civilization, are the ancient Persians, after the time of Zoroaster, and the Arabs, after that of Mohammed. But, saving these two exceptions, Asia presents only the sad spectacle of a few nations that were arrested in their growth after they had attained at an early period a stage of culture in some respects advanced, and which did not receive from those who forced the way into their midst any new or fruitful germ. We must come back to Europe to discover for events any reason but a purely external one, and to see them developed with that logical sequence and power of combination which marks the statesman. —Even wars of a secondary order come to have, on this account, some significance. When the German people settled in the provinces of the Roman empire, they did not settle at once within the limits in which they have been since confined. Not only did the several states not have their present frontiers, but, owing to the scattering of their forces brought about by feudal organization,

the distribution of their respective forces was in nothing analogous to what it is to-day. After the European states were consolidated internally, and had concentrated their resources, sovereigns began to look beyond their frontiers, to measure their forces and calculate their relative strength. From this originated the wars intended to bring about an equilibrium of power (see BALANCE OF POWER), and the conquest of provinces, with the view of increasing the defensive power of states and giving them better frontiers. Each state drew up for itself a series of diplomatic and strategic rules, endowed by tradition with the force of precedent, and their precedents controlled for a long time the policy of cabinets. The system of equilibrium is evidently right to a certain point; for it concerns the liberty of all Europe to prevent the predominance of any single power. Which of us has not been forcibly impressed by the first chapter of Gibbon, in which he pictures the Roman empire as a vast prison, opening throughout its vast extent not a single door to the victim of tyranny, and leaving him no other refuge than death, the last asylum of the free? A multitude of sovereignties is therefore a guarantee of human liberty, and the disproportionate increase of one power is a menace to all. But the system of equilibrium soon became a pretext for the most iniquitous conquests; and, although it found its origin in the interests of the liberty of Europe, there is no political theory which has led to such deeds of tyranny and arbitrariness. Francis I. and Henry IV., struggling against the house of Austria, and William III. against Louis XIV., acted in accordance with this salutary principle, but one which was caricatured at a later time; for it was in the name of the equilibrium of Europe that three spoliating powers effected the partition of Poland. The eighteenth century has been, moreover, a witness of the most glaring abuses of conquest, open or disguised. At no time have princes been seen to trade for or seize provinces with such eagerness, without troubling themselves in the least whether they obtained the consent of the people, and consulting only their own convenience. Frederick the Great is the best example of this; and he would have been surpassed by Joseph II. if the latter had had as much genius and the same opportunity as his rival and model. It is strange that, just on the eve of the French revolution, and during an age of generous philosophy, people should have been most treated like a herd of cattle.—It remains for us to speak of a third species of conquest, the conquest of barbarian nations by civilized peoples. Many authors have raised the question whether the same rules should be applied to them as to conquests made in Europe. This question is settled by the facts in the case. One of the historic phenomena of our century is the subjection of the globe to three great European powers. The aggrandizements of Russia, England and France in India, the extreme east and Africa, are not otherwise regarded than as the conquests by civilization of

barbarism; and these heathen lands are considered the common property of Christianity and the white race, which is called to universal dominion. The reproach of ambition directed against England in India, Russia on the borders of China and in central Asia, France in Algeria, come to naught in presence of the imperative law which confers on great nations the mission of drawing humanity nearer its goal. The right of civilization over barbarism is not limited to nomad peoples, and hunters, which make no use of the soil which they are supposed to occupy, but it extends to every nation which pretends to ward off the influence of Europe or civilization by factitious barriers. People do not think that China, Japan, Madagascar, were founded to continue their existence apart; and public opinion has not blamed the efforts which have succeeded, at least in part, in making these countries a common patrimony of the nations. The right of civilization goes as far as to dispossess or put under guardianship peoples who do not accomplish their mission. The Ottoman empire and Mexico, situated at the connecting points of two worlds, which, instead of making their natural advantages of any value, to the benefit of all, live in a state of continual inertia, are destined to pass from the weak hands which hold them back, into those of some civilizing race. But this right of extension of civilization, as against barbarism or incapacity, is attended by duties to the conquered. It is to this kind of conquest that we may apply the words of Montesquieu: "I define the right of conquest in this way: A necessary, legitimate and unfortunate right, which always leaves an immense debt to be paid to humanity." The past offers us examples in which the evils of conquest have been more than balanced by the benefits which followed them, and others, in which the subsequent benefits have not compensated for the injury inflicted. Leaving Europe out of consideration, we may take the case of the English colonies in New England, and the French colonies in Canada and Louisiana, as illustrative of the first; and, of the second case, the Spanish colonies of the new world. Was the civilization of the Incas and the Aztecs of less value than that brought them by their conquerors? To avoid misunderstanding, therefore, let us say that we are far from approving conquest except as an evil sometimes necessary, and which is justified only by the good it produces.—II. Let us now pass to the right of conquest as admitted in civilized states. This right has been modified by the refinement of the customs of war, and it has in nothing preserved the absolute and stern character of ancient times. The ruling principle is, that conquest alone does not confer definitive and incontestable rights, and that the loss of possession by the fortune of war does not extinguish the proprietary right of the sovereign against whom the war has gone. The conqueror would therefore be considered as abusing his power and *de facto* sovereignty which has devolved on him

provisionally, if he should dispose, by gift or otherwise, of a conquered or usurped domain. Nevertheless, a distinction is made as to the property of the dispossessed sovereign. If it be a question of his private property, the principle which guards the property of subjects guards his also; but, if the conqueror take possession of the domain of the state, even temporarily, he may dispose of it without being accused of abuse of force, leaving it to the proprietor, in case of his return, to take advantage of the right of *postliminium*. But the same license does not extend to the authorization of the alienation of private estates or other real property, thus devouring the substance of the conquered country. The alienation of a conquered province in favor of a third party would expose the new possessor to a demand for restoration from the original owner, who might claim his property from all possessors of it without even the strict obligation of paying them anything more for it than the value of their improvements. It is clear, from what precedes, that military occupation is not sufficient to take away proprietary rights. But the privileges of the conqueror are not less important on this account. He exercises the rights of sovereignty; he uses the public revenue; he may perform every act resting on the persistence of the social tie, and of government as well as of private law. If the conquered country is a constitutional state, in which the sovereignty is divided between the prince and the people, the conqueror is not bound to respect this division: he has conquered not only the prince's part of the sovereignty, but also that belonging to the people. The conqueror, therefore, is free to govern according to the constitution established, or according to another régime of his own choice; and this latter takes place most frequently, considering that the character of the new authority is essentially military. The acts of the conqueror or conquering power become final if the treaty of peace which ends the war confirms him in the possession of the conquered country, and confers the proprietorship of it on him. The treaty of peace determines the conditions of this transfer. If, on the contrary, the conqueror does not retain the province occupied, either because he loses it during the war, or because he restores it when peace is restored, the original proprietor, on entering into possession anew, exercises the right of *postliminium*. In virtue of this right, property taken by the enemy is restored to its former status when returned to its former owner. It is then that the consequences and complications of the provisional condition which weighed on the country during the conquest, become evident. (See *POSTLIMINIUM*.)

JULES GRENIER.

CONSEILS DES PRUD'HOMMES, is the name given to a class of tribunals established by law in many of the important cities of France and Belgium, for the speedy and inexpensive settlement of certain specified industrial disputes, and

the execution of certain laws and regulations affecting manufacture and trade. These tribunals are the outgrowth of the trade guilds that existed in France for centuries, and regulated trade and labor. These guilds shared the fate of all corporations during the French revolution, their suppression being decreed by the national assembly in 1789. Lyons alone retained some semblance of the old jurisdiction in its "common tribunal;" and out of this, forced by the confusion that followed the suspension of the guild function, grew the first "Conseil des Prud'hommes," which was established at Lyons by a decree of Napoleon I., dated March 18, 1806.—Under this decree, with but few material modifications, the conseils have acted until the present. The most important change has been in the relative influence of employers and employed, the preponderance, until 1848, being with the former, and then for five years, until June 1, 1853, with the latter. By a law passed at this date, under which the conseils now act, the perfect equality of employer and employed in the organization and working of the conseils is secured. In the earlier conseils, also, the officers were elected, in the latter, appointed, as stated below.—These conseils are judicial tribunals, established under the authority of the minister of commerce, upon the request of the chamber of commerce, indorsed by the municipal council of the city where the proposed conseil is to be located. The request sets forth the need of a conseil; the trades that will be represented in it, divided into categories of cognate trades; and other facts that guide the minister in deciding upon the application. The municipal council promises to provide for the necessary expenses of the conseil.—The officers of the conseil are a president and vice president, named by the chief of state, who hold office for three years; a secretary, appointed and removed by the prefect; and a certain number of members termed *prud'hommes*; the number in any conseil being not less than six, half of whom are employers and half employed, each class electing its own representatives. Certain qualifications as to ability, experience, age, residence and character, are required to be possessed, both by the *prud'hommes*, and, in a less degree, by those who elect them. The *prud'hommes* hold office for six years, and, together with the officers, are re-eligible. The members of the conseils serve without pay.—Each conseil is divided into two chambers, called the private bureau and the general bureau. The sole duty of the former, which is composed of two members only, and before which the proceedings are quite informal, is to conciliate, if possible, the members who come before it and settle disputes without a formal trial. Failing this, the case is taken before the general bureau, where an attempt is again made to settle the trouble by agreement; and this again failing, the case is tried and judgment given. The relative importance of these two bureaux is seen in the reports of cases settled, given below.—Not only

does the jurisdiction of the conseils extend to all questions that may result from the relations of employer, employed, foremen and apprentices, but they are charged with the execution of the trade-mark laws, the inspection of factories, and the general laws and regulations affecting manufacture and trade and its police. While certain disputes and differences growing out of industrial relations are excluded from its jurisdiction, even many of these may by consent be considered. There is no limit as to the amount of the claim in dispute that may be brought before the conseils. —The methods of procedure in the general bureau are those of a court, much simplified, and with no delay. The parties to a dispute can, by common consent, refer the dispute to the conseil for settlement; but generally cases are brought before it on complaint of one or the other party. A letter of invitation similar to a summons is sent to the party defendant. The case may be heard on statement or pleadings, or witnesses may be examined. A majority of the prud'hommes present decides the case. The decisions in which the amount in dispute does not exceed 200 francs are without appeal. In cases involving more than this, an appeal can be taken to the tribunal of commerce, or, in arrondissements in which no such tribunal exists, to the civil courts. The decisions have all the authority of a court, and are enforced by the same means as those of all other courts of law in France. The costs are very light in most cases, being, in those in which only the letter of invitation is issued, not over six cents. —The workings of these conseils, though they are confessedly imperfect and have some grave faults, have been of the highest value to French industry. In 1847 the 69 conseils then in existence had brought before them 19,271 cases, of which 17,951 were settled by conciliation in the private bureau, 951 more by advice of the conseil, and, in only 519 cases, was it necessary to enter formal judgment. In 1878 the number of cases brought before the conseils was 35,046. Of these, 18,415 were settled in private, 9,076 in the conseils, and formal judgment entered in 7,555. Of the causes of dispute in 1878, 21,368 were relative to wages, 4,733 to dismissals, and 1,795 to matters affecting apprentices.

JOS. D. WEEKS.

CONSERVATIVE, a name generally adopted in free countries by the party opposed to sudden innovations. It is sometimes known, also, as the party of resistance. In England the conservative is almost identical with the tory party. The reform party was represented formerly by the whigs; but for sometime past a third party, known as the radicals, has existed. The whigs now form a sort of middle party between the radicals and the tories.—In France, under the monarchy of 1830, the name conservative was given to the party which supported the moderate politics practiced by Louis Philippe and his ministers. It was not really conservative in one sense, for it adopted the principles of the revolution of 1830,

which excluded the elder branch of the Bourbons from the throne; but, within the limits of constitutional order founded by this revolution, it really merited the title, because it was occupied in preserving existing institutions while progressively developing them. It was against this party that the revolution of 1848 was organized, which established the republic in France, and which succeeded in re-establishing the empire at the end of three years. The time has not come to judge these events historically. Let it suffice to state, that, immediately after the fall of the constitutional monarchy, a conservative republican party was formed; and, immediately after the fall of the republic, a conservative imperial party. A similar thing happened with reference to the government which came into power after the revolution of Sept. 4, 1870. It is the essence of all governments to preserve their own existence, first of all. In republics having a less ephemeral existence than in France, such as Switzerland and the United States, there is also a conservative party, which assumes various names, but always with the same end in view. This party is sometimes victorious and sometimes beaten at elections, in proportion as the public mind inclines to novelty, or goes back to tradition. But it is especially in monarchies that the conservative spirit shows itself, because, in a certain sense, it is manifested in a person representing hereditary power. It is extremely difficult to lay down rules in a matter of this kind. The spirit of conservatism is obliged to conquer or yield, according to circumstances. Carried to excess, it becomes the triumph of immobility: reduced to helplessness, it leaves a dangerous void in society. All that may be laid down as a general rule is this: that, the less political liberty a country enjoys, the more dangerous conservatism is; and the freer a country the more salutary does the conservative spirit become. In the first case it represents the permanence of oppression; in the second it represents order, the first condition of liberty. It is for this reason that constitutional monarchies offer the best conditions of government yet known. Side by side with a broad liberty they place great stability. On examining the history of England we find that reform parties obtain power only at long intervals, and retain it but a short time. The conservative party maintains ascendancy most of the time, and loses it only to re-appear with renewed force. In this way the need of change is reconciled with the need of stability, which is no less essential. When a new idea appears it is taken up by enthusiastic minds, but there are as many chances of its being bad as good. The instinctive resistance of the conservative party permits examination, discussion, putting to the proof. This delay is productive of more advantage than inconvenience, for, though it delays real progress somewhat, it gives time to separate the false from the true. In fine, when a new and correct idea has carried the day, the conservative element knows best how to repair the breach made, and

bring it into harmony with the whole national organization. If, on the other hand, no organized force is opposed to innovations, all things are in question every day, the most unfortunate experiences follow each other, a universal unrest seizes on men's minds. Whenever the past is not respected, confidence in the future disappears, for, as M. de Maistre has said, time respects only that which it has founded. Nothing is more contrary to the material and moral progress of a nation than the continual feeling of uncertainty.—The chief seat of conservative power in a constitutional country is generally in the second chamber, called the senate, or chamber of peers. The constitution of this body may vary: it may be hereditary, as in England; elective, as in Belgium; for life, as recently in France; but, in all countries, it is prudent to have one as a check to the precipitate action of a single house. Even in the United States and Switzerland this necessity has been felt. But the wisest institutions are of no avail unless public opinion guards itself against its own fancies. *Quid leges sine moribus?* It is useless to insert legal restrictions in a constitution: they will endure but a short time if national passions pay no attention to them. The mode of action most opposed to the conservative is the revolutionary. Popular as it is in our day, it is rarely for good. Seldom can a nation applaud itself for having caused a revolution. It is better to wait patiently for the success of legitimate improvements than to break down every obstacle at the first blow. The most obstinate conservative party does not resist forever; it ends by yielding to the pressure of necessity; but, unfortunately, to attain this result, it is necessary, while working for the legal triumph of one's opinions, to have a mixture of decision and patience, of firmness and moderation, rarely met with in nations. A revolution seems the shortest way, although in reality it is the longest. There is no constitution in which resistance is more firmly organized than in England. The house of lords, besides having an absolute veto on all propositions of the commons, has a considerable influence in the house of commons itself, through the electors of the counties. Still, all the wishes of the commons have been embodied in laws whenever they have been maintained with persistence, without commotion, without revolutions, by the sole power of lawful weapons. For England liberty is a broad river which respects its banks. One of the most striking examples of the opposite disposition was shown in France during the revolution of 1848. In England the house of commons struggled for many years to obtain the electoral reform: it had to endure several adjournments. In France the electoral reform was on the eve of finding a majority in the chamber of deputies, and the chamber of peers had not power enough to stand in its way. The triumph of the reform was sure within a short time, without meeting one-half of the delays and difficulties which it encountered in England. There was not patience enough to

wait for a few months, perhaps a few days. It is true that those who demanded the electoral reform in England wished only for electoral reform; while in France the majority of those who asked for reform wished for a revolution, and those who did not, allowed it to come. Never has France proved more clearly her lack of that conservative instinct which animates all English society, as well the reform as the conservative party itself.

L. DE LAVERGNE.

CONSERVATIVE, (IN U. S. HISTORY.) I. In 1837–40, when support of the sub-treasury bill had become the test of democracy, those democrats who opposed it, as dangerous to the financial interests of the country, formed a temporary alliance under the name of conservatives, voting with the whigs on this single question, but in other cases generally with the democrats. (See **INDEPENDENT TREASURY**).—II. After the suppression of the rebellion, and the inauguration of the plan of reconstruction by congress, the southern whites, who considered their state governments still legally in existence, and were opposed to a change by authority of congress, very generally took the name of conservatives, and in several states, particularly in Virginia, retained it until about 1872.—III. In the north, throughout the same period, the name was occasionally used as synonymous with democrat, for the purpose of attracting moderate republicans. (See **WHIG PARTY**, II.; **HUNTERS**; **DEMOCRATIC PARTY**, IV., VI.)

ALEXANDER JOHNSTON.

CONSTITUTION OF THE UNITED STATES. (For its formation see **CONVENTION OF 1787**.) The constitution is given below, the sub-titles and other matter in brackets not being a part of the instrument.

[PREAMBLE.]

We the People of the United States, in order to form a more perfect Union, establish Justice, insure Domestic Tranquillity, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I.

[Legislative Department.]

SECTION. 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

SECTION. 2. 1 The House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

2 No Person shall be a Representative who shall not have attained to the Age of twenty five Years, and been seven Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State in which he shall be chosen.

3 Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons. The actual Enumeration shall be made within three Years after the first Meeting of the Congress

of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to chuse three, Massachusetts eight, Rhode-Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

4 When vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies.

5 The House of Representatives shall chuse their Speaker and other Officers; and shall have the sole Power of Impeachment.

SECTION. 3. 1 The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.

2 Immediately after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes. The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year, and of the third Class at the Expiration of the sixth Year, so that one-third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, during the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments until the next Meeting of the Legislature, which shall then fill such Vacancies.

3 No Person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State for which he shall be chosen.

4 The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

5 The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the office of President of the United States.

6 The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two-thirds of the Members present.

7 Judgment in Cases of Impeachment shall not extend further than to removal from Office, and Disqualification to hold and enjoy any Office of honour, Trust or Profit under the United States; but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law.

SECTION. 4. 1 The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by Law make or alter such Regulations, except as to the Places of chusing Senators.

2 The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

SECTION. 5. 1 Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do business; but a smaller Number may adjourn from day to day, and may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

2 Each House may determine the Rules of its Proceedings, punish its Members for disorderly Behaviour, and, with the Concurrence of two-thirds, expel a Member.

3 Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the Desire of one fifth of those Present, be entered on the Journal.

4 Neither House, during the Session of Congress, shall,

without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting.

SECTION. 6. 1 The Senators and Representatives shall receive a Compensation for their Services, to be ascertained by Law, and paid out of the Treasury of the United States. They shall in all Cases, except Treason, Felony and Breach of the Peace, be privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning from the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

2 No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States, which shall have been created, or the Emoluments whereof shall have been increased during such time; and no Person holding any Office under the United States shall be a Member of either House during his Continuance in Office.

SECTION. 7. 1 All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other Bills.

2 Every Bill which shall have passed the House of Representatives and the Senate, shall, before it become a Law, be presented to the President of the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be considered, and if approved by two-thirds of that House, it shall become a Law. But in all such Cases the Votes of both Houses shall be determined by yeas and Nays, and the Names of the Persons voting for and against the Bill shall be entered on the Journal of each House respectively. If any Bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

3 Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary, (except on a question of Adjournment) shall be presented to the President of the United States; and before the same shall take Effect, shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill.

SECTION. 8. The Congress shall have Power 1 To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties, Imposts and Excises shall be uniform throughout the United States;

2 To borrow Money on the credit of the United States;

3 To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

4 To establish a uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

5 To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

6 To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

7 To establish Post Offices and post Roads;

8 To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

9 To constitute Tribunals inferior to the supreme Court;

10 To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

11 To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

12 To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

- 13 To provide and maintain a Navy;
- 14 To make Rules for the Government and Regulation of the land and naval Forces;
- 15 To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;
- 16 To provide for organizing, arming, and disciplining, the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;
- 17 To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the same shall be, for the Erection of Forts, Magazines, Arsenals, Dock-Yards, and other needful Buildings;—And
- 18 To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

SECTION. 9. ¹ The Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or Duty may be imposed on such Importation, not exceeding ten dollars for each Person.

² The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.

³ No Bill of Attainder or ex post facto Law shall be passed.

⁴ No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken.

⁵ No Tax or Duty shall be laid on Articles exported from any State.

⁶ No Preference shall be given by any Regulation of Commerce or Revenue to the Ports of one State over those of another: nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

⁷ No Money shall be drawn from the Treasury, but in consequence of Appropriations made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time.

⁸ No Title of Nobility shall be granted by the United States: And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince, or foreign State.

SECTION. 10. ¹ No State shall enter into any Treaty, Alliance, or Confederation; grant Letters of Marque and Reprisal; coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

² No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing it's inspection Laws: and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury of the United States, and all such Laws shall be subject to the Revision and Controul of the Congress.

³ No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of Delay.

ARTICLE. II.

[Executive Department.]

SECTION. 1. ¹ The executive Power shall be vested in a President of the United States of America. He shall hold

his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows:

² Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certify, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no Person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Votes shall be taken by States, the Representation from each State having one Vote: A quorum for this Purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

[The manner in which the electors vote has been changed by the 12th Amendment.]

³ The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

⁴ No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

⁵ In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation, or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

⁶ The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be increased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them.

⁷ Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation:—

“I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States.”

SECTION. 2. ¹ The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

² He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in the Courts of Law, or in the Heads of Departments.

³ The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

SECTION. 3. He shall from time to time give to the Congress Information of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the officers of the United States.

SECTION. 4. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

ARTICLE. III.

[Judicial Department]

SECTION. 1. The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behavior, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

SECTION. 2. ¹ The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority:—to all Cases affecting Ambassadors, other public Ministers, and Consuls; to all Cases of admiralty and maritime Jurisdiction:—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens of another State;—between Citizens of different States;—between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.

[The Judicial Power has been modified by the 11th Amendment.]

² In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

³ The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

SECTION. 3. ¹ Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

² The Congress shall have Power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attained

ARTICLE. IV.

[The States and the Federal Government.]

SECTION. 1. Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.

SECTION. 2. ¹ The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States.

² A Person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive Authority of the State from which he fled, be delivered up to be removed to the State having Jurisdiction of the Crime.

³ No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

SECTION. 3. ¹ New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

² The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

SECTION. 4. The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

ARTICLE. V.

[Power and Modes of Amendment.]

The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year one thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate.

ARTICLE. VI.

[National Supremacy.]

¹ All Debts contracted and Engagements entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

² This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

³ The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

ARTICLE. VII.

[Establishment of the Constitution]

The Ratification of the Conventions of nine States, shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

Done in Convention by the Unanimous Consent of the States present the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty seven and of the Independence of the United States of America the Twelfth IN WITNESS whereof We have hereunto subscribed our Names,
 GO WASHINGTON—

Presid and Deputy from Virginia.

[Under each state the names of the signers are given first; then, in brackets, those of delegates who attended but did not sign; then, in brackets and italics, those of delegates who never attended.]

—Articles in addition to, and amendment of, the Constitution of the United States of America, proposed by congress, and ratified by the legislatures

of the several states, pursuant to the fifth article of the original constitution:

ARTICLE I.

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press: or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

ARTICLE II.

A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed.

ARTICLE III.

No Soldier shall, in time of peace be quartered in any house, without the consent of the Owner, nor in time of war, but in a manner to be prescribed by law.

ARTICLE IV.

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V.

No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any Criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law: nor shall private property be taken for public use, without just compensation.

ARTICLE VI

In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him: to have Compulsory process for obtaining Witnesses in his favour, and to have the Assistance of Counsel for his defence.

ARTICLE VII.

In Suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law.

ARTICLE VIII.

Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

ARTICLE IX.

The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

ARTICLE X.

The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ARTICLE XI.

The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by Citizens of another State, or by Citizens or Subjects of any Foreign State.

ARTICLE XII.

The Electors shall meet in their respective states, and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same state with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct

lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate:—The President of the Senate shall, in presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;—The person having the greatest number of votes for President, shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by states, the representation from each state having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the states, and a majority of all the states shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President.—The person having the greatest number of votes as Vice-President, shall be the Vice-President, if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

ARTICLE XIII.

SECTION 1. Neither slavery nor involuntary servitude, except as a punishment for crime, whereof the party shall have been only convicted, shall exist within the United States, or any place subject to their jurisdiction.

SECTION 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV.

SECTION 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law, nor deny to any person within its jurisdiction, the equal protection of the laws.

SECTION 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

SECTION 3. No person shall be a senator or representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof; but Congress may, by a vote of two-thirds of each house, remove such disability.

SECTION 4. The validity of the public debt of the United

States authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States, nor any State, shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

SECTION 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV.

SECTION 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

SECTION 2. The Congress shall have power to enforce this article by appropriate legislation.

—I. ADMISSION OF THE STATES. The dates given for the first thirteen states are those on which they ratified the constitution and became states of the Union. The remaining dates are those on which the admissions took effect. (But see OHIO.)

1. Delaware, Dec. 7, 1787; 2. Pennsylvania, Dec. 12, 1787; 3. New Jersey, Dec. 18, 1787; 4. Georgia, Jan. 2, 1788; 5. Connecticut, Jan. 9, 1788; 6. Massachusetts, Feb. 7, 1788; 7. Maryland, April 28, 1788; 8. South Carolina, May 23, 1788; 9. New Hampshire, June 21, 1788; 10. Virginia, June 26, 1788; 11. New York, July 26, 1788; 12. North Carolina, Nov. 21, 1789; 13. Rhode Island, May 29, 1790; 14. Vermont, March 4, 1791; 15. Kentucky, June 1, 1792; 16. Tennessee, June 1, 1796; 17. Ohio, Feb. 19, 1803 (see OHIO); 18. Louisiana, April 30, 1812; 19. Indiana, Dec. 11, 1816; 20. Mississippi, Dec. 10, 1817; 21. Illinois, Dec. 3, 1818; 22. Alabama, Dec. 14, 1819; 23. Maine, March 15, 1820; 24. Missouri, Aug. 10, 1821; 25. Arkansas, June 15, 1836; 26. Michigan, Jan. 26, 1837; 27. Florida, March 3, 1845; 28. Texas, Dec. 29, 1845; 29. Iowa, Dec. 28, 1846; 30. Wisconsin, May 29, 1848; 31. California, Sept. 9, 1850; 32. Minnesota, May 11, 1858; 33. Oregon, Feb. 14, 1859; 34. Kansas, Jan. 29, 1861; 35. West Virginia, June 19, 1863; 36. Nevada, Oct. 31, 1864; 37. Nebraska, March 1, 1867; 38. Colorado, Aug. 1, 1876.—II. RATIFICATION.

