an advance made, there are, nevertheless, a great many writers who continue to place the judicial power within the domain of the executive power, which is charged with the carrying of the law into effect. According to these writers, justice and administration constitute the two chief attributes of the executive power in the state. It is necessary to form a clear idea of the bearing of these distinctions. The judicial power and administration are not connected in the same way with the executive power. When this power gives personal, direct, formal and unceasing direction to political and administrative affairs, it allows judicial action to move in a sphere of its own, in an independent sphere, the limits of which are determined by the laws; and although justice is usually rendered in the name of the chief executive, no one dreams of giving to the executive the right to modify the decisions of the courts or to substitute his will for the judgments or decrees of the courts, just as no one dreams of putting the executive on the bench. — The essential conditions of justice are these: it should be equal; it should know no distinction of rank or class; it should be accessible to all; it should be gratuitous in this, that the parties to an action should not be obliged to remunerate the judge; it should be both prompt and sure; it should be surrounded by guarantees in the mode of procedure calculated to prevent error, and among these guarantees we must assign the first place to the liberty of defense and to the publicity of the proceedings; lastly, and above all, justice must rest on the faithful and rigorous application of the laws. — Judges have sometimes been asked to temper the severity of the laws by appealing to a species of charity applied to matters of justice. But, in the end, want of respect for the rule has always been regretted. Dictated by a feeling of humanity, this charity too frequently serves as a cloak for the ignorance of the judge, or as a pretext for the exercise of arbitrary power. Absolute respect for the laws by the judge himself is the most serious and most efficacious guaranty of justice. With reason does Bacon say: *Optimus judex qui minimum sibi * *, optima lex quæ minimum judici;* and this saying of his is true in every age. FÉRAUD-GIRAUD.

hasty and improvident action. Upon legislative action there is, first, the check of the executive, who will generally be clothed with a qualified veto power, and who may refuse to execute laws deemed unconstitutional; and second, the check of the judiciary, who may annul unconstitutional laws, and punish those concerned in enforcing them. Upon judicial action there is the legislative check, which consists in the power to prescribe rules for the courts, and perhaps to restrict their authority; and the executive check, of refusing aid in enforcing judgments which are believed to be in excess of jurisdiction. Upon executive action the legislature has a power of restraint, corresponding with that which it exercises upon judicial action; and the judiciary may punish executive agents for any action in excess of executive authority. And the legislative department has an important restraint upon both the executive and the judiciary, in the power of impeachment for illegal or oppressive action, or for any failure to perform official duty. The executive in refusing to execute a legislative enactment, will always do so with the peril of impeachment in view." (See CHECKS AND BALANCES.)

JUSTICE, Department of. The attorney general of the United States, although his office was created by congress as early as Sept. 24, 1789 (1 Stat. at Large, 92), was not made the head of a department until June 22, 1870, when the department of justice was created, (16 Stat. at Large, 162). By this act the various law officers of the government, whose functions under previously existing laws were to interpret and apply the statutes governing the business of the various departments and bureaus, and to prosecute violations of United States laws in certain cases, were placed under the supervision of the attorney general. One leading reason for creating a department of justice was to bring about uniformity in the construction and application of the laws, which had not been realized under the previously existing system, with half a dozen independent law officers, responsible to no common head. — The attorney general is made the head of the department of justice, being the chief law officer of the government. He is one of the seven members of the cabinet; he advises the president on questions of law, and, when required, renders opinions to the heads of any of the executive departments upon legal questions arising as to the administration of any one of them. He is the representative of the United States in all matters involving legal questions. He has supervision of the United States district attorneys and marshals in the United States courts of the states and territories. He sometimes appears in the supreme court of the United States to argue causes in which the government is a party, and even sometimes (as in the notable star route cases of 1882) in a subordinate court of the United States. In all other cases, the attorney general directs what officer is to appear and argue cases in which the United States is interested, in the supreme court, the court of claims, or any other court, providing special counsel for the United States when in his judgment it is required. — The office of solicitor general, created by the act of 1870, is the second office in the department of justice. He assists the attorney general, and in case of a vacancy in that office, or the absence of his chief, performs the duties of attorney general. The solicitor general conducts and argues United States cases in the courts at Washington, except when the attorney general otherwise directs. There are also two assistant attorneys general, whose duty it is to aid the attorney general and the solicitor general in the business of the department; one assists in the argument of causes in the supreme court, besides preparing legal opinions when called for; while the other conducts the cases in behalf of the United States in the court of claims. — The official salaries of those connected with the department of justice (including the law officers of the executive departments, who by the law of 1870 exercise their functions under the supervision of the attorney general), are as follows: The attorney general, $8,000; the solicitor general, $7,000, two assistant attorneys gen-

eral, each $5,000; assistant attorney general for the interior department, $5,000; assistant attorney general for the postoffice department, $4,000; solicitor of the treasury, $4,500; solicitor of internal revenue, $4,500; examiner of claims, state department, $3,500; twenty-four clerks and assistants, $73,600. The office of solicitor of the navy, formerly established, has been abolished, and a judge advocate general, with the rank and pay of a captain, has been substituted. — Besides the conduct of law cases involving the interests or authority of the government, the department of justice is charged with the extensive and complicated business connected with the judicial establishment, including the appointment (or recommendation for appointment) of judges, attorneys and marshals of the circuit and district courts of the United States; the examination and allowance of the accounts of these courts, now numbering nine judicial circuits, and fifty-eight district courts in the states, besides nine United States courts in the territories and District of Columbia. The tenure of these judicial officers, and their salaries, are as follows: Judges of circuit courts, for life, $6,000 each; judges of the United States district courts, for life, salaries, $3,500 to $5,000. These judges, like those of the supreme court, may be retired on full pension after ten years continuous service, provided they have reached the age of seventy. The district attorneys and United States marshals are appointed for the term of four years by the president and senate; their salaries are $200 a year, and the fees received in judicial proceedings, as fixed by law, limited, however, to a maximum compensation of $6,000 per annum. The clerks of the United States courts are appointed by the judges, and are paid by fees limited to $3,500 per annum, except in the Pacific states, where the limit is $7,000. The total appropriation for judicial salaries for the year 1882 was $420,300, besides fees. The same year congress appropriated for the expenses of the courts of the United States, $2,950,000, including the fees. This is to cover the entire expenditure for jurors, witnesses, support of prisoners, special counsel, contingent expenses of the courts, etc. — The offices of the department of justice occupy the same building with the court of claims, opposite the treasury department, on Pennsylvania avenue. —Following is a complete list of the attorneys general of the United States, with their terms of office. Those whose names are repeated were reappointed by successive presidents. The list, though already given under the title ADMINISTRATIONS, is repeated here for the sake of convenience.

K

KANSAS, a state of the American Union. Under its present (state) boundaries it is formed mainly from territory acquired by the Louisiana purchase (see ANNEXATIONS, I.); the southwest portion, lying south of the Arkansas river and west of longitude 23° west of Washington (100° west of Greenwich), was part of the territory ceded to the United States by Texas in 1850. (See COMPROMISES, V.) Under its territorial boundaries Kansas did not include this southwest portion, but extended west to the Rocky mountains, thus taking in part of the modern state of Colorado. — The greater part of Kansas was a part of the district and territory of Louisiana, and of the territory of Missouri, until 1821; after that time it remained for thirty-three years without an organized government. About 1843 the increase of overland travel to Oregon led S. A. Douglas to introduce a bill in the house of representatives to organize the territory of Nebraska, covering the modern state of Kansas and all the territory north of it, in order to prevent the alienation of

this overland route by treaties for Indian reservations. This bill he unsuccessfully renewed at each session until 1854, when Kansas was at last organized as a separate territory. (See KANSAS-NEBRASKA BILL.) — The Missouri compromise had forever prohibited slavery in this and all the other territory acquired from France north of 36° 30′ north latitude; the passage of the Kansas-Nebraska bill, which provided that the territory, when admitted as a state, should be received by congress "with or without slavery, as their constitution may prescribe at the time of their admission," began the "Kansas struggle" between free state and slave state immigrants for the settlement of the territory and the control of its conversion into a state. The latter were first in the field, owing to the proximity of the slave state of Missouri. They crossed the border into the new territory, pre-empted lands, and warned free state immigrants not to cross the state of Missouri, which barred the straight road to Kansas. They were thus able to control the first election for delegate to congress, Nov. 29, 1854. A. H. Reeder, the federal governor of the territory, arrived in Kansas Oct. 7, 1854, and ordered an election for a territorial legislature to be held March 30, 1855. Free state immigration had already begun, in July, 1854, under the auspices at first of a congressional association called the "Kansas Aid Society," and afterward of a corporation chartered by the Massachusetts legislature, Feb. 21, 1855, called the "New England Emigrant Aid Company," and other similar associations. Before this evident free state preparation could be effective the March election took place, and was carried by organized bands of Missourians, who moved into Kansas on election day, voted, and returned to Missouri at night. The territorial census of February, 1855, showed 2,905 legal voters in the territory; in the election of the next month 5,427 votes were cast for the pro slavery candidates and 791 for their opponents. These figures alone, leaving aside the testimony to the terrorizing of free state voters, will explain why the free state settlers always refused to recognize the pro-slavery legislature as representing anything beyond a Missouri constituency. — By whatever means the election was carried, this initial success of the pro-slavery element gave it a tremendous advantage during the next two years. Its legislature, which met at Pawnee, July 2, 1855, proceeded to make Kansas a slave territory, adopted the slave laws of Missouri *en bloc*, with a series of original statutes denouncing the penalty of death for about fifty different offenses against the system of slavery, and provided that, for the next two years, every executive and judicial officer of the territory should be appointed by the legislature or its appointees, and that every candidate for the next legislature, every judge of election, and every voter, if challenged, should swear to support the fugitive slave law. The territorial legislature had thus, as far as it was able, made Kansas a slave territory, and guarded against any easy reversal of its action by subsequent legislatures. The free state settlers, therefore, ignoring the territorial legislature, took immediate steps to transform Kansas into a state, without waiting for any enabling act of congress. California and other states had previously formed governments in this manner (see TERRITORIES), but the parallelism was denied by the democratic administration at Washington on the ground that no territory had ever been, or could properly be, thus transformed into a state in direct opposition to the constituted authorities of the territory. The political history of Kansas, for the next few years, is therefore a series of attempts to inaugurate a state government, complicated by disobedience to territorial authorities, indictments of free state leaders for treason, and actual armed conflict between partisans of the territorial and state governments. — In obedience to the call of a private free state committee, a convention met at Topeka, Sept. 19, 1855, and ordered an election for delegates to a constitutional convention. Only free state voters took part in the election. The convention met at Topeka, Oct. 23, and formed the "Topeka constitution," prohibiting slavery, which was submitted to popular vote and was adopted, Dec. 15, by a vote of 1,731 to 46, only free state settlers voting. An election for state officers was then held, Jan. 15, 1856, at which a governor (C. Robinson), a representative to congress, and a complete legislature and state government, were chosen. The bill to admit the state of Kansas, under the Topeka constitution, was passed by the house of representatives, July 3, 1856, by a vote of 107 to 106, but failed in the senate. Nevertheless, on the claim that the state was already in existence (see STATE SOVEREIGNTY), the free state legislature met at Topeka, July 4, 1856. It was dispersed by federal troops under Col. Sumner, by orders from Washington. This action had been foreshadowed by a proclamation of President Pierce, Feb. 11, in which he declared any such attempt to be an insurrection, which would "justify and require the forcible interposition of the whole power of the general government, as well to maintain the laws of the territory as those of the Union." It was the occasion of considerable excitement, in and out of congress, and a provision, or "rider," was added by the republican majority in the house to the army appropriation bill, forbidding the use of the army to enforce the acts of the territorial legislature of Kansas. The senate rejected the proviso, and during the debate the time fixed for adjournment arrived and the session of congress closed, Aug. 18, 1856, with the army bill unpassed. The president at once called an extra session, in which the army bill was passed without the "rider," and congress again adjourned, Aug. 30. (See also BROOKS, PRESTON.) — Long before this time Kansas had become the principal topic of newspaper, political and private discussion. The territory itself had fairly relapsed into a state of nature, the free state settlers disobeying and re-

sisting the territorial government, and the slave state settlers disobeying and resisting the state government. A desultory civil war, waged on public and private account, was marked by the murder of many individuals and by the sack of at least two cities in the free state section, Lawrence (May 21), and Osawatomie (June 5, 1856). All this would have been of no more permanent interest than the early lawlessness of California, but for the premonitions which "bleeding Kansas" afforded all thinking men of the infinitely more frightful convulsion to come. The predominance of a moral question in politics, always a portentous phenomenon under a constitutional government, was made unmistakable by the Kansas struggle, and its first perceptible result was the disappearance, in effect, of all the old forms of opposition to the democratic party, and the first national convention of the new republican party, June 17, 1856. (See REPUBLICAN PARTY.) Kansas, it might be said, cleared the stage for the last act of the drama, the rebellion. — Reeder, the first territorial governor, had quarreled with his legislature soon after it first assembled in 1855. He had convened it at Pawnee city, for the purpose, as was alleged, of increasing the value of his own property in that place, and when the legislature passed an act, over his veto, to remove the capital to Shawnee Mission, he refused to recognize it as any longer a legal legislature, and became one of the free state leaders. At the request of the legislature the president removed him, July 31, 1855, and appointed Wilson Shannon, of Ohio. Shannon was incompetent, and fled from the territory in September, 1856. The next governor, John W. Geary, of Pennsylvania, arrived in Kansas Sept. 9, 1856, and by a skillful blending of temporizing and decided measures succeeded in a reasonable time in disbanding most of the armed and organized forces on both sides, and in bringing about a temporary lull in the open conflict Before the end of the year he even claimed to have re-established order in the territory. Early in the next year he seems to have become distrustful of the sincerity of the federal administration in supporting him, and March 4, 1857, he resigned. Robert J. Walker, of Mississippi (a Pennsylvanian by birth), was appointed in his place. He reached Kansas May 25, 1857, and proved to be one of the most successful of the territorial governors. It must be noted, however, that his work had been much simplified by the enormous increase in the free state immigration, which had by this time almost entirely swamped open opposition.— Nevertheless, Kansas was still governed by the nearly unanimously pro-slavery territorial legislature, backed by the power of the federal government. After a final attempt of the free state legislature to meet at Topeka, Jan. 6, 1857, which was prevented by the arrest of its members by the federal authorities, the free state party abandoned the Topeka constitution forever. Governor Walker was successful in gaining their confidence, and succeeded in inducing them, for the first time, to take part in the election for the territorial legislature, in October, 1857, which resulted in the choice of a free state legislature and delegate to congress. Before losing their hold of the legislature, however, the pro-slavery party had used it to call a constitutional convention, which met at Lecompton, Sept. 5, 1857, and adopted the "Lecompton constitution," Nov. 7. It sanctioned slavery in the state, prohibited the passage of emancipation laws by the legislature, forbade amendments until after 1864, and provided that the constitution should not be submitted to popular vote, but should be finally established by the approval of congress and the admission of the state. Governor Walker had repeatedly promised the free state voters, to secure their participation in the October election, that the proposed constitution should be submitted to popular vote; the convention evaded the fulfillment of the pledge by submitting to a popular vote, Dec. 21, only the provision sanctioning slavery. The vote stood 6,266 "for the constitution *with* slavery," and 567 "for the constitution *without* slavery," the free state party generally declining to vote; but the new territorial legislature passed an act submitting the whole constitution to popular vote, Jan. 4, 1858, when the vote stood 10,226 against the constitution, 138 for it with slavery, 24 for it without slavery. — The whole question then passed into national politics, and occupied most of the next session of congress, 1857–8. Both branches were democratic, but no complete party majority could be secured in the house for the approval of the Lecompton constitution. The president desired and urged it; the senate passed the necessary bill, March 23, 1858; but in the house 22 Douglas democrats and 6 Americans united with the 92 republicans, April 1, to pass a substitute requiring the resubmission of the constitution to the people of Kansas. As a compromise, both houses passed, April 30, the "English bill" (so called from its mover), according to which a substitute for the land ordinance of the Lecompton constitution was to be submitted to popular vote in Kansas; if it was accepted, the state was to be considered as admitted; if it was rejected, the Lecompton constitution was to be considered as rejected by the people, and no further constitutional convention was to be held until a census should have shown that the population of the territory equaled or exceeded that required for a representative. (See APPORTIONMENT.) Aug. 3, the people of Kansas voted down the land ordinance, 11,088 to 1,788, and thus finally disposed of the Lecompton constitution. — Nevertheless, the territorial legislature called a state convention, which met at Leavenworth and adopted a constitution, April 3, 1858, prohibiting slavery. It was ratified by popular vote, but was refused consideration by the senate, on the ground that Kansas had not the requisite population. — The territorial legislature directed the question of a new constitutional convention to be

again submitted to popular vote in March, 1859. It was approved; the convention met at Wyandotte July 5, and adopted the "Wyandotte constitution" July 27, which was ratified, Oct. 4, by a vote of 10,421 to 5,530. The senate was still a barrier in the way of the admission of Kansas, and it was not until the withdrawal of southern senators (see SECESSION) had changed the party majority in that branch of congress that Kansas was at last admitted as a state, Jan. 29, 1861, under the Wyandotte constitution. Under this organic law slavery was prohibited; the governor was to hold office for two years; the suffrage was limited to whites, and Topeka was made the capital. — From the beginning of the war of the rebellion, to which the Kansas struggle was the prelude, it was natural that Kansas should take the side of the Union with even more warmth than the other northern states. To her people it was rather the development of an old war than the beginning of a new one, and they sent a larger percentage of their number to the armies in the field than any other state. In state politics the republican party, whose name had from the first been associated with the efforts to make Kansas a free state, has always had a complete and overwhelming predominance. Every governor, congressman and United States senator has been a republican; almost all the local officers have been republicans; and there have been very few legislatures in which the opposition to the dominant party has risen so high as 20 per cent. of the whole number of members. Indeed, it can hardly be said that there has been any opposition party in the state since 1857. In 1875 the democrats even dropped their party name, and the combined opposition, under the name of "independent reformers," polled 35,308 out of 84,132 votes, and elected 37 out of 136 members of the legislature. With the exception of this year the republican vote has always been from 60 to 80 per cent. of the whole, and party contest has been confined to struggles between factions of the dominant party. (See also PROHIBITION.) — This constant and foregone control of the state by one party has operated to the disadvantage of the abler leaders of Kansas in national politics, since the two great parties have naturally reserved their favors for politicians of other and more doubtful states. After the conclusion of the Kansas struggle (see BROWN, JOHN), it would be difficult to name any leader of the state whose name has obtained a national reputation. Another ill consequence has been that politicians have aimed to influence conventions and legislatures, rather than the people, and have not forborne at times the use of the most questionable means of influence. The investigations of the charges of bribery and corruption, in 1872–3, at the elections of United States senators S. C. Pomeroy and Alexander Caldwell, led to the resignation of the latter, and the permanent retirement of the former from politics at the end of his senatorial term. Similar charges have been freely made in regard to other elections in which the people have not taken part, and, though not sustained by the evidence, have given Kansas politics an unpleasant notoriety which is utterly unmerited by the character of the people or by the general conduct of their political contests. — The name of the state was given from that of its principal river, an Indian word, said to mean "the smoky water," but more probably derived from the name of the Kaws, or Konzas, an Indian tribe living on its banks. — Among those who have been prominent in state politics, outside of the list of governors, given below, are the following, all republicans: Alexander Caldwell, United States senator 1871–3; Sidney Clarke, representative in congress 1865–71; Martin F. Conway, one of the leaders of the free state party, and representative in congress 1861–3, John James Ingalls, United States senator 1873–85; James H. Lane, democratic lieutenant governor of Indiana 1849–53, representative in congress from Indiana 1853–5, the principal military leader of the free state immigrants in the Kansas struggle, and United States senator 1861–6; P. B. Plumb, United States senator 1877–83; S. C. Pomeroy, United States senator 1861–73; and E. G. Ross, United States senator 1866–71. — GOVERNORS: Charles Robinson, 1861–3; Thomas Carney, 1863–5; S. J. Crawford, 1865–9; Jas. M. Harvey, 1869–73; Thomas A. Osborn, 1873–7; George T. Anthony, 1877–81; John P. St. John, 1881–3. — See 1 Poore's *Federal and State Constitutions;* Cutts' *Treatise on Party Questions*, 84; authorities under KANSAS-NEBRASKA BILL; 1 Greeley's *American Conflict*, 235; Greeley's *Political Text Book of* 1860, 87; *Report of the House Special Committee on the Troubles in Kansas* (republican report, pp. 1–67, democratic report, pp 68–109); 1 Draper's *History of the Civil War*, 409; the particulars of the "Emigrant Aid Society" are in 2 Wilson's *Rise and Fall of the Slave Power*, 465; 3 Spencer's *United States*, 514; Harris' *Political Conflict in America*, 168; *Buchanan's Administration*, 28; Claskey's *Political Text Book*, 346; Gihon's *Geary and Kansas* (generally the fairest contemporary account); Robinson's *Kansas;* Gladstone's *Englishman in Kansas;* Holloway's *History of Kansas* (1868); Wilder's *Annals of Kansas* (1875); 4 Sumner's *Works*, 127; Porter's *West in* 1880, 323.

ALEXANDER JOHNSTON.

KANSAS-NEBRASKA BILL (IN U. S. HISTORY), the act of congress by which the territories of Kansas and Nebraska were organized in 1854. Its political importance consisted wholly in its repeal of the Missouri compromise. (See COMPROMISES, IV.) — Before the introduction of the bill it did not seem possible for any further question to arise as to slavery in the United States. In the several states slavery was regulated by state law; in the Louisiana purchase both sections had in 1820 united to abolish slavery in the portion north of latitude 36° 30', ignoring

the portion south of it; all the southern portion, outside of the Indian Territory, was covered soon afterward by the slave state of Arkansas; and in the territory afterward acquired from Mexico both sections had united in 1850 in an agreement to ignore the existence of slavery until it could be regulated by the laws of the states which should be formed therefrom in future. Every inch of the United States seemed to be thus covered by some compromise or other. (See COMPROMISES.) — The slavery question was in this condition of equilibrium when a bill was passed by the house, Feb. 10, 1853, to organize the territory of Nebraska, covering, also, the modern state of Kansas. It lay wholly within that portion of the Louisiana purchase whose freedom had been guaranteed by the Missouri compromise, and the bill therefore said nothing about slavery, its supporters taking it for granted that the territory was already free. In the senate it was laid on the table, March 3, the affirmative including every southern senator, except those from Missouri; but their opposition to the bill came entirely from an undefined repugnance to the practical operations of the Missouri compromise, not from any idea that that compromise was no longer in force. If it had been repealed by the compromise of 1850, those most interested in the repeal do not seem to have yet discovered it in 1853. — During the summer of 1853, following the adjournment of congress, the discussion of the new phase, which the proposed organization of Nebraska at once brought about in the slavery question, became general among southern politicians. The southern people do not seem to have taken any great interest in the matter, for it was very improbable that slave labor could be profitably employed in Nebraska, even if it were allowed. The question was wholly political. The territory in question had been worthless ever since it was bargained away to secure the admission of Missouri as a southern and slaveholding state; but now immigration was beginning to mark out the boundaries of present territories and potential states, which would, in the near future, make the south a minority in the senate, as it had always been in the house, and perhaps place it at the mercy of a united north and northwest. To prevent this result it was of importance to southern politicians, 1, that, if the Missouri compromise was to endure, Nebraska should remain unorganized, in order to check immigration and prevent the rapid formation of another northern state; 2, that, if the Missouri compromise could be voided, Nebraska should at least be open to slavery, for the same purpose as above, since it was agreed on all hands that free immigration instinctively avoided any contact with slave labor; and 3, that, if slave labor could possibly be made profitable in Nebraska, the territory should become a slave state, controlled by a class of slave owners in full sympathy with the ruling class of the southern states. The last contingency was generally recognized as highly improbable; one of the first two was the direct objective point. — When congress met in December, 1853, the southern programme, as above stated, had been pretty accurately marked out. It was not a difficult task to secure the support of northern democrats for it, because the latter had for five years been advocating the right of the people of New Mexico to decide the status of slavery in that territory. (See POPULAR SOVEREIGNTY.) The only step backward that was necessary was to accept the application of the doctrine to *all* the territories, whether south or north of latitude 36° 30'. The excuse for this backward step was thus stated by Douglas in his report of Jan. 4, 1854: "The Nebraska country occupies the same relative position to the slavery question as did New Mexico and Utah when those territories were organized." A wrong premise: for the difficulty in the case of New Mexico and Utah had arisen entirely from the fact that the status of slavery in them was unsettled, and could not be settled without a struggle; while in the case of Nebraska the struggle was rightfully over, and the status of slavery fixed. Congressional action was directed, in the former case, toward an amicable adjustment of the dispute, and, in the latter case, toward a needless reopening of the dispute; and yet the assumed parallelism of the two cases was absolutely the only justification ever offered by Douglas and the Douglas democracy of the north for their introduction and support of the Kansas-Nebraska bill. They seem to have been forced into it by their constitutional arguments in support of "squatter sovereignty"; after arguing that congress had no constitutional power to prohibit slavery in New Mexico in 1850, it seemed difficult for them, without stultifying themselves, to argue in favor of the power of congress in 1820 to prohibit slavery in Nebraska. They seem to have forgotten that the compromise of 1850 was confessedly not based upon constitutional grounds at all, but was a purely political decision, based upon expediency; that the *constitutional* objections to the power of congress to prohibit slavery in a territory applied equally to the power of congress to prohibit a territorial legislature from legislating for or against slavery, and so struck at the very root of the compromise of 1850 itself; and that the expediency which counseled them to refrain from meddling with the slavery question in New Mexico and Utah as imperatively counseled them to refrain from disturbing the settlement of the slavery question in Nebraska. — Dec. 15, 1853, in the senate, A. C. Dodge, of Iowa, offered a bill to organize the territory of Nebraska, but his bill, like the one of the preceding session, made no reference to slavery. Jan. 4, 1854, it was reported with amendments by Douglas, chairman of the committee on territories. The report endeavored to make out a parallel between New Mexico and Nebraska by comparing the Mexican abolition of slavery in the former case with the act of 1820 in the latter case; it

remarked that in either case the validity of the abolition of slavery was questioned by many, and that any discussion of the question would renew the excitement of 1850; and it recommended, though not directly, that the senate should organize the new territory without "either affirming or repealing the 8th section of the Missouri act, or [passing] any act declaratory of the meaning of the constitution in respect to the legal points in dispute." But the report stated the basis of the compromise of 1850 as follows: "that all questions pertaining to slavery in the territories, and in the new states to be formed therefrom, are to be left to the decision of the people residing therein, by their appropriate representatives, to be chosen by them for that purpose." This was, in the first place, incorrect, since the New Mexico and Utah acts left no such power to the territorial legislature (see POPULAR SOVEREIGNTY), and, in the second place, not pertinent, since it was an attempt to expand an act of congress, passed for a particular purpose, into a great constitutional rule which was to bind subsequent congresses. Jan. 16, Dixon, of Kentucky, gave notice of an amendment abolishing the Missouri compromise in the case of Nebraska. This was the first open signal of danger to the Missouri compromise; and on the following day Sumner, of Massachusetts, gave notice of an amendment to the bill, providing that nothing contained in it should abrogate or contravene that settlement of the slavery question. Douglas at once had the bill recommitted, and, Jan. 23, he reported, in its final shape, the Kansas-Nebraska bill, which, in its ultimate and unexpected consequences, was one of the most far-reaching legislative acts in American history. — The bill divided the territory from latitude 37° to latitude 43° 30′ into two territories, the southern to be called Kansas, and the northern Nebraska; the territory between latitude 36° 30′ and 37° was now left to the Indians. In the organization of both these territories it was declared to be the purpose of the act to carry out the following three "propositions and principles, established by the compromise measures of 1850": 1, that all questions as to slavery in the territories, or the states to be formed from them, were to be left to the representatives of the people residing therein; 2, that cases involving title to slaves, or personal freedom, might be appealed from the local tribunals to the supreme court; and 3, that the fugitive slave law should apply to the territories. The section which extended the constitution and laws of the United States over the territories had the following proviso: "except the 8th section of the act preparatory to the admission of Missouri into the Union, approved March 6, 1820, which, being inconsistent with the principles of non-intervention by congress with slavery in the states and territories, as recognized by the legislation of 1850, commonly called the compromise measures, is hereby declared inoperative and void; it being the true intent and meaning of this act not to legislate slavery into any territory or state, nor to exclude it therefrom, but to leave the people thereof perfectly free to form and regulate their domestic institutions in their own way, subject only to the constitution of the United States." With the exception of these two novel features, the bill was the usual formal act for the organization of a territory. An amendment offered by Chase, of Ohio, allowing the people of the territory to prohibit the existence of slavery therein, if they saw fit, was voted down, 36 to 10. It is difficult to see any reason for the affirmative vote, since the Chase amendment was strictly in the line of "popular sovereignty," but it was probably due in part to a general distrust of any amendment coming from the anti-slavery element, and in part to the idea that the closing words above given, "subject only to the constitution of the United States," excluded the Chase amendment and made popular sovereignty unilateral in the territories, with authority to permit slavery, but not to prohibit it. March 3, 1854, the bill passed the senate by a vote of 37 to 14. In the affirmative were fourteen northern democrats, and twenty-three southern democrats and whigs; in the negative were eight northern anti-slavery senators, free-soilers or "anti-Nebraska men" (see REPUBLICAN PARTY), Bell, southern whig, Houston, southern democrat, and Hamlin, of Maine, James, of Rhode Island, and Dodge and Walker, of Wisconsin, northern democrats — The bill was not taken up in the house until May 8, and was passed May 24, by a vote of 113 to 100. The affirmative vote included forty-four northern democrats, fifty-seven southern democrats, and twelve southern whigs; the negative vote included forty-four northern democrats, two southern democrats, forty-four northern whigs, seven southern whigs, and three free-soilers. May 30, the Kansas Nebraska bill was approved by the president, and became law.— The effects of the bill upon the parties of the time are elsewhere referred to. (See DEMOCRATIC PARTY, V.; WHIG PARTY, III.; REPUBLICAN PARTY, I.; AMERICAN PARTY.) They may be summarized as follows: 1, it destroyed the whig party, the great mass of whose voters went over, in the south to the democratic, and in the north to the new republican party; 2, it made the democratic party almost entirely sectional, for the loss of its strong anti-slavery element in the north reduced it in the course of the next few years to a hopeless minority there; 3, it crystallized all the northern elements opposed to slavery into another sectional party, soon to take the name of republican; and 4, it compelled all other elements, after a hopeless effort to form a new party on a new issue, to join one or the other sectional party. Its effects on the people of the two sections were still more unfortunate: in the north, it laid the foundation for the belief, which the Dred Scott decision was soon to confirm, that the whole policy of the south was a greedy, grasping, selfish desire for the extension of slavery; in the south,

by the grant of what none but the politicians had hitherto asked or expected, the abolition of the Missouri compromise, it prepared the people for the belief that the subsequent forced settlement of Kansas by means of emigrant aid societies was a treacherous evasion by the north of the terms of the Kansas-Nebraska bill. In other words, the Kansas-Nebraska bill, and still more the Dred Scott decision which followed it, placed each section in 1860, to its own thinking, impregnably upon its own peculiar ground of aggrievement: the north remembered only the violation of the compromise of 1820 by the Kansas-Nebraska bill, taking the Dred Scott decision as only an aggravation of the original offense; the south, ignoring the compromise of 1820 as obsolete by mutual agreement, complained of the north's refusal to carry out fairly the Kansas-Nebraska bill and the Dred Scott decision. (See also FUGITIVE SLAVE LAWS.) And all this unfortunate complication was due entirely to Stephen A. Douglas' over-zealous desire to settle still more firmly and securely a question which was already settled. — On the other hand, it is but fair to give Douglas' grounds for his action, as reported by Cutts (cited below). Having shown the imperative necessity for immediate organization of the two territories, he proceeds as follows (italics as in original): "If the necessity for the organization of the territories did in fact exist, it was right that they should be organized *upon sound constitutional principles;* and if the compromise measures of 1850 were a safe rule of action upon that subject, *as the country* in the presidential election, and *both of the political parties* in their national conventions in 1852, had affirmed, then it was the duty of those to whom the power had been intrusted to frame the bills *in accordance with those principles.* There was another reason which had its due weight in the repeal of the Missouri restriction. The jealousies of the two great sections of the Union, north and south, had been fiercely excited by the slavery agitation. The southern states would never consent to the opening of those territories to settlement, so long as they were excluded by act of congress from moving there and holding their slaves; and they had the power to prevent the opening of the country forever, inasmuch as it had been forever excluded by treaties with the Indians, which could not be changed or repealed except by a two-thirds vote in the senate. But the south were willing to consent to remove the Indian restrictions, provided the north would at the same time remove the Missouri restriction, and thus throw the country open to settlement on equal terms by the people of the north and south, and leave the settlers at liberty to introduce or exclude slavery as they should think proper." All this is certainly of very great force, but only as a statement of the problem which was to be solved mainly by Douglas and the northern democracy, and not, as Douglas evidently takes it, as a justification of the particular solution which was adopted. (See, further, DRED SCOTT CASE, SLAVERY, SECESSION, UNITED STATES.) — See *Congressional Globe*, 33*d Congress*, 1*st Session*, 221; Greeley's *Political Text Book*, 79; Claskey's *Political Text Book*, 346; 3 Spencer's *United States*, 504; Cutts' *Treatise on Party Questions*, 91; 2 Stephens' *War Between the States*, 241; *Buchanan's Administration*, 26; Botts' *Great Rebellion*, 147; Benton's *Examination of the Dred Scott Decision*, 156; Harris' *Political Conflict*, 155; 1 Draper's *Civil War*, 417; 1 Greeley's *American Conflict*, 224; *New Englander*, May, 1861; Giddings' *Rebellion*, 364; 2 Wilson's *Rise and Fall of the Slave Power*, 378; Cairnes' *Slave Power*, 115; Schuckers' *Life of Chase*, 134; authorities under KANSAS, and other articles above referred to; Theodore Parker's *Speeches*, 297. The act is in 10 *Stat at Large*, 277. ALEXANDER JOHNSTON.

KENTUCKY, a state of the American Union, formed from territory originally belonging to Virginia. A land company formed the government of "Transylvania" within its limits, May 23, 1775, but Governor Dunmore refused to recognize it, and the Virginia legislature formed the whole territory into the county of Kentucky, Dec. 6, 1776. In 1784-5 three conventions demanded a separation, to which the Virginia legislature agreed on condition that congress should agree, and that Kentucky should assume a share of Virginia's debt, and recognize Virginia's land warrants. Congress postponed consideration of the matter until the organization of the new federal government; and this, and the neglect to insist on the navigation of the Mississippi (see ANNEXATIONS, I), so angered the people that active but unsuccessful efforts were made to constitute Kentucky an independent republic, in alliance with Spain or with the British in Canada. The final act of the Virginia legislature, consenting to separation, was passed Dec. 18, 1789; congress, by act of Feb. 4, 1791, admitted the state, the admission to take effect June 1, 1792; and a state convention, April 2-19, 1791, formed the first constitution of Kentucky. This last was the tenth popular convention which had been held during the long process of admission. — BOUNDARIES. The Virginia act of Dec. 6, 1776, had defined the county of Kentucky as "all the country west of the Big Sandy creek to the Mississippi," and this was the limit of the subsequent state. The boundary between Virginia and Kentucky, from the Big Sandy southwestward, along the ridge of the Cumberland mountains, was fixed by joint commissioners in May, 1799, and was ratified by Kentucky Dec. 2, 1799, and by Virginia Jan. 13, 1800. The southern boundary, between Kentucky and Tennessee, was settled by joint commissioners in February, 1820, and ratified by congress May 12, 1820. — CONSTITUTIONS. The first constitution made suffrage universal on two years residence in the state. The house of representatives was to consist of not more than 100 nor less than 40 members, chosen annually by the people. Every fourth year a number of

electors equal to the number of representatives was to be chosen by popular vote, and these were to choose the governor and a senate one-fourth of the house's members, "men of the most wisdom, experience and virtue, above twenty-seven years of age." The legislature was empowered to prohibit the importation of slaves, but not to pass emancipation laws without consent of owners and compensation. The selection of the capital was intrusted to a committee, who chose Frankfort. — The second constitution was framed by a convention at Frankfort, July 22–Aug. 7, 1799. It was not submitted to the people, and took effect Jan. 1, 1800. Its principal changes were the abolition of the electoral system and the choice of the governor and senate by popular vote, the latter in senatorial districts. An effort, led by Henry Clay, to insert a clause securing the gradual abolition of slavery was defeated. — The third constitution was framed by a convention at Frankfort, Oct, 7, 1849–June 11, 1850, and ratified by popular vote. Its principal changes were a complete reorganization of the judiciary system; the fixing of the number of senators at 38 and of representatives at 100; the limiting of the state debt to $500,000; and the insertion of a clause declaring the right of property in slaves to be "before and higher than any constitutional sanction."— GOVERNORS: Isaac Shelby (1792–6); James Garrard (1796–1804); Christopher Greenup (1804–8); Charles Scott (1808–12), Isaac Shelby (1812–16); George Madison (1816–20); John Adair (1820–24); Joseph Desha (1824–8); Thomas Metcalfe (1828–32); John Breathitt (1832–6); Jas. Clark (1836–40); Robert P. Letcher (1840–44); William Owsley (1844–8); John J. Crittenden (1848–51); Lazarus W. Powell (1851–5); Charles S. Morehead (1855–9), Beriah Magoffin (1859–63); Thos. E. Bramlette (1863–7); John L. Helm (1867–71); P. H. Leslie (1871–5); James B. McCreary (1875–9); Luke P. Blackburn (1879–83). — POLITICAL HISTORY. Notwithstanding Kentucky's determination to separate from Virginia, the political connection between the two states was very intimate for many years. The first inhabitants were very largely of Virginia origin, and the Virginia influence over their leaders is well illustrated by the coincidence in the passage of the Kentucky and Virginia resolutions of 1798 and 1799. (See KENTUCKY RESOLUTIONS.) The only disturbing element was a small but active "Spanish party," whose leaders, some of them prominent in the state judiciary, were pensioners of the Spanish commandant at New Orleans until the cession of Louisiana. (See ANNEXATIONS, I.) The feeling of the mass of the people, however, was so strongly against Spain and the Spanish party that both Genet and Burr made Kentucky the scene of their most active intrigues. (See GENET, CITIZEN; BURR, AARON.) A federalist party was gradually formed, and in 1795 it succeeded in securing the election by the legislature of Humphrey Marshall to the United States senate. With the exception of this federalist success, the state was under republican (democratic) control during its early years, and in 1801 the tenure of the dominant party was made permanent and secure by the national overthrow of the federal party. The state's electoral votes were cast for Washington and Jefferson in 1792 and for Jefferson and Burr in 1796; and from that time until 1830 the governors, legislatures and congressmen were democratic, though in 1824 the electoral votes of Kentucky were naturally given to Henry Clay.—The only purely local political contest during this period was upon the relief of delinquent debtors, 1820–26. An act for that purpose was passed by the legislature, and was decided unconstitutional, first by a circuit court and then by the state supreme court. The "relief party" elected their candidate for governor in 1824, and a majority of the legislature, but not the two thirds majority necessary to remove the judges. They therefore proceeded to reorganize the supreme court by act, and two supreme courts were in existence until 1826, when the "anti-relief party" gained control, repealed the act of reorganization, and left the old court in possession. — Henry Clay exercised a great influence over the politics of Kentucky from the beginning of his public life. In 1828 the state's electoral votes were cast for Jackson against Adams, and most of the state's representatives in congress were "Jackson democrats"; but the new governor was a partisan of Clay. On the appearance of the national whig party, soon after, with Clay as its leader, Kentucky became a whig state, and so remained until the overthrow of the party. The legislatures were whig; the governors were whig until 1851; and a majority of the representatives in congress were of the same party. In 1837-9 there was but one democratic representative out of thirteen; but usually the whig proportion was from one-third to one-half. The United States senators, during the same period, were all whigs; Senator Powell, chosen in 1859, being the first democratic senator chosen by Kentucky since 1828. In 1854 the whig organization, now taking the name of Americans, elected the governor, a majority of the legislature, and six of the ten congressmen. In 1856 the democrats for the first time carried the state in a presidential election, and the state's electoral votes were cast for Buchanan. In 1858 the legislature also became democratic. In 1860 the electoral votes of the state were cast for Bell. (See BORDER STATES, CONSTITUTIONAL UNION PARTY.)—At the outbreak of the rebellion in 1861 the sympathies of the state administration were with the south, and an extra session of the legislature was summoned by the governor, Jan. 18, for the purpose of calling a state convention. This the legislature refused to do, but appointed delegates instead to the "peace convention" at Washington. Another extra session of the legislature was called, April 28. It again refused to call a state convention, refused to grant the governor $3,000,000 to arm the state guard, and ordered that body to take the

oath of allegiance to the United States as well as to the state. June 30, representatives were chosen to the extra session of congress, eight being unionists and one secessionist, the total vote being 92,500 for the former and 37,700 for the latter. — At first the idea of "neutrality" between the federal and confederate governments was somewhat in vogue in Kentucky, and Governor Magoffin, by proclamation of May 20, 1861, even ordered both the federal and confederate authorities to abstain from any entrance upon the soil of the state. The legislature which met in September, 1861, put an end to this idea. By very large majorities it passed over the governor's veto a resolution demanding the unconditional withdrawal of confederate troops from Kentucky; another to transfer the command of the state troops to Gen. Robert Anderson, of the federal army; and another to request the resignation or expulsion of United States senators Breckinridge and Powell. From this time the position of the state was never ambiguous, and those citizens of the state who went into the confederate armies warred against their state as well as against their national government. Dec. 18, 1861, a mass "sovereignty" convention met at Russellville, and appointed a revolutionary state government which controlled some of the southern counties for a few months, but dissolved before the first advance of the federal armies. Dec. 10, 1861, the confederate states congress had passed an act admitting Kentucky, and the state was represented there by members chosen by the Kentucky regiments in the confederate service. In 1862 Bragg, in his great raid, drove the legislature out of Frankfort and inaugurated Richard Hawes as provisional governor, Oct. 4; but Hawes retired the next day with Bragg's retreating army. During the remainder of the war Kentucky was released from most of the distresses which were felt by the other border states which were the seat of war; but had to endure the minor hardships of guerilla warfare, military interferences with elections, the suspension of the writ of *habeas corpus*, and abolition of slavery. — Throughout and since the war the state has been steadily democratic, the opposition proportion of the popular vote being 30 per cent. in 1864, 26 per cent. in 1868, 46 per cent. in 1872, 37 per cent. in 1876, and 39 per cent. in 1880 During the same period the governors, congressmen, and most of the local officials have been democrats. In 1880 the republicans carried one of the ten congressional districts, the ninth, comprising the southeastern portion of the state; in three other districts the republicans secured between 40 and 50 per cent. of the total vote; in the remaining six the republican vote is of hardly any influence. In the legislature of 1880–81 the democrats had 112 of the 137 members of the state legislature. — The name of the state, originally *Kain-tuck-eé*, is said to mean "the dark and bloody ground," and to have been given because the territory was the scene of almost constant Indian warfare. The derivation is at least doubtful. — Among the political leaders of the state have been the following: William T. Barry, democratic representative 1810–11, United States senator 1815–16, and postmaster general under Jackson; James B. Beck, democratic representative 1867–75, and United States senator 1877–83; Joseph C. S. Blackburn, democratic representative 1875–83; Linn Boyd, democratic representative 1835–7 and 1839–55, and speaker of the house 1851–5; John C. Breckinridge (see his name); Benj. H. Bristow (see WHISKY RINGS, ADMINISTRATIONS, XXII.); John Young Brown, democratic representative 1873–7; William O. Butler (see his name); John G. Carlisle, democratic representative 1877–83; Henry Clay, J. J. Crittenden (see those names); Garret Davis, whig representative 1839–47, and United States senator 1861–72, James Guthrie, secretary of the treasury under Pierce, and democratic United States senator 1865–8; Joseph Holt, postmaster general and secretary of war under Buchanan, and judge advocate general under Lincoln; Richard M. Johnson (see his name); Amos Kendall, postmaster general under Jackson and Van Buren (see KITCHEN CABINET); J. Proctor Knott, democratic representative 1867–71 and 1875–83; Robert P. Letcher, representative (Clay republican and whig) 1823–35, governor 1840–44, and minister to Mexico 1849–52; Humphrey Marshall, representative (whig) 1840–52, (American) 1855–9, minister to China 1852–4, and brigadier general in the confederate service; George D. Prentice, editor of the Louisville "Journal" (whig) 1830–70; L. H. Rousseau, major general in the United States army, republican representative 1865–7, James Speed, attorney general under Lincoln and Johnson. — See 1 Poore's *Federal and State Constitutions;* Filson's *Discovery, Settlement and Present State of Kentucké* (1784), Mann Butler's *History of Kentucky* (to 1813); H. ALEXANDER JOHNSTON.