In accordance with the desire of the convention (see CONVENTION OF 1787), the congress of the confederacy, by resolution of Sept. 28, 1787, referred the constitution to state conventions, to be called by the state legislatures, for their approval or rejection. As the main work of the new instrument was the creation of a stronger federal government, the people divided at once into federalists and anti-federalists. The ratifications were as follows: Delaware, Dec. 7, 1787, unanimously; Pennsylvania, Dec. 12, 46 to 23; New Jersey, Dec. 18, unanimously; Georgia, Jan. 2, 1788, unanimously; Connecticut, Jan. 9, 128 to 40; Massachusetts, Feb. 7, 187 to 168; Maryland, April 28, 63 to 12; South Carolina, May 23, 149 to 73; New Hampshire, June 21, 57 to 46; Virginia, June 26, 89 to 79; New York, July 26, 31 to 27 (on the final vote). North Carolina, Aug. 2, by 184 to 84, refused to ratify without a bill of rights and amendments. In February, 1788, the

Rhode Island legislature refused to call a convention, and referred the constitution to the town meetings, where it was rejected in March by 2,708 votes to 232. The ratification of the ninth state, New Hampshire, gave the constitution life, and announced that the confederacy was to be succeeded by a new form of government which, while retaining many league features, should rest upon national popular will as its basis.—It would hardly be inaccurate to say that the friends of the constitution would have been found between the coast and a line 50 miles west of it. West of the latter line lay the opposition. The states where ratification was easy were mainly commercial states. Of these, New Jersey had originally objected to the articles of confederation because they gave no protection to commerce; South Carolina's commerce was a far larger part of her wealth in 1788 than at any time since; Georgia was further influenced by her position as a frontier state, exposed to the powerful southern Indian tribes, and anxious for protection by a strong federal government; and Maryland and Connecticut, having large and vague claims to territory in the northwest, had solid hopes of justice from a firm federal government than from the confederacy. In the agricultural states ratification was difficult. Massachusetts was not then, as now, packed with manufactories. Her strength lay in agriculture, and her farmer delegates, with only Samuel Adams as a leader, and John Hancock as a doubtful ally, held their ground obstinately from Jan. 9 until Feb. 7 against the arguments of such able federalist advocates as Fisher Ames, Theophilus Parsons, Rufus King, Theodore Sedgwick, Dana, Gorham and Bowdoin. The final action was called the "Massachusetts plan," a ratification supplemented by a warm recommendation of certain amendments. Only one of these (Amendment X.) was afterward adopted. The New Hampshire convention met Feb. 17, a majority of its delegates being instructed against ratification, and adjourned until June, when a majority of 11 was obtained for ratification on the "Massachusetts plan." In Virginia the anti-federalists had able leaders, including George Mason, James Monroe, and the eloquent and popular Patrick Henry; the federalists were led by James Madison, John Marshall, and Edmund Randolph who had drawn up the "Virginia plan" for the convention, had refused to sign the completed constitution, but now decided to support it. The essence of the Virginia opposition may be found in two sentences in the debate: "Why are such extensive powers given to the senate? *Because the little states gained their point.*" It was only very reluctantly that Virginia, then more powerful than New York, gave up her commanding position of sovereignty for membership in the Union. In New York the agricultural delegates preferred a continuance of the privilege which they had enjoyed under the confederacy, of exempting themselves and their constituents from taxation by retaining to the state the power of

levying duties at the port of New York. They were headed by governor Clinton, Robert Yates, and John Lansing (the last two having been delegates to the convention), and at first had a strong majority over the federalists, who were led by Alexander Hamilton, John Jay and Robert R. Livingston. The ratifications of New Hampshire and Virginia, weakened the opposition of the New York anti-federalists so far that they offered a conditional ratification, reserving to New York the right to secede if the amendments which she offered were not acted upon within six years. This was rejected as worse than no ratification, and the federalists, July 23, by a vote of 31 to 29, succeeded in changing the words "on condition" into the phrase "in full confidence" that New York's list of amendments would be acted upon. In this halting and ungracious form the ratification was finally passed, July 26. In Rhode Island the country or agricultural party were fanatical believers in the virtues of their state paper currency, and refused even to consider a constitution which would destroy their fetish. The city or commercial party were at first powerless, though they assured the convention of their sympathy; but they were enabled to bring the state into the Union in 1790 by virtue of the strong hints conveyed in propositions before congress for the restriction of Rhode Island commerce. North Carolina's action was due to her desire to compel a second general convention, which New York had demanded and Virginia had recommended.—III. AMENDMENTS. A. *Amendments ratified by the States.* (1: AMENDMENTS I-X.) Massachusetts had proposed 9 amendments, South Carolina 4, New Hampshire 12, Virginia 20, New York 32, and North Carolina 26, besides 14 offered by the Pennsylvania minority, 28 by the Maryland minority, the Virginia bill of rights in 20 articles and that of New York in 24 articles. Many of these were repetitions, but the mass of distinct propositions was sufficiently alarming. Such of them as were brought before congress in 1789 were summarily voted down, to the particular indignation of Virginia. In place of them all the house agreed upon 17 amendments. The senate compressed these to 12, which were passed by two-thirds of both houses, Sept. 25, 1789. The first two were not ratified (see III: B); the remaining 10, having been rejected or not acted upon by Massachusetts, Connecticut, and Georgia, and ratified by the other states, became the first 10 amendments, and were declared in force Dec. 15, 1791. None of them changed the structure of the constitution, and Livermore, of New Hampshire, declared them "of no more value than a pinch of snuff, since they went to secure rights never in danger." It is worthy of note, however, that the 1st seems to have made the sedition law unconstitutional (see ALIEN AND SEDITION LAWS), and that the 5th, 7th and 10th have proved very important restraints upon the action of the general government.—(2: AMENDMENT XI.) In the case of *Chisholm vs. Georgia* (2 Dall., 470)

the supreme court decided in general that, under Art. III. § 2, of the constitution, suit might be brought against a state by citizens of another state. The possibility of being thus arraigned as defendants before federal courts was by no means pleasing to the states. The 11th amendment was therefore introduced, passed by two-thirds of both houses March 5, 1794, and declared in force Jan. 8, 1798. Art. III., § 2, must now be construed to mean "between a state *as plaintiff* and citizens of another state," and this form of words was carefully adopted in the southern revision of the constitution in 1861. (See CONFEDERATE STATES.) The 11th amendment has been further construed in the case of *Coburn vs. Virginia* (6 Wheat., 264).—(3. AMENDMENT XII.) The election of 1800 (see DISPUTED ELECTIONS, I.; ELECTORS) showed that, under the original provisions of the constitution, party spirit would always give the two leading candidates a tie vote and prevent a choice by the electors. The 12th amendment was therefore introduced, failed to receive the necessary two-thirds vote in one congress, and was finally proposed by congress, Dec. 12, 1803, passing the house only by the speaker's vote. It was declared in force Sept. 25, 1804, the state vote in its favor being 13 to 4, just a three-fourths vote. Georgia, Kentucky, Maryland, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Vermont and Virginia ratified it, and Connecticut, Delaware, Massachusetts and New Hampshire rejected it.—(4. AMENDMENT XIII.) For the purpose of supplementing the emancipation proclamation (see also ABOLITION, III.) by making universal and permanent its abolition of slavery, the 13th amendment was introduced in 1864. Its phraseology may be traced back, through the Wilmot proviso in 1846 and the attempt to exclude slavery from Missouri in 1819-20 (see COMPROMISES, IV.), to the ordinance of 1787 (Art. VI). It passed the senate, April 8, 1864, by 38 to 6, but failed in the house, June 15, 95 to 66, (not two-thirds). President Lincoln's re-election in November, and the brightening prospects of the war, encouraged the friends of the amendment to another effort during the second session of the same congress in the following winter. The vote of the house was re-considered Jan. 31, 1865, and the amendment was finally passed by a vote of 119 to 56. It was rejected by Delaware and Kentucky, the only states in which slavery was still nominally legal, was not acted upon by Texas, was conditionally ratified by Alabama and Mississippi, and was ratified by all the other states (31 out of 36, a three-fourths vote). It was proclaimed in force Dec. 18, 1865. (5. AMENDMENT XIV.) The 14th amendment was an essential element of the plan of reconstruction by congress. Its first section was intended to overturn the still binding principle of the decision in the *Dred Scott* case, that negroes, even though emancipated, could never become citizens of the United States (see also CIVIL RIGHTS BILL), its other sections were in-

tended to make it the interest of southern states to allow the right of suffrage to negroes (see SUFFRAGE), to put the leaders of the rebellion under a temporary disability to hold office, to secure the payment of the national debt, and to void the confederate debt, general or state. It passed the senate, June 8, 1866, by a vote of 33 to 11, and the house, June 13, by a vote of 138 to 36. It was rejected by Delaware, Kentucky and Maryland, not acted upon by California, and ratified by the remaining 33 of the 37 states, a three-fourths vote. (See CONSTITUTION, I., for the states in the Union in 1867-8.) Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas and Virginia at first rejected the amendment at their legislative sessions between Nov. 9, 1866, and Feb. 6, 1867, whereupon the reconstruction act of March 2, 1867, declared their state governments provisional only until, among other conditions, the amendment should be ratified. The 10 states above named successively ratified the amendment and were recognized by congress, and the amendment was declared in force July 28, 1868. New Jersey and Ohio rescinded their ratifications when an adverse majority afterward gained control of their legislatures, and secretary Seward's proclamation of July 20, 1868, announced conditionally that, if the ratifications of New Jersey and Ohio were still to be taken as binding, the amendment had been adopted by 30 states and was part of the constitution. On the following day congress supplemented this by a resolution that the amendment had been lawfully adopted, and that the secretary of state should unconditionally proclaim its ratification, which he accordingly did by proclamation of July 28, 1868. The subsequent ratification of three other states, making 33 in all, cleared away any cloud on this point. (See also RECONSTRUCTION.)—(6. AMENDMENT XV.) The evident and complete inefficacy of the second section of the last amendment (see SUFFRAGE) was the reason for the introduction of the 15th amendment. Its object was not only to forbid the states from abridging suffrage by reason of race, color, or previous condition of servitude, but also to secure, if necessary, to federal courts, the cognizance of offenses against the amendment, through the power granted to congress to enforce it. It was proposed by congress, Feb. 26, 1869, passing the senate by a vote of 39 to 13, and the house by a vote of 144 to 44. It was not acted upon by Tennessee, was rejected by California, Delaware, Kentucky, Maryland, New Jersey and Oregon, and was ratified by the remaining 30 of the 37 states, a three-fourths vote. Ohio and Georgia at first rejected it, but afterward ratified it. New York rescinded its ratification. The amendment was declared in force March 30, 1870, the proclamation of secretary Fish mentioning the filing of a notice in the state department that New York "claimed" to have rescinded its ratification, but making no decision on the validity of the claim.—B. *Amendments never finally ratified.* (1: 1789.) In addition to the first 10 amendments ratified by the states

(see III.: 4.) congress proposed two, as follows: "I. After the first enumeration required by the first article of the constitution, there shall be one representative for every 30,000 persons, until the number shall amount to 100; after which the proportion shall be so regulated by congress that there shall not be less than 100 representatives, nor more than one representative for every 40,000 persons, until the number of representatives shall amount to 200; after which, the proportion shall be so regulated by congress, that there shall be not less than 200 representatives, nor more than one representative for every 50,000 persons. II. No law varying the compensation for the services of the senators and representatives shall take effect until an election of representatives shall have intervened."—Delaware rejected the first of these, Pennsylvania rejected the second, and Massachusetts, Connecticut, New Hampshire, Rhode Island, New York and Georgia rejected, or did not act upon, both of them, and consequently both of them failed to obtain the necessary three-fourths vote.—(2: LOUISIANA.) In 1803 Jefferson's doubts about the constitutionality of his acquisition of Louisiana (see ANNEXATIONS, I.) led him to prepare the following amendment to cover the case: "XIII. Louisiana, as ceded by France to the United States, is made a part of the United States, its white inhabitants shall be citizens and shall stand as to their rights and obligations, on the same footing with other citizens of the United States in analogous situations: save only that, as to the portion thereof lying north of an east and west line drawn through the mouth of Arkansas river, no new state shall be established, nor any grants of land made, other than to Indians in exchange for equivalent portions of land occupied by them, until an amendment of the constitution shall be made for these purposes. Florida, also, whenever it may be rightfully obtained, shall become a part of the United States; its white inhabitants shall thereupon be citizens, and shall stand, as to their rights and obligations, on the same footing with other citizens of the United States in analogous situations." Congress and the people, however, contentedly accepted Louisiana without an amendment, and Jefferson "acquiesced with satisfaction." (See CONSTRUCTION, III.)—(3: INTERNAL IMPROVEMENTS.) The surplus of revenues over expenditures led Jefferson to suggest in his message of Dec. 2, 1806, the preparation of amendments empowering congress, after the payment of the debt, to expend any surplus on "public education, roads, rivers, canals, and other objects of public improvement," on the ground that these objects, however deserving, were "not among those enumerated in the constitution." This suggestion was renewed by Jefferson, in his messages of Oct. 27, 1807, and Nov. 8, 1808; by Madison, in his message of Dec. 5, 1815; by Monroe, in his messages of Dec. 3, 1817, Dec. 3, 1822, and Dec. 2, 1823, and in his Cumberland road veto of May 4, 1822; by Jackson, in his Maysville road veto of May 27,

1830; and by Polk, in his message of Dec. 15, 1847; but without result. Congress has frequently exercised, and now habitually exercises, the once doubted power without amendments. (See INTERNAL IMPROVEMENTS.)—(4: TITLES OF NOBILITY.) Congress proposed an amendment as follows, Nov. 27, 1809: "XIII. If any citizen of the United States shall accept, claim, receive or retain any title of nobility or honor, or shall, without the consent of congress, accept and retain any present, pension, office, or emolument of any kind whatever from any emperor, king, prince, or foreign power, such person shall cease to be a citizen of the United States, and shall be incapable of holding any office of trust or profit under them or either of them." This amendment was rejected by New York and Rhode Island, not acted upon by Connecticut, South Carolina and Vermont, and ratified by the remaining twelve states, but, lacking one state of a three-fourths majority, it failed to become a part of the constitution.—(5: SLAVERY.) The second session of the 36th congress, 1860-61, was prolific in propositions to amend the constitution. The most important of these were the Crittenden compromise (see COMPROMISES, VI.); the amendment proposed by the peace conference (see CONFERENCE, PEACE); the amendment proposed by representative Vallandigham, of Ohio; and the amendment proposed by senator Douglas, of Illinois. The Vallandigham amendment was never acted upon, and is too long for insertion in full. It divided the union into four sections, *The North, The West, The Pacific, and The South*; and the passage of bills, and the election of president and vice-president, were to depend on the affirmative vote of a majority of the congressmen or electors of each and all of the four sections. It also provided that "No state shall secede, without the consent of the legislatures of all the states of the section to which the state proposing to secede belongs," thus implying a permission to secede bodily to any section which should be unanimous in desiring it. (See SECESSION.) The Douglas amendment was as follows: "XIII. No amendment shall be made to the constitution which will authorize or give to congress the power to abolish or interfere, within any state, with the domestic institutions thereof, including that of persons held to labor or service by the laws of said state." This was lost in the house, Feb. 28, 1861, by a vote of 123 to 71 (not two-thirds), and then reconsidered and adopted by a vote of 133 to 65; it was adopted by the senate the same day by a vote of 24 to 12. It was approved March 2, but the state of war which almost immediately followed prevented its consideration or ratification by the states. Feb. 8, 1864, a resolution was offered in senate to repeal the joint resolution by which the Douglas amendment had been proposed, but it was never brought to a vote.—(6: FEMALE SUFFRAGE.) At various times propositions have been made to so amend the constitution as to give the right of suffrage

to females of suitable age. As an example the following, offered by representative Julian, of Indiana, March 16, 1869, is given: "XVI. The right of suffrage in the United States shall be based on citizenship, and shall be regulated by congress; and all citizens of the United States, whether native or naturalized, shall enjoy this right equally, without any distinction or discrimination whatever founded on sex."—(7. RELIGIOUS AMENDMENT.) Since about 1865 many petitions have been offered that congress would amend the preamble to the constitution by inserting, after the words, "We the people of the United States," and before the words, "form a more perfect Union," the following: "Acknowledging Almighty God as the source of all authority and power in civil government, the Lord Jesus Christ as the ruler among the nations, and his will, revealed in the Holy Scriptures, as of supreme authority, in order to constitute a Christian government." (See CONSTITUTION, PREAMBLE.) (For other amendments offered but not ratified, see ELECTORS; JUDICIARY; CONVENTION, HARTFORD; EXECUTIVE.)—IV. The formation of the constitution (for its history see CONVENTION OF 1787) was due to the easily perceptible fact that one of the people's two great governmental agents, the states, had been given too much power, and the other, the central government, too little. That the basis of the constitution is the general popular will, is now so generally accepted that it may almost be stated as undisputed. The states, under the constitution, remained sovereign (in the narrow American technical sense of having no *political* superior, in their own sphere, however contracted that sphere may be; see also STATE SOVEREIGNTY), and the federal government became similarly sovereign in its own sphere; but all these nominal sovereignties were only manifestations of the ultimate sovereignty of the people, and flowed in a carefully bounded channel, from the whole people, not from the state governments, or even from the people of the several states. Thus, as a general rule, the constitution of a state can be changed only by the people of that state; nevertheless the majority in a state, if it forms a part of a three-fourths majority of all the states, may, by amending the federal constitution, aid in restricting, altering and amending the constitutions of every other state in the Union as well as its own. Of course, this process might be carried so far as to provoke armed resistance and revolution; but the constitution has intentionally hedged about this subject of amendment with so many barriers as to make change extremely difficult and to secure the rights of an active and determined minority. The whole scheme has proved very simple in practice, but it has always been very difficult to make its double "sovereignty" clear to any one who has not lived under it.—One school of political thinkers (see STATE SOVEREIGNTY) long considered the states to be, apart from the federal union, functionally complete sovereignties (in the

general sense of the word, not as used above), a part of whose powers was in a sort of temporarily suspended animation, to be revived again whenever the people of the state should see fit to resume it. (See SECESSION.) The inexorable logic of events has proved that no such doctrine can ever become an acknowledged part of the American political system. A state may enter the Union of its own free will, or the soil on which it is afterward formed may be acquired, without or against the will of its inhabitants, by conquest or purchase; but, once entered, the fundamental bond of the society which it has entered attaches to it, and it becomes, in the language of the supreme court in 1868, a member of an "indestructible Union of indestructible states." It follows also that, whatever allegiance a state may claim from its citizens, this can never legitimately conflict with that paramount allegiance which the citizen owes to the government of the nation. (See ALLEGIANCE.)—Apart from the fundamental principle that the supreme law of the land shall come from the constitution, its interpretation is open to the very widest liberty of private judgment. (See CONSTRUCTION.) It can hardly be said that the constitution means exactly the same thing, in every minute point, to any two individuals, or any two generations of individuals, in the United States. Two general divisions of opinion, strict construction and broad construction, are easily perceptible, both of which have always had able and distinguished leaders; but, inside of both, the variations of opinion on points of little or great importance defy calculation, and must be sought in the various authorities cited below. The constitutional history of the United States has thus been an orderly development whose general equilibrium has been due to the pressure of an infinite variety of conflicting opinions, all of which deserve respect and consideration. (See DECLARATION OF INDEPENDENCE; CONTINENTAL CONGRESS; CONFEDERATION, ARTICLES OF; CONVENTION OF 1787; UNITED STATES.)—See, for the text of the constitution, 1 *Stat. at Large* (Bioren and Duane's edition), 60; 1 Poore's *Federal and State Constitutions*, 13; 2 Curtis' *History of the Constitution*, 607 (Curtis' text has been taken in this article). CONSTITUTIONAL CONVENTION. (See CONVENTION, CONSTITUTIONAL.)

CONSTITUTIONAL UNION PARTY, The (IN U. S. HISTORY), the name adopted in 1860 by the southern remnant of the defunct whig party. The election of 1852 closed the national career of the whigs. In 1856 they endeavored to evade the slavery question by joining with the know nothings (see AMERICAN PARTY, I.), but the result

showed that this alliance had no hope of success. May 9, 1860, a convention was held at Baltimore, of whigs who had not yet drifted off, in the south, to the democratic, or, in the north, to the republican, party. Delegates were present from 20 states, and but two ballots were needed for the choice of the leading candidate. On the first, Bell had 68½ votes, Houston 57, Crittenden 28, Everett 25, W. A. Graham 22, McLean 21, and 32½ scattering; on the second, Bell had 138, Houston 69, Graham 18, and 27 scattering. Bell was thus nominated for the presidency; and Everett was then unanimously nominated for the vice-presidency. The platform adopted consisted of a preamble denouncing platforms in general as tending to form "geographical and sectional parties," and a resolution, in part as follows: "That it is both the part of patriotism and of duty to recognize no political principle other than the constitution of the country, the union of the states, and the enforcement of the laws." The rest of the resolution merely pledged the convention to support the principles assigned. It seems to have unfortunately escaped the attention of the convention that the true interpretation of the three principles, which it announced as fixed and settled, was the question then in dispute and unsettled. The object of the resolution, however, though clumsily expressed, is sufficiently plain; it was an invitation to all patriotic voters to abandon the republican party, which attacked, and the democratic party, which defended slavery, and recur to the old whig programme of entirely ignoring slavery as a political question. Its avoidance of the word whig, and its acceptance of a new name, should have been a plain warning that its programme was also obsolete.—In the south the Bell-Everett platform was the only medium of expression for the Union men of the section, who could not be republicans and would not be Breckinridge democrats. It carried Kentucky, Tennessee and Virginia (see BORDER STATES), by pluralities over Breckinridge, and came within 722 votes of carrying Maryland. It was defeated by less than 4,000 votes in each of the states of Arkansas, Delaware, North Carolina, Florida and Louisiana, and in only two southern states, Mississippi and Texas, was defeated by more than 10,000 votes. In the north it was almost a nonentity, its votes ranging from 161 out of 152,180 in Wisconsin to 6,817 out of 118,840 in California. Its total popular vote was 589,581, and its electoral vote 39. (See ELECTORAL VOTES.)—The Bell leaders in the south seem to have been stung by the northern indifference to their claims, and offered little effective resistance to the secession movement which followed the election. (See also ALLEGIANCE.) The first wave of civil war blotted out forever the last trace of the whig party, and its few surviving members, when they reappeared in politics, during and after reconstruction, did so as democrats. (See DEMOCRATIC PARTY, VI.)—See 2 Coleman's *Life of Crittenden*; Botts' *Great Rebellion*; 1 Greeley's

American Conflict, 319; and authorities under WHIG PARTY, III. ALEXANDER JOHNSTON.

CONSTRUCTION (IN U. S. HISTORY). In a country where manhood suffrage is the rule, a written constitution would seem to be a necessity, for the purpose of securing those guarantees against the tyranny of a majority which are attained in Great Britain by limited suffrage, property representation and crown influence. In Great Britain, therefore, the constitution is unwritten, and practically is changed at the will of parliament; in the United States the constitution is written, and is changed either directly, though with great difficulty, by amendments (see CONSTITUTION, IV.), or indirectly and even more slowly by a stricter or broader construction, or interpretation, of its provisions. On this fundamental question of a strict or a broad construction of the constitution, all legitimate national party differences in the United States are and always have been based; and all efforts to establish national parties without reference to it have proved failures. (See ANTI-MASONRY; AMERICAN PARTY, I.; GREENBACK-LABOR PARTY.)—I. STRICT CONSTRUCTION is the outcome of the particularist element of American politics. It is not based, however, upon any particular affection for the states as states, or upon any opposition to the federal government; these are its effects, not its causes. Its roots really lie in the inertia of the mass of the people, in their unwillingness to make changes at the demand or for the sake of special interests. When this inertia had been so far overcome as to secure the establishment of the constitution in 1789 (see ANTI-FEDERAL PARTY), its next and natural expression was the principle that the constitution should be strictly construed, and this has always been the fundamental principle of the democratic-republican party. It was first put into form by Jefferson and Madison (see BANK CONTROVERSIES, II.; KENTUCKY AND VIRGINIA RESOLUTIONS), and has since been very generally maintained by their party. The most conspicuous instances of its abandonment have been in 1844, 1858–60 (by the southern wing), and in 1868. (See DEMOCRATIC PARTY, IV., V., VI.) The extreme particularist element has usually been marked, not so much by a strict construction of the constitution, as by an exaggerated devotion to the states as principals, not as instruments. (See STATE SOVEREIGNTY, NULLIFICATION, SECESSION.)—II. BROAD CONSTRUCTION, or LOOSE CONSTRUCTION, of the constitution, is the necessary expression of the nationalizing, often called the centralizing, element of American politics. Its main object has always been to make the federal government as powerful in the internal administration of the whole country as in the management of its foreign affairs. The founder of this school was Alexander Hamilton (see BANK CONTROVERSIES, II.), whose writings are still, to a remarkable degree, a compendium of the broad constructionist doc-

trines of succeeding times. The little that was lacking in his work was supplied by the Adamases, John and John Quincy; and Webster, Story and Clay had only to complete and beautify a theory whose framework had already been strongly built. In the writings of these six men, may be found all the essentials of broad construction, with the exception of that which was applied to the abnormal political influences of slavery. (See ABOLITION, II.; SLAVERY; RECONSTRUCTION.)—As this political school has not been constant, but has been steadily developed, it follows that its supporters have been compelled to change their party name and organization as the successive phases of their doctrine have appeared, and have not been able to maintain, through all our history, an identity of name like that of their conservative opponents. Three successive parties have carried out the ideas which Hamilton first advanced. The work of the federal party was mainly to secure the existence of the federal government which it had called into being. The whig party, dropping the federalist opposition to unlimited suffrage, accepted the mass of federalist doctrines, and added to them those of internal improvements and a protective tariff. The republican party, dropping the whig opposition to agitation on the slavery question, accepted the mass of the whig doctrines, and added to them those of the federal government's power to restrict slavery to state limits, to abolish slavery (as the result of civil war), to re-admit seceding states upon conditions, and to protect the slaves when set free. It has also secured the adoption of one amendment (the 15th) which seems to have opened the door to future political consequences, as yet hardly to be estimated. Like the opposing school, broad construction has also its evil side; its extremists have sometimes shown a contempt for the constitution and its limitations which would, if it prevailed, reduce the organic law to a nullity, and subject the whole country to the caprice of a shifting congressional majority.—III. CONSTRUCTION IN GENERAL has always been "strict" and "loose" relatively, not absolutely. As broad construction has advanced, strict construction has advanced with it *pari passu*, so that much which is now taken as strict construction, would have seemed to Jefferson, or to John Taylor of Caroline, the loosest possible. The constitution, therefore, even where it remains *ipsissimis verbis*, is in practice a very different instrument, in many important points, from that which it was in 1789. The great reason for change of construction has, of course, always been necessity or convenience; but the immediate causes are reducible to three: party tenure of power, judicial decisions, and war.—1. Whenever a broad construction party has gained control of the government, it has put its ideas into practice, and, when once put into practice and become familiar to the people, some of these new constructions have generally held their place and been adopted by the democratic party on its return to power or in its efforts to do so.

Thus the idea of vast and undefined indirect powers in congress under the "general welfare" clause of the constitution (Art. I., § 8), was adopted, 1800-12 from the overthrown federal party; the doctrine of the power of congress to appropriate the national funds for internal improvements was adopted, 1854-60, from the overthrown whig party; and the slavery and reconstruction amendments and legislation were recognized and adopted, 1872-80, in the effort to overthrow the republican party.—2. The general rule followed by the federal courts has always been that in purely political questions the judicial department must be governed by the action of the legislative and executive. This one rule has evidently left a clear road to broad construction whenever the legislative and executive have inclined to take it. But, even in matters not strictly political, the general drift of the decisions in United States courts has been toward a broad construction. Thus, instead of the cardinal principle of the original democratic party (see *BANK CONTROVERSIES*, II.), that only absolutely necessary laws were within the power of congress, the federal courts have decided that congress may pass laws that are absolutely necessary, very necessary, or simply *necessary* in the judgment of congress. In the same way many other powers, which were once doubtful or denied, have since been settled by the federal courts in accordance with the broad construction view. (See *CONGRESS, POWERS OF*.) The supreme court decisions in 1879 (100 U. S.), in their interpretation and application of the 14th and 15th amendments, show that this process has by no means stopped, but is only entering a new stage of development.—3. As there is no limit to the force which may be brought against a republic in war, so there is practically no limit to the force with which the republic, if thoroughly roused, will repel it. During the revolution the continental authorities habitually tampered with the mails, arrested and deported, or summarily executed, suspected persons, and, wherever necessary or possible, considered state laws as practically suspended. The alien and sedition laws of 1798 were defended mainly on the ground that war really existed with France. In 1812-16 the extremities to which the federal government was often reduced compelled the strict construction democratic party to resort to measures, such as conscription, impressment, naval equipment, disregard of state control of the militia, and the creation of a public debt and a national bank, which, by their own party principles, were either highly inexpedient or flatly unconstitutional. (See *DRAFTS*, I.; *GUNBOAT SYSTEM*; *CONVENTION, HARTFORD*; *BANK CONTROVERSIES*, III.) In 1846-50, as the Mexican war was conducted outside of the country, its effects were less perceptible, but the supreme court's decisions on the absolute power of the federal government over the conquered soil of New Mexico and California were important, and were afterward used as precedents in reconstruction. (See also *TERRITORIES*.) In

1861 the southern wing of the strict construction party not only voluntarily abandoned that branch of the federal government, congress, of which it had undisputed possession, to its broad construction opponents, but even strengthened the hands of its opponents by making war on the government, and thus bringing into play the undefined and unlimited war power. The consequence has been the enormous and now hardly questioned development of the permanent powers of the federal government.—The above will make it evident that construction, strict or broad, is the *vis viva* of the constitution, which has enabled it, with very little formal change, to survive "the pressure of exigencies caused by an expansion unexampled in point of prosperity and range." By its means the law-abiding character of the American people, and their unquestioning faith in their constitution, have both been preserved intact throughout a vast foreign immigration which has radically altered the nature and blood of the people, and each characteristic has been able reciprocally to act upon and increase the other.—See authorities cited under the articles above referred to, particularly under *CONSTITUTION*, IV.

ALEXANDER JOHNSTON.