KENTUCKY AND VIRGINIA RESOLUTIONS (IN U. S. HISTORY), two series of resolutions adopted in 1798–9 by the legislatures of Kentucky and Virginia, for the purpose of defining the strict construction view, at that time, of the relative powers of the state and federal governments. (See DEMOCRATIC-REPUBLICAN PARTY, II.) — The underlying reason for the preparation of these resolutions was the feeling which had been growing since 1791, that the federal party, not satisfied with the powers given to the federal government by the constitution, was endeavoring to obtain further and greater powers by strained and illegitimate interpretations of the powers which had been granted (see

BANK CONTROVERSIES, II.; CONSTRUCTION); the immediate moving cause was the passage of the alien and sedition laws in 1798. (See ALIEN AND SEDITION LAWS.) Jefferson and Madison therefore prepared these two series of resolutions as a statement of the objections not only to these particular laws, but to broad construction in general. — Jefferson was unwilling to appear openly in the matter, either, as his enemies charge, because of the secretiveness and underhandedness which were natural to him, or, as his friends put it, because of his punctilious regard to the requirements of his position as vice-president. He therefore intrusted the resolutions which he had prepared to George Nicholas, of the Kentucky legislature, under a solemn assurance that "it should not be known from what quarter they came" Nicholas became the reputed father of the resolutions, and it was not until December, 1821, that his son obtained from Jefferson an acknowledgment of their real authorship. The resolutions were passed by the Kentucky house, Nov. 10, 1798, and by the senate Nov. 13, and were approved by the governor Nov. 19. The Virginia resolutions were prepared by Madison, who was then a member of the legislature, were introduced by John Taylor, of Caroline, were passed by the house Dec. 21, 1798, and were passed by the senate and approved by the governor, Dec. 24. The resolutions were transmitted by the governors of the two states to the governors of the other states, to be laid before their respective legislatures. The only responses, all warmly antagonistic to the resolutions, were made by Delaware, Feb. 1, 1799, by Rhode Island in February, by Massachusetts Feb. 9, by New York March 5, by Connecticut May 9, by New Hampshire June 14, by Vermont Oct. 30; that of Massachusetts is especially long and argumentative, and fully denies the competency of any state legislature "to judge of the acts and measures of the federal government." Nov. 14, 1799, the Kentucky legislature added another resolution to its series of 1798, thus forming the so-called Kentucky resolutions of 1799. In the Virginia legislature the unfavorable answers of the other states were referred to a committee, Madison being chairman, which made, Jan. 7, the celebrated "report of 1800," explaining and defending the resolutions of 1798. With this report the formal history of the resolutions ends. They were renewed, however, in substance, by other states in later years, as by Pennsylvania in 1809, and by Massachusetts in 1814, and, oddly enough, one of the first and most emphatic repudiations of these later offsprings of the Virginia resolutions came from the Virginia legislature. How far the later doctrines of nullification and secession are the legitimate outcome of the Kentucky and Virginia resolutions will be considered after the substance of these resolutions, and the exact language of the more important ones, have been given. — THE KENTUCKY RESOLUTIONS (of 1798) are nine in number, as follows: 1. "That the several states composing the United States of America are not united on the principle of unlimited submission to their general government; but that, by compact, under the style and title of a constitution for the United States, and of amendments thereto, they constituted a general government for special purposes, delegated to that government certain definite powers, reserving, each state to itself, the residuary mass of right to their own self-government; and that whensoever the general government assumes undelegated powers, its acts are unauthoritative, void, and of no force; that to this compact each state acceded as a state, and is an integral party; that this government, created by this compact, was not made the exclusive or final judge of the extent of the powers delegated to itself, since that would have made its discretion, and not the constitution, the measure of its powers; but that, as in all other cases of compact among parties having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress." 2. The second resolution denied the power of congress to pass laws for the punishment of any crimes except those mentioned in the constitution, and therefore declared the sedition law to be "void and of no force." 3. The third made the same declaration as to the same law on the ground of its abridgment of freedom of speech and of the press. 4. The fourth made the same declaration as to the alien law on the ground that no power over aliens had been given to the federal government by the constitution. 5. The fifth made the same declaration as to the same law on the ground that it infringed the right of the states to permit the migration of such persons as they should think proper to admit until the year 1808 6. The sixth made the same declaration as to the same law on the ground that it violated the amendments which secured "due process of law" and "public trial by an impartial jury" to accused persons, and also that it transferred the judicial power from the courts to the president. 7. The seventh complained of broad construction in general as "a fit and necessary subject for revisal and correction at a time of greater tranquillity, while those specified in the preceding resolutions call for immediate redress." 8. The eighth directed the transmission of the resolutions to the state's senators and representatives in congress for the purpose of securing a repeal of the obnoxious acts. 9. The ninth directed the transmission of the resolutions to the other states, with a warning that, "if the barriers of the constitution were thus swept from us all" by an acknowledgment of the power of congress to punish crimes not enumerated in the constitution, "no rampart now remains against the passions and the power of a majority of congress," nor any power to prevent congress, which had banished the aliens, from banishing, also, "the minority of the same body, the legislatures, judges, governors, and counselors of the states, nor their other peaceable inhabitants, who may be

obnoxious to the view of the president or be thought dangerous to his election or other interests, public or personal"; and it closed by asking that "the co-states, recurring to their natural rights not made federal, will concur in declaring these void and of no force, and will each unite with this commonwealth in requesting their repeal at the next session of congress." The additional Kentucky resolution of 1799, reiterated its definition of the constitution as "a compact," and declared "that the several states which formed that instrument, being sovereign and independent, have the unquestionable right to judge of the infraction; that a nullification, by those sovereignties, of all unauthorized acts, done under color of that instrument, is the rightful remedy; that, although this commonwealth, as a party to the federal compact, will bow to the laws of the Union, yet it does, at the same time, declare that it will not now or ever hereafter cease to oppose, in a constitutional manner, every attempt, at what quarter soever offered, to violate that compact; and finally, in order that no pretext or arguments may be drawn from a supposed acquiescence, on the part of this commonwealth, in the constitutionality of those laws, and be thereby used as precedents for similar future violations of the federal compact, this commonwealth does now enter against them its solemn protest."—THE VIRGINIA RESOLUTIONS were eight in number. 1. The first resolution expressed the determination of the legislature to defend the constitutions of the United States and of the state. 2. The second expressed its warm attachment to the Union. 3. "That this assembly doth explicitly and peremptorily declare that it views the powers of the federal government as resulting from the compact to which the states are parties, as limited by the plain sense and intention of the instrument constituting that compact, as no further valid than they are authorized by the grants enumerated in that compact; and that in case of a deliberate, palpable and dangerous exercise of other powers, not granted by the said compact, the states, which are parties thereto, have the right, and are in duty bound, to interpose, for arresting the progress of the evil, and for maintaining, within their respective limits, the authorities, rights and liberties appertaining to them." 4. The fourth expressed the deep regret of the assembly at the introduction of a broad construction of the constitution as inevitably tending to change the American republican system into "at best a mixed monarchy." 5. The fifth protested against the alien and sedition laws as unconstitutional. 6. The sixth called attention to the amendment protecting liberty of speech and of the press as having been originally proposed by Virginia. 7. The seventh expressed the affection of Virginia for the other states, and concluded as follows: that "the general assembly doth solemnly appeal to the like dispositions in the other states, in confidence that they will concur with this commonwealth in declaring, as it does hereby declare, that the acts aforesaid are unconstitutional; and that the necessary and proper measures will be taken by each for cooperating with this state, in maintaining unimpaired the authorities, rights and liberties reserved to the states respectively, or to the people." 8. The eighth requested the governor to transmit the resolutions to the governors of the other states, to be laid before their legislatures, and to the Virginia senators and representatives in congress.—Hardly any problem in American political history offers so many difficulties as the effort to get at a fair estimate of these two series of resolutions. The evil and the good are so complicated that disentanglement sometimes seems hopeless. On the one hand, the general spirit of the resolutions, their insistence upon the absolute *illegality* of anything but a strict construction of the constitution, has always been a fundamental feature of the party founded by Jefferson and Madison. Its doubtful utility is elsewhere considered; but, whether necessary or unnecessary, the doctrine is legitimate, and is one of the factors which have made up American political history to the present time. (See DEMOCRATIC-REPUBLICAN PARTY, II., VI.; CONSTRUCTION.) On the other hand, the illegitimate doctrine that the American Union is a "compact" between separate and sovereign states is so clearly, even "peremptorily," laid down in both series of resolutions that it can not be mistaken or evaded. The historical truth of this doctrine is elsewhere considered (see NATION, STATE SOVEREIGNTY); it remains here only to consider the difference between the state sovereignty of Jefferson and Madison, and that of the nullificationists and secessionists of later times. It is difficult to follow, at the best, and is still more obscured by the course of Benton and other later Jeffersonians in flatly denying that the sovereignty of states, *proprio vigore*, is asserted in the resolutions. By so doing, they made an issue on which Calhoun and Calhoun's disciples found no difficulty in overthrowing them. It does not seem to have occurred to them that the issue might perhaps have been fairly confessed and avoided.—Before considering the question whether the term "nullification," as used by Jefferson in the Kentucky resolution of 1799, was identical with the same word as used by Calhoun, it is well to notice how carefully both the Kentucky and the Virginia resolutions avoid any suggestion of action by a single state. They certainly maintain the doctrine that "each state acceded to the Union as a state, and is an integral party" to the "compact under the style and title of a constitution for the United States"; and from this doctrine the Calhoun programme derives its justification. But, in the application of the doctrine by Jefferson and Madison, it is always "those sovereignties" which are to undo unconstitutional laws—"the states," not "a state"; and practically the Jeffersonian doctrine seems to have been that there were but two parties to the "compact," the

states of the one part, and the federal government of the other, and that the former in national convention were to be frequently assembled to decide on the constitutionality of the latter's acts. Webster, long afterward, ridiculed unsparingly the idea that the states could form a compact with another party which was only created by the compact, and non-existent before it; and Calhoun's theory that the "compact" was between the states themselves, and that the federal government was the result of it and not a party to it, seems more logical than Jefferson's. Logicial or illogical, however, Jefferson's theory was infinitely less destructive than Calhoun's; was strictly in line of constitutional practice; and is perfectly in accord with the constitution's provisions for its own amendment. The state sovereignty preamble in the first Kentucky resolution, and third Virginia resolution, is not essential, and is, in fact, only a hindrance, to the spirit of the resolutions, which is simply that desire for a national convention of the states which has since been the first thought of all Jefferson's disciples in times of difficulty or danger. This Jeffersonian idea of the ultimate interpreter of doubtful constitutional questions can not be more strongly put than in Jefferson's own words, in his letter of June 12, 1823, to Justice Johnson: "The ultimate arbiter is the people of the Union, assembled by their deputies in convention, at the call of congress, or of two-thirds of the states. Let them decide to which they mean to give an authority claimed by two of their organs."— Though state sovereignty was by no means essential as a basis for the resolutions, it was the shortest and easiest way to justify them. It is therefore important to notice that in the hands of Jefferson and Madison state sovereignty, separate or collective, was to be a shield for the protection of the individual; in the hands of Calhoun it was to be a shield for a section and for slavery. The distinction is not trivial; it is vital, as can be seen most easily from its necessary results. It is difficult to conceive of an act involving individual rights, which an American congress could be induced to pass, so arbitrary and tyrannical as to lead a state, or even a group of states, beyond declamation and resolutions, and into open conflict with the federal government. Even the development of so-called "sections" would hardly have been likely to make even state sovereignty anything more than a check, and a very weak one, upon the federal government, so long as the country was reasonably homogeneous and each state had separate interests. But the development of slavery as a distinctive badge of a particular section made state sovereignty, for that section, really *sectional* sovereignty, since all its states were controlled by a common design. While each state tended to its own particular direction, the total force exerted was fairly balanced and comparatively harmless; when the force of a group of states became bound together by slavery, state sovereignty became an imminent peril to union. The Jackson and Benton school of democrats seem to have had this distinction in mind when they so warmly denied that which seems so difficult to deny, the identity of Jefferson's and Calhoun's state sovereignty. It is apparent, however, that the distinction is one of purpose, not of substance. (See SLAVERY, STATE SOVEREIGNTY.) — It has been stated that the great object of state opposition to federal enactments, in the minds of Jefferson and Madison, was to secure the meeting of a national convention of all the states, in which, as the highest exponent of national authority, the federal enactment would be valid unless declared void, or "nullified," by an amendment which when ratified by three-fourths of the states, should bind not only congress and the executive, but the judiciary as well. Such a convention has been a desideratum with Jefferson's party at intervals since 1787, and, as it is provided for in the constitution, it would be a perfectly legitimate mode of procedure; but the difficulty of uniting the necessary proportion (two-thirds) of the states in the demand for it has as yet proved insuperable. This seems undoubtedly to have been the "nullification" intended by the Virginia resolutions, 1, from the debates upon them in the Virginia assembly which passed them, and 2, from the remarks of the "report of 1800" upon the third Virginia resolution. Jefferson, not being the avowed author of the Kentucky resolutions, has left no defense or explanation of them, but a line of citations is given among the authorities at the end of this article, illustrative of his adherence to the general position that "the states" (in national convention) were the final interpreters of the constitution. The objection to this statement of the main object of the resolutions is that, as such a convention is provided for in the constitution, its defense by a state legislature was a work of supererogation. In this respect it is well to compare the proceedings of the British parliament in 1792–3, which the reader will find well stated by Yonge, as cited below: that body had passed an alien bill, a sedition bill (suspending the *habeas corpus* act), and a bill authorizing magistrates to disperse by force any public meeting to petition the king or parliament, or to discuss grievances, if the object or the language should to the magistrates seem dangerous. The American congress had followed the first two steps of the British precedent (excepting the *habeas corpus* suspension): to follow it out in full nothing was needed but a temporary forgetfulness of the difference between the unlimited power of parliament and the limited power of congress. To Madison and Jefferson the common federalist claim that the federal government was the "final" judge of its own powers seemed to be a paving of the way for some such politic forgetfulness, and for a possibly indirect prohibition of any new national convention: hence the resolutions. Their descendants have found that the small percentage of the voting population, which can, by a change of

vote, overturn the dominant party in congress, is a better guarantee against congressional usurpation than all the resolutions of our history: Madison and Jefferson, with only ten years experience behind them, may fairly be held excusable for seeing no refuge from congress but the state legislatures. — It can not, however, be doubted that Jefferson and his school would have looked upon forcible resistance by a single state to an oppressive federal law with far less disapproval than their opponents would have done (see NATION, I.), though it is just as certain that they would have looked upon such resistance as a revolutionary right. It was so stated in 1829–30 by Edward Livingston, the devoted adherent of Jefferson in 1798 and of Jackson in 1833 (see NULLIFICATION), as cited below. In a constitutional point of view, this fundamental difference between the right of "the states" in national convention, and of a single state, *proprio vigore*, to "nullify" acts of congress, and to interpret the constitution, above and beyond the federal judiciary, is the essential difference between the "nullification" of Jefferson and that of Calhoun. The strongest evidence to the contrary is a sentence in Jefferson's original draft of the Kentucky resolutions. It is as follows: "that every state has a natural right, in cases not within the compact, to nullify of their own authority all assumptions of power by others within their limits." This was struck out in the final copy of the resolutions, but by whom is not known. Various explanations of this sentence have been offered, the most plausible being that the inexcusable sentence was due only to heat of composition, and was struck out by Jefferson on his realizing the full force of what he had written. On the one hand, this sentence has arrayed against it a great mass of contemporary testimony; on the other, if it is to stand as Jefferson's perfected theory, every atom of Calhoun's theory finds in it a perfect antetype. — It is also fair and proper, in this connection, to call the reader's special attention to a letter of Dec. 24, 1825, from Jefferson to Madison, which has never hitherto received the prominence which it deserves. It is on the subject of internal improvements. He regards opposition to the new system as "desperate," but proposes a new series of resolutions, to be passed by the Virginia legislature, as a protest against it. They are much like the resolutions of 1798, but conclude by demanding an amend ment to the constitution, to grant the doubtful power (see INTERNAL IMPROVEMENTS), and by promising for the state and imposing upon the citizens of the state an acquiescence in the acts which we have declared to be usurpations" "*until the legislature shall otherwise and ultimately decide.*" — The above has been given, so far as possible, with a due regard to the standpoint and feelings of the republicans of 1798. There remains now to be considered the opening assertion of both series of resolutions, that the American Union is a "compact" between the several states. No one, not the most unreasoning admirer of Jefferson or Madison, can now defend this assertion, which is the great political error of the resolutions. (For its further consideration see STATE SOVEREIGNTY.) Even if it were true, the doctrine of nullification would not necessarily or properly flow from it; but the doctrine of secession is too plainly based upon it to make it an easy or profitable task to attempt to separate the two. (See NULLIFICATION, SECESSION.) It is not meant that Jefferson and Madison were secessionists: the following considerations may perhaps make the meaning more clear: 1. The idea that the Union is a compact is not at all essential to either series of resolutions; but it is the sum and substance of secession. Its elimination could have had no effect upon the former, but would have made the latter an impossibility, except as a confessed revolution. 2. The date of the resolutions was less than ten years after the inauguration of the new form of government, and at a time when the idea of a "compact" was common in political language, in judicial decisions, and elsewhere. The term was a political weapon ready for use by all political leaders of all sections, and was used without any great consideration of its full results. There is infinitely more excuse for such an error in the infancy of the nation than in 1860. 3. The belief in a real "compact" was rapidly and easily eliminated in the due course of nature during the following sixty years, as its utter uselessness became apparent, except in a single section, where the interests of slavery demanded its retention and extension to its complete logical results. Even where the word was used in other sections of the Union, it was used rather as a venerable formula, signifying a particularist feeling, than with any full sense of a meaning; and its users were as much shocked in 1860 as its earlier users would have been, when its complete consequences were forced upon them. (See NATION.) — As a summary, it may be said that the resolutions of both series are a protest against a supposed intention of the federalists to place some restrictions upon any attempt of state legislatures to demand a national convention to sit in judgment upon the acts of the federal government; that the belief in such an intention was fostered by the federalists' use of the then novel word "sovereign," as applied to the federal government, and by their constant assertions that the federal government was the "final" judge of the extent of its own powers, thus seeming to exclude any such power in a new national convention; that both Jefferson and Madison intended, 1, to appeal to public opinion, and 2, to rouse the states for a prompt call for a national convention upon the first appearance of an attempt by congress and the president to make such legislative action penal under a new sedition law; that the word "compact" in the resolutions, though unessential, is historically false and indefensible, if used in its full sense; that, as regards Madison, it is quite clear that the word was not used in its full sense; and that, as

regards Jefferson, the case is much more doubtful, but may fairly be summed up in the terms of his proposed resolutions of 1825, before referred to—a theoretical acceptance of the idea of a compact in its full sense, coupled with an intense aversion to its practical enforcement.—See 5 Hildreth's *United States*, 272; 1 von Holst's *United States*, 144; 2 Spencer's *United States*, 444; 1 Schouler's *United States*, 423, 424 (note); 4 Elliot's *Debates*, 528 (Va. Res.), 532 (answers of other states), 540 (Ky. ALEXANDER JOHNSTON

KITCHEN CABINET (IN U. S. HISTORY), a coterie of intimate friends of President Jackson, who were popularly supposed to have more influence over his action than his official advisers. General Duff Green was a St. Louis editor, who in 1828 came to Washington and established the "United States Telegraph," which became the confidential organ of the administration in 1829. Major Wm. B. Lewis, of Nashville, had long been Jackson's warm personal friend, and after his inauguration remained with him in Washington, as second auditor of the treasury. Isaac Hill (see NEW HAMPSHIRE), editor of the "New Hampshire Patriot," was second comptroller of the treasury. Amos Kendall, formerly editor of the Georgetown "Argus," in Kentucky, was fourth auditor of the treasury, and became postmaster general in 1835. Others, besides these, were sometimes included under the name of "the kitchen cabinet," but these four were most generally recognized as its members.—In 1830–31 Green took the side of Calhoun against Jackson, and his newspaper was superseded as the administration organ by the "Globe," Francis P. Blair and John C. Rives being its editors. Blair thereafter took Green's place in the unofficial cabinet.—The name of "kitchen cabinet" was also used in regard to certain less known advisers of Presidents John Tyler and Andrew Johnson, but, as commonly used, refers to the administration of Jackson. The best and most easily available description of Jackson's "kitchen cabinet" is in 3 Parton's *Life of Jackson*, 178. A. J.

KING. The primary signification of this word is, a person in whom is vested the higher executive functions in a sovereign state, together with a share, more or less limited, of the sovereign power. The state may consist of a vast assemblage of persons, like the French or the Spanish nation, or the British people in which several nations are included; or it may be small, like the Danes, or like one of the Saxon states in England before the kingdoms were united into one; yet if the chief executive functions are vested in some one person who has also a share in the sovereign power, the idea represented by the word *king* seems to be complete. It is even used for those chiefs of savage tribes who are a *state* only in a certain loose sense of the term.—It is immaterial whether the power of such a person is limited only by his own will, or whether his power be limited by certain immemorial usages and written laws, or in any other way; still such a person is a king. Nor does it signify whether he succeed to the kingly power by descent and inheritance on the death of his predecessor, just as the eldest son of a British peer succeeds to his father's rank and title on the death of the parent, or is elected to fill the office by some council or limited body of persons, or by the suffrages of the whole nation. Thus there was a king of Poland, who was an elected king; there is a king of England, who now succeeds by hereditary right.—In countries where the kingly office is hereditary, some form has always been observed on the accession of a new king, in which there was a recognition on the part of the people of his title, a claim from them that he should pledge himself to the performance of certain duties, and generally a religious ceremony performed, in which anointing him with oil and placing a crown upon his head were conspicuous acts. By this last act is symbolized his supremacy; and by the anointing a certain sacredness is thrown around his person. These kinds of ceremonies exist in most countries in which the sovereign, or the person sharing in the sovereign power, is known as king; and these ceremonies seem to make a distinction between the succession of an hereditary king to his throne and the succession of an hereditary peer to his rank.—The distinction between a king and an emperor is not one of power, but it has an historical meaning. *Emperor* comes from *imperator*, a title used by the sovereigns of the Roman empire. When that empire became divided, the sovereigns of the west and of the east respectively called themselves emperors. The emperor of Germany was regarded as a kind of successor to the emperors of the west, and the emperor of Russia (who is often called the czar) is, with less pretension to the honor, sometimes spoken of as the successor to the emperor of the east. But we speak of the emperor of China, where emperor is clearly nothing more than king, and we use emperor rather than king only out of regard to the vast extent of his dominions. Napoleon usurped the title of emperor; and we now sometimes speak of the British empire, an expression which is free from objection. The word *imperium* (empire) was used both under

the Roman emperors, and under the later republic to express the whole Roman dominion. — The word *king* is of pure Teutonic origin, and is found slightly varied in its literal elements in most of the languages which have sprung from the Teutonic. The French, the Italian, the Spanish and the Portuguese continue the use of the Latin word *rex*, only slightly varying the orthography according to the analogies of each particular language. *King*, traced to its origin, seems to denote one to whom superior knowledge had given superior power, allied, as it seems to be, to *know, con, can;* but on the etymology, or, what is the same thing, the remote origin of the word, different opinions have been held, and the question may still be considered undetermined. — There are other words employed to designate the sovereign, or the person who is invested with the chief power of particular states, in using which we adopt the word which the people of those states use, instead of the word *king*. Thus, there is the *shah* of Persia, the grand *sultan*. and formerly there was the *dey* of Algiers. In the United States of America certain powers are given by the federal constitution to one person, who is elected to enjoy them for four years, with the title of *president*. A *regent* is a person appointed by competent authority to exercise the kingly office during the minority or the mental incapacity of the real king; this definition, at least, is true of a regent of the British empire. — A personage in whom such extraordinary powers have been vested must of necessity have had very much to do with the progress and welfare of particular nations, and with the progress of human society at large. When held by a person of a tyrannical turn, they might be made use of to repress all that was great and generous in the masses who were governed, and to introduce among them all the miseries of slavery. Possessed by a person of an ambitious spirit, they might introduce unnecessary quarreling among nations to open the way for conquest, so that whole nations might suffer for the gratification of the personal ambition of one. The lover of peace and truth, and human improvement and security, may have found in the possession of kingly power the means of benefiting a people to an extent that might satisfy the most benevolent heart. But the long experience of mankind has proved that for the king himself and for his people it is best that there should be strong checks in the frame of society on the will of kings, in the forms of courts of justice, councils, parliaments, and other bodies or single persons whose concurrence must be obtained before anything is undertaken in which the interests of the community are extensively involved. In constitutional kingdoms, as in England, there are controlling powers, and even in countries in which the executive and legislative power are nominally in some one person absolutely, the acts of that person are virtually controlled by the opinion of the people, a power constantly increasing as the facilities of communication and the knowledge of a people advance. — Nothing can be more various than the constitutional checks in different states on the kingly power, or as it is more usually called in England, the royal *prerogative*. Such a subject must be passed over in an article of confined limits such as this must be, else in speaking of the kingly dignity it might have been proper to exhibit how diversely power is distributed in different states, each having at its head a king. But the subject must not be dismissed without a few observations on the kingly office (now by hereditary descent discharged by a queen) as it exists in the British empire. — The English kingly power is traced to the establishment of Egbert, at the close of the eighth century, as king of the English. His family is illustrated by the talents and virtues of Alfred, and the peacefulness and piety of Edward. On his death there ensued a struggle for the succession between the representative of the Danish kings, who for awhile had usurped upon the posterity of Egbert, and William then duke of Normandy. It ended with the success of William at the battle of Hastings, A. D. 1066. — This is generally regarded as a new beginning of the race of English kings, for William was but remotely allied to the Saxon kings. In his descendants the kingly office has ever since continued; but though the English throne is hereditary, it is not hereditary in a sense perfectly absolute, nor does it seem to have been ever so considered. When Henry I. was dead, leaving only a daughter, named Maud, she did not succeed to the throne; and when Stephen died, his son did not succeed, but the crown passed to the son of Maud. Again, on the death of Richard I. a younger brother succeeded, to the exclusion of the son and daughter of the deceased. Then ensued a long series of regular and undisputed successions; but when Richard II. was deposed, the crown passed to his cousin, Henry of Lancaster, son of John of Gaunt, son of Edward III., though there were descendants living of Lionel, duke of Clarence, who was older than John among the children of Edward III. When the rule of Henry VI. became weak, the issue of Lionel advanced their claim. The struggle was long and bloody. It ended in a kind of compromise, the chief of the Lancastrian party taking to wife the heiress of the Yorkists. From that marriage have sprung all the later kings, and the principle of hereditary succession remained undisturbed till the reign of King William III., who was called to the throne on the abdication of James II., when an act was passed excluding the male issue of James, the issue of his sister the duchess of Orleans, and the issue of his aunt the queen of Bohemia, with the exception of her youngest daughter the Princess Sophia and her issue, who were Protestants. On the death of Queen Anne this law of succession took effect in favor of King George I., son of the Princess Sophia. — Now the heir succeeds to the throne immediately on the decease of his predecessor, so that the king, as the phrase is, never dies. The

course of descent is to the sons and their issue, according to seniority; and if there is a failure of male issue, the crown descends to a female. The person who succeeds by descent to the crown of England, succeeds also to the kingly office in Scotland and Ireland, and in all the possessions of the British empire. — At the coronation of the king he makes oath to three things: that he will govern according to law; that he will cause justice to be administered; and that he will maintain the Protestant church. — His person is sacred. He can not by any process of law be called to account for any of his acts. His concurrence is necessary to every legislative enactment. He sends embassies, makes treaties, and even enters into wars without any previous consultation with parliament. He nominates the judges and other high officers of state, the officers of the army and navy, the governors of colonies and dependencies, and the bishops, deans and some other dignitaries of the church. He calls parliament together, and can at his pleasure prorogue or dissolve it. He is the fountain of honor; all hereditary titles are derived from his grant. He can also grant privileges of an inferior kind, such as markets and fairs. — This is a very slight sketch of the powers that belong to the kings of England; but the exercise of any or all of these powers is practically limited. The king can not act politically without an agent, and this agent is not protected by that irresponsibility which belongs to the king himself, but may be brought to account for his acts if he transgresses the law. The agents by whom the king acts are his ministers, whom the king selects and dismisses at his pleasure; but practically he can not keep a ministry which can not command a majority in the house of commons; and virtually, all the powers of the crown, which make so formidable an array upon paper, are exercised by the chief minister, or prime minister, for the time. The king now does not even attend the cabinet councils; and the power which in theory belongs to his kingly office, and in fact in earlier periods was exercised by him, is now become purely formal. But though the king of England has lost his real power, he has obtained in place of it perfect security for his person, and for the transmission to his descendants of all the honor and respect due to the head of an extensive and powerful empire. BOHN.

KING, Rufus, was born at Scarborough, Mass. (now in Maine), March 24, 1755, and died at Jamaica, N. Y., April 29, 1827. He was graduated at Harvard in 1777, was a Massachusetts delegate to the continental congress 1784–6, and removed to New York in 1788. He was United States senator (federalist) 1789–96, and minister to Great Britain 1796–1803. His support of the war of 1812 made him United States senator 1813–25, and he was again appointed minister to Great Britain 1825–6. From 1800 until 1812 he was the regular federalist candidate for vice-president. (See FEDERAL PARTY, II.)

KING, William Rufus, vice-president of the United States in 1853, was born in Sampson county, N. C., April 7, 1786, and died at Cahawba, Ala., April 18, 1853. He was graduated at the university of North Carolina in 1803, studied law, was a democratic member of congress from Alabama 1811–16, United States senator 1819–44, minister to France 1844–6, and United States senator 1846–53. In 1852 he was elected vice-president (see DEMOCRATIC-REPUBLICAN PARTY, V.), and died soon after taking the oath of office.

KNIGHTS OF THE ORDER OF ST. CRISPIN. The workmen employed in the manufacture of boots and shoes numbered more than a hundred thousand when Newell Daniels, of Milwaukee, Wisconsin, projected the organization of a trades union, designed, among other things, to secure good wages, and to prevent the increase of the number of workmen beyond the needs of the community. The first lodge of this order was organized in Milwaukee, March 1, 1867, and was composed of English-speaking members exclusively. Another lodge, composed of Germans, was immediately organized in the same city. After this, the order spread with great rapidity over the United States and Canada. In 1869 it numbered 83,000 members. It consisted, 1, of the international grand lodge, which perfected its organization in 1868 at Rochester, New York; 2, of state (or province) grand lodges, of which as many as eighteen were formed; and 3, of subordinate lodges, which were formed in almost every city or town in which boots and shoes were made to any considerable extent. Grand lodges were established in Maine, New Hampshire, Massachusetts, New York, New Jersey, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Wisconsin, Missouri, Maryland, Kentucky, California and Louisiana, and in Ontario and New Brunswick. In 1870 the grand lodge of Massachusetts was incorporated by the legislature; and in the case of Snow *vs.* Wheeler (113 Mass Rep., 179), the supreme judicial court of that state decided that a lodge could maintain a suit in equity for its funds against persons having such funds in their possession; although it had decided, in the case of Walker *vs* Cronin (107 Mass Rep., 159), that an action could be maintained for damages sustained by an employer by reason of a combination to prevent men from continuing in his employ. This order was not long in existence. Conflicts of jurisdiction arose between the international lodge and the grand lodges, and, in addition to the difficulties incident to trades unions in general, special difficulties arose from the diversity of the elements that composed this order, and from the greatness of the number of its members. The last meeting of the international lodge was held in Cleveland, Ohio, in 1873, soon after which the order became extinct. It was partially revived in 1876, and participated in the strikes of 1877 and 1878; but by the close of 1878 it had passed out of existence. The Daughters of St. Crispin were

a female branch of the order, which flourished in the eastern, middle and western states in 1870 and 1871, but soon collapsed. Unlike many other trades unions, this order sought for the improvement of that great mass of laborers who are below themselves. Having the ten-hour system among themselves, by custom, without the aid of law, they nevertheless gave a zealous support to the agitation for a ten-hour law for cotton and woolen manufactories; and it was largely through their action that the Massachusetts legislature was induced to enact the ten-hour law of 1874.

C. C.

KNOW-NOTHING PARTY. (See AMERICAN PARTY.)

KU-KLUX KLAN (IN U. S. HISTORY), a secret, oath-bound organization, otherwise known as "The Invisible Empire," "The White League," "The Knights of the White Camellia," or by other names, formed in the southern states during the reconstruction period, for the primary purpose of preventing the negroes, by intimidation, from voting, or holding office. Until the abolition of slavery necessity compelled a rigid policing of the black population by official or volunteer guards. (See SLAVERY.) The origin of the "ku-klux" order was in all probability a revival of the old slave police, at first sporadic, to counteract the organization of "loyal leagues," or "Lincoln brotherhoods," among the negroes, and afterward epidemic, as the process of reconstruction by congress began to take clear form. — The various moving causes which led to the reconstruction of southern state governments by congress are elsewhere given. (See RECONSTRUCTION.) When the preparations for reconstruction had gone far enough to make it reasonably certain that negro suffrage was to be the law in the south, the opposition, hopeless of open revolt, took the shape of this secret society. Attempts have been made to date its origin back to 1866, under the rule of Governor Brownlow in Tennessee; but the most probable date is early in 1867. The constitution mentioned below dates the first election of the order in May, 1867. The place of its origin is entirely unknown, and it was probably at first a congeries of associations in different states, originated without concert and from a common motive, and finally growing together and forming one combined organization in 1867. No authentic account of its origin, founder or date has come to light. — A "prescript," or constitution, of the order, discovered in 1871, shows an attempt to imitate the machinery of masonic and other similar societies. The name of the order is not given; its place is always filled by stars (* * *). A local lodge is called a "den"; its master the "cyclops," and its members "ghouls." The county is a "province," and is controlled by a "grand giant" and four "goblins." The congressional district is a "dominion," controlled by a "grand titan" and six "furies." The state is a "realm," controlled by a "grand dragon" and eight "hydras." The whole "empire" is controlled by a "grand wizard" and ten "genii." The banner of the society was "in the form of an isosceles triangle, five feet long and three feet wide at the staff; the material yellow with a red scalloped border about three inches in width; painted upon it, in black, a *Draco volans*, or flying dragon, with the motto *Quod semper, quod ubique, quod ab omnibus.*" The origin, designs, mysteries and ritual were never to be written, but were to be communicated orally. The dress of the members, when in regalia, is not given, but is known to have been mainly a hood covering the head, with holes for the eyes and mouth, and descending low upon the breast; fantastic or horrible figures according to the owner's ingenuity; in other respects the ordinary dress. — A more effective plan could hardly have been devised with which to attack a race which was superstitious, emotional, and emasculated by centuries of slavery. Before it had been tried very long the cry of "ku-klux" was sufficient to break up almost any negro meeting at night; the suspicion that disguised horsemen were abroad at night was sufficient to keep every negro in his own cabin; and the more virile and courageous of their number, who had become marked as leaders, were left to whipping, maiming or murder at the hands of the "ghouls" without any assistance from their cowering associates. By day the negroes would fight, and often did so; by night the "ku-klux" had the field to themselves. — So long as the attacks of the order were confined to the negroes there was little need of any means more violent than whipping. A more difficult problem was that of the "carpet-baggers" and "scalawags," who with the negroes made up the republican party in the south. The "carpet-baggers" were northern men, whose interests in the south were supposed to be limited to the contents of their carpet-bags; the "scalawags" were southerners who, either from conviction or from interest, had joined the republican party and taken part in reconstruction. Neither of these classes was easily to be terrorized, and in their cases the order very easily drifted into murder, secret or open. Before the end of its third year of existence the control of the order had slipped from the hands of the influential men who had at first been willing, through it, to suppress what seemed to be the dangerous probabilities of negro suffrage, and had been seized by the more violent classes who used its machinery for the gratification of private malice, or for sheer love of murder. Even before the appointment of the final congressional investigating committee in 1871, the order had "departed from its political work, and gone into murder for hire and robbery." It had thus become dangerous to the very men who had at first tacitly or openly sanctioned its existence, and open attempts to suppress it were only checked by a fear of being classed among the "scalawags."— Throughout the winter of 1870–71 the ku-klux

difficulties in the south were debated in congress, and a joint investigating committee was appointed by the two houses, March 21. Two days afterward a message from President Grant informed congress that the condition of affairs in the south made life and property insecure and interfered with the carrying of the mails and the collection of the revenue; and asked that congress would enact measures to suppress the disorders. The result was the passage of the so-called "force bill," April 20, 1871. Its provisions were as follows: 1, it gave federal courts cognizance of suits against any one who should deprive another of any rights, privileges or immunities secured by the constitution, "any law, regulation, custom or usage of a state to the contrary notwithstanding"; 2, it denounced punishment by fine, imprisonment, or both, against any conspiracy of two or more persons to overthrow, put down, destroy, or levy war against the government of the United States, to delay the execution of federal laws, or to deter any one from voting, holding office, or acting as a witness or juror in a federal court; 3, in case the state authorities were unable or unwilling to suppress disorders intended to deprive any class or portion of the people of their constitutional rights, it authorized the president to employ the federal land and naval forces or militia to suppress the disorders, and 4, to suspend the privilege of the writ of *habeas corpus* "during the continuance of such rebellion against the United States," the trial provision of the act of March 3, 1863, to remain in force (see HABEAS CORPUS); 5, it authorized federal judges to exclude from juries persons whom they should judge to be in complicity with such conspiracy; 6, it gave a civil remedy to injured parties against persons who, having knowledge of conspiracy and power to prevent injuries being done, should neglect or refuse to do so; and 7, it confirmed former civil rights legislation. The *habeas corpus* section was to remain in force only until the end of the next regular session. — Oct. 12, 1871, President Grant issued a preliminary proclamation calling on members of illegal associations in nine counties of South Carolina to disperse and surrender their arms and disguises within five days. Five days afterward another proclamation issued, suspending the privileges of the writ of *habeas corpus* in the counties named. Arrests, to the number of 200, were at once made, and the more prominent persons implicated were prosecuted to conviction. In other parts of the south the organization was rapidly run to death, the most effectual provision being that which gave federal judges power to exclude suspected persons from juries. It is probable that the order was completely overthrown before the end of January, 1872. — The generic name of "ku-klux troubles," however, was still applied to the political and race conflicts which still continued in the south. The name was made more odious by the report of the joint congressional investigating committee, Feb. 19, 1872, in thirteen volumes, covering about 7,000 printed pages of testimony, which had been taken during the previous year. It only lacks such a collation and comparison of evidence as that of the English chief justice in the Tichborne case to make it one of the most valuable sources of information as to the social condition of the south during the reconstruction period. The reports of the majority and minority of the committee do not supply the need, for both are rather partisan than judicial. The majority (republican) report considered the issue between anarchy and law in the southern states fairly made up; the minority (democratic) report, while it did not deny that "bodies of armed men have, in several of the states of the south, been guilty of the most flagrant crimes," held that the perpetrators had no political significance, nor any support by the body of the people. The latter report seems to have been the more nearly correct at the time it was made, but only because the order itself had already become dangerous to both friends and foes. A line of citations from the volumes of the report is given below, from which the reader may learn the general features and purposes of the order. — At the following session of congress, May 17, 1872, a bill to extend the *habeas corpus* section of the "ku-klux" act for another session was taken up in the senate and passed. May 28, an attempt to suspend the rules in the house, so as to consider the bill, was lost, two-thirds not voting for it; and the bill was not further considered by the house. — The attempt to check negro suffrage in the south by the irresponsible action of disguised men, was practically abandoned after 1871. From that time such attempts were confined to open action, the presence of organized parties of whites at negro meetings, and the employment of every engine of the law by an active, determined and intelligent race. The results were the overthrow of the reconstructed state government in every southern state before 1878 (see INSURRECTION, II.; and the names of the states, particularly MISSISSIPPI and SOUTH CAROLINA), and the formation of the so-called "solid south" (See DEMOCRATIC-REPUBLICAN PARTY, VI.) The indications, however, are very strong in 1882 that the "color line" in the south, if not already broken, will soon be broken, and that the white vote of the south will soon be divided into opposing parties, each determined on maintaining unimpaired the rights of its share of the colored vote. (See RECONSTRUCTION.) — See *Report of the Joint Select Committee on the Condition of Affairs in the Late Insurrectionary States*, Report No. 22, part 1, 42d Congress, 2d Session, Feb. 19, 1872, as follows: 1:1, report of the majority (republican); 1:101, of the subcommittee on election laws; 1:289, of the minority (democratic); 1:589, journal of the committee; 13:35, constitution of the order; 8:452, probable origin; 2:208, 232, 11:274, 12:778, 1159 (cut), disguises; 4:653, oaths; 11:385, definition of "scalawag"; 7:764, definition of "carpet-bagger"; the most useful testimony to the reader is that of James L. Orr, South Carolina (3:1), D C. Forsyth,

J. B. Gordon, and Carleton B. Cole, Georgia (6:19, 354, and 7:1182), Peter M. Dox, Lionel W. Day, and Wm. S. Mudd, Alabama (8:428, 590, and 10:1745), John A. Orr and G. W. Wells, Mississippi (12: 697, 1147), and N. B. Forrest, Tennessee (13:3); *Ku-Klux Trials* (1871); the act of April 20, 1871, and proclamations of Oct. 12 and 17, are in 17 *Stat. at Large*, 13, App. iii. (Nos. 3, 4).

ALEXANDER JOHNSTON.

L

LABOR is the voluntary exertion of human beings put forth to attain some desired object. We say *human beings*, for the toil of beasts is but the agency of an instrument, reckoned a part of capital. We say *voluntary* exertion, for the involuntary work of slaves is, in the view of political economy, like the toil of oxen, the mere use of a thing owned as a part of one's capital. We say, also, for a *desired object*, for this distinguishes labor from *play*. In play we are satisfied with the mere exercise of our faculties. The exertion is at once means and end. In labor we seek a further end—a result which comes as an abiding reward for the effort. (Wayland.) Labor is either bodily or mental, involving exertion either of the muscular or nervous system. The line of demarcation between these two kinds of labor is not always perfectly distinct. There is probably no purely muscular labor, *i. e.*, labor involving absolutely no nervous exertion; nor, on the other hand, any purely nervous labor, unmixed with muscular effort. — 1. *Labor as a Factor of Production.* Labor is one of the essential elements of production. Nature offers to man a vast variety of objects which by their constitution are adapted to satisfy his wants. But labor is necessary to make them available. Even in the case of those things which in their natural state are suited to the supply of human wants, such as water, fruits, wild honey, etc., etc., some exertion is necessary, even if it be nothing more than appropriation, in order to make them of any use; while in the vast majority of cases very much labor is needed in finding, transforming and transporting natural objects before they can be made serviceable. Now what is the office of labor in production? A moment's thought will convince one that labor does not produce, *i. e.*, does not create, matter. That is beyond human power. It may change matter from one mode of manifestation into another, it may change the shape of matter, it may change the place of matter; but it can neither increase nor diminish (*i. e.*, neither produce nor destroy) the existing quantity of matter. Bacon says that man can do nothing else than move natural objects to or from one another; while nature, working within, accomplishes the rest. "Labor," says Mill, "in the physical world is always and solely occupied with putting objects in motion: the properties of matter, the laws of nature, do the rest." The consideration of what actually occurs in any process of production will make this point clear. We say that a baker produces bread. In what does his work consist? He brings together in one vessel the various ingredients of his wished-for product, forces them into closer contact by stirring and kneading, puts the dough into an oven which he has heated by exciting the process of combustion near it. This last he has accomplished by bringing into juxtaposition certain natural elements which act upon each other so as to produce heat. If we examine any other case of what is called the action of man upon nature, we shall find in like manner that the powers of nature, or, in other words, the properties of matter, do all the work, when once objects are put into the right position. The farmer stirs the soil, so that the natural agents can produce their effects more easily; he puts the seed into the ground, but nature sends down the root, sends up the stem, and brings forth the leaf and flower and fruit. What is true of the farmer is equally true of the spinner and weaver. The natural qualities of the flax or wool form the necessary basis for their work. Although physical labor thus performs but one service in production, yet it manifests itself in several different ways, some of which are important enough to deserve especial mention. Labor in its most immediately productive form is engaged in appropriation, *i. e.*, in simply taking the objects which nature has made fit for man's use without any agency of his. The labor of some savages consists very largely of this kind. They live upon the berries, roots, wild honey, etc., which nature provides in more or less profusion. It is plain that where man's effort is mostly exerted in labor of this sort he must be exceedingly dependent upon nature, and can never rise very high above barbarism. The labor of appropriation, except so far as it is concerned with mining, plays but a small part in the life of civilized man. Labor is further employed in the production of raw materials, *i. e.*, in giving a direction to nature which results in the increase of raw materials. We may mention in this connection agriculture, forest culture, pisciculture, stock raising, etc., etc. The process which is carried on in these branches is sometimes called *transmutation*, *i. e.*, a change in the manifestation of matter. Thus, the seed is transmuted into the corn which it produces, and the corn into the wool which forms the basis of the coat. A third way in which labor is occupied with objects we may call *transformation*, *i. e.*, a change in the shape and appearance of matter Thus, the wool, by carding, spinning, weaving, coloring and sewing, is transformed into the coat.

This process is pre-eminently an industrial one, and is seen in all kinds of manufactures. It takes up the raw material and turns out the finished product. Finally, labor is employed in *transportation, i. e.*, the carrying of the raw material or the finished product from the place where it is not wanted to the place where it is wanted. This is the great business of commerce.— Mental labor manifests itself in a different way from physical labor. It is occupied in investigation and discovery. It seeks to find out the laws of nature which make physical labor effective, and to discover new ways in which they may be utilized. It invents, *i. e.*, devises instruments of production, without which physical labor could accomplish but little. It oversees and superintends, without which physical labor would be blind and inefficient. It educates, legislates and governs. It is, in a word, the precedent and condition of any extensive effective physical labor.— If labor fails to attain the desired object for which it is put forth, it is evidently unfruitful, *i. e., unproductive;* while, if it be successful, it would seem natural to call it *productive.* The history of the politico-economic discussion on the distinction between productive and unproductive labor is interesting and significant. The mercantilists considered as productive only such labor as contributed directly to increase the quantity of the precious metals possessed by the nation, either through the agency of mining at home or by the agency of foreign trade. They ascribed to industry a greater power of attracting gold and silver than to agriculture, and to the finer sorts of industry than to the coarser. The former, therefore, were more productive than the latter. The physiocrats, on the contrary, considered that the labor employed in producing raw materials was the only productive labor. All other classes, it matters not how useful they are, they called sterile, because they draw their income only from the superabundance of landowners and the workers of the soil. Artisans merely change the form of matter, and any extra value they may give it depends on the quantity of other material consumed during their labor. Commerce simply transfers existing wealth from hand to hand, and, hence, the less there is of it the better. These views are practically obsolete. Adam Smith considered personal services in the narrower sense as unproductive. The clergyman, physician, legislator, opera singer, ballet dancer, buffoon, were all classed as unproductive. The violin maker is productive, the violin player unproductive; the hog-raiser is productive, the educator of man unproductive, etc. Those classes are productive whose labor can be incorporated and fixed in some material object of wealth. Mill follows Adam Smith in this distinction. But the tendency of the most recent political economy is strongly toward considering as productive every useful business which ministers to the whole people's requirement of external goods. The idea of productivity changes according as we regard it from the standpoint of the producer, that of the consumer, or that of the national economy as a whole. The first regards all labor as productive which brings him in the desired return for his labor. Thus a thief, who makes a good haul on some expedition, views his labor as exceedingly productive, though the non-thieving classes would hardly agree with him. The consumer deems all labor productive whose achievements he may use, and which he can obtain at a convenient price. From the economico-social point of view, all labor is productive which increases, directly or indirectly, the wealth of society. The services of the statesman and policeman are in this view as productive as those of the shoemaker or tailor. — II. *Conditions Affecting the Efficiency of Labor.* Since labor is exertion put forth, not for its own sake, but in order to attain some ulterior object, it is evident that no more labor will be expended than is necessary to secure the desired result. This fact might be expressed as a law which would hold a very similar place in economics to that held by the law of gravitation in physics. It would be formulated as follows: *Man strives to attain the greatest possible results with the least possible exertion.* In consequence of this fact we find man in all stages of civilization trying to invent or discover labor-saving instruments. In view of his disinclination to useless labor it becomes a matter of the greatest importance to diminish that element as much as possible. He is, consequently, always more or less busily employed in seeking to increase the efficiency of his labor. This can be done in various ways, some of which we enumerate. Man can greatly increase the effectiveness of his labor (*i. e.*, increase the total amount produced) by the *use of natural agents.* Of all the animal world man is most poorly provided with organs which are immediately fitted to procure him a subsistence. In his search for food he finds himself but ill-adapted for climbing the trees to obtain the nuts, or digging in the earth to get out the roots, or diving in the water to gather the shellfish. The bird escapes him in its flight, the fish out-swims him, the deer out-runs him, the buffalo is too strong for him to kill. Even the rats, mice and moles can out dig him and out-gnaw him. In the construction of his shelter he appears but poorly equipped when compared with the beaver or the bird. If man's intelligence did not enable him to take advantage of natural agents, the race would soon become extinct. But the elasticity of wood and the tenacity of cord enable him to make a bow, and the hardness of the flint and the lightness of the stick enable him to make an arrow, which, driven by the bow, transfixes the bird in its flight, stops the deer in its mad course, and pierces the heart of the mightiest buffalo. With a sharpened stick he is enabled to stir up the soil, which else he would have to turn with his hands. A hollow stone and a hard stick make it easy for him to break and crush the grains of corn into meal or flour, instead of having to crush them between

the teeth. A lump of stone of a certain shape affords him an instrument with which to cut down the tree, that he might have gnawed at for months without bringing down. And thus in all directions he increases the efficiency of his labor by subduing to his use the natural agents he finds about him. By the aid of some he increases the amount of his production fivefold, tenfold, a hundred thousand fold. By the aid of others he produces things which he could never have produced at all without them. Natural agents, says an old author, may be classed as those which create momentum and those which change the direction of momentum. The former may be classed as animate and inanimate agents. Thus, horses, oxen, etc., are among the earliest animate agents which man made serviceable to himself. He found that a horse could turn one stone around and around on top of another and thus crush his corn, and so relieve him of a great deal of labor. It was not a great step to devise a means of utilizing the power of an inanimate agent, such as wind or water. And we consequently find wind and water mills among all peoples who have advanced very much beyond barbarism. The lapse of time brought with it a means of using the expansive power of steam, and the explosive power of gunpowder, and similar agencies. The use of wind and water greatly increased the efficiency of labor, as compared with a time when only animate agents were used. But the invention of the steam engine marked a still greater progress. Water power can be had only in comparatively few places. Wind power is irregular and unequal. Steam power is practically to be had everywhere at will. The use of inanimate agencies is relatively on the increase. They are cheaper, more enduring, and safer. They create more momentum, and take up less space; they are continuous, and work with mathematical exactness; they are unwearied, never wear out, and the machinery through which they act is easily repaired. All inanimate agents for changing the direction of momentum fall under the general head of tools and machines. By them we may change the direction of motion, convert power into velocity, manage forces too great for animate power, accumulate power, execute operations too delicate for animate agencies, and convert irregular, spasmodic effort into a regular or continuous movement. (Wayland.) — Labor may be rendered more efficient, not only by taking advantage of natural agents, but also by combining the efforts of individuals—so-called *combination of labor*. It is a universally known fact, that two men by working together can produce in certain branches many times as much as both working separately. Two hunters can kill more than twice as much when hunting together as either could kill alone. Two greyhounds running together will kill more hares than four greyhounds running separately. In the lifting of heavy weights, in the felling of trees, in the sawing of timber, in the gathering of much hay or corn during a short period of fine weather, in the pulling of ropes on board ship, in the rowing of large boats, in the erection of scaffolding for building; in all these simple operations, and in thousands more, it is necessary that many men should work together in the same place, at the same time and in the same way. (Mill.) Savages help each other but little. The combination of labor in low states of society is very limited, but with every advance in civilization comes a development of the associative powers of labor, until, in our modern industrial state, society becomes one vast co-operative association. — But combination of labor in a high degree is possible only when subdivision of labor has already taken place, and this brings us to a third means of increasing the productivity of human exertion, viz., *division of labor*. By division of labor we mean simply, that different kinds of labor are assigned to different classes and individuals, so that each shall do that for which he is best fitted. Division of labor involves an analysis of work into its parts and a distribution of those parts to different laborers. It is possible, therefore, only in the production of such commodities as require several distinct operations for their completion. Division of labor occurs in its simplest form among individual laborers. Adam Smith's example of the advantages of such division has become classical, and we can do no better than transcribe it. "The business of making a pin is divided into about eighteen distinct operations. One man draws out the wire, another straights it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on is a peculiar business, to whiten the pins is another; it is even a trade by itself to put them into a paper. I have seen a small manufactory where ten men only were employed, and where some of them consequently performed two or three distinct operations. But though they were very poor, and therefore but indifferently accommodated with the necessary machinery, they could, when they exerted themselves, make about twelve pounds of pins in a day. There are in a pound upward of four thousand pins of middling size. These ten persons, therefore, could make among them upward of forty-eight thousand pins in a day. Each person might be considered, therefore, as making four thousand eight hundred pins in a day. But if they had all wrought separately and independently, and without any of them having been educated to this peculiar business, they certainly could not each of them have made twenty, perhaps not one, pin in a day." The advantages of a thorough division of labor from a productive point of view, are many of them apparent. We may class them under five heads. — 1. The skill and dexterity of the individual workman are largely increased. The oftener a thing is done, the more easily it is done. The organs acquire a greater power; the muscles become stronger and

more pliant. The repetition of a given process tends to make it mechanical. It becomes, therefore, more rapid and exact. Adam Smith has given an excellent example of the above advantage. "A common smith," says he, "who, though accustomed to handle the hammer, has never been used to make nails, if upon some particular occasion he is obliged to attempt it, will scarce, I am assured, be able to make above two or three hundred nails in a day, and those very bad ones. A smith who has been accustomed to make nails, but whose sole or principal business has not been that of a nailer, can seldom with utmost diligence make more than eight hundred or a thousand nails in a day. But I have seen several boys under twenty years of age, who had never exercised any other trade but that of making nails, who, when they exerted themselves, could make each of them upward of two thousand three hundred nails in a day"; or nearly three times as much as the smith who had been accustomed to make them, but who was not entirely devoted to that particular business. — 2. Time is saved. The advantage which is gained by saving the time usually lost in passing from one sort of work to another, is much greater than we should at first view be apt to imagine it. It is impossible to pass very quickly from one kind of work to another, that is carried on in a different place and with different tools. A man commonly saunters a little in turning his hand from one sort of employment to another. When he first begins the new work he is seldom very keen and hearty; his mind, as they say, does not go to it, and for some time he rather trifles than applies to good purpose. The habit of sauntering and of indolent, careless application, which is naturally or rather necessarily acquired by every country workman who is obliged to change his work and his tools every few hours, and to apply his hand in twenty different ways every day of his life, renders him almost always slothful and lazy, and incapable of vigorous application even on the most pressing occasions. (Smith) The saving of time effected in learning the business should also be classed under this head. It is evidently a much simpler and shorter matter to learn how to perform one process than seventy, and the time thus saved in the early stages of one's work life amounts in the aggregate to an enormous sum. — 3. Division of labor facilitates the invention of machines and processes of saving labor. Inventions to abridge labor in particular operations are more likely to be made in proportion as one devotes one's physical and mental attention exclusively to that one occupation. Besides, a man who is busied continually in performing one simple operation is more likely to hit upon some mechanical device to substitute for his labor, than one who is engaged in a complex process involving several operations; if for no other reason, because the former is much simpler than the latter. Mill, however, calls attention to the undoubted fact that invention depends much more on general intelligence and habitual activity of mind than on exclusiveness of occupation; and if that exclusiveness is carried to a degree unfavorable to the cultivation of intelligence, there will be more lost in this kind of advantage than is gained. — 4. Mr. Babbage has called attention to a further very important advantage connected with division of labor, which consists in the more economical distribution of labor by classing work-people according to their capacity. Different parts of the same series of operations require unequal degrees of skill and bodily strength; and those who have skill enough for the most difficult, or strength enough for the hardest parts of the labor, are made much more useful by being solely employed in them; the operations which everybody is capable of, being left to those who are fit for no other Production is most efficient when the precise quantity of skill and strength which is required for each part of the process is employed in it and no more. The operations of pin-making, it seems, require in its different parts such different degrees of skill that the wages earned by the persons employed vary from four-pence half-penny per day to six shillings, and if the workman who is paid at the highest rate had to perform the whole process he would be working a part of his time with a waste per day equivalent to the difference between six shillings and four-pence half penny. Without reference to the loss sustained in the quantity of work done, and supposing even that he could make a pound of pins in the same time in which ten workmen combining their labor can make ten pounds, Mr Babbage computes that they would cost in making, three and three-fourths times as much as they now do by means of the division of labor. In needle-making, he adds, the difference would be still greater, for in that the scale of remuneration for different parts of the process varies from sixteen to twenty shillings per day. (Mill.) — 5. A saving is effected in capital by a division of labor "If any man," says Rae, "had all the tools which many different occupations require, at least three-fourths of them would constantly be idle and useless." As a consequence they would be so much dead capital, taking no part in production. The ordinary individual could not afford to have as good tools as a specialist, and, therefore, his work on this account also would be less effective. — The extent to which division of labor can be carried with advantage depends upon several conditions. 1 *Upon the nature of the process.* Agriculture, for example, can not be distributed as fully as manufactures, because its different operations are not simultaneous. A man whose work consisted solely of plowing would be idle most of the year; if he limited himself to reaping he would find it difficult to employ himself for more than a month or two. In manufacturing, when a process has once been reduced to its simplest elements, and the various operations distributed, the limit of subdivision has been reached. For it is no division

of labor to employ two men in the same occupation. To attain the greatest economy in a factory, it is necessary to so adjust the operations and the laborers that the latter will fully employ one another. And this having been once accomplished, the establishment can not be economically enlarged unless it employs multiples of this number of workmen. 2. *Upon the accumulation of wealth.* It is evident that in a detailed system of divided labor there must be means on hand to support all the various classes of laborers engaged in the production of a commodity until it can be disposed of in the market, *i. e.*, there must be a large amount of capital on hand. In new countries, therefore, the division of labor is very limited even among civilized nations. The American pioneer was his own carpenter, farrier, physician, etc., etc., being confined to the immediate exertions of his own family for all the commodities or services he enjoyed. In the progress of society the evolution of new callings is but slow, and the division of labor within those callings still slower. 3. *Upon the extent of the market.* The efficient cause of the division of labor in an industrial society is the demand for the products of labor. If there were no demand for the surplus products of a man's exertion in any field, he would only put forth labor enough to provide himself with what he alone could use. A man, for instance, might find himself in need of pins, we will say. He makes enough to supply himself and then takes up some other product, which he needs. But his neighbor needs pins also, and the skill he has acquired in making his own enables him to produce some for his neighbor more cheaply than the latter could do it for himself. He manufactures enough for both and exchanges his surplus for what he needs. Other neighbors hear of it and wish to buy pins in exchange for what they produce. Our pinmaker finds it profitable to spend all his time in making pins and exchanging his surplus for other things he needs. Pretty soon, as his fame goes abroad, and more and more resort to him, he finds it profitable to hire a man to help him, and after awhile he can add another and another. It occurs to him to distribute the labor of making a pin among eighteen different laborers, and he can then make a hundred thousand pins a day, where formerly he only made a hundred. Now he can do this profitably, only so far as the market expands enough to take his ever-increasing product of pins. It would not pay him to hire eighteen men to make five pins, if that were all he could sell, merely to secure a division of labor. We thus see how an accession of demand for a commodity tends to increase the efficiency of labor engaged in its production—it makes possible a greater division of labor. The extent of the market may be limited by several causes: 1st. The number of consumers. Other things being equal, one hundred men will need ten times as many shoes and coats as ten men. 2d. Cost of the article. A diminution of 20 per cent. in the cost of an article will often double the market for it, and *vice versa* a similar increase in the cost will decrease the market. 3d. The wealth of the inhabitants. England is a far better market for certain goods than Russia, in spite of the fact that its population is scarcely one-fourth as large, for its wealth is far greater. 4th. Facilities for transportation. Even if the cost of an article at the place of its manufacture be low enough to satisfy a large market, the conditions of transportation may be such as to make it impossible to get it to consumers at a popular price. 4. *Upon the executive ability of men.* The more detailed the division of labor becomes, the higher the order of executive ability necessary to manage the industry. The instant an industrial undertaking outgrows the ability of its overseers, that instant it becomes wasteful and extravagant, and all advantage of division of labor is lost.—The effects of the division of labor upon the laborer himself ought not to be passed over in a discussion of the subject of labor. Where it is carried to the development which it has attained in modern industrial life it is fraught with serious danger both to the individual laborer and to the society to which he belongs. A variety of exercise is essential to the full and healthy development of the faculties and functions of the body. But the division of labor often involves long and close confinement to a single operation; an over-tasking of some one limb or set of muscles; a posture which may cramp and oppress the vital organs; exposure to deleterious gases and exhalations; the breathing for hours in crowded rooms of air bereft of oxygen, and charged with carbonic acid. The introduction of women and children into factories by which that economic distribution of the workpeople according to their capacity, which we have mentioned above, has been made possible, is certainly to be greatly regretted from a social point of view. The mind is liable to be contracted and enfeebled. What must be the aspect of the soul of a workman who for forty years has done nothing but watch the moment when silver has reached the degree of fusion which precedes vaporization! (Roscher.) There is a compensating circumstance, however, in all such work. It tends to become mechanical and thus to leave the mind free to think about something else; while the concentration of numbers makes it possible to introduce schools, debating societies, etc. Division of labor tends to increase the power of capital and diminish the independence, and, therefore, the self-respect of the laborer. The small producer is driven to factory labor, and his success which was before largely dependent on himself is now in the hands of a few managers and capitalists. It intensifies the feeling of bitterness between laborers and capitalists, when trouble arises, as the extremes of poverty and wealth meet under such conditions. (See MACHINERY.)—Division of labor may occur among classes of laborers and different nations as well as among individuals. There is a distribution of labor, for

instance, among the producers of raw material, the transporters, and the manufacturers. Commercial freedom enables a perfect system of division of labor among the different countries to develop itself. International division of labor is as profitable and oftentimes more profitable than domestic division of labor. The world is slow to learn this lesson, and even yet many parties can be found who maintain that international division of labor is ruinous and should be hindered at any cost. The division of labor has an important bearing on all questions of distribution. — There are other agencies that affect the efficiency of labor, which we can do no more than mention. The greater energy of labor, the skill and knowledge of the community, the general diffusion of intelligence, the moral qualities of the laborers, the security of person and property, all have great influence on the productivity of labor. Production on a large scale often greatly increases the effectiveness of labor. As a general rule, the expenses of a business do not increase by any means proportionally to the quantity of business. It costs no more, for instance, to take ten letters from New York to San Francisco than it does to take one, and but little more to take ten thousand than ten hundred, and far less in proportion to take one hundred thousand than ten thousand. It takes a brakeman, an engineer, a fireman and an engine to draw two cars, but the same force can manage twenty just as well. A set of books which it is necessary to keep for one hundred customers will do about as well for five hundred The storeroom, light, heat and clerks for a small business need but to be slightly increased for a business twice as large, etc., etc. Whether or not the advantages obtained by operating on a large scale preponderate in any particular case over the more watchful attention and greater regard to minor gains and losses usually found in small establishments, can be ascertained in a state of free competition by the relative ability of such establishments to compete with each other. — III. *The Ethical Significance of Labor; Hope of Diminishing its Burden.* If we examine the effect of the increased productivity of labor, caused by progressive division and combination, by growing accumulation of capital and ever-widening freedom, it will be seen that it consists almost entirely in an extension of positive satisfactions, but it has not diminished essentially the amount of labor demanded of man. And even for the future, however wide the prospect for continued advance in this direction, we can hardly hope to lessen the burden of labor, since the demands and wants of man seem to increase in the same proportion as his productivity. Now, as labor is indisputably felt to be a burden, the questions involuntarily force themselves upon our attention as to the inner justification of this burden laid upon humanity, as to the prospects of our being ultimately freed from it or of freeing ourselves from it, and as to the means which we must apply in order to do it. The justification of labor is to be found in the imperfection of human nature. Without some external compulsion to exert himself, man, owing to his disinclination to exertion, his unsteadiness, and his love of passive enjoyment, would not become conscious of his true destiny, viz., self-development toward Godlikeness, and even if he did, he would grow weary in its pursuit. The ethical significance of labor consists in its quality as a means of education. And in fact who can fail to see how powerfully this burden resting upon it has advanced humanity, and how far, without it, it would have fallen short of its present attainments? The incomplete development of those very nations which in consequence of the wealth of surrounding nature feel this burden but lightly, and the countless examples in individual cases of moral relaxation in the relations of life which do not require labor, suffice to prove our position. Is there a tendency in the progress of civilization toward lessening the burden of human labor? The laws of nature are unchangeable, the resistance of the outer world to man's dominion will never become less, though his power to overcome it is constantly increasing. Exertion is labor or is not labor, according to the end for which it is made. If it is its own end, it ceases to be labor. The exertion a man puts forth from public spirit, because he enjoys the very making of it, is not labor. The artist who creates for the love of creating, is not laboring. In every pursuit which is followed for the love of it, labor passes away. It is along this line that labor is to be diminished. We can but present the thought. Labor can be diminished by the moral education and elevation of the laborer, *i. e.*, laborious exertion can be converted into pleasurable exertion. (Cp. von Mangoldt.) — Labor in its relation to the state, as to its law of increase, as to how it is affected by machinery, etc., will be found discussed elsewhere in this work under various heads, such as FACTORY LAWS, STRIKES, MACHINERY, POPULATION, etc. — *Literature.* The literature of the subject is vast and increasing. All standard works on political economy discuss the points we have mentioned above. The many works on Wages, Laboring Classes, Machines, Distribution, etc., contain discussions pertinent to the subject. Socialistic works, in particular, devote special attention to the laboring classes and the means of their improvement. The works most worthy of notice will be mentioned in the articles above referred to E. J. JAMES.

LABOR, The Right to (IN FRENCH POLITICO-ECONOMIC HISTORY). The right to labor, that fundamental principle of the French socialistic gospel, is not the power, which belongs to all men in a free state, of making use of their own industry. The right to labor has nothing in common with the freedom of labor. The apostles of this doctrine mean by it not the unobstructed use of strength and resources, but a claim given to the individual against society. They pretend that all

members of society, who have neither the knowledge nor will to create means of subsistence, have good grounds for saying to the rulers who represent and govern them, "See that I have work, for you are obliged to maintain me." It is what M. de Lamartine, believing that the principle would be accepted if he softened the name, called "the right to existence." Before passing into the crucible of science this formidable question was planted in the soil of revolution. It does not date from 1848, and has nothing new but its form. — It is the extreme result of every strict system of public charity. It is the danger which few of the Protestant states escaped after the destruction of the monasteries. The act of the 43d year of the reign of Elizabeth planted the germ of it in English legislation. It says, "And they [overseers] shall take order from time to time * * for setting to work the children of all such whose parents shall not, by the said church wardens and overseers or the greater part of them, be thought able to keep and maintain their children; and also for setting to work all such persons, married or unmarried, having no means to maintain them, and use no ordinary daily trade of life to get their living by; and also competent sums of money for and toward the necessary relief of the lame, impotent, old, blind, and such other among them, being poor and not able to work; and also for the putting out of such children to be apprentices." The same law gives them the power to raise taxes for this purpose, which must be borne by the people of the parish, or, if this does not yield enough, by the people of the district, or, if necessary, by those of the whole county. A law of Henry VIII. had already imposed a penalty on parishes in which the weak were not aided. From this the poor clearly received the right to demand help, and to bring suit against the authorities who should refuse them assistance. English legislation, therefore, created the right to assistance, modified by the obligation of labor. — Examples abound in French revolutionary legislation. The constitution of 1791 declared in the first clause, which enumerated the guarantees given to all citizens, that there should be created a general bureau of public aid for the purpose of bringing up foundlings, of caring for the infirm poor, and of providing work for such of the able-bodied poor as were unable to obtain it for themselves. This was borrowing from England the system of a poor tax, with the enforced building of workhouses and charity schools, but that doctrine of the constitution was not put in practice; it was, indeed, considered a dead letter. The constitution of 1793 went a step farther. Art. 21 declared that public aid was a sacred debt; and that society owed a living to unfortunate citizens, either by procuring work for them or by assuring means of life to those unable to labor. The constitution of 1793 did not limit itself, like that of 1791, to proclaiming that society owed labor, under the form of help. It demanded that the labor thus given should assure subsistence. The right to live was implied in this formula, in this duty imposed upon society. Need we add, that the radical charter of 1793, having been suspended from the date of its promulgation, to give place to the revolutionary government, it is impossible to judge by its works the new theory of public aid? — None of the constitutions following that of 1793 reproduced this formula, but all socialistic schools, born during the transition from the old régime to the new, drew inspiration from it. Babœuf deduced from it the community of goods. In this abortive theme, in these tables of the law, broken as they came from the furnace, like an impure or defective casting, the conspirators did not cease to search for the ideal of the future republic. Even perverted science wished to fasten itself to it. It was by following the road made by Robespierre and St. Just that Fourier constructed his formula of the right to labor. He wrote in 1819 in his *Théorie de l'unité Universelle*, "Scripture tells us that God condemned the first man and his posterity to work in the sweat of their brow, but he did not condemn us to be deprived of that labor on which our existence depends. We can from this derive a right of man to ask philosophy and civilization not to keep from us that resource which God left us, as a last resort or punishment, and to guarantee to us at least the right to that class of labor with which we are familiar. We have passed ages thus quibbling over the rights of man without recognizing the most essential — labor, without which all others are nothing. What a shame to a people who consider themselves skilled in social science! Should we not dwell upon so ignominious an error, in order to study the mind of man and the social mechanism which is to give to man all his natural rights, whose civilization can neither guarantee nor even allow the principal one, that of labor?" While exhuming and proclaiming this new right of man, Fourier still recognized that it was incompatible with social order as moulded and developed by civilization according to the mandates of Providence. We shall see later whether the reformer and his disciples succeeded better with this in the mechanism of society, and on what arguments that pretended right, which is but the negation of all others, rested. Let us prove first that the impossibility recognized by Fourier was so generally admitted that outside his school and with the exception of a single paper by M. Considérant in the "Phalange," no one before 1848 had raised the standard of the right to labor. — The two principal theorists of the social republic had very different projects. They absorbed and engulfed that theory in more vast and ambitious conceptions. M. Cabet, renewing the utopian schemes of the fifteenth and sixteenth centuries, placed beyond the seas the attraction of absolute community of interest. M. Louis Blanc, under the pretext of organizing labor, wished to remodel society. Fourier's thought was considered by them as wanting in greatness and as impossible of

practical application. One man only, de Lamartine, in an article previous to 1844, admitted, with certain reservations, and in extreme cases, the right to labor. He had at first said, with eloquent logic, "There is no other organization of labor but its freedom, there is no other distribution of wages but that made by labor itself, remunerating itself according to its work and judging itself with an impartiality impossible to your arbitrary systems. The free will of labor in the producer, in the consumer and in the workman is as sacred as the free will of the conscience in man: touching one, you kill action; touching the other, you kill morality. The best governments are those which let it alone. Every time that it has been tampered with, an industrial catastrophe has stricken at the same time government, capitalists and working men. The law which governs them is invisible; it vanishes under the hand the moment we try to write it down." This law, on the contrary, is plainly visible; with a little attention any one can read it written in facts in brilliant characters. It is the relation of supply to demand. The rate of wages regulates itself invincibly by the scarcity or abundance of labor. There is no power on earth that can raise the price of labor when unoccupied workmen throng the doors of the shops, or can lower or depress it when work presses, or the workmen are few. But after recognizing this law, although declaring it invisible, de Lamartine adds, "To sum up, we wish society to recognize the right to labor in extreme cases and under definite conditions." And the poet-economist does not see that the right to labor, which he admits, would lead surely to the organization of labor, which he had just opposed. — Revolutions oblige men to be logical: they neither haggle over the application of theories, nor recoil from their consequences. In spite of a government which brought together weak conservatives and tribunes frightened at their own boldness, the revolution of February, 1848, proclaimed the right to labor. Feb. 26, the following decree was posted upon the walls of the capital: "The provisional government of the French republic guarantees the subsistence of the workman by labor. It agrees to guarantee labor to all citizens. It recognizes the fact that working men should associate themselves together, in order to enjoy the legitimate profit of their labor." That decree, M. Louis Blanc himself admits, was forced upon the provisional government. "Entering rudely," says he, "into the council chamber, and making his gunstock ring upon the floor, a workman came with sparkling eye and pale brow to demand in the name of the people recognition of the right to labor." This working man, in whose person M. Louis Blanc sees the incarnation of the people, was, not to wrong him, but the instrument of some member of the government who wished to force his colleagues to do what he desired. This was soon apparent from the docility with which the impulse from without was received and obeyed to the end. "Indeed, thousands of laborers," it is still M. Louis Blanc who speaks, "still black with the grime of the barricades, having filled the *Place de Grève* with standards on which you could have read, *Organization du travail*, the organization of labor was decreed." The right to labor has produced thus historically its natural consequences. "Considering," says the decree of Feb. 28, "that revolution made by the people should be made for them; that it is time to put an end to the long and iniquitous sufferings of working men; that the question of labor is of the highest importance; that there is none higher or more worthy the attention of a republican government; that it belongs particularly to France to study intently and to solve a problem laid to-day before all the industrial nations of Europe; and that we must try, without any delay, to guarantee to the people the legitimate fruits of their labor — the provisional government of the republic resolves: That a permanent committee, which shall be called the committee of the government for the working man, shall be appointed with the express and peculiar mission of caring for their lot, * *." — Here, then, is the system of the right to labor bound by law, to support all the fruit it could produce. The provisional government placed it under the shelter of the state, charged one of its members with its organization, and devoted to this end, or left at its disposition, the forces of the mob as well as that of the government. M. Louis Blanc was absolute master: what use did he make of this dictatorship? In order to give labor a new organization he commenced by making breaches in the organization which had existed from the earliest development of industry. A hateful rivalry, sown between masters and workers, by the inflammatory influence which came from Luxemburg, soon rendered discipline in shops, and, by a natural sequence, labor, impossible. The progress of industry had substituted, in a great many factories, as a measure of wages, a day's task or work. The dictators of February could not pardon this method whose equity was in keeping with all interests concerned. They abolished the task or job. Master and workmen were forbidden free discussion of the conditions of wages. Soon the intervention of the state was pushed still farther. After having dictated to master and workman the manner in which labor must be carried on and paid, they wished to regulate its duration. A decree decided that the day's work should be but ten hours in every branch of industry and throughout the whole of France. Finally, after having misled the workmen, throttled the contractors, and frightened the capitalists, they talked of the state's appropriating manufactures. "To managers," said M. Louis Blanc, "who, finding themselves to-day in a failing condition, come and say to us, 'Let the state take our establishments and put itself in our places,' we reply, the state consents to do so. You shall be abundant-

ly indemnified. But as this indemnity, which is your due, can not be taken from present resources, which would not be sufficient, it will be required of future resources. The state will give you notes, bearing interest, secured by the value of the ceded establishments, and redeemable by annuities or liquidation." The plans of M. Louis Blanc, we know but too well, were not an ephemeral inspiration. The provisional government followed up the execution of them, until they themselves made shipwreck and placed social order itself in peril. It desired to bring under the dominion of the state the large establishments of credit and labor, the banks, the insurance companies, and the railroads. Some were sequestered; others, stricken with a bottomless depreciation, awaited as a favor, derisive indemnity. The state commenced by becoming common carrier and insurer, and later became itself a producer. But as credit and money were both wanting, to pay, even at the lowest price, for all that they desired to take, it became necessary to allow those shops to close which had been disorganized. Manufacturers stopping, the workmen, whose hands were no longer busy, and to whom subsistence by work had been guaranteed, asked, amid loud cries, that this blockade of labor should be relieved. The government, which had disorganized ordinary works, saw itself under the necessity of organizing extraordinary ones. — The Luxemburg conferences brought about, as a direct and immediate consequence, the opening of the government workshops. M. Louis Blanc need not have protested and traced back to another member of the government the thought of this outrageous creation. What difference did it make whether he had or had not signed the decree, if he had made it inevitable? I know that M. Louis Blanc imagined that he could have carried on, by the workmen of each trade, the industries from which he banished capital, and the management which was their soul. But without orders, capital holding back, and tried skill banished from them, how could factories run? To take away the director and the motive power from a factory, is to close it. Society would not know how, in any case, to improvise resources and management for all industries. Work stopping in the shops, and the dictator at Luxemburg unable to start it again where it had stopped, it became necessary in order to fulfill the guarantee given by the government, to open shops, whether useful or not, which were like a general refuge for all unemployed hands, and, to use the language of de Lamartine, a relief dépôt for the people of Paris. Indeed, all the theories of official communism were practiced there, commencing with equality of wages. All professions were placed on the same level. Labor, claimed as a right, was nowhere considered as a duty. The liberal alms given to this army of factious beggars, absorbed and exhausted rapidly the substance of society. The yards employing mechanics of the various kinds, which had gathered together hardly 6,000 men in March, 1848, had collected 87,942 just previous to the events of June. Recognition of the right to labor had brought about the conferences of Luxemburg. The conferences of Luxemburg had brought forth this great strike which found shelter and expression in the national shops. National workshops were destined to produce, and did produce, social war. — This, then, is the result of the right to labor practically tested. Can we believe that a great assembly found it necessary to discuss it after an experience so full and decisive? Ought not the history of this heresy, in subjects connected with social economy, to have been closed after the bloody days of June? And what manifestation could have enlightened those who were unable to read the truth by the lightning flashes of such a storm? The first draft of the constitution read by Marrast from the tribune June 2, 1848, only a few days before the mob howled in the streets of the capital, asserted, in the most explicit manner, the decrees of the provisional government and the doctrines of Luxemburg. Article 7 read: "The right to labor is the right of every man to live by working. Society ought, by all productive and benevolent means at her disposal, and by those which will be subsequently organized, to furnish labor to able-bodied men who can not procure it in any other way"; and farther on, at article 9: "The right to assistance is that which belongs to foundlings, to the weak and to the aged, of receiving from the state the means of subsistence." After these articles which fixed the principles, article 132 indicated the means of application. "The main guarantees of the right to labor are liberty of labor itself, freedom to form labor associations, equality of relations between master and workman, free instruction, professional education, savings and other banks, and the establishment, by the state, of great works of public utility, to provide labor, in case of a stoppage of work, for unoccupied hands." The constitutional commission proclaimed at the same time the right to education, the right to labor and the right to assistance by the state. Society was thus about to substitute its own action and responsibility for those of the individual and the family. It took charge of man from the cradle to the grave, caring on the way for all his necessities from education to wages, opening, in a word, to all human beings, according to age, the cradle, the asylum, the school, the workshop and the hospital. These different formulæ, submitted to the examination of the bureaus, after the events of June, did not meet with that general reprobation which the indignation of the country led one to expect. Eight out of fifteen bureaus admitted the right to labor. The constitutional committee, warned by public opinion, and defeated in the preliminary debates in which the delegates of the bureaus engaged before them, thought best to modify their first draft. But at the same time they explained this forced retreat as a purely formal concession.

"This formula (the right to labor)," said M. Armand Marrast, "seemed equivocal and perilous; it was feared that it would put a premium on idleness and dissipation; it was feared that legions of working men, giving to this right an extent it did not have, would consider it a right to insurrection. To these important objections is added another, more important still. If the state agrees to furnish labor to all those who have none, from one cause or another, it must give to each the kind of work to which he is adapted. So the state will become manufacturer, merchant, wholesale and retail producer. Charged with the satisfaction of all wants, it must have the monopoly of all industries. Such are the great evils which have been seen in our formula of the right to labor, and since it might lend itself to a construction so contrary to our own thought, we have wished to make the thought more clear and precise by replacing the right of the individual by the duty imposed upon society. The form is changed, but the substance remains the same."—M. Marrast was right; the changes made did not touch the substance of things. The second draft, like the first, gave to the individual a claim against society. Here is Art. VIII. of the preamble in the edition of Aug. 29: "Society ought to protect the citizen in his person, his family, his religion, his property, his labor, and bring the education indispensable to all within the reach of all. It owes subsistence to needy citizens, either by procuring work for them to the extent of its resources, or by giving the means of subsistence to those whose families fail to provide such means for them, and who are not in a condition to work." The earnest and brilliant debate which arose before the constituent assembly did not bear upon even the text of the commission. M. Mathieu (department of Drôme) took care to furnish a field more vast by proposing the following: "The republic recognizes the right of all citizens to education, labor and assistance." When we read this discussion we remark, as its characteristic trait, a certain timidity of reasoning which did not allow the orators to come to definite conclusions. For instance, M. Mathieu (of Drôme) defends his having wished to restore the first draft of the bill, and he makes an effort to weaken the force of his amendment, by explaining that he recognized the right, but did not guarantee its operation. As if the recognition of this pretended right did not confer upon the individual the right to hold society legally responsible for its violation. M. Lédru-Rollin, who came next, gave it to be understood that there was question only of a verbal concession, a purely ideal theory. "When you do grant the right to labor, you will not be obliged to enforce it at once." Finally, de Lamartine reduced the right to labor to a question of charity, and wished that the moral zone, to use his own expression, might penetrate the legal zone. The adversaries of the right to labor, on the other hand, confined themselves to opposing the amendment of M. Mathieu (from Drôme). They reject a too explicit form, without going farther with their opposition. M. Duvergier de Hauranne accepted the draft of the commission. M. Thiers wished the state in certain cases to undertake public works, with the object of furnishing labor to the unemployed. M. Dufaure, refusing to recognize in the individual the right to demand work, imposed upon society the duty of furnishing him work or the means of subsistence. So much logic and eloquence displayed to end only in a change of words! Discussion, thus carried on on both sides, necessarily degenerated into a useless passage of arms. — Taking advantage of the situation, at the last moment M. Glais-Bizoin weakened by a new draft the amendment of M. Mathieu (from Drôme). The right to subsistence replaced the right to labor. The subamendment was expressed in this way: "The republic recognizes the right of every citizen to existence by labor, and the right to assistance." It is proper to notice, in the interest of history, that the constituent assembly, appointed under the influence and so to speak under the threat of February, gave only 187 votes out of 783 voters to the draft of M. Glais-Bizoin. But immediately afterward, and as if it feared to have done too much, it adopted the motion of M. Dufaure himself, which had for its object "to bring into greater prominence the idea that society ought to insure subsistence to needy citizens." Here is the text of that draft which became the second paragraph of Art. VIII. of the preamble in the constitution which governed, during three years, the destinies of France: "It [the republic] ought by fraternal assistance to insure the subsistence of its needy citizens, either by procuring work for them within the limits of its resources, or in giving assistance, their families failing to give it, to those who are unable to work." We have just indicated the place occupied by the right to labor in the French parliamentary debates. After this historical statement of the facts, it remains for us to examine the theory. — The theorists who uphold the right to labor, take, voluntarily or unwittingly, for their starting point, the sophism of Rousseau: "Everything is good when it leaves the hands of the Creator; everything degenerates in the hands of man." They suppose a state of nature existing antecedent to that of society, and a contract, by which men established social order, and reserved certain rights inherent in and essential to existence. This contract is a pure fiction. There is nothing prior to, nothing higher than, society, because outside of society the existence of man is impossible. The social scale has an infinite number of degrees, from the savage state to that of the most advanced civilization. But the exploration of the globe has shown that in no country have man and the family struggled in a state of isolation to satisfy their wants or to develop their powers; that the tribes the least polished and the most wretched had a language, traditions, principles and a government. Man and society

have the same date as well as the same origin. Man can not develop himself except in the bosom of society. He brings to it nothing but the germs of his faculties, and receives everything from it. His rights flow from the same principle as his duties. The individual finds in the rights of others the limit of his own, and their guarantee in the duties which are imposed on each one of his fellows. Rights, like duties, are but the expression of the relations which the social state, which destiny here below, produces among men. The individual then could not reserve, at the moment when society took him up, a pretended right to existence. He comes into it weak and naked, supported by the family and protected by the state, until he has learned to take care of himself. Arrived at the age of manhood, he sees the limits of his rights extended, and his own powers grow greater in proportion as the power of society itself increases. Enlightenment, liberty, wealth, are so many steps in the progress of the social state, in which every member of society shares. As to existence, it is all the better guaranteed to individuals in proportion as the community is wealthier, more enlightened and stronger. Take for example a hunting or even a pastoral people, who, to live, need immense tracts of land. Famine, against which they struggle painfully all their days, often carries off whole tribes. In a less imperfect state of civilization, that of the middle ages in Europe, notwithstanding the bounty of the monasteries, the difficulty of communication as well as the absence of commerce and industry, rendered a deficit, however small, in the harvests, fatal to the population of serfs. In the eighteenth century the memory of these frightful calamities still weighed so heavily on the public spirit that Turgot had to perform prodigies in order that freedom might again be given to trade in grain through the interior of France. In our days, on the contrary, human foresight has inexhaustible treasures to repair such disasters. Trade carries the cereals from the country which has reaped a superabundant harvest to those which the inclemency of the weather has stricken with temporary sterility. Industry in turn redoubles its activity to pay for the produce of the soil with the products of the factory. In a word, famine is henceforth, for the civilized people of Europe, but an accident, which serves to test the strength and excellence of European institutions. In 1847, although the deficit of the harvest was at least a fifth, and although a hectolitre of wheat was worth fifty-three francs, that is, three to four times its normal price, not an individual died of hunger in France.—It seems, then, idle enough to try to find what the rights of an individual to existence in society may be, when we see that the advance of society has the effect of overcoming the difficulties and of multiplying and making general the means of living. What is the use of examining whether there be such a thing as the right to labor, when the freedom of labor is fully guaranteed, and when each enjoys the fruit of his own labor without question or reservation? Finally, of what interest is it to discuss the right to assistance, another form of that claim which the socialists wish to give to man against society, in a time when the foresight of public authority, more watchful and more humane than it has ever been, is studious to repair the accidents of fortune, without weakening prudence, and without checking individual activity? Notwithstanding the world as it is is ignored that men may have a pretext to take refuge in an ideal world, society is divided into two classes, those who have and those who have not. A weapon is placed in the hands of both these classes, as if thus equilibrium between them could be produced. The right of labor is arrayed against the right of property. The most subtle and most complete expression of this theory is found in the writings of M. Considérant, whom we have already noticed, and whose conclusions were advocated from the tribune by M. Lédru Rollin. The following are its principal features: "The human species is placed upon the earth to live and develop there; the species is therefore the usufructuary of the surface of the globe. But by the property system of all civilized nations, land, to which the whole species has a usufructuary right, has been confiscated by the few, to the exclusion of the many. Were there, in fact, but one man excluded from his right as usufruct of the land by the nature of the property system, this exclusion alone would constitute a violation of right, and the property system which upheld it would certainly be unjust and illegitimate. The savage, in the midst of the forests and plains, enjoys the four natural rights of the chase, of fishing, of the picking of fruit, etc., and of pasture. This is the first form of right. In all civilized societies the proletarian inherits nothing and possesses nothing, is purely and simply stripped of his rights. We can not say, then, that here the primitive state has changed in form, since it no longer exists. The form has disappeared with the substance. Now, under what shape could the right be reconciled to the conditions of industrial society? The answer is easy. In the savage state, to avail himself of his right, man is obliged to act. The labors incident to hunting, fishing, the picking of fruit, etc., or pasture, are the conditions of the exercise of his right. Primitive right is, therefore, only the right to these labors. Now, let an industrial society, which has taken possession of the land, and which has taken from man the power of exercising anywhere and in freedom, upon the face of the earth, his four natural rights; let this society recognize in the individual, as compensation for the rights of which it has stripped him, the right to labor; this done, the individual has no right to complain. In fact, his primitive right was the right to labor exercised in a poor workshop, surrounded by brute nature. His present right would be the same right exercised

in a shop better provided and richer, where individual activity ought to be more productive. The *sine qua non* of the legitimacy of property is, therefore, that society should recognize in the proletarian the right to labor, and that it should assure him at least such means of subsistence for a given amount of action, as such an amount could have procured for him in the primitive state. But has the workman, to-day, who has no work, the right to go and say to the mayor of his commune, the prefect of his department, or any other representative of society, 'There is no longer work for me at the shop where I was engaged,' or 'Wages have become so low that I can't live on them. I come, therefore, to demand work of you, at such a rate of wages that my lot may be preferable to that of the savage in the forests'? Not only is this right not recognized, not only is it not guaranteed by social institutions, but society says to the proletarian, despoiled by it of the first of his most sacred rights, of his right of usufruct in the land; it says to him: 'Find work if you can, and if you can not find it, die of hunger, but respect the property of others.' Society pushes its derision to the point of declaring guilty the man who can find no work, who can not find the means of living. Every day we throw into prison unfortunates, guilty of begging or of vagrancy, that is, guilty of having neither means nor refuge, nor the way of procuring either. The régime of property in all civilized nations is then unjust in the highest degree; it is founded on conquest, upon the taking possession, which is but permanent usurpation as long as an equivalent for their natural rights is not given to those who in fact are excluded from the use of the soil. This régime is, besides, extremely dangerous, because in nations where industry, wealth and luxury are very much developed, the proletarian can not fail sooner or later to take advantage of this spoliation to disturb society." M. Thiers ridiculed this beautiful theory, when he asked if the insurgents of June, whom they were transporting to Madagascar or to Guiana, that is, to countries in which the four pretended primitive rights—fishing, hunting, the gathering of the fruits of the earth, and pasture—are reputed to exist, rights which they say have perished in civilized society, would esteem themselves happy to return to the savage state, or if, on the contrary, they would not accuse of barbarity the power which thus imposed exile upon them. We can say as much of laborers who rejoice in their liberty and who expect their subsistence to come from labor. The most unfortunate among them would not change his lot with that of the Ojibbeways or Osages. This proves, at least, that if society has stripped man of some right, held from nature, she has given him in return gifts of a greater value. A primitive, natural right is something which belongs not to one man, not to a generation, not even to a people, but to all nations, to each generation and to every individual. More than this, the rights truly natural to man are those which the progress of civilization makes easy and develops the use of, such as the liberty of thought and that of industry. Generations, in their course through history, do not transmit to those which succeed them either fictions or chimeras. We find the abolition of the right of property which the school of Fourier imagines, nowhere recorded by tradition. Has the earth, indeed, ever existed in that state of primitive capital, independent of all value created by the labor of man? Is this not a purely abstract proposition, conceived by the mind outside the data of reason and the realities of history? Who can teach us how far civilization dates back in time? Is there in the inhabited portion of the globe a spot of earth which has no trace of man, or which in some age or other his sweat has not made fertile? In order that every individual, at birth, should be virtually invested with the right of usufruct to the earth, of the right, represented, according to M. Considérant, by the power to fish and hunt, to gather the fruits of the earth and to pasture herds, the earth would have had to support, in its primitive state, which the disciples of Fourier imagine, under the form of tribes of fishers and hunters, not alone a small number of individuals scattered over immense tracts like the Indians of America, but nations as thickly settled as are those of France and of England. But we all know that in a nomadic state a large area of country is necessary for the support of one man, while, in countries which have reached a high degree of culture, the same territory will support from 1,500 to 2,000 inhabitants. What then is a right which can be exercised only in the wilderness, and in virtue of which that which is hardly sufficient to maintain one man should be bequeathed to his descendants to be shared among a thousand, two thousand, or divided into as many parts as the fecundity of the human race, as it grows, can make of it? There exists no natural right to the possession of the land in its natural state. Land belongs rightly to the person who appropriates it to himself by his labor. Labor creates property; it creates it by leaving on things the impress of man. It is human activity applied to natural forces which gives birth to capital. Here then, in the order of immovable property, is the real source of wealth. Hunting, fishing, and the other processes of the savage state, are at best but imperfect and ephemeral means of appropriation. They already suppose some action of man upon nature; this is the beginning of labor in society. Nomadic tribes divide the land among themselves; each tribe has its own territory, which thus belongs to the whole community, before it is distributed to families and individuals. Later, cultivation of the soil comes, and with it inheritance. The more value man gives to the soil, the deeper does property, as it develops, strike its roots. In the hands of the cultivator of the soil land becomes capital. Man draws this capital in a sense from himself, because capital is only an accumulation

of labor. He has therefore a just right to the possession of what he has produced, and of what his fathers produced before him. Immovable capital, like movable capital, is produced by human activity; to give them another origin is to introduce a fable in the place of facts. What we should say, what is true, is, that we ought not to consider property as a purely individual fact. The influence and power of society clearly cooperate, in its formation, with the action and the labor of man. Society is, in the hands of the individual, like a lever, with the assistance of which he lifts and removes burdens whose weight, without that help, would exceed his strength. Public power protects him, gives him that security which is the first implement of labor, and without which labor would be impossible. He can draw from the common fund of tradition and knowledge. Finally, he has an interest in producing, only because society opens up a market for his produce. — The right of property is then at the same time individual and social. Property is legitimately held and transmitted only on condition of paying tribute to the state, in the form of a tax. By the same title, in countries where vast tracts remain to be cleared up, the state fixes a price at which it makes concession of land, because these tracts have already a value given them by their nearness to civilization and the guardianship exercised by power. As private property is consolidated and extended, we see the public domain—that is, undivided property, the patrimony of the entire people, the wealth common to all and which every one can enjoy at any time—grow. Means of communication and transportation increase; the police, public works, schools, libraries, monuments, all unite to render existence surer, easier and more agreeable. Each one has in reality his part in this common treasure which is not exhausted, which rather grows, and of which the state is but the dispenser for general use. No longer either privileged persons, or parials, and, whatever any one may say, no longer any proletarians. Every one has the right of citizenship, which is far better than the right to labor. Thus, civilization gives to the individual far more of common property that it could have taken from him of private property. Let us add, that in modern society the proprietor does not possess for himself alone. Property resembles those trees whose every branch, reaching the limit of its growth, drops to the earth again, is planted, and pushes out new shoots around it. Property produces and multiplies property. It makes capital, the instrument of labor, more and more accessible from day to day. It grafts industry upon agriculture, commerce upon industry, and credit upon commerce. This spreading of wealth makes, for acquiring and possessing, the barbarous process of confiscation, spoliation and war unnecessary. Wages wait upon labor; from wages come savings, and savings find the market of property always open. In the system of M. Considérant and of Fourier landed property would alone be under obligations, and would be exclusively burdened with the right of usufruct in the soil; for this theory leaves out personal property, a new world, which equals, if it does not exceed, the value of landed property. Personal property would thus obtain a privilege impossible to explain, and would owe nothing to society from which it receives the same protection. Principles which admit of such exceptions are not principles. No; society can not hope to buy of individuals the property which is the very condition of order. The right of property can not have for corollary, counterpoise, nor for an offset, the right to labor. — It remains for us to show that the right to labor is the negation of the right of property, and that we can not admit the former without destroying the latter, as M. Prudhon himself admitted. We know that the author of "Economic Contradictions," the man who invented or renewed that hateful paradox, "Property is robbery," said one day to the committee on finance of 1848, in an outburst of frankness, "Give me the right to labor, and I abandon to you the right of property." The right to labor differs essentially, as M. Dufaure has noticed, from the various rights the free exercise of which it is the object of the constitutions of all countries to protect and guarantee. All these rights, in fact, are inherent in man; every individual can exercise and develop them in the sphere of his personal activity; it is a power he does not borrow, but which he draws, on the contrary, from himself, and which he only asks society to cause to be respected in him. Liberty to think, liberty to write, liberty to work and to possess, are in this condition The right to labor, that socialistic claim, must not be confounded with the right of working, that possession of every man, of which Turgot has rightly said that it is the highest, the most sacred, the most indefeasible of all. The right of working is nothing but the freedom which belongs to every individual, of employing his reason, his hands, his time, in the manner he deems most profitable; while the right to labor, as we have already shown, is a claim given to the individual against society as a whole, or against a portion of it. In the right to labor are at the same time a right and an obligation created. It implies, between the individual and society, a contract, by whose terms society owes subsistence to each of its members—a contract not reciprocal, and which would hold but one of the parties. For while the state would have to furnish individuals, on demand, means of labor and of living by labor, it would not be armed with power of compelling them to seek by labor their usual subsistence; thus would the superiority of personal right over social right be proclaimed. The individual would become the master, the tyrant, and society the servant, the slave. — M. Dufaure has not said too much. The right to labor is a species of servitude which is imposed on the whole community, in the interest of few or many, who would be tempted to avail themselves of it. Admitting this claim of the individual against society neces-

sarily brings two interests face to face, and exposes them to a struggle. Suppose that society resists, the result is a battle. There is on both sides a call to arms, recourse to force is had to interpret the right. The rioters of Lyons, in 1832, blazoned on their banner this device of despair, "Live working or die fighting." Article 8 of the draft of the constitution reproduced only the first portion of the popular credo, events have brought the latter part to light; neither logic nor the force of circumstances permits of their separation. When we give a right or cause of action to individuals against society, we encourage and even justify revolt. We raise again the standard of Spartacus; we raise it in the midst of a people who know neither the separation of castes nor the difference of ranks; we proclaim civil war between members of the same political family, between equals, between brothers. Let us suppose, on the contrary, that society submits, and, accepting the right to labor, is ready to accept all the practical consequences of the principle. Let us see whither this would lead. To decree the right to labor is to make the state a purveyor for all, assurer of all fortunes and *entrepreneur* of all industries. The right to labor is the right to capital, the right to wages, the right to competency; it is, in a word, the most extensive right with which individuals can be armed against the public treasury. When we go to the bottom of such a system, division of property seems a thousandfold preferable, because a community of wealth places at least on the same level the man who possesses and the man who does not; it takes, for the poor, only from the rich, and limits itself to making a new division of capital and existing incomes. The right to labor goes far beyond this; it is a seizure not only of that which is now, but of that which may be; it is not only the community of acquired wealth, but of producing power, perpetual servitude imposed upon the heads of society, in the interest of the numerous proletarians which society takes into her employ. — The right to labor, as I have said elsewhere, implies the permanent existence and the unlimited power of production, whatever the circumstances may be, or whatever the organization of society. What value then should a principle have which is outside the limit of possibility? A social state does not exist which assures permanence or regularity of production. Let a commercial crisis come on, or some check to consumption, making the supply greater than the demand, and you will see a certain number of shops close entirely or diminish in activity. Industry, like the solar year, has its seasons; and the harvest of labor, like that of the fruits of the earth, has years of sterility as well as years of abundance. The foresight of man holds in reserve for these difficult times capital accumulated by saving, but it does not give at will impulse to the power which produces; nor does it create labor with the wave of its wand. Man can always employ his intelligence and his hands; but motion is a different thing from labor. Labor is the useful employment of forces; it is recognized by its products. To effect production at will one must be able to enlarge and contract the limits of consumption, because the most necessary products receive their value from the use which is made of them. Of what use would it be, for example, to gather quantities of grain or herds of cattle into a deserted city? And of what use would the wealth of Mexico be under circumstances in which a kilogram of silver would not procure an ounce of bread? If the troubles would stop when one had said that the workmen had a right to labor, the prescription would be simple. The state would only have to furnish funds to workshops which were about to stop, and to give orders to manufacturers to produce. But manufacturing is not all. We must find buyers for the merchandise which we create, so as not to add to the glut of the market. Production should not be increased at just the moment that the market is closed or diminished. To add in such a case to the amount of products is to depreciate them. To allay the sufferings of the present, we thus add new embarrassment to the near future.—Socialists start from another supposition, which is not less extravagant than the first They establish a dualism between the individual and society, instead of considering society as a union of all forces, and as the aggregate of all intellects. They make it a creature of the mind, a power apart, a fanciful person, a kind of fairy which has hidden treasures and faculties without limit. All then demand different things and more than they bring with them into the community. According to the socialistic ideal, the state always gives and never receives. Socialists refuse to understand that the state is only rich by individual wealth; that it produces only by the labor of each and every one; and finally, that its power is the result of a number and concert of wills. In a word, they forget that if the social tree bears leaves and fruit it is because it strikes its roots into the soil, and draws thence nourishing sap. Let us, nevertheless, take the right to labor as the natural right of every man who possesses nothing. Let us admit, for an instant, the fiction which invests the state with a chimerical omnipotence: how will it fulfill the obligations with which it is weighed down? This system desires that every individual who does not find employment for his intelligence or his hands, or to whom the employment which he has found does not suffice to give means of living, shall be allowed to ask from the government the work which he can not find, or a lucrative employment in the place of his labor which produces little. Thus the state would have to employ all unoccupied workmen, and make up for the insufficiency of wages. It would have to make up for a lack of demand in the market, and undertake to furnish the instruments of labor. In the social organization of France, when a prolonged stoppage occurs in manufactures, or when there are too many agricultural laborers, then, and only in extreme cases, the state and the communes

open charity shops. They call upon the poor to macadamize the roads. All property owners bleed themselves to pay these workmen by their accumulated contributions. But under the system of the right to labor, things could not go on in this way. The workman armed with his absolute title, would not be content with the labor society had chosen and allotted for him. He would demand the work for which he thought himself fit, and require the most abundant remuneration. He would wish to follow his profession under the most favorable conditions: and determining the kind of employment, he would also fix the return for it. He would inform himself neither of the condition of the markets nor of the treasury. The wages that would be coming to him, a sum due to him by the state, would preserve an unvarying level. Thus the right to labor would lead to the complete exhaustion of property. This servitude would have no other end but ruin. — In his admirable discourse upon the right to labor, M. Thiers incidentally gave an opinion with which socialists can arm themselves against him, and which is astonishing, emanating, as it did, from a mind so eminently practical. He admitted that the state holds in reserve for moments of stoppage or times of crisis, independent of great public works, a certain number of orders to distribute to industry. This would not be good, and seems hardly possible. A state, like all other consumers, buys and produces only as the wants of consumption become apparent. Its disbursements are annual, like its revenue, and it apportions them according to its political necessities. In the system marked out by M. Thiers it would reserve the progress of works and the bulk of the apportionments for calamitous times, which might not coincide with the greatest needs of the service. It might order, for example, the cloth and the linen to clothe a million soldiers, when it had not a hundred thousand men in arms. It would thus heap up in the state merchandise which would represent a large amount of capital, and it would be exposed to the danger of losing this capital through many years. It would be the same with public works. In order to develop them in times of crisis, states would have to support, during periods of prosperity, a numerous staff, to double and treble the size of the list of their officers. They would have to create, in the first place, sinecures, from which they might draw the elements of active service, when times were bad. I know of no system less rational or in any way more fatal to the finances. But the gravest side to this experience is, that one would call upon the state to make its greatest effort and its greatest sacrifices under circumstances in which its resources would diminish with those of individuals. Men would place it under obligation to add one or two hundred millions to public disbursements at the very moment when the returns from direct taxation would be reduced, and when, even by paying a high rate of interest, it would be impossible to borrow. In a word, to use an expression of M. Thiers, they would ask for the largesses of the rich for a treasury which would be only the treasury of the poor. — The right to labor carries with it the organization of labor. There is not room in a free society, and one which belongs to itself, for a proletarian aristocracy. As long as capital and property count for anything, they will protest against the chains with which socialists try to bind them. The ramparts of civilization must therefore be demolished to introduce this weapon of war. Social order must be transformed. Liberty must give place to monopoly; the action of individuals to that of the state. No more property, no more inheritance. The state must own everything, must produce everything, must distribute everything. The state must supply labor, and divide the wealth produced. The right to labor has neither sense nor value if it does not mean that every individual applying to the state to obtain employment has a right to the kind of employment for which he is best fitted; that the tiller can demand that he be given a plow to drive and land to cultivate; that the tailor shall receive orders for clothing; that the mechanician be asked to build a locomotive; that the painter be ordered to decorate palaces or churches; that the historian shall find hearers for his lessons, or readers for his writings. This supposes that the state has all rights and all power. It means that the government is the master, to regulate as it sees fit, or as the crowd sees fit for it, production and consumption, the loan of capital, the hours of labor, and the rate of wages; that in society there is no landed owner, no capitalist, no industrial and commercial manager, but the state. To have the right to labor is to have the right to wages, to wages which assure the subsistence of the workman; and as the needs of subsistence ("to each one according to his needs," said Louis Blanc) vary with situations and individuals, it is having the right to wages which the laborer determines himself. Under the rule of industrial freedom no person has the right to fix the rate of wages, which follow the fluctuations of the market, and obey a law superior to the will of the employer as well as that of the employed. — To have a right to labor is to have a right to the instruments of labor, to capital and credit. The army of laborers can not do without officers to lead them, any more than the army of soldiers. These officers are produced with the freedom of industry. They are the capitalists, manufacturers, inventors, contractors, head clerks, officers. They obtain these posts through merit, or through services rendered, or because of their experience. But from the moment that the individual has the absolute right to demand employment in his own sphere of aptitude, he can also demand that he shall be placed in those conditions which are most favorable to bring his intelligence and power into play. We thus see that the right to labor in individuals supposes necessarily the monopoly of labor in the hands of the state. We go back to the childhood of society. This system treats emancipated