CONSULS. Consuls are officials appointed by competent authority to reside abroad for the purpose of protecting, facilitating and extending commerce between the countries which appoint them and the countries whither they are sent.—Count Beugnot, French minister of the navy, speaks in the following manner of consular functions: "Consuls are officers sent by a sovereign to the different ports or harbors to decide commercial questions between the subjects of his nation. The establishment of consuls has no other object than the advantage, the increase, the security and the police regulation of the commerce of nations with each other. Consuls are the guardians of their countrymen against the vexations, injuries and injustices of the country where they reside; and they exercise certain police powers over all the individuals of their nation."—On a careful examination of the principles laid down here by count Beugnot, it is clearly seen that the functions of consuls have a character both commercial and diplomatic. They suppose in him who is invested with them, a *public character* which commands consideration. This character is still further increased by the fact that the consul is not only the representative of the state which sends him abroad, but that he is, besides, accepted by the sovereign of the country to which he is sent.—The state which gives a nation permission to carry on commerce seems also to consent tacitly to the establishment of a consulate of that nation, and to engage to receive a consul from it.—Nevertheless, the state not being bound to this in virtue of an obligation which gives to the other nation a perfect and *coactive* right, the nation which wishes to have a consul must obtain that right by a treaty of peace

or commerce. Such is the opinion expressed by Vattel. (*Droit des gens*, t. i., liv. 11, chap. 11.) Valère expresses the same opinion. (*Commentaires sur l'ordonnance de la marine*, t. i., p. 232.) Thus we see that nations, in treaties of commerce, generally stipulate for the reciprocal right of establishing consuls in all the ports of a country or only in the ports and places mentioned in the treaties.—It is not sufficient, then, to be appointed and armed with letters on the part of his sovereign: the consul must also obtain the approbation of the sovereign of the country in which he is to reside and exercise the functions of this office. This admission of the consul into a foreign country depends on the good pleasure of the sovereign of that country.—The power granted a nation of doing business, says Mr. Steck (*Essai sur les Consuls*, p. 56), in a foreign country, seems to give authority tacitly to establish consuls there; but it is safer to have this authority expressly provided for in a treaty.—Consuls are furnished with credentials and instructions, which they present to the princes of the states where they are going to reside; and, on this presentation, they obtain the sovereign's approbation, and it is ordered that they shall be recognized as possessing the character of consul: this is called an *exequatur*.—When consuls are clothed with a diplomatic title, such as that of diplomatic agent or *chargé d'affaires*, they are furnished with a commission to accredit them in their consular capacity, and with a letter of credence to accredit them in their diplomatic quality.—The origin of consulates is generally carried back to the time of the crusades. “The establishment of consuls,” says Martens, in his *Traité du droit des gens*, “seems to date from the middle ages, from the period of the crusades. The commercial cities of Italy then employed their wealth in the equipment and provisioning of fleets to transport Christian armies to Asia. Great marts were established on the shores of the latter continent, under the protection of the princes who planted their standards there. These places attracted, through the desire of gain, new speculators, who came to compete with the merchants who established them. At this juncture they conferred on certain of their own number, by the name of *consuls*, jurisdiction in matters of arbitration, and submitted to the decisions of these judges.” Mr. Steck (*Essai sur les Consuls*, p. 14,) also carries the origin of consulates back to the crusades. “The Pisans, the Venetians, the Genoese, formed at that time various establishments in Asia. The princes, the masters of the places where they established these marts, accorded to them the most extensive immunities. All the merchandise which they exported was declared free from all duties and taxes. They were given entire quarters in certain maritime cities; and in others streets and houses: but one of the most important privileges granted them was to cause to be decided, according to their own laws, and by judges of their own nation, appointed by themselves, all

the controversies arising between persons carrying on trade under their protection, or who were established within the limits of the territory ceded to them.”—At first the consuls were, in reality, only arbitrators in commercial matters; but their privileges were extended; they became the delegates of their sovereigns, and were intrusted, not only with settling disputes between the merchants of their country, but also with protecting them in their relations with the countries to which they had come to trade. Thus, a consul in a foreign country is really a *public minister*.—“I do not hesitate,” says Steck, in the work cited above, “to call the consul a *public minister*. It is a pure logomachy, a useless dispute of words, to deny him this quality and this name. Whoever is intrusted by his sovereign with the interests of the nation should be considered a public minister. I acknowledge that the consul is only a minister of an inferior order; but that only affects the honors paid him.”—M. de Moser also expresses himself in this sense, and recognizes the public character with which consuls are clothed beyond a contradiction. He admits they are public ministers, though of a kind and rank inferior to those of the first and second order. “As consuls,” this learned publicist says, “are charged by their sovereigns with watching over the interests of national commerce, seeing to the observance of treaties, asking for their execution, making remonstrances on this score, presenting complaints to the court where they reside in case of infraction, and since they are thus really charged with affairs of state, it appears strange to me to call in doubt their official character, and to wish to refuse them the name of public minister.”—This settled, we must admit that consuls ought to be placed under the protection of the law of nations, and enjoy the privileges and prerogatives which treaties or usage assure them. If we insist on this point of the public character of consuls, it is because it has been greatly controverted, and because eminent jurists in the seventeenth and eighteenth centuries have wished to recognize in them merely commercial agents and commercial judges. Vattel, Martens and Klüber have denied them the quality of political agents, which is nevertheless inherent in their office. The error of these authors has come from this, that they have not sufficiently considered the changes which have taken place in international relations, and from the fact that they have not studied carefully the provisions of the different treaties of commerce touching the consular institution: otherwise, they would have seen that these treaties accord to consuls the essential guarantees which surround diplomatic agents of a higher order. Consult especially on this subject the capitulation concluded between France and the Ottoman porte (April 28, 1604, June 5, 1673; May 28, 1740), and you will soon have the proof of this. “The consuls of France, according to these capitulations, shall enjoy *all the privileges* of the laws of nations, and be protected in all peace and tranquillity. They are

never to be constrained and forced to appear personally before a court of justice; they are free and exempt from all kinds of taxes." These privileges, it is seen, are of the same nature as those which diplomatic agents enjoy. Why not recognize, therefore, their public character, which results from the very nature of the facts in the case? ¹ RITTIEZ.

CONSUMPTION, Taxes on Articles of.

Taxes imposed on consumption of provisions, merchandise or products of any kind, and collected, either at the time when the articles taxed pass the boundaries of a state, a province, or a commune, or at the time they are sold, removed or manufactured, constitute, in almost all the modern states of Europe, and in those of European origin, the chief source of public revenue.—In France, these taxes comprise those included under the title of *indirect taxes*—duties on liquors, native sugar, the proceeds from the sale of tobacco, gunpowder, paper, etc., plus the customs duties and the proceeds from the sale of salt; the total amounting, according to the estimate of the budget of 1869, to 742,559,000 francs on a total national receipt of 1,722,444,903 francs. The *octrois* of French cities are also taxes on consumption, and their gross annual amount exceeds 150,000,000 francs. Certain *direct* taxes are in their nature similar to taxes on articles of consumption: such are those imposed on carriages, horses, dogs, etc., when used as luxuries. If the stamp duty was extended to all writing paper, that duty also would be a tax on consumption, but as in France it is confined to paper which may be produced in court, or for agreements, contracts, checks, etc., they are included under the large class of taxes on *documents*.—In Great Britain duties on consumption, comprising the custom house duties and excise, in the year 1867–8, reached the sum of £45,642,851, on a total receipt of £83,333,217.—In Austria *indirect taxes*, imposed generally on consumption, figure in the budget of 1868 at 220,292,813 florins, on an ordinary total receipt of 546,035,407 florins.—These taxes are put down in the budget of Prussia of 1861, including salt, at 44,627,107 thalers, on a total receipt of 135,094,415 thalers.—The budget of Russia for 1868 gives indirect taxes, *customs and excise duties* at 193,850,330

rubles, on a total receipt of 480,593,517 rubles.—Before the war between the north and south the income of the United States was almost entirely furnished by customs duties. For the year included between July 1, 1859, and June 30, 1860, the ordinary receipts were made up from the three following sources only (see UNITED STATES): customs, \$53,187,511; sale of lands, \$1,778,557; from various sources, \$1,010,761; total, \$55,976,829.—Among the drawbacks inseparable from all taxes there are some which taxes on articles of consumption have in the highest degree: 1. The distribution of the burden which it imposes is in no way proportionate to the resources of the taxpayers; and the most productive of these taxes, those on liquors and provisions in general use, on salt, combustibles, etc., weigh as heavily on the poor as on the rich. 2. Their collection demands an amount of administration, supervision and verification very damaging to production, and to the circulation of or trade in the objects taxed. It is well known in France what a network of minute rules and difficulties are connected with the general taxes on liquors and the *octrois*. 3. A considerable part of the proceeds of the taxes in question is absorbed by the cost of collecting them. That proportion is not generally less than 13 or 14 per cent.—It has been urged, in favor of these taxes, that the payers, for different reasons, meet them more willingly than direct taxes. It is said, first of all, that their collection is generally divided into smaller fractions, and more easily paid. It is next alleged, that, in the majority of cases, they are added to the price of the articles taxed in such a way that the consumer, confounding them with the price, bears the burden of them almost without knowing it; that weighing more frequently on kinds of consumption not indispensable to the maintenance of life or health, the taxes in question are paid only when it is convenient to buy articles which could really be done without; so that the poorest, the most prudent or the most economical have always the power of avoiding them by refraining from buying, and find in this a new stimulant to saving.—These motives often appealed to by financiers, politicians and all publicists occupied with fiscal questions, may be more or less justified in reference to certain special taxes, but if it is intended to appeal to them in the case of all duties on articles of consumption, it is very questionable whether it can rightly be done. It is by no means demonstrated that these duties are acknowledged and paid more willingly than direct taxes, and, as to customs duties and *octrois*, smuggling, which always continues in spite of the activity and the severity of repression, shows the contrary clearly enough. We know, besides, to what an extent taxes are collected under the inspection of officers of indirect taxes, such as the retail duty on wine, the duties on the manufacture of beer, native sugar, etc., and how impatiently they are borne by those on whom they are imposed. We know, also, that

¹ In the United States consuls are nominated by the president and confirmed or rejected by the senate. Before entering on the duties of his office, the consul is required to give bond for the faithful discharge of his duties, with sureties to be approved by the secretary of state. Consuls "have authority to receive protests or declarations which captains, masters, crews, passengers, merchants and others make relating to American commerce. They are required to administer the estates of American citizens dying within their consulate and leaving no legal representative, when the laws of the country permit it; to take charge of stranded American vessels, in the absence of the master, owner or consignee; to settle disputes between masters of vessels and the mariners; and to provide for destitute seamen within their consulate, and send them to the United States at the public expense." (See Bouvier's Law Dictionary.)

in France the octrois have always been the most unpopular of all taxes; and the favor with which their complete suppression in Belgium was received by public opinion, shows well enough what a general object of hatred they are.—It will not be easier to justify the allegation that these taxes are paid more easily and in smaller fractions than direct taxes which may be collected in *twelfth parts*. This is not the case with customs duties, which are generally collected in large sums; nor with taxes on liquors, native sugar, salt, etc. Although divided, so far as the consumers are concerned, they cause heavy expenses to producers, merchants and dealers, before reaching their final destination. It is quite true that consumers, when they have to pay or refund these taxes, pay them in fractions more or less small, and confound them with the price of the object taxed, without thinking how much they pay in this way to the government. But is this really a public advantage? In view of the use which the greater number of governments make of their resources, is it really desirable that they should increase them at the expense of private persons, without the masses observing, or, at least, without their being able to render an account of all that has been thus taken from them?—And lastly, the assertion that taxes on consumption are generally levied on articles of little need in the maintenance of life or health, and which can be dispensed with conveniently, is not better founded than the other considerations appealed to in defense of these taxes. This assertion lacks truth altogether with regard to salt, meat and the greater part of other provisions on which a customs duty or an octrois is levied. Sugar, indeed, appears to be of less absolute necessity, the populations of Europe having done without it for a long time; but they have also done without shirts and shoes; and would it be proper at present to tax these articles of clothing heavily under the pretext that those who wish to avoid the tax are able to do without them? The use of sugar is common among all classes: it is used in preserving fruits, in the preparation of a multitude of medicines and food; and its consumption has become almost as necessary in the civilized world as that of salt. As to beverages, such as wine, beer and cider, it is not certain that a suppression of their consumption would not be very injurious to the health of people who use them. The use of fermented liquors is universal in human society; it exists in every degree of civilization; and if this does not sufficiently authorize us to consider it one of the *necessaries* of social life, if we must see in it but an artificial want or pleasure, we should still have to ask ourselves whether it is reasonable and just to make this pleasure much more costly, more difficult for the most numerous classes, by overloading with taxes the objects capable of procuring that want or pleasure.—Taxes on consumption, considered in their totality, are not justified by any of the reasons generally adduced in their favor; and they present,

in a higher degree than any others, the drawbacks arising from a want of proportion between them and the resources of tax payers, the heavy cost of collection and the hindrances and difficulties imposed by them on production and commerce. There is, therefore, no valid reason for giving them the preference in the general system of taxation; and there are very strong reasons why they should be resorted to as little as possible. Their only *raison d'être* is to be found in excessive public outlay which the resources procurable by the most equitable and least harmful means can never meet, and which brings about recourse to all possible methods of collecting taxes, whatever they may be.—Some of the taxes on consumption weigh, nevertheless, on articles injurious to the health, to the mental or moral faculties, of those who use them habitually, such as tobacco and alcoholic drinks. These taxes are certainly among the best warranted, and their establishment or maintenance can only be approved; but, the best method of collecting them should be a constant object of research.¹

AMBROISE CLÉMENT.

CONSUMPTION OF WEALTH. I. The consumption of wealth is one of the great divisions of political economy, according to J. B. Say, who is followed here by several other economists, authors of general systematic treatises on the subject. Storch, de Tracy, James Mill, McCulloch, Florez Estrada, Skarbek, Dutens and Droz. This last part of the science treats of all questions relating to the employment and use of acquired wealth, either in production or in the satisfaction of the wants of the person or of the family of the producer, and also questions connected with the public outlay and the resources necessary to meet that outlay, viz., taxes and loans. Hence there are two subdivisions of the subject. one treating of questions relating to *private consumption*, and the other of questions relating to *public consumption*.—These two kinds of consumption have themselves been subjected to subdivision. In accord with J. B. Say and Adam Smith, *reproductive* consumption has been defined as advances made to production; and *unproductive* consumption, as not only all kinds of consumption that are a pure loss, but those destined to satisfy the wants and the pleasures of man, in contradistinction to reproductive consumption. The same distinction has been made in the case of public consumption; but a somewhat different sense has been attached to the words here.—Rossi did not admit the subdivision consumption in his teaching. In the first lesson of his published *Course*, he says: "We have studied the science in its two great divisions, the production and distribution of wealth; and, if we have not specially concerned ourselves with a third branch, which is called in

¹ It is proper to add that indirect taxation finds its real justification in the unwillingness which all ratepayers exhibit in giving the necessary information on which to base direct taxation or distribute its burdens equitably. M. B.

the books consumption, it is because we consider this branch included in the other two. What is called productive consumption is nothing else than the employment of capital. the consumption sought to be called unproductive—taxes—enters directly into the subdivision distribution of wealth; the rest belongs to hygiene and morals.”—Rossi is right, in certain respects. Productive consumption is, indeed, the employment of capital, as we have just said, and taxes are one of the parts of the national revenue, expended in a more or less productive and legitimate manner. It is also quite true that political economy should rely on hygiene and morals when it warrants this or that employment of private wealth; but this is no argument against grouping the phenomena of the consumption of wealth together, as well as those of the production, circulation, exchange and distribution of wealth, the better to understand them by comparison and analogy. Properly speaking, political economy exists, as a whole, either in the doctrine of production or in that of exchange; but we must not forget that it is by classification of knowledge that we succeed in more clearly comprehending what it is given to man to know.

—II. *Nature of reproductive and non-reproductive Consumption and of private Consumption.* To consume is to make use of the values inherent in products, but to make use of products is to transform their utility and its resultant value, or to change it, or to destroy it altogether. To produce is not to create matter, but so to dispose of it as to endow it with utility: and so to consume is not to destroy matter (a thing as impossible as it is to create it): it is to transform or destroy the qualities which render matter useful and exchangeable. The importance, therefore, of consumption should not be valued so much by the quantity or dimensions of the matter consumed as by the value which it represents.—Everything produced is intended for consumption; and why should a price be put on, or a value given to, a useless thing? Consumption is the only object of production, and every product is consumed; that is to say, its utility is enjoyed, and in this enjoyment is found the recompense for the trouble expended in producing it; for, if the producer does not himself consume the thing which he has produced, he consumes that which he receives in exchange for it.—The slowness or rapidity with which different kinds of consumption take place does not change their nature: the jewel which lasts for centuries, the garment which lasts for years, the fruit or immaterial product which lasts but an hour, all lose their value in analogous ways.—Exported products should be considered as consumed; for by exportation they become, so to speak, raw material used in the manufacture of other products. In like manner, if we were estimating the value of the production of a country, its imports should be included.—Consumption has been classed with reference to its objects and the returns obtained from it. J. B. Say has termed *unproductive* or *sterile* the con-

sumption which has for its object the well-being resulting from a satisfied want, and *reproductive consumption* that which is devoted to the production of an amount of wealth equal or superior to the value consumed, and which constitutes a real exchange, in which one gives acquired wealth or the services of implements of labor, land, labor or capital, to acquire new wealth. J. B. Say was not mistaken in the value of these expressions; he understood perfectly well that a consumption which satisfies our wants is neither unproductive nor sterile, since it produces a satisfaction which is a real good; but he employs these expressions for want of better. This nomenclature has been generally adopted. No great objection can be made to the expression reproductive; as to the other, unproductive, it does not seem to have been successfully replaced by *sterile* or *destructive*, which Duteus proposes; but could we not say with less inexactness, *non-reproductive consumption*?—Senior proposes to call that consumption productive which is intended for the support of producers, and unproductive only that which has not this object in view.—Reproductive consumption is nothing else than production. We shall therefore refer the reader to that word, and limit ourselves here to the consumption which results from the employment of capital.—But, outside of industrial phenomena proper, we have to consider the total of consumption, especially non-productive; consumption proper, private consumption.—Here arises the question of determining those kinds of consumption which are the more desirable and judicious.—The question would not be difficult if the decision had to be made between productive and non-productive consumption. The former evidently is preferable because it increases the wealth of the country, since it gives birth to subsequent products, while the characteristic mark of other kinds of consumption is that they furnish enjoyment to no one but the consumer. But what are productive and unproductive consumption? M'Culloch answers by the just observation that the question has been obscured, by considering the kind of consumption, while the results should rather have been considered. “Evidently,” he says, “it is not enough, in order to prove that a certain quantity of wealth has been employed productively, to say that it has been expended in improving the soil, digging a canal, etc., for this wealth may have been applied without judgment, or in such a manner that it can not be reproduced; and, on the other hand, it is not sufficient proof that a certain amount of wealth has been employed unproductively, to say that it has been expended in carriages and in pleasures; for the desire to incur these expenses may have been the original cause of the production of the wealth, and the desire to incur expenses of the same kind may involve, as a consequence, the production of a still greater amount of wealth. If we wish, then to arrive at an exact conclusion on such questions, we should carefully examine, not only the immediate but the remote conse-

quences of the expense; affirming that it is productive when, by direct or indirect action, it gives occasion to the reproduction of an identical or greater amount of wealth, and unproductive when this is not completely replaced."—According to J. B. Say, the most judicious and desirable consumption is that which satisfies real wants, which is slow rather than rapid. Slow consumption had already been recommended by Adam Smith. It is recommended by the greater number of economists. J. B. Say understands, by real wants, not only those of prime necessity, but also those which civilization gives rise to.—Senior remarks that certain things are susceptible only of unproductive consumption. Such, for example, are laces, embroideries, jewels and other ornaments which do not protect the person against the rigor of the weather. He places in the same category tobacco and other stimulants, the least evil of which, he says, is that frequently they are not harmful. Senior further observes that the distinction between consumers is drawn with still less difficulty than the distinction between their consumption. All men being at the same time consumers more or less productive and unproductive, each individual may be put in the one class or the other according as the greater part of his expenses belong to one kind of consumption or the other. Besides, he adds, every personal expense which goes beyond what is strictly necessary is not absolutely unproductive.—Florez Estrada, having, with J. B. Say, spoken in praise of the consumption which serves to satisfy real wants, and of slow consumption, or that of durable wealth, also recommends consumption in common, in which certain expenses are avoided, and with which, relatively speaking, the greatest possible amount of enjoyment can be procured.—Although the preceding observations are not without value, they yet show that it is impossible to fix the measure of individual expense. Consumers, therefore, are alone capable of being, and should be, the sole judges as to how much they shall consume. Doubtless a certain number may squander their property; but the greater number endeavor to increase it. Good sense enables every man to decide whether a want is real or imaginary, and whether it ought to be satisfied or not. The man who buys superfluities will, as Franklin makes "Poor Richard" say, end by selling necessities; but to distinguish the superfluous from the necessary there is no aid except that afforded by a good moral education and sound sense.—A word here on consumption of articles purchased on credit. Credit-consumption, as a means of supporting an individual or a family, can be justified only by unavoidable necessity. Buying on credit is the cause of greater outlay, of higher prices of goods, of excessive profit by the seller at the expense of the buyer, and, later, of the insolvency, discouragement, immorality and dissipation of the consumer.—III. *The statistical law of Consumption.* Consumption is not, as Sismondi said it was when he objected to the employment of machines, a fixed,

invariable quantity. It is as elastic as the wants of man, and these are limited only by the means of satisfying them. But these means, once given, satisfy more wants in proportion as they may purchase more products, and, consequently, as the price of the products is low.—This has been observed whenever, through decrease of import duties or other taxes, or through progress in manufacturing, the prices of products have been diminished in a noticeable degree. In 1824 coffees from the colonies, on reaching England, paid one shilling duty: one and six pence if from India; and two shillings, from foreign countries. Huskisson reduced these duties one-half; and in 10 years the consumption had quadrupled, and increased from 8,000,000 to 32,000,000 pounds. At this same epoch, and after the reforms of Sir Robert Peel, many similar phenomena were observed. In 1839 postal reform was introduced; instead of one shilling average postage on a letter, a sum a little less than one-sixteenth of that amount was paid. The consequence was that the number of letters had quadrupled in 1847, and rose from 1,252,000, in 1839, to 4,837,000, in 1847.—This phenomenon is easily explained. It depends on this, that the low price of products and services enables the lower classes, which are the most numerous, to extend their consumption. In reality, as Adam Smith remarked, almost all the capital of every country is distributed among these classes in the shape of wages; and, in addition, they spend the income of their little capital.—IV. *Producer and Consumer—Importance of the Consumer.* Consumption, in the last analysis, is the only object, the only end of production, and we should never occupy ourselves with the interest of the producer except in so far as it is necessary to advance the interest of the consumer. Adam Smith lays down this fundamental maxim as self-evident, but he merely enunciates it incidentally in discussing the mercantile system. And, indeed, every man is a consumer; his interest is the general interest, the interest of the greatest number, the interest of the poorest, the interest of producers taken all together as a body; while the producers are subdivided into an indefinite number of classes, with different, special and multifarious interests. If privileges are granted to these they can not be granted equally. Some will be benefited at the expense of others, and at the expense of the mass of consumers. Liberty alone is capable of doing justice to all interests, and the only remuneration to which the various branches of production have a right, is that which they can draw from the trunk of consumption.—It is to be regretted that the founder of the science of political economy did not give a demonstration of the proposition referred to in the preceding paragraph. Frederic Bastiat more than once undertook to prove it. In the first pages of his *Sophismes économiques* he brought out clearly the natural antagonism existing between the interests of producers and consumers, and the social necessity of protecting the latter from the retrograde tendencies

of the former. "Let us take," he says, "a producer of any class, what is his immediate interest? It consists in two things: 1, that the number of persons occupied in the same industry as himself shall be as small as possible; 2, that the greatest possible number of persons shall demand the product of his kind of labor, which is expressed more briefly by political economy in the following terms: that the supply shall be very limited, and the demand very great; in other words, limited competition and an unlimited market.—What, on the other hand, is the immediate interest of the consumer? That the supply of the product in question shall be great, and the demand limited. Since these two interests are in direct opposition, one of them must necessarily coincide with the social or general interest, and the other antagonize it. But, if legislation is to favor either, in the interest of the public good, which of the two should it be? To discover this, it suffices to inquire what would happen if the secret desires of men were realized. We must confess that the desires of every man, so far as he is a producer, are anti-social in their nature. The wine producer might not regret a frost. A manufacturer of iron would wish to see no other iron in the market than his own, however much the public might be in need of iron."—Bastiat shows that if the wishes of all producers were realized, the world would quickly relapse into barbarism. The sailing vessel would endeavor to do away with the steamer, and the steamer with the sailing vessel; wool to exclude cotton, and cotton wool; and so on until a dearth of everything was reached. Considering, further, the interest of the consumer, he finds it in perfect harmony with the general interest, with what is demanded by the well-being of mankind. What does the consumer really wish for? Favorable seasons, fruitful inventions which reduce labor, time and expense. He wishes for a decrease of taxation, peace among nations, liberty in all international relations.—Here an objection is made. It is said, that if these wishes were realized the labor of the producer would be restricted more and more, and would at last stop altogether, for want of support. To which it may be answered, that in this extreme case all wants and imaginable desires would be completely satisfied, and, on this hypothesis, laborious production would not be a matter of regret. Bastiat justly concludes, that to consult the immediate interests of production exclusively is to consult an anti-social interest; that to take the immediate interest of consumption as sole basis would be to take the general interest as basis.—This reasoning strikes a direct blow at the heart of the protective and prohibitive system, and its partisans leave nothing undone to prevent an analysis of the various interests of the producer and consumer. They affirm that, as the producer and consumer are one, it is wrong to class men as producers and consumers. Of course economists do not pretend to establish as a principle the absurdity that the human race is divided into two distinct classes, one occupied only in producing,

and the other only in consuming. But it is not a question of dividing the human race: it is a question of studying it under two very different aspects. All the sciences have their classifications, and it is evident that, so far as products and services are concerned, he who creates the product or renders the service is altogether distinct from him who purchases the product or the service.—In order to show the value and the correctness of this distinction, Bastiat, in another work, (*Les Harmonies économiques*, 2nd ed., c. xi.), exhibits the producer and consumer face to face in the whole circle of their transactions. On the one hand is the producer producing the supply; on the other, the consumer causing the demand. Now, supply and demand are apparently not the same thing. Bastiat next gives us an ingenious analysis of the phenomena of production, by which he shows that the consumer or the public is, so far as the gain or the loss of a given class of producers is concerned, what the earth is to electricity, a great common reservoir. From that reservoir all proceeds, to it everything returns. After a time, and after having played some part in the phenomena of the world, economic results glide, so to speak, over the producer, on their way to the consumer; so that all great questions should be studied from the point of view of the consumer, if we wish to solve them in such a way as to grasp their general and permanent results. Bastiat finally bases on considerations of morality this same subordination of the rôle of the producer which he had already established on principles of utility. It is really the purchaser of products, the consumer, who must bear the responsibility of the use they are put to, and not the producer, who is influenced by the demand; for the producer has not to concern himself whether a good or a bad use is made of his wine, his iron, or his opium. Bastiat remarks that this is in perfect harmony with the principles of religion, which addresses to the rich, to the great consumers, a severe warning as to their immense responsibility.—V. *Consumption of Capital*.—*Waste of Capital*. What employment is made of capital is of the utmost importance to society. The office of capital is to furnish the *advances* necessary to production, in whose results it re-appears under the form of other utilities and other values. All the questions of consumption of capital are in truth questions of production; and they are more naturally treated by analyzing the functions of capital and the nature of production. There is one, however, at which we must stop, in order to point out the difficulties it presents.—Capital intended for reproduction is divided, according to Adam Smith, into fixed and circulating capital. one renders continual service remaining in the hands of its owner; the other renders a service only when it passes into other hands, or is transformed. It might be asked in what proportions these two kinds of capital, considered as an instrument of labor, should enter into a given industry; but it is plain that this question is not susceptible of a

general answer. Every industry has its special character and needs, which vary according to place, time and circumstances. But if theory can give no satisfactory information on this point, it is none the less necessary that a business man should be able to form a correct estimate by consulting his own experience or the experience of others. The division of capital into these two branches is a point of departure of the highest importance, and if we seek to give an explanation of industrial catastrophes, it will be found that a great number of them had no other cause than an erroneous estimate in matters of this kind. Too much capital renders business slow, and too little capital stops it; too much circulating capital at the expense of fixed capital, and too much fixed capital at the expense of circulating capital, produce similar effects.—The change of times has frequently led business men into ruinous paths. In France, for example, after the events of 1814, young men, simple clerks, were able by very modest savings, energetic labor and irreproachable conduct to make a fortune, in the very houses in which their successors were ruined, although they began with the same moral qualities and frequently with greater intelligence. The latter lacked one thing, sufficient capital. We may often see in great cities the influence of fashion on many industries which are obliged, as it is said, to appeal to the eyes of the public. Such industries change the proportions of fixed and of circulating capital, induce the manufacturer to lessen the latter and to increase the former. They thus lead to his ruin. How many business houses have had to be closed because too large a proportion of their capital was consumed in ornamental façades, etc.—A word now on the waste of capital. "Waste, which destroys capital, is opposed to saving, which increases capital. We waste capital when we devote, without judgment, to the satisfaction of our pleasures or our wants, values formerly employed in making advances to production. Let us suppose, in order to understand the part played by a spendthrift, two amounts of capital of \$100,000 each; one, in the form of a factory belonging to the spendthrift; the other, in the form of coffee and sugar belonging to a merchant. The factory is sold by the spendthrift, and bought by the merchant. To effect the purchase, the latter withdraws his capital from trade and no longer buys coffee and sugar. A hundred thousand dollars are withdrawn from commerce, and this value is handed over to the spendthrift as the price of his factory, and converted by him into consumable articles, and destroyed without return. Thus of the two amounts of capital, only one remains: the value of the other is destroyed, because squandered capital is no longer capital. * * * There is also the capital which is wasted by the inexperience of men who begin enterprises which give back only a part of the capital invested in them, and which is as completely lost as if consumed by a spendthrift. The immaterial products of a