man, man arrived at the age of liberty, of strength and of enlightenment, in the same way that man in the age of ignorance consented to be treated, by the powers which placed him under guardianship. It is a question of overturning all the processes by the aid of which civilization has progressed in the world up to the present time. This necessary consequence of the system, admitted by the most frank defenders of the right to labor, has been contested by those whom I will call neophytes ashamed of socialism. They have held, that society interfered even now in questions of labor, that this interference was legitimate, and that, having already taken upon itself to guarantee to a certain extent the profits of the capitalist, the government might, with greater reason, guarantee the workman his wages "I do not speak to you," said M. Billault, in the session of Sept. 15, 1848, "of the irregular and transitory interventions, which in trying moments weigh upon the treasury, upon the government, and end in national workshops, in riots, or in aid more or less happily distributed. It is something more normal, more permanent, which I wish you to notice. The authority of society is engaged in such a manner in all combinations of national labor that there is not a single point at which it does not touch it. It is society itself, which by these customs tariffs, by their prohibitions, differential duties, subsidies, combinations of every kind, supports, retards or advances all the combinations of national labor. It not only holds the balance between French labor, which it protects, and foreign labor; but at home the diverse industries see it often and unceasingly interfere among themselves. Listen to the perpetual claims made by one against the other before its tribunal. See, for example, the industries which use iron complaining of the protection accorded to French iron against foreign iron, those which use linen or cotton thread protesting against the protection accorded to home manufacture against the introduction of foreign thread; and so on with others. Society, therefore, thus finds itself obliged to mingle in all the struggles, in all the embarrassments of labor. It interferes in them actively every day, directly or indirectly; and the first time that you have to consider a question of customs, you will see that you will be forced, willingly or unwillingly, to take the part yourselves of all interests." M. Bastiat has pointed out the identity of tendency which exists between the protective system and communism. Indeed, protection, by means of a tariff, is a guarantee that the state, in the name of society, gives to certain industries, against similar foreign industries; and the moment this principle is admitted, all branches of national labor can claim the same assistance. If the state guarantees a minimum of profit to the capitalist, it is not easy to see why it should refuse a minimum of wages to the workman. Protection should extend to all producers under pain of degenerating into injustice. Even under this hypothesis it sacrifices consumers to producers. The state builds up the fortune and insures the well-being of one class of citizens at the expense of other classes. It takes what it gives to certain ones from the pockets of all. This is the right to labor recognized by way of a guarantee. It is the organization of labor under the form of partnership. It is indirect communism, but, after all, it is communism. Advocates of protection have nothing to urge against the theory of the right to labor. All privileges grow one from another. Only those are in a position to combat the arguments of socialists who hold that the protective system is an economic heresy, and industrial privilege an evil. Let us, however, exaggerate nothing. Protection is not a new phenomenon. It has a tendency to diminish. — Outside of the organization of labor, which is absurd and would be impossible in any case, the right to labor becomes a simple right to assistance. In this attenuated and at the same time unreasonable form, it is recognized in France by solemn vote. The constitution of 1848 is no longer of authority in the country, but the errors which it accredited and sanctioned still remain. Right is something certain, and power something uncertain. There is boldness in attempting to establish a direct relation between these two terms in the social order. Society will do nothing which Providence has not willed God has permitted suffering and misery in this life. The best ordered state will not be able to suppress them. Progress of well-being is incontestable. It has grown, it will grow; and our efforts should tend to augment it still more. But let us not dream of an age of gold. Society should, as far as its resources allow, and within the limits authorized by wisdom, come to the assistance of unfortunate individuals; because individual foresight does not exclude the foresight of all. We must be careful, however, not to convert the duty of society into a right of the individual. If you say that all those who have reason to complain of their lot have the right to draw assistance from a common fund, you recognize that they may call society to account. You legitimize and even preach revolt. The right to assistance must invariably lead in the long run to the demoralization of individuals, and the weakening and ruin of the state. The law of Elizabeth proclaimed this right, as we have already shown—the law which gave birth to the poor tax. The poor tax in England was intelligible. It represents *a priori* the equivalent of spoliation exercised by the rich against the poor, by the Norman against the Saxon, and that upon the largest scale. The aristocracy divided the land by right of conquest, and confiscated to its own exclusive advantage the public wealth and the wealth of the churches. Finally, it imposed the burden of taxes upon the laboring classes, and reserved the patronage as well as the lucrative positions of the government for itself. Did it not owe a compensation in return—an indemnification to the people whom it had excluded from all the goods of this world? The poor tax was this indemnity. The evil results

of the system are known. In 1832, the time when the excess of the evil had caused an attempt at reform, the support of the poor cost England and Wales more than seven millions sterling a year. A little more increase to this tax, and the revenue of the landed owner, rent, would have been absorbed by it. Yet the poor did not become rich, while they ruined and consumed the wealthy; because misery and degradation were extending insensibly to the whole country. Assistance was given instead of work, or to serve as a supplement to wages. When parishes themselves employed the poor, their labor was a farce. The result was, that, on the one hand, the working men assisted by the parishes, fell into indolent ways and into debauchery, laying upon society the duty of nourishing them, and considering the alms which they received as an acquittal of a debt due to them: on the other hand, that the free laborers and those who wished to owe to labor alone their subsistence, as well as that of their families, having to meet the competition of laborers hired by public charity, saw the rate of wages lower, and found themselves led, against their will, by the insufficiency of the remuneration which they obtained for their daily labor, to solicit the assistance of the parish. Besides, as aid was proportionate to the number of persons in each family, it was to the interest of the family to contract premature and unwise marriages, because their revenue, or rather the prize offered to their inaction, grew with the number of their children. Immorality had no longer a check, because children born outside of wedlock fell to the care of the state. The reform of 1834 gave, as a corrective to the right of assistance, the duty of labor. The administration of public aid was authorized to detain and put to work all able-bodied persons who asked aid. Houses of charity and labor thus became at the same time prisons. The wife was separated from her husband, and the mother from her child. To give to the poor a taste for labor they attempted to disgust them with alms. The prosperity of the country, and the activity of industry coming to their assistance, there was obtained in a few years a considerable saving in the department of public charity. In 1837 the support of the poor, notwithstanding the growth of the population, cost barely four millions sterling. An annual saving of three millions was the result of the reform. — It is an axiom accepted in England under a government of which property is the essential foundation, that property has duties as well as rights. How far do these duties extend, and what is their nature? Should the owner of property support, nourish, take on himself as a burden the man who has none? Is this an obligation by natural law? a species of servitude attached to wealth? Property would perish under it. We can conceive that in a despotic government the master would be responsible for the slave, and the feudal lord would have to care for the serfs who live upon the manor, because there exists here a sort of reciprocal obligation. The serf has the right to receive support from the proprietor because the proprietor has a right to the labor of the serf; but to emancipate the laborers from the soil in the first place, afterward from the claims of monopoly, and then to hypothecate property for their subsistence, would be a contradiction. It would be confounding the conditions of liberty with those of slavery. The social bond unites men among themselves in mutual dependence, but in making this dependence too strict, in stretching the chain beyond measure, we risk its breaking. We must not immolate the individual to society, nor *a fortiori* society to the individual. Let us hold aloof with equal vigilance and equal energy from communism and egotism. Let not charity cease to be a moral duty, but do not make a legal obligation of it. M. Thiers demonstrated that the right to labor once recognized would destroy emulation among laborers; that is, the principle which urges one man to do better than others, and which is the cause of progress, of wealth in individuals. M. Dufaure demonstrated that the right to assistance would destroy human forethought, that is to say, the principle upon which the future of each individual as well as the future of society rests. "When the workman," the eloquent orator said, "shall once have acquired the habit of working as people work for the state for a stipulated salary which he is always certain of drawing, his taste for labor will gradually disappear. He will fall into indolence, idleness, and into all the vices which follow as a consequence. More yet, he will set this example to his children. You will have in the country an aristocracy of indolent families to whom the state will pay salaries; which will grow larger each day, and continue to grow; an aristocracy which, on the one hand, will ruin society, and, on the other, will see little by little its courage decrease, the enervation of all its strength, and the corruption of all its better instincts. The right to labor and the right to assistance are, in the thought of the socialists who use these expressions, but means to change the distribution of wealth. The state has not the capacity to do this. The laws which regulate the distribution of wealth in the social world are above the action of public powers. The state should see that the burdens of society should be equally divided among its members in proportion to their wealth. The state should endeavor to remove the obstacles which shall stop or hinder the development of enlightenment or production; but it should never forget that if it be a collective force, if it represent the association of individuals, it is not their absorption. And after all, what is the end sought for? What is wished to be done? When the right to labor and the right to assistance are proclaimed, it is hoped doubtless, by means of this seizure of the accumulated results of production and of capital of every kind, to destroy poverty. An effort may indeed be made to diminish its extent and to moderate its effects, but to go beyond this, is, in a

way, to condemn providence. Evil exists upon the earth. It is a consequence of human liberty. A man can be deceived in his calculations, neglect his duties, relax his efforts, disregard his true interests. After all his faults, the punishment must appear, and this punishment in this world is, morally speaking, the loss of wealth, and the loss of the esteem of his fellow-citizens. The fear of losing goods so precious is the sole rein which keeps man from utter ruin. The desire to acquire them is the real force which quickens and develops his energy. Progress is born of difficulties. By taking poverty out of the world we would be taking labor out of it, and the law of labor is the very law of existence.

LÉON FAUCHER.

LAISSEZ FAIRE—LAISSEZ PASSER. These two formulas, which are frequently met with in economic, political, social and socialistic discussions, were invented by the physiocrates. By *laissez faire* they mean simply *let work*, and by *laissez passer, allow exchange;* in other words, the physiocrates demand, by these phrases, the liberty of labor, and the liberty of commerce. —These two phrases have never been used by economists in any other sense; but the partisans of interference of all forms—socialists, protectionists, administrationists and interventionists—have often pretended to believe that they were the expression of the *liberty to do everything*, not only in political economy, but in morals, in politics and in religion. Jabard made this same assertion, about half a century ago, in the numerous pamphlets which he published, and even went so far as to assert that by *laissez faire* and *laissez passer* economists understood "unrestrained depredation." To repeat such an interpretation is sufficient refutation for any serious, thinking man who does not close his eyes in order that he may not see, and stop up his ears that he may not hear. Economists do not apply their axiom to morals, politics or religion, which subjects they do not consider at all as economists, but only inasmuch as they relate to human activity and human industry; they do not pretend that men should be allowed to do everything, and that everything should be allowed to pass, but simply that men should be allowed to work and to exchange the fruits of their labor without hindrance and without being subjected to preventive measures, under the protection of laws repressing attempts against the property and labor of another. —Dupont de Nemours thus relates the origin of these formulas in his preface to Turgot's "Eulogy of de Gournay": "M. de Gournay, who was the son of a merchant and had long been actively engaged in commercial pursuits himself, had recognized that manufactures and commerce could be made to flourish only *by liberty and competition.* They discourage rash enterprises, and induce reasonable speculation; they prevent monopolies, restrict the private gains of merchants for the benefit of commerce, quicken industry, simplify machinery, diminish the burdensome expense of transportation and storage, and lower the rate of interest. They secure the highest possible price for the products of the earth, for the benefit of the producer, and the sale of these products at the lowest possible price, for the benefit of the consumers, for their satisfaction and enjoyment. He concluded from these observations that commerce should never be submitted to any tax or interference, and drew from them this axiom: *laissez faire, laissez passer.*"—But it seems that this axiom was inspired by a reply made a long time before to Colbert when inquiring about measures favorable to the interests of commerce, the justice of which had impressed itself upon the friends and disciples of Quesnay. "It is well known," says Turgot, in his "Eulogy of de Gournay" already quoted, "what the reply of Legendre to Colbert was: *Laissez nous faire*, (Let us alone), to which Quesnay added, somewhat later: "Do not govern too much "

JOSEPH GARNIER.

LAMAISM. The religion of the Thibetans, which is also that of the Mongols, and, under a slightly different form, that of Bhotan, is called Lamaism by Europeans, from the word Lama, the title of the high dignitaries of the priesthood among these nations. It is Buddhism corrupted by a mass of heterogeneous elements. Brought to Thibet, in the middle of the seventh century, both from China and Nepaul, the doctrine of Buddha was propagated there with the alterations which it had undergone in the latter country, where it had been mingled with the impure worship of the personification of the female principle, as it appears in Sivaism. This Buddhism of the Tantras, books in which, according to Eugene Burnouf, purely Buddhistic elements scarcely appear, received new alterations in Thibet, where it could only be propagated by making concessions to the superstitious beliefs already in existence there. The previous religion of the Thibetans consisted merely in magic practices by which the priests conjured away the malignant action of the spirits of the air and the mountains. This rude Shamanism which still exists in certain remote valleys of lower Thibet, left prominent traces in Thibetan Buddhism. The holy personages of the legends of that country are connected with sorcery on some side, and the inhabitants of Thibet, Mongolia and Bhotan have never ceased to dread the malign influence of spirits. Nevertheless at an early period and at various times attempts were made to introduce reforms into the Thibetan religion. The object was to change the Buddhism of the Tantras for that of the Sutras. The principle of this movement originated, without doubt, in the Buddhist monasteries of China, in which the doctrine of Mahâyâna (the great vehicle) was professed. For a long time these attempts were fruitless; but at the end of the fourteenth century the reform was carried out decisively by Tsong-Kha-Pa, a religious personage, born toward 1330 in the country of

Amdo, to the south of Koukou-Noor, and placed almost on the same level as Buddha in Mongolia as well as Thibet. — The object of the reformer was, without the least doubt, the re-establishment of primitive Buddhism, but he lacked the necessary knowledge to discover the work of Buddha under the numerous layers of interpretations with which it had been successively covered. He stopped at the doctrine of the Mahâyâna which he mistook for primitive Buddhism, and he endeavored to abolish the magic practices derived from the Tantras and the ancient superstitions of Thibet, and restore the asceticism which is in reality one of the marked and genuine traits of pure Buddhism. On the first point he only obtained incomplete results. The practice of magic was restricted, but not abolished. In the largest monasteries of Thibet there is an official diviner who, on certain grave occasions, is formally intrusted with predicting the future, conjuring the elements, etc. On the second point the success left nothing to be desired. Ascetic practices form the chief employments in the monasteries, the members of which are subjected to celibacy, confession, frequent fasts, and numerous spiritual retreats. — Lamaism, conformable in this point to ancient Buddhism, has no secular clergy; its priests of all ranks are monks, living in monasteries (in Thibetan, *gonpa*, solitude, *monasterium*). Their generic name is Ge-sslong (practicing virtue), a name conferred on them by Tsong-Kha-Pa, when he gave them the yellow bonnet, the distinguishing color of primitive Buddhism. In places where the reformation has not penetrated and where the ancient red Lamaism is still maintained, the monks still enjoy the right of marrying and living with their families. — According to the precepts of Buddha, the Lamaist clergy is supposed to live on the alms of the laity: in reality they possess immense wealth. The devout Thibetans have found in their indigence the means of enriching the monasteries. The number of the religious class of both sexes in Thibet must form about one-fifth of the whole population, each family devoting at least one of its children to monastic life. But it must be added that this clergy has never abused either its power or its wealth, though the veneration which it inspires is carried to absurdity. — In principle the monasteries were independent of each other. In the eleventh century, the superior of Sa-Khya, one of the richest monasteries, laid claim to the supremacy. He found a powerful antagonist in the Grand Lama of the monastery of Bri-Goung. He first sought the arbitration of the emperor of China, who did not fail to decide the case in his favor, and in spite of the protest of the Lamas of Bri-Goung, those of Sa-Khya, thanks to the protection of the Chinese government, dexterous in taking advantage of this occasion to interfere as a protector in the affairs of Thibet, remained sovereign pontiffs in the Lamaist church till the period of the reformation. — Tsong-Kha-Pa deprived them of this supreme dignity. At his death he left the government of religious affairs to two of his disciples, of whom one, the Pan-Tschen-Lama, had charge of teaching, and the other, the Dalai-Lama (or, more correctly, Talé-Lama), of watching over discipline. In a church in which everything is finally reduced to observances, the chief of discipline must soon overshadow the master of instruction, and this is what has happened. The Dalai-Lama became the sovereign pontiff, as well as sovereign of Thibet. The Pan-Tschen-Lama is merely his adjunct in a certain way. The first lives in one of the monasteries of Mount Potala, a quarter of a league from Lhassa, and the second in the monastery of Lhoun-Po, in lower Thibet. The Dalai-Lama has, as vicar in Mongolia, the Grand Lama of Khouren. — Without being the equal of these eminent personages, the superiors of monasteries are, like them, Choubilghans (those who are reborn), that is to say, incarnations of the Bôdhisattvas, divine beings who, in order to preserve always among weak men the good doctrine of salvation, never cease to appear under a human form. It follows from this belief that, when a Lama dies, or, to speak the language of the Lamaist religion, is deprived of his earthly wrappings, it is necessary, in order to give him a successor, to find under what new earthly wrapping the Bôdhisattva of which he was the incarnation has deigned to appear. — Affairs have been managed as follows since the end of the last century, that is to say, since the emperor of China, under the pretense of protecting and honoring the Dalai-Lama, freed him from the care of governing Thibet. Whenever it is a question of replacing any high dignitary of Lamaism, the names of male infants born since the death of the Lama to whom a successor is sought, are collected and sent to the monastery of La-Brang, at Lhassa. Among the children registered, three are designated who bear the mark of Choubilghan, which the Lamas and the chief diviner are called on to prove, under the inspiration, of course, of the Chinese delegates, who are careful to choose those whose families offer some guarantees to their government. The three names are placed in a golden urn sent for that purpose to Lhassa in 1792 by the emperor of China, and after the high dignitaries of the Lamaist clergy, united in conclave, have prepared for this ceremony by six days of retreat, of fasting and prayer, one of the tickets is drawn from the urn by the most aged; the child designated by lot is proclaimed successor of the deceased Lama, and the two others receive presents to console them. When it is a question of replacing the Dalai-Lama, the drawing of lots takes place at Pekin, in presence of high Chinese functionaries and under the presidency of the Tschan Tscha, the delegate and representative of the Lamaist church near the emperor of China. To prove that there was no mistake in the lot in declaring the newly elected as the same person whom he is called to replace, or, more correctly, to continue, the child at the age of four or five must show

that he has some reminiscences of his previous existence. It never happens that he makes a mistake in this examination. — This method of appointment to high ecclesiastical functions does not appear suited to put eminent men at the head of the church; but in reality nothing is less needed. The whole office of a Lama consists in allowing himself to be venerated with proper dignity, in knowing how to vary his blessings according to the ritual, and in practicing with the greatest accuracy the formalities of worship. It is easy to train a child to these different exercises. If a difficult case appears, there are always at hand some adroit monks trained to their profession; the threads which move the automaton are held by them, whenever it is necessary that it should issue from its repose. Besides, the real directors are, since 1792, the two Chinese delegates resident at Lhassa. — It would be a mistake, however, to suppose that all the Dalai Lamas were empty shadows. There were among them, especially in the sixteenth and seventeenth centuries, men who knew how to conduct the affairs of their church with rare ability, and to extend their influence over neighboring peoples with an astonishing adroitness Their wisdom perhaps was a little too often equal to that of the serpent, and the readiness with which they employed pious frauds to further their ambition casts a certain shadow on their moral character; but they had not always a choice of other means: it is probable, moreover, that in their eyes the end sanctified the means, and it must be added that habit left them no scruples in the employment of duplicity and apocryphal miracles. Not all, however, gave themselves up to the crookedness of a tortuous policy. There were noble characters among the high dignitaries of the Lamaist church; among others must be cited Pan-Tschen-Erteni, who died at Pekin in 1780, a victim, perhaps, of Chinese policy, and who is so often mentioned in the account of Turner's "Embassy in Thibet." — Lamaism, as is sufficiently shown by the preceding, is a religion with very few spiritual elements, not raised above the simple *opus operatum*. It is almost entirely made up of pilgrimages, processions, continual offices in the temples, the endless repetition of formulas of prayer, principally of the prayer of six syllables. This last is composed of the following words: *om mani padme hoûm*, and is almost always on the lips of the Thibetans, lay and clerical. Religious merit is measured by the number of times this prayer is recited, the rosary being used in counting the repetitions of the prayer; and the general prosperity is in proportion to the care used in reproducing it in speaking, writing and engraving. It is written on flags floating in the wind from the tops of lofty poles, on public edifices, on housetops. It is written in gigantic characters on the sides of the mountains, fastened to trees, painted on the walls, and engraved on household utensils. — In order that this prayer should be in movement incessantly, and doubtless also to obey the precept given by Buddha, to turn the wheel of the law continually, a figurative precept literally understood, the celebrated praying machine was invented. This is a cylinder made of wood, copper or leather, filled with little strips of paper, on which the six precious syllables are printed, and is put in movement by a crank Stirring these pieces of paper is a pious work profitable to him who moves the machine Large machines of this kind are placed in the vestibules of temples, on the public squares, and in the principal streets, to enable passers-by to fulfill their religious duties. In pious families there are small machines, and they are put in motion as often as possible. Wealthy persons have a servant especially appointed to this labor Finally, we see in Thibet and in Mongolia praying machines moved by water power and by windmills Among the Thibetans and the Mongols the clergy do not doubt, any more than the laity, that this celebrated prayer which they pompously call the way of deliverance, the gate of salvation, the bark which bears the soul to the haven, the light which dissipates the darkness, and which constitutes all religion for the majority of them, is simply an invocation of the universal generative power, expressed here under an obscene symbol, but very much used in Sivaism which reproduces it in all its temples by sculpture and painting. But the less the theologians of Lamaism understand its real meaning the more they are able to give mystic explanations of it They give assurances that it contains a sublime doctrine, the extent and profundity of which could not be measured during the longest life. In general, they see in it a symbol of the transmigration of souls through the six realms of successive births, realms represented each by one of the six precious syllables, or, further, the elevation of the soul toward perfection, by passing through the six transcendent virtues, each of which is also expressed by one of the six syllables. (The prayer of six syllables is in Sanscrit, a language entirely unknown to the Lamas.) — It can not be said, however, that there is not a certain show of science in Lamaism. There is no monastery in which a monk is not intrusted with the instruction of novices. In the most considerable there is a superior instruction. But the studies pursued in them bring merely the memory into play; numerous prayers of the Lamaist church are committed to memory; the best scholar is the one who can recite the greatest number of these. The novices are instructed in the performance of ceremonies. The rules of contemplative life are explained and supported by the edifying examples of the saints of Buddhism. Metaphysical subtleties do not appear to be wanting in Lamaist science, subtleties which recall those of the theologians of the middle ages, and which have no other object than to give an appearance of reason to the things most unreasonable. In substance, this science has not for its object the search after truth; like scholasticism, it seeks simply

to demonstrate a fixed, immutable doctrine, which is laid down, without discussion, as the truth, but which is the truth only for those who believe in it. Magic also forms a part of Lamaistic science. It is only taught at Lhassa, in the two convents of Ra-mo-tshe and Mo-rou. At these places those come to study who wish to become masters in the art of conjuring spirits, commanding the elements and practicing sympathetic and magic medicine. Lamaist science rests entirely on two collections of sacred books, namely: the Kah-gyour (a translation of Sanscrit texts) which is composed of 1,083 different writings, and the Tah-gyour (an explanation of the doctrine) which is still more voluminous than the preceding. By the side of these two enormous collections, which Alexander Csoma first brought to the knowledge of Europeans, there exist thousands of works, the greater number of which are edifying books, collections of prayers, or legendary accounts of the lives of saints of the Lamaist church.—Thibet has as good a title as China to be called a country of books. And still in this country where for centuries the printing press has been in active operation, where the reproduction of a writing is considered to be a holy work which will have its reward in heaven, where men bow down before a few pages covered with characters with as much respect as before the living Buddha, not a single clear idea on religion has been acquired; men are in the most profound ignorance of history and the laws of nature; reflection has not been aroused to any of the great problems, the solution of which, or at least meditation on which, seems to be one of the wants of the human mind; the social condition is not raised above the level of the infancy of peoples. Would not the history of the country of snow prove the vanity of all that has been spoken and written among us on the eminently civilizing rôle of the printing press? After seeing what has taken place in Thibet, it is difficult not to admit that the press is an instrument as much suited to the enslavement of the mind as to its emancipation and development. Europe would probably be still at the point where the Thibetans stopped more than ten centuries ago, if printing had only served, in the hands of Dominicans and Franciscans, to reproduce the legends of saints and scholastic *Summæ theologiæ*. Printing became an auxiliary of liberty and intellectual and moral progress, only through the great movement which, in the sixteenth century, transferred science from the hands of priests to those of laymen, and to the new spirit which the study of the great writers of Greek and Roman antiquity raised up in the west. (See BUDDHISM, BRAHMANISM, THEOCRACY.) MICHEL NICOLAS.

LAND. Considered from an economic point of view, land appears in the first rank of natural wealth susceptible of appropriation. Land is at the same time the principal deposit of capital accumulated by the labor of the generations which have preceded us in civilized life; it is in some sort but a manufactured tool, which intelligent cultivation incessantly improves instead of using. We shall not dwell upon the great economic properties of land, which have been made the object of special articles, but we must briefly point out the well-known laws that regulate the value and price of land.—Adam Smith long since observed the relation which exists between the value of landed property and the rate of interest. When interest is high, in time and space, the price of land is low; when, on the contrary, the rate of interest is lowered, the value of land increases. The reason of this is, that land, no matter what transformation it may undergo in the possession of its owner, is always and necessarily capital intended for reproduction. The owner may diminish and almost destroy this capital by neglecting to cultivate it or by cultivating it poorly, but he can never destroy it while society retains its influence. Thus, land is always acquired to be employed in reproduction, and it can only be exchanged for capital, which its owners intend for the purposes of reproduction. Now it is the scarcity or abundance of precisely this kind of capital which raises or lowers the rate of interest. The consequence of this is that, while the usefulness of landed property varies but very little, its value and price undergo frequent and considerable changes, according as available capital for reproduction is scarce or abundant in the market, and that the price of land always follows the fluctuations of the credit market. Another result of this fact is, that the avenues open to capital which is intended for reproduction directly tend, as far as investment is concerned, to lessen the value and price of landed property. Thus, for example, when Louis XIV. established *rentes* in order to obtain the funds necessary to build the palace of Versailles, he certainly diminished the market demand for landed property.—In countries whose inhabitants make no savings, because of a defective social condition, land in a manner loses its market value. It is said that there are no buyers because each one prefers to keep his land rather than to exchange it for a sum which represents two or three times the amount of its revenue. We may add that in these countries, in which saving does not lead to the accumulation of movable wealth, the means of exchange are so limited that the revenue of the land is scarcely anything. Thus the market value, and the price of the land as well as the revenue which it produces, are in exact proportion to the saved movable property which can be offered in exchange for it. Both are dependent upon the force of the tendency of the owners of movable property to save and accumulate.—When a country has little or no foreign commerce, the accumulation of movable capital and the price of land advance very slowly, but in parallel lines. It is otherwise when the products of a country are absorbed by foreign commerce, as is the case in the Danu-

bian provinces and southern Russia; then the revenue from the land increases, without any increase in its price, and without it being possible to insure the revenue to a farmer, because there is no security either for a farmer or for a purchaser.—As the price of land in civilized countries is affected by the fluctuations of the credit market, it is temporarily reduced by commercial crises: it depends upon the movement of an amount of capital always very moderate, if we compare it with the total of the land in a country; a fact which causes results that seem strange at first sight, and not proportioned to their causes. By reason of this intimate relation between the price of land and the credit market, it was once possible in France to say that the country had been made poorer by twenty thousand millions, and subsequently that it had grown richer by an equal amount; overlooking the fact that, while the fortune of a private individual is specially affected by the phenomena of exchange, the wealth of a country depends above all upon the utility of the objects which it possesses.—It has been sometimes asked if the numerous investments represented by titles which are for individuals, thanks to exchange, movable capital, tend to raise or lower the price of landed property. Considered as an investment, it is certain that the sale of titles which carry with them the right to the enjoyment of an income is a competition with land; but the judicious employment of the money obtained by this sale may have the effect of adding to the wealth of the country, that is, to its means of saving, to such an extent as to add more to the value of the land than the investment took from it.—Adam Smith seems to suppose that the price of land is in proportion to the rate of interest, in this sense, that land would produce the same revenue for its owner as an investment in movable property. This is not exactly correct: landed property nearly always produces a revenue less than fiduciary investments, or, in other words, land is always, on an average, dearer than the titles of these investments.—Land is, of all species of property, that whose lot is intimately united to the lot of society, considered as a collective living being, capable of enjoyment and privation, of wealth and poverty. It is in some sort the great savings bank in which is laid up the greater part of the capital which the present generation leaves to that which is to follow after it. COURCELLE-SENEUIL.

LAND OFFICE. (See PUBLIC LANDS.)

LANDS, Public. (See PUBLIC LANDS.)

LANE, Joseph, was born in Buncombe county, N. C., Dec. 14, 1801, settled in Indiana, and was thence appointed governor of Oregon territory, in 1848. He was delegate from the territory to congress 1851–7, and United States senator 1859–61. He was warmly pro-southern in his political sympathies, and in 1860 was nominated for the vice-presidency by the Breckinridge democracy. (See DEMOCRATIC PARTY, V.)—See Savage's *Living Representative Men*, 357.

LA PLATA. (See ARGENTINE CONFEDERATION.)

LAW, Canon. The two expressions *canon law* and *canonical law* are continually taken one for the other, and are applied indifferently, as well to the science of canons and ecclesiastical laws as to the body itself or collection of these laws. Still, Doujat, author of a history of canonical law, after having acknowledged that in common usage no distinction is made between these two terms, thinks that by canon law should rather be understood the body of ecclesiastical laws, and by canonical law the science of these laws. As for the word *canon*, which, in Greek, signifies rule, it is taken in its most general sense for all ecclesiastical law or constitutions, and, in its most restricted sense, for those constitutions which are inserted in the body of the law, old as well as new.—Canonical law rests upon the following bases: 1, and chiefly, the Holy Scriptures; 2, the authority of the general councils and that of the particular councils, "whose discipline has been received by all the church"; 3, the constitutions of the popes; 4, custom, which has also great authority "when it is commendable and established by long practice, by the consent of the pastors of the church, at least by their public knowledge." (Fleury.)—The body of canon law, properly speaking, is composed of six parts, which have each a special name. These are so many compilations of canons, decrees and decretals, which have been drawn up at different times and inserted successively in the *corpus*. The first part is a full collection of all kinds of ecclesiastical constitutions, made by Gratian, a monk of St. Benedict, and published about the middle of the twelfth century. It is known under the name of the *Gratian decree*, or simply the *decree*. This compilation had been preceded by many others: but, more complete and better arranged, it took their place in the schools and consigned them to oblivion. It was carefully revised under the supervision of Pope Gregory XIII., and, after this work of correction, was recommended to the faithful by a bull of June 22, 1582. The second collection is that of the decretals of the popes, which was made by Saint Raymond of Pennafort, under the auspices of Gregory IX. This collection embraces all the letters of the popes presenting any interest, which appeared from the year 1150 to the year 1230, and, besides, some decrees of the councils and decisions of the popes which had escaped the notice of Gratian. It was divided into five books; Boniface VIII. had the subsequent decisions collected in a sixth book, which, by reason of this, was called the *Sextus*. The next collection was called *Clementinus*, because it was devoted to the canons of the council of Vienna, presided over by Clement V., and to the constitutions of that pontiff; the *extravagantes*, a series

of constitutions of John XXII, which, at first, remained outside (*extra*) the *corpus*, and was only inserted in it some time afterward; and the *extravagantes communes*, a last collection, which contained the constitutions emanating from different popes. Here stops the law styled *new*, in contradistinction to the law anterior to Gratian, or ancient law. The law called *newest* is composed of subsequent canons, decrees, etc., which have not been inserted in the *corpus*, but which none the less have an authority of their own. Canon or canonical law must not be confounded with the *civil ecclesiastical law*, which comprises the laws made by the temporal power to regulate certain relations of church and state in certain countries of Europe. GASTON DE BOURGE.

LAW, Common. This term is frequently used in contradistinction to all statute law, sometimes in contradistinction to the civil or canon law, occasionally to the admiralty and maritime jurisprudence, and very often to equity. Its proper signification, however, is an unwritten law which receives its binding force from immemorial usage and universal reception, in distinction from the written or statute law. Its rules or principles are to be found only in the works of institutional writers, in the records of courts, and in the reports of judicial decisions, and it is overruled by the statute law. Its origin is indefinite and can be traced only to the ancient customs of the early people of England, more particularly known as the "ancient Saxon privileges" or the body of laws and privileges framed by Alfred the Great and reaffirmed by Edward the Confessor. The spirit of these ancient laws is assumed to have descended with the race, and to have continued to be developed and the laws to have been framed, and the common law expanded, from the original Saxon vigor, even after the Norman conquest. This ancient code is assumed by historians to have been compiled by Alfred from various sources; from the Mercian laws, existing in counties bordering upon Wales, and retaining old British customs; from the west Saxon of southern and southwestern counties of England; and from the Danish of the western coast, where a Danish settlement had been effected. Some allege that it was in part framed from the Old Testament; and the belief is entertained by others, that these ancient laws and customs were gathered from the principles of the Roman Pandects, which had been compiled in the sixth century from the decisions, writings and opinions of the old Roman jurists, by order of Justinian, and which formed a part of the body of the civil law of Rome, which has been universally accepted as the basis of all mediæval legislation and of all European law. The spirit of these laws, if not the letter, found its way into England, perhaps through the clergy who were the only learned class of that period, as the laws did, some centuries later, in a more positive and extensive form. It is a fact, however, that they had already entered into the system of other European countries, which at one time formed in part the fabric of the Roman empire. A century and a half after the death of Alfred a new code was compiled by Edward the Confessor, the basis of which was the code of Alfred. This was probably a collection of all laws then in force both by custom and statute, and was long held in the highest esteem by the English people, and for many years formed the basis of English jurisprudence. It was, in fact, the system in force at the time of the Norman conquest, and thoroughly identified with Saxon liberty and nationality. The renewal by *magna charta* of the "ancient Saxon privileges," was the re-enactment, doubtless, of a part of the code of Edward, the spirit of which had always existed in the common law. — Although the common law is an unwritten law, its rules and principles have been handed down from generation to generation, and sometimes have almost approached, from exactitude, the complete and precise form of statute law. The law of primogeniture—a rule of law under which the oldest son of the family succeeds to the father's real estate in preference to, and to the absolute exclusion of, all others of the family—is a part of the common law. This rule dates back to the conquest, when, under the feudal system, the ownership of land depended upon the personal ability of the party to perform military service, and thus excluded females. While the principle is repugnant to the spirit of British institutions, it has been preserved and handed down by the common law from that period. Blackstone also classifies the law merchant—a system of laws consisting largely of the usages of trade and applied by courts to contracts and dealings of persons engaged in mercantile business—as a part of the common law. The correctness of this classification has been questioned by other authorities, inasmuch as many of the rules of this system were in direct contradiction to the common law. During the operation of the feudal law, the system was found to be inadequate to the needs of the mercantile class then springing into prominence, and the courts of that day, when commercial contracts were brought before them, adopted from the merchants, for their guidance, the rules that governed their business dealings and made them rules of law. During the reign of James I. these rules were declared to be a part of the law of the realm. In such cases the common law was extended by the courts, and new rules were adopted to meet the association of circumstances which bore an analogy to what the common law had established in causes that came within the scope of its provisions. — The decisions of the courts of law are of the highest authority in declaring its principles, and, when not inconsistent, are accepted as establishing the law. But being merely declaratory and not mandatory, among courts of equal jurisdiction a single judgment of a court will not be accepted as final. Among inferior courts, however, the decisions of

a superior court are accepted as binding. Courts generally are not iron-bound in their decisions, and frequently reverse their own decisions when convinced that the law has been incorrectly stated. It is, however, held that the house of lords should be an exception to this rule, as it is the court of last resort, and therefore, as the highest court of the land, its judgments partake of the essence of statute law, and having been once declared, the rule can not be altered save by a statute. In its judicial capacity, as defined by the English appellate jurisdiction act of 1876, the house of lords forms a court of final appeal from the queen's court of appeal in England, from the court of sessions of Scotland, and the superior courts of law and equity of Ireland. It is, however, regarded as settled that the jurisdiction of the house of lords is absolute and its decrees irrevocable, as being the only manner in which a court of supreme jurisdiction can remain in the unchallenged exercise of its chief functions. — While the common law is recognized as pertaining to the whole realm, it yet determines the principle as a part of its own system, that under a certain condition of facts connected with the *status* of a case, it may accept the binding force of rules of law which are not of universal application. It is not, therefore, absolutely unalterable in declaring the law, as in some courts it adopts the provisions of codes which in others it rejects. Some of the rules of civil and canon law are also accepted as part of the common law, having been transmitted from the customs of remote ages. Custom frequently establishes such precedents as are recognized by the common law as a part of its system, although at variance with its general principles, viz.: under the law of primogeniture which, as we know, forms a part of the common law of England, the eldest son succeeds to the father's real estate, to the exclusion of all others. Although the law of primogeniture is the general law of England, as well as of Scotland and Ireland, there is one county in England—that of Kent—where, by "ancient custom," called *gavelkind*, a different rule prevails, and the land, instead of going wholly to the eldest son, is divided equally among all the sons. *Gavelkind* was the old British custom or law of succession in Wales, Kent and Northumberland. In its mixture with Anglo-Saxon law, all the sons of the father inherited. Although Blackstone ascribed to it a Celtic origin, legal antiquaries claim that it prevailed over the whole kingdom in Anglo-Saxon times. In Wales it was abolished during the reign of Henry VIII., but still remains in force in Kent county, England, having been permitted to remain by the Conqueror, as one of the "ancient liberties." There is likewise an exception called borough English in some cities and boroughs of England, where the land, instead of going to the eldest son, goes wholly to the youngest. These exceptions to the general rule of law in the kingdom are accepted by the common law as a part of its system, although at variance with its general provisions and the established custom.— The tension, however, of the common law is still greater, and it will accommodate itself to customs of still more limited operation. It is not deemed at variance with its system to adopt a rule which is pronouncedly contrary to its own, if its application be established to be clear and precise, although confined to a single locality. Still, to be vested with the sanctity of law, a custom must be firmly established as of ancient origin. Should the custom be determined to have originated at a period of English history embraced within a hundred years succeeding the conquest, it would be accepted by the system as a part of itself. If such proof does not exist, the custom must be established by living witnesses of undoubted character, or by unquestioned documentary evidence that will sustain the assumption — The feudal law system established the principle of non-alienation. This restriction was removed by the statute 18 Edward I., and the principle of conditional fees or estates tail was introduced. By the charter of Henry III., conveyances to religious houses were prohibited. By the statute *De Religiosis* of 7 Edward I., usually called the statute of mortmain, this prohibition was extended to all others holding for the same purpose. The clergy, to evade these provisions, devised a system of conveyance by which the *use* instead of the *fee* was granted to the church beneficiary, while the possession or seisin remained with the feoffee, and the decisions of the courts of equity which were in the hands of the clergy, held that the feoffee was bound in conscience to account to the *cestuy que use*, for the profits of the estates. By the act of 15 Richard II., this was annulled by the provision declaring that *uses* should be subject to the statute of mortmain as well as the lands.— In the reign of Henry VIII., the statute relating to wills was passed, which excluded devises to corporations. By a subsequent act, 43 Elizabeth, a devise to a corporation for a charitable purpose was allowed. This is now the only means whereby religious corporations can acquire real estate either by deed or will. — A complicated part of the English law of real property was introduced by the doctrine of uses, forming a part of the common law. In order to perpetuate estates in families, large landed proprietors, to prevent alienation, resorted to the expedient of the clergy—that of conveying the use instead of the fee, and the court of chancery held such conveyances to be binding. This gave rise to the statute of uses, 27 Henry VIII, of which Lord Bacon said, in his celebrated treatise upon this statute, expounding its connection with common law principles: "A law whereupon the inheritances of this realm are tossed at this day, like a ship upon the sea, in such sort that it is hard to say which bark will sink, and which will get to the haven, * * on account of the tides and currents of received errors and unwarranted and abusive experience, as they were not able to keep a right course according to the

law." This statute provided that the use should be transferred into possession, or, in other words, the estate vested in the *cestuy que use*. Its operation was to a very great extent evaded by the substitution of trusts for uses, and under that name conveyances were introduced and enforced in chancery, with some important modifications as to legal effect.—To more fully understand the development of the principles of the common law through ecclesiastical connection, it may be stated that, in the year 1130, in the town of Amalfi, in Italy, there was accidentally found a copy of the Roman Pandects compiled by order of Justinian the emperor, in the sixth century. This great system of jurisprudence was immediately adopted by the ecclesiastics who zealously spread its knowledge throughout every part of Europe. Besides its intrinsic merit, it became recommended by its early association with the imperial city of Rome, the seat of their religion, which acquired greater lustre by thus diffusing throughout Europe its own matchless laws. Before ten years had elapsed from the period of the discovery, Vacarius, under the direction of the archbishop of Canterbury, began the reading of public lectures on civil and municipal law, in the university of Oxford. The order of ecclesiastics was possessed of all the knowledge of the age, and naturally the science of law fell into their hands; with large possessions to defend from the rapacity and violence of princes and barons, it became to them a matter of personal interest to enforce the observance of general and equitable rules and customs, by which alone they could receive proper protection. Thus they formed a connection between the civil and canon law. But their energetic assumption begot a jealousy in the laity of England which prevented the Roman jurisprudence from becoming the municipal law of England, as was the case in many European states. Still, a great part of it was secretly transferred into the practice of the courts of justice, and further, by the imitation of its more fortunate neighbors, England gradually elevated its own law from its original state of rudeness and imperfection. During the reign of Edward I. in the closing years of the thirteenth century, the people of England reaped a wonderful benefit from the correction, extension, amendment and establishment of the laws of England, which Edward accomplished and transmitted to posterity as an enduring monument of his wisdom and personal worth. This patriotic labor conferred upon Edward the name of the English Justinian. According to Sir Edward Coke, not only were the statutes of his reign deserving of the character of *establishments* on account of their standing and durability, but the common law became refined to a remarkable degree by the regular order maintained in the administration. The judges were brought to a certainty in the determination of the law, and lawyers to a greater precision in their pleadings, and according to Sir Matthew Hale, the remarkable improvement of the common law during the reign of Edward was unexampled, save in the increase of his own time. Edward settled the jurisdiction of the several courts and first established the office of justice of the peace. He refused to interfere with the operations of justice by mandates from the *privy council*, as had been the custom of previous reigns. He repressed robberies and lawlessness, and encouraged trade by enabling merchants to recover their debts, by improving the system of collection under the common law, and simplifying the operation of the common law courts. He divided the court of exchequer into four distinct courts, each of which managed its own branch without dependence on the others, and as the lawyers introduced a system of carrying business from one court to another, the several courts became checks upon each other, and the administration of justice became wonderfully improved in tone. — Three hundred years before the reign of Edward, William the Conqueror had instituted an ordinance which provided that the bishop who sat in the county court with the sheriff, disposing of causes both civil and ecclesiastical, should hold a separate court for the trial of ecclesiastical cases. Under this procedure, the bishop being now independent of the secular court, appropriated to his separate jurisdiction a large number of causes, on the plea of their involving matters of a spiritual nature relating to tithes and benefices. Under this head the bishop's court claimed jurisdiction over questions relating to marriage on the ground of a spiritual contract being involved by the act, and consequently a power to annul marriages, grant divorces, determine questions of bastardy and legitimacy, and issue letters of administration in cases of intestacy on the ground that the bishops were best qualified to determine what would most benefit the soul of the intestate. On the effort of the clergy, however, to proceed still further in the assumption of judicial power under the new constitution of the ecclesiastical courts, in the attempt to introduce the entire canon law as promulgated at Rome, the national jealousy was so aroused that the king, Henry II., although a warm friend of the clergy, was compelled to prohibit the reading of books of canon law at Oxford, and a contest was inaugurated in which the whole pontifical power was invoked in behalf of the efforts of the clergy. The constitution of Clarendon, enacted by Henry II., with the concurrence of the great council, in 1164, and afterward confirmed by a council at Northampton in 1176, finally determined the disputed points. It was ordained that questions relating to benefices should be tried by the king's secular courts; that the ecclesiastical courts should be subject to the jurisdiction of the king's secular courts; that the ecclesiastical courts should be excluded from jurisdiction of pleas of debt which they had also assumed. The authority of the canon law now rests upon a statute of Henry VIII., which declares that all causes, constitutions, etc., then existing and which are not re-

pugnant to the law of the land or the king's prerogative, shall remain in force. The canon law now pertains solely to the laws, regulations and exigencies of the church. — With regard to the union of the canon and common law it may be said that the law of England relating to personal property which in many respects was deficient, received important accessions from the canon law, especially its rules relating to consanguinity and descent. — The most important part of the common law of England is that which pertains to the personal rights and liberty of the citizen. At various periods of English history a large number of statutes have been passed declaratory of common law principles in aid of constitutional rights. The first that boldly strikes national attention is that of magna charta, which was a royal confirmation of inherent rights of the people by King John at Runnymede, in the thirteenth century This charter was afterward confirmed by Henry III. with other important grants. (See MAGNA CHARTA.) Also during the reign of Edward III., there were twenty parliamentary confirmations of the great charter granted, relating to common law principles. It was also during this reign that the use of the French language in common law pleadings and public deeds, first instituted by William the Conqueror in the subjugation of England, was abolished, and the English tongue substituted. The second is the petition of rights, passed by parliament during the reign of Charles I. This act continued those principles of common law contained in the great charter, which by usurpation of the crown in a measure had lapsed. The third is the habeas corpus act, passed during the reign of Charles II., which did not alter or amend the provisions contained in magna charta, but provided for their greater efficiency in the clear and precise manner of their application by the courts of law. (See HABEAS CORPUS.) The fourth is the bill of rights, which extended the provisions of magna charta in favor of those fundamental principles of the constitution which denied to the sovereign the power of suspending or dispensing with laws of the realm, etc., etc., which was adopted by parliament early in the reign of William and Mary. (See BILL OF RIGHTS.) To the common law, which applied these principles of freedom, the English subject owes all his liberty. Statutes could have availed nothing without the principles entering through the courts into the national life. The common law claimed the existence of these free principles long before their essence was established by particular statutes. The right of trial by jury is one of the most prominent of common law rights, as it belongs almost exclusively to the English race. The oldest law writer of the time of Henry VI. declares that no other country at that time and previously contained the elements of society able to constitute a jury. That in other countries there was no "middle class" between the nobility and the impoverished peasantry, and no class of commoners sufficiently intelligent to perform the duties of jurymen. The English law of evidence is a wide branch of the common law In all criminal cases the accused is not compelled to testify against himself; while in a preliminary examination he is always permitted to do so, if it is his desire. — While there is much to admire in the common law system, some of its rules are very inequitable. Until superseded by the statutes of 1870 and 1882, common law vested all the property of a married woman in her husband, without responsibility on his part; and for a long time the only way through which she could enjoy any part of it was by the intervention of the court of chancery. — Under the common law marriage can be annulled for but one offense after the union— the act of adultery. Fraud, impotence, and such *pre-existing* causes, may constitute grounds for divorce, but only the act of adultery after the marriage ceremony. Under the common law a child born out of wedlock is illegitimate, and no subsequent act of the father and mother can affect its legal *status* This intolerant rule has, however, been indelibly stamped upon the common law by the action of parliament. During the reign of Henry III great disputes originated between the civil and ecclesiastical courts concerning bastardy. By the common law those who had been born before wedlock were bastards. By the canon law they were legitimate: and when any dispute arose relating to inheritance, it had been usual for the civil courts to issue writs to the spiritual, directing them to inquire into the legitimacy of the person. The bishop always returned answer according to the canon law, though contrary to the municipal law of the kingdom For this reason the civil courts changed the terms of their writs, and required the spiritual courts merely to make inquiry concerning the legitimacy of the party in question, by proposing the simple interrogatory whether he were born before or after marriage. The prelates complained of this practice to the parliament assembled at Merton in the twentieth year of the king's reign, and requested that the municipal law might be made to conform with the canon law. They, however, received from that parliament the memorable answer, *Nolumus leges Angliæ mutare.* — The courts of common law are divided into superior and inferior. They bore the names of the court of queen's bench, the court of common pleas or common bench, and the court of exchequer. They all sprung originally from the *aula regia* of the Norman kings. This court was formed of the chief officers of state and of the king's household, and of the chief nobility and other learned justices of the kingdom, all presided over by the *chief justiciar.* This court for a long time was omnipresent with the king; followed him from place to place in his journeyings, and formed the supreme court of the kingdom. The inconvenience to the people by this mode of dispensing justice became so great that a demand was made for a fixed court, which was granted in magna charta by King John, and the court of common

pleas established. A still greater change occurred under Edward I., as before alluded to, when the court of *aula regia* was entirely abolished, and its judicial functions apportioned among a court of chancery and the three courts of common law above mentioned. By the acts of 1873 and 1875 all the superior courts of England were consolidated into two new courts, styled the high court of justice and the court of appeal. Three of the five divisions of the high court of justice were called after the names of the old common law courts, to wit, the queen's bench, common pleas and exchequer divisions. Their business relations were unchanged, save with this distinction, that thereafter they should administer justice without regard to its being known as common law or equity. All the judges of the consolidated courts acquired equity jurisdiction; the result of this "fusion of law and equity" being to put an end to that anomalous system under which decisions of courts of law were continually set aside by co-ordinate courts of equity, and to give wider application to the old doctrine that when law and equity are at variance, equity should prevail. — The inferior courts, formerly numerous, are nearly all abolished. Those that remain are of very restricted jurisdiction, chief of which is the modern county court. A few borough courts exist, from which a writ of error lies to a superior court. The lord mayor's court and the city court of London transact considerable business. There is also remaining a court of hustings, a court of the cinque ports, and the stannary courts of Cornwall and Devonshire. In some counties there are baronate courts for adjudication of mining matters. The court of common pleas in Lancaster and the court of pleas in Durham, have jurisdiction in personal matters, and form part of the high court of justice. — The common law in the United States is the same in all particulars as the common law in England. It differs only in the form of administration. It contains the principles, customs and rules pertaining to the government and the safety of persons and property, not to be found in any statute or legislative enactment. The rule of common law with regard to the relations between husband and wife has been modified in some respects, principally that relating to the control of the wife's property. This change has not been effected by altering the principle of common law, but by statute, as in England. Also with regard to the legitimacy of children, the statutes of many, if not all, of the states have ameliorated the harsh rules of the common law, and infants born out of wedlock are legitimized and succeed to all the rights of those born in wedlock, by the subsequent marriage of the parents. This is in imitation somewhat of the Scotch law of *legitimation*, under the operation of which a person who was born illegitimate, was rendered legitimate by the parents' subsequent marriage, provided that at the time of his birth there was existing no legal impediment to their union. The Scotch law of putative marriages also legitimized the children of the union. — Among the earliest institutional writers on the common law was Henry de Bracton, an ecclesiastic and chief justiciary in the reign of Henry III. He wrote a comprehensive work on "The Laws and Customs of England," modeled after the "Institutes" of Justinian, treating largely upon the rules of personal property and contracts. — He was followed by Sir John Fortescue, who was chief justice of the king's bench during the reign of Henry VI. He was exiled on attainder after the battle of St. Albans, and accompanied Queen Margaret and her young son into Scotland. While in Scotland Sir John Fortescue wrote his celebrated treatise *De Laudibus Legum Angliæ*. This treatise on the common law of England was written originally for the benefit of the young prince. He likewise wrote a valuable work on the English constitution. — During the same reign Sir Thomas Lyttleton, a celebrated jurist and judge of the court of common pleas, wrote a valuable treatise on *Tenures*, which went through a multitude of editions. Lord Bacon characterized the writings of this jurist, together with those of Mr. Fitzpatrick, another common law writer, as the "Institutions of the laws of England."— Another eminent authority on common law is Sir Edward Coke, one of the brightest legal luminaries of English history. He was a jurist of great power and learning, and early acquired a high rank in his profession by his argument in Shelly's case, from which case came the celebrated rule of real property law known as "the rule in Shelly's case," reported in Coke, i., 104, to wit: "When the ancestor by any gift or conveyance takes an estate of freehold and in the same gift or conveyance an estate is limited, either mediately or immediately, to his heirs in fee or in tail, *the heirs* are words of limitation and not words of purchase." (This rule, however, in most of the states has been abolished by statute.) He successively became king's sergeant, recorder of London, member of parliament, speaker of the house of commons, solicitor general, attorney general, judge of the court of common pleas, chief justice of the court of king's bench, member of the privy council, and had it not have been for the enmity and opposition of Lord Bacon, would have reached the position of lord chancellor. His principal legal work is "Coke upon Lyttleton," or the *First Institute*, a standard work on all constitutional and municipal law in England. His other treatises on the common law are the *Second, Third, and Fourth Institutes*. His work on *Copyholder and Fines*, and his law reports, which made a commotion on their appearance, are still of great value to the profession. As a member of parliament he performed very important services for the people. His resolutions which formed the basis of the habeas corpus act, and his work in framing the famous bill of rights, entitle him to the gratitude and veneration of his countrymen. — As remarked, Sir Francis Bacon was the contemporary of Coke. He was affirmed to be the greatest

genius that England ever produced, and the glory of his age and race. His works on the common law were numerous, and composed of his treatise on *The Elements of the Common Law of England*, divided into *Maxims of the law* and *The use of the law;* treatise on *Compositions for Alienations; Reading on the Statute of Uses; Proposal for Amending the Laws of England;* essays on *Despatch Judicature* and *Innovation; Advancement of Learning;* and his work entitled the *Doctrine of Universal Justice;* all presenting, in the language of his biographer, "the substance of profound jurisprudential reflection." — Coke and Bacon were succeeded by Sir Matthew Hale, a distinguished lawyer of the seventeenth century, who was appointed by Cromwell a judge of the court of common pleas, and afterward, by Richard Cromwell, chief justice of the court of king's bench. He was incorruptible and able, and his treatises on the common law were received with great favor and are still of high authority in England, where his legal MSS. are preserved at Lincoln's Inn. — Sir William Blackstone, another writer and lecturer on common law of the last century, has transmitted his famous *Commentaries*, which for a lengthy period were greatly esteemed as an authority and are now regarded as of great value as materials for history. — Space does not permit a more extended review of this part of the subject, but the foregoing have been the principal writers on the science of English common law. The causes have accumulated with the years, and other abridgments and digests have followed, reproducing the rules and principles in other forms, and the old books of the old masters are rarely cited now as authorities. The common law continues to grow on both continents, and with each generation will become more rich and powerful in determining the principles of law governing the growth, development and security of society.

J. W. CLAMPITT.

LAW, Criminal, is that branch of jurisprudence which takes cognizance of those wrongs which are injurious to the public, and punished by the government in its own name by what are denominated criminal proceedings. The criminal law, like the civil, is both statutory and common. In all but four states of the Union, the common law extends as well to criminal matters as to civil. In Ohio the court decided that the common law could not be resorted to for the punishment of crimes and misdemeanors, and in Indiana the statute provides that all crimes and misdemeanors must be defined and punished by the statutes of the state. In Florida and Missouri there are legislative enactments restricting to a limited fine and imprisonment the right to punish for common law offenses. On the other hand, Louisiana and Texas, not originally governed by the common law, have expressly introduced it as to crimes. Common law offenses against the general government do not exist in the states in the liberal sense of the proposition, as we have no national common law; but there are in special cases common law offenses against the United States, within the territorial limits of the states. In localities where state power is unknown, common law offenses against the United States must necessarily exist, and yet the result has been definitely reached through the decisions of the court that the United States courts can not punish crimes against the general government, unless specified and defined by an act of congress. (Bishop, Crim. Law.) In the District of Columbia the laws existing previous to its acquirement are by statute still in force, and common law crimes against the United States exist the same and to the same extent as they do in the several states against the state. — In criminal law, when applying the specific rules of statutory interpretation, there are two kinds that appear: the liberal or open, and the strict or close. The liberal interpretation expands or covers a larger space than words import; the strict contracts within a less space. Both are modified in accordance with the requirements of particular cases The law both abhors and favors. In respect to things odious, a strict interpretation is used; in respect to things favored, a liberal. All statutes detracting from common law rights are strictly construed, and reach no further in meaning than their words express; no one is subject by implication, and all doubts are construed in favor of the prisoner. Revenue laws come within this rule, for though their primary object is but the collection of duties, yet they range themselves beside other penal statutes, by imposing fines, working forfeitures, and depriving men of their property. The leading doctrine is, that criminal statutes are to be strictly enforced. As against defendants the statute may be enlarged where the reason and intent of the law require it, and they may be extended by other provisions of statutory law, and by the common law combining with them; and this rule is not violated by permitting the words of the statute to have their full meaning, or the more extended of two meanings; as for instance, the statute forbidding the larceny of any "bank note" extends to the bank notes of other states; or, against betting "upon any election of this state" extends to the betting within the state upon an election for president. A strict construction is not violated by giving the words of a statute a reasonable meaning according to the sense in which they were intended. Thus, the state or corporation may be included in the word "person"; a woman may be indicated by the masculine pronoun "his"; a ewe or lamb by the word "sheep"; a girl by the word "woman"; and horses, geldings, asses and pigs by the word "cattle." The words of a penal statute, however, can not be extended by construction beyond what they will reasonably bear. An act which makes an assault indictable, must be an actual assault and not of a constructive nature. If two men are in altercation, and one holds a weapon in his

hand and the other forces a part of his body against the point of the weapon, the wound inflicted is not by the party holding the weapon. Money is not meant by the words, "security for money." Wheat threshed for straw is not a "stack of wheat." This principle is, however, established: If the court entertains a reasonable doubt as to the meaning of a criminal statute, it must decide in favor of the prisoner. It must also construe statutes so as not to multiply felonies, and no case is to be brought within the statute by construction while it does not fall within its words. Thus, where a statute regulating the sale of cord wood imposed a penalty of so much per cord "for every cord of wood bought and sold," the court held that no penalty could be incurred in the purchase or sale of less than a cord. —On the other hand, it is held that whenever the thing done does not come within the wrong which the statute evidently intended to suppress, though it come within its words, the person so doing is not punishable. It is a principle of the common law that no one shall suffer criminally for an act in which his mind does not concur. If the act committed is not within the intention of the law makers, it is not within the law although within the letter; therefore the case must come not only within the words of a statute, but also within its reason and spirit. Thus statute 12 Anne, stat. 1, c. 7, against stealing goods "being in any dwelling house, although such dwelling house be not actually broken in by such offender, and although the owner of the goods or any other person or persons be or be not in such house," is not violated where one steals, in his own house, the goods of another; or where a wife does the same thing in her husband's house; or where the larceny is of property found upon the person, though in a dwelling house, but therefore not under its protection; or where the things stolen are such as are not usually deemed to be under the protection of a dwelling house. — Time and place operate distinctly in the character and division of crime. The attempt to commit felony by breaking into a house at night is a common law felony, called burglary. When the same act is committed in the daytime, it is a felony called a misdemeanor. A dwelling house includes the cluster of buildings surrounding the main building in which a family lives, and a burglary committed in any one of these out-buildings is of the same character of offense as if committed in the mansion itself. — The uttering of forged paper or counterfeited bank notes or coin, or anything of like character, is to offer the same, intending it to be received as good, and whether it is accepted or not, the act of uttering it is complete. It is, however, held to be the rule, that to constitute the uttering, there must be a complete attempt to do the particular act the law forbids. There may be also a complete conditional uttering which will be criminal, as where a master gives an innocent servant a counterfeit bill to be delivered to another party in another county; while it was no part of his intention that the servant should receive it himself, and therefore not a complete uttering, it still appears that there would be ground for construing the act of delivery of the forged bill to the servant as an indictable attempt to cheat the third party. — The act of breaking into a man's castle either with burglarious intent, or by an officer to serve process on him, is not to be construed legally to mean an act of violence. The mere lifting of a latch and thus opening a door not otherwise fastened; raising or lowering a window sash held by a wedge, or by a weight with ropes and pulleys; raising a trap-door kept down by its own weight; or obtaining by stealth and procuring by threats of violence an entrance; or by intimidating a person within to open the door; or by the removal of a pane of glass or window shutter, or by forcing the blinds partially closed, is held legally to be a breaking. But if a door or window is open a little way, it is not breaking into the house for an officer in serving process to push it open still farther to admit the passage of his body. This part of the treatise of criminal law, to wit, statutory interpretations, could be commented upon still further with profit, but space forbids. It is possible only to glance at it. — To constitute a criminal offense two things must be established: the intent to do the wrong, and the performance of the act in pursuance of the intent. It is a universal rule that to constitute an offense, the act and intent must concur in point of time. To constitute a larceny the act of trespass and the intent to steal must occur at one and the same time. To constitute a burglary the intent to commit the felony in the house must occur at one and the same time. — It was a principle of Roman jurisprudence that ignorance of the law did not excuse its violation. This rule has been engrafted upon our own jurisprudence, combining with it another general principle, that every man is presumed to know the laws of the country in which he dwells. This rule may appear arbitrary, but is nevertheless essential to the proper administration of government. Sometimes the court takes into consideration a prisoner's ignorance of the law, when passing sentence after conviction. Also the degree of responsibility from mental condition. Should the guilt or innocence of the prisoner depend on the fact, to be ascertained by the jury, of his mental condition at the time of the perpetration of the act, the jury, in determining this question of mental condition, may take into consideration his ignorance or misinformation in a matter of law. — Ignorance of fact, however, stands on different grounds from ignorance of law. "Ignorance or mistake in point of fact is, in all cases of supposed offense, a sufficient excuse." (Gould, J., Myers *vs.* State, 1 Conn., 502.) This doctrine is held in those cases of justifiable homicide where the act was committed either in self-defense or to prevent the person killed from committing a felony. If he has reasonable cause to believe that

the facts exist which excuse a homicide, and he does believe them to exist, without any fault or carelessness on his part, he is legally innocent, although it becomes apparent after the deed that he was mistaken, and the life of an innocent person was sacrificed through his ignorance. The law of libel furnishes an illustration of this doctrine. The words charged in a criminal case to be libellous are construed as the defendant understood them, rather than as understood by others or by the court. This principle also applies to an "innocent agent" who is moved to do a forbidden thing by another person, and yet incurs no legal guilt, because either not possessing sufficient mental capacity, or not having been made acquainted with the true facts of the case. These distinctions between law and fact, where the excuse of ignorance is offered for the commission of crime, are held to be of the highest importance in criminal law jurisprudence. — Another principle laid down in criminal law jurisprudence, where an act committed produces an unintentional result, is, that the thing done having proceeded from a wicked intent, is to be viewed in the same light, whether the crime was of one particular form or another. Thus, if one attempting to kill a particular individual, discharges a weapon at him and by accident the charge is lodged in the body of another person and kills him; or if seeking the life of a person one places poison in his way which another person consumes, and dies; or if one, while in the attempt to steal poultry or the like, discharges his gun and shoots and kills accidentally a human being, the party who commits the act, though unintended, is legally as much guilty of murder as if he had intentionally performed any one of the acts. So where a man criminally assaults a woman, and she in the attempt to protect her honor, offers money to her assailant to release her or desist from the assault, which he accepts by putting it in his pocket, although he made no demand for the money, he is nevertheless in law guilty of robbery. But in the enforcement of this principle it must be clearly shown that the thing intended to be done was *malum in se*, and not alone *malum prohibitum*. Archbold thus states the principle: "When a man in the execution of one act, by chance or misfortune and not designedly, does another act for which, if he had willfully committed it, he would be liable to be punished; in that case if the act he was, doing were lawful, or merely *malum prohibitum*, he shall not be punishable for the act arising from misfortune or chance; but if *malum in se*, it is otherwise." — With respect to the doctrine of *necessity and compulsion*, Rutherford says: "No action can be criminal if it is not possible for a man to do otherwise. An unavoidable crime is a contradiction; whatever is unavoidable is no crime; and whatever is a crime is not unavoidable." (Ruth. Inst., c. 18.) An act from necessity or compulsion is not therefore a crime, but anything short of a firm apprehension of personal injury endangering life can not excuse the killing of another in self-defense. Should a man be attacked by a ruffian who attempts to inflict upon him severe bodily harm, the law presumes the man's life endangered and he may lawfully kill the ruffian. But although a man should assault another with such violence as to endanger his life in the effort to compel him to take the life of a third party, there would be no legal excuse for complying with the demand. Upon this point there has arisen some controversy. Russell on Crimes says: "It has been observed that if the commission of treason may be extenuated by the fear of present death, there seems to be no reason why homicide may not also be mitigated upon the like consideration of human infirmity. But Lord Denman, in charging the jury in the case of The Reg. *vs.* Tyler, 8 C. & P., 616, emphatically stated the doctrine to be, that no man, from fear of consequences to himself, has a right to make himself a party to committing mischief on mankind. The weight of authority is with this opinion. — With regard to coverture, marriage does not absolve a woman's legal capacity for crime which as a *femme sole* she possessed. Her relations toward her husband, however, compel obedience, affection and confidence. For this condition the law permits an indulgence. If through constraint of her husband's will, her duty of obedience is carried to such an extent as to commit unlawful acts, she shall not suffer for them criminally. This consideration is peculiar to the common law. The act, however, must be done or completed in his presence. A command is insufficient, unless the act is committed in his presence, and then the law presumes her to be compelled by him to perform the act. But the rule that coercion is presumed from the mere presence of the husband does not apply to certain crimes on account of their peculiar nature, such as treason, murder, robbery, and all such malignant crimes as render it probable that the mere presence of the husband would not be sufficient to compel her to commit the crimes, without the active co-operation of her own mind. The presumption that the wife, being in the presence of her husband, acts under his coercive power, is only a *prima facie* one, and can be rebutted by evidence. If the two acted together, she will be acquitted. But if her husband was a cripple or otherwise powerless to enforce his command, although present, or if she acted from a co-operating will, she is to be convicted Therefore the wife may be proceeded against jointly with her husband in the same indictment, and when they come to trial she can rely upon coercion when the proofs are sufficient. There are other points of interest, which space forbids, involved in this part of the subject; notably those acts which it is impossible for a wife to legally commit on account of her peculiar relations with her husband.—With respect to legal capacity, the common law fixes the age at twenty-one for both males and females. The law enforces filial obedience and yet does not establish the close relation between parent and child as between husband and

wife. In law, all children under twenty-one are viewed as infants; but infants who have arrived at a maturity of understanding are capable of committing crimes. They can not plead in justification of the crime committed that they were constrained by their parents to commit the same. At common law a child under seven years of age is held to be unaccountable; between seven and fourteen incapable *prima facie;* between fourteen and twenty-one, capable *prima facie,* and incapacity must be established by proof. A boy under fourteen or a girl under twelve can not contract a perfectly valid marriage. The legal principle denies puberty in a boy under fourteen, and also establishes the rule that he can not at that age legally commit a rape, whatever his physical capabilities. — Under the head of want of mental capacity as an excuse for the commission of crime, criminal law ethics treats of the various grades of insanity. The classification adopted by Dr. Ray involves the subdivisions necessarily existing. From defective development of the faculties springs idiocy and imbecility. Idiocy may result from congenital defect and obstacles to the development of the faculties supervening in infancy.. Imbecility may result from the same causes. From the lesion of the faculties subsequent to their development, spring mania and dementia—mania intellectual and affective, general and partial; dementia from injuries to the brain, and the senility of old age. The existence of these grades of insanity establishes the nature or character of the act as in proportion to the mental capacity of the individual. The court usually puts the question of insanity to the jury in this form: whether at the time the prisoner committed the act he was in a state to comprehend his relations to other persons, the nature of the act and its criminal character as against the law of the land, which, if sane, he is presumed to know; in fact, whether he was conscious of doing wrong. — With respect to the defense of drunkenness as an excuse for the commission of crime, the legal doctrine is, that voluntary intoxication furnishes no excuse for crime committed under its influence. But if a party be made drunk by stratagem or the fraud of another, or the unskillfulness of his physician, he is not responsible. (Parks, J., in Pearson's Case, 2 Lewin, 144.) The legal principles which operate in the case of drunkenness are the same as those which govern an act of evil intent producing an unintended result. Under the common law, drunkenness is regarded in the nature of a crime, and its public exhibition in this country is usually punished by fine, as a misdemeanor. There is still, however, a question as to the extent of criminal responsibility he may incur. If one is too drunk to entertain an intent to steal, although he takes another's property into his hands, he is not guilty of larceny. In further illustration of this point, Bishop says in relation to its application in cases of homicide: "The common law divides all indictable homicides into murder and manslaughter; but the specific intent to kill is not necessary in either. A man may be guilty of murder without intending to take life; he may be guilty of manslaughter without so intending; or he may intend to take life, yet not commit any crime in taking it. Now the doctrine of the courts is, that the intention to drink may fully supply the place of malice aforethought; so that if one voluntarily becomes so drunk as not to know what he is about, and then with a deadly weapon kills a man, the killing will be murder, the same as if he were sober." In some of the states, however, murder is divided by statute into two degrees. The first requires the specific intent to kill; the second degree is where there is an absence of specific intent, as in the case of extreme drunkenness, when the party would be incapable of entertaining a specific intent. In like manner under the common law distinction between murder and manslaughter, evidence of intoxication under certain circumstances may reduce the homicide to manslaughter. If it should be shown that the killing arose from provocation at the time of the act, and that the prisoner was too drunk at that particular time to carry in his mind any previous malice he entertained, if such existed, this will be of weight with the jury in mitigation of the offense, as rendering the presumption correct that he yielded to provocation and not to malice. Therefore, while the law holds men criminally responsible for what they do under the influence of liquor, yet if the habit begets frenzy or insanity such as *delirium tremens,* the act becomes excusable, the same as for other causes operating in the same way. — With respect to criminal acts viewed as an injury to the public, this rule is laid down: Whenever the public believes that an act of wrong to individuals is of a character requiring the public protection for the wronged individual, the public assumes the act of punishment as its own suit, and makes the act itself a crime. And the rule of law is still broader in its general significance. No one can have a private action under criminal law. Therefore unless there were a public remedy the transgression would go unpunished. This doctrine is also asserted when the injury arising to the public is by a corporation or body of men, as when the law invests a corporation with the duty of repairing a public way, a neglect of such duty or refusal upon the part of the corporation, is indictable at common law. Thus the law protects the individual, in the protection of the community. Says Bishop, in commenting on this rule of law: "In all ages and countries the path of human improvement is macadamized with bones and wet with blood. The strong tread down and trample out the feeble; and by ending them diminish the average weakness of the race, and the conflict which goes on among the survivors strengthens their bodies and minds, and the acquired vigor passes down to succeeding generations. But in the conflict which prevails among men there is a point beyond which if it

proceeds it injures the community in a way requiring criminal prosecution for what is done. * * If, therefore, two or more persons undertake any of the controversies of life, and one of them assumes toward another or the rest what the law deems to be unfair ground, the community interferes and punishes the wrong by a criminal prosecution. In estimating what is fair ground we are simply to inquire what view the common law takes of the question. The old common law, originating in an age of rough minds, iron sinews and semi-barbarous manners, demanded less fairness than is required by the superior culture and finer moral sentiments of modern times. And the demand increases as we progress in civilization. The common law has, therefore, been expanded by slow and insensible gradations, and by legislation which both adds to the number of crimes and enlarges the boundaries and augments the punishments of the old ones." — With respect to the common law divisions of crime, by the old rule it is divided into treason, felony and misdemeanors. In England, treason is of two kinds, high and petit. In the United States it is confined to the act of levying war against the United States and giving aid and comfort to its enemies. All treason is felony, and with the aggravation that makes it a greater offense it is rendered the most heinous of this classification of crimes. Felony, when a common law offense in England, will usually be the same in the United States. There are some exceptions founded on special reasons. It is provided by statute in some of the states that all offenses punishable either by death or by imprisonment in the state prison, shall be felonies. Any crime less than a felony is termed a misdemeanor. Russell on Crimes thus defines it: The word misdemeanor, in its usual acceptation, is applied to all those crimes and offenses for which the law has not provided a particular name, and they may be punished according to the degree of the offense by fine and imprisonment, or by both. A misdemeanor is, in truth, any crime less than felony; and the word is generally used in contradistinction to felony, comprehending all indictable offenses which do not amount to felony, such as perjury, libel, conspiracies, battery, and public nuisances. — In criminal law jurisprudence, an accessory is a person who participates in a felony without coming sufficiently near to become a principal. A person may be an accessory both before and after the fact. An accessory before the fact is one who aids and assists by his will or command another's felonious act, committed while he himself is too remote from the act to be a principal; as when a husband commands his wife, or a master his servant, to perform for his benefit some crime, which thing is in his absence performed through fear or affection, constraining an inferior or subject mind. If, before the birth of a child, a mother is counseled to murder her offspring when born, and she does so, the person so advising is an accessory in the murder, before the fact. If several parties plan the uttering of a forged order, where the act would be a statutory felony, and in the absence of all the others, one of them utters it, an indictment will lie for the utterer as principal and all of the others as accessories. Murder of the second degree admits of accessories before the fact. A wife may be an accessory before the fact in a crime of her husband. — An accessory after the fact is one who receives, harbors and assists to elude justice, one whom he knows to be guilty of felony. The true test for determining whether a party is an accessory after the fact is, to consider whether what he does is done by way of personal help to his principal with a view of enabling him to escape punishment, the nature of the aid rendered being unimportant. If a person furnishes another, whom he knows to have committed a felony, with a horse to escape arrest, or conceals him from search, or feeds and shelters him, or exercises violence in his behalf toward those who lawfully hold the prisoner, or attempts his rescue from the officers of the law, he is an accessory, and may be held to answer at the election of a prosecuting power for the crime of accessory to another's felony, or for a substantive crime. The receiver of stolen goods is not an accessory, as he renders no aid to the felon, but he can be indicted at common law for the misprision of knowing the thief, and failing to prosecute him. There are no accessories, either before or after the fact, to misdemeanors. In the latter case, they are usually too small for the law to notice; and in the former, should they approach sufficiently near to be an accessory, they will be indicted as principal. — Compounding a crime is agreeing with a criminal not to prosecute him. It is accessorial to the principal offense, as in the case of a misdemeanor. The party compounding may be proceeded against without reference to the prosecution or conviction of the offender. — Misprision of felony is a criminal neglect to either prevent the commission of a felony by another, or to bring the party to justice known to be guilty of felony. Misprision of treason is the same of treason, and misprision of misdemeanor is unknown to the law A statute of the United States provides: "If any persons or person, having knowledge of the actual commission of the crime of willful murder or other felony upon the high seas, or within any fort, arsenal, dockyard, magazine or other place or district of country under the sole and exclusive jurisdiction of the United States, shall conceal and not as soon as may be disclose and make known the same to some one of the judges or other persons in civil or military authority under the United States, on conviction thereof such person or persons shall be adjudged guilty of misprision of felony, and shall be imprisoned not exceeding three years and fined not exceeding five hundred dollars." Another section makes it misprision of treason, punishable by imprisonment not exceeding seven years and fine not exceeding one thousand dollars, if any person, having knowledge of the commission of

any treason against the United States, "shall conceal, and not, as soon as may be, disclose and make known the same to the president of the United States or some one of the judges thereof, or to the president or governor of a particular state, or some one of the judges or justices thereof." — With respect to the supervision of the domestic relations by the criminal law, the principle prevails that the parent possesses the legal authority to compel obedience by the exercise of merciful judgment. Sometimes parents are unmerciful, and then the law intervenes to protect the helpless child, and punish the parent for an abuse of parental trust. The general rule is, that the parent may inflict moderate correction. If he go beyond this, he is indictable for assault and battery, and if the child should die from the same, he is indictable for felonious homicide. The parent is likewise criminally guilty who refuses or neglects to provide his child with food and clothing, or exposes him to the elements, or abandons his offspring. — The relations of guardian and ward are usually established by the statutes of the states in which they reside, and differ under diverse circumstances. The relations with respect to chastisement between the teacher and pupil are similar in many respects to those existing between parent and child. Between husband and wife the rule in this country is, that the husband has no right to chastise his wife, and an indictment for assault will lie against him if he does. He may, however, under certain circumstances, restrain her movements. — In civil jurisprudence, there is a principle that admits of a rehearing of a cause under proper forms and circumstances. In the criminal law, however, this general right is restrained by the maxim laid down by Blackstone, "that no man is to be brought into jeopardy of his life more than once for the same offense." This principle, which is recognized in the United States by the common law, has likewise been engrafted upon our system by a provision in the constitution which declares "that no person shall be subject, for the same offense, to be twice put in jeopardy of life or limb." While this provision binds the United States only, the principle has nevertheless been extended into the states, by its adoption into state constitutions, and the courts of all the states accept it as the true common law rule. — With respect to the protection of the public health, anything that tends toward its impairment is indictable at common law. A person sick with an infectious disease is not permitted to go among his neighbors, nor to carry an infected child where the public may contract the disease. Nor can a man bring a horse infected with glanders into a public place. For all of these offenses he is indictable. So manufactures, in themselves lawful but calculated to impair the public health, can not be permitted in populous places. Under this rule it is an indictable offense to sell or cause to be consumed provisions injurious to the public health. There are many others of a statutory nature which do not come within the scope of the common law. — Public morals are protected by public law. Under the criminal law, swearing in public and blasphemy are indictable offenses. So also are the public utterances of obscene words; the publishing of obscene prints and writings; the keeping of bawdy houses; the indecent and public exposure of the person; the public buying and selling of a wife; polygamy, and the horrible crime of sodomy; all these are indictable under the common law, and the crime of incest by statutory enactment. Indecent public shows; gaming houses; disorderly inns, or any other disorderly house; casting of dead bodies of human beings into a river, without the rites of Christian sepulture; the stealing of a corpse; resurrecting it for purposes of dissection; are all indictable offenses. The common law, having reverence for life and wealth of population, punishes abortion; indicts for murder one who voluntarily deprives another of his life at his own request, or who persuades another to take his life, and stands by at the time of the act; recognizes the act of self-destruction as criminal, and holds the survivor accessory to the murder of an individual, if two men conspire to commit suicide, and, together attempting the act, one expires and the other survives. It also takes cognizance of matters of trade, and punishes the act of forestalling the market as an offense against public trade and an injury to the rights of the fair trader. Russell on Crimes says: "Every practice or device by art, conspiracy, words or news, to enhance the price of victuals or other merchandise, has been held to be unlawful; as being prejudicial to trade and commerce and injurious to the public in general. Spreading false news; buying things in the market as a whole commodity, with intent to sell at an unreasonable price, is an offense indictable at common law." So also the criminal law punishes all wrongful violations of the convenience or safety of the public. Under this principle all obstructions of highways, public squares, harbors, navigable rivers, and injuries done to such public ways; all neglect or refusal to keep them in repair by those in authority; the carrying on of noxious trades near highways or public places; making of great noises to the great discomfort of the neighborhood; storing of large quantities of gunpowder and other inflammable and combustible articles in public places; the refusal of an innkeeper to receive a lawful guest in his house of public entertainment, after a tender of money in payment of the same; also all public disturbances, riots, routs and unlawful assemblies, where three or more have gathered together to perform an unlawful act; a public prize fight; an assault and battery; forcible entry and detainer; the riotous entry of a landlord into a house to terminate a lease; riotous tearing down of inclosures; the breaking of windows with wood or stone at night, to the terror of the inmates; the breaking into a dwelling house in a loud and noisy manner, so that a wo-

man with child, being frightened, miscarries; the sending of a challenge to fight a duel; going about armed, to the terror of the public; hazarding the lives of the people by furious driving in populous places; stirring up neighborhood broils by publishing libels; eavesdropping; being a common scold; the disturbance of public worship and public meetings, barratry, maintenance and champerty, are all indictable offenses at common law. — With respect to the individual the criminal law spreads its protection over all of his individual as well as his public rights. He is maintained in his personal preservation and comfort; in acquiring and retaining property; and in his reputation. The greatest offense under the law against an individual is the act depriving him of his life. This is called felonious homicide. The common law divides this crime into two grades, murder and manslaughter. This repugnant crime, in the first degree, is visited with the highest punishment known to the law, the taking of the murderer's life also. There are two offenses against the person of the individual usually combined in one charge, to wit, assault and battery. There is no more odious form of violence in either law or morals than the crime of rape. It is visited with the severest punishment known to the law, other than capital, and by statute in some of the states by capital punishment. As every form of violence or unlawful physical restraint is indictable, so the law punishes any attempt to forcibly carry off for marriage a woman, against her will. Malicious mischief, although but a trespass at common law, is made by statute penal to a high degree. A cheat or fraud at common law is the criminal deception of an individual through the means of a false symbol or token, as by counterfeiting or forgery with intent to defraud. Extortion is also punished as an infringement on the rights of the individual, as taking from him that which is not due from him. — As the law leaves to an individual the care of his own reputation, no damage to a reputation by a single party, will be entertained as the foundation of a criminal prosecution. Indictments for libel and slander are founded upon the tendency of those acts to create a breach of the peace and not upon the injury to reputation which the individual has sustained, and the offense is therefore not mitigated by the charge being true, which in a civil suit for damages would be vital. — Of course from the circumscribed nature of this article, it has been possible only to glance, as it were, at the salient features of criminal law jurisprudence. As a science of ethics as well as law, it sweeps with broad pinions and unerring wing over a wide field of human rights and wrongs. To be thoroughly understood in all its rules and applications, it must be completely explored in all of its extended fields and operations.

JNO. W. CLAMPITT.

LAW, International.* I. *What is International Law? what is its basis?* International law, no longer confined in its operation to the nations of Europe, has no less a destiny than to unite all individuals and all states, the whole human race, in fact, in one great community of rights, of law.

* "This term was originally applied by Bentham to what was previously called the 'law of nations,' and it has been generally received as a more apt designation than that which it superseded. When the term 'law of nations' was in use, that of 'law of peace and war' was sometimes employed as a synonym, and as indicative of the boundaries of the subject. It was thus in its proper sense restricted to the disputes which governments might have with each other, and did not in general apply to questions between subjects of different states, arising out of the position of the states with regard to each other, or out of the divergences in the internal laws of the separate states. But under the more expressive designation, international law, the whole of these subjects, intimately connected with each other as they will be found to be, can be comprehended and examined, and thus several arbitrary distinctions and exclusions are saved. To show how these subjects are interwoven, the following instances may be taken: A port is put in a state of blockade: a vessel of war of a neutral power breaks the blockade: this is distinctly a question between nations, to be provided for by the law of peace and war, in as far as there are any consuetudinary rules on the subject, and the parties will submit to them. But suppose a merchant vessel belonging to a subject of a neutral power attempts an infringement of the blockade, and is seized — here there is no question between nations in the first place. The matter is adjudicated on in the country which has made the seizure, as absolutely and unconditionally as if it were a question of internal smuggling; and it will depend on the extent to which just rules guide the judicature of that country, and not on any question settled between contending powers, whether any respect will be paid to what the party can plead in his own favor, on the ground of the comity of nations, or otherwise. But there is a third class of cases most intimately linked with these latter, but which are completely independent of any treaties, declarations of war, or other acts by nations toward each other. They arise entirely out of the internal laws of the respective nations of the world, in as far as they differ from each other. The 'conflict of laws' is a term very generally applied to this branch of international law, and the circumstances in which it comes into operation are when the judicial settlement of the question takes place in one country, but some of the circumstances of which cognizance had to be taken have occurred in some other country where the law applicable to the matter is different. — Thus the three leading departments of international law are: 1. The principles that should regulate the conduct of states to each other: 2. The principles that should regulate the rights and obligations of private parties, arising out of the conduct of states to each other, and 3. The principles that should regulate the rights and obligations of private parties, when they are affected by the separate internal codes of distinct nations. — The first of these has been the principal subject of the well-known works of publicists, who have derived from general principles of morality and justice a series of minute abstract rules for the conduct of nations toward each other, and subsidiarily for the conduct of their subjects in relation to international questions. It has been usual to call this department the 'law of nature,' as well as the law of nations, on the supposition that, though it has not the support of the authority of any legislature, it is founded on the universal principles of natural justice. — It is clear that thus in its large features, as a rule for the conduct of independent communities toward each other, the law of nations wants one essential feature of that which is entitled to the term law — a binding authority. Nations even the most powerful are not without checks in the fear of raising hostile combinations and otherwise; but there can be no uniformity in these checks; and in general when the interest is of overwhelming importance, and the nation powerful, it takes its own way. The

International law embraces the principles governing both the legal relations of states with one another (international law proper), and the legal relations of the individuals of a state to individuals who are aliens to that state, and of individuals to foreign states (private international law). Only to the extent that we recognize in foreign nations, and even in individual aliens, a common humanity, a humanity everywhere and ever the same, do we enter into an international relation with foreign states and individuals.— When we closely compare the basis of the public or constitutional order of things with the basis of the international order of things, an essential difference between them can not escape us.— The public or constitutional order of things is based upon a strongly articulated public or constitutional organism. In the public or constitutional order of things there exists a public or constitutional power, which is independent of the individuals belonging to the state, and which all such individuals must obey. The government is, vis-a-vis of the governed, a self-dependent power based on a firm organization. — It is otherwise in the international order of things. In a certain respect, indeed, states bear the same relation to international law that individual citizens bear to the state. Thus, individual citizens are in duty bound to obey the state, and individual states owe obedience to international law; thus, too, the state is above individual citizens, and international law should be above individual states; thus, finally, individual citizens see, in the state, a higher authority which regulates their relations to one another by law, and individual states should look upon international law as the rule to regulate their interna-

importance of the questions which may be involved in the law of nations thus materially affects the question how far it is uniformly obeyed. In a set of minor questions, such as the safety of the persons of ambassadors, and their exemption from responsibility to the laws of the country to which they are accredited, and in other matters of personal etiquette, a set of uniform rules has been established by the practice of all the civilized world, which are rarely infringed. But in the more important questions, regarding what is a justifiable ground for declaring war, what territory a nation is entitled to the sovereignty of, what is a legitimate method of conducting a war once commenced, etc., the rules of the publicists are often precise enough; but the practice of nations has been far from regular, and has been, as every reader of history knows, influenced by the relative strength of the disputing parties more than by the justice of their cause. The later writers on this subject have from this circumstance directed their attention more to the means by which any system of international law can be enforced, than to minute and abstract statements of what may be theoretical justice, but has little chance of being enforced. They have found several circumstances which have an influence in the preservation of international justice, though of course no sanctions which can give it the uniformity and consistency of internal laws. The combinations for the preservation of what is called the balance of power are among the most useful restrictions of ambition. All periods of history furnish illustrations of this principle. Hume found that the Peloponnesian war was carried on for the preservation of the balance of power against Athens. The late war exhibited a noted illustration of combination to prevent universal conquest on the part of the French. The safety of small states from being absorbed by their larger neighbors, is in the jealousy which these neighbors feel of each other's aggrandizement. Thus the jealousy of rulers is one barrier to national injustice. Another is public opinion: sometimes that of the nation whose rulers would be prepared to commit injustice; sometimes that of other nations. Of course it can only be to a very limited extent that the public feeling of a despotic government can check the grasping spirit of its rulers; but the public feeling of the constitutional and democratic states is the great check on the injustice that might be perpetrated by a nation when it becomes so powerful as Great Britain. — The seizure of the Danish fleet by the English has been a subject of warm censure in England. Necessity—even the plea that Napoleon would have used the fleet to invade the shores of England—has not been accepted in palliation of the act; and the manner in which it has been canvassed is very likely to prevent any British government from adopting the precedent. The partition of Poland is an instance of national injustice condemned by the public feeling of countries other than those by which it was perpetrated; and it may be questioned whether the states which accomplished the partition may not yet suffer by it. Good fame in the community of nations is like respectability in private circles, a source of power through external support; and the conduct of Russia toward Poland has frequently diverted from the former country the sympathy of free nations. It need scarcely be observed that the press, whether fugitive or permanent, is the most powerful organ of this public opinion, and that the views of able historians, jurists and moralists have much influence in the preservation of international justice. Among the principal subjects of dispute in this department of international law are: the sovereignty of territory and the proper boundaries of states, as in the question regarding the Oregon territory in North America; questions as to discovery and first occupancy of barbarous countries; questions as to any exclusive right to frequent certain seas—and here there is a well-known distinction between the broad ocean and the narrow seas that lie close to particular territories, questions regarding the right of navigation in rivers which may be either between the upper and lower territories, or between states on opposite banks; questions as to the right of harbor or fishing, etc.; and questions as to the right of trading with particular states. In cases of arbitration the national pride is not injured when that which is yielded to is the award of a neutral party, not the demand of an opponent. It has been suggested by Bentham and Mill that the civilized states of the world should establish among themselves a congress, which should adjudicate on all disputes between its members, the members being excluded from voting in their own disputes. — The second department into which we have considered international law divided—the rights and obligations of individuals as affected by the conduct of states toward each other—has, like the first, been examined by the publicists in their theoretical manner; but it has never, perhaps, received so much practical illustration as it has in the British courts. In a despotic country it would of course scarcely ever occur that the bench should fail to give effect to the national policy of the government, whatever that may be. But in England it was the rule that foreigners as well as natives were entitled to the rigid administration of the law, and that, if the proceedings of the government were at variance with the rights of parties according to the law of peace and war, individuals might have redress. Thus, when Great Britain, in opposition to the Berlin decrees, tried to establish a 'paper blockade,' that is to say, by force of orders in council to declare places to be under blockade, whether there were a force present to support it or not, Sir William Scott found that 'in the very notion of a complete blockade, it is included that the besieging force can apply its power to every point in the blockaded state. If it can not, it is no blockade of that quarter where its power can not be brought to bear.' — The third division of international law is that which most properly comes under the head 'conflict of laws,' viz., the principles that should regulate the rights and obligations of private parties when they are affected by the separate internal codes of distinct nations. This has some points in common with the preceding department of the subject." (Bohn.)

tional relations. — In other respects, however, the similarity ceases entirely. There is, for instance, no constituted international authority over, and independent of, states, as the authority of the state is above, and independent of, individual citizens. When it becomes a question of enforcing international law, states can not appeal to any power above them as do individual citizens, in case of necessity, to the coercive power of the state.— Rather is the attitude of states to international law and their relation to international authority to be thus conceived: spite of the fact that states are governed by international law and should obey it, they are themselves the sole and voluntary supporters, upholders and enforcers of that law —the sole international power, following their own unconstrained good will. There exists no great international central body holding the several states in their international orbits, as does the sun the planets which it causes to revolve about it; the ruling centre of gravity of international law does not lie in a separate self-dependent organism: rather is the realization of international law to be conceived as the consequence of the reciprocal influence of the gravitation of the several state-bodies themselves. And if we be allowed to continue this figure borrowed from astronomy, we may remind the reader of the double stars which revolve not about a third body nor about the sun but about each other, thus giving themselves a common, *ideal* centre. International law is an *ideal* centre of this kind for states. It is, indeed, a governing centre; and yet it is a centre created continually only by the reciprocal influence of the several states, one which is, at any given moment, the act of their own efficiency and force.— This has been ignored by two opposite schools. Many, like the German philosopher, Wolff, overlooking the fact that international power rests in the individual independent states themselves, based international law on a *universal state* (*civitas maxima*). Others, on the contrary, like Hegel, pushing the idea of the sovereignty of individual states to an extreme, look upon international law only as *external* public law. They do not sufficiently bear in mind that international law, although lacking a self-dependent organism, stands high above individual states. According to Hegel, international law is only the *outer* side of the state, and has its centre in the state. And, indeed, to the positive rights of individual states belong their *external* rights, their "*external* public law," *i. e.*, the aggregate of the international provisions and treaties, which give expression to the legal relations of those states to other states. Every individual state has its internal public law and its external public law; and this external public law is a fragment of international law. But international law draws all these external rights of states together about its own self-dependent centre, and thus gives us the principle, from which, as the central unit, all individual external public rights of states are to be understood and controlled. Every individual external public right is only a fragment from the periphery of international law. Hegel's error consists in this, that he places the centre of this periphery in the individual states, *i. e.*, that he does not free the principle of international law from the state — But the question may be asked, whether the absence of an international authority lodged in a self-dependent organism, and the consequent absence of a coercive power over states engaged in a conflict or controversy, of a power which might declare and enforce the law; it may be asked, we say, whether such an absence of such an authority does not deprive international law of all life, and whether it does not turn all the rules of international law into a series of pleasant dreams destitute of reality. — But the life of the law is, in no way, merely a continually forced existence; and even within the limits of the individual state, the government is by no means obliged uninterruptedly to employ coercion in order to make the law obeyed. The existence of the law, even in individual states, is based essentially on the power of reason. On the whole, the law exists because it is the right, and because men's minds recognize it as such. Even when the coercive power of the state is removed, the condition of things which the law had created is not destroyed. When that power is taken away, there occur, indeed, many instances of excess, but the general ideas of right and wrong remain unshaken, like immovable pillars which do not by any means rest on the pedestal of governmental compulsion. And it is precisely in times of great social crises, in which, spite of the paralysis of governmental power, property, and the law generally, often remain undisturbed, that we find convincing proof of what little coercive means suffice to a wise government which knows how to win the minds of men and properly to use the power of reason. International law rules generally, because it is the expression of the reason of nations, to which nations voluntarily submit; and the treaty provisions and the non-treaty provisions of international law enter daily unquestioned and uncontested into thousands of human transactions, in all civilized nations. Hence from the absence of an organized coercive power, it can only follow that, in individual exceptional cases, in which the right or the law is violated, the existence of international law is suspended; but spite of this, the existence of the international law in general should not, therefore, be denied. — But we must go farther and claim that, even in these exceptional cases in which unreason or selfishness rises up against the right, international law is not defenseless, and that, for the most part, even then, it does not depend on the greater physical power of the individual state whether it will obey or violate international law. Even in such cases there exist guarantees for the maintenance of international law which are not entirely powerless. The power which rises up against the law, has to do not merely with the perhaps weaker power of

its opponent. Rather is the power of the weaker under the ægis of both moral and material coercive means. These means are the following: 1. By a breach of international law, a state exposes itself to general reprobation; and its honor suffers injury. No low estimate is to be placed on this first guarantee of the law. We know what a powerful moral coercion the law of honor has in all moral communities; the individual will stake his life to save his honor. And really, in the great community of states, honor plays no less a part. There is, indeed, no state which would not feel its arm more or less weakened, by a deed which injured its honor. 2. A state which violated international law, would deprive itself of the advantages of that law. It would exclude itself from the advantages of international communion, and would thus incur great material disadvantages, such as reprisals of all kinds, the paralysis of its commerce with foreign nations, etc. Hence there is a species of material compulsion to obey international law. The violation of that law carries with it loss, property penalties, so to speak. 3. A state, intent only on fulfilling its unlawful design, might, indeed, disregard all this. But, when such is the case, we see, as a rule, that direct coercive measures are employed against that state. Alliances of several states powerful enough to subdue the wrong, are wont to be formed against such bold contemners of the law. 4. If it be objected to these alliances—called into being because the law is left momentarily in the lurch—that they are, after all, only accidental and transitory, and afford international law no reliable and lasting protection, we may finally point to the pentarchy of Europe. For a long time the five great powers have practically constituted a species of *tribunal of nations*, which watches over the observance of great treaties between states and of international customs. — Hence there are a great many guarantees and measures of coercion for the maintenance of international law, and it would be an exaggeration to put the observance of merely moral and charitable duties on the same level with the international duties of a state. The great system of states is not so badly constituted that the will of an individual state, disregardful of the law, can trample on the principles of the great whole at its pleasure. — It can not, however, be denied that all these guarantees of international law are frequently insufficient. — In most cases states come to disagree because on this subject or that they appeal to and apply different legal opinions. It is seldom, indeed, that one state does another an entirely evident wrong. In a case of such bold contempt for the law, a great alliance of states would be sure soon to be formed, in order to repel the wrong in the name of the system of states injured jointly with the individual state. But the cases of mere legal controversies between states are incomparably more frequent. — What, then, becomes of the means of protection which should uphold international law when menaced? — Since the party which is in the wrong here honestly believes itself to be in the right, it need not fear any detraction from its honor or any exclusion from the community of nations. Alliances to protect uncertain rights will not be calculated upon. Finally, the members of the pentarchy, before coming to a decision and taking action, would have to agree among themselves. But there is no means by which such an agreement can be effected. There is no binding mode of voting in force among the five powers, no constitutional rule in accordance with which the decision of the majority is looked upon as the decision of the pentarchy itself. Besides, the great powers themselves may be the opposing parties in an international controversy as to their respective rights; and it would evidently be derogating from the other states, some of which are still very powerful, to submit them to the judicial authority of the five great powers. Representatives of the smaller states, too, would have to take part in the decisions of international controversies, in order that the principle of the equality of states might be preserved. Representatives of all important nations should participate in such decisions, to the end that the judgment rendered might not be given in a narrow, national sense, but that it might proceed from the true source of international law, from universal human reason. — Here evidently there is a rent, so to speak, in the structure of international law, through which many a destructive storm will yet break. Congresses, courts of arbitration, and even a permanent tribunal of nations with limited jurisdiction, might, indeed, prevent much evil, and settle many questions of war in a rational and peaceful way. For judicial decisions can apply only existing law, and can not decide concerning those states of things in the future which the spirit of humanity—the spirit that rules in history and is ever transforming the present—conjures up in the course of time. Thus the great questions of nationalities are questions of the growth of historic powers which can never be held in check by the arm of the administration of justice. In every great historic crisis in the life of the state, a new condition (of justice) is evolved out of the old, one which destroys the old and which from the standpoint of the old seems illegitimate. To condemn this new condition of the right by a judicial decree which is thinkable only on the basis of the existing condition of the law, for the reason that it is opposed to the spirit of the law actually in force, would be to stop the course of history and to petrify the mind of humanity. — We can only hope therefore that the rent here referred to in the walls of the structure of international law may never close, but that it may remain forever open to admit the fresh drafts of the air of the future to peoples and states, vivifying and purifying them. — II. *History.* Since from the remotest times of which history has preserved any account, peoples and states have had some kind of intercourse with one another, and since all human in-