teacher, a lawyer, or a priest, etc., may be wasted in the same way; that is to say, consumed in a non-reproductive manner. The imprudent, the unskillful, who do not value the cost of production or the value of the products of their industry, are also spendthrifts. To appreciate the disastrous consequences of waste, it suffices to remark, that a value saved becomes capital, the consumption of which is renewed unceasingly, while a wasted value is consumed but once." VI. *Gratuitous or absolutely unproductive Consumption.* There are various kinds of unproductive consumption, that are not only unproductive because they are not reproductive, but because they take place at the expense of certain members of the social body, and are effected by consumers who are altogether unproductive, who destroy utilities and values belonging to others. This is consumption at the expense of a production which is not even reproductive, and to which Skarbek has given the name of gratuitous or doubly unproductive consumption, and which Senior calls absolutely unproductive.—If we seek to draw up a list of the kinds of this consumption, which is assuredly very harmful to society, we have, first of all, the consumption of criminals who are professional invaders of their neighbors' rights of property; next, the consumption of all those who carry on spoliation of any kind under the protection of abuse or artificial monopolies, unpunished or tolerated, or created by bad legislation. Following these are the paupers, who, without being criminals, live at the expense of others; both those who are permanently deprived of their physical or intellectual powers and those who are temporarily in this condition, such as the able-bodied poor, out of employment for the time being, and who have exhausted their resources, and even those who, although industrious and occupied, do not receive enough in exchange for their labor to give them the means of subsistence.—"The support of the poor," says Frederick Skarbek, "is doubly unproductive consumption, gratuitous, negative, and made to the detriment of those who provide for them. So that the poverty of a greater or less number of people diminishes the productive forces of a nation, by producing a decrease of workmen, and preventing the accumulation of capital; for everything that is devoted to the support of the poor might be saved and amassed in the form of productive capital; and the poor, for the very reason that they are deprived of the means of labor, can not co-operate in the production of values, still less in the formation of capital." This is a refutation of the quietism of those who see in the support of the poor, by public or private charity, merely a distribution of social wealth which is desirable in many regards, and who forget that the wretchedness of the poor, by decreasing the income of the rich, diminishes the common stock of labor and engenders universal misery. Human society is decidedly a society of exchange of wealth or services, and not of benevolence. If men in society

come together for mutual assistance, this can take place normally, without damage to any one, only when it is an exchange of services and values. All gratuitous consumption is a diminution of individual and social wealth.—Senior includes in this class consumers who produce absolutely nothing in return for what they consume; that is to say, men rich enough to live without working and without rendering any service to society. But the number of such men is very small. The proper employment of capital and the preservation of property, so useful to society, demand incessant care on the part of those who have them. On the other hand, in proportion as nations become enlightened, the men we have here in view are impelled to engage in some occupation, frequently in one very productive by its nature, either through love of accumulation or of power, or the love of study, or the desire of distinction, or by the still nobler want of being useful to their kind.—VII. *Balance of Consumption and Production.* Consumption being the end and sole object of production, there is naturally an intimate relation between these two great social phenomena.—From the point of view of private or non-industrially reproductive consumption, it is evident that the decay of a nation depends on the balance of national consumption and reproduction. It is by the excess of wealth produced over wealth consumed that capital increases; and capital is here synonymous with the means or instruments of labor and with the well-being of the population.—VIII. *Public Consumption.* Whatever is consumed in the interest of the whole nation, constitutes governmental or public consumption.—The character of the consumer does not change the nature of the consumption. Nations, provinces, associations of every kind, consume in a way precisely similar to private persons, and these kinds of consumption may either be productive or unproductive; but here the terms have a little different meaning from that which they have in the case of private consumption. Unless a state carries on an industry itself (and in this case it almost always makes a monopoly of it), its expenses are not positively reproductive; that is, it does not find the capital advanced in the results obtained. But, in the form of security, of justice, of administration, of the police power, in the use of roads, in the enjoyment of works of art, of monuments, and other services, it finds utilities representing more or less fully a return for the capital expended.—In the discussion of public consumption or outlay we must begin by determining what are the necessities of the state which determine this consumption or outlay, and also by determining what are the taxes, loans and other resources intended to meet them. The majority of economists who have written methodical treatises on the science discuss all these questions in the last part of their works, which thus become treatises on finance.—It is especially with reference to public expenses that it is proper to point out the abuse of the sophism that every

expense, no matter what its object, or how unproductive it may be, "is good for business," hastens circulation and production. Men go so far as to believe that in times of crisis and stagnation caused by political disturbances public outlay is a powerful agency to enliven industry, provide employment for labor, and bring things back to the condition they were in previous to the crisis. Some public men, dupes of the sophism, others to satisfy popular prejudice and quiet the popular mind, others with personal interests and position in view, have recourse to this pretended remedy; and this is one of the causes of the increase of outlay which enlarges the budget. Fêtes, festivals, official rejoicings, perfunctory receptions by public officials, in times of sadness or misfortune, are useless expenses as a stimulant to business; they irritate more than they calm the suffering class of society; they force the families who take part in these festivals and receptions to ruinous expenses; they give an artificial encouragement to certain industries at the expense of certain others: they are, therefore, a pure loss to the community. For an economic phenomenon to be both the cause and effect of prosperity, it should be produced in the inverse direction; the impulse to prosperity should come from the family, the well-being of families should render the satisfaction of wants possible, and produce an increase of consumption.—The error which we have just pointed out is found, in another form, in the public outlay which the authorities frequently allow themselves to make, when, in times of difficulty, they have to come to the aid of the needy classes, deprived of labor and wages, and thus dangerous to public tranquillity and security. What matter, it is said, under these circumstances, if the works about to be begun are without utility? what matter if the useful effect produced is less than the expenses incurred? "it is good for business;" and, in consequence of this false reasoning, a great amount of labor is consumed unproductively, and a considerable amount of capital swallowed up, as has been witnessed in many countries, and in France especially, during the crises of the first revolution, the revolution of July, 1830, and the revolution of 1848.

CONTEMPT. (See PARLIAMENTARY LAW.)

CONTESTED ELECTIONS. (See PARLIAMENTARY LAW.)

CONTINENTAL SYSTEM. (See EMBARGO, I.)

CONTRABAND OF WAR. The prohibition of trade in goods contraband of war is a limitation imposed by international law upon the commerce of neutrals. This commerce, generally speaking, is *free*, both in the intercourse of neutrals with one another, and in the intercourse of neutrals with belligerents. Still it is free only

on condition that it remain neutral, that it does not interfere in the war, and that its nature and object be of a peaceful character. This condition is violated when commerce engages in supplying the *wants of war*, in which case it assumes the character of assistance to the enemy. It can then no longer claim the rights of neutrality, whose character it has itself denied and lost, and its goods are treated as enemy's goods, as contraband of war. It results herefrom that no special treaties are necessary for the definition of the idea of contraband of war; this idea lies in the nature of the thing and of neutrality itself.—If the doctrine of contraband of war is one of the most unsettled and most open to controversy in the whole body of international law, this must be ascribed to the fact that the practical application of the general principles applicable to contraband of war is always made by belligerent maritime powers, the strongest of which finds it consonant with its interests to extend the meaning of the word contraband as far as possible, while the weaker has just as much interest to restrict it.—In former centuries, each of the belligerent maritime powers was wont to declare, at the beginning of hostilities, what articles it would consider as contraband of war. At the present time such declarations are not made; it is left to the prize courts to decide whether, in a particular case, articles are contraband of war or not. The prize courts are compelled not to go beyond reasonable limits in their decisions in such cases, because the neutral power has the right of making any decision which should be contrary to the laws of nations a *casus belli* against the power in question.—This consideration has had such a salutary effect that a dispute respecting the contraband nature of an article has never been followed by war. But, on the other hand, it follows from this condition of things, necessarily, that so long as it continues to exist there is no possibility of determining, in theory, what are and what are not articles of contraband of war, by any rule of universal application. Theory must be satisfied with elucidating the principles applicable at the present time, and stating what were the articles which have provoked discussion during recent times.—Wants of war are contraband of war. But what are wants of war? There are certain objects which, as Grotius says, every one will recognize as being articles intended to supply the wants of war, and consequently articles contraband of war. Such are arms, implements of war, especially ships of war and war material; finally, the ingredients employed in the manufacture of gunpowder. And, on the other hand, there are articles which every one will recognize as being of an eminently peaceful character. To this category belong not only pianos and prayer books, as Dana says, but also the great mass of articles of commerce, such as cotton, etc. However, there will always be found a number of articles concerning the destination of which—whether they are intended for peaceful or belli-

cose objects—doubts will arise. So far as these articles are concerned, the decision rests essentially in the equitable judgment of the prize courts. When the special circumstances of the case tend to demonstrate, without a doubt, the intention of an employment of the articles for war purposes, the prize court will be able to condemn the cargo without having to fear the intervention of the neutral power; consequently, there exists, *de facto*, such a thing as *contrabande par accident*, scoffed at by so many theorists. The articles of doubtful use, *res ancipitis usus*, concerning which there has been most controversy in modern times, are: iron, steel, steam engines, boilers, coal, horses, specie money, and articles of food. We can not enter more minutely into the details of this controversy, and must confine ourselves to the statement that, so far as there exists no special stipulation between a belligerent and a neutral power providing otherwise, only the seizure of all supplies of articles of food of every kind could afford the neutrals a motive for protest.—According to the law in force at the present time neutral powers are *not* bound to forbid their subjects the carrying on of trade in articles of contraband. They simply permit such trade, subject to the right of confiscation on the part of the belligerents.—Belligerents have the right to interfere in neutral trade as contraband trade, when a neutral vessel attempts to carry articles of contraband to the enemy. It is necessary, however, that the ship should be seized *in flagrante delicto*: a vessel that has sold her cargo can not be seized on her return voyage.—The consequence of the seizure of a vessel engaged in contraband trade is, according to tradition, that, by way of prize court law, the cargo is confiscated. By delivering up the articles of contraband the captain of the neutral vessel can free himself from any further interruption of his voyage. But if he refuses to deliver up such articles, then the vessel must be brought before a prize court; but the articles of contraband must not be carried away by force.—The confiscation of the portion of the cargo not contraband of war, as well as of the ship itself, is made when the owner of the vessel, or freighter, knew of the transportation of the contraband articles.—Analogous to the contraband of war is the transport of troops or dispatches for the benefit of the enemy. A neutral vessel which consents to engage in such service is, according to English custom, subject to confiscation, because she thus loses her neutrality by an evident act of hostility. The English admiralty courts do not admit the plea that the ship had been forced by the enemy to perform such service. If the enemy compels a neutral vessel to violate the laws of neutrality, then the ship owner must seek redress at the hands of the enemy's government, through the intervention of his own country. The other belligerent looks upon a breach of neutrality simply as a breach of neutrality, and acts accordingly; because, admitting the plea that the act was per-

formed under compulsion would render useless and uncertain all its rights of prohibition.

WERNER.

CONTRACT, SOCIAL. (See SOCIAL CONTRACT.)

CONTRIBUTION OF WAR. Although war is a state of violence between two countries, and violence generally supposes the employment of arbitrary power, still there are established between civilized nations customs and rules, to which the belligerents submit. There is, therefore, a distinction made between the legitimate and illegitimate means of injuring an enemy. Chief among the former are contributions of war, requisitions, forage and conveyances which are exacted in the enemy's country. There was a time when war consisted of a series of acts of violence, without rule or restraint; when both the person and property of the vanquished were at the mercy of the victor; and when the country invaded by an army was submitted to pillage and devastation. When all nations had in turn experienced the horrors of war, they agreed, at least, to submit these inevitable evils to rule, since it was impossible to suppress them entirely. Instead of plundering the inhabitants and burning their houses, the invading army exacted of the invaded district or conquered city contributions of war (*tributa bellica*). On condition of the payment of this tribute, the preservation of private property of all kinds was assured, and the enemy were obliged to buy and pay for whatever he demanded afterward, excepting the services which might be eventually required of the citizens and temporary subjects. Such is the history of the origin of tribute contribution of war levied by the enemy upon a country which they have invaded. The progress of public or state morality, and the mitigation of the hard usages of war, have made it the common rule to respect private property except in maritime warfare; and tribute, or contribution, is now no longer regarded as a substitute for fire and pillage; that is to say, a declaration of the local authorities that they would not or could not pay the tribute demanded would not give the enemy the right to pillage and burn, but would simply oblige the enemy to have recourse to force. Tribute of war is, therefore, an extraordinary tax levied for the benefit of the enemy and by their order. In order that this levy may be made in an equitable manner, it is customary for the assessment and collection of the sum demanded to be left to the local authorities. Their first duty is to proportion each one's share to his means; they, therefore, ordinarily take as their guide the assessment roll for ordinary taxes. If an individual has paid more than he justly should in proportion to his fortune, he has the right of recourse against the commune, the canton; in short, against the district on which the tribute was assessed. If a district has been too heavily taxed, it has the same resource against the district, the

department, the province, and so on. As we said above, it is only in the case of the refusal of the local authorities to levy the tribute that the victor can exercise his authority directly by way of force. He takes it upon himself to assess the required tax according to the same rules as those stated above for the local authorities. But, considering his limited knowledge of the country, and the greater or less pressure of his wants, this mode of procedure is more apt to be marked by arbitrariness than the former. We must not, however, believe that tribute of war constitutes an absolute guarantee of safety to private property. The weakening of the enemy being the aim of military operations, it is permitted to destroy property the possession of which could not be abandoned to the enemy without increasing his strength. This is an additional proof that tribute of war is not based upon the redemption of private property. Thus gardens, vineyards, villas and forests should be spared, but the enemy always has the right to destroy them in order to strengthen his position. We must distinguish between contribution of war and requisition. Requisition consists in the asking for certain specified objects, under the form of a request, but exacted by force in case of need. Washington, in the American revolutionary war, invented both the word and the thing it denotes. But the use of requisition dates mainly from the wars of the French revolution, and was practiced by the French armies, who brought to a high degree of perfection the system of living upon the enemy's country. Besides what we may call the local contribution of war, which is exacted in the course of military operations, there is the tribute exacted at the conclusion of hostilities, either by a special agreement, or by virtue of conditions inserted in the treaty of peace. We may cite, as examples of tribute in this last acceptance, the war tribute of 140,000,000 francs required of Prussia (6,000,000 inhabitants) by France, in virtue of the agreements of Sept. 8, and of Nov. 5, 1808; the tribute of 700,000,000 francs required of France (30,000,000 inhabitants) by the allies, in virtue of the fourth article of the treaty of Nov. 20, 1815; and, finally, the tribute of 5 000,000,000 francs required by the treaty of February, 1871 (France having 37,000,000 inhabitants). There is no difference between a contribution of war, taken in this sense, and the payment of the costs of the war.—What is the position of the part of the country which, by the course of events, is subjected to the payment of a tribute of war, relatively to the state at large? Is the state, when restored to the full exercise of its sovereignty over the provinces temporarily overrun and laid under tribute by the enemy, bound to reimburse to these provinces the sum they have been forced to pay? Not in justice; for the state had nothing to do with this expense, and it is responsible only for the acts which are performed by its order. If the territory has been invaded because of the weakness of the state, it is a case of superior force, for

the consequences of which the state should not be called to account. Besides, there would be a certain amount of danger in laying down in principle the obligation of the state to make such reimbursement; for it would suffice for the enemy to be master of a part of the country to drain by his exactions the entire state. On the other hand, it would often be contrary to equity to adhere to the strict law, or to the general considerations of political interest. If the inhabitants of a city have saved the country by a prolonged resistance, by sacrificing their fields, their villas, their suburbs; or if a province has retarded the enemy's march by destroying its crops and resources of every kind, and by harassing the enemy, it is just that the state should compensate this province for the losses which it has suffered in the general interest. These considerations of equity apply, also, when the part of the country occupied by the enemy has been abandoned to him for purposes of strategy, the real line of defense being placed much further back. They may be applied, also, though the application is more doubtful here, when the occupation is the fault of a gross blunder of the general intrusted with the defense of the territory. Finally, they apply most naturally when a province is, by its situation, exposed to become the theatre of the war, as was formerly the case with Belgium, the province of Milan and the provinces of the Rhine. We might multiply examples of this kind. Quite the reverse of the principle of law, which adapts to itself the circumstances of a fact, equity, more pliable, adapts itself to the circumstances, and follows after them in all their windings. JULES GRENIER.

CONVENTION, The Hartford (IN U. S. HISTORY). The success of the commercial party in extorting the constitution from the agricultural party, the gradual consolidation of the latter party and its success in 1800, the union of the south and west against New England, and the division of the middle states, are matters elsewhere dwelt upon. The difference occasioned by the last named coalition had grown inveterate through time and the heat of conflict, until in 1812 the dominant democratic-republican party administered the government with as little reference as possible to the existence of the federal party, or of New England, where alone the federalists retained a party organization. The south and west, under Henry Clay and other leaders, whom the bitter Quincy described as "young politicians, fluttering and cackling on the floor of this house, half hatched, the shell still on their heads and their pin feathers not yet shed—politicians to whom reason, justice, pity, were nothing, revenge everything," had determined upon war and an invasion of Canada, as a means of compelling Great Britain to abandon the rights of impressment, search and paper blockade, and had coerced the peace-loving president, Madison, into participation with them by a threat to deprive him of his second term. A bill declaring

war against Great Britain was passed in the house, June 4, 1812, by a vote of 79 (62 from Pennsylvania and the south, and 17 from the north) to 49 (32 from the north, and 17 from Pennsylvania and the south). A proposition to include France in the declaration received 19 votes. In the senate, June 17, the vote was 19 to 13, 4 northern and 2 southern democratic senators voting with the federalists against the war. June 18 the act became law, under the nominal auspices of an administration which had made no adequate preparations in men or money, by land or sea, for a war which was to protect American commerce by invading Canada, and in which the navy was to be drawn up on shore and defended by the militia. Against such a war so conducted the federalists were unanimous, on the grounds (as stated in the address of the federalist members of congress in 1812) that French aggressions had never really ceased; that the British orders in council operated only against American trade with France, Holland and northern Italy; that this deprivation, though burdensome, was not sufficiently so to justify the destruction of all remaining American commerce for the purpose of avenging it; that American commerce asked from the dominant party, not war, but protection in the form of an efficient navy or the power to arm and protect itself; and that the declaration of war was only designed by American Jacobins to draw off by a side attack the energies of Great Britain from its struggle with France. They denounced the invasion of Canada as "a cruel, wanton, senseless and wicked attack, in which neither plunder nor glory was to be gained, upon an unoffending people, bound to us by ties of blood and good neighborhood, undertaken for the punishment over their shoulders of another people 3,000 miles off." When summoned, June 12, to supply detachments of militia for garrison duty, the governors of Massachusetts and Connecticut denied the power of the president to make such a draft except to execute the laws, suppress insurrections, or repel invasions. In this denial the council and legislature of Connecticut joined, and the popular approval of their action was shown by the election, immediately after, of 163 federalists to 36 democrats in the house. The difficulty was in part removed by allowing the militia to remain under its state officers, and by the general conciliatory measures of the federal government. Nevertheless, the New England states continued in every debatable point to adopt the very strictest construction of the federal government's constitutional powers, and to do so in language which showed plainly their continued dislike for the war; and their action seemed to meet popular approval. In the spring of 1813 the federalists showed a clear majority in every state election in New England. Their Massachusetts majority rose from 1,370 in 1812 to 13,974; in Connecticut and Rhode Island the democratic vote was much decreased, and even the hitherto doubtful or democratic states—

New Hampshire and Vermont, were carried by the federalists. In the 13th congress, which met May 24, the house contained 68 peace to 112 war members, the New York delegation having become largely federalist.—Stimulated by success the party took a higher tone. The Massachusetts legislature declared the whole war “impolitic and unjust,” and refused votes of thanks for naval victories on the ground “that, in a war like the present, waged without justifiable cause, and prosecuted in a manner indicating that conquest and ambition were its real motives, it was not becoming a moral and religious people to express any approbation of military and naval exploits not immediately connected with the defense of our seacoast and soil.” The state officers and leading federalists even refused to attend the public funeral of captain Lawrence of the Chesapeake. In November the newly elected federalist governor of Vermont recalled a brigade of militia which his democratic predecessor had ordered out for garrison duty, and, when a proposition was made in congress to direct the attorney general to prosecute the governor, a counter proposition was at once brought into the Massachusetts senate to aid Vermont with the whole power of the state. New England, in short, presented a united federalist front of opposition to the war; and the administration, ceasing its futile efforts at conciliation, practically abandoned the whole section and threw all its efforts into the invasion of Canada. For this purpose it was driven to attempts to raise men by conscription and impressment (see DRAFTS, I.), measures to which submission could hardly have been expected from New England.—In the autumn of 1814 the difficulties of the federal government, the desperation of the democratic leaders, and the exasperation of the New England federalists, seemed to have reached their common climax. The propositions in congress to enforce a draft and to enlist minors without the consent of their parents, the embargo which had been enacted to counteract the British exemption of the New England coast from blockade, the neglect of the federal government to provide for the defense of the New England coast or to prevent the advance of the British along the shores of Maine, which they now controlled up to the Penobscot river, the destruction of New England commerce and fisheries, for which privateering and infant manufactures were no substitute, and the complete nullity of New England in the councils of the nation, formed a mass of grievances which seemed to have become intolerable. In February, 1814, a committee of the Massachusetts legislature, while referring the question of a New England convention to the next legislature, had used the following strong language. “We believe that this war, so fertile in calamities and so threatening in its consequences, has been waged with the worst possible views, and carried on in the worst possible manner; forming a union of wickedness and weakness which defies, for a parallel, the annals of the world.”

It is significant of the temper of the times that this language was pronounced weak and inadequate by many federalists who considered “action” to be the most urgent need.—Oct. 18, 1814, the Massachusetts legislature adopted the proposal of a convention of the New England states to “lay the foundation of a radical reform in the national compact by inviting to a future convention a deputation from all the other states in the Union.” The proposal was promptly adopted by the legislatures of Rhode Island and Connecticut, which last named body had just ordered its governor to call a special session for the protection of its citizens if the federal conscription bill should become a law. The object was cautiously limited in Massachusetts to matters “not repugnant to their obligations as members of the Union,” in Connecticut to matters “consistent with our obligations to the United States,” and in Rhode Island to “measures which it may be in the power of said states, consistently with their obligations, to adopt.” In New Hampshire, where the council was democratic, and in Vermont, where the successful fight at Plattsburgh had awakened a new war feeling, the federalists did not venture any state action upon the proposal, but the federalist counties of Cheshire, Grafton and Coos, in New Hampshire, and Windham, in Vermont, appointed delegates by town meetings. That the recent disasters of the war, the depreciation of the public credit 25 per cent. below par, and the humiliating demands of the English commissioners as the price of peace, should now be supplemented by this portentous union among the New England federalists, who had just succeeded in carrying every congressional district in their section except three, in which there was no popular choice, brought the wrath, alarm and suspicion of the democratic party and the administration to their highest point. Executive agents were scattered over New England to search for evidences of a secret plot to separate that section from the Union and form a grand duchy under an English prince of the blood; a regular officer was sent to Hartford, with assurances of support from the New York state troops and the “fighting democracy” of Connecticut, to oversee the deliberations of the 26 elderly gentlemen who were soon to meet there in convention; and the president, at the request of congress, appointed Jan. 12, following, as a day of national fasting and prayer.—The convention met at Hartford, Conn., Dec. 15, 1814, the delegates being as follows. *Massachusetts*—George Cabot, Nathan Dane, William Prescott, Harrison Gray Otis, Timothy Bigelow, Joshua Thomas, Samuel Sumner Wilde, Joseph Lyman, Stephen Longfellow, Jr., Daniel Waldo, Hodijah Baylies, George Bliss. *Connecticut*—Chauncey Goodrich, John Treadwell, James Hillhouse, Zephaniah Swift, Nathaniel Smith, Calvin Goddard, Roger Minot Sherman. *Rhode Island and Providence Plantations*—Daniel Lyman, Samuel Ward, Edward Manton, Benjamin Hazard. *New Hampshire*—Benjamin West, Mills Olcott. *Vermont*—Wil-

liam Hall, Jr. George Cabot was chosen president, and Theodore Dwight, editor of the Hartford Union, secretary. After a secret session of three weeks and the preparation of a report to their respective legislatures, the convention adjourned, Jan. 5, 1815. The report denied any present intention to dissolve the Union, and admitted that, if a dissolution should be necessary, "by reason of the multiplied abuses of bad administrations, it should, if possible, be the work of peaceable times and deliberate consent." It enumerated the New England grievances above mentioned, with the addition of "the easy admission of naturalized foreigners to places of trust, honour and profit," and "the admission of new states formed at pleasure in the western regions," as destroying the original balance of the sections. It proposed that congress, paying in to the state treasuries a certain proportion of the taxes raised in the respective states, should confide to the states their own defense. It laid down the general principle that "it is as much the duty of the state authorities to watch over the rights reserved as of the United States to exercise the powers which are delegated;" and proceeded from this stand point to the narrowest particularism of the Kentucky resolutions. (See also STATE SOVEREIGNTY.) It recommended the following changes in the constitution: 1. That the southern states should be deprived of the representation given them for three-fifths of their slaves. 2. That a two-thirds vote of both houses should be requisite for the admission of new states. 3. That embargoes should be limited to 60 days. 4. That a two-thirds vote of both houses should be requisite to prohibit commercial intercourse; or 5, to declare war, or authorize hostilities, except in case of invasion. 6. That naturalized foreigners should be debarred from membership in congress and from all civil offices under the United States. 7. That the president should not be re-eligible, and should not be taken from the same state two terms in succession. It closed with a suggestion that if affairs should not change for the better, or if these amendments should be slighted, another convention should assemble in Boston, on the third Thursday of June following, "with such powers and instructions as the exigency of a crisis so momentous may require."—The legislatures of Massachusetts and Connecticut adopted the suggestions of the report, and sent commissioners to Washington to urge the proposed amendments. Before they arrived the administration had been relieved from all anxiety; England had agreed to an honorable peace; the rout of 12,000 picked veterans from Wellington's peninsular army by Jackson and 7,000 raw Kentucky and Tennessee militia at New Orleans, had closed the war in a blaze of glory; and the commissioners found themselves only the discredited agents of a meeting of secret conspirators against the unity of the republic, and of states which had deserted their country in its hour of sorest need. No attention was paid to their recommendations, nor was any renewal of

the convention ever attempted. From the series of humiliations, of which the Hartford convention was the close, New England learned thoroughly the necessity of carrying on struggles against the national government *within* the Union, a lesson which it had occasion to rehearse often afterward. It would have been fortunate for her sister section of the south if the same lesson had been impressed upon her attention 50 years previous to 1861.—The federalist politicians who fathered or composed the Hartford convention never escaped from the popular odium which attended it. Nov. 16, 1819 the president, Cabot, deposited its journal with the secretary of state at Boston, that all men might see that its designs and debates were legitimate and not treasonable. In 1833 Theodore Dwight, the secretary, published his *History of the Hartford Convention*, but public opinion had even then become fixed, as it has since remained, against the convention. (See EMBARGO; SECESSION, I.; STATE SOVEREIGNTY; FEDERAL PARTY, II.; DEMOCRATIC PARTY, III.)—See Dwight's *Hartford Convention*; 6 Hildreth's *United States*, 545; 4, 5 Benton's *Debates of Congress*; 2 Ingersoll's *Second War with Great Britain*, 216, 248; 2 Holmes' *Annals*, 467; 2 Goodrich's *Recollections*, 9; 3 Spencer's *United States*, 286; Carey's *Olive Branch*; Adams' *Documents relating to New England Federalism*; Sullivan's *Letters*; Quincy's *Life of Quincy*; 1 von Holst's *United States*, 263. The act recognizing the existence of war between the United States and Great Britain is in 2 *Stat. at Large*, 755.

ALEXANDER JOHNSTON.

CONVENTION, Joint. (See PARLIAMENTARY LAW.)

CONVENTION, Peace. (See CONFERENCE, PEACE.)