tercourse is accompanied by a mode of procedure more or less legal, there has been at all times a species of international law; and we may speak even of an international law of savage nations. (Fallatti, *Keime des Völkerrechts bei wilden und halbwilden Stämmen*, in the Tübingen *Zeitschrift für Staatswissenschaft*, 1850, pp. 150, etc.) — The international law of to-day, however, is a product of Christian Europe. It has no perceptible connection with the old international law of savage tribes, nor with the international law of the Orientals, nor even with that of the ancient Greeks and Romans. Hence a history of the international law of to-day must be confined to Christian Europe and to the countries which it has fructified in the intellectual order. The east, as well as Greece and Rome, we shall mention only to show the character of ancient international law and the contrast it offers to the international law of our times. — True religion generates a love as broad as the world, a love which embraces all mankind, breaks down the barriers which separate peoples into hostile camps, and leads to a community of nations. In the east, religion is everything. It absorbs both the law and the state. It is rigidly national, with the utmost hostility to all international community. Thus, the Jews looked upon themselves as the chosen people, holding a commission from Jehovah to extirpate all neighboring peoples and consume all nations whom the Lord God would give them. (Deuteronomy, vii., 1, 16.) The institutions of the Jewish people calculated upon their seclusion from other peoples. The law of Moses, indeed, ordains that exaction shall not be practiced on strangers, that they shall not be vexed (Leviticus, xix., 33); it even ordains that there shall be one manner of law for the stranger and for the Jew (Leviticus, xxiv., 23): yet, in spite of this, we find a very marked disregard of, and want of consideration for, strangers in this same law (compare Leviticus, xxv., 45, 46), and that the practice of usury was forbidden the Jews as against their Jewish brethren and at the same time allowed them as against strangers. (The field of oriental international law has been cultivated by Haelschner, *Diss. de jure gentium, quale fuerit apud gentes Orientis*, Halle, 1842; by Pütter, *Beiträge zur Völkerrechtsgeschichte und Wissenschaft*, Leipzig, 1843; Müller-Jochmus, *Geschichte des Völkerrechts im Alterthum*, 1848. These works, however, are vastly surpassed by the great work of Laurent (Geneva): *Histoire du droit des gens et des relations internationales*, tome i., L'Orient, 1850.) — In the minds of the peoples of classical antiquity, the state occupied the first and highest place to such an extent that they sacrified to it the whole domain of private life, religion and foreign peoples. This is true especially of the Greeks at the period of their prime. We may be silent as to Sparta, which sacrificed all human feelings to the Moloch of the state. But even the ideal of Athenian morality, as it finds expression in Plato's "Republic," is a state which absorbs every other moral domain. The Greeks knew nothing of a humanity which exceeded the limits of the state. Their motto with regard to other nations was: Eternal war on the barbarians! (Livy, i., 29 : *Cum aliengenis, cum barbaris, æternum omnibus Græcis bellum est;* Heffter, *Völkerrecht*, § 6; Ward, "Enquiry into the Foundation and History of the Law of Nations in Europe, from the Time of the Greeks and Romans to the Age of Hugo Grotius," London, 1795, 2 vols.; Wachsmuth, *Jus gentium quale obtinuit apud Græcos*, Berol., 1822; Heffter, *Prolegomena de antiquo jure gentium*. Laurent, in his work already cited, devotes a separate volume (the second) to the international law of the Greeks. Compare also, Henry Wheaton, *Histoire des progrès du droit des gens*, tome i., pp. 1–17, and G. de Wal, *Inleiding tot de Wetenschap van het europesche Volkenregt*, Groningen, 1835.) — The ancient world was, indeed, acquainted with certain customs of nations agreed upon by all, especially in regard to the conduct of war, ambassadors, asylum and treaties. Ambassadors were held to be inviolable, and it was considered that treaties between states could not be rightfully broken. But was it the consciousness of right that supported this inviolability, and this respect for treaties? It was not. It was religion in which the principle of legal right was still enveloped. Hence, ambassadors made their appearance with religious symbols, and thus claimed for themselves the protection of religion. Treaties were sealed with the religious sanction of an oath, and solemn sacrifices were offered to the gods when they were closed. But beyond this, the ancients considered that they owed no obligations to strangers or barbarians. — The Greek tribes frequently treated each other with the most revolting inhumanity. After the fall of Mitylene, the reputedly mild Athenian people decreed that all its male adult population should be put to death and that its women should be reduced to slavery; and although a second decree prevented this atrocity, about a thousand men suffered the penalty of death and the land was divided among Athenian citizens. The surrender of Platæa to the Lacedemonians took place contrary to the promise that only the guilty should be punished. With infamous sophistry the Platæans were simply asked whether they had been useful to the Lacedemonians during the war; and, as they very naturally denied that they had been, orders were given that they should be put to the sword, their wives sold, their houses torn down, and their city and lands transferred to the Thebans. In like manner, after the conquest of Melos by the Athenians, all its citizens who had attained to man's estate were, by order of Alcibiades, put to death. — To what extent the rights of mere humanity were ignored is shown by the existence of slavery, especially that of the helots. Slavery was maintained not only by the coarser lower classes of the Grecian people, but it was approved by Greek philosophy. To such a degree were the exclusive rights of Greek nationality the limit of

the highest moral consciousness of the Greeks, that even an Aristotle could say that the barbarians were intended by nature to be the slaves of the Greeks. (Arist. Polit , lib i., cap. 8.)—The Greeks distinguished peoples into non-allies and allies, *ἐκσπονδοι*, *ἔνσπονδοι*. Non-allies were considered as having no rights. All peoples with whom they had no express alliance they treated as enemies, and permitted themselves, as in the case of the Platæans, all kinds of treachery and atrocity against them. (Thucydides, lib. iii., cap. 68)—The amphictyonic league was an attempt by the Greek tribes to form closer ties The amphictyonic council was a general federal court for the whole of Greece. Each Greek city sent two representatives to it, first to Delphi and afterward to Thermopylæ. Religious solemnities accompanied their assembling. After this, international controversies were settled, and crimes against the temple at Delphi and violations of international customs were punished. A money penalty was imposed on the guilty people. If the penalty was not paid at the proper time, it was doubled. When all other means failed, the decree of the amphictyons might be carried out by the full force of arms of the league. (Titmann, *Ueber den Bund der Amphiktiyonen*, 1822; Heinsberg, *De Concilio Amphictyonum*, 1828.) The amphictyonic council was closely connected with the Delphic oracle, in the immediate vicinity of which it was originally held. This connection gave the sentences of the council a higher sanction. The Delphic god took its decrees under his protection, and made them, so to speak, laws of religion. Yet the utility of the council was not great. (Johannes von Müller says of the council, in his notes on Herder's works on philosophy and religion, vol. vi , p. 153, ed. of 1827: "It can not be boasted that it was of much use in times of great crises. In many things it was like the German *reichstag*.") Hence not many rules of international law proceeded from the amphictyonic council. Endeavors were made by some provisions to mitigate the laws of war. Mutual agreements were entered into to bury those who had fallen in battle, and the right of asylum in the temples was recognized. Beyond this, the influence of the league did not go; and it lost its really international importance by the fact that it excluded all other nations. — Among the Romans we find, from the very earliest time, the *jus fetiale*, based upon ancient Italian customs. The college of *fetiales*, or Roman priests, instituted by Numa, consisted of twenty members, with a *pater patratus* at their head. The *fetiales* were invested with a diplomatic character. International transactions and declarations of war were within their province. A religious and priestly character was attributed to them, and their acts were accompanied by religious symbolic ceremonies. (Livy, i., 2; Plutarch, *Numa*, c. 12; Dion., ii., c. 72; Cic. de Leg., ii., 9; Weiske, *Considérations sur les ambassadeurs Romains, comparés avec les modernes*, Zwickau, 1834; Osenbrüggen, *De jure belli et pacis Romanorum liber singularis*, Lips., 1835; Müller-Jochmus, *Geschichte des Völkerrechts im Alterthum*, Leipzig, 1848; Laurent, *Rome*, tome i.)—However the international observances of Rome may have developed and extended from these first germs, certain it is that the really fundamental idea of international law never asserted itself among the Romans. They neither respected foreign nationalities nor recognized the universal dignity of human nature in the individual. They annihilated those states and nations which would not become subject to them, and extinguished the character of nations. In their devastation of Greece, they had no respect even for Greek civilization. They sold hundreds of thousands of Greeks into slavery, and finally filled Italy with such a mass of slaves that destructive wars of the slaves broke out, wars in which the suppressed rights of human beings avenged themselves on their hard-hearted despots.—The Germanic races, when they began their incursions into the Roman world, confronted other nations with their rugged and repulsive nationality. Their weregild system is evidence of the small value they put on persons of foreign nationality. They dispossessed proprietors, in conquered territory, of their lands, and reduced the conquered, for the most part, to the condition of bondmen. Strangers they looked upon as having no rights. Yet hospitality was sacred in the minds of the Germans; and hence they had some susceptibility for the ideas of humanity and of international law. — The Romans who dwelt mixed among the Germans, lived, even after their subjugation, in accordance with the Roman law. Even the national privileges of the Germans assumed a Roman coloring. The Germans allowed the framework of the Roman constitution of the provinces to rest on its old Roman foundation. In many parts of the former Roman empire, as, for instance, in the Burgundian and West Gothic parts of the Frankish empire, the constitution of the Roman city was maintained The downfall of the western empire left after it, accordingly, very important traces of Roman regulations and Roman laws. — Besides, Rome and Byzantium lived on in the imagination of the young, fresh conquering nations which had destroyed the Roman empire. A German-Byzantine dualism runs through the whole old constitution of the Frankish court, a constitution which may be traced back, in part, to the retinue system of the Germans, and in part to regulations of the Byzantine court. The idea of the old Roman empire was at work even in the minds of Alaric, Ataulph and Theodoric. In Charlemagne it became clearly manifest. — Besides the influence of Rome on the new nations, we early perceive the influence of Christianity and of the church also. The idea of humanity is the offspring of Christianity, which would unite the whole human race into a nation of brothers, and which declares human personality sacred in every human being. Both Christianity and international law rise above, and go beyond, what is simply national. Christianity

and international law are called to unite the whole human race. Whereas, previous to Christianity, the people of each nation could follow only their own great leaders, in whom they recognized the personified prototype of their nationality, in Christ a common prototype and sole centre was given to all humanity; and by this fact all barriers between nations were by anticipation removed. (Galatians, iii., 28; 1 Corinthians, iii., 21–23, and xii. and xiii. Schleiermacher speaks pertinently on this point.) Thus was the spiritual soil in which international law might grow, prepared. An important contrast must, indeed, not be overlooked here. International law was called upon to establish only an *external legal* community. Christianity, on the other hand, was to establish an *internal* community, embracing the whole human race. But the eyes of humanity had first to open gradually to the purely interior greatness of the Christian idea; and thus the purely spiritual universal empire of Christianity was transformed with the priesthood of the Roman empire into an external universal empire, not unlike the old empire of the Romans. The unification of the church was completed by the *concilia œcumenica* and the papacy. With the constitution which it had obtained in the Roman empire the church entered among the Germanic nations, and drew them into its great hierarchic unity. Finally, the grand minster of the middle ages became one great spiritual-temporal whole, with its two high-towering spires, the papacy and the empire. Christendom was one sole, firmly articulated body. God had given it the two swords, the spiritual and the temporal. The church had a deeper conception yet of the great unity. It denied the dualism of the two swords, and deduced all power, even the temporal, from the one spiritual centre. — The old view, that all foreign peoples were barbarians and enemies, was now, in spite of the coarseness of the period, overthrown, and a higher standpoint reached. The idea of a union of the human race to be effected by Christianity, of a union whose firm foundations were to be the papacy and the empire, had, from the time of the coronation of the emperor Charlemagne, become a living, propelling force in the nations. The empire of Charlemagne, extending from the Ebro to the Raab, and from the Tiber to the German ocean, united the nations of middle and western Europe, whose future was so rich, and gave them, in the capitularies, certain common laws. The peculiarities of the several nations were maintained in the empire, and each people was allowed its own special national laws. The system of personal rights which obtained in the Frankish empire, and by virtue of which every member of a nation was judged, even when in a foreign nation, by the laws of the nation to which he belonged by birth, was pregnant with the mutual recognition of the rights of foreign nations, a recognition of great importance for the development of international law. — The empire of Charlemagne, indeed, crumbled to pieces soon after its founder's death. The Germans were not yet ripe enough to preserve so vast a political organization in its objective self-dependent course. To do this, they needed a powerful governing personality, and such a personality they did not find after the death of Charlemagne. Moreover, nationalities within the empire had, even now, assumed characters too dissimilar. The Romanic and Germanic elements, especially in the different parts of the extensive empire, had become so inseparably and peculiarly mixed that the modern character of the different nations with their mutual repulsion became perceptible. The accidental external reunion of the great empire under the weak-headed and cowardly Charles the Fat, in the year 884, was not able to overcome these too powerful differences any longer. The history of the several parts of the Frankish empire now begins, and the union of France and Germany comes to a close completely. None the less, the capitularies lost their formal force and application with the dissolution of the empire. But the great community of nations of the Frankish empire was as far from passing away without lasting after-effects on the subsequent life of the nations of Europe, as the overthrow of the Roman empire was from destroying Roman ideas. Nations had come into close contact with one another, and had acquired certain common views of law, of the state and of the church. Those countries into which the peculiarities of the ancient Germans had made their way, retained a certain unity in their modes of thinking and in their mode of life, which subsequently became the foundation of international law and of the European system of states. — With the dissolution of the empire of Charlemagne, the energetic temporal centre for European nations ceased to exist. The empire of the Germans was of less importance than the Frankish empire. True, Henry II (1002–1024) continued to receive from the pope the golden symbol of imperial power, a ball surmounted by a cross, significant of the empire of the world under the protection of the Christian church; but Henry owed this less to his vigorous assertion of the position of the imperial power in the world than to his obsequiousness to the clergy; and the symbol was less calculated to call to the emperor's mind his imperial power than the protection he received from the church. The church was even now in need of reform. The emperor, Henry III., began this reform inasmuch as he checked simony, the immorality of the clergy, and party spirit in Rome, by promoting suitable German bishops to the papal chair, who endeavored with all their might to repress the old disorders. The popes, in consequence, acquired renewed authority, which they caused to be felt partly through their legates and partly in person. This renewed consideration for the popes depended on the power of the emperor to whom the popes owed their place, and without which they would perhaps have fallen back into

their former condition. But this dependence on the emperor did not last long. The greater the papal power, through the emperor's own co-operation, became within the church itself, the more strenuously did the pope strive to make himself independent, even as regards the emperor Hence the reformation of the church begun by Henry III. soon took a turn disadvantageous to the imperial power itself. His successor, Henry IV., met in Gregory VII. a pope who made the bold attempt to transform, at the cost of the imperial dignity, all Europe into one great theocracy that he might enthrone the pope on the summit of the great theocratic pyramid of the world. The papacy interfered in the province of states more and more, curtailed their sovereignty, and caused the greatest collisions to take place among them while the idea of the imperial *dominium mundi* faded away. The independent centre of gravity of states was displaced by the papacy. Uninterrupted papal interference checked their concentration and disturbed the process of their development. — In a certain sense, indeed, the Roman hierarchy united Europe into one great whole; and the pope was at times a Christian international tribunal for states in conflict with one another. The church, too, prevented the shedding of much blood by the institution of the *truce of God*. But there was little peace, under the auspices of the papacy, among states, and the papal see was by no means guiltless of this fact. This double power, this papal state within all states, brought it to pass that states could not comprehend themselves and could not grow strong and firm internally. But self-dependent states are a condition precedent to the existence of international law, and where there are no autonomic states an international system of states can never be formed; where there are no autonomic states, the idea of international law is wanting in the organs by which that idea can be properly realized. Hence the phenomenon that the international law of private individuals, that the recognition in every man of his purely human rights binding everywhere, preceded the international law of states in the middle ages. The bishops of that period, impelled by the spirit of Christianity, took the oppressed under their protection, checked the trade in human beings, ransomed slaves and opened the asylum of the church to the rights of man; while the great Christian nations, not without the church's being in fault for it, engaged in barbarous struggles with one another. — We can not find a paving of the way for international law in the middle ages nor in the crusades. Chivalry, indeed, attained to sword law and feudal law, but not to an international law; while the crusades aroused between Christian nations and infidel nations an opposition inimical to international law. They neither promoted the cause of humanity, nor opened new avenues to commerce, nor established a closer or more rightful relation among the nations of Europe. The so-called holy wars began with a frightful slaughter of the Jews, devastated a great part of Europe, and trampled under foot the best germs of the development of the sentiment of humanity. But one thing we must grant—the universality, the European character of the crusades In them all Europe participated, was animated by one feeling, and united to do one thing. In this first European movement, it became manifest that there was one great common European national life. — Good consequences flowed from the commercial spirit and from the alliances of cities, which was the cause, finally, of a commercial state that extended its sway over the Atlantic ocean and over the Black, Mediterranean, Baltic and North seas. These cities, the prince of which was Lübeck, were situated in Germany and the Netherlands, in the northern kingdoms, Poland, Prussia, Russia and Livonia; and the greatest commercial places in England, France, Spain and Italy associated themselves with them. This league was perhaps the most effectual the world has seen. It did more to make Europe one commonweal than all the crusades and all the usages of Rome; for it went beyond differences of religion and nationality and established the alliance of states on mutual utility, on emulous industry, on honesty and order. — Under Innocent III., the greatest man of his age, who, from 1198 until 1216, conducted papal affairs with equal firmness and shrewdness, the papacy rose once more to its full height. He gave utterance to it as a principle, that Germany and Italy should not be united under one crown —a principle which, if strictly carried out, would have led to the independent importance of Italy. With a bold hand he interfered in the political quarrels of Europe. But the consciousness of the states of Europe of their own rights rose up against him. The German empire had, indeed, been on the road of decline since the interregnum (1256–73) and the Hapsburgs were unable any longer to prevent the separation of Switzerland from the empire (1308). But states assumed a manly attitude toward the papacy. France reduced the pope to complete dependence on it (Avignon exile, 1305–78). Germany was no longer willing to allow the interference, in its political affairs, of a pope reduced to bondage by France, but still presumptuous in his bondage. The memorable assembly of electors at Rense (1338) declared the election of the German king to be independent of his confirmation and coronation by the pope; and Germany boldly proclaimed to the world that it wanted to see the spiritual power confined to the sphere of the spiritual. The council of Basil also, which lasted from 1431 to 1444, and revived the principle that a general council was above the pope, deserves mention in this connection. — How much the *dominium mundi*, conceded to the emperor, implied, was not clearly defined, and the whole idea had in it, at all times, much that was fantastical. Yet that the emperor had precedence of all other rulers was recognized even during the decline of the empire, and the emperor had the right to grant the title of king, as the

royal Bohemian and Polish dignity had their origin in imperial privileges. Yet in other kingdoms, and not in France and England only, men felt themselves much more independent of the emperor than of the pope. — The mariner's compass, gunpowder and the art of printing were three great elements of progress. The mariner's compass opened the broad ocean to commerce, and extended that commerce over the whole earth. Gunpowder put an end to the carnage of personal combat and made war more humane. The art of printing brought about a rapid exchange of thought in Europe, and generalized the beneficent effects of the sciences, then rapidly growing. — Three powerful currents had, from the beginning of the middle ages, poured themselves over the whole of Europe, and spread everywhere like intellectual elements: the Roman current, with the idea of the empire, of provincial and municipal organization, and of intercourse regulated by law; the Christian current, with the idea of humanity, the idea of universal fraternity, and ideas of pure morality; lastly, the Germanic current, with the ideas of personal faithfulness and honor, but especially of individual liberty and self-government. As the great deposits of these currents in the domain of law appeared the *corpus juris civilis*, the *corpus juris canonici*, and the *corpus juris Germanici:* all three of European importance and of consequence to all Europe. — The renewed diffusion of Roman law over a great part of Europe and the principles of Christianity gave a common basis to European law. The Bible and the Institutes of Justinian became the common property of all the more civilized nations of Europe, and brought about the harmony of moral and legal ideas necessary to the international agreement and understanding of states. — The reformation, the first great intellectual European upheaval, which, begun in Germany, spread over the whole north and west, brought the middle ages, from the standpoint of international law, as from all others, to a close. The reformation rendered possible, for the first time, the existence of self-dependent states—the support and organs of the idea of international law—by doing away with the dualism of the spiritual and temporal power, and by emancipating the state from the joint lordship of the Roman see. — The ascendency of the church could not, from this time, be feared by states. But, on the other hand, one state might obtain a dangerous preponderance over other states. And, indeed, from the sixteenth century, we find two ideas, engaged in a decided struggle with each other: the idea of a universal monarchy and the idea of the balance of power. The idea of a universal monarchy was a legacy of antiquity which knew little of international rights. It was inherited by the Frankish empire and then by the Germans; and after the decline of the empire other states sought to realize it. The more modern principle of international law, on the other hand, sought realization in the idea of the political balance of power. — From the standpoint of the development of the European system of states, the thirty years war is to be considered as a reaction of the idea of the balance of power against the ascendency of the house of Hapsburg. How the relations of states, in what concerns international law, have been modified from the peace of Westphalia to the present time, is best studied in the history of modern congresses and treaties of peace. The further development of the *theory* of international law will be treated of briefly in what we shall have to say in this article on the literature of the subject. — In spite of the wars and revolutions which have stirred Europe in recent times, humanity has gained visibly; the consciousness that all men belong together has grown stronger; the foundations of international law have become broader and firmer; and numerous traces of a barbarous international condition, which we find mentioned by writers on international law as still the law of barbarous peoples, are disappearing before the ever brighter and ever warmer beams of the still ascending sun of Christianity. An eloquent sign that the spirit of the present has invaded the sphere of international law is afforded by the Paris congress of 1856. Although that congress gave only an imperfect solution to the Eastern question, which was the occasion of its coming together, it will remain forever memorable in the history of international law, because of its reception of Turkey into the political system of Europe, because of its humanization of the laws of naval warfare, and because of the wish solemnly expressed by the powers before all Europe—though that wish was never fully realized—that in controversies between nations, these latter should, so far as circumstances permitted, have recourse to the good services or to the mediation of a friendly state before resorting to brute force. We have only to open the eye of the intellect to discern from this point the lofty mountain tops of the ideas of the modern era gilded by the sun of the future. — III. *Sources of International Law.* 1. Treaties between states occupy the first rank among the sources of international law. — 2. A second important source of international law are the records of the official proceedings of whatever kind, in which states have given expression to their convictions on international law. Here belong, 1st, the protocols of congresses and international conferences of ministers. These protocols have, for the most part, served in the preparation of important treaties between states. They are, besides, a means, worthy of all consideration, to enable us to determine the true and complete sense of the treaties for which they have paved the way, and hence they must be considered a source of at least so-called *special* or *particular* international law, that is, of that international law which is binding only on the contracting states. In addition to this, they frequently contain the expression of the common conviction of the right of all civilized states, and thus furnish valuable material for the international law which is "binding on all states."

Here belong, 2d, the declarations of the great powers, notes, manifestoes, correspondence, and even the protests of states. Declarations of the great powers as to their views of the right, such as the declaration made by them in 1856 in relation to maritime law, acquire very soon, when they have reason on their side, a force equal to what they would have if made by a legislative body. Manifestoes, notes, correspondence, are often the unbiased expression of legal convictions, which will never afterward be questioned by states in their international intercourse with one another Even the protests of individual states against violations of rights by others may be considered as a source of international law when, because based on the right, they have received the assent of impartial states or of impartial posterity. Neither of these kinds of documents, however, has the binding force of treaties. Science should be as far from passing them by without notice as it should be from accepting what they contain without any more ado. Rather is science here called upon to go into the fullest examination. The material of these documents is to be found in the numerous writings on treaties of peace, those which are wont to appear under the titles *Négotiations, Négotiations secrètes, Actes et Mémoires, Pièces officielles;* also in the matters laid before constitutional chambers for their discussion, in the collections of "state archives," "political archives," etc., in the blue books; but especially in the voluminous English "portfolios."—3. Laws and regulations of individual states come into consideration, in various ways, as sources of international law. Where, for instance, on matters which may become the subject of international as well as of private or civil controversy, the laws of states agree, and when no objection can be rightfully raised against applying the principles of the civil law, by way of analogy, to cases of international dispute, a controlling principle of international law may be deduced from the civil law. So, too, when the principles of purely international law are incorporated into the statute law of a country, as has been done, for example, in the law of booty, the law of blockade, in the laws on the slave trade on the high sea, either because the statute law of the countries in question anticipated the universally admitted principles of international law, as did, for instance, the English laws on the slave trade, and the French decree of March 28, 1852, which absolutely prohibited the reprinting of foreign books on French soil; or else because the legislation of an individual state has merely sanctioned provisions of international law already universally recognized. More especially worthy of notice are the laws and regulations of states governing maritime prizes in times of war; for each state allows its own courts to decide on the validity of the maritime prizes made by its ships. The state of course lays down laws by which its courts must be governed in such cases, and these laws are not the result of the caprice of the state; rather are they intended to be, as they should be, the expression of the general principles of international law.—The old sources which constitute the common historical basis of the law of civilized Europe are gladly resorted to, the Roman law and also the canon law, so far as both continue to express the consciousness of right of the present. The Roman law and the canon law have of course no legally binding force on nations; only as *ratio scripta* can they be taken into consideration.—4. The verdicts of international courts, of so-called mixed commissions and prize courts, fill a place in international law similar to that filled in Roman law by prejudication. The same may be said of the legal opinions asked by states in matters of international dispute. Very important are the decisions of mixed commissions which are composed of arbitrators of different states on the international controversies of such states. By the very composition of such commissions, the national narrowness of the legal consciousness of the commissioners is removed, and the way opened for the universally rational. The judgments of prize courts, indeed, since prize courts are appointed or established by the one party or the other, have not the presumption of complete impartiality in their favor. Such judgments must therefore be constantly criticised and cautiously used. Legal opinions on questions of international law are sometimes asked by a state of its own jurisconsults, and sometimes also from distinguished foreign jurisconsults, that it may regulate its course according to them. Such opinions possess especial weight and the strongest presumption of impartiality when they are opposed to the interests of the jurisconsult's own consulting state; their importance is so much the less in the opposite case.—5. In view of the deficiency of international law in positive provisions, the writings of jurists enjoy great authority in it. Statesmen gladly consider themselves bound by what they find in them. Not for the reason that the writers of such works are absolutely better versed in the matter than statesmen. But the individual case interwoven with a great many interests, which it is incumbent on the statesman to decide, makes him easily prejudiced and one-sided, and hence it is essential to justice and impartiality to listen to the voice of those who, unprejudicedly engaged in the cultivation of science, endeavor only to give expression to the truth. The weight of the decisions of jurists is increased when the writers of different, or, better yet, of all civilized nations, agree, so that it may be said we have in such opinions the harmonious testimony of nations.—International customary or unwritten law can, in general, be drawn only from the writings of jurists, who here appear not as mere theorizers, but as witnesses to historical facts. We here distinguish international customs and international observances. International customs are recognized by certain uniformly recurring facts, in which a permanent consciousness of the legally right, one

common to all nations; finds expression. The simple recurrence of the merely external facts is not decisive here. Proof is necessary that the reason of the recurrence is, in very deed, in an unchanging consciousness of nations of the right. By observances are meant the merely external formal usage, not the shaping of the forms of international intercourse, which has no essential necessity in it. They may for the most part be insisted on as real rights, as law, but they are not law absolutely, but only because of usage. A great part of international ceremonial law is based on such merely external usages; little of it depends on agreement, and hence much of it is controverted. — When jurists speak not as witnesses to the historical international law, but as theorizers, their theories must be carefully examined, and subjective views must be distinguished from objective truths by independent investigation. Every theoretical proposition, however, which is nothing but an inference from a principle already recognized as a principle of international law, has an unqualified claim to being in force; and the art of the theoretic improvement of international law consists mainly in this, to grasp such principles and render them productive of others. — IV. *Literature.* What we have to say here on the literature of international law may be considered, in a measure, as the continuation of what we have said above on its history. — The theory of international law has been developed since the reformation. That theory received its first powerful impulse from the reformation which, for the first time in the world's history, made self-dependent states possible, and with the principle of intellectual freedom smoothed the path of political freedom. (Mart. Huebneri, *Orat. de immortalibus Mart. Lutheri in imperia meritis*, Hafn., 1761; Creuzer, *Luther und Hugo Grotius*, Heidelberg, 1846.) — At first international law was treated as a part of the law of nature, because writers confounded the Roman meaning of the *jus gentium* with its modern meaning. Thus, Oldendorp, *Juris naturalis, gentium et civilis isagoge*, Coloniæ, 1537; also Hemming, *De lege naturæ methodus apodictica*, 1550; finally, Winckler, *Principiorum juris libri quinque*, Lipsiæ, 1615. Besides these predecessors of Grotius, the father of the science of international law, we must also mention Albericus Gentilis, who was born in 1551 in Ancona. He was obliged to take refuge in England because of his Protestant opinions, and died in Oxford in 1611. He wrote his *De legationibus* in 1585; in 1588, his *De jure belli;* and in 1590, *De justitia bellica*. From the relationship existing between his ideas and the resemblance of the subdivisions of his work, and even the titles of his chapters, to those of Grotius, it has been assumed that Grotius drew much from him. (The history of the literature of international law has been written by De Val, *Inleiding tot de Wetenschap van het europesche Volkenregt*, Gron., 1835; Kaltenborn, *Kritik des Völkerrechts nach dem jetzigen Standpunkte der Wissenschaft*, Leipzig, 1847; Robert Mohl, *Geschichte und Literatur der Staatswissenschaften*, 1855. A comprehensive history of the literature of international law may be found in Henry Wheaton's *Histoire du droit des gens*, 4th ed., 1870. Among the precursors of Grotius, the Spaniard Suarez (1538–1617) should not be forgotten. He wrote *De legibus ac de legislatore.* Compare Kaltenborn, *Die Vorläufer des Grotius*, Halle, 1848.) — Grotius, however, is the first who accomplished anything of importance in international law. — When the Spaniards demanded of the Netherlands, which had become independent, that they should no longer continue to carry on their trade with India, Grotius composed, in 1609, his *Mare liberum, seu de jure quod Batavis competit ad indica commercia*, Lugd. Bat. Subsequently, having fled to Paris, he there wrote his masterpiece, *De jure belli ac pacis*, 1625, in which we find a frequent admixture of views pertaining to natural law and to international law, although it is very evident it was Grotius' intention to give the world not natural law but international law, in the modern sense of the term. The influence of the work was very great, for it was permeated with the spirit of Christianity and humanity, while it opposed to the system of machiavelism only the simple fundamental principles of right. Gustavus Adolphus carried it always with him. All diplomates of the period immediately following Grotius referred to it as they would to a book of statutory law. It will live forever as the first work on international law. (Hartenstein, *Darstellung der Rechtsphilosophie des Hugo Grotius*, in the *Abhandlungen der philosophisch-historischen Klasse der k. sächs. Gesellschaft der Wissenschaften*, Leipzig, 1850; Van Hagendorp, *Commentatio de juris gentium studio in patria nostra*, Dorpat, 1858. Commentaries on, selections from, and translations of, Grotius' work have appeared in great numbers and increased its influence.) — The Englishman, John Selden, contested Grotius' views drawn purely from natural right, in his *De jure naturali et gentium, juxta disciplinam Ebræorum*, 1629. He met Grotius' *Mare liberum* with his *Mare clausum.* — A loftier position was taken by the Englishman, Richard Zouchy (*Zouchæus*). He was the first to write a text book on international law, which he did under the title: *Juris et judicii fecialis, sive juris inter gentes, et quæstionum de eodem explicatio*, Lugd., Bat., 1651. — Pufendorf, the first teacher of natural law at Heidelberg, and later at Lund (born 1631, died 1694), starts out with the view that the doctrines of natural law and of international law are identical; that is, that certain same principles applied to individuals constitute natural law, and that applied to states and nations they constitute international law. He here follows Hobbes *De Cive*, cap. xiv., § 4. He denies international law on the whole the character of positive law. His *Jus naturæ et gentium* appeared first in 1672, and an improved edition in 1684. He found an adherent in Christian Thomasius, who, born in 1655, was professor at Halle, and died in 1728, a man who

denied all positiveness to international law, for the reason that there is no legislative power over states. — In opposition to this tendency in the direction of natural law, we find others insisting on the positive character of international law. Thus, Samuel Rachel (1628–1691) professor in Halberstadt and afterward in Kiel, and ambassador at the peace congress at Nimwegen; also Wolfgang Textor, who was born in 1637, was professor at Altdorf and Heidelberg, and died as protosyndic in Frankfurt in 1701. Rachel wrote *De jure naturæ et gentium dissertationes duæ*, 1676, and Textor a *Synopsis juris gentium*, 1680. — Christian Wolff, who was born in Breslau in 1679, and died as chancellor of the university of Halle, in 1754, applied his notoriously stiff mathematical method even to international law. And so he composed his extensive work *Jus gentium methodo scientifica pertractatum*, 1749, and in 1754 issued an abridgment of it under the title *Institutiones juris naturæ et gentium*. He did much to systematize international law. He considered that nations and states stood in the same relation to one another as the members of the same body. He called the legal community of all nations and states a *civitas maxima*. By so doing, he—it matters not how much he dwelt on the independence of states—almost transformed the free community of states into the unfree unity of one universal state. (Wheaton, *Histoire*, 1853, tome i , p.227; Kaltenborn, *Kritik*, pp. 66, etc.; T. Rutherforth, "Institutes of Natural Laws, being the substance of a course of Lectures on Grotius' *De jure belli ac pacis*," Lond , 1754 See also, Burlamaqui, whose *Principes du droit de la nature et des gens* appeared originally in 1766, etc., in eight volumes; and Gérard de Rayneval, whose *Institutions du droit de la nature et des gens* was published in 1832, and a new edition in Paris in 1851.) — Wolff 's celebrated follower, Vattel, who was born in 1714 and died in 1767, selected the best of his master's ideas on international law and accepted Wolff's principles and definitions. Yet he could rightly claim that his work was very different from Wolff's. It has had, and still has, great weight. His *Droit des gens* appeared (1st edition) at Leyden in 1758; the second at the same place in the same year. The last edition, in three volumes, appeared in 1863. — Johann Jacob Moser shows too great a contempt for philosophy in international law, but, on the other hand, furnishes us with a vast amount of philosophical matter, and thus supplies the theory of international law with a sure, positive foundation. It is to be regretted that he takes into consideration almost exclusively the historical events of comparatively recent times, instead of following the positive principles of international law in their gradual growth. Of the writings on international law produced by him during his literary career of nearly fifty years (1732–81), we must mention: *Grundsatze des jetzt üblichen Europ. Völkerrecht in Friedenszeiten*, 1750; *Grundsätze des jetz üblichen Europ. Volkerrecht in Kriegszeiten*, 1752; *Erste Grundlehren des jetzigen Europ. Völkerrecht in Friedens-und Kriegszeiten*, 1778; *Versuch des neuesten Europ. Völkerrecht in Friedens-und Kriegszeiten, vornhmlich aus der Staatshandlungen der Europäischen Mächte, auch anderen Begebenheiten, so sich seit dem Tode Kaisers Karl VI.*, 1740; *zugetragen haben*, in ten parts, 1777–80; and, lastly, *Beiträge zu dem neuesten europ Völkerrecht in Friedenszeiten*, in five parts, 1778–80. — Efforts were now made to systematize international law from the positive material collected, although the "systems" thus formed continued to have a very arbitrary, capricious character. (Compare Kaltenborn, *Kritik des Völkerrechts*, pp. 103, etc.) — R. G. Gunther, a Saxon, who had published, in 1777, an anonymous work on the outlines of international law, composed a work: *Europäisches Völkerrecht in Friedenszeiten, nach Vernunft, Verträgen und Herkommen, mit Anwendung auf die deutschen Reichsstände*, part i., 1787; part ii., 1792. K. H. von Römer denied the existence of a general European international law, and sought to give an exposition of German international law. He, in this work, mixed up the relations of the German princes to the emperor, and thus produced a compound of German public law and international law in his book, *Das Völkerrecht der Deutschen*, 1789. Friedrich von Martins is the most noted representative of this capriciously systematizing school of international law. — Kant treated of international law at the end of his *Rechtslehre*, which appeared for the first time in 1797. Kant does not hold strictly to the distinction between international public law and international private law, a distinction which he evidently conceived from the separation of international law proper from cosmopolite law. He starts out with the fiction of natural law, of a state of nature, both of individuals and nations. This state is a state of war, of club-law, a state which must be done away with, and, in the domain of international law, done away with by a confederation of states created to ward off attacks from without. But a universal confederation of states, embracing all nations, is impossible. A multiplicity of confederations existing, there again arises for these, in their relations with one another, a state of nature and a possibility of war. Hence the unattainableness of perpetual peace. But an approximation to perpetual peace may be made by unions of individual states effected to maintain peace among themselves. This subject is treated more fully in Kant's *Zum ewigen Frieden*. By "cosmopolite law" Kant understands simply the right of every man to have intercourse with all the nations of the earth. (*Sich jedem Volke des Erdballs zum Verkehre anzubieten.*) — Among German Kantists in international law we must mention Pölitz and the elder Zachariä. Pölitz, who was born in 1772 and died in 1834, a professor in Leipzig, devotes much space to international law in his *Staatswissenscheften im Lichte unserer Zeit*. Karl Salomo Zachariä (born 1769, died 1843), professor in Heidelberg, treats of international law in his

Vierzig Bücher vom Staate, vol. iv. He works out Kant's idea of a confederation of states for the prevention of war still farther, and gives the notion of cosmopolite right or law more substance. — An exhaustive disquisition on international law from the Kantian standpoint was furnished by Baroli, professor of philosophy in Pavia, in the fifth and sixth volumes of his *Diritto naturale*, i.–vi., Cremona, 1837. Of inferior importance is what Tolomei says of international law in his *Corso elementare di diritto naturale*, i.–iii, Padua, 1848.—Johann Gotlieb Fichte published an outline of international and cosmopolite law, as a second appendix to his work on natural law which appeared, 1796–7, in two volumes. He follows Kant rather closely, but exposes his doctrines in strictly methodical connection, while on international law we find only detached sentences in Kant. — The most recent period in the science of law, especially on the continent of Europe, is characterized by a tendency in the direction of the removal of the former enmity between philosophy and history, a direction which found expression in Hegel. Modern authors of works on international law, without being fully conscious and clear that they have been moving in this same direction, take into consideration both the positive and the philosophic-theoretical, which is connected with, is based upon, and frequently transcends, the positive. And when we see some writers treat mainly of the philosophical in international law, simply acknowledging the value of the historical; and others again bestowing their industry chiefly on the historical, and relegating the philosophical to a secondary place; we must seek the explanation of the fact, not so much in a difference of standpoint of the two classes of writers, as in a difference in their intellectual peculiarities and endowments. — We here give a list of the chief treatises of international law.—Americans: Henry Wheaton, *Elements of International Law*, 2 vols., 1836; 2d ed., annotated by W. B. Lawrence, 1863; 8th ed., by Dana, Boston, 1866; W. H. Halleck, *International Law, or Rules Regulating the Intercourse of States in Peace or War*, San Francisco, 1861; Theodore D. Woolsey, *Introduction to the Study of International Law*, 4th ed, New York, 1875; Kent, *Commentaries on International Law, revised, with Notes and Cases brought down to the present time*, by Abdy, Cambridge, 1866.—Englishmen: Oke Manning, *Commentaries on the Law of Nations*, 1839; new edition by Sheldon Amos, 1875; Wildham, *Institutes of International Law*, 1849; Polson, *Principles of the Law of Nations*, 1854; Travers Twiss, *The Law of Nations considered as Independent Political Communities*, 2d ed., 1875; Sir Robert Phillimore, *Commentaries on International Law*, 3 vols. (vol. 4 is devoted to private international law), 2d. ed., 1871. —Germans: Heffter, *Das Europäische Völkerrecht der Gegenwart auf den bisheregen Grundlagen*, 5th ed., 1867, Oppenheim, *System des Völkerrechts*, 2d ed., 1866; de Martens, *Précis du droit des gens modernes de l'Europe augmenté des notes de Pinheiro-Ferreira par Ch. Vergé*, Paris, 1864; Huhn, *Völkerrecht, volksthümbliche Darstellung*, 1864; Bulmerincq, *Die Systematik des Volkerrechts*, 1 *Th.*, *Kritik der Ausführungen und Forschungen zu Gunsten der Systematisirung des positiven Völkerrechts*, Dorpat, 1858; Bulmerincq, *De Natura principiorum juris inter gentes positivi*, 1856; Pözl, *Grundriss zu Vorlesungen über Europäisches Völkerrecht;* 1852; Mohl, *Encyclopädie der Staatswissenschaften*, 2d ed., 1872, pp. 402, etc.—Frenchmen: de Rayneval, *Institutions du droit de la nature et des gens*, 2d ed., 1832.—Italians: Romagnosi *Introduzione allo studio e diritto pubblico universale*, 1838; Ludovico Casanova, *Lezioni di diritto pubblico internazionale*, 1860, Padova, 1868; Ferrero Gola, *Corso di diritto internazionale privato e marittimo*, Parma, 1866; Carnazzi Amari, *Elementi di diritto internazionale;* Avio, *Saggio di una teorica giuridica dei rapporti internationali;* Fiore, *Nouveau droit international public*, 1869, Mancini, *Diritto internazionale*, 1873.—Spaniards and South Americans: Pando, *Elementos del derecho internacional*, 1843; Riquelme, *Elementos del derecho internacional español*, 1849; Bello, *Principios del derecho internacional*, 2d ed., Paris, 1864; C. Calvo (South American) *Derecho internacional teorico y practico*, 2 vols., 2d ed., 1870. —Portuguese: Paiva, *Elementos do dereito das gentas*, 4th ed., 1857; Pinheiro-Ferreira, *Cours de droit public interne et externe*, Paris, 1830.

K. Brater.

LAW, Natural. (See Fictions.)

LAW, Penal. The historian finds penal law intermingled with all the primitive customs of nations. It is the first sign of the existence of human society. It is in fact impossible to conceive any association, even that of the family, without a principle of order and a sanction. In the first age of civilization its rules are uncertain: founded upon an imperative need of defense, it follows the progress of the manners, customs, prejudices and institutions which it protects. It seems unquestionable, however, that among all uncivilized nations the right of revenge has ever been the first principle of punishment: as they had no social justice, private justice took its place; each one defended himself; the family or clan undertook to make reprisals; the shedding of blood for revenge was allowed without judgment or restriction. The barbarous custom received its first check from religion: murderers or plunderers appeased the divine wrath by expiatory sacrifices, and the priests were consulted about reprisals. Among the Germans it was not lawful to inflict punishment upon a criminal, *nisi sacerdotibus permissum velut deo imperante*. Other moderating influences, no less efficacious, were brought to bear upon men's manners; first, the law of retaliation, the rude expression of a sort of moral justice. We find this formula in Exodus: "An eye for an eye, a tooth for a tooth." The Greek and the Roman laws have preserved traces of its application, consisting of the infliction of

precisely the same injury that had been committed. Thus, while recognizing the law of retaliation, they regulated its application, confined it within fixed bounds, and forbade it to go beyond them. Such was also the object of the compounding of crime, which, like retaliation, recognized the right of personal vengeance, and which authorized the surrender of this right for an amount of money. A Roman law, which Paulus and Aulus-Gellius trace back to the Twelve Tables, declares: *Si membrum rupit, ni cum eo pascit, talio esto.* Compounding of crime, therefore, did away with reprisals, and consequently with retaliation. This custom, which we find in the Hebrew, the Greek and the early Roman laws, reached its greatest development in the German law, which even regulated the amount of compensation to be paid for each species of crime. Its introduction into the final laws of *the fredum* addressed to the judge or chief magistrate of the state, impressed upon compensation a general character; in this we may recognize a first tendency toward the régime which was to substitute public for private penalties, and the action of society for individual action. — The development of a central power favored this tendency among every tribe and nation. It was the duty of this authority, whatever it was, to protect and avenge the injured parties; it took up their quarrel and supported it in its own name; revenge, instead of being personal and private, became general and public. In the early ages, penalties were mild, and consisted in most cases of simple fines. Cicero affirms that Romulus did not establish any other penalties: *multa ditione ovium et boûm, non vi et suppliciis coercebat.* It must, however, be remarked that default of payment of the pecuniary penalty imposed authorized the infliction of corporal punishment, and that the system of compensation and of fines was never extended to the numerous and disinherited class of slaves; these latter were always subjected to the most atrocious punishments. The character of the penalties inflicted, however, was soon changed; they gradually became a means of power and revenge in the hands of the rulers of nations. The right of *public prosecution* entered into general legislation and was regarded as perfectly legitimate. A threatened state, broken laws, justice itself when outraged, avenged themselves by inflicting punishment. Hence the extravagant nature of these punishments, hence the tortures and torments that have overrun the penal code. The penalty had no limit, because revenge has no limits; man even pretended to avenge the divinity when the guilty acts seemed to have a sacrilegious character, and the punishment of the guilty party became an act of piety. — The manifestations of these excesses of the penal laws were not entirely identical among ancient and among modern nations. At Athens, stoning, crucifixion, burning, whipping with the lash or with rods, were inflicted, even under the laws of Solon, not only for homicide, but for treason, desertion to the enemy, for open theft, for the profanation of the mysteries, and for sacrilege. At Rome the condemned were at times precipitated from the Tarpeian rock, at other times tied up in a bag and cast into the sea, at others burned alive, at others hung upon a cross or delivered to wild beasts; some of these punishments were, however, done away with, to be replaced by the sword and the gibbet, *damnatio ad gladium et ad furcam.* In the middle ages this severity was increased still more: men's manners had become rude, acts of violence were habitual, disorders frequent, wars continual; penalties to be effective must needs be severe. Atrocious punishments were invented; death did not suffice to satisfy the vengeance of the social power. The condemned were quartered, their flesh was torn off with red hot pincers, they were burned alive, cut to pieces, tied to the heels of untamed horses, pierced with pointed sticks, buried alive, plunged into boiling oil, shut up in iron cages, or had melted lead or pitch poured over them. It seemed that men could only be restrained by punishments equal in violence to the violent acts which they committed The laws described all these punishments with a sort of complaisance. In France the death penalty was inflicted in one hundred and fifteen cases, and the crimes which escaped capital punishment entailed the mutilation of a member, burning with a red hot iron, splitting the lip or tongue, branding, and all the refinements of torture which an ingenious cruelty could devise. The object of all these penalties, which the laws decreed, was, as we have already said, public vengeance; the effect they aimed to procure, intimidation. The legislators, therefore, were restrained by no obstacle nor remorse: they proposed to themselves, as their aim, to avenge the divinity, society and individuals, and, as the result of their enactments, to restrain the rudeness of manners by fear. — It was not until the nineteenth century that the first ideas of reform acquired any strength. Montesquieu limited himself to establishing the principle of moderation in punishments and to pointing out the close connection between penal laws and political institutions. Vattel and Rousseau, Locke and Thomas Hobbes went further: they sought for the foundation of penal law, and thus began to destroy the old edifice of legislation. But it was really overturned only by Beccaria. The little book which he published in 1766, a sort of pamphlet, entitled, "Of Crimes and Penalties," met with immense success, and brought before the bar of public opinion, which it had transported with enthusiasm, the highest questions of penal law. It is not a scientific work: it is a few pages written with rare good sense and under the impulse of a profound sentiment of justice and humanity. The author proposed to himself to introduce moderation into the penal laws, and to defend the rights of mankind in the persons of the accused. It exercised an immense influence; its doctrines, developed in a host of writings, acquired incredible power. Penal legislation was partially reformed

in France even before the meeting of the constituent assembly. The codes of Dec. 25, 1791, of the third Brumaire of the fourth year of the republic, and of Jan. 1, 1811, did nothing but confirm the doctrines of the eighteenth century, although restraining and curtailing them. — What is the principle of penal law? We have just seen that until quite recently most penal legislation, after having abolished private vengeance, considered as the fundamental principle of penal justice a right to prosecution by the state, for the general good. The publicists of the eighteenth century tried to substitute for this principle, which justified every excess, the principle of lawful defense restricted within the limits of common utility Beccaria, Feuerbach, Carmignani, and even Bentham, professed, with differences more or less marked, this doctrine which has for its point of departure the separation of divine and human justice. According to Kant, who is the leading doctor of this school, penal law has the right to punish only what is bad; what is contrary to moral law, what is unjust. It punishes because the guilty one has deserved the punishment, and because chastisement is only a means, and a manifestation of expiation. This doctrine, which has been accepted by a great many German publicists, was propagated in France by Guizot, de Brogli and Rossi, who, however, thought it incumbent upon them to place side by side with the moral law and as a further condition of the penal law, the interest of social order, and that which is of use to society. These are the principal systems known to science; we omit a great number of mixed theories which it would take too long to analyze. — Among all these theories, where are we to find the truth? Is it true that moral justice and human justice have a common origin? Is it true they both have the same mission to fulfill, although using different means and acting in different spheres? No; for what moral justice exacts is the expiation of the fault, that is to say, retribution made for the fault committed by the evil inflicted. Is this the mission of social justice? Has it been delegated by eternal justice to enforce its laws? Has it the power to exact the expiation of crime? It has not even the means of proving that expiation has been made, for its vision is short, and its means of ascertaining truth are limited. It can not enter the conscience of the guilty party, it can not see his motives or his remorse, it can measure neither the degree of the fault nor the degree of expiation, it apprehends the external facts alone; how then, since it can not determine absolute criminality, can it act the part of divine justice? It proceeds against material acts, with the aid of material means; the exalted but mystic view of expiation does not belong to it; this view is that of the human soul, it can not be that of society. — The principle of action which should govern society is to be found in the law of self-preservation inherent in it. This law, which is the first of all human laws, obliges the social power to maintain order, that is, to secure respect for the rights of the state, and the rights of its members. Penal justice exists because society exists, because it is one of the attributes, one of the conditions of its life. It needs no other title; its legitimacy rests entirely on social law. Is the right which it exercises the right of self-defense? If we take this word in its ordinary acceptation, no; if it be taken in the sense in which we understand it, that is, as the right of adopting the general measures necessary for the common defense of the rights of all, for the preservation of the state, it is. Penal justice admits the moral law, not as the source from which it emanates, but as a condition and a limit of its accusations and its penalties. Its mission is not to give a sanction to this divine law, and enforce the observance of its precepts. It concerns itself, and can only concern itself, with public order and social interests; it can have no other object than to maintain this order and protect its interests. Chastisement, as has been very truly said, has no right except against crime; but to constitute crime in the eyes of human justice, it does not suffice that moral order is disturbed; it is necessary that there should be a grievous attack upon social order, a serious breach of external peace. — There flow from this fundamental principle two corollaries: the first is, that society has the right to forbid and to punish whatever is injurious or guilty, or of such a nature as the law ought to repress. Social danger, moral criminality and penal efficacy are the three conditions of penal justice. The second is, that the law, when punishing the acts which offend against both the social and the moral order, should confine its action to this class of acts, and can not go beyond this without infringing upon the rights of individuals. It may be laid down in general that the right of social power is to require the fulfillment of the conditions essential to its preservation; its duty is to insure the moral and material development of mankind. The right of the individual is freely to employ his activity, his intelligence and his liberty; his duty is to offer no obstacle to the exercise of the collective action of the rights of society. It is in endeavoring to reconcile these rights and these obligations that penal law must establish the grounds and limits of its accusations and penalties. — Here there arise two questions: What actions should be considered criminal? In what cases can the authors of these punishable actions be considered responsible? We shall not dwell upon the first of these questions: to examine it in all its details would carry us too far from our subject. The legislator has the right to restrain all immoral acts which threaten the security of the state and of individuals, provided the offense be grave, and be manifested by an appreciable external act. The second question constitutes what, in penal law, is called accountability. The guilt of the authors of a crime or of an offense is modified by the circumstances which accompanied the act. Their criminality is lessened

if the previous life of the culprit has been pure, if he acted only under the impulse of want or passion, or if he shows repentance or remorse; it is lessened still more if he was provoked by a violent outrage, if he can plead the weakness of childhood, or the feebleness of old age, finally, it is entirely removed if he merely made use of the right of self-defense. — In French law, extenuating circumstances, which that law has not defined and will not define, are all facts that lessen criminality: weakness of intellect, lack of education, bad example at home, the instantaneousness of the action, poverty, ignorance, suffering; the declaration of these circumstances and the appreciation given them by penal law, form one of the most precious conquests of French modern legislation. The judge has acquired the power to be just, for he can proportion the punishment to the gravity of the offense. Excuses, like extenuating circumstances, do not exclude penal accountability, they merely lessen it and efface it in part; they may reduce the penalty to its smallest limit, but they do not remove culpability entirely. Justifying facts exclude all criminal intention; they establish the innocence of the accused, they do away with all infliction of punishment: such are insanity, actual necessity of self-defense, the proving of an *alibi* by the accused, and constraint. Under certain circumstances the motives of excuse and the motives of justification work the same effect. Thus the child that acts without knowledge is justified, because it has no criminal intention; if, on the contrary, it act knowingly, it is merely excused on account of its tender age. FAUSTIN HÉLIE.

LAW, Roman. This general title is used to express the collection of the principles of law that were in force among the Roman people, and, more especially, the collection of laws published by Justinian, which constitutes the last stage of Roman law. Before reaching this stage, Roman law, considered in itself, without any regard to events, passed through four periods. The first period extends from the foundation of Rome to the law of the Twelve Tables (year of Rome 1 to 300). This is the period of its birth. The second period is from the law of the Twelve Tables to Cicero (350 to 600). The contentious disposition early exhibited by the Romans gave to the law an importance which increased daily. The third period, from Cicero to Alexander Severus, includes the space between the year of Rome 650 and the year of Rome 1000. This is the epoch of its maturity and perfection. While the Roman arms extend the rule of its laws over the greater part of the known world, the science of law is carried to a high degree of perfection by the eminent minds that devote themselves to it. Their rare talent marvelously improves and fertilizes the naturally ungrateful and sterile soil of primitive law. The fourth period extends from Alexander Severus to Justinian. This is the period of its decadence. To the spirit of ingenious but rigorous deduction, and to the learning which produced great jurists, there succeeded, in practice, the rule of citations, in science, the more laborious than fruitful work of compilers and abbreviators. At last the number and contradictory teachings of the works of jurisprudence produced confusion and obscurity. To remedy this evil and render the study and application of law less difficult, Justinian caused to be compiled, abbreviated and codified all that was worthy of preservation in the old law. This task, which was accomplished by John, Tribonius, Theophiles and other jurists, produced: first, the Digest, a collection of the decisions delivered by the most esteemed jurists (533 B.C.); second, the Institutes, an abridged treatise for the use of students, presenting in a short course the principles and definitions of law; third, two lessons on the Code (527 and 534), devoted to the imperial constitutions. These three works, each of which received the force of law, together with a certain number of later imperial constitutions (the new or authentic constitutions), form what was styled the *corpus juris civilis*. Under this form, which certainly is not its best form, the Roman law has outlived Roman domination, preserved its sway even over nations which had escaped this domination, exerted its influence over all European legislation, and still exists and is obeyed or consulted, either as positive law or as written reason, among most of the nations of modern times.

GASTON DE BOURGE.

LAW, Spoliation by. What is law? It is the collective organization of the individual right of legitimate defense. Every man certainly has received from nature, from God, the right to defend his person, his liberty and his property, since these are the three constitutive or conservative elements of life, elements which complement one another, and which can not be understood, one without the other. For what are our faculties but an extension of our personality? And what is property but an extension of our faculties? If every man has the right to defend, even by force, his person, his liberty and his property, a number of men have the right to concert together, to agree and to organize a common force in order to provide regularly for this defense. The collective right has its principle, and its reason of being, and bases its legitimacy upon the individual right, and the common force can not legitimately have any other end or any other mission than the isolated forces for which it is substituted. Thus, as an individual can not legitimately make any forcible attempt against the person, liberty or property of another individual, so, for the same reason, a community can not legitimately make use of force to destroy the person, liberty or property of individuals or of classes. For this perversion of force would be, in the latter case, as well as in the former, in contradiction to our premises. Who will dare to say that we have been gifted with strength, not

to defend our rights, but to destroy the equal rights of our fellow-men? And if this is not true of the force of each individual, when acting alone, how can it be true of the collective force, which is but the organized union of individual force? The following proposition, therefore, is a most plainly evident truth: law is the organization of the natural right of legitimate defense; it is the substitution of collective force for the force of individuals, to act in the circle in which these latter have the right to act, to do what these latter have the right to do, to guarantee life, liberty and property, to maintain every one in his rights, to mete out *justice* to all. — Unfortunately, the law has not confined itself to playing its part. Nor has it erred simply by the adoption of neutral views or of views open to discussion. It has done worse than this; it has acted contrary to its end; it has destroyed the very object of its existence; it has endeavored to abolish that very justice whose reign it ought to inaugurate, to blot out that limitation of different rights which it was its mission to cause to be respected; it has put the force of the community at the service of those who wish to turn to their own advantage, without risk or scruple, the person, the liberty or the property of others; it has turned spoliation into a right, in order to protect it, and has made legitimate defense a crime, in order to punish it. How has this perversion of law been accomplished? What have been the consequences of it? Two very different causes have led to this perversion of law: ignorant egoism and false philanthropy. Let us consider the first of these causes. — So truly are self-preservation and development the common aspiration of all men, that, if all enjoyed the free exercise of their faculties and the free disposal of their products, social progress would be incessant, uninterrupted and unfailing. But there is another disposition which all men possess in common. This is the disposition to live and develop, one at the expense of another. This is not a bold imputation, prompted by a peevish and croaking spirit. History bears testimony to its truth by the incessant wars, the migrations of nations, by priestly oppression, the universality of slavery, and the industrial frauds and monopolies with which its annals are filled. This unfortunate disposition springs from the very constitution of man, from that primitive, universal and invincible sentiment which impels him to seek happiness and fly from pain. Man can live and enjoy only by assimilation, by a perpetual appropriation, that is, by a perpetual application of his faculties to things, or by labor. This is the source of the right of property. But he may, in fact, live and enjoy by assimilating and appropriating to himself the product of his neighbor's faculties. Hence spoliation. Now, as labor is itself a pain, and man is naturally inclined to avoid pain, it follows, and history serves to prove it, that spoliation prevails wherever it is less burdensome than labor; and so prevails that neither religion nor morality is able to prevent it. When, therefore, may we expect an end of spoliation? When it becomes more burdensome and more dangerous than labor. — It is very evident that the aim of the law should be to oppose the power of collective force to this lamentable tendency, and side with property against spoliation. But the law is generally made by a man or a class of men. And, as law can not exist without a sanction, without the support of a preponderating force, this force must of necessity be ultimately placed in the hands of those who make the laws. This inevitable phenomenon, and the unfortunate disposition which we have shown to exist in the heart of man, serve to explain the almost universal perversion of law It may readily be conceived how, instead of acting as a restraint upon injustice, it becomes its most irresistible instrument. It may readily be conceived that, according to the power of the legislator, it destroys for his profit and in different degrees the personality of other men by slavery, their liberty by oppression, and their property by spoliation. It is in the nature of man to rebel when made the victim of iniquity. When, therefore, spoliation is organized by law for the benefit of the lawmakers, all the classes despoiled endeavor, either by peaceful or by revolutionary means, to have some share in the making of the laws. These classes, according to the degree of enlightenment which they have reached, may be actuated by one of two very different motives in thus aiming to acquire their political rights: either they desire to put an end to legal spoliation, or they aspire to a share in it. Unhappy, thrice unhappy, the nations in which this latter thought prevails among the masses when they, in their turn, possess themselves of the legislative power! — Hitherto legal spoliation has been practiced by the few on the many, so that it was to be found only among nations in which the right to legislate was concentrated in the hands of a few men. But it has now become universal, and an equilibrium is sought for in universal spoliation! Instead of weeding out the injustice which society contained, men are making this injustice more general. As soon as the disinherited classes recover their political rights, the first thought which possesses them is, not to free themselves from spoliation, (this would suppose in them an enlightenment which they do not possess), but to organize against the other classes, and to their own detriment, a system of reprisals, as if such conduct must not, even before the beginning of the reign of justice, bring down a cruel retribution upon them all—on the one class because of their iniquity, and on the other because of their ignorance. It would be impossible to introduce a greater change or a greater misfortune than this conversion of the law into an instrument of spoliation. What are the consequences of such a disturbance? It would require volumes to describe them all. We shall merely indicate the most striking ones. — First, it effaces from the conscience the idea of justice and injustice.

No society can exist in which there is not some degree of respect for the laws; but the surest way to have the laws respected is to make them respectable. When the law and morality are opposed to each other, the citizen finds himself placed in the cruel alternative of sacrificing either his ideas of morality or his respect for the law: two evils, the one as great as the other, and between which it is difficult to choose. It is so much the nature of law to cause justice to reign, that law and justice are one and the same thing in the opinion of the masses. We are all strongly disposed to regard what is legal as legitimate, so much so that there are many who falsely derive all justice from law. It suffices, therefore, that the law ordains and sanctions spoliation to make it appear just and sacred to the consciences of many. Slavery, constraint and monopoly find defenders not only in those who profit by them, but also among those who suffer from them. If you undertake to propose any doubts as to the morality of these institutions, you will be called a dangerous innovator, a utopian, a theorist, a contemner of the laws; you will be told that you are disturbing the foundation upon which society rests. So that, if there exist a law which sanctions slavery or monopoly, oppression or spoliation under any form, it will not even be necessary to speak of it; for how shall we speak of it without lessening the respect which it inspires? Moreover, it will be necessary to teach morality and political economy in keeping with this law, that is, upon the supposition that whatever is law is, for that reason alone, just. — Is there any need to prove that this odious perversion of law is a perpetual cause of hatred and discord, leading even to social disorganization? Let us look at the United States. Here, of all the countries of the world, the law most strictly adheres to its proper rôle, which is, to guarantee to every one his liberty and property. Hence it is, of all the countries of the world, that in which social order seems to rest upon the most solid basis. Still, in these United States, there are two questions, and only two, which have several times imperiled political order. And what are these two questions? Slavery and the tariff, that is to say, precisely the only two questions in which the law, contrary to the general spirit of this republic, assumed the character of a despoiler. Slavery is a violation of personal rights sanctioned by law. Protection is a violation of the right of property, perpetrated by law; and it is certainly very remarkable that, in the midst of so many other questions of debate, this double *legal scourge*, the sad heritage of the old world, is the only one that may possibly threaten to lead to the dissolution of the Union. In fact, we can not imagine any greater misfortune than *the law made an instrument of injustice.* And if this fact engendered such dreadful consequences in the United States, where it was only of exceptional occurrence, what must it not produce in Europe, where it is a principle and a system?— "We should make war upon socialism," said Montalembert, borrowing the thought of a famous proclamation of Carlier, "with law, honor and justice." But Montalembert fails to perceive that he places himself in a vicious circle. He would oppose law to socialism. But law is the very power which socialism appeals to. It does not aim at extra-legal but at legal spoliation. It pretends, like monopolists of every class, to use the law as an instrument to accomplish its ends; and once it has the law on its side, how can you turn the law against it? How can you try, convict or imprison its followers? You wish to exclude socialism from all share in the framing of the laws. You wish to keep it out of the legislative halls. I dare predict that you will never succeed in this so long as the laws enacted within these halls acknowledge the principle of legal spoliation. It is too unjust and too absurd.— This question of legal spoliation must be solved, and there are only three solutions of it: Let the few despoil the many; let every man despoil every other man; let no one despoil any one. We must choose between partial spoliation, universal spoliation, and no spoliation; the law can achieve but one of these three results. *Partial spoliation.* This system prevailed as long as the right of election was *partial*, and men are returning to it in order to escape the invasion of socialism. *Universal spoliation* is the system with which France was threatened when the electoral right became universal; the masses conceived the idea of legislating upon the principle of the legislators who preceded them. *No spoliation* is the principle of peace, order, stability, reconciliation and good sense, which I shall proclaim with all the strength of my poor lungs to my very last breath And can we honestly ask anything more of the law? Can the law, which has force for its necessary sanction, be reasonably employed for any other purpose than to preserve every one in his rights? I defy any one to employ the law for any other purpose without perverting it, and consequently without turning force against right. And as this is the most lamentable and most illogical social disturbance that can be imagined, it will be well to recognize that the true solution of this social problem, so much sought after, is to be found in these simple words: *Law is organized justice.* — Now, let us mark well that to organize justice by law, that is by force, excludes the idea of organizing by law or by force any manifestation whatever of human activity: labor, charity, agriculture, commerce, industry, education, the fine arts, or religion; for it is impossible for one of these secondary organizations not to destroy the essential organization. How, in fact, can we imagine force encroaching upon the liberty of citizens without assailing justice, without acting against its own end? I am now attacking the most popular prejudice of our time. This prejudice not only wishes the law to be just; it wishes it also to be philanthropic. It does not consider it sufficient that the law should guarantee each citizen the full and unrestricted exercise of his

faculties applied to his physical, intellectual and moral development; it requires that the law directly diffuse prosperity, education and morality. This is the seductive side of socialism. The socialists say to us: since the law organizes justice, why should it not organize labor, education and religion? Why? Because it could not organize labor, education and religion without disorganizing justice. Notice, therefore, that law is force, and that consequently the domain of law can not legitimately go beyond the lawful domain of force. When law and force keep a man within the bounds of justice, they do not impose upon him anything but a negation They merely require him to abstain from injuring others. They attack neither his person, his liberty, nor his property. They merely protect the person, liberty and property of others. They stand upon the defensive; they defend the equal right of all. They fulfill a mission, whose harmlessness is evident, whose utility is palpable, and whose lawfulness is incontestable. This is as true as if one of my friends were to observe to me that to say that *the object of law is to cause justice to reign*, is to use an expression which is not rigorously exact. We should say *the object of law is to prevent injustice from reigning*. In fact, justice has no existence of its own, it is injustice that exists. The one results from the absence of the other. But when the law—through the medium of its necessary agent, force—imposes a certain kind of labor, a method or manner of education, a form of faith or manner of worship, upon men, it does not act negatively, but positively. It substitutes the will of the legislator for their will, the initiative of the legislator for their initiative. They no longer have to reflect, compare or foresee; the law does all this for them. Their intelligence becomes a useless possession; they cease to be men; they lose their personality, their liberty and their property. Imagine, if you can, a form of labor imposed by force, which is not an attempt against liberty; a transfer of wealth imposed by force which is not an attempt against property. If you can not succeed in this, acknowledge that the law can not organize labor and industry without organizing injustice. — When a publicist, from the seclusion of his study, allows his eyes to wander over society, he is struck by the spectacle of the inequality which presents itself to him. He groans over the sufferings which are the lot of so great a number of his brethren, sufferings, the sight of which is rendered still sadder by contrast with surrounding luxury and opulence. He should perhaps ask himself whether the cause of such a social state is not to be found in old spoliations, caused by conquest, and new spoliations caused by the laws. He should ask himself whether, with the aspiration of all men toward happiness and improvement, the reign of justice would not lead to the realization of the greatest activity of progress and the greatest amount of equality compatible with individual responsibility. But his thoughts do not rest here. They run on to combinations, arrangements and organizations, legal or factitious. He seeks the remedy for the evil in the perpetuation and exaggeration of the very thing which produced it. For, besides justice, which as we have seen is really nothing more than a negation, are there any of these legal arrangements which do not include the principle of spoliation? — You say: "Here are men who have no wealth," and appeal to the law to correct the evil. Nothing enters into the public treasury for the benefit of a citizen or a class but what other citizens or other classes have been *forced* to put there. If each one is entitled only to draw from it merely the equivalent of what he has put in, your law, it is true, escapes the imputation of spoliation, but it does nothing for those men who *have no wealth*, it does nothing for equality. It can not be an instrument of equalization unless it take from some to give to others, and then it becomes an instrument of spoliation. Examine, from this point of view, protective tariffs, subsidies, the right to a profit, the right to labor, the right to assistance, the right to education, progressive taxation, gratuitous credit, co operative workshops, and you will always find, at the bottom, legal spoliation and organized injustice. — You say: "Here are men who lack enlightenment," and you appeal to the law for them. But the law is not a torch that sheds its own light afar. It hovers over a society in which there are men who are educated and men who are not; citizens who need to be taught, and others who are able and willing to teach. The law must do one of two things: either it must leave matters of this kind to be performed with entire liberty, it must leave this kind of wants to be freely satisfied; or else it must exercise force over men's wills, and take from some wherewith to pay the professors who are engaged to teach others free of charge. But it can not prevent its conduct in this second case from being an attempt against liberty and property, or, in other words, legal spoliation — You say: "Here are men who are devoid of morality or religion," and appeal to the law. But the law is force, and can there be any need to remark how violent and foolish a proceeding it would be to invoke the aid of force in these matters? — After all its systems and attempts, socialism seems unable to avoid perceiving the monstrosity of legal spoliation. But what does it do? It skillfully disguises it from all eyes, even from its own, under the seductive names of fraternity, solidarity, organization and association. And because we do not ask as much of the law, because we do not exact of it anything but justice, socialists suppose that we reject fraternity, solidarity, organization and association, and jeeringly style us *individualists*. Let us inform them, therefore, that it is not natural but forced organization that we reject; not free association, but the forms of association which socialism pretends to impose upon us; not spontaneous but legal fraternity; not providential but artificial solidarity, which is but an unjust displacement of responsibility.—

Socialism, like the old political system from which it emanates, confounds government and society. And therefore it is, that whenever we do not want a thing done by the government, socialism concludes that we do not want it done at all. We reject education by the state; therefore we do not want education at all. We reject a state religion; therefore we reject all religion. We reject equalization by the state; therefore we do not desire equality, etc. It is as if our socialistic friends were to accuse us of not wishing men to eat, because we do not advocate the cultivation of wheat by the state. How has this whimsical idea been able to gain ground in the political world; this idea which would draw from the law what the law does not contain: good, in the positive sense, riches, science, and religion? — Modern publicists, particularly those of the socialistic school, base their different theories upon one common hypothesis, truly the strangest and proudest hypothesis which could enter into a human brain. They divide mankind into two parts. All the human species, less one individual, form the first part, the publicist himself alone forms the second, and by far the most important part. In fact, they begin by supposing that men have within them neither a principle of action, nor a means of discernment; that they are devoid of initiative; that they are formed of inert matter, of passive molecules, of atoms lacking spontaneity, at most but a vegetation indifferent to its proper mode of existence, capable of receiving from the hand and will of another an infinite number of forms more or less symmetrical, artistic, and more or less perfect. Next, each of them supposes, without any ceremony whatever, that he himself under the names of organizer, revealer, legislator, teacher, or founder, is this will and this hand, this *universum mobile*, this creative power whose sublime mission it is to reunite in society these scattered human materials. Starting from these data, as each gardener trims his trees according to his fancy, in the shape of pyramids, umbrellas, cubes, vases, fruits, distaffs and fans; so every socialist, according to his whim, trims poor humanity in groups, series, centres, subcentres, alveoles, social workshops, harmonic societies, etc., etc. And, just as the gardener has need of hatchets, saws, pruning knives and scissors to regulate the height of his trees, so the publicist, in order to manage his society, needs forces which he can find only in laws: the customs laws, the laws regulating taxes, public charity and education. The socialists, it is true, consider humanity as material for social combinations, so that, if by chance they are not very sure of the success of these combinations, they claim at least a certain portion of mankind as *material for experimentation*. It is well known how popular the idea of *trying all systems* is among them, and one of their leaders even went so far as to ask of the French constituent assembly, in all earnestness, a commune and all its inhabitants to try his system on. It is thus every inventor makes his invention in miniature before making it of full size. It is thus the chemist sacrifices certain re-agents, or the farmer sacrifices some seed and a corner of his field in order to test an idea. But what an incommensurable distance between the gardener and his trees, between the inventor and his invention, between the chemist and his re-agents, between the farmer and his seed! The socialist believes in good faith that the same distance separates him from humanity. — We need not wonder that the publicists of the nineteenth century consider society as an artificial creation, the work of the legislator's genius. This idea, the result of classical education, has swayed all the deep thinkers and all the great writers of France. All of them find between humanity and the legislator the same relations which exist between the clay and the potter. To show how universal this strange disposition of minds has been in France, I should have to copy all of Mably, all of Raynal, all of Rousseau, all of Fénelon, and extensive extracts from Bossuet and Montesquieu. I should, besides, have to reproduce in full the proceedings of the various sittings of the convention. This task I shall leave for my reader to undertake. — One of the strangest phenomena of our times, and one which will, probably, very greatly astonish our grandchildren, is, that the doctrine which is based upon the triple hypothesis of the radical inertness of mankind, the impotence of the law, and the infallibility of the legislator, is the creed of the party that proclaims itself exclusively democratic. It likewise styles itself *social*. Inasmuch as it is democratic, it has an unlimited faith in humanity. By its *socialism* it drags humanity into the mire. — If it be a question of political rights, or of driving out the legislator: oh! then, according to this socialistic doctrine, the people are possessed of infused science, and endowed with admirable tact; *their will is always right, the popular will can never err*. Suffrage can not be too *universal*. No one owes society any guarantee. The will and the capacity to choose wisely are always supposed. Can the people be deceived? Are we not in the age of enlightenment? Shall the people remain forever in tutelage? Have they not acquired their rights by their own labors and sacrifices? Have they not given sufficient proofs of their intelligence and wisdom? Have they not reached their maturity? Are they not capable of judging for themselves? Do they not know their own interests? Will any man or class of men dare claim the right of putting himself in the people's place, and of deciding and acting for them? No; the people wish to be and shall be *free*. They wish to direct their own affairs, and they shall direct them. But the election once over, their tone changes completely. The nation returns to a passive, inert state; to nothingness, in fact; and the legislator assumes omnipotent sway. To him belong invention, direction, power and organization. Mankind have now nothing to do but to let things take their course; the hour of despotism has arrived. And

bear in mind that all this is fatal; for the people, who were but a short time ago so enlightened, so moral, so perfect, have no longer any tendencies, or, if they have any, they all drag them toward degradation. They might be allowed a little liberty; but do you not know that, according to Considérant, *liberty fatally leads to monopoly?* Do you not know that liberty means competition, and that competition, according to Louis Blanc, is *a system of extermination for the people and a cause of ruin to the middle class?* It is for this reason that the more freedom nations enjoy the more complete is their extermination and ruin: witness Switzerland, Holland, England and the United States! Do you not know that, according to Louis Blanc, *competition invariably leads to monopoly, and that, by the same course of reasoning, cheapness leads to exorbitant prices; that competition tends to exhaust the sources of consumption and forces production to an unnatural activity; that competition compels the increase of production and the decrease of consumption?* Whence it follows that free nations produce more than can be consumed, that *they are at the same time given over to oppression and madness,* and that it is absolutely necessary that Louis Blanc have a hand in their government! What liberty can men be allowed to enjoy? Will you give them liberty of conscience? You will soon see them all availing themselves of the permission to become atheists. Liberty of education? But parents will very soon be paying professors to teach their children immorality and error; moreover, if we may believe M. Thiers, if education were left to national liberty, it would cease to be national, and we would bring up our children more after the manner of the Turks or Hindoos, than according to the noble ideas of the Romans, as is now the case. Freedom of labor? Why, freedom of labor means competition, and the result of competition is to leave all products unconsumed, to work the destruction of the people, and to ruin the middle class. Liberty of exchange? But it is a well-known fact that the protectionists have demonstrated to satiety that free exchange is ruinous, and that in order to grow wealthy by means of exchange, a man must exchange without freedom. Freedom of association? But according to the socialistic doctrine, liberty and association are exclusive, one of the other, since the attempt to deprive men of their liberty is merely to force them to association. — Hence it is evident that socialistic democrats can not, in conscience, leave men any liberty, since of their very nature, if these gentlemen do not regulate them, they tend to every species of degradation and demoralization. This being the case, we are at a loss to divine on what ground they can so persistently demand, for these same men, universal suffrage. The pretensions of our socialistic organizers give rise to another question which I have often addressed to them, and to which, as far as I know, they have never offered any reply. Since the natural tendencies of mankind are so evil as to justify their being denied their liberty, how does it come to pass that the tendencies of the organizers are good? Do not legislators and their agents form part of the human race? Are they made of a different clay from the rest of mankind? They say that society, if left to itself, runs headlong to ruin, because its instincts are perverse. They claim for themselves the credit of arresting it in this downward course and guiding it in a better direction. Have they then received from heaven intelligence and virtues which place them outside of and above humanity? If so, let them show their credentials. They wish to be the *shepherds,* while we constitute their *flock.* This arrangement presupposes in them a superior nature, of which, before admitting it, we have very good right to demand the proof. We do not by any means deny them the right of inventing social combinations, of urging and extending their adoption, and of testing them upon themselves at their own expense and risk; we merely deny their right to impose these combinations upon us by means of the law, that is to say, by means of force, and of public contributions. — We ask the *Cabetists, Fourierists, Proudhonians* and the protectionists to renounce, not their special ideas, but the idea, common to all of them, of forcibly subjecting us to their groups and series, their co-operative workshops, their banks to loan money without interest, their Græco-Roman morality, and their commercial restraints. All that we ask is, that they allow us the right to judge of their plans for ourselves, and to decline to take any part in them, either directly or indirectly, if we find that they are prejudicial to our interests or repugnant to our consciences. For to pretend to call in the aid of power and taxation, besides being an act of oppression and spoliation, implies, moreover, the injurious hypothesis of the infallibility of the organizer and the incompetency of mankind And if humanity is incompetent to judge for itself, why do they talk to us of universal suffrage? This contradiction in their ideas has unfortunately been reproduced in historical facts, and, while the French people have surpassed all others in the achievement of their rights, or rather of their political guarantees, they have nevertheless been more ruled, more managed, more governed, more imposed upon, more trammeled, and been made the subject of more experiments, than any other nation on the face of the earth. They are also more exposed to revolutions than any other nation, as they most naturally would be under such circumstances.— Once we adopt this idea, admitted by all French publicists, and which is so forcibly expressed by Louis Blanc when he says, "society receives its impulse from power"; once men consider themselves as sentient but passive beings, incapable of raising themselves by their own knowledge and their own energy to any moral height or to any condition of prosperity, and compelled to expect everything of the law; in a word, when they admit that their relations to the state are those of a flock to its shepherd, it is evident that the re-

sponsibility of the governing power is immense. Good and evil, virtue and vice, equality and inequality, wealth and misery, all flow from it. It is intrusted with everything, it undertakes everything, it does everything; it is therefore respon sible for everything. If we are happy, it, with justice, demands our acknowledgment, but if we are wretched, we have no other recourse than this same governing power. Does it not, in principle, dispose of our persons and our goods? Is not the law omnipotent? In creating the university monopoly in France it has endeavored to respond to the hopes of the fathers of families, who have been deprived of their liberty; and if these hopes are deceived, whose fault is it? In regulating industry, it has undertaken to make it prosper, otherwise it would have been absurd to deprive it of its liberty; and if industry suffers, whose fault is it? In undertaking to regulate the balance of trade by means of the tariff, it has endeavored to bring about commercial prosperity; and if commerce, far from prospering, is really languishing, whose fault is it? In extending its protection to maritime armaments, in exchange for their liberty, it has endeavored to make them a source of income to the state; and if they are in reality a burden, whose fault is it? Thus there is not a single evil in the nation for which the government has not voluntarily rendered itself responsible. Is there any reason to wonder that suffering of every kind is a cause of revolution?—And what is the remedy which our socialistic teachers propose? To extend the domain of the law, that is to say, the responsibility of the government, indefinitely. But if the government undertake to raise and to regulate salaries, and is unable to do it; if it undertake to assist all the unfortunate, and can not do it; if it undertake to furnish shelter to all working men, and can not do it; if it undertake to furnish tools to all mechanics, and can not do it; if it undertake to offer gratuitous credit to all who are in want, and can not do it; if, according to the words which we regret to acknowledge have flowed from the pen of de Lamartine, "the state takes upon itself the mission of enlightening, developing, fortifying, spiritualizing and sanctifying the souls of the people," and fails to fulfill it, is it not evidently more than probable that each of these deceptions must lead to an inevitable revolution?—I now resume my thesis. Directly after the consideration of economic science, and at the very opening of the subject of political science, there arise the questions. What is law? what should it be? what is its domain? what are its limits? and, consequently, what is the limit of the legislator's power? I reply, without hesitation: *Law is the common force organized to oppose injustice;* to be brief, *Law is justice.* It is not true that the legislator has absolute power over our persons and property, since they antedate his elevation to power, and his duty is to strengthen them by every possible guarantee. It is not true that the mission of the law is to direct our consciences, our ideas, our wills, our education, our sentiments, our labors, our exchanges, our gifts, and our enjoyments. Its mission is to prevent one individual from usurping the rights of another in these matters. Law, since it has force for its necessary sanction, can not have any other legitimate domain than the legitimate domain of force, that is, justice. And, as each individual has not the right to resort to force except in case of legitimate defense, collective force, which is nothing more than the union of individual forces, naturally should not be applied to any other end. Law is, therefore, merely the organization of the right pre-existing in each individual, of legitimate self-defense.—Law is justice. So utterly false is the opinion that it can oppress persons, or despoil them of their property, even for a philanthropic purpose, that its mission is to protect them. To say that the law can be at least philanthropic, provided it abstain from all oppression and all spoliation, involves a contradiction. Law can not avoid acting upon our persons and our goods; if it does not protect them, it violates them by the very fact that it acts, from the very fact that it exists.—Law is justice. This is perfectly clear, simple, definite and defined, intelligible to every intellect, visible to every eye; for justice is a fixed, unalterable quantity, which does not admit of *more* or *less*. But once make religious, fraternal, leveling, philanthropic, industrial, literary or artistic laws, and you forthwith cast yourself into the infinite, the uncertain, the unknown; into an enforced utopia, or, what is worse, into a multitude of utopias, vying with each other to take possession of the law and to impose themselves in its place; for fraternity and philanthropy have not, like justice, fixed limits. Where will you stop? Where will the law stop? Some, like de Saint-Cricq, will extend their philanthropy only to certain industrial classes, and will demand of the law that it *dispose of the consumers in favor of the producers.* Others, with Considérant, will champion the cause of the laboring classes, and demand of the law for them, an *assured minimum of wages, clothing, lodging, food, and all the necessaries of life.* A third will say, with Louis Blanc, and justly, that this is but a rude and incomplete brotherhood, and that the law should supply every one with the implements of labor and education. A fourth will tell you that even such an arrangement leaves room for inequality, and that the law should introduce into the most remote hamlets luxury, literature and the arts. You will thus find yourself led to *communism*, or rather legislation will be—as it is already—the battle-field of every idle dream and of every covetous fancy.—Law is justice. When I say this, I refer to a simple and steady government. And I defy any one to show me what could give rise to the thought of a revolution, an insurrection, or a simple riot against a public force which confines itself to the repression of injustice. Under such a government there would be more prosperity, and prosperity would be more equally distributed;

and as to the ills which are inseparable from human nature, no one would think of laying them to the charge of the government, which would have no more to do with them than with the changes in the temperature. Has any one ever seen the people inaugurate an insurrection against the court of appeal, or break into the sanctuary of a justice of the peace to demand the minimum of wages, gratuitous loans, implements of labor, tariff favors, or community of labor? They know full well that these combinations are beyond the power of the judge, and they understand likewise that they are beyond the power of the law. But establish the law upon the principle of fraternity, proclaim that good and evil flow from it, that it is responsible for all individual suffering, and all social inequality, and you open the door to an endless series of complaints, animosities, troubles and revolutions. — Law is justice. And it would be very strange if it could with equity be anything else. Is not justice right? Are not all rights equal? How then could the law interpose to subject me to the social plans of Mimerel, Melun, Thiers, or Louis Blanc, any more than to subject these gentlemen to my plans? Do you not believe that I have received from nature sufficient imagination to invent a utopia also? Is it the duty of the law to choose between so many chimeras and to place the public force at the service of one of them? — Law is justice. Let no one say, as is said incessantly, that the law thus conceived, atheistical, individualistic and heartless, should model humanity after its own image. This is an absurd deduction well worthy of the governmental infatuation which sees humanity in the law. What! Must we cease to act because we are free? Must we be deprived of all power because we do not receive our power from the law? Must our faculties remain inert because the law confines itself to guaranteeing us the free exercise of these faculties? Must we forthwith abandon ourselves to atheism, isolation, ignorance, misery and egoism, because the law does not impose upon us any form of religion, method of association or system of education, or does not establish any process of labor, rule of exchange, or plan of bestowing charity? Must we, on this account, no longer recognize the power and goodness of God, or refuse to associate together, to aid one another, to aid our brethren in distress, to study the secrets of nature, and to aspire to the perfecting of our being? — Law is justice. And under the law of justice, under the rule of right, under the influence of liberty, security, stability and responsibility each man will obtain his full value, and assert the full dignity of his being, and mankind will reach in a calm and orderly manner, slowly but surely, the degree of progress which it is destined to acquire. — It seems to me as though the theory were my own; for, whatever question I submit to my reason, whether it be religious, philosophic, political or economic; whether it refer to prosperity, morality, equality, right, justice, progress, responsibility, solidarity, property, labor, exchange, capital, wages, taxes, population, credit, or government; whatever point of the scientific horizon I take for the point of departure of my researches, I invariably end with this: the solution of the social problem is to be found in liberty. And am I not borne out in my conclusion by experience? Cast your eyes over the globe. Which are the happiest, the most moral and the most peaceable nations? Those in which the law least interferes with the private activity of the citizens; those in which the government least makes itself felt; those in which individuality has the greatest sway, and public opinion the most influence; those in which the administrative machinery is least complicated; in which the taxes are lightest and most equally levied; in which popular discontents are most rare and have least occasion for their existence; those in which the responsibility of individuals and classes is most active, and where, in consequence, if morals are not perfect, they irresistibly tend to right themselves; those in which business transactions, agreements and associations are least trammeled; those in which labor, capital and the population experience fewest artificial obstacles; those in which men best follow their natural talent, and the thought of God prevails most over the inventions of men; those, in a word, which approach nearest to this solution: Within the bounds of right, everything by the free and perfectible spontaneity of man; nothing by law or force but universal justice.

FREDERIC BASTIAT.

LAW'S SYSTEM. This is the name given to the great financial experiment made in France by the government of the duke of Orleans under the direction of John Law. — Had John Law's financial operations been only a series of expedients devised from day to day to tide over a condition of embarrassment, they would not merit a place in a scientific work. History gives us many examples of means and abuses similar to those adopted or produced in France at the beginning of the past century. But Law's operations were distinguished in more than one way from ordinary expedients: first, they were entered upon as the practical application of a preconceived theory, and in the aggregate they form a system; second, they were the signal for a revolution in the manners and habits of the French, third, they afforded a magnificent example of the combinations and effects of stock-jobbing. On these accounts they are pre-eminently deserving of the consideration of the economist, and it may be useful, while exposing them, to make some little comment upon them also. — At his death Louis XIV. left the finances of France in a most deplorable condition. The debt in a thousand different forms, payable on demand, made a sum of 785,000,000 livres; 64,000,000 of annuities, perpetual or redeemable at a fixed date and drawn from every branch of

the revenue, represented a principal sum of 460,000,000; and finally, the creation of offices, increase of salaries, etc., had involved the state to the extent of about 800,000,000. The public debt amounted thus to a principal sum of about 2,000,000,000 livres, of which about 785,000,000 were payable on demand. "When the king died," says Bailly, "not more than four or five millions could be anticipated from the last three months of the year; and the revenues of the succeeding years were more than half consumed." Complete disorder reigned, besides, in every department of the financial administration, so much so that no one could give, or even know, till much later, the balance-sheet figures of the situation. — By different measures of a sufficiently suspicious nature the regent's government reduced the debt payable on demand, and embodied it in bonds of uniform description, giving them the name of *billets d'état*. These were issued to an amount of 250,000,000, and bore interest at the rate of 4 per cent. They were receivable for arrears of taxes, and were to be destroyed as they came in; but as the promises of the state then inspired no confidence, these *billets* were at a discount of no less than about 80 per cent. of their nominal value. However, some method was introduced into the collection of taxes and the financial administration in general, judicial investigation instituted against the farmers of the revenue, and an alteration of the coinage furnished some little funds, dishonorably obtained and dearly bought. It was at this crisis that Law submitted to the finance council a first scheme which was not adopted; and in order to cause his ideas to prevail he was obliged to adopt indirect means — Letters patent of May 2, 1716, gave to John Law the privilege of establishing a bank. It was constituted under the name of the *Banque Générale*, with a capital of 6,000,000 livres, in 1,200 shares, of 5,000 livres each, payable in four installments, one-fourth in specie and the remainder in *billets d'état*. The functions of this bank, which to all appearance was independent of the government, were to be, according to its by-laws, the same as those now fulfilled by the bank of France. — This establishment was very well received by public opinion. Banks of issue were in all the first vigor of youth. The bank of England had only been in existence since 1694, and that of Scotland since 1695, and they were both giving good results. Commerce highly appreciated an establishment which gave a price current to discount, and which caused its rate to decline, at first to 6 and finally to 4 per cent. It appreciated still more highly the current accounts and the bank credits based on a currency whose weight and standard never varied, however great the alteration undergone by the current coin. It was the first introduction into France on a large scale, or at least with great pretensions of two excellent commercial undertakings, the bank of deposit and the bank of issue. But no one had any definite knowledge of the theory of its working, and the start of the new bank was regarded with that distrust which is so common in France and so closely akin to the blindest credulity. — The *Banque Générale* prospered, but it developed but slowly in an environment in which credit had received some rude shocks and in which there was but little business done. Besides, the establishment's own capital was very small: of the 1,500,000 livres payable by the shareholders in specie, one-fourth only, that is to say, less than 400,000 livres, had been paid up. As for the *billets d'état* they were still at a discount of 70 per cent., and it was impossible, in the then condition of affairs, to derive any advantage from them. — The secret connection which existed between the *Banque Générale* and the government was brought to light April 10, 1717. On that date, a decree of the council ordered the receivers of the public revenue, not merely to accept the bank's notes in payment of taxes of all descriptions, but even to pay the value of these notes in hard cash, when asked to do so and if they had the money at their disposal. It does not appear, however, that these privileges had the effect of extending much the circulation of the notes, which, concentrated in Paris and some other large cities, never exceeded 12,000,000. Evidently it was not with such trifling resources that a credit could be obtained sufficient to liquidate the public debt. This was only the first story of the great edifice called the *Système*. — Toward the end of August, 1717, a celebrated merchant named Crozat, who had obtained a monopoly of the Louisiana trade, ceded this privilege to a company floated by Law under the name of the *Compagnie de l'Occident*. The letters patent authorizing the formation of this company gave it a monopoly of the commerce with Louisiana for twenty-five years, and of the trade in furs, arms, munitions and ships in Canada. The privileges given to the company were somewhat justified by the way in which its capital was obtained; it was in amount 100,000,000 livres, in shares of 500 livres, payable in *billets d'état*, which the government assimilated to life annuities, and the interest of which it guaranteed at the rate of 4 per cent. But it was not necessary to have great experience in business to be able to understand that a capital thus formed could not furnish the necessary resources for commencing an undertaking so vast as the colonization of Louisiana, that is to say, of a tract of country which included the valleys of the Mississippi and the Missouri, and which extended northwest as far as the Pacific ocean. At first, then, the credit of the *Compagnie de l'Occident* languished. Public opinion was opposed to it, and capitalists hesitated to invest in shares. Affairs were in this condition when, on May 11, 1718, an edict was published ordering the recoining of the coinage. The silver marc had already been carried from twenty-seven to forty livres; the edict of May carried it from forty to sixty livres. "From the order to recoin all money," says Eugène Daire, "arose the

obligation to take all the old money to the mints; but it was permitted to join to one's silver two-fifths in *billets d'état*. It happened, therefore, that when, in the words of the law, a man disseized himself in favor of the fisc of eight écus of five livres each, or, altogether, forty livres, that is, a marc of silver, it was optional with him to add to them sixteen livres in *billets d'état*, the effect of which was the delivery of fifty-six livres to the profit of the treasury. When the latter had received this value, it returned in exchange nine and one-third of the new écus, denominated six-livre pieces, which also made fifty-six livres. But the intrinsic value of those fifty-six livres, the weight of silver which they contained, was less by one-fifteenth than the weight of silver previously paid into the treasury, and thus the person paying lost, first, that amount of his silver, and, secondly, gave up his paper, his *billets d'état*, for nothing. In brief, the state gained by this honest operation 6⅔ per cent. in silver and 26⅔ per cent. in paper; in all, 33⅓ per cent. on all sums paid into the mints." Parliament resisted this operation in vain. — Was the edict of recoinage Law's work? It has been believed to be so, since it had the effect of raising bank silver in the public estimation, that being money of fixed weight and standard, and of encouraging the use of paper among the people. Several writers, on the contrary, have attributed this edict to the minister d'Argenson who had succeeded the council on finance, and is supposed to have devised this simple and summary means of extinguishing the *billets d'état*, solely with the view of proving himself a financier of greater powers than Law. — Be that as it may, this minister gave soon a clear proof of the ill-will he bore the Scotchman, by farming out the taxes to the brothers Paris, skillful bankers who had introduced some order into the administration of the finances, on terms usually considered advantageous. With their contract in relation to the taxes as a basis, the brothers Paris established a company of limited liability in June, 1716, with a capital of 100,000,000 livres, in 100,000 shares of 1,000 livres each, payable in *rentes* or bills. This operation had a much more solid basis than the *Compagnie d'Occident*, for it was much more probable that the brothers Paris would gain by their contract of the farming of the taxes than it was that the *Compagnie d'Occident* would gain by the commerce of Louisiana. The shares of the latter company met with a formidable competition in the market when they were brought in collision with the shares of the association gotten up by the Paris brothers, which was called the "Anti-System." — New financial operations had to be resorted to to impart value to the shares of the *Compagnie d'Occident*. On Sept 4, 1718, it farmed out the tobacco monopoly; its shares rose a little, for public opinion rightly viewed with favor speculation in the state revenues. But the rise was slow and slight. — On Dec. 4, 1718, a royal edict changed the *Banque Générale* into the *Banque Royale*. The 1,200 shares of the *Banque Générale*, only the fourth part of which had been paid in, were bought at a price of 5,000 livres, their nominal value, and were redeemable in écus. Never had shareholders made so much in so short a time. What might not be the intrinsic value of an enterprise that the public treasury, completely involved in debt as it was, thought fit to purchase at that price. Men's imaginations were possessed, and little attention was paid to the radical changes that the by-laws of the bank underwent. — The notes of the *Banque Générale* were payable in *bank money*, the weight and standard of which were defined; those of the *Banque Royale* were payable in livres of tours currency (*livres tournois*), that is to say, in nominal money the weight and standard of which was not exactly settled. The notes of the *Banque Générale* could not be made and issued except against securities in hand; an order in council was sufficient to authorize the *Banque Royale* to issue notes to the profit of the government. The *Banque Royale* had branches in which were exchanged notes for écus and écus for notes, and in the cities in which they were established the use of specie was restricted to payments of 600 livres and under. It was clear that liberty was distrusted and that there was an intention of outraging public opinion; in short, on April 22, 1719, a decree of the council forbade all transport of coin by private persons into the cities where the bank had offices; it ordered the public officers in those cities to keep their cash in notes, under penalty of bearing the loss on specie in the event of a depreciation of the currency; it authorized creditors in these cities to refuse as worthless the offers of their debtors, unless made in notes, and only to receive the precious metals in payment of small change. It was attempted to demonetize, as far as possible, the precious metals, and to give the paper of the *Banque Royale* the properties of money. However, those measures decreed by a government which had already made a bad use of its paper, could not inspire much confidence; it was necessary to captivate men's minds by a bold stroke which should disarm suspicion, upset all calculations and raise the value of the shares of the *Compagnie d'Occident*, then at a discount of about 40 per cent. Law bought 200 shares at par, at six months date, paying 40,000 livres on the price of the 100,000 livres which those shares represented, with the stipulation that he should lose the 40,000 livres if the shares did not reach at least par. The premium market was then unknown in France and the confidence felt in Law's personal ability was so great that in a short time the shares of the *Compagnie d'Occident* rose to par. Rumors skillfully set afloat, all tending to enhance the idea of the company's probable future prosperity, also contributed to this result. — The most difficult step had been taken: however little observation may have been bestowed on the course of such speculations, it is well known that it is sufficient to establish an up-

ward movement in the price of shares in order even with moderate ability to push that advance in due course to a considerable extent. Now Law's ability was very great; he was backed by all the power of public authority; and he dealt in titles whose intrinsic value was little known, and was therefore all the more easily exaggerated. What golden dreams was it not easy to have about the resources afforded by the commerce of an immense, new, unknown and uninhabited country. For the rest, Law did not leave men's imaginations idle; like a skillful gambler, he caused frequent changes of luck. In May, 1719, all the great commercial companies which still existed, were acquired by the *Compagnie d'Occident*. It took the name of the *Compagnie des Indes*, and was authorized to issue 25,000 new shares of 500 livres each, payable in specie and by twentieths (*vingtièmes*) monthly: only fifty livres had to be paid immediately, and a decree of June 20, 1719, permitted only those to subscribe for the new certificates who already possessed an amount four times greater of the old certificates. Already fortunes had been made by the rise in the first certificates; they were in still greater demand as soon as it became necessary to possess a certain amount of them in order to obtain the new shares, which on this account were called the "*filles*" (daughters), and rose rapidly. — This rise was maintained by new schemes. On June 25 the state ceded to the *Compagnie des Indes* all the profit it might make by the coinage of money, in consideration of a sum of 50,000,000, payable monthly in fifteen equal sums. The company issued 25,000 new shares at a nominal value of 500 livres, but at an actual price of 1,000 livres, at which the first shares were selling. It was necessary, before being permitted to subscribe for the new certificates, to qualify by holding five shares of the old to obtain one share of the last issue. These were named the "*petites filles*" (grand-daughters) and had the same success as the preceding ones. The company had guaranteed its shareholders a dividend of 12 per cent., dating from Jan. 1, 1720. At the beginning of September all the shares were placed and were selling at a price of 5,000 livres, those which had been subscribed for in *billets d'état*, as well as those the amount of which had been furnished in specie. — On Sept. 2 the *Compagnie des Indes* undertook a new enterprise, which was in some sort the crowning of all. It had secured the rescision of the contract with the brothers Paris for the farming of the taxes; it took upon itself the collection of the taxes at 52,000,000, and in addition the payment of 1,500,000,000 of the king's debts. The creditors of the state were paid by orders on the cashier of the *Compagnie des Indes*, payable in notes or specie. In order to provide the funds needed for the repayment, the company was authorized to issue transferable shares bearing 3 per cent. interest, payable half yearly; it was itself to receive 3 per cent. on the 1,500,000,000 which it furnished to the government. — In reality there was nothing more in this transaction than a conversion of annuities. The state, instead of paying 4 per cent. now only paid 3 per cent., thereby making an annual saving of 15,000,000. The company borrowing and lending at 3 per cent. seemed to be performing a disinterested speculation; but it is easy to comprehend that in a transfer of 1,500,000,000 of capital for the repayment of which the choice was given between a bond of definite amount and the shares of a company whose brilliant success was everywhere prophesied, many capitalists would choose the shares. The company issued 324,000 shares, nominally for 500 livres, payable in tenths monthly, but which, if sold at the market price of the day, would bring it a gain of 1,620,000,000, with which sum it could easily meet all its requirements. — The "*Système*" was complete. Law, sharing a delusion which still finds defenders, confounded price with value; he believed that it was sufficient to raise prices to increase a nation's capital; he attributed to the augmented quantity of paper money, of the "sign," to use the language of the time, the property of creating value, which belongs only to labor. It was with this object that several decrees had been issued with the view of discouraging the use of metallic currency and that stock-jobbing was over-stimulated. A decree of Sept. 26 having settled that the company's shares could only be paid in notes, gold and silver lost in a moment 10 per cent. in exchange with paper. The shares sold in the open market were bought up eagerly, and their price rose constantly for several months. There is no need to seek far for the cause of this rise; foreseeing that the payment of the second tenth would embarrass the holders and would occasion a fall, an order of the council made the payments quarterly, and postponed till the month of December, 1719, the payment which fell due at the end of October, the following till March, and the third till June, 1720. On the other hand, the *Banque Royale*, which, in accordance with the decree of Dec. 4, 1718, was forbidden to issue notes for a greater amount than 100,000,000 livres, had issued them to the extent of 520,000,000 at the end of October, 1719; of 640,000,000 at the end of November, and on Dec. 29 it was decided that the amount of notes should be raised to 1,000,000,000. The sophism on which Law's system was founded became a gigantic illusion. But this illusion created facts which were very real. Specie in its two common uses was replaced by paper. The sums amassed and hoarded up for future consumption took the shape of shares; the sum for present use became bank notes. — What was the nature of the real values represented by the shares of the *Compagnie des Indes* and the billets or notes of the *Banque Royale*, and what was the disposable capital operated with? We do not know exactly what the operations of the bank were, but it is likely that discounting commercial paper was the least important. Perhaps it made advances on shares deposited with it; probably it simply met the financial wants of the government