CONVENTION, The Constitutional, an institution of the United States, charged with the formation of the fundamental law. By the American constitutions the enactment of the ordinary statute law is the work of the legislature, acting conjointly with the executive, who has a veto upon its action. On the other hand, the framing of strictly organic laws has been generally committed to a special legislative body, meeting for that purpose only, called a constitutional convention, acting conjointly with the electors or the body of the people, to whom is given a veto upon its action. The constitutional convention is, therefore, strictly a legislature: but, because of the transcendent character of the laws which it initiates, it is, as Austin says, an "ulterior legislature." To this convention there is nothing similar in other countries having governments called constitutional. So much of their fundamental law as is not composed of customs or usages, or of judicial decisions, is but a statute, deriving a somewhat higher solemnity from its subject matter, and the greater deliberation at-

tending its genesis, and not from the extraordinary character of the body by which it is enacted. Of this description is the English constitution. So, in France and other European countries, where written or enacted constitutions exist, they are the work of the ordinary law-making power, done at perhaps a special session, or by an increased majority, but without the intervention of extraordinary agencies. The obstinate conservatism of its character enables the English people to employ safely and successfully such a mode of fundamental legislation. It stands in need of no unusual checks to restrain it from disturbing rashly "the nice equipoise" of its constitution. With Burke it realizes that "every project of material change in a government so complicated * * * is a matter full of difficulties, in which a considerate man will not be too ready to decide, a prudent man too ready to undertake, or an honest man too ready to promise." It is doubtful whether the temperament of any people living under liberal institutions, excepting that of England, is capable of the requisite self-control to pursue with safety such a course.—Whether from conviction of this truth, or from a lucky accident, the founders of the American governments, under the wise guidance of the elder Adams, adopted the safer mode of distributing the legislative function between separate agencies, the fundamental to one, and the ordinary to another. It is, perhaps, not so fortunate that the misleading name of convention was given to the former, a body charged with a function so delicate and novel in the history of political institutions. For the name convention has been regarded as evidence of its identity with a wholly different institution, the revolutionary convention. Many of the worst evils experienced in the political life of the American people have arisen from confounding these two institutions, and from attributing to them, as though identical in character, because developed the one from the other, or both from a common original, like powers and functions. The revolutionary convention is an earlier development from the ordinary assemblies of the people (*contuentis populi*), common in all ages in England and other free countries. The English convention parliaments of 1399, 1660 and 1689, are familiar examples of this phase of the institution. Omitting the first, as of less interest, that of 1660 was assembled upon the downfall of the protectorate of Richard Cromwell, to take the formal steps deemed necessary to effect the restoration of Charles II. to the throne. There existing no lawful parliament, elections were held throughout England, on the recommendation of a rump of the old parliament, which had been forcibly dispersed by the late protector, to form a new parliament. This body met in London, and called Charles II. to the throne; but, as these elections were illegal, because held without the royal writ, the assembly was styled, as Macaulay says, a convention, and not a parliament. Similarly, the convention of

1689 was called to lay the foundations for the new dynasty of William and Mary, upon the abdication of James II. Because, regularly, there existed at that time in England no parliament, since there was no king, and, without a king's writ, no lawful parliament could be summoned, the prince of Orange, afterward king William III., called elections, at which delegates were chosen throughout England, who, together with the lords, spiritual and temporal, then in London, constituted a convention, by whom the new dynasty was established. The former case differed from the latter only in the fact that, by a legal fiction, Charles II. was held to be, and ever since the execution of his father to have been, king of England; whereas, by a like fiction, James II., forcibly driven from his kingdom, was declared, by reason of his oppressions and usurpations, to have abdicated the throne, which was thereupon pronounced vacant. In the one case, according to this conception, there was a *de jure*, but not a *de facto*, king of England; and, in the other, there was a king *de facto*, but not *de jure*; and the union of both qualities, real or imputed, was deemed necessary to the regular institution of a parliament, or the re-establishment of a legitimate political order. Both of these conventions were equally revolutionary bodies, assembled without law, as temporary expedients, to bridge over a chasm between a state of things that had ceased, and one that was beginning to be. The characteristic qualities of the revolutionary convention, accordingly, are two: that it is hostile to the state of things by law established; and that, as it is an embodiment of revolutionary forces, there is no limit to the powers it may exercise, save its own will. It is, in short, merely a provisional government, resting on force.—In the United States there have been examples of this type of convention at three epochs, all epochs of upheaval and transition: the first and second, during and at the close of the colonial condition; and the third, at the time of the so-called secession of the southern states from the Union. The most notable case in the first period was that of a convention assembled in May, 1689, in Massachusetts, simultaneously with that last described in England, having for its purpose the displacement of the government established by the crown, and presided over by governor Andross, and the formation of a government by the people, "according to the ancient forms," in force before the condemnation of their charter by the king's courts. This revolution was consummated two days before news reached the colony of the revolution in England, the same ship bringing with it orders from the authorities to proclaim king William and queen Mary. Similar cases arose in 1775 and 1776—the second period—in those colonies whose assemblies were controlled by the friends of the crown. The governments established by the crown having been suppressed, conventions or provincial congresses were called to supply their place, and to carry on the contest with

England. So, in the third period, when eleven southern states resolved to secede from the Union, there were called, in nearly all of them, conventions to initiate and to direct the movements to that end. In two or three, where the sentiment of the people prevented the election of conventions, the promoters of secession effected their object through the legislatures of their states, in which a friendly majority usurped the power to pass the necessary ordinances. These bodies were all alike revolutionary conventions, modeled, so far as the diversity of circumstances permitted, strictly after the English conventions of 1660 and 1689.—From this revolutionary body the constitutional convention is a widely different institution. Historically, it need not be denied, that the former is the root from which the latter sprang. In no country but America, however, has such a development been witnessed, though in none, in which revolution has led to provisional organizations hostile to the existing order, has the revolutionary convention, under some form and name, been unknown. Within that species of convention must be comprehended every embodiment of revolutionary forces articulated into working committees for the establishment of a new order upon the ruins of an old. By its definition revolution is the essence of unlawfulness. If successful, its triumph is the triumph of force over that which is legitimate as based upon recognized law. It then becomes the source of wholly new law, since so much of the old law as it permits to survive, survives by its will alone, and is, in effect, a law of its own enactment. The constitutional convention, on the other hand, is never the organ of revolution. It is called by an established government, in pursuance of fixed constitutional customs or prescriptions, to do a definite work in furtherance of the ends of that government, for its amelioration and not for its destruction; accordingly, the purpose of those who call it into being, is, that it shall do its appointed work and none other; that it shall melt into the general mass of citizens when its task has been completed, giving to the power that spoke it into being, such an account of its conduct and labors as by law or custom may be required. The constitutional convention is not itself a government; it is the agent or minister of a government, which moves along in full life while the convention is in session, and which is meant to survive it. It is therefore, in substance, but a numerous and dignified committee, so selected as, from its numbers and territorial distribution, to represent the various phases of opinion at the time existing. As intimated, however, it is in point of historical sequence, a development from the revolutionary convention. It is that institution shorn of its revolutionary features, of those absolute powers, adverse to the existing order, which would render its existence incompatible with that of any government but its own; that institution, in short, transformed and employed for a consti-

tutional purpose. That this most important truth has been doubted or denied, depends upon the circumstances attending its introduction into our constitutional system. Of the constitutions first formed for the states of the Union, in the early years of the revolutionary war, many were framed by the provincial conventions or congresses above mentioned as examples of the revolutionary convention. That those bodies had ample power to do this can not be denied, because they were revolutionary governments, and as such were possessed of unlimited powers. They could adopt a constitution because they could do anything within the limits of the actual force at their command. When, therefore, after the peace with England, conventions were called by the various states, for the purpose simply of procuring the revision of their existing constitutions, some confusion of ideas at times developed itself in regard to their nature and powers. Bearing the same name, were not those conventions the same bodies with which the people had been familiar during the revolutionary war, when they constituted the only governments existing in the colonies? And if the same, could they not now cut loose from the governments under which they were convened, and exercise all the powers of an absolute sovereign? To this question, one of the most important that ever arose under the American constitutions, but one answer could or can be given. No. They are not the same as their revolutionary congeners, and they could not exercise the same powers, save by rebelling against their states as now organized. This, of course, they, as any body of men, might do, and under the same penalties. But as constitutional conventions they could do nothing but what they were empowered to do by the state which spoke them into being. The erroneous view here controverted has never in this country been universal, or very widespread, though in some conventions, held before the war of secession, and in the Illinois convention of 1862, it had earnest supporters. France, unfortunately, which borrowed from England, through the American colonies, the revolutionary convention, has never been able to free herself from the idea that all the powers and methods of that dread engine of force have been inherited by its namesake, the constitutional convention, there called the constituent assembly. What the effect of that error has been upon the political fortunes of France will be seen from the words of one of her most eminent publicists, given below.—Corresponding to the different views of the nature of the constitutional convention are the principal theories as to its powers. These, which have been partly foreshadowed already, are what may be properly denominated the French theory, and the American theory. By the latter the convention is regarded, in general, as a subaltern agency employed by the state to perfect its political organization. Revolution being, as history teaches, a too frequent incident in the life of states, the

purpose of this institution has ever been to prevent it by a timely removal of its causes. This has been sought to be done by giving to the forces that, from time to time, have become dominant within the state, the actual political control, instead of suppressing them until they compelled recognition by its disruption. As thus viewed, the function of the convention is analogous to that of the organs of reparation and reproduction as contrasted with that of the organs of locomotion, of defense, and the like, in the animal economy. It ministers to the perfecting and perpetuating and not to the ordinary working of the structure. So, the convention has no part whatever in the function of government, but only in that of perfecting the apparatus of government. By the nearly unanimous voice of the American people it is pronounced the duty of such a body to abstain from administrative measures; from attempts at ordinary legislation; from interfering with the action of the various departments of the existing government; and to render obedience to the laws by which it is convened, so far as is not incompatible with the execution of the commission with which it is charged; and finally, when the work required of it is performed, to surrender its commission and, unless authorized otherwise to dispose of it, to submit to the government of the state the result of its labors for approval or rejection. The cardinal point, as before stated, is that the convention is intended to do a special work, at the bidding and under the supervision of the existing political organization; to ameliorate and not to displace it. Hence its duty is to dissolve when its work is completed, leaving that organization in full life, and to take no step beyond the scope of its charter, the act which calls it into being. All excess of authority is for it revolution. If it may transcend its commission at all, it may do so without limit; and "a convention having unlimited powers, is a revolutionary and not a constitutional convention." (2 Hill S. C. Rep., 222.) The American theory that the convention, as a constitutional expedient, is a body of strictly limited powers, has been well stated by Mr. Grimke, an eminent lawyer of South Carolina, thus: "A convention," said he, "is thus limited by the fundamental laws of moral obligation; by the declaration of independence; by the national and state constitutions; by the occasion and object of the call; by the call itself, as the act of the people and of the legislature. These in fact," he continues, "are the constitution of the convention, and by them that body is as clearly and inflexibly bound, as the legislature by the constitution itself. They may do anything consistent with all these, they can do nothing inconsistent with them." (Id., 33.)—So, the supreme court of Pennsylvania upon the same subject, in a late case, said. "A convention has no inherent rights; it exercises powers only. Delegated power defines itself. To be delegated it must come in some adopted manner to convey it by some defined means. This

adopted manner, therefore, becomes the measure of the power conferred. * * * The people have the same right to limit the powers of their delegates that they have to bound the power of their representatives. Each are representatives, but only in a different sphere. It is simply evasive to affirm that the legislature can not limit the right of the people to alter or reform their government. Certainly it can not. The question is not upon the power of the legislature to restrain the people, but upon the right of the people, by the instrumentality of the law, to limit their delegates. Law is the highest form of a people's will in a state of peaceful government" (Wood's Appeal, 75 Penn. State Rep., pp. 71, 72.)—The French theory, on the other hand, is that the convention is a virtual assemblage of the whole people, by both theories supposed to be the true sovereign; that by reason of the impracticability of an actual assemblage of the sovereign body itself, the convention must be taken to be its plenipotentiary representative, and, as such, possessed of all the powers that that body would have were it "assembled on some vast plain," in a state of nature, without government, but purposing to ordain and establish one by its original authority; that, accordingly, when the convention meets, the laws and bill of rights and constitution previously existing are abolished, since, if any part of either should survive the convention, it would be because that body had so willed, and had thus, as it were, rewritten them in the book of the laws; that the functions of the various departments of the government before existing are either suspended or discharged at the bidding and under the supervision of the convention; that the revenues of the state are subject to its disposition; that the police, the army and the navy exist at its will and are under its command; in a word, that the lives, the liberties and the property of the whole people lie at its mercy. A body which is virtually the people itself could not properly be required to refer its work to the people for approval. Hence, according to this theory, if a convention frame or amend a constitution, no submission of it to the people need be made. It is possessed of inherent sovereignty, limited only, when the convention meets in this country, by the constitution of the United States. Whether this concession of a limitation is not destructive of the theory of conventional sovereignty among us need not be now considered. In France, from the nature of its constitution, no such concession is required. Accordingly, from the time when the convention met which marshaled the forces of revolution for the destruction of the French monarchy, in 1789, to the present moment, to the so-called constituent assemblies at various times summoned to remodel the French constitution, the powers of a revolutionary convention, disguised under the name of conventional sovereignty, have been uniformly conceded. How conducive such a theory and such a practice must have been to the success of traitors and reaction-

aries in that kingdom it requires no argument to show. That it has actually proved disastrous, nearly every page of the history of France since 1789 demonstrates. It has completely taken away from the French people and committed to conspirators and assassins, or to charlatans masquerading as kings and emperors, the control of the political destinies of France. That this is no exaggeration may be seen from the deliberate admission, published in 1871, in the *Reveu des Deux Mondes*, of perhaps the most distinguished living publicist of France, a senator and a member of the institute, M. Edouard Laboulaye. In an article entitled *Du Pouvoir Constituant*, based on an American work upon the constitutional convention, he said: "In the first rank of these fatal theories must be placed that of the constituent power as conceived in 1789. * * What is the constituent power? It is the power of making or of reforming a constitution. * * In the last 80 years France has had 11 constitutions, which have precipitated her abruptly from servitude into liberty, from liberty into servitude. * * While in the United States the call of a convention is an act as simple and as peaceful as the convocation of an ordinary legislature, have we ever seen in France a constituent assembly which has not brought about a revolution? * * Our whole theory of the constituent power rests upon an error, and a sophism. The error is the delegation of sovereignty. Sovereignty is never delegated. The sophism is the identity of the people and its delegates, the confounding of the principal and the agent. * * From this double error, as from a poisoned spring, have proceeded all our mistakes, and all our calamities. The delegates being considered as the people itself by virtue of the delegation they have received, and the people being the source of all power, our politicians have thence concluded that the assembly possesses all the rights of sovereignty, and, according to them—which is also an error of the revolution—these rights are without limit. The authority of the assembly is therefore absolute. Life, liberty, property, religion, everything, is in the hands of this fraction of the nation. It needs the whole force of habit to blind us to the falseness and the danger of such an invention." (*Rev. des Deux Mondes*, for Oct. 15, 1871.)—If the consequences of the adoption of this theory have been for France so deplorable, the fault has been that of the statesmen who have piloted her through her various revolutions, for in adopting it they have despised the warnings and the advice of Lafayette. Referring in his memoirs (t. iv., p. 36) to a claim put forward by Sieyès, that the idea of the separation of the constituent power from the ordinary governmental powers, was an invention of his own, dating from 1788, and that it ranked among the discoveries which had contributed to the advancement of science, Lafayette remarks, that "the Americans had had conventions to amend their constitutions, both state and federal, before 1788; that consequently the idea

of the separation of the constituent power was not a French invention, and that the French, so far from contributing by it to science, had rather caused it to retrograde by mixing constituent and legislative functions in the assembly of 1789 and in the national convention, while in America these functions had always been kept distinct." Of this passage, Laboulaye, in the article before cited, says. "This was putting his finger upon one of the fundamental errors of the French system; but in 1789, they were infatuated with Sieyès and his political visions. As for Lafayette, the friend of Washington, they admired, but they would not listen to him. When the assembly, on the eve of its adjournment, adopted the chapter of the constitution relating to its revision, all the propositions made by Lafayette were rejected. 'M. de Lafayette,' said the *Journal de Paris*, of the 1st of September, 1791, 'voted for neither of these decrees: all his views were too adverse, he had too thoroughly studied the constituent power to be willing to confide it to the ordinary government; but when he cited the example of America, they replied, *Bah! America!*'" (*Memoirs de Lafayette*, t. iii., p. 113.)—Having thus defined the general range of conventional power, a few words now as to the powers of conventions in special relations, or in particular cases. Constitutional conventions are of two varieties, governed, in some respects, by different rules: state conventions and national conventions. The powers of each of these varieties will be briefly discussed, considering them in turn as independent of constitutional limitations, and as subject to such limitations. And, first, of state conventions. The convention being a legislative body, how is it related to the ordinary legislature? Is it superior to it and independent of it; co-ordinate with it, or subject to it? Assuming the validity of the French theory of its powers, the answer is easy: it is independent of the legislature and superior to it, so far superior, that there can hardly be said to be any legal relations between them; the one has, relatively to the other, all powers, and that other has none. But if the American view be accepted, the case is less simple: the convention is then both subject and superior to the legislature; subject to it, in that the *flat* which speaks it into existence, prescribes the details of its organization, and regulates the submission for adoption or rejection, and the final promulgation, of the fruit of its deliberations, must be the work of the legislature; superior to it, in that, when fully launched, the legislature ordinarily can not and ought not to attempt to dictate to the convention what it shall or what it shall not recommend in the way of amendments. Accordingly, the rule has been generally recognized as a valid one, that all legislative prescriptions touching the time and place of assembling, the formalities to be observed in the organization of the convention, or the disposition to be made of the constitution or amendments formulated by it, are mandatory, though couched in affirmative

terms only; much more, if involving negative terms or conditions. On the other hand, provisions in an act calling a convention, indicative of the preferences of the legislature, or of its views of expediency, relative to matters clearly within the scope of the commission of the convention to revise the constitution and to propose a new or amended one, ought to be regarded as directory, and to be observed by it or not as it may deem best. If, however, the limitations imposed are transcribed from the existing constitution, or if the legislative act containing them has been so submitted to the people, as to draw from them a definite expression in favor of such limitations, they ought to be regarded as doubly mandatory and to be strictly obeyed. Cases have occurred in which restrictions have been laid by legislative acts upon conventions called by them, not embraced in any of these categories, and in respect to their binding force opinions have not been agreed. Upon principle, it would seem, that because a citizen has been chosen a member of a convention, a body which, to use the expression of Mr. J. Wilson in the federal convention of 1787, "proposes but concludes nothing," he is no more excused from obedience to a positive requirement of law than any other citizen, and that even if the supposed requirement be thought to be inconsistent or absurd, it lies not with him to adjudge it to be so. This presents the question as it ought to be viewed by the member himself. On the other hand, with reference to the propriety or expediency of legislative restrictions, in general, doubt may well be entertained. It is believed, that the drift of opinion is toward the position that all restrictions are unwise, if not indefensible, which dictate the nature or extent of the amendments which the convention shall recommend; for, while it is important that conventions shall be held to their proper function with a strict rein, it is believed to be no less so that, through their ministry, an opportunity may be given for discontent to vent itself in peaceful changes of the constitution, rather than that it should be suppressed by legislative prescriptions, at the risk of ruinous explosions.—Some of the most important of these principles are well illustrated by the case of a convention called in North Carolina, in 1835. The act of the legislature calling it, which had been submitted to the people and accepted by them, required the convention to report amendments to the constitution upon three points specified, and left it discretionary with it to report amendments upon nine other points. It then prescribed the form of an oath to be taken by each member of the convention before he should be permitted to take his seat, that he would not "directly or indirectly evade or disregard the duties enjoined or the limits imposed" upon the convention by such act. After much discussion as to the power of the legislature to impose such an oath, and as to the duty of the members in respect to the limitations contained in the act, it was

finally conceded, that until the oath should be taken, there could be no convention, since, it had been made a condition to its organization, and, the oath once taken, the limitations must be observed. In discussing the question of the power of the legislature to pass such an act, weight was given to the fact that it had been favorably voted on by the people. (Debates N. C. Conv. 1835, pp. 4-8.) In the case just cited, the terms of the act were negative, and were clearly mandatory; but that they may be mandatory it is not necessary that they should be negative. Thus a case arose in the Pennsylvania convention, of 1872, involving provisions partly in affirmative terms, which were held by the highest court of the state to be mandatory. The act of the legislature calling the convention had prescribed that it should have power to propose to the people of the state, for their approval or rejection, a new or amended constitution, subject to the following provisions: first, that one-third of all the members of the convention should "have the right to require the separate and distinct submission to a popular vote of any change and amendment proposed by the convention," and that the convention should submit the amendments agreed to by it to a vote of the people, "at such time or times, and in such manner as the convention should prescribe, subject, however, to the limitation as to the separate submission of amendments contained in this act." Secondly, that the election to decide for or against the adoption of the new constitution or amendments should "be conducted as the general elections of this commonwealth are now by law conducted." Thirdly, that nothing in the act contained should authorize the convention "to change the language, or to alter in any manner the several provisions of the ninth article of the present constitution, commonly known as the bill of rights," but that the same should "be excepted from the powers given to said convention," and should "remain inviolate forever." Notwithstanding these restrictions, the convention made the following proposals and dispositions directly at variance with them: It proposed to the people an amended constitution, to be voted on as a whole, although one-third of all the members of the convention, as it was claimed, required that article V., relating to the judiciary, should be separately submitted. It also disregarded the requirements of the act in respect to the mode of conducting the election to be held for the adoption or rejection of the constitution. It created, by ordinance, a special board of commissioners for the city of Philadelphia, who should have direction of the election, instead of the proper election officers of the commonwealth, by whom its general elections were by law conducted. Finally, it proposed alterations in several provisions of the bill of rights. Upon bills in chancery filed in Philadelphia, by two different parties, praying for injunctions to prevent the holding of the elections in that city

under the ordinance, upon the ground that the ordinance for submission under the direction of special commissioners was void, as in violation of the express limitations contained in the act of the legislature, which was claimed to be mandatory, the injunctions were allowed by all the judges of the supreme court, sitting at *nisi prius*, explicitly upon that ground.—As to the question of separate submission of article V., the decision of the judges was adverse to the plaintiff, not on the ground that the limitation was not mandatory, but that it was not clearly shown that one-third of the members of the convention had required article V. to be submitted separately; and, as “the convention was clothed with express power to act upon the question of submitting the amendments in whole or in part, the question of a separate submission being one committed to the whole body, of which the requiring third was itself a part, it must be presumed that the decision of the body as a whole was rightly made, and either that the request was not made by a full one-third of all the members, or, if made by one-third, it was not (made) in a regular or orderly way.” (Wells *vs.* Bain, and Donnelly *vs.* Fittler, 75 Penn. State Rep., 39, 55, 56.) Upon the general question of the power of a convention to disregard the limitations imposed by the legislature, the court, by Agnew, Ch. J., said: “Since the declaration of independence, in 1776, it has been an axiom of the American people, that all just government is founded in the consent of the people. This is recognized in the second section of the declaration of rights of the constitution of Pennsylvania, which affirms that the people ‘have at all times an inalienable and indefeasible right to alter, reform or abolish their government in such manner as they may think proper.’ A self-evident corollary is, that an existing lawful government of the people can not be altered or abolished unless by the consent of the same people, and this consent must be legally gathered or obtained. The people here meant are the whole, those who constitute the entire state, male and female citizens, infants and adults. A mere majority of those persons who are qualified as electors are not the people; though, when authorized to do so, they may represent the whole people.—The words ‘in such manner as they may think proper’ in the declaration of rights, embrace but three known recognized modes by which the whole people, the state, can give their consent to an alteration of an existing lawful frame of government, viz. 1. The mode provided in the existing constitution. 2. A law, as the instrumental process of raising the body for revision and conveying to it the powers of the people. 3. A revolution. The first two are peaceful means through which the consent of the people to alteration is obtained, and by which the existing government consents to be displaced without revolution. The government gives its consent, either by pursuing the mode provided in the constitution, or by passing a law to call a convention. If consent be

not so given by the existing government the remedy of the people is in the third mode, revolution.—When a law becomes the instrumental process of amendment, it is not because the legislature possesses any inherent power to change the existing constitution through a convention, but because it is the only means through which an *authorized* consent of the whole people, the entire state, can be lawfully obtained in a state of peace. Irregular action, whereby a certain number of the people *assume* to act for the whole, is evidently revolutionary. The people, that entire body called the state, can be bound as a whole only by an act of authority proceeding from *themselves*. In a state of peaceful government, they have conferred this authority upon a part to speak for the whole only: an election authorized by law. It is only when an election is authorized by law, that the electors, who represent the state or whole people, are bound to attend, and, if they do not, they can be bound by the expression of the will of those who do attend. The electors who can pronounce the voice of the people are those alone who possess the qualifications sanctioned by the people in order to represent them; otherwise they speak for themselves only, and do not represent the people. The people, having reserved the right to alter or abolish their form of government, have, in the same declaration of their rights, reserved the means of procuring a law as the instrumental process of so doing. The twentieth section is as follows: ‘The citizens have a right, in a peaceable manner, to assemble together for their common good, and to apply to those invested with the powers of government for redress of grievances or other proper purposes, by petition, address or remonstrance.’—If the legislature, possessing these powers of government, be unwilling to pass a law to take the sense of the people, or to delegate to a convention *all* the powers the people desire to confer upon their delegates, the remedy is still in their own hands; they can elect new representatives that will. If their representatives are still unfaithful, or the government becomes tyrannical, the right of revolution yet remains. * * * To make this still more plain: Suppose a constitution formed by a volunteer convention assuming to represent the people, and an attempt to set it up and displace the existing lawful government. It is clear that neither the people as a whole nor the government having given their assent in any binding form, the executive, judiciary and all officers sworn to support the existing constitution would be bound, in maintenance of the lawfully existing institutions of the people, to resist the usurpation, even to the whole extent of the force of the state. If overpowered, the new government would be established, not by peaceful means but by actual revolution.—It follows, therefore, that in a state of peace a law is the only means by which the will of the whole people can be collected in an authorized form, and the powers of the people can be delegated to the agents who

compose the convention. The form of the law is immaterial in this question of derivative authority. It may be a law to confer general authority, or one to confer special authority. It may be an invitation, in the first place, as in the act of 1789, under which the convention of 1790 was convened, and an authority to the people to meet in primary assemblies to select delegates and confer on them unrestricted powers; or it may be a law to take the sense of the people on the question of calling a convention; and then a law to make the call and confer the powers the people intend to confer upon their agents.—The power to pass the law carries with it of necessity that to frame and declare the terms of the law. The terms of delegation, which the people themselves declare, when acting under and by virtue of the law which they have called to their aid, as the instrumental process of conferring their authorities, and reaching their purpose of amendment, become of necessity the terms of their own will. All outside of this channel is revolutionary, for it has neither the consent of the government nor of the people who have called the government to their aid, and acted through it.—The process of amendment being through the instrumentality of legislation, these laws must be enacted in the forms of the constitution and be interpreted by the rules which govern in the interpretation of laws." (*Wells vs. Bain, and Donnelly vs. Fitler*, 75 Penn State Rep., 46-49.)—Afterward a bill was filed in Pittsburgh, in Alleghany county, praying for an injunction against holding any election in that county, upon the same ground set out in the other bills, and upon the further ground that the action of the convention in altering several of the provisions of the bill of rights, contrary to the limitations imposed by the act calling it, was illegal. The lower court refused the injunction prayed, on the grounds, that these limitations were not binding upon the convention, since that body was possessed of sovereign power, thus, in substance, affirming the French theory of conventional supremacy; and, secondly, that, conceding the ordinance for holding the election in Philadelphia to be illegal, it had no bearing upon Alleghany county, and the court would not entertain a bill for an injunction filed by parties as to whom the legality or illegality of the ordinance in reference to Philadelphia was a mere abstract question. On appeal to the supreme court the judgment of the lower court was affirmed. This decision was apparently a reversal of its previous decision, above cited, but it was in fact a confirmation of the principles announced in it. After the former decision, and before the present one was rendered, the constitution reported by the convention had been submitted to and adopted by the people, and thus, however irregular or even revolutionary its inception had been, it had become the supreme law of the state. The supreme court, therefore, say, that "the change made by the people in their political institutions by the adoption of the proposed constitution

since this decree" [was entered by the court below] "forbids an inquiry into the merits of this case." But they then proceed, by Agnew, Ch. J., to repudiate expressly and in a most impressive and luminous judgment, "the claim for absolute sovereignty in the convention affirmed substantially in the opinion" of the lower court, as "dangerous to the liberties of the people." While, therefore, holding the constitution to have been in fact adopted, they pronounce the action of the convention, in disregarding the limitations imposed upon it by law, to have been revolutionary. The revolution had been a successful one, but the action of the convention was not for that reason legal. These decisions are unquestionably, on a large view of the interests of the American people, among the most important that have ever been rendered by our courts, and are based upon the soundest principles of law. (*Wood's Appeal*, 75 Pennsylvania State Reports, 71.)—In practice, questions of some nicety have arisen, two of which it may be useful to consider, not because of their frequency, but of the light which the discussion of them may throw upon the theory of those bodies. The first presents the obverse side of a question already considered as one of power, namely, as to the propriety of requiring the members of a convention to take an oath to obey the constitution under which it is called, and consequently as to their duty to obey; and the other, as to the power of the body to appropriate money out of the state treasury. With a right view of the relations of the convention to the people, or government, for which it acts, neither of these questions could arise. The reasoning which has given birth to the first is, either that the convention is possessed of sovereign powers, and therefore can not be limited by any conditions whatever—a view based upon the French theory of its nature; or that the work laid out for the body by the act calling it is "to trample the existing constitution under its feet," as it has been sometimes put; that is, to dismember and abolish it as preliminary to its reconstruction; and hence, that to require the convention to take such an oath would be so inconsistent with that duty that it ought to refuse obedience. Such reasoning results from confusion of ideas as to the foundations of free institutions, which one would hardly expect in the representatives of a people that for a hundred years had governed itself. To perceive its fallacy one need but to recall the principle that while a constitutional convention is in session, the laws, the constitution and the bill of rights remain unrepealed, and the entire judicial and administrative machinery of the government continues in active operation; and that such will be the case when that body shall have done its work and ceased to exist. All that has been given it to do is to revise the political structure and recommend to the power it represents such changes in it as may seem desirable. To speak of itself as having the constitution in fragments

under its feet, is as absurd as for a council of architects, engaged to inspect a building and to propose to its owner modifications of it, to use the like figure of speech respecting such building. If a convention intends to confine itself to its duty of proposing amendments for another's adoption, there can be no impropriety in its members doing what every public servant is required to do, to take an oath of obedience to the laws of the land. How important it is that they should do so, will be seen when it is considered, that the main reason why an oath is required is that traitors may attempt to reduce to practice the French theory of conventional sovereignty, and that an oath of obedience to the laws established must prove one of the most effectual barriers against such attempts. But, waiving great political crimes, is it not proper that the members of so important a body should swear honestly and faithfully to discharge the duties required of them, and not to attempt, by virtue of their position and in violation of rights secured by the laws, to injure their fellow-citizens for their own advantage, or that of their party?—As to the powers of a convention to appropriate money out of the state treasury, it need only be said, that, by the American constitutions, no money can be thence appropriated but by law, and that an ordinance of a convention, not submitted to and adopted by the people, is no more a law than a bill for an act passed by both houses of a legislature, but not approved by the executive of the state, is a law. Besides, to impute to a convention the power to wield without check or responsibility, the purse, is to give to it also the sword, of the state; that is, to make it sovereign master of its destinies. Not only has the government concerned in calling such a body no authority to grant to it such a power, a grant which would involve an entire surrender of its own constitutional function, but had it such authority, its exercise would be puerile as being needless; because to make such appropriations, on all necessary occasions, is made by law the duty of the legislature. Accordingly, the better opinion in the conventions thus far has been, that to assume the power, without authority, would be a usurpation, and to exercise it, even were the authority expressly given by law, would be unconstitutional. In a few cases, appropriations by ordinance have been made, which, not being carried into effect, were afterward followed by legislative ratification, showing that they were regarded as recommendations, and not as valid and effectual appropriations. In the Illinois convention of 1862, an ordinance was adopted appropriating \$100,000 for the soldiers wounded at fort Donelson. Not a dollar, however, was ever paid, or perhaps intended to be paid, and the ordinance, together with the constitution framed by the convention, was afterward rejected by the people. In New York, the act of March, 1867, calling the convention of that year, had provided that compensation at the rate of six

dollars per day, should be paid to the members by the state treasurer, upon warrants of the comptroller, drawn on presentation of certificates of service, signed by the president of the convention; and it had then prescribed, that the constitution framed by that body should be submitted to the people at the general election to be held in the month of November following. It not being possible to conclude the labors of the convention in time to submit the new constitution to the people at that election, the question was raised whether the comptroller would be authorized to issue his warrants upon certificates of service after the day named for the election. It was decided, in accordance with the opinion of the attorney general, that he would not, since payments made by the treasurer upon such warrants would not be made in pursuance of law. In the few cases in which conventions have ventured to pass ordinances of the kind, opposition has been generally made, as in this case, by the responsible custodians of the public moneys, who naturally have been reluctant to assume the risk of violating the conditions of their official bonds, by paying upon the authority of such ordinances.—Thus far attention has been given only to state conventions considered independently of the federal constitution. In fact, those bodies are controlled in their action by very strict limitations prescribed in that instrument. Beside that contained in article V., prohibiting any amendment abolishing the equality of state suffrage in the United States senate, to which attention will be called below, article IV., section 4, requiring the United States "to guarantee to every state in the Union a republican form of government," operates indirectly as such a limitation. So, no convention in any single state, nor indeed conventions in all the states acting together, but without the federal initiative, could abolish that form of government, since power could not be implied, constitutionally, to do what the United States is bound by the constitution to use its whole power to prevent. On the contrary, such a power is, by the strongest implication, denied. So sections 8 and 10 of article I., sections 2, 3 and 4 of article IV., and the 13th, 14th and 15th amendments to the constitution, contain either grants of power exclusively to congress, or prohibitions upon the states, which respectively operate as limitations upon state action, whether by legislatures or conventions. The former class is illustrated by the exclusive power given to congress to regulate commerce with foreign nations, to establish a uniform rule of naturalization, to enact bankruptcy laws, to coin money, to declare war, to provide and maintain a navy, and the like; and the latter, by the prohibitions against a state's entering into any treaty, etc., emitting bills of credit, passing bills of attainder, keeping troops or ships of war in time of peace, forming new states, without consent of congress, and the like, contained in the body of the constitution, and by those embodied in the amend-

ments referred to, against slavery, against the making or enforcement of any law abridging the privileges or immunities of citizens of the United States, depriving them of life, etc., without due process of law, or denying to them the equal protection of the law; against electing to congress or appointing to office any person, who, having taken an oath to support the constitution, should have engaged in insurrection or rebellion; against the payment or assumption of debts incurred in aid of insurrection or rebellion, or questioning the validity of the public debt of the United States incurred in suppressing the same; and finally, against denying or abridging the right of citizens of the United States to vote, on account of race, color or previous condition of servitude. Evidently, state conventions, no less than state legislatures, are within the operation of these provisions. Further, both the conventions and the legislatures, equally with the judges of the states, are bound by article VI., which provides that the laws of the United States, made in pursuance of the constitution, and all treaties made under the authority of the United States, shall be the supreme law of the land, and that the judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding. (*Ware vs. Hylton*, 3 Dallas' Rep., 199.)—Where, on the other hand, the powers granted to congress are, by their nature, or because not exercised by congress, concurrent in the states, conventions called in the latter might, doubtless, provide for their exercise, in any case in which it would be competent for a state legislature to do the same. (*Brown vs. Maryland*, 12 Wheat. Rep., 419; *The License Cases*, 5 How. (U. S.) Rep., 504; *The Passenger Cases*, 7 How. (U. S.) Rep., 288, 285; *The State Freight Tax Cases*, 15 Wall. Rep., 232)—In respect to the powers of a national convention, called to propose amendments to the federal constitution, it is conceived that in the main the same principles apply as in the case of state conventions. The relation of such a convention to the people of the United States and to congress being the same as that of a state convention to the people and legislature of the state, it would be bound by the act calling it, to the same extent and under the same conditions. Thus, if a national convention had been called to revise the federal constitution, without restriction in any respect, it would be authorized to propose any modification of that instrument, which it might deem desirable. In fact, however, no case so simple could arise under the present constitution. If placed under no restraint by the act calling it, there would always be one limitation on its action imposed by the constitution itself: it could not propose to the people to deprive any state of its equal suffrage in the United States senate, save by the consent of such state. Article V. directly prohibits any such amendment in negative terms, and thus operates as a limitation equally upon the United States and upon the sev-

eral states. Notwithstanding this prohibition, a national convention might recommend a complete transformation of the government, provided the states, with equal representation in the senate, constituted a part of its plan; it might even propose the substitution of a monarch for life, with descent of the crown to his heirs, instead of a president for four years, unless the provision, that the United States should guarantee a republican form of government to the several states, should be held to be a prohibition against the guarantor's taking steps to effect such a transformation; and it might do so notwithstanding that provision, if, as many contend, a monarchy as that of England, may be at the same time a republic. So, doubtless, by the unanimous consent of the states, the senate, or even the states might be abolished, upon the recommendation of a convention. All the other constitutional limitations upon the United States are contained in article I., section 9, and in the fifteen amendments, and bear only upon the congress, or upon some department of the general government. These could all, doubtless, be repealed upon the recommendation of a national convention, or by the legislatures of three-fourths of all the states, acting upon the recommendation of congress, as provided in article V. of the constitution. But, it may be asked, suppose the people of all the states in the Union, save one, should desire to sweep away the limitation contained in article V., touching equality of state suffrage in the senate, is there no way in which it could be done? Under the constitution, there seems to be no way. Could congress recommend the repeal of that section in the face of this interdict, contained in article V. of the constitution, which relates only to amendments thereof: "No state, without its consent, shall be deprived of its equal suffrage in the senate"? What congress could not recommend to the states, in pursuance of that article; what, without such recommendation, state legislatures or conventions could not ratify, it is clear that a national convention could not propose for adoption. "No amendment," etc., "shall be made." In the case supposed, there would be but one way in which to accomplish the general desire of the nation, and that would be by revolution, peaceful, if, notwithstanding the interdict, the wished-for change were recommended, no matter by whom, and by general consent adopted; violent, and by force, should any part of the nation contest it unsuccessfully by arms. By the courts, however, no mode of effecting the change could be recognized as valid but that provided by the constitution itself, until after the requisite provision had been grafted upon the constitution as the result of a successful revolution.—In the opening part of this article, it was said, that, under the American constitutions, fundamental legislation is generally committed to the constitutional convention. It is deemed germane to this subject to describe briefly another mode of effecting specific amendments, authorized by many of our constitutions—

a mode which is less cumbrous and expensive, if not more expeditious, than that by the employment of conventions. That mode is by the action of the legislature, followed by that of the people, or body of the electors. The earliest constitutions prescribing it were those of Delaware and Maryland, framed, respectively, in September and November, 1776. The Delaware constitution contained this very stringent provision: "No article of the declaration of rights and fundamental rules of this state agreed to by this convention, nor the first, second, fifth (except that part thereof that relates to the right of suffrage), twenty-sixth, and twenty-ninth articles of this constitution, ought ever to be violated on any pretense whatever; no other part of this constitution shall be altered, changed, or diminished without the consent of five parts in seven of the assembly, and seven members of the legislative council," the assembly containing seven, and the legislative council nine members.—Section LIV. of the first Maryland constitution provided, "that this form of government, and no part thereof, shall be altered, changed, or abolished, unless a bill so to alter, change or abolish the same, shall pass the general assembly, and be published at least three months before a new election, and shall be confirmed by the general assembly after a new election of delegates, in the first session after such new election." This section seems to have been copied by the congress in the articles of confederation submitted to the states and finally adopted in 1781, and to be the model on which similar provisions in the later constitutions were framed. The provisions quoted from the Delaware and Maryland constitutions were, it will be observed, mandatory and in negative terms. In this respect the later constitutions have not generally followed these early models. As a type of the provision commonly adopted may be taken that contained in the Iowa constitution of 1857, as follows: "Any amendment or amendments to this constitution may be proposed in either house of the general assembly; and, if the same shall be agreed to by a majority of the members elected to each of the two houses, such proposed amendment shall be entered on their journals, with the yeas and nays taken thereon, and referred to the legislature to be chosen at the next general election, and shall be published, as provided for, three months previous to the time of making such choice; and if in the general assembly so next chosen as aforesaid, such proposed amendment or amendments shall be agreed to by a majority of all the members elected to each house, then it shall be the duty of the general assembly to submit such proposed amendment or amendments to the people in such manner and at such time as the general assembly shall provide; and if the people shall approve and ratify such amendment or amendments by a majority of the electors qualified to vote for members of the general assembly, voting thereon, such amendment or amendments shall be-

come a part of the constitution of this state"—Upon a comparison of these two modes it is apparent that that by conventions is best adapted to the cases in which a general revision of the constitution, and possibly the preparation of an entirely new instrument, are contemplated, and the specific mode, to the elaboration of a limited number of amendments, not necessitating, for harmony or congruity, the revision of the whole system. There are advantages and disadvantages attending both modes. Saying nothing of the dangers that may arise from conventions exceeding their powers, the expense and the social disturbance likely to accompany a radical inquiry into the evils of an existing government and into their remedies, make it undesirable that those bodies should be frequently called. On the other hand, the specific mode, unless very effectual checks are provided, may, by the facility with which it may be employed, be easily perverted to partisan ends.—In the later constitutions it has been usual, in most cases, to provide for amendments in both modes, that is, by conventions to be called under certain conditions, or by the conjoint action of the legislature and of the people, as may be thought advisable. Of those which remain, some have made no provision for amendments by either mode, some have provided for them by conventions alone, and some by the specific mode alone. The number of the first and last two classes are nearly equal, and that of the second class is small, especially in the later constitutions.—In a few states a modification of the specific mode has been employed, which is thought to have some advantages over that above described. It consists in the appointment in pursuance of law of a commission to revise the constitution, or to report amendments to it, for the subsequent action of the legislature and of the people, according to the constitutional provisions relating to specific amendments. It was first employed in New York in 1872; afterward, in Michigan, in 1873; and a similar commission is now (1881) sitting in New Jersey. In the first case the commission consisted of 32 members selected by the governor, four from each judicial district. They were characterized in the act requiring their appointment, simply as "persons," and were required to meet for the purpose of proposing to the legislature, at its next session, amendments to the constitution; provided, that no amendments should be proposed to the sixth article thereof, relating to the judiciary. By a subsequent act, passed while the commission was in session, this limitation was repealed. (Jour. Const. Com. N. Y., 3, 178).—In Michigan the commission was required by the act of the legislature to be made up of 18 "able and discreet citizens," appointed by the governor, no more than two of whom were to reside in any one congressional district, as then organized. The commission was authorized to examine into and report "such amendments and revision of the constitution" as

in their judgment might be necessary for the best interests of the state and the people. The act further authorized the legislature, at its next session, to cause such revision to be submitted to the people for ratification.—(Jour. Const. Com., Mich., 3, 4.) The peculiar advantage of this mode is said to be that it enables the legislature to avail itself of the wisdom of a select committee of men fitted to consider dispassionately any constitutional amendments it may be deemed desirable to adopt; or if a general revision should be thought necessary, and within the scope of their lawful powers, to effect that object with less expense and with greater expedition, if not with greater wisdom, than were recourse had to a convention. This would very clearly be possible, other things being favorable, were the governor to appoint upon the commission the ablest and most experienced men in the state, whether members of the legislature or not. As this course of procedure, however, involves the reporting of the plan matured by the commission to the legislature, and the taking of all the constitutional steps by that body, including the final submission to the people, the adoption of this mode is not certain to avoid delay, nor to secure a well-considered and harmonious plan. Members of the legislature, wise or unwise, interested or disinterested, may raise objections to the scheme of the commission, and perhaps lessen its value by material modifications. Nor is it clear, that, under a constitution authorizing particular amendments by what is termed the specific mode, a commission can be substituted for it with the view of effecting a general revision of the constitution. In the Michigan case such a revision was authorized by the act constituting it and was made, but, when submitted to the people, the new constitution was for that, with other reasons, rejected by the people. There was, it is said, a latent feeling, that, although the processes by which it was evolved might be within the letter of the constitution, the commission, or the legislature, or both, had assumed too much in making a general revision; that a revision should spring from the wish of the people properly expressed through the ballot box, and be made by a convention chosen for the purpose, as contemplated by the constitution itself, and not from the legislature or from a body of its creation. Of this the commission seem to have been conscious, for, while in their report to the governor, they admit that the work done by them was equivalent to a revision of the constitution, they affirm that in the official records of the commission they recognize it only as the "amended constitution."—In New York no objection seems to have been raised to the constitutionality of the commission, because authorized to make a general revision, and the result was the preparation of numerous amendments to the existing constitution, some of which were afterward approved by the legislature, and finally adopted by the people. On the whole, it is doubtful whether

the requirement that the scheme matured by a commission, however enlightened and patriotic, shall run the gauntlet of the legislature, constituted, as it too often is, of ignorant or designing politicians, a requirement which can not be evaded, does not nullify its principal claims to acceptance. It could be made to work favorably only by a concerted effort on the part of the leading men of all parties in the legislature to give effect to the scheme of the commission without substantial modification. Care even then would need to be taken that the scheme should express the prevalent sentiment of the legislature, since to be lawful, doubtless, it must be its act, the exercise of its discretion, and not that of a body unknown to the constitution or to the common law. The difficulty of securing these conditions makes it extremely questionable whether the employment of such legislative commissions, if pronounced constitutional, will, on a balance of advantages and disadvantages, be considered generally desirable. JOHN A. JAMESON.

CONVENTION OF 1787, The (IN U. S. HISTORY). The fatal defects of the confederacy (see CONFEDERATION. ARTICLES OF) had become obvious even during the long space of time between its adoption by congress and its ratification by all the states. In 1780 Hamilton, then a young man of 23, stated elaborately, in a private letter, the evils of the existing government and the necessity of its reformation by a convention of all the states. In May, 1781, the first public proposal of this means of revival was made by Pelatiah Webster in a pamphlet. In the summer of 1782 the legislature of New York, and in 1785 the legislature of Massachusetts, by resolution recommended such a convention. But even after the convention had been called, congress only approved of it at the last moment, impelled thereto by the failure of the impost plan of 1786, which New York alone refused to ratify. The hesitation of congress had reason. The only method of amendment allowable by the articles of confederation was a unanimous concurrence of the states; but, as the evils of the confederacy became more glaring, the flat impossibility of unanimity among the states became more evident. If such a convention was merely to recommend changes, it must act as a body of private persons, and its recommendations could have no legal or official weight except through the approval of congress. If its recommendations were to be adopted by the ratification of all the states, the convention could plainly do no more than congress had repeatedly and vainly done. If its recommendations were to be adopted by a smaller number than *all* the states, then plainly a real, though peaceable, revolution was to be accomplished, and this was the final result.—In the spring of 1785 the legislatures of Virginia and Maryland, in the exercise of their plenary power to regulate commerce, had appointed commissioners to lay down joint rules for the navigation

of the Potomac. Washington's attention was fixed on the matter, and in March, during a visit to Mount Vernon, a plan was concerted by the commissioners for the general commercial regulation of the Chesapeake bay and its tributaries. As this was a subject of general interest, it naturally grew into a resolution, which was passed by the Virginia legislature, Jan. 21, 1786, appointing eight commissioners to meet delegates from the other states at Annapolis, in the following September, to consider the trade of the United States and its proper regulation, and report to the states. Five states (New York, New Jersey, Pennsylvania, Delaware and Virginia) sent delegates to the meeting; four others appointed delegates who failed to attend; and the other four made no appointments. Representing a minority of the states, the delegates merely reported that the defective system of the general government absolutely prevented any hope of a proper regulation of trade, and recommended another convention for the single object of devising improvements in the government. As the report cautiously provided that the improvements were to be ratified by the legislatures of *all* the states, congress could properly sanction the proposed convention, and did so, Feb. 21, 1787. May 14 had been appointed for the meeting of the convention, but a quorum of seven states was not secured until May 25, when George Washington, who had with extreme difficulty been induced to act as delegate from Virginia, was made president.—The list of delegates (55 during all the four months' sittings) will be found under the article CONSTITUTION. They represented the conservative intelligence of the country very exactly; from this class there is hardly a name, except that of Jay, which could be suggested to complete the list. Of the destructive element, that which can point out defects but can not remedy them, which is eager to tear down but inapt to build up, it would be difficult to name a representative in the convention; and as the debates were wisely made secret, this element had no power, during the convention's four months' session, of influencing its action, or exaggerating its difficulties. Of these difficulties the first was the balancing of the opposing ideas of the large states and the small states, and the second and third were created by the opposite feelings of the two sections, north and south, on the subject of commerce and the slave trade. In short, the task of the convention was to frame such a plan of government as should induce two almost distinct nations, one with six, and the other with seven, separate constituent commonwealths, to unite into one representative republic; and the secret and method of its success will be found under the article COMPROMISES.—May 25, seven states were represented (New York, New Jersey, Pennsylvania, Delaware, Virginia, North Carolina and South Carolina); May 28, Massachusetts and Connecticut, May 31, Georgia, and June 2, Maryland, had competent representatives present; but

New Hampshire had no delegates present until July 23. Rhode Island was not represented at all. A more fortunate union of accidents for even-handed compromise could hardly have been imagined. The "large" states (see COMPROMISES, I.) had, through all the preliminary debates, a majority of six to five, large enough to insure a general run of success in nationalizing the new government, but not so large as to obviate the necessity of deference to the minority.—In the proceedings of the convention the nationalizing party was first in the field. Hardly had the convention been organized, and rules adopted, when, May 29, Edmund Randolph, of Virginia, presented the *Virginia plan*, designed to establish "a more energetic government," and reduce the "idea of states" to a minimum. It consisted of 15 resolutions, in substance as follows. 1. That the articles of confederation should be corrected and enlarged. 2. That the representation in both branches of congress should be proportioned to the quotas of contribution, or to population. 3. That congress should have two branches. 4. That the first branch [representatives] should be chosen by the people. 5. That the second branch [senate] should be chosen by the representatives out of a number of nominations by the state legislatures. 6. That congress, besides the powers of the confederacy, should legislate wherever state legislation might interrupt the harmony of the United States [that is, as to commerce, taxation, etc.], should have a veto power on state laws, and should coerce delinquent states. 7. That congress should choose the executive. 8. That the executive, with a part of the judiciary, should have a limited veto on acts of congress. 9. That a judiciary should be formed. 10. That new states should be admitted. 11. That the United States should guarantee a republican government to each state. 12. That all the obligations of the confederacy should be assumed. 13. That provision should be made for amendments. 14. That members of state governments should be bound by oath to support the new government. 15. That the new constitution should be ratified, not by the state governments, but by popular conventions. Charles Pinckney, of South Carolina, the same day submitted a draft of a constitution in 16 articles, which, as printed, follows the general idea of the Virginia plan, but agrees in so many particulars with the constitution as finally adopted that it is probable that it was altered as the debates proceeded.—May 30, the convention, in committee of the whole, took up the Virginia plan, and continued the examination of each resolution in turn until June 13, when the plan, in 19 resolutions, was reported favorably to the convention. The main changes produced by the debate had been, that a *national* government ought to be established; that the representatives should hold office for three years, and the senators (chosen directly by state legislatures) for seven years; that the power of coercing delinquent states should not be granted, that the

executive should consist of one person, elected for seven years and ineligible the second time; and that the executive alone should possess the veto power. The next day a request was made for adjournment, as a federal, or league, system was in preparation. It was offered the following day, June 15, by William Paterson, of New Jersey, and was therefore generally known as the *Jersey plan*. It was in substance as follows: 1. That the articles of confederation should be revised, corrected and enlarged. 2. That congress [remaining still a single body] should be given the additional powers of taxation and regulation of commerce. 3. That the system of requisitions should be continued, with power in congress to enforce their collection in delinquent states. 4. That congress should choose the executive. 5. That a judiciary should be established. 6. That members of state governments should be bound by oath to support the constitution. 7. That acts of congress and treaties should be "the supreme law of the respective states," "anything in the respective laws of the individual states to the contrary notwithstanding;" and that the executive should coerce refractory states or individuals. 8. That new states should be admitted. 9. That provision should be made for deciding state disputes as to territory. 10. That naturalization should be uniform. 11. That citizens of a state, committing crimes in another state, should be punished by the state whose peace had been broken. June 16, the convention again went into committee of the whole on both plans, and, June 19, reported the inadmissibility of the Jersey plan and an adherence to the Virginia plan. During the debate, June 18, Alexander Hamilton, of New York, objecting very strongly to the Jersey plan, as a continuation of the vicious state sovereignty of the confederation, and almost as strongly to the Virginia plan, as only (to use his own phrase) "pork still, with a little change of the sauce," proposed a plan of his own, whose main features were that the assembly [representatives] were to be chosen by the people for three years, the senate to be chosen for life by electors chosen by the people, and the governor [president] to be chosen for life by electors, chosen by electors, chosen by the people; and that the state governors should be appointed by the federal government, and should have an absolute, not a limited, veto on the acts of their state legislatures. His plan was "praised by everybody, and supported by none."—Until July 23 the convention was busy in debating the 19 resolutions referred to it, and in compromising (see *COMPROMISES*, I., II.) the opposite views of its members. July 24, its proceedings and compromises, Pinckney's plan, and the Jersey plan, were given to a "committee of detail," consisting of five members, and July 26, three new resolutions were given to the same committee, and the convention adjourned until August 6, when the committee of detail reported a draft of a constitution, in 23 articles. This draft, in essentials,

begins already to bear a strong resemblance to the present constitution, in which, however, the 23 articles are consolidated into 7. In the draft the preamble read, "we, the people of" the several states (naming them in order). By its ninth article the senate was made a court to try disputes between states as to territory. (See *CONFEDERATION*, ARTICLES OF, IX.) By other articles the president, with the title of "His Excellency," was to be chosen by congress for seven years, and not eligible for a second term, and was to be impeachable by the house of representatives and tried by the supreme court; and there was no provision for a vice-president, the senate choosing its own president. During the debate on the draft, which lasted for over a month, the third great compromise, giving to congress complete control over commerce, and to Georgia and South Carolina in return 20 years' continuance of the slave trade (see *COMPROMISES*, III.), was adopted; the vice-president's office was created; the electoral system was introduced (see *ELECTORS*); and the fugitive slave clause added to article IV. Sept. 12, the amended draft was given to a committee of five, Gouverneur Morris, Johnson, Hamilton, Madison and King, for revision of its style and arrangement. In the committee, by common consent, the work was intrusted mainly to Morris, who could therefore fairly claim, nearly 30 years afterward, that "That instrument [the constitution] was written by the fingers which write this letter."—Sept. 13, the constitution was reported to the convention very nearly in its present form. Some few changes were made; the three-fourths vote required to pass bills over the veto was changed to a two-thirds vote; the method of amendment by general convention was added; and a motion for a bill of rights was lost by a tie vote. Several propositions for new articles were voted down, as introduced too late in the day. The convention then settled on a rule which, however necessary, was to hazard most seriously the adoption of its work. It voted down a proposition for a new convention, to consider the amendments which might be proposed by the states, thus throwing down the gauntlet of battle to the destructive element, and forcing upon the states the alternative of unconditional adoption or rejection of the constitution as it came from the convention's hands. The consequences were at once apparent. Many delegates, such as Randolph, Gerry and Mason, who had entered the convention with the most angry antipathy to the state sovereignty of the confederacy, were now taken aback by a complete view of the very national system which had grown up under their fingers. In spite of an urgent appeal from Washington, and a dexterous suggestion of Dr Franklin that the constitution should be signed only as "Done in Convention by the unanimous consent of the States present," without expressing any approval of it, 16 of the 55 delegates who had personally attended refused or neglected to sign it. Of these, two, Yates and Lansing, of the

three New York delegates, had left the convention in disgust, July 5, on the adoption of the first compromise. A list of the delegates who signed the constitution, of those who did not sign, and of those who did not attend, will be found under the article CONSTITUTION, Sept. 17, having by resolution requested the congress of the confederacy to submit the constitution to popular state conventions, and to provide for putting it into effect when ratified, the convention adjourned finally.—The constitution, the resolutions of the convention, and a letter from Washington, its president, were transmitted to the congress of the confederacy, then in session, and that body, Sept. 28, by resolution unanimously passed, directed copies of these papers to be sent to the state legislatures, to be submitted to state conventions. (For their proceedings see CONSTITUTION, II.)—No attempt has been made to give any details of the extended and voluminous debates of the convention, but they constitute an essential part of its history. In the debates the leaders of the nationalizing party were Hamilton, Madison, King, Wilson and Gouverneur Morris; of the decentralizing, or state rights, party, Lansing, Yates, Patterson, Luther Martin and Bedford; of those who began with the former, and ended with the latter, Gerry, Mason and Randolph; and of the shifting vote, which, with a natural bent one way or the other, was always anxious for conciliation and compromise, Franklin, Johnson, Sherman, Ellsworth and the two Pinckneys.—The injunction of secrecy laid upon the debates and proceedings was never removed. The last act of the convention was a resolution that its papers should be left with Washington, subject to the order of the new congress, if ever formed under the constitution. March 19, 1796, Washington deposited in the state department three manuscript volumes; the first (in 153 pages) being the journal, the second (in 28 pages) the proceedings in committee of the whole, and the third (in 8 pages) the yeas and nays. The whole was published, with additions from Madison's notes, by the state department in October, 1819.—See 1 *Hamilton's Life of Hamilton*, 284; 3 *Hildreth's United States*, 477, 482; 3 *Hamilton's United States*, 520; 9 *Washington's Writings*, 509; 2 *Marshall's Life of Washington*, 105; 2 *Rives' Life of Madison*; 1 *Curtis' History of the Constitution*, 341; 1 *Elliot's Debates*, 116, (Report of the Annapolis Convention); 2 *Hamilton's Works*, 336, 409; 12 *Journals of Congress* (edit. 1800), 15; *Story's Commentaries*, § 272; 2 *Curtis' History of the Constitution*; *Jameson's Constitutional Convention*; *Journal of the Convention of 1787*; *Yates' Secret Proceedings of the Convention*; 5 *Elliot's Debates (Madison Papers)*; 3 *Sparks' Life of Gouverneur Morris*, 323; H. B. Dawson's *The Federalist (Introduction)*, and Jay's *Letters* in answer.

ALEXANDER JOHNSTON. -

COODIES, The (IN U. S. HISTORY), a small faction of federalists in New York city in 1812, opposed to DeWitt Clinton and in favor of sup-

porting the war with England. The name was given from the signature, *Abimalech Coody*, assumed by their leader, Gulian C. Verplanck, in his communications to the newspapers.—See 1 *Hammond's Political History of New York*, 397; Verplanck's *The Coodies*. A. J.

CO-OPERATION. This word in political economy, is a rejuvenation, so to speak, of the term *association*. By means of the propagation of Saint-Simonian, Fourieristic and communistic ideas, association, the benefits of which have been recognized by mankind at all times, and in all places, was offered as a panacea for all social evils, and as a means of producing general prosperity. Attempts at association were made in 1848, in France; the state even granted an appropriation to certain unions of workingmen, to facilitate the establishment of workingmen's societies. But as the greater part of these attempts at association for production were anything but successful, reaction set in against the idea of association itself.—Somewhat later an association for production having been successfully operated at Rochdale, and Schulze-Delitzsch, having quickly called into existence popular banks and other associations in Germany, the idea of workingmen's associations found new followers in France, who advocated its application under three principal forms of associations of credit, associations for consumption, and associations for production. The public authorities, the people and the press were very favorable to the idea. Legislation promulgated a law, "on societies with a varying amount of capital;" Napoleon III. donated money from his private purse; and some economists and capitalists founded a bank, with a capital of 100,000 francs; and united with the workingmen to bring it into general favor. It did not, however, seem to make much headway. This is not owing, as some have said, to want of capital, for we have seen workingmen, by means of economy, accumulate capital enough to start them in business. We believe, rather, that workingmen do not enter into co-operation, for the same prudential reasons which deter a great many men from associating intimately with other men: they do not know them well enough; they fear to misplace their confidence; they foresee incompatibility of temper; they do not wish to renounce their liberty; and, if they feel able to do it, they continue to enjoy alone the fruit of their own ability. This last reason, which is perfectly legitimate, is not always openly avowed; it requires courage to expose one's self to the reproach of egoism. (Those who make this reproach are not more disposed to self-sacrifice than others.) Those who pretend to found society upon devotion and solidarity—supposing them to possess the virtues which they recommend to others—would wish to impose burdens upon the upper classes, for the benefit of the middle and lower classes, and this without any compensation, either to the individual or to society. What natural law can justify

such a duty as this?—But suppose co-operation, encountering no obstacle, were established, would the workman be made happier thereby? We doubt it. Unless you associate together all the co-operative societies of the world, which would constitute universal slavery, and cause perpetual stagnation, competition would necessarily exist. Now, competition would not be less obstinate between associations than between individuals, we even believe that it would be more so, because a collection of men is always more passionate than an individual. The consequence would be, that the revenue of the workman would be no better than it is now. It will be asserted, in reply, that he would add to his wages the profit which the employer receives under the present system, and that his well-being would be increased by so much. But, first, if we divide the employer's profits among his numerous workmen, there would be but little for each of them, and, in case of a crisis, there would be nothing in reserve; secondly, if we set aside a part of the dividends to form a reserve fund, then the share of profit which each workman would receive would be so small that it would not be worth the trouble it causes. Besides, thirdly, the competition between the associations might easily become so violent as to destroy all profit; the workman would live upon his wages as before; everything would remain the same, except that the reserve for a rainy day, and the saving which paves the way to something better, would be missing. If the advantages to be derived from co-operation by the workman appear doubtful, those which mankind are to derive from it seem entirely of a negative character. Co-operation would hold men in the bonds of equal mediocrity. Intelligence, knowledge, skill, taste, superior force, would be lost to individuals possessing them, and consequently to society. If co-operation could become general, which seems to us impossible, the existence of science and art would be in danger; for these two delicate plants can thrive only in nations in which a certain number of men are dispensed from the necessity of manual labor.—The true reason why co-operation is not generally adopted is, that the wages of the co-operators are necessarily contingent. Now, the vast majority of men prefer a fixed income to a contingent one, so that, if allowed the liberty of choosing they would seldom decide in favor of co-operation. The co-operative combination for production, called association, has these three inconveniences: first, the narrow community of interests with other men; second, its uncertainty; third, the impossibility *de facto* if not *de jure*, for the individual endowed with a superior degree of intelligence, knowledge and skill, to profit by his gifts. It is neither likely this system of co-operation will, nor desirable that it should, become general. It will be able to render some service in certain cases, and this service it has rendered at all times, under all manner of names, and it will continue to render them, whatever name may be

given to the association.—We shall, in conclusion, give the statistics of co-operative associations in the two countries in which they have acquired a real importance.—*Germany.* We learn, from the reports of M. Schulze-Delitzsch, that there were in Germany, in 1870, 1,859 loan or advance associations, (*conschuss-vereine*), 275 associations for production, and 750 associations for consumption; having in all, 314,656 members. The business transacted by them amounted to 207,618,387 thalers (more than \$155,500,000). The capital actually possessed by these associations was 14,663,397 thalers (about \$11,000,000). In 1871 the number of these associations had much increased, and, up to the present time, no cause of interruption in the prosperity of these German co-operative institutions can be found. By this, however, we do not mean that they are all equally successful, for there are some which have not succeeded at all: but, in general, their progress is rapid and constant. (See the reports of M. Schulze-Delitzsch.)—We give these figures just as they are, but they should be closely examined. What is, for instance, a society which is pompously styled an *association for production*, when, as is frequently the case in the table we have before our eyes, it is composed of three, four or five members? It is purely and simply an association in name. Associations of three or four persons have often succeeded, but how of associations of two or three hundred? According to the system of M. Schulze-Delitzsch, the propagation of associations has been facilitated particularly by the popular banks, which do not appeal to the factory operatives, and do not, like the association for production, put all the interests of the members in common; their interests remain separate, and, what is of still greater importance, each one receives the entire profit of the product of his labor, his energy, his skill, his natural gifts. Would it be thus with associations for production?—*England.* In August, 1871, a parliamentary document, published on motion of Walter Morrison, informs us that, in 1870, England and Wales had 769 co-operative associations, with 250,000 members, having a capital of £2,060,000, and which had earned £555,000 net profit. The amount of purchases during the year had been £7,457,000; and of the sales £8,202,000. All things considered, the progress of these associations (for consumption) had been real and constant, although more than one of them had failed. The detailed report for the year 1870, a *resumé* of which we here give, serves to prove this: Number of associations registered, from their beginning to the end of the year 1870, 1,375; number of associations dissolved, 406; number remaining, 969. Of this number, 67 were begun—or at least registered—in 1870, and 133 were not reported, perhaps because not in active operation; which leaves 769, the number mentioned above.

MATRICE BLOCK.

CO-OPERATION, U. S. (See SECESSION.)

COPPERHEAD (IN U. S. HISTORY), a term of contempt applied by the republican party to its democratic opponents during the rebellion. It is properly the name of a well-known northern snake, which stings from behind and without warning. (See DEMOCRATIC PARTY, VI.; REBELLION.)

A. J.

COPYRIGHT is the name of a certain species of incorporeal property. It is the exclusive right of receiving the profits from publishing and selling works of literature and art.—Property is a right residing in the person, and there may be property in things which already exist, and also property in things which will only come into existence at a future period. The former is usually called corporeal property, and the latter incorporeal property.—Thus there may be property, or the exclusive right, to use a manuscript, or a printed book, and there may also be the property, or exclusive right, to multiply and sell copies of the manuscript, or book, and appropriate the profits. This latter property is called copyright, and is manifestly a distinct property from the former.—We have also shown that every future profit whatever has a present value, which may be bought and sold, like property in any material existing substance. This mass of property receives different names, according to the source of the profit, such as the *good will* of a business, the *practice* of a profession, the *patent* of an invention, the *shares* in a commercial company, the *funds*, and *annuities* of all sorts, *credit*, and *copyright*.—Now, as economists are agreed that whatever is exchangeable is wealth, it follows that this enormous mass of property is wealth, nay, it is probable that nineteen-twentieths of existing wealth is in this form, and yet there is scarcely one word about it in any English work on political economy!—The only English work on political economy that we are aware of at present, that even mentions copyright, is Dr. Whately's *Lectures on Political Economy*, p. 6, where he says, "In many cases where an exchange really takes place, the fact is liable (till the attention is called to it,) to be overlooked, in consequence of our not seeing any actual transfer from hand to hand of a material object. For instance, when the copyright of a book is sold to a bookseller, the article transferred is not the mere paper covered with writing, but the exclusive *privilege* of printing and publishing. It is plain, however, on a moment's thought, that the transaction is as real an exchange as that which takes place between the bookseller and his customers who buy copies of the work."—It is quite clear that copyright is a species of fixed capital. When a publisher buys the copyright of a popular work, it is manifest that it is part of his capital. When an author produces a work for which there is a popular demand, and whose copyright is therefore valuable property, he is unquestionably producing wealth.—The introduction of this species of property into political economy which can by no possibility be excluded

from it, shows the inconsistency of the fundamental conceptions of many writers. Thus Mr. Mill, who says that everything forms a part of wealth which has a power of purchasing, and therefore admits, by implication, that a copyright is wealth, speaks of the production of wealth as the extraction of the instruments of human subsistence and enjoyment from the materials of the globe, thereby very nearly agreeing with Adam Smith's notion of wealth, as the produce of land and labor. But how is a copyright extracted from the materials of the globe? How is it the produce of land and labor?—It also shows that some theorems which he lays down as fundamental, are not so. Thus he says that all capital is the result of saving. But how is a copyright the result of saving? He also states as another fundamental theorem, that although saved, and the result of saving, all capital is nevertheless consumed. But how is a copyright consumed? He says that "capital is kept in existence from age to age, not by preservation, but by perpetual reproduction; every part of it is used and destroyed, generally very soon after it is produced, but those who consume it are employed meanwhile in producing more." (Vol. i., p. 92.) But how is copyright kept in existence by perpetual reproduction? How does the owner of a valuable copyright consume it, and how is he employed in producing more? These are examples of hasty generalization from too small an induction of facts.—Copyright, we thus see, is a species of valuable property, produced entirely by the demand of the public for works of literature and art. It is thus purely the creation of diffused civilization and education, and could not have any existence, except from the educated taste of the public, and unless there were the means of gratifying it at a moderate expense.—It has been discussed whether there was any copyright among the ancients. Mr. McCulloch, quoting some well-known passages, thinks there was. But we think the passages he alleges do not bear out any such doctrine. Thus he quotes from the prologue to the "Eunuchus" of Terence, who, we are told by Suetonius, received 8,000 sesterces, or £64 12s., for writing the play to be acted at the Megalensian games. This was the largest sum paid to any poet for such a work. This, however, proves nothing as to copyright. It was a mere payment for writing a play for a particular occasion. Juvenal also speaks of selling a play to an actor (vii., 87). But this is manifestly merely payment for writing a play to be acted, as was usual. This did not refer to copyright, for the very purpose of the satire is to lament the utter decay of all taste for literature among the Romans. Horace (Ep. i., 20, 2; Art. Poet., 345) speaks of the Sossii, who were his publishers, and Martial (i., 67; iv., 72; xiii., 3; xiv., 194) speaks of Tryphon, who had his works on sale. These cases point to copyright much more than the others. But yet they are by no means conclusive. They by no means imply that the author received payment for the exclusive right

to sell his works. We may well understand that there might be a certain comity of trade that one publisher should not sell another's works; but that does not prove the legal right to prevent him doing so. The real question is, Could an author, or publisher, bring an action to prevent another from copying and selling his works? Now, if such a property had existed, it would certainly have been mentioned in the Pandects. But there is no mention in them of any such property. There is no name in Roman law for copyright. There is no case in Roman law of any action having been brought to punish the invasion of such property. Therefore we think the only conclusion is that it did not exist.—It is stated by bishop Fell, that before the invention of printing, the university of Oxford claimed to have the exclusive right of transcribing and multiplying books by means of writing. This, however, by no means implies copyright, because it does not imply that the works so copied were the property of the university, but only that they had the monopoly of writing them out.—Soon after the invention of printing, a printer, called the king's printer, was appointed to print papers of state, proclamations, etc. The earliest notice we have of such an appointment is in 1504, when William Faques styles himself "Regius Impressor," in a proclamation against clipped money. Richard Pynson succeeded Faques in this office, and in 1518 we have the earliest instance in England of copyright. A speech printed by him has the following colophon: "*Impressa Londini anno verbi incarnati m.d.xviii. idibus Novembris, per Richardum Pynson, regium impressorem, cum privilegio à rege indulto ne quis hanc orationem intra biennium in regno Angliæ imprimat, aut alibi impressam et importatam in eodem regno Angliæ vendat.*"—During the reign of Henry VIII. these privileges were frequently granted to printers, usually for seven years. Piracy was not long in showing itself. In 1523 Wynken de Worde printed a treatise on grammar by Robert Witinton. The author, in a new edition in 1533, complains that the work had been pirated by Peter Trevers. To prevent this being done to the second edition, he procured the king's privilege for it.—These cases seem to negative the idea that there was then believed to be any such thing as copyright at common law.—All these privileges had been granted to printers, who may probably be supposed to have paid the authors something for their work. In 1530 we have the first instance of copyright granted to an author. John Palsgrave had published a French grammar at his own expense, and in consideration of this he received a privilege for seven years.—In 1556 the subject of copyright was put on a new footing. Complaints were made that many false, seditious and heretical books, ballads and rhymes were published. To bring printers more under control, they were incorporated by the name of the "Stationers' Company." They were allowed to make by-laws, and no one but a member of their body

was allowed to practice the business of printing in England. In 1558 they received a second charter, and a by-law was made that every one who printed a work should enter it in their register, and pay a fee; and every one who omitted to do this, or printed a book belonging to another member, was fined. In this year entries of copies for particular persons begin, and in 1559 there are persons fined for printing other men's copies. In 1573 there are entries of the sales of copy and their price.—Privileges for printing particular works were the legitimate protection of the labor and expense of publication. But with the general spirit of monopoly which prevailed to such a pernicious extent, patents for the exclusive right to publish all works on particular subjects were granted to various persons. Thus one had the monopoly of printing all books on common law; another all catechisms and spelling books; another all music books; another all almanacs, etc. The printers were so injuriously affected by these monopolies, that they petitioned the queen against them. But meeting with no redress, they disputed the queen's right to grant these patents, and printed works in defiance of them, and the rules of their own company. Complaints were made to the privy council of these irregularities, but they were too much occupied with foreign and domestic troubles to take any effectual steps to remedy them.—The queen had, in 1559, issued a proclamation, strictly forbidding any one to publish anything without a license. In 1566, this proclamation being little regarded, the star chamber issued a decree enforcing it, under the penalties of seizure of all books so printed, disability from exercising the trade of printing, and three months' imprisonment. The printers were ordered to give bonds to observe the decree. But they continued to disregard all decrees and penalties, and in 1586 another decree was issued, to restrict the number of printers, and to confine the trade to London, except one press at Oxford, and another at Cambridge. All printers were forbidden to print books contrary to the by-laws of the company.—A proclamation of Sept. 25, 1523, forbade any one to import from abroad any works which were copyright. Another proclamation to a similar effect was published in 1637.—In 1640 the star chamber was abolished. All regulations of the press by proclamation, decrees of the star chamber, and the powers of the stationers' company, were declared illegal and void. But the abuses of unlicensed printing were so great that, in 1643, it was ordered that all books should be entered in the register of the stationers' company, according to ancient custom. Copyright was thus restored as it stood before. In 1644 Milton published his famous *Areopagitica*, against the licensing act, but he particularly excepts that part relating to "the just retaining of each man his several copy, which God forbid should be gainsaid." In 1649 an act of parliament ordained that any one printing, or reprinting, or stitching, or binding, any books entered in the register of

the stationers' company, without the consent of the owner, should forfeit all such books, and be fined 6s. 8d. for each. No presses were allowed, except in London, the universities, York, and Finsbury.—The statute 1662, cap. 33, re-enacted these provisions, and ordered that a copy of every work printed should be deposited in the king's library, and each of the universities. This act, after several renewals, expired in 1679, and with it expired all legislative penalties for pirating copyright. Accordingly, piracy very soon began to be common, and in 1681 the stationers' company passed a by-law to fine every one so offending in the sum of 12d. for every copy so printed, or imported. In 1684 Charles II. granted a new charter to the stationers' company, in which it was stated, "That divers brethren and members of the company have great part of their estates in books and copies, and that for upward of a century before, they had a public register kept in their common hall, for the entry and description of books and copies." It then said "We, willing and desiring to confirm and establish every member in their just rights and properties, do well approve of the aforesaid register," and "that every member of the company who should be the proprietor of any book, should have and enjoy the sale, right, power and privilege and authority of printing such book and copy, as in that case has been usual heretofore." The act of 1662 was revived by the 1 Jac. II., c. 7, for the term of seven years, and renewed till the end of the session of parliament next after Feb. 13, 1692. The booksellers petitioned against it, and 11 peers entered a protest against it, as subjecting all learning and true information to the arbitrary will and pleasure of a mercenary and perhaps ignorant licenser, and destroying the property of authors in their copies.—It appears that at this time the stationers' company had been guilty of many malpractices. They sometimes extorted large sums for entering works; sometimes they refused, or neglected, to do so at all. Sometimes they made false entries, or fraudulent erasures, or cut out the leaves in which entries were made, to the confusion of all literary property, which was supposed to rest on the entry in the register.—Attempts were made to renew the licensing act, but the commons resisted, and it finally expired on April 25, 1694. The circumstances which brought about the final emancipation of the English press are fully stated by Macaulay.—The opposition of the commons was to the arbitrary power of the licenser. They clearly thought that the property in copyright was inherent in the author and his assigns, and well secured by the charters and laws of the stationers' company. But unfortunately, in abolishing the licensing act, they had swept away all statutory penalties for pirating copyright; and persons whose rights were invaded had no other remedy but for damages at common law. Several cases had been before the courts relating to copyright, but these all referred to disputed property, none ever ques-

tioned the right. In the case of *Roper vs. Streater* (Skinner, 234), the court of common pleas held that the plaintiff having purchased it from the executors of the author was owner of the copy at common law.—The removal of the statutory penalties for piracy opened the door to the same practices as had been committed before, and in 1694 the stationers' company renewed their by-law of 1681, but with little effect. The recovery of damages at law was so hazardous and uncertain, as most of the pirates were men who had no property sufficient to pay damages, and as it required a separate action for each copy proved to be sold, that it was in practice illusory. In 1703, 1706, and 1709, the owners of copies petitioned parliament for redress, and security to their properties. They had been so long secured by penalties that it had not occurred to them to proceed by a bill in equity, which had never hitherto been attempted or thought of, except upon letters patent adjudged to be legal.—The petitioners declared that the property of English authors had always been owned as sacred among the traders, and generally forborne hitherto to be invaded. That when the author had conveyed over his copy to any one of them, they had a just and legal property thereunto. That they had given sums of money for copies, and had settled these copies on their wives at marriage, or on their children at their deaths. That many widows and orphans had none other subsistence. That their existing copies had cost them at least £50,000. That this property was the same with houses and other estates. In consequence of these petitions, an act was passed in March, 1710, for the encouragement of learning, by vesting the copies of printed books in the authors, or purchasers of such copies, during the times therein mentioned. It gave authors of the works then existing, and their assigns, the sole right of printing the same for 21 years, from April 10, 1710, and no longer. Authors of works not printed, and their assigns, had the sole right of doing so for 14 years, and no longer. The penalties in the act were not to be exacted from any one unless the book should be entered in the usual way in the register of the stationers' company. If too high prices were put upon books, certain great officers of state might order them to be lowered. The number of copies to public libraries was increased to nine. The libraries of the four universities of Scotland, Zion college, London, and the advocates' library in Edinburgh, were added to those entitled by the statute of Charles II. If the authors were alive at the end of the first 14 years, they received a prolongation of their privilege for another 14 years. All penalties under the act were to be sued for within three months after the offense was committed. Nothing in the act was to prejudice or confirm any right that the universities, or any person or persons, had, or claimed to have, in the printing, or reprinting any book, or copy, already printed, or hereafter to be printed.—We thus see that,

with that tender regard for the interests of the robe, which parliament displays, they carefully avoided pronouncing any decision at all with regard to the right of copy at common law, but took care to leave the door open for a plentiful crop of litigation.—It is quite impossible to read this act without seeing that it distinctly recognizes copyright as existing already, and independently of the act. All they did was to enact certain statutory penalties for its infringement. But that, by a well-known rule of law, in no way affected proceedings at common law. We have seen that the courts of law never raised the slightest doubt as to the existence of copyright at common law. We shall now see how the court of chancery regarded it. As the act gave 21 years for old copies from April 10, 1710, no question on copyright at common law could arise before 1731. In 1735 Sir Joseph Jekyll granted an injunction in the case of *Eyre vs. Walker*, to restrain the defendant from printing the "Whole Duty of Man," the first assignment of which had been made in December, 1657, being 78 years before.—In the same year, lord Talbot, in the case of *Matte vs. Falkner*, granted an injunction restraining the defendant from printing "Nelson's Festivals and Fasts," printed in 1703, during the life of the author, who died in 1714.—In 1739 lord Hardwicke, in the case of *Tonson and Another vs. Walker*, otherwise Stanton, granted an injunction restraining the defendant from printing "Milton's Paradise Lost," the copyright of which was assigned in 1667, or 72 years before. In 1752 lord Hardwicke, in the case of *Tonson vs. Walker and Merchant*, granted an injunction, restraining the defendants from printing "Milton's Paradise, or Life, or Notes."—All this time there had never been any solemn decision by the king's bench as to the existence of copyright at common law, or as to how it was affected by the statute of Anne. But the court of chancery never granted an injunction unless the legal right was clear and undisputed. If there had been any doubt about it, they would have sent it to be argued in a court of common law.—At last the question was brought before the king's bench, in the case of *Tonson vs. Collins*, but after it had gone into the exchequer chamber, and the leaning of the court was clearly in favor of the plaintiff, it was discovered that it was in fact a collusive action, got up merely to obtain the judgment of the court, and they thereupon refused to proceed with it. While this action was pending, applications to the court of chancery for an injunction were refused, until the result of the common law action was decided. Lord Mansfield said that he looked upon these injunctions as equal to any final decree, because they were never granted unless the legal property of the plaintiff was made out.—At length, in 1769, the question was solemnly argued before the king's bench in the famous case of *Millar vs. Taylor*. Millar had purchased from Thomson the copyright in the "Seasons," which were published in 1728, and

therefore, if the right existed only by statute, it expired in 1756. Taylor published an edition in 1763, and Millar brought an action for damages against him in 1769. It, of course, can not be expected that we should give an outline of the arguments in this celebrated case. It is sufficient to say that three of the judges, lord Mansfield, and JJ. Aston and Willes, held that every author had, by common law, a perpetual copyright in his own works, quite independent of the statute. Yates, J., held that there was no such property at common law. The plaintiff, therefore, got the judgment, and in Trinity Term, 1770, the lords commissioners granted an injunction.—In 1774, however, the question was again raised. In the case of *Beckett vs. Donaldson*, the plaintiff had obtained an injunction founded on the decision in the case of *Millar vs. Taylor*. The case was immediately carried by appeal to the house of lords, when the house proposed the following questions to the judges: I. Whether at common law an author of any book, or literary composition, had the sole right of first printing and publishing the same for sale, and might bring an action against any person who printed, published and sold the same without his consent?—Upon this question, JJ. Nares, Ashurst, Blackstone, Willes, Aston, Perrot and Adams, Smythe, C. B., and De Grey, C. J., of the common pleas, held the affirmative; Eyre, B., held the negative.—II. If the author had such right originally, did the law take it away upon his printing and publishing such book or literary composition? And might any person afterward reprint and sell for his own benefit such book or literary composition against the will of the author?—Upon this question judges Nares, Ashurst, Blackstone, Willes and Aston, and Smythe, C. B., held the affirmative; Eyre, Perrot, Adams and De Grey, C. J., held the negative.—III. If such action would have held at common law, is it taken away by the statute 8 Anne, c. 19? And is an author by the said statute precluded from every remedy, except on the foundation of the said statute, and the terms and conditions prescribed thereby?—Upon this question judges Eyre, Nares, Perrot, Gould and Adams, and De Grey, C. J., held the affirmative. Judges Ashurst, Blackstone, Willes, Aston, and Smythe, C. B., held the negative.—IV. Whether the author of any literary composition, and his assigns, had the sole right of printing and publishing the same in perpetuity by the common law?—Upon this question judges Nares, Ashurst, Blackstone, Willes, Aston and Gould, and Smythe, C. B., held the affirmative. Judges Eyre, Perrot, Adams, and De Grey, C. J., held the negative.—V. Whether this right is any way impeached, restrained, or taken away by the statute of 8 Anne?—Judges Eyre, Nares, Perrot, Gould and Adams, and De Grey, C. J., held the affirmative. Judges Ashurst, Blackstone, Willes and Aston, and Smythe, C. B., held the negative.—Upon these answers, the decree of the court of chancery was reversed, on the motion of lord

Camden, seconded by the lord chancellor, by a majority of 22 to 11.—By this majority of a single judge this momentous question was decided. It will be observed that it was brought about by two judges, Nares and Gould, who voted that an author had perpetual copyright by common law, leaving their side, and voting that this perpetual right was taken away by the statute.—Such an opinion seems to us to be incomprehensible. Modern opinion has confirmed the judgment of the minority, that there is no such thing as copyright at common law. But how judges, who held that copyright did exist at common law, could hold that it was taken away by the statute of Anne, seems past understanding, for there is a clause expressly enacting that the statute should in no way whatever affect pre-existing rights.—Right or wrong, however, this judgment declared that the practice of two centuries, and the deliberate opinion of all the courts of law and equity during that period, were erroneous, and henceforward copyright had nothing but statute law to support it.—Authors, publishers, and the universities were taken by surprise at this unexpected decision of the house of lords, destroying what they imagined was their inviolable property. The universities immediately took the field, and in 1775 an act was passed (15 Geo. III., c. 53), which granted to both the universities in England, and to each of the colleges therein, to the colleges of Eton, Westminster, and Winchester, and to the four universities of Scotland, perpetual copyright in all works that should be bequeathed to them, so long as they should print them at their own presses, and not assign them over to any one else. They, nevertheless might sell them to any one they pleased, in the same manner as any individual author.—And here we may observe that a very curious question might arise. It is a plain maxim of law that a man can not grant, or assign to another, a greater estate, or interest, than he possesses himself. But here is a manifest exception to this rule. An author has only a very limited interest in his own works, according to the present law, only 42 years, or his own lifetime, whichever is the longest. Hence he can only assign over that interest to any private person. But if he assign this copyright to any university or college named in the act, it becomes an estate in perpetuity. Therefore, he has clearly assigned a greater estate than he himself possesses. Again, this question might arise. Suppose an author assigns over his copyright as above, which immediately becomes perpetual by force of law, and suppose the college, or university, sell this copyright, which has now become perpetual, to an individual. Is the copyright perpetual, or limited?—The booksellers also petitioned the house of commons on Feb. 28, 1774, stating that in the full belief of the perpetuity of copyrights, they had invested large sums in their purchase, and that the support of many families depended on the same, and prayed for such relief

as the house might deem proper. A bill was brought in for this purpose, but rejected. In 1798 a new point was raised in the case of *Beckford vs. Hood*. The plaintiff had published a work anonymously, and sued for damages for the piracy of it. The defendant contended that no action lay for damages since the statute of Anne, which gave penalties, and that the author had lost his right by publishing his work anonymously, and not entering it on the stationers' register, as prescribed by the act. The court, however, by one of those skillful examples of hair-splitting, where plain sense is against them, gave judgment for the plaintiff. The judgment, however, was so manifestly weak, that an act was brought in to bolster it up (41 Geo. III., c. 107), and authors and their assigns were allowed to bring actions on the case for damages for pirating their works during the currency of the privilege granted by the statute of Anne. Trinity college and the king's inn, Dublin, were also added to the list of those places which were entitled to pillage authors of their works. Trinity college also received the right of holding copyrights in perpetuity, like the English and Scotch universities and colleges.—By an act passed in 1814 (54 Geo. III., c. 156) the copies of printed books were required only to be delivered on demand, within 12 months of their publication. The author's copyright was extended to 28 years certain, and for the remainder of his life, if he survived that period. The grievance of every author being mulcted in 11 copies of his work, was complained of in parliament several times, but nothing was done till 1836, when Mr Buckingham brought in a bill which was passed, which enacted that the rights of Zion college, the four universities of Scotland, and the king's inn, Dublin, should cease, upon receiving compensation, which was to be expended in the purchase of works. By this act the number of presented copies was reduced to five.—At last Serjeant (afterward Mr. Justice) Talfourd appropriately took up the subject of copyright, and brought the subject before the house of commons. The discussion extended through several sessions, and his bill having been considerably modified, was passed in 1842, as the 5th and 6th Vic., c. 45. This act repealed the 8 Anne, c. 19; the 41 Geo. III., c. 107; the 51 Geo. III., c. 156; and is now the one which regulates the subject of literary copyright. By this act, the word "book," is to mean every volume, or part thereof, pamphlet, sheet of letterpress, or music, map, chart, or plan separately published. The copyright in every such book published, in the lifetime of the author, is to last for his lifetime and seven years after; but if such term elapse before the end of 42 years from the publication of the work, then the copyright shall exist for 42 years. If the book is published after the author's death, the copyright is to last for 42 years, and shall belong to the owner of the author's manuscript from which it is first published. If the proprietor of such copyright refuse to publish it, the judicial committee of

the privy council may authorize it. One copy of every such book to be delivered at the British Museum. The libraries at Oxford, Cambridge, the Advocates' at Edinburgh, and Trinity college, Dublin, may have one copy on demand. Articles in encyclopædias, magazines, and reviews, and periodicals, are subject to the same copyright as books, except that the copyright of articles in reviews, magazines, and periodicals, reverts to the author after 28 years, for the remainder of the term. Subsequent provisions were made for preventing the importation into British possessions of the works of British authors, in which copyright still subsists.—The next subjects which received copyright from law, were prints and engravings. The acts relating to this, are the 8 Geo. II., c. 13; the 7 Geo. III., c. 38; the 17 Geo. III., c. 57; and the 15 and 16 Vic., c. 12. By these acts, the copyright in prints, engravings, lithographs, and all such works of art, is given for 28 years from the day of publication.—By the 27 Geo. III., c. 38, copyright was given in the designing and printing of manufactures; this act was modified and extended by subsequent acts. The present acts on the subject are the 5 and 6 Vic., c. 100; the 6 and 7 Vic., c. 65; the 13 and 14 Vic., c. 104; and the 20 and 22 Vic., c. 70. By these acts, designs in manufactures are divided into various classes, and various terms are allowed for the copyright of designs in each. For designs for ornamenting articles in metal; wood; glass; earthenware, and other solid substances; paper hangings; carpets, including floor and oil-cloths; shawls, unprinted; linen fabrics with pattern, printed; woven damasks; the term is three years. For shawls, printed; yarn, thread, or warp; nine months. For woven fabrics, unprinted; lace, and all other articles, twelve months. For the shape or configuration of articles of utility, three years.—By the 38 Geo. III., c. 71; and 54 Geo. III., c. 56, copyright was granted for sculptures, models, and casts, for 14 years from the time of first publication; and to the author, if living at the end of that term, 14 years more.—By the 3 and 4 Wm. IV., c. 15, the term of copyright granted to authors by the 54 Geo. III., c. 156, was extended to the author of dramatic compositions of all sorts; publication in this instance being interpreted as representing at a place of dramatic entertainment; and a similar extension was granted by the 5 and 6 Vic., c. 45, and its provisions extended to musical compositions.—By the 5 and 6 Wm. IV., c. 65, the author of any lectures, or the person to whom he might assign the copyright in them, was to have the sole right of publishing them. No newspaper editor is to publish them without leave. And no person who is allowed to attend them is to have the right to publish them. If, however, they are published, the copyright lasts for 28 years. To secure this copyright, however, no ice must be given to two justices of the peace within five miles of the place where they are to be delivered, two days beforehand. And it does not extend to lectures delivered in unlicensed places, or in pub-

lic schools and colleges.—International copyright was first granted by the 1 and 2 Vic., c. 59; but this act was repealed by the 7 and 8 Vic., c. 12, further amended by the 15 Vic., c. 12. By the first of these acts the queen, in council, was permitted to grant to the authors of original foreign works, such term of copyright in the British dominions as she pleased, not exceeding the term allowed for similar works in this country. By the latter act the queen, in council, may grant a copyright of five years for an authorized translation of foreign works; and also may prohibit, for a similar period, the representation of an unauthorized translation of a foreign dramatic piece.—Such is the history and present state of the laws regarding copyright in England.—We may mention that the copyright in private letters remains in the writer after transmission; and the receiver of them, and his representatives, have no right to publish them without the consent of the writer or his representatives.—Copyright in France, as is stated in the *Dictionnaire de l'Economie Politique*, was conferred by the grant of the sovereign, as in England, and sometimes for a limited period. The ancient law was contained in the *Ordonnance de Moulins* of 1566, a declaration of Charles IX. in 1571, and the letters-patent of Henry III. Usually no limit was fixed to the duration of copyright, but when a perpetual copyright was granted, it was always under the condition that it should not be parted with to booksellers. If so, it ceased with the author's life. Several edicts in 1618, 1665, 1682, 1686, and 1723, enacted corporal and pecuniary punishments against pirates.—The revolution of 1789 changed this. Copyright was granted as a right to every one, but its duration was limited. According to existing laws, the copyright is vested in an author and his wife during their respective lives, and to their children for 20 years afterward. If they have none, their heirs have it for 10 years. In dramatic pieces, the widow has the same as the children, 20 years.—According to the same authority, the copyrights in different countries are as follows. Before the union of Holland and Belgium, copyright was perpetual in Holland. In 1817 the French law was adopted in the united country, and is now continued in each separately.—In the Zollverein the Prussian law has been adopted, which gives copyright to the author during his life, and to his heirs for 30 years after.—This law was adopted in Austria in 1846.—In Russia it belongs to the author for life, and to his heirs for 25 years. But if they have published a new edition within five years of the expiry of this term, it is prolonged for 10 years.—In Sardinia it lasted only for 15 years. In 1846 a convention was agreed to with France, by which the benefits of French law were extended to the subjects of both nations. We believe that a new convention has been recently concluded between these two countries regarding literary property.—In Portugal, the law is the same as that of Germany.—In Spain, according to the present

law, authors have the copyright for their lives, and their heirs for 50 years after.—Prussia was the first country which set the example of granting international copyright. In 1837 a law was passed that every country might secure copyright for its authors in Prussia upon granting reciprocity. This was followed by England in 1838. In consequence of these, several international treaties of copyright have been negotiated. France, however, has set the example, under the Emperor Napoleon III., by a law of March 28, 1852, of forbidding the piracy of books and works of art published abroad, without requiring reciprocity. It is said, too, that steps were then about to be taken to make copyright perpetual.

H. D. MACLEOD.

COREA. The native name of this peninsular kingdom of eastern Asia is Chō-sen (Morning Calm). It lies between Japan and China, and between parallels 33 and 43 of north latitude. Properly speaking, it is an island, since the Tumen and Yalu rivers are said to flow from one source. The former river divides it from Russia, and the latter from China, while the mainland of Japan is but 150 miles distant from her southern shore. Corea is thus surrounded by China, Russia, and Japan. Three-fourths of Corea's boundary is a coast line, which, on the sea of Japan, has few harbors; while on the west are numerous ports, and an amazing number of islands called "the Corean archipelago." Quelpart, the most southerly and largest island, has been the scene of most of the wrecks which have cast foreign waifs upon her shores.—The policy of Corea to the outer world has been for centuries that of the hermit. A jealous and rigid system of seclusion, even of Chinese and Japanese, has been practiced from the middle ages, until recently. Vigilantly guarding her coasts, picketing her rivers, and palisading her mountains, she has forbidden all foreigners to touch her shores; the only exception reluctantly allowed, being that of occasional envoys from Peking. When unable to guard her coasts and river borders, she has desolated them to the extent of ten miles or more inland. On the Chinese side, beyond the Yalu river, there has existed, since about 1644, by convention with China, a neutral strip of desolated territory fifty miles wide, on which cultivation or habitation is forbidden. The Chinese, however, are less and less respecting this neutrality; and the pressure of increasing population has recently compelled its partial occupation.—The reasons for this extraordinary national policy, maintained intact long after its abandonment by China and Japan, may be learned from a brief survey of Corean history. Her unfortunate position, between two such jealous, not to say hostile, nations as Japan and China, has kept her in a chronic state of invasion, vassalage or tribute. For centuries, both nations claimed her as a dependency, their quarrels being often fought on her soil. Her danger has not remotely

resembled that of the live infant between the contending mothers, under the sword of Solomon. The act of her former master and conqueror, Japan, in recognizing Corea as a distinct nation, in 1876, may not unfitly be compared to that of the true mother, who wished the child no harm. The Coreans and Japanese, being of the same basic stock, are more truly allied in kin and temperament than are the Coreans and Chinese; their blood being thicker than the water which separates them.—The Coreans evidently belong to the same hardy race, which, descending from the north, the Amur valley, conquered the peninsula, and then crossed over into the Japan archipelago. Their primal civilization is, in Chinese annals, ascribed to Kishi (Ki Tsze), the ancestor of Confucius, who, being dissatisfied with his royal master, emigrated to the northeast, B. C. 1122, and named his domain, which was part of ancient Corea, but quite beyond its modern boundaries, Chō-sen (Tranquillity of the Morning). From about the opening of the Christian era, three states began their career in and north of the peninsula, Shinra, Korai and Hiaksai, (Chinese, Sinlo, Kaoli, and Petsi. Korai, at first, was Kokorai.) In the intervals of peace these states were the pupils of Chinese civilization, which they imparted to Japan. Civil wars, which were frequent, and alternate invasion and succor from China and Japan, fill the pages of Corean history, until Shinra became paramount, during the eighth, and until the tenth century. True political unity to the entire peninsula was not, however, secured until about 960 A. D., when, under Wang, who had risen out of Korai, the entire country was tranquilized under the name of Kori or Korai (whence our *Corea*), and tributary relations with China were resumed. As the various conquering hordes, Tartar, Mongol or Manchiu, issued out of the north to conquer China, they reduced Corea to submission; and thus, under many dynasties, Corea has paid tribute to China. In 1392 the dynasty of Kori was overthrown by a revolution, and the present one established, under the official name of Chichung. The new king received investiture under the title of Chō-sen O, or King of Chō-sen, the ancient name of the nationality having been restored, though Kori (Corea) is still popularly used; the capital, or seoul, was fixed, and the present system of administration founded. In 1592 Hidéyoshi, the taiko, or mikado's lieutenant, sent a force of 160,000 Japanese to invade Corea, under pretense of collecting arrearages of tribute. Most of the peninsula was overrun and captured, the main body, under Konishi, reaching the capital in about 18 days after landing. The Chinese sent large armies to succor the Coreans; and, after five years of bloody war, the Japanese armies were withdrawn at the death of Hidéyoshi, in 1597. The Japanese held the port of Fusan, and the Coreans sent embassies to Japan. These relations, including trade, continued until the recent revolutions in Japan; when, upon the

invitations of the mikado's government, in 1868, to resume their relations of homage and tribute, the Corean regent angrily and insultingly severed all relations with Japan, on account of that nation's adoption of western ideas and customs. Roman Christianity entered Corea in 1777, a number of students having adopted it after studying the books written by the Jesuits in Peking. Gradually the doctrines spread, until, in 1836, when the first French missionary penetrated the country in disguise, there were thousands of believers, who grew stronger as the persecutions broke out from time to time. In 1864 no fewer than nineteen Frenchmen had passed the barriers at the frontiers in disguise, or landed at night on the coast. Four died, but the others vigorously propagated their faith. The period from 1864 to 1868 may be called the turning point in the history of modern Corea, when affairs within and without began to culminate. Before narrating these, we shall notice the political system of the little kingdom.—The power of the king, which was formerly absolute over all his subjects, even the high nobility, has been in recent years much curtailed. The court etiquette is based on that in vogue in Peking. The king's name must never be mentioned. Horsemen must dismount and walk past the palace. It is not allowed to stamp the coins with the royal effigy. Whoever is admitted to audience must make many prostrations before the throne. No one must touch the king's person. If, by accident, this is done, the fact must be made known by the individual's wearing a thread of red silk. Nominally, the king is father of his people, and must listen to their petitions. The alarm drum and box for requests hangs in front of the palace and magistrates' offices. All may memorialize or seek redress. Gifts are made to the poor, the aged, and the signally virtuous. Princes of the blood have little or no power in government affairs. The real power lies in the nobles, who are steadily increasing in influence, and who practically fill and control the highest offices. A recent native caricature represented the king as the head, the people as the legs and feet, and the nobles and high officials as the breast and belly. The head, legs and feet were shriveled and dried up, while the chest and stomach were bloated and full. From above, these plunderers of the people reduce the royal prerogative to nothing; while below, they suck the blood of the nation. In choosing a successor on the throne, the king nominates one of his own children, if he has issue; if he has none, he chooses an heir from one of the high noble families.—The real government, as in Japan, is in the hands of the three highest Dai-Jin (Great Ministers). These are the premier, junior prime minister of the left, junior prime minister of the right. The six boards of government are those of civil service, finance, ceremonies, war, justice, and public works. The heads of these departments rank next in order after the three chief dai jin, and each is assisted by a substitute, and a

counselor. These four grades, *chung, pan-tso, tsam-pan, tsam-ai*, including in all twenty-one officials called *dai-jin*, constitute the supreme council of the government. The real authority, however, is in the council of the three dai-jin of the first rank; the eighteen others of lower rank merely confirming or approving the acts of their superiors. The heads of the six departments and their assistants are expected to make a daily report of all affairs under their cognizance; occupying themselves with routine details, but referring all important questions to the council of three. There are also three chamberlains, with assistants, who daily record the acts and words of the king; and three officers, who may be called the chiefs of the royal police.—For administrative purposes, the country is divided into eight dō, or circuits, three of which border the sea of Japan, and five the Yellow sea, the dividing wall being the range of mountains that traverses the peninsula, and the area of each province being usually one or more river basins. The royal or capital province (King-ki dō) is the central one on the west coast. The *seoul*, or capital (Chinese, *king*; Japanese, *kyō*), is Han-Yang, on the Han river, about fifty miles from its mouth. It is a walled city of about 200,000 souls. The entire population of Corea is estimated at from 8,000,000 to 15,000,000, its area including about 80,000 square miles. Each province has a *kam-sa*, or governor. The cities are graded into six classes, *yin, mu, fu, kun, ling* and *hien*, and are governed by officers of corresponding rank. There are twelve ranks or dignities in the official class. The towns are given in charge of the petty magistrates. There are few *yin* (secondary or former national capitals) or *mu* (city ruled by an hereditary noble). The *fu* is the prefectural city. The *kun* and *ling* correspond to the county seat, or sub-prefecture, (Chinese, *chow*, or *chau*; Japanese, *ken*); and the *hien* being a district or township. There are, in all, 332 districts. The *kam-sa*, or governor, resides at the province capital. There are also military magistrates in fortified cities near the capital, and at strategic points on the coast and frontiers. In theory, any male Corean able to pass the government examinations is eligible to office; but the greater number of the best positions are filled by the nobles. The term of office is two years. The salaries seem to be sufficient; but the extravagances required of men in public station tend to grasping, bribery and corruption. Royal inspectors, or "messengers on the dark path," are sent out from the capital to investigate and report upon official abuses. Civil matters are decided by the ordinary magistrate, who is judge and jury at once; criminal cases are tried by the military commandant. Very important questions are referred to the governor of the province; the highest court of appeal being in the capital. Accusations of treason, rebellion and malfeasance in office, are tried by a special court instituted by the king. In case of conviction of treason, the punishment

extends to the family of the traitor. In consequence of the indolence and corruption of the magistrates, much of the actual power of administration is held by two classes of men. The first of these, hereditary in power and office, and exclusive in social life and marriage, usually secure the clerical work in the magistrate's office, act as his substitutes and form a local influence of vast power. The other class, recruited from the lowest social grade, act as the police, messengers, prison attendants, torturers, and servants of the magistrate. Torture is freely used to extort confession; beating with paddles, rasping the flesh with ropes, or suspension by the arms, being common. Decapitation is the common method of execution.—The basis of education and religion, in Corea, is the Confucian system of ethics. Buddhism was formerly prevalent, but can not now be said to be general. Since the present dynasty came into power, in 1392, the system of ancestral worship, and the doctrines of Confucius, mingled with much Shamanistic superstition, has been the popular and official religion. The government encourages education by nominally making fitness for office depend upon literary qualifications. Yearly examinations are held in the provinces and at the capital, supervising commissioners being chosen by the supreme council. This system of competitive examinations is modeled after that of the Chinese, but is less rigidly adhered to. Three degrees are bestowed, the second fitting the receiver to fill provincial posts; and the third, positions in the court and capital. Special schools of languages, science, and useful arts, required by the government, are established in the capital, and are conducted by salaried scholars, whose profession is hereditary. These are interpreters, astronomers, map makers, physicians, artists, mechanicians, scribes, etc. The annual embassy which visits Peking is usually composed of court officials, and a large train of servants and traders. Besides paying the tribute, which is now merely nominal, they bring back the Chinese calendar, the reception and adoption of which by any nation is an acknowledgment of Chinese supremacy. The almanac is now almost the only burden which China lays upon Corea. That the relation of the little kingdom to her colossal neighbor is now that of ceremonial only, has been amply proved; since the Tsung-li Yamen at Peking has again and again disavowed all responsibility for Corea's behavior, to France, Germany, Japan and the United States.—The Chi-chong (or Ni) dynasty, founded in 1392, came to an end in 1864, the king Chul Chong dying without issue, and before he had nominated an heir. A desperate intrigue for the control of the throne now began, in which many prominent nobles took part, especially the three widows of the three kings who had reigned in succession since 1831. The eldest of the widows, having seized the royal seal and the emblems, was the acknowledged mistress of the situation. Waiving her preference for her

nephew, she nominated a boy, then twelve years old, from one of the princely families. The crafty father of this lad managed to secure possession of the royal seal, made himself the regent, and held the government with almost absolute power until 1873, ruling with great cruelty and rigor. During this regency, the following events took place: By the treaty of Peking, in 1860, the Russian possessions extended to the Tumen river, making Corea's neighbor on the north, Russia, instead of China. Russian vessels now appeared off the coast; and the fear that the Russians might force the long isolation of Corea became a chronic fear. Among the native Christians and the small minority who hoped for intercourse with Europe, there was hearty joy when, in January, 1866, a Russian war vessel came to Wen-san, on the northeast coast, and demanded that Corea be open to commerce, while, at the same time, a body of Russian troops crossed the Tumen to re-enforce the demand. The regent refused the request, but managed, at the same time, under pretense of friendship, to draw from their hiding places the French missionaries. The Russians went away; and shortly after, the nine Frenchmen were tried and publicly decapitated near the river bank, in front of the capital. A fierce persecution of the native Christians, or "foreigner-Coreans," now broke out, in which several thousands were put to death. About 5,000 fled northward, crossed the Tumen river, into Russian territory, and are now living in settlements under Russian officials, priests and schoolmasters. In August, 1866, the American schooner *General Sherman* entered the Ping Yang river, on the northwest coast, on a trading or semi-piratical expedition. How those on board met their death is not certainly known, but they were slain to the last man, being probably mistaken for Frenchmen. In October, 1866, the French admiral Roze, with seven ships and 1,000 men, made a descent on Kang-hoa island, at the mouth of the river leading to the capital, and captured the city, but, after a week's stay, came away, accomplishing nothing of importance. On the 8th of May, 1867, the steamer *China*, floating the North German flag, and the tender *Greta*, with a motley crew of 120 Chinese, led by a German named Oppert, with capital furnished by an American, with a French priest for a guide, arrived in Prince Jerome gulf, about forty miles south of the capital. Landing, the party marched inland, and attempted to break into and rifle the family mausoleum of the regent, in order to seize the bones and relics and hold them to ransom. The attempt failed, and the rascals got off with only the loss of one or two men. This last was Oppert's third attempt to enter and open Corea to trade. The United States government sent the *Wachusett* and *Shenandoah* to demand redress, for the *General Sherman* affair; but, no attention being paid to their request, a small fleet was dispatched in 1871 to Kang-Hoa, having on board our minister to China, Hon. F. F. Low, who was directed, if

possible, to make a treaty. After provoking hostilities by an armed survey of the Han river, the forts were captured, 400 Koreans killed, and the expedition came away, accomplishing nothing, but "wiping out the insult to our flag." In 1875 the Japanese envoy Moriyama secured a convention with Korea; but shortly afterward the gunboat *Unyo Kuan* was fired on by Koreans, the Japanese ship and uniform being like that of foreigners. An assurance from Peking that China had nothing but ceremonial relations with Korea having been secured by Arinori Mori, the Japanese government sent an expedition (modeled in detail after that of commodore M. C. Perry to Japan in 1854) under Kuroda and Inouyé; and, on Feb. 27, 1876, a treaty was made between the two nations, according to principles of international law; and, besides the exchange and renewal of diplomatic intercourse, Gusan and Fusan were opened as ports of trade and residence to Japanese. In 1880 another unsuccessful attempt was made by the United States to open relations with Korea, through commodore R. W. Shufeldt, in the United States steamship *Ticonderoga*. Since 1873, when the young king reached his majority, the drift of Korean opinion has been steadily tending toward a liberal policy, which must finally bear fruit in bringing Korea within the comity of nations.—The best works on Korea are in the Japanese language. See Dallet's *Histoire de l'Eglise de Corée*, 2 vols., Paris, 1874; Oppert's *A Forbidden Land*; Ross' *Korea*; and *Korea, the Hermit Nation*, by W. E. Griffis.

W. E. GRIFFIS.

CORN LAWS. From the circumstance of corn forming, in England and most other countries, the principal part of the food of the people, the trade in it, and the laws by which the trade is regulated, are justly looked upon as of the highest importance. But this is not the only circumstance that renders it necessary to enter at some length into the discussion of this subject. Its difficulty is at least equal to its interest. The enactments made at different periods with respect to the corn trade, and the opinions advanced as to their policy, have been so very various and contradictory, that it is indispensable to submit them to some examination, and, if possible, to ascertain the *principles* which ought to pervade this department of commercial legislation.—I. HISTORICAL SKETCH OF THE CORN LAWS. For a long time the regulations with respect to the corn trade were principally intended to promote abundance and low prices. But though the purpose was laudable, the means adopted for accomplishing it had, for the most part, a directly opposite effect. When a country exports corn, it seems, at first sight, as if nothing could do so much to increase her supplies as the prevention of exportation; and even in countries that do not export, its prohibition seems to be a prudent measure, and calculated to prevent the supply from being diminished, upon any emergency, be-

low its natural level. These are the conclusions that immediately suggest themselves upon this subject; and it requires a pretty extensive experience, an attention to facts, and a habit of reasoning upon such topics, to perceive their fallacy. These, however, were altogether wanting when the regulations affecting the corn trade began to be introduced into Great Britain and other countries. They were framed in accordance with what were supposed to be the dictates of common sense; and their object being to procure as large a supply of the prime necessary of life as possible, its exportation was either totally forbidden, or forbidden when the home price was above certain limits.—The principle of absolute prohibition seems to have been steadily acted upon, as far as the turbulence of the period would admit, from the conquest to the year 1436, in the reign of Henry VI.; but at the last mentioned period an act was passed, authorizing the exportation of wheat whenever the home price did not exceed 6s. 8d. (equal in amount of pure silver to 12s. 10½d. present money) per quarter, and barley when the home price did not exceed 3s. 4d. In 1463 an additional benefit was intended to be conferred on agriculture by prohibiting importation until the home price exceeded that at which exportation ceased. But the fluctuating policy of the times prevented these regulations from being carried into full effect, and, indeed, rendered them in a great measure inoperative.—In addition to the restraints laid on exportation, it has been common in most countries to attempt to increase the supply of corn, not only by admitting its unrestrained importation from abroad, but by holding out extraordinary encouragement to the importers. This policy has not, however, been much followed in England. During the 500 years immediately posterior to the conquest, importation was substantially free; but it was seldom or never promoted by artificial means; and during the last century and a half it has, for the most part, been subjected to severe restrictions.—Besides attempting to lower prices by prohibiting exportation, our ancestors attempted to lower them by proscribing the trade carried on by corn dealers. This most useful class of persons were looked upon with suspicion by every one. The agriculturists concluded that they would be able to sell their produce at higher prices to the consumers, were the corn dealers out of the way; while the consumers concluded that the profits of the dealers were made at their expense; and ascribed the dearths that were then very prevalent entirely to the practices of the dealers, or to their buying up corn and withholding it from market. These notions, which have still a considerable degree of influence, led to various enactments, particularly in the reign of Edward VI., by which the freedom of the internal corn trade was entirely suppressed. The *engrossing* of corn, or the buying of it in one market with intent to sell it again in another, was made an offense punishable by imprisonment and the pillory; and no

one was allowed to carry corn from one part to another without a license, the privilege of granting which was confided by a statute of Elizabeth to the quarter sessions. But as the principles of commerce came to be better understood, the impolicy of these restraints gradually grew more and more obvious. They were considerably modified in 1624; and in 1663 the engrossing of corn was declared to be legal so long as the price did not exceed 48s. per quarter (15 Ch. II., c. 7); an act which, as Adam Smith has justly observed, has with all its imperfections done more to promote plenty than any other law in the statute book. In 1773 the last remnant of the legislative enactments restraining the freedom of the internal corn dealers was entirely repealed. But the engrossing of corn has, notwithstanding, been since held to be an offense at common law; and so late as 1800, a corn dealer was convicted of this imaginary crime. He was not, however, brought up for judgment; and it is not very likely that any similar case will ever again occupy the attention of the courts.—The acts of 1436 and 1463, regulating the prices when exportation was allowed and when importation was to cease, continued, nominally at least, in force till 1562, when the prices at which exportation might take place were extended to 10s. for wheat and 6s. 8d. for barley. But a new principle—that of imposing duties on exportation—was soon after introduced; and in 1571 it was enacted that wheat might be exported, paying a duty of 2s. per quarter, and barley and other grain a duty of 1s. 4d., whenever the home price of wheat did not exceed 20s. per quarter, and barley and malt 12s. At the restoration the limit at which exportation might take place was very much extended; but as the duty on exportation was, at the same time, so very high as to be almost prohibitory, the extension was of little or no service to the agriculturists. This view of the matter seems to have been speedily taken by the legislature; for in 1663 the high duties on exportation were taken off, and an *ad valorem* duty imposed in their stead, at the same time that the limit of exportation was extended. In 1670 a still more decided step was taken in favor of agriculture; an act being then passed which extended the exportation price to 53s. 4d. per quarter for wheat, and other grain in proportion, imposing at the same time prohibitory duties on the importation of wheat till the price rose to 53s. 4d., and a duty of 8s. between that price and 80s. But the real effects of this act were not so great as might have been anticipated. The extension of the limit of exportation was rendered comparatively nugatory in consequence of the continuance of the duties on exportation caused by the necessities of the crown; while the want of any proper method for the determination of prices went far to nullify the prohibition of importation.—At the accession of William III. a new system was adopted. The interests of agriculture were then looked upon as of paramount importance; and to promote them, not only were the duties on

exportation totally abolished, but it was encouraged by the grant of a *bounty* of 5s. on every quarter of wheat exported, while the price continued at or below 48s.; of 2s. 6d. on every quarter of barley or malt, while their respective prices did not exceed 24s.; and of 3s. 6d. on every quarter of rye, when its price did not exceed 32s. (1 Wm. and Mary, c. 12.) A bounty of 2s. 6d. per quarter was subsequently given upon the exportation of oats and oatmeal, when the price of the former did not exceed 15s. per quarter. Importation continued to be regulated by the act of 1670.—Much diversity of opinion has been entertained with respect to the policy of the bounty. That it was intended to raise the price of corn is clear, from the words of the statute, which states “that the exportation of corn and grain into foreign parts, *when the price thereof is at a low rate in this kingdom*, hath been a great advantage not only to the owners of land, but to the trade of the kingdom in general; therefore,” etc. But admitting this to have been its object, it has been contended that the low prices which prevailed during the first half of last century show that its real effect was precisely the reverse; and that, by extending tillage, it contributed to reduce prices. It will be afterward shown that this could not really be the case; and the fall of prices may be sufficiently accounted for by the improved state of agriculture, the gradual consolidation of farms, the diminution of sheep husbandry, etc., combined with the slow increase of the population. In point of fact, too, prices had begun to give way 30 years before the bounty was granted, and the fall was equally great in France, where, instead of exportation being encouraged by a bounty, it was almost entirely prohibited, and in most other continental states. (For proofs of what is now stated, see the article “Corn Laws,” in the new edition of the *Eucyc. Brit.*)—With some few exceptions, there was, during the first 66 years of last century, a large export of corn from England. In 1750 the wheat exported amounted to 947,000 quarters; and the total bounties paid during the 10 years from 1740 to 1751 reached the sum of £1,515,000. But the rapid increase of population subsequently to 1760, and particularly after the peace of Paris, in 1763, when the commerce and manufactures of the country were extended in an unprecedented degree, gradually reduced this excess of exportation, and occasionally, indeed, inclined the balance the other way. This led to several suspensions of the restrictions on importation; and at length, in 1773, a new act was framed, by which foreign wheat was allowed to be imported on paying a nominal duty of 6d. whenever the home price was at or above 48s. per quarter, and the bounty and exportation were together to cease when the price was at or above 44s. The bounty amounted to 5s. on every quarter of wheat; 2s. 6d. on every quarter of barley; 3s. 6d. on every quarter of rye; and 2s. 6d. on every quarter of oats. This statute also permitted the importation of corn at any price, duty free, in order to be again exported, provided it