by its notes, so that its paper was based upon no actual value; it was merely a state debt bearing no interest. — The paper issued in the shape of shares by the *Compagnie des Indes* amounted to a nominal principal sum of 312,000,000, issued at a price of 1,797,000,000. But, out of this enormous amount what had been the real payments into the company's treasury? The official documents do not give it exactly, and besides they are not particularly worthy of credence. The company's resources in revenue may be better estimated. They were, first, 49,000,000, due annually by the state; second, the company's profit on the tobacco monopoly, on the tax farming, on the *rentes* and salt tax of Alsace, and on the coinage of money; and third, the gain on the commercial profits of the company, estimated at 8,000,000. The estimate of the company's profits was singularly exaggerated; for it is at least doubtful if a commercial company constituted without real capital, or, if it be preferred, with a capital of 50,000,000, could realize immediate and considerable profits by the commerce and colonization of Louisiana and Canada, and even by that of the coast of Africa and China. Besides, all its income consisted of an annuity due by the state, the profits on the farming of the public revenue, and the very uncertain gain to be obtained from a monopoly granted by the state. Finally, admitting that the company's revenues reached the exaggerated total of 82,000,000, it could only pay a very moderate interest on a capital of 1,797,000,000, ill calculated to keep up the inflated price of the shares, whatever might be the depreciation of the currency owing to the multiplication of bank notes, since, after all, this depreciation would also reduce the real value of the revenue. It is evident, then, that Law's system could not live, not only on account of the faulty constitution of the bank, but also of that of the *Compagnie des Indes* itself. By exhausting all the resources of stock jobbing, an edifice of opinion and credit, whose lease of life could not be a long one, had been erected on very slender foundations. It remained to be seen who should be the victim of the illusion, who should give solid and real value in exchange for new paper. — It is well known that the success of Law's system was beyond all expectation. The factitious fortunes made by the rise in value of the first shares had fired men's imaginations; all who had any disposable capital hurried to the market with it. Those who had not, sold lands, houses, government bonds, etc., and stock-jobbing soon raised the price of the different securites issued by Law to the enormous sum of 12,000,000,000. Certainly if the style of reasoning employed by the publicists of our day be adopted, such signs of prosperity had never before been seen, and, to use the language of the present, business was never as brisk as it was then. The documents of the day are filled with incredible stories of the magnificence of the houses, the furniture and the retinues of the *nouveaux riches* of that time and the court people, who, in that ephemeral prosperity, had the chief share after the lackeys. The state was not less munificent than private persons; it remitted 80,000,000 of taxes in arrear, did away with vexatious burdens, studied new systems of imposts, and even brought to a successful close a short war with Spain without increasing the burdens which pressed on the people Every one was intoxicated with his dream of wealth. What was the real cause of all this wealth? The consumption in a few months of almost the entire value of the metallic money of the country, both that which had for long been kept as a treasure or reserve and that which served for the purposes of exchange and circulation. The same phenomena were produced as would have been produced had a treasure trove of two or three thousand millions suddenly been discovered and spent productively or unproductively in a few months. — It was not the *Compagnie des Indes* itself which gathered the fruit of this movement; nor was it the creditors of the state, for but a small number of them had been paid in time to convert their bonds into shares; it was the people of the court, with the regent himself at their head, who benefited equally by the unlimited issue of the bank's notes and the jobbing in shares If stock-jobbing was not the sole object of Law's system, it can not be denied that it filled a very large place in it, and it is difficult to understand in what other interest the decrees of the council postponed the payment of the amounts about to fall due on the shares. Would this have been done if the genuine success of the unique commercial monopoly which had been created had been the only end in view? Certainly not. Besides, without having recourse to conjecture, it is sufficient to glance at the documents of the day to see that Law had imported into France or brought to light every means by which a factitious price may be given to securities of doubtful and uncertain value. Since that time the art of appropriating another's property by stock gambling has made no advance; there is but a repetition of the same tricks. — A catastrophe was inevitable, but Law did not see it. He was fully persuaded that it was possible to sustain the currency of money which was wholly imaginary, by exchanging it for securities whose value was hypothetical; and when the crisis overtook him, he did not even have recourse to the means which might have lessened the effect of the catastrophe It must be recognized, too, that the want of morality in the government of the time and the extravagant habits which Law himself had encouraged, would scarcely have permitted him to use the means suitable, even had he himself wished to do so. — Toward the end of December, 1719, discerning foreigners, and those of the French who had a calculating turn of mind, saw that it was time to withdraw from the speculation. After having themselves operated a rise in which the shares reached the value for a moment of 20,000 livres, they sold out, and, with the price obtained,

bought real estate, bullion, merchandise—in a word, real wealth. This was called realizing. It will be understood that the sale of a number of the shares soon ran down the price. At the same time the presentation of notes to be exchanged depleted the bank of specie, even although an edict forbade the use of silver in payments of above forty livres, and of gold in payments of over 300 livres, and although, on Jan. 28, 1740, another edict gave compulsory circulation to the notes throughout France, and the edict ordering the reminting of money was carried out vigorously. In February it became necessary to forbid private persons, under pain of confiscation, to have in their possession more than 500 livres in specie, and in March gold and silver were demonetized completely. On Feb. 22, with an end in view which it is not easy to determine, the *Banque Royale* was united to the *Compagnie des Indes*. The value of shares was at that time far above the price of issue. A declaration of March 11 fixed the exchange between notes and shares at a settled rate of 9,000 livres the share. Law imagined that by this means he could control the issue of notes; but to succeed it would have been necessary that one of the two objects exchanged should have possessed some intrinsic value. Now the value of the share was not much more real than that of the note, and, however it might be counted, it was impossible to maintain the share at a price of 9,000 livres. On May 21, then, the share was reduced to 5,000 livres. The rate of exchange established by the declaration of March 1 only served to increase still more the issue of notes, which was, according to report, carried to three thousand millions It is well known that the destruction of notes which had come back, promised by edict, was not honestly carried out, and that M. de Trudaine, provost of the merchants' guild, was removed from office because he refused to become a party to the government's frauds —It is useless to recall the events which marked the fall of Law's system: the creation of annuities payable in *billets de banque*, the repeated edicts which altered continually the metallic currency, the indictments filed, the confiscations made; how the bank was besieged and reduced to the redemption of one note only of ten livres for each person; the want of specie for the purposes of exchange; the reduction of wages, the engrossing of merchandise, the riots, and the terrible distress which succeeded one of the most extraordinary revolutions of fortunes which history tells of. After having, in the space of six months, promulgated about forty financial edicts, the government was reduced to yielding to public opinion and the force of circumstances. On Nov. 1, 1720, it declared that the notes should be receivable according to private agreement, and as, in spite of the compulsory circulation, they were at a discount of about 90 per cent., they ceased to possess any sort of value. Some time previous to this, Law had been obliged to escape by flight the vengeance of those whom his system had ruined. About two years were needed to prepare the system, and about the same length of time sufficed to develop it and to see its fall. In his speculations, founded on an erroneous conception of the creation of wealth, Law had succeeded, at first, by the importation into France of new and good commercial processes; and because of circumstances entirely unconnected with his theory, from the moment that his ideas were confronted with facts, Law's system crumbled. — It was not, as has been said and repeated often, because Law's system was carried to excess that it failed. If operations had been confined to the *Banque Générale*, if that had been allowed to develop within the limits of its by-laws without resorting to rash or adventurous speculations, it might have rendered great services; but this bank was only a decoy, meant to accustom the people to the use of paper; it was in no way a part of the system; Law's writings and the edicts leave no doubt of this. His theories on the subject of paper money were like a story in the Arabian Nights, and the system was only the practical application of those theories. — In spite of the financial difficulties resulting from the downfall of Law's system, it would have been easy to reap some advantage from the impulse imparted to business and from the state of men's minds at the time, from the custom of the association of small amounts of capital into one whole to accomplish any great purpose, and from the bank of issue Nothing of the kind was done: the winding up of the affairs of the system, which was confided to Law's bitterest enemies, was conducted with a fury of reaction too frequent in France. The object seemed to be to destroy every trace of the great financial events that had just taken place, in such a way as to leave nothing of them but their ruins All Barême's arithmetic was put under contribution to prove that Law had been a spendthrift and a knave, who had not only ruined private persons, but involved the state in debt, and people affected to speak with horror of paper. The system became the object of the declamations of philosophers and the epigrams of wits. — The history of Law's experiments, not yet completed from an economic point of view, would be a curious and very instructive study in examining the theories based on paper money and stock-jobbing. All that has been dreamed of or tried of this kind since 1720 had been conceived and tried by the fertile genius of Law. The study of the system would be the more curious inasmuch as the author of it had at his disposal, at least with respect to the mass of the people, absolute power, that he used this power to its utmost extent, and that he lived in a society accustomed to this power, as to all other monopolies. After this great lesson which confirms so thoroughly the teaching of science, the demonstration of the sterility of paper money and stock jobbing is complete. COURCELLE-SENEUIL

LAWS, Agrarian, (*agrariæ leges*). Those enactments were called agrarian laws by the Ro-

mans which related to the public lands (*ager publicus*). The objects of these agrarian laws were various. A law (*lex*) for the establishment of a colony and the assignment of tracts of land to the colonists, was an agrarian law. The laws which regulated the use and enjoyment of the public lands, and gave the ownership of portions of them to the commonalty (*plebes*), were also agrarian laws. Those agrarian laws indeed which assigned small allotments to the plebeians, varying in amount from two jugera to seven jugera (a jugerum is about three-fourths of an English acre), were among the most important; but the agrarian laws, or those clauses of agrarian laws which limited the amount of public land which a man could use and enjoy, are usually meant when the term agrarian laws is now used.—The origin of the Roman public land, or of the greater part of it, was this: Rome had originally a small territory, but by a series of conquests carried on for many centuries she finally obtained the dominion of the whole Italian peninsula. When the Romans conquered an Italian state, they seized a part of the lands of the conquered people; for it was a Roman principle that the conquered people lost everything with the loss of their political independence; and what they enjoyed after the conquest was a gift from the generosity of the conqueror. A state which submitted got better terms than one which made an obstinate resistance. Sometimes a third of their land was taken from the conquered state, and sometimes two-thirds. It is not said how this arrangement was effected; whether each landholder lost a third, or whether an entire third was taken in the lump, and the conquered people were left to equalize the loss among themselves. But there were probably in all parts of Italy large tracts of uncultivated ground which were under pasture, and these tracts would form a part of the Roman share, for we find that pasture land was a considerable portion of the Roman public land. The ravages of war also often left many of the conquered tracts in a desolate condition, and these tracts formed part of the conqueror's share. The lands thus acquired could not always be carefully measured at the time of the conquest, and they were not always immediately sold or assigned to the citizens. The Roman state retained the ownership of such public lands as were not sold or given in allotments, but allowed them to be occupied and enjoyed by any Roman citizen, or, according to some, by the patricians only at first, and in some cases certainly by the citizens of allied and friendly states, on the payment of a certain rent, which was one-tenth of the produce of arable land, and one-fifth of the produce of land planted with the vine, the fig, the olive, and of other trees the produce of which was valuable, as the pine. It does not appear that this occupation was originally regulated by any rules: it is stated that public notice was given that the lands might be occupied on such terms as above mentioned. Nor was the occupation probably limited to one class, either the patricians or the plebeians; either of these two portions of the Roman community might occupy the lands. The enjoyment of the public land by the plebes is at least mentioned after the date of the Licinian laws. Such an arrangement would certainly be favorable to agriculture. The state would have found it difficult to get purchasers for all its acquisitions; and it would not have been politic to have made a free gift of all those conquered lands which, under proper management, would furnish a revenue to the state. Those who had capital, great or small, could get the use of land without buying it, on the condition of paying a moderate rent, which depended on the produce. The rent may not always have been paid in kind, but still the amount of the rent would be equivalent to a portion of the produce. The state, as already observed, was the owner of the land: the occupier, who was legally entitled the possessor, had only the use (*usus*). This is the account of Appian ("Civil Wars," i., 7, etc.). The account of Plutarch ("Tiberius Gracchus," 8,) is in some respects different. Whatever land the Romans took from their neighbors in war, they sold part and the rest they made public and gave to the poor to cultivate, on the payment of a small rent to the treasury (*aerarium*); but as the rich began to offer a higher rent, and ejected the poor, a law was passed which forbade any person to hold more than 500 jugera of (public) land. The law to which he alludes was one of the Licinian laws. ("Camillus," 39)—This mode of occupying the land continued for a long period. It is not stated by any authority that there was originally any limit to the amount which an individual might occupy. In course of time these possessions (*possessiones*), as they were called, though they could not be considered by the possessors as their own, were dealt with as if they were. They made permanent improvements on them, they erected houses and other buildings, they bought and sold possessions like other property, gave them as portions with their daughters, and transmitted them to their children. There is no doubt that a possessor had a good title to his possession against all claimants, and there must have been legal remedies in cases of trespass, intrusion, and other disturbances of possession. In course of time very large tracts had come into the possession of wealthy individuals, and the small occupiers had sold their possessions, and in some cases, it is said, had been ejected, though it is not said how, by a powerful neighbor. This, it is further said, arose in a great degree from the constant demands of the state for the services of her citizens in war. The possessors were often called from their fields to serve in the armies, and if they were too poor to employ laborers in their absence, or if they had no slaves, their farms must have been neglected. The rich stocked their estates with slaves, and refused to employ free laborers, because free men were liable to military service and slaves were not. The free population of

many parts of Italy thus gradually decreased, the possessions of the rich were extended, and most of the laborers were slaves The Italian allies of Rome, who served in her armies and won her victories, were ground down by poverty, taxes and military service. They had not even the resources of living by their labor, for the rich would only employ slaves; and though slave labor under ordinary circumstances is not so profitable as free labor, it would be more profitable in a state of society in which the free laborers were liable at all times to be called out to military service. Besides this, the Roman agricultural slave was hard worked, and an unfeeling master might contrive to make a good profit out of him by a few years of bondage; and if he died, his place would readily be supplied by a new purchase. Such a system of cultivation might be profitable to a few wealthy capitalists, and would insure a large amount of surplus produce for the market; but the political consequences would be injurious — The first proposition of an agrarian law, according to Livy, was that of the consul Spurius Cassius, B. C. 484, a measure, as Livy observes, which was never proposed up to his time (the period of Augustus) without exciting the greatest commotion. The object of this law was to give to the Latins half of the lands which had been taken from the Hernici, and the other half to the plebes. He also proposed to divide among the plebes a portion of the public land, which was possessed by the patricians. The measure of Cassius does not appear to have been carried, and after the expiration of his office, he was tried, condemned, and put to death, on some charge of treasonable designs, and of aspiring to the kingly power. The circumstances of his trial and death were variously reported by various authorities. (Livy, ii., 41) Dionysius ("Antiq. Rom.," viii., 76) says that the senate stopped the agitation of Cassius by a measure of their own. A consultum was passed to the effect that ten men of consular rank should be appointed to ascertain the boundaries of the public land, and to determine how much should be let and how much distributed among the plebes; it was further provided that if the Ispolite and allied states should henceforth aid the Romans in making any further acquisitions of land, they should have a portion of it. The senatus consultum being proposed to the popular assembly (*δῆμος*), whatever that body may here mean, stopped the agitation of Cassius. This statement is precise enough and consistent with all that we know of the history of the agrarian laws; nor does its historical value seem to be much impaired by the remarks of Niebuhr upon it. ("Licinian Rogations," vol. iii., note 12.)— At length in the year B. C. 375, the tribunes C. Licinius Stolo and L. Sextius brought forward, among other measures, an agrarian law, which, after much opposition, was carried in the year B. C. 365. The measures of Licinius and his colleague are generally spoken of under the name of the "Licinian Rogations." The provisions of this law are not very exactly known, but the principal part of them may be collected from Livy (vi., 35), Plutarch ("Tib. Gracchus," 8), and Appian ("Civil Wars," i., 8). No person was henceforth to occupy more than 500 jugera of public land for cultivation or planting; and every citizen was qualified to hold to that amount, at least, of public land acquired subsequently to the passing of the law. It was also enacted that every citizen might feed 100 head of large cattle and 500 head of small cattle on the public pastures. Any person who exceeded the limits prescribed by the law was liable to be fined by the plebeian ædiles, and to be ejected from the land which he occupied illegally. The rent payable to the state on arable land was a tenth of the produce, and that on lands planted with fruit or other trees was a fifth. This is not mentioned by Appian as a provision of that law which limited the possessions to 500 jugera, but as an old rule; but if the law of Licinius contained nothing against it, this provision would of course remain in force. A fixed sum was also paid, according to the old rule, for each head of small and large cattle that was kept on the public pastures.—The rent was farmed or sold for a lustrum, that is, five years, to the highest bidder. There was another provision mentioned by Appian as part of the law which limited possession to 500 jugera, which is very singular. To render it more intelligible, the whole passage should be taken together, which is this: "It was enacted that no man should have more of this land (public land) than 500 jugera, nor feed more than 100 large and 500 small cattle, and for these purposes the law required them to have a number of free men, who were to watch what was going on and to inform."* Niebuhr simply expresses the last enactment thus: "The possessors of the public land are obliged to employ free men as field laborers in a certain proportion to the extent of their possessions." Nothing is said as to any assignment of lands to the plebeians by the law of Stolo, though Niebuhr adds the following as one of the clauses of the law: "Whatever portions of the public land persons may at present possess above 500 jugera, either in fields or plantations, shall be assigned to all the plebeians in lots of seven jugera as absolute property." He observes in a note: "No historian, it is true, speaks of this assignment, but it must have been made"; and then follow some reasons why it must have been made, part of which are good to show that it was not made. But though Livy does not speak of assignments of land as being made to the plebes, such assignment is mentioned as one of the objects of his laws in the

* This passage of Appian is very obscure, but it has certainly been misunderstood by Niebuhr. The Latin version is "Decretum praeterea est, ut ad curanda opera rustica certum numerum liberorum alleret quisque, qui ea quae agerentur inspicerent dominoque renunciarent." The word "domino" is an invention of the translator. The words *τὰ γιγνόμενα* may mean all "the produce," as in Thucydides (vi., 54); and this is a more probable interpretation than that given above.

speech of Licinius (Livy, vi., 39) and of his opponent Appius Claudius (vi., 41). — About two hundred and thirty years after the passing of the Licinian law, the tribune Tiberius Sempronius Gracchus, who was of a plebeian but noble family, brought forward his agrarian law, B. C. 133. The same complaints were still made as in the time of Licinius: there was general poverty, diminished population, and a great number of servile laborers. Accordingly, he proposed that the Licinian law as to the 500 jugera should be renewed or confirmed, which implies, not perhaps that the law had been repealed, but at least that it had fallen into disuse: but he proposed to allow a man to hold 250 jugera, in addition to the 500, for each son that he had; though this must have been limited to two sons, as Niebuhr observes, inasmuch as 1,000 jugera was the limit which a man was allowed to hold. The land that remained after this settlement was to be distributed by commissioners among the poor. His proposed law also contained a clause that the poor should not alienate their allotments. This agrarian law only applied to the Roman public lands in Apulia, Samnium, and other parts of Italy, which were in large masses: it did not affect the public lands which had already been assigned to individuals in ownerships, or sold. Nor did it comprise the land of Capua, which had been made public in the war against Hannibal, nor the Stellatis Ager: these fertile tracts were reserved as a valuable public property, and were not touched by any agrarian law before that of C. Julius Cæsar. — The complaints of the possessors were loud against this proposed law; and to the effect which has already been stated. They alleged that it was unjust to disturb them in the possessions which they had so long enjoyed, and on which they had made great improvements. The policy of Gracchus was to encourage population by giving to the poor small allotments, which was indeed the object of such grants as far back as the time of the capture of Veii (Livy, v., 30): he wished to establish a body of small independent landholders. He urged on the possessors the equity of his proposed measure, and the policy of having the country filled with free laborers instead of slaves; and he showed them that they would be indemnified for what they should lose, by receiving, as compensation for their improvements, the ownership of 500 jugera, and the half of that amount for those who had children. It seems doubtful if the law as finally carried gave any compensation to the persons who were turned out of their possessions, for such part of their possessions as they lost, or for the improvements on it. (Plutarch, "Tib. Gracchus," x.) Three persons (*triumviri*) were appointed to ascertain what was public land, and to divide it according to the law: Tiberius had himself, his brother Caius, and his father-in-law Appius Claudius, appointed to be commissioners, with full power to settle all suits which might arise out of this law. Tiberius Gracchus was murdered in a tumult excited by his opponents at the election when he was a second time a candidate for the tribuneship (B. C. 133). The law, however, was carried into effect after his death, for the party of the nobility prudently yielded to what they saw could not be resisted. But the difficulties of fully executing the law were great. The possessors of public land neglected to make a return of the lands which they occupied, upon which Fulvius Flaccus, Papirius Carbo, and Caius Gracchus, who were now the commissioners for carrying the law into effect, gave notice that they were ready to receive the statements of any informer; and numerous suits arose. All the private land which was near the boundary of the public land was subjected to a strict investigation as to its original sale and boundaries, though many of the owners could not produce their titles after such a lapse of time. The result of the admeasurement was often to dislodge a man from his well-stocked lands and remove him to a bare spot, from lands in cultivation to land in the rough, to a marsh or to a swamp; for the boundary of the public land after the several acquisitions by conquest had not been accurately ascertained, and the mode of permissive occupation had led to great confusion in boundaries. "The wrong done by the rich," says Appian, "though great, was difficult exactly to estimate; and this measure of Gracchus put everything into confusion, the possessors being moved and transferred from the grounds which they were occupying to others" ("Civil Wars," i., 18.) Such a general dislodgement of the possessors was a violent revolution. Tiberius Gracchus had also proposed that so much of the inheritance of Attalus III., king of Pergamus, who had bequeathed his property to the Roman state, as consisted of money, should be distributed among those who received allotments of land, in order to supply them with the necessary capital for cultivating it. (Plutarch, "Tiberius Gracchus," 14.) It is not stated by Plutarch that the measure was carried, though it probably was. — Caius Gracchus, who was tribune B. C. 123, renewed the agrarian law of his brother, which it appears had at least not been fully carried into effect; and he carried measures for the establishment of several colonies, which were to be composed of those citizens who were to receive grants of land. A variety of other measures, some of undoubted value, were passed in his tribunate; but they do not immediately concern the present inquiry. Caius got himself appointed to execute the measures which he carried. But the party of the nobility beat Caius at his own weapons; they offered the plebes more than he did. They procured the tribune Marcus Livius Drusus to propose measures which went far beyond those of Caius Gracchus. Livius accordingly proposed the establishment of twelve colonies, whereas Gracchus had only proposed two (Plutarch, "Caius Gracchus," 9.) The law of Gracchus also had required the poor to whom land was assigned to pay a rent to the treasury, which payment was either in the nature of a tax

or an acknowledgment that the land still belonged to the state: Drusus relieved them from this payment. Drusus also was prudent enough not to give himself or his kinsmen any appointment under the law for founding the colonies. Such appointments were places of honor at least, and probably of profit too. The downfall of Caius was thus prepared, and, like his brother, he was murdered by the party of the nobility, B. C. 121, when he was a third time a candidate for the tribunate. — Soon after the death of Caius Gracchus, an enactment was passed which repealed that part of the law of the elder Gracchus which forbade those who received assignments of lands from selling them. (Appian, "Civil Wars," i., 27.) The historian adds, which one might have conjectured without being told, that the rich immediately bought their lands of the poor; "or forced the poor out of their lands on the pretext that they had bought them"; which is not quite intelligible.* Another law, which Appian attributes to Spurius Borius, enacted that there should be no future grants of lands, that those who had lands should keep them, but pay a rent or tax to the ærarium, and that this money should be distributed among the poor. This measure then contained a poor-law, as we call it, or imposed a tax for their maintenance. This measure, observes Appian, was some relief to the poor by reason of the distribution of money, but it contributed nothing to the increase of population. The main object of Tiberius Gracchus, as already stated, was to encourage procreation by giving small allotments of land, a measure well calculated to effect that object. Appian adds: "When the law of Gracchus had been in effect repealed by these devices, and it was a very good and excellent law, if it could have been carried into effect, another tribune not long after carried a law which repealed that relating to the payment of the tax or rent; and thus the plebes lost everything at once. In consequence of all this, there was still greater lack than before of citizens, soldiers, income from the (public) land, and distributions." — Various agrarian laws were passed between the time of the Gracchi and the outbreak of the Marsic war, B. C. 90, of which the law of Spurius Thorius (*lex Thoria*) is assigned by Rudorff to the year of the city 643, or B. C. 111; and this appears to be the third of the laws to which Appian alludes as passed shortly after the death of Caius Gracchus. Cicero also ("Brutus," 36) alludes to the law of Thorius as a bad measure, which relieved the public land of the tax (*vectigal*). The subject of this lex was the public land in Italy south of the rivers Rubico and Macra, or all Italy except Cisalpine Gaul; the public land in the Roman province of Africa, from which country the Romans derived a large supply of grain; the public land in the territory of Corinth; and probably other public land also, for the bronze tablet on which this law is preserved is merely a fragment, and the agrarian laws of the seventh century of the city appear to have related to all the provinces of the Roman state. One tract, however, was excepted from the Thoria lex, the ager Campanus, or fertile territory of Capua, which had been declared public land during the war with Hannibal, and which neither the Gracchi nor any other politician, not even Lucius Sulla, ventured to touch: this land was reserved for a bolder hand. The provisions of the Thoria lex are examined by Rudorff in an elaborate essay. — In the year B. C. 91 the tribune Marcus Livius Drusus the younger, the son of the Drusus who had opposed Caius Gracchus, endeavored to gain the favor of the plebes by the proposal of laws to the same purport as those of the Gracchi, and the favor of the Socii, or Italian allies, by proposing to give them the full rights of Roman citizens. "His own words," says Florus (iii., 17), "are extant, in which he declared that he had left nothing for any one else to give, unless a man should choose to divide the mud or the skies." Drusus agitated at the instigation of the nobles, who wished to depress the equestrian body, which had become powerful; but his agrarian profusion, which was intended to gain the favor of the plebes, affected the interests of the Socii, who occupied public land in various parts of Italy, and accordingly they were to be bought over by the grant of the Roman citizenship. Drusus lost his life in the troubles that followed the passing of his agrarian law, and the Socii, whose hopes of the citizenship were balked, broke out in that dangerous insurrection called the Marsic or Social war, which threatened Rome with destruction, and the danger of which was only averted by conceding, by a lex Julia, what the allies demanded (B. C. 90). The laws of Drusus were declared void, after his death, for some informality. — The proposed agrarian law of the tribune P. Servilius Rullus, B. C. 63, the year of Cicero's consulship, was the most sweeping agrarian law ever proposed at Rome. Rullus proposed to appoint ten persons with power to sell everything that belonged to the state, both in Italy and out of Italy, the domains of the kings of Macedonia and Pergamus, lands in Asia, Egypt, the province of Africa, in a word, everything; even the territory of Capua was included. The territory of Capua was at that time occupied and cultivated by Roman plebeians (*colitur et possidetur*), an industrious class of good husbandmen and good soldiers: the proposed measure of Rullus would have turned them all out. There was not here, says Cicero (ii., 30), the pretext that the public lands were lying waste and unproductive; they were in fact occupied profitably by the possessors, and profitably to the state, which derived a revenue from the rents. The ten persons (*decemviri*) were to have full power for five years to sell all that belonged to the state, and to decide without appeal on all cases in which the title of private land should be called in question. With the money thus raised it was proposed to buy lands in Italy on which

* ταῖσδε ταῖς is probably corrupt.

the poor were to be settled, and the decemviri were to be empowered to found colonies where they pleased. This extravagant proposal was defeated by Cicero, to whose three orations against Rullus we owe our information about this measure. — In the year B. C. 60 the tribune Flavius brought forward an agrarian law, at the instigation of Pompey, who had just returned from Asia, and wished to distribute lands among his soldiers. Cicero, in a letter to Atticus (i., 19), speaks at some length of this measure, to which he was not entirely opposed, but he proposed to limit it in such a way as to prevent many persons from being disturbed in their property, who, without such precaution, would have been exposed to vexatious inquiries and loss. He says, "One part of the law I made no opposition to, which was this, that land should be bought with the money to arise for the next five years from the new sources of revenue (acquired by Pompey's conquest of Asia). The senate opposed the whole of this agrarian measure from suspicion that the object was to give Pompey some additional power, for he had shown a great eagerness for the passing of the law. I proposed to confirm all private persons in their possessions; and this I did without offending those who were to be benefited by the law; and I satisfied the people and Pompey, for I wished to do that too, by supporting the measure for buying lands. This measure, if properly carried into effect, seemed to me well adapted to clear the city of the dregs of the populace, and to people the wastes of Italy." A disturbance in Gallia Cisalpina stopped this measure; but it was reproduced, as amended by Cicero, by C. Julius Cæsar, who was consul in the following year, B. C. 59. The measure was opposed by the senate, on which Cæsar went further than he at first intended, and included the Stellatis ager and Campanian land in his law. This fertile tract was distributed among 20,000 citizens who had the qualification which the law required, of three children or more. Cicero observes ("Ad Attic.," ii , 16), "That after the distribution of the Campanian lands and the abolition of the customs duties (*portoria*), there was no revenue left that the state could raise in Italy, except the twentieth which came from the sale and manumission of slaves." After the death of Julius Cæsar, his great nephew Octavianus, at his own cost and without any authority, raised an army from these settlers at Capua and the neighboring colonies of Casilinum and Calatia, which enabled him to exact from the senate a confirmation of this illegal proceeding, and a commission to prosecute the war against Marcus Antonius. Those who had received lands by the law of the uncle supported the nephew in his ambitious designs, and thus the settlement of the Campanian territory prepared the way for the final abolition of the republic. (Compare Dion. Cassius, xxxviii., 1–7, and xlv., 12.) — The character of the Roman agrarian laws may be collected from this sketch. They had two objects: one was to limit the amount of public land which an individual could enjoy; the other was to distribute public land from time to time among the plebes and veteran soldiers A recent writer, the author of a useful work (Dureau de la Malle, *Economie Politique des Romains*), affirms that the Licinian laws limited private property to 500 jugera, and he affirms that the law of Tiberius Gracchus was a restoration of the Licinian law in this respect (ii., 280, 282). On this mistake he builds a theory, that the law of Licinius and of Tiberius Gracchus had for their "object to maintain equality of fortunes and to create the legal right of all to attain to office, which is the fundamental basis of democratic government." His examination of this part of the subject is too superficial to require a formal confutation, which would be out of place here. But another writer already quoted (Rudorff, *Zeitschrift für Geschichtliche Rechtswissenschaft*, x , 28) seems to think also that the Licinian maximum of 500 jugera applied to private land, and that this maximum of 500 jugera was applied by Tiberius Gracchus to the public land. Livy (vi., 35), in speaking of the law of Licinius Stolo, says merely, "Nequis plus quingenta jugera agri possideret," but, as Niebuhr observes, the word "possideret" shows the nature of the land without the addition of the word public. And if any one doubts the meaning of Livy, he may satisfy himself what it is by a comparison of the following passages (ii., 41; vi., 4, 5, 14, 16, 36, 37, 39, 41). The evidence derived from other sources confirms this interpretation of Livy's meaning. That the law of Gracchus merely limited the amount of public land which a man might occupy, is, so far as we know, now admitted by everybody except Dureau de la Malle; but a passage in Cicero ("Against Rullus," ii., 5), which he has referred to himself in giving an account of the proposed law of Rullus, is decisive of Cicero's opinion on the matter; not that Cicero's opinion is necessary to show that the laws of Gracchus only affected public land, but his authority has great weight with some people. — It is however true, as Dureau de la Malle asserts, that the Licinian laws about land were classed among the sumptuary laws by the Romans. The law of Licinius, though not directly, did, in effect, limit the amount of capital which an individual could apply to agriculture and the feeding of cattle, and jealousy of the rich was one motive for this enactment. It also imposed on the occupier of public land a number of free men: if they were free laborers, as Niebuhr supposes, we presume that the law fixed their wages. But their business was to act as spies and informers in case of any violation of the law. This is clear from the passage of Appian above referred to, the literal meaning of which is what has here been stated, and there is no authority for giving any other interpretation to it *

* The precise meaning of this passage of Appian is uncertain. If the words τὰ γιγνόμενα refer to the produce, their duty was to make a proper return for the par-

The law of Tiberius Gracchus forbade the poor who received assignments of land from selling them; a measure evidently framed in accordance with the general character of the enactments of Licinius and Gracchus. The subsequent repeal of this measure is considered by most writers as a device of the nobility to extend their property; but it was a measure as much for the benefit of the owner of an allotment. To give a man a piece of land and forbid him to sell it, would often be a worthless present. The laws of Licinius and Gracchus, then, though they did not forbid the acquisition of private property, prevented any man from employing capital on the public land beyond a certain limit; and as this land formed a large part of land available for cultivation, its direct tendency must have been to discourage agriculture and accumulation of capital. The law of Licinius is generally viewed by modern writers on Roman history as a wise measure; but it will not be so viewed by any man who has sound views of public economy; nor will such a person seek, with Niebuhr, to palliate by certain unintelligible assumptions and statements the iniquity of another of his laws, which deprived the creditor of so much of his principal money as he had already received in the shape of interest. The law by which he gave the plebeians admission to the consulate was in itself a wise measure. Livy's view of all these measures may not be true, but it is at least in accordance with all the facts, and a much better comment on them than any of Livy's modern critics have made. The rich plebeians wished to have the consulate opened to them: the poor cared nothing about the consulate, but they wished to be relieved from debt, they wished to humble the rich, and they wished to have a share of the booty which would arise from the law as to the 500 jugera. They would have consented to the law about the land and the debt, without the law about the consulate; but the tribunes told them that they were not to have all the profit of these measures; they must allow the proposers of them to have something, and that was the consulate: they must take all or none. And accordingly they took all.—The other main object of the agrarian laws of Rome was the distribution of public land among the poor in allotments, probably seldom exceeding seven jugera, about five English acres, and often less. Sometimes allotments of twelve jugera are spoken of. ("Cicero against Rullus," ii., 31.) The object of Tiberius Gracchus in this part of his legislation is clearly expressed; it was to encourage men to marry and to procreate children, and to supply the state with soldiers. To a Roman of that age, the regular supply of the army with good soldiers would seem a sound measure of policy; and the furnishing the poorer citizens with inducement enough to procreate children was therefore the duty of a wise legislator. There is no evidence to show what was the effect on agriculture of these allotments; but the ordinary results would be, if the lands were well cultivated, that there might be enough raised for the consumption of a small family; but there would be little surplus for sale or the general supply. These allotments might, however, completely fulfill the purpose of the legislators. War, not peace, was the condition of the Roman state, and the regular demand for soldiers which the war would create, would act precisely like the regular emigration of the young men in some of the New England states; the wars would give employment to the young males, and the constant drain thus caused would be a constant stimulus to procreation. Thus a country from which there is a steady emigration of males never fails to keep up and even to increase its numbers. What would be done with the young females who would be called into existence under this system, it is not easy to conjecture; and in the absence of all evidence we must be content to remain in ignorance. It is not stated how these settlers obtained the necessary capital for stocking their farms; but we read in Livy, in a passage already quoted, that on one occasion the plebes were indifferent about the grants of lands, because they had not the means of stocking them; and in another instance we read that the treasure of the last Attalus of Pergamus was to be divided among the poor who had received grants of lands. A gift of a piece of land to a man who has nothing except his labor, would in many cases be a poor present; and to a man not accustomed to agricultural labor —to the dregs of Rome, of whom Cicero speaks, it would be utterly worthless. There is no possible way of explaining this matter about capital, except by supposing that money was borrowed on the security of the lands assigned, and this will furnish one solution of the difficulties as to the origin of the plebeian debt. It is impossible that citizens who had spent most of their time in Rome, or that broken-down soldiers should ever become good agriculturists. What would be the effect even in the United States, if the general government should parcel out large tracts of the public lands, in allotments varying from two to five acres, among the population of New York and Philadelphia, and invite at the same time all the old soldiers in Europe to participate in the gift? The readiness with which the settlers in Campania followed the standard of young Octavianus shows that they were not very strongly attached to their new settlements.—The full examination of this subject, which ought to be examined in connection with the Roman law of debtor and creditor, and the various enactments for the distribution of grain among the people of Rome, would require an ample volume. The subject is full of interest, for it forms an important part of the history of the republic from the time of the legislation of Licinius; and it adds one to the many

pose of taxation, that is, of the tenths and fifths. But this passage requires further consideration. All that can be safely said at present is, that Niebuhr's explanation is not warranted by the words of Appian.

lessons on record of useless and mischievous legislation. It is true that we must make some distinction between the laws of Licinius and the Gracchi, and such as those proposed by Rullus and Flavius: but all these legislative measures had the vice either of interfering with things that a state should not interfere with, or the folly of trying to remedy by partial measures those evils which grew out of the organization of the state and the nature of the social system. — The nature of the agrarian laws, particularly those of Licinius and the Gracchi, has often been misunderstood in modern times; but it is a mistake to suppose that all scholars were equally in error as to this subject. The statement of Freinsheim, in his "Supplement to Livy," of the nature of the legislation of the Gracchi, is clear and exact. But Heyne ("Opuscula," iv., 351) had the merit of putting the matter in a clear light at a time, during the violence of the French revolution, when the nature of the agrarian laws of Rome was generally misunderstood. Niebuhr, in his "Roman History," gave the subject a more complete examination, though he has not escaped error, and his economical views are sometimes absurd. Savigny (*Das Recht des Besitzes*, p. 172, 5th ed.) also has greatly contributed to elucidate the nature of possession of the public land, though the main object of his admirable treatise is the Roman law of possession as relates to private property. BOHN.

LAWS, Sumptuary, laws designed to repress or moderate the expenditures of private citizens. Such laws existed in almost all the ancient republics and in most of the modern states. — The ancient republics were based, as we know, on equality of conditions.* As soon as that equality was in a certain measure changed, the very existence of the state was in peril. Legislators, then, to avert the danger, had recourse to agrarian laws, sumptuary laws, laws to favor marriages, and laws ordering the employment of free men in field labor. All these laws, so diverse in the nature of the subjects to which they applied, were inspired by one single idea and tended to the same end, to prevent the extinction of the free population, from which the national armies were recruited. These laws, which to-day seem strange to us, show how the ideas of the ancients on liberty differed from ours, and how different was their social condition from that which exists among us. — "The Romans," says Plutarch, "thought the liberty ought not to be left to each private citizen to marry at will, to have children, to choose his manner of life, to make feasts; in short, to follow his desires and his tastes, without being subject to the judgment and supervision of any one. Convinced that the deeds of men are manifest in these private actions, rather than in public and political conduct, they had created two magistrates charged with keeping guard over morals, and reforming and correcting them, so that no one should allow himself to be enticed from the path of virtue into that of voluptuousness, or should abandon the ancient institutions and established usages" — But the censure instituted at Rome was only one particular form given to the exercise of a right which all antiquity recognized in the state. They thought that by prohibiting the use of articles of luxury, they would repress the avidity of the great and diminish the general consumption of society, that impoverishment would be retarded; that men of the middle class would be prevented from falling into indigence, from which they could emerge only by labor; for we must remember the fundamental principle of the military republics, that labor was dishonorable. Public opinion excused the Roman patrician for having poisoned and assassinated; it would not have pardoned him for engaging in commerce or working at a trade: hence a whole economic system that was artificial and against nature. — At Rome, we find sumptuary tendencies in even the law of the Twelve Tables. "Do not carve the wood which is to serve for a funeral pile. Have no weeping women who tear their cheeks, no gold, no coronets." People never regarded these prohibitions. The *Oppian law*, passed almost immediately after the establishment of the tribunate, forbade matrons to have more than a half ounce of gold, to wear clothing of diversified colors, or to use carriages in Rome. Soon, in the year 195 before our era, the abrogation of that law was demanded, and the demand supported by a revolt of women, as described by Titus Livy. In spite of the opposition of Cato, who, in his speech, showed the intimate relation of that law to the agrarian laws, its abrogation was decreed. — Fourteen years later, under the inspiration of the same Cato, the *Orchian law*, limiting table expenses, was promulgated. Twenty years later the *Fannian law* was passed for the same end. It fixed the expense of the table at about ten cents for each individual on ordinary days, and at less than thirty-one cents for the days of festivals and games. It was prohibited to admit to one's table more than three outside guests, except three times a month, on fair and market days; prohibited to serve at repasts any bird, were it merely a fatted chicken; prohibited to consume more than fifteen pounds of smoked meat per year, etc. Soon the luxury of the table passed these narrow bounds, and Sylla, Crassus, Cæsar and Antony, in succession, caused new decrees to be issued against gluttony. — It is true that, by a singular coincidence, most of these men who made laws against luxury at the table, were conspicuous in history for their excesses. The infamy of the feasts of Sylla, Crassus and Antony has come down to us through all these centuries; and if Cæsar was less addicted to gluttony than these famous personages, he introduced no less luxury at his repasts. This circumstance likewise proves clearly

* The error of this statement appears from the writings of Aristotle. *Vide* Blanqui's Hist. of Polit. Econ., chap. ii., p. 10.—E. J. L.

that all these statesmen, whatever course they followed themselves and whatever were their personal tastes, considered sumptuary laws a political remedy in some sort applicable to a people in a bad condition. It was not through regard for morals, for private integrity, that they had recourse to sumptuary laws; it was to preserve, if it was still possible, the Italian race, which was rapidly disappearing under the two-fold action of pauperism and civil wars. But private expenses can not be regulated either by laws disregarded by the very persons who make them, or by physical means; the change must be effected through public opinion, religion and morals. When public opinion is so corrupt as to honor theft and despise labor; when all religion is destroyed; when it is honorable among the great to eat and drink immoderately, and to vomit in order to eat again, laws can have no efficacy. Sumptuous banqueting also, incredible as it may seem, increased under the emperors. The emperors then also made sumptuary laws at the same time that they were presenting the spectacle of the most scandalous excesses. Some of them, however, gave what was better than laws, grand examples of abstinence and sobriety, but without result, without power to arrest society on the declivity down which it was precipitating itself. It is as impossible to regulate the employment of wealth acquired by conquest and robbery as that of wealth acquired by gaming. — The sumptuary laws in all ancient countries were of no avail. Sometimes evaded, sometimes openly despised, they did not arrest the increase of luxury, and did not retard the downfall of the military republics founded upon equality. It seems to us, however, that J. B. Say has treated them with a little too much disdain in the following passage, where he has, however, clearly brought out the difference between the sumptuary laws of antiquity and those of modern states: "Sumptuary laws have been made, to limit the expenditures of private individuals, among ancient and modern peoples, and under republican and monarchical governments. The prosperity of the state was not at all the object in view; for people did not know and could not yet know whether such laws had any influence on the general wealth. * * The pretext given was, public morality, starting with the premise that luxury corrupts morals; but that was scarcely ever the real motive. In the republics the sumptuary laws were enacted to gratify the poorer classes, who did not like to be humiliated by the luxury of the rich. Such was evidently the motive for that law of the Locrians which did not permit a woman to have more than one slave accompany her on the street. Such was also that of the *Orchian law* at Rome, a law demanded by a tribune of the people, and which limited the number of guests one could admit to his table. During the monarchy, on the contrary, sumptuary laws were the work of the great, who were not willing to be eclipsed by the middle classes. Such was, doubtless, the cause of that edict by Henry II., which prohibited garments and shoes of silk to any others than princes and bishops." — There were, in ancient times, other motives for the enactment of sumptuary laws than desire to gratify the poorer classes, and in feudal monarchies the laws originated in other causes than a jealousy of the great. These monarchies were also an artificial creation, founded "on ancient institutions and received usages"; these institutions, these usages, tended to entail property in some families, and to settle rank permanently; and if antiquity had its agrarian laws, which meant equality, feudal society, we must not forget, had its own, which meant inequality and hierarchy. — The advent of movable wealth and of luxury profoundly disturbed feudal society, where all was founded on the pre-eminence of that property considered especially noble, viz., real estate. A system of agriculture which had become fixed by tradition did not allow the nobility to increase their revenues, while the profits of commerce, navigation and the industries, and the possession of movable capital, elevated the middle class. The luxury of this class, who were eager to imitate the style of the great, disturbed the harmony of society: it deranged a hierarchy without which people saw only disorder. Hence arose sumptuary laws, which distinguished classes by their garb, as the grades in an army are distinguished by the uniforms. — The vanity of the great, perhaps, called for the sumptuary laws of modern nations, as the jealousy of the lower classes had welcomed those of the ancient republics. But, in antiquity as in feudal monarchies, the legislator was inspired by state considerations, by a desire to prevent innovations which he considered as fatal. From the time when the plebeians came into competition with the luxury of the nobles, from the moment that they were their rivals, it was evident that, if the way was left open for such competition, wealth would finally gain the victory over birth in the opinion of the people, *i. e.*, over the nobility themselves. Now, as feudal monarchies were founded on the right of race, everything that could diminish the authority of this right, tended to subvert the constitution of the state. Even those who did not clearly perceive the import of the luxury of the bourgeois, and who, bourgeois themselves, could not be wronged by it, nevertheless felt that this luxury disturbed the established order, and they supported the sumptuary laws. — These laws, then, were at all times inspired by the desire of arresting an irresistible movement resulting from the very force of things, from the development, disordered perhaps, but logical, of human activity. They were, moreover, powerless, and were always evaded by a sort of tacit and general conspiracy of all the citizens, without any one daring or being able to find fault with the principle, without any one thinking of contesting the power of the legislator on this point in the very least. In fact, we must remember that in monarchies in modern times, the law-making power was scarcely less extended

than in antiquity. People did not recognize the right of every man to work, and still less, the right to work when he pleased; and, what was of much more consequence, they professed that the king held a strict control over his kingdom, and would not allow one class to encroach on the rights of another, or to change the rank assigned to it by ancient custom. "The said lord the king," we read in an ordinance of 1577, "being duly informed that the great superfluity of meat at weddings, feasts and banquets, brings about the high price of fowls and game, wills and decrees that the ordinance on this subject be renewed and kept; and for the continuance of the same, that those who make such feasts as well as the stewards who prepare and conduct them, and the cooks who serve them, be punished with the penalties hereunto affixed. That every sort of fowl and game brought to the markets shall be seen and visited by the poulterer-wardens, in the presence of the officers of the police and bourgeois clerks to the aforesaid, who shall be present at the said markets, and shall cause a report to be made to the police by the said wardens, etc. The poulterers shall not be allowed to dress and lard meats, and to expose the same for sale, etc. The public shall be likewise bound to live according to the ordinance of the king, without exceeding the limit, under penalty of such pecuniary fines as are herein set forth against the innkeeper, so that *neither by private understanding nor common consent* shall the ordinance be violated."—The world to-day lives in a different order of ideas, and when we read the ordinances of French kings, we find them no less strange than the ancient laws: they seem to us to apply to a social condition in which each laborer was a civil officer, as in the empire of Constantine. These ordinances are nevertheless the history of but yesterday, the history of the eve of the French revolution, and we are still dragging heavy fragments of the chain under which our fathers groaned. But ideas and sentiments have gone far in advance of facts: we have difficulty in comprehending the intervention of the government in the domestic affairs of families, and in contracts which concern only private individuals. As to luxury, it can not disturb classes, in a society where all are on a level, and it can not do much harm if the law of labor is respected, if rapine can not become a means of acquiring property. — Since the revolution, no sumptuary law has been enacted in France, and yet the luxury of attire which formerly distinguished the nobility has disappeared. A duke dresses like anybody else, and he would be ridiculed if he sought to distinguish himself by a manner of dress different from others. Such is sumptuary law in our time. Any one who should try to make himself singular by particular garments or an exceptional mode of life, would be immediately noted, not as a dangerous citizen, but as a ridiculous fellow. Opinion has undergone an entire revolution. Private expenses are meanwhile increasing, and this increase, too, is pretty rapid. They can not, however, depart far from uniformity: vain prodigalities can not be a title to glory in a society where the law of labor is recognized, and the one who will surrender himself to them, however rich he may be, is forced by public opinion to wear a certain modesty, even in his greatest excesses. Sumptuary laws can no longer be proposed. We need not think the honor of the change is due to our wisdom, to our pretended superiority to the ancients; let us simply recognize, (and it is in this that progress consists), that the essential principle of society has changed: the world moves on another basis. — When the Roman people had, in despite of the observations of Cato, abrogated the Oppian law against the luxury of women, Cato, who had become censor, attempted to have it revived in another form. He included in the census, that is, in the valuation of the wealth of the citizens, jewels, carriages, the ornaments of women and of young slaves, for a sum ten times their cost, and imposed a duty on them of $\frac{3}{1000}$ or $\frac{3}{100}$ of the real price. He substituted a sumptuary tax for a sumptuary law. The moderns have done as did Cato. After the sumptuary laws had become a dead letter, they imposed taxes on the consumption of luxuries. England has taxes on carriages, on servants, on armorial bearings and on toilet powder. So far as political economy is concerned, these taxes are irreproachable; but they bring little into the treasury, and have scarcely any influence on consumption or on morals.

COURCELLE-SENEUIL.

LEGAL TENDER. (See COMPULSORY CIRCULATION.)

LEGISLATION is the exercise of that part of the sovereign power which promulgates new laws; modifies and repeals old laws; gives to ethical convictions their crystallized form by expressing in apt language the conception of society as to what constitutes offenses, and prescribes their punishment; formulates how contracts should be made and observed; and regulates the affairs of men in their relations with the state and with each other. In this concrete form it is the expression of the will of the law-making power of the community, behind which stands its administrative machinery to enforce that expression of will by punishment for its infraction, or by changing relative rights and duties, if the law applies to matters of contract instead of matters of penal law. The legislation need not necessarily emanate from a legislative body. A convention of the people, either directly or through representative bodies other than legislatures, formulates and establishes the highest laws in any given community by the organic distribution of powers in a nation or community in the shape of a constitution. This is fundamental legislation. All other legislation of the community is subsidiary to it. There is a considerable amount of legislation done by judges in their interpretation of statutes,

or in the application of general principles to new cases, which we may for the present leave out of sight, because while judge-made law is law, it does not, in ordinary parlance, come under the head of legislation. It is referred to here for the purpose of drawing attention to the fact that the legislature is not the only source of law. In European countries a large proportion of what occupies what is ordinarily termed legislation in the United States falls under the head of administrative rescripts, which have the force of law. Each particular minister in the constitutional governments of Germany, France and Italy has the power to make administrative regulations for the departments under his control, which have the same character as, and indeed are not distinguishable from, a great part of the laws which encumber the statute books of the United States. For instance, all that class of legislation which grants charters of cities and governments for counties, and changes their nature from time to time, would all come under some ministerial department and be regulated and changed or modified, as the case might be, without any appeal to the general legislative body. By reason of this and kindred large bodies of regulations emanating from executive officers, the legislatures of those countries are but little encumbered with the questions that vex and worry us, which come under the head of local and special laws that form the bulk of the statutes annually enacted in the United States; but, on the contrary, the legislative bodies of those countries are freer to devote their attention to the general legislation of the community, because it is not properly deemed legislative work to regulate the administrative machinery of the minor administrative organizations of the community. — The legislative bodies of the United States have been modeled upon those of England. In every state of the Union there are two legislative houses corresponding to the senate and house of representatives of the national legislative body, and to the house of lords and house of commons of the English parliament. The senate is the house of greater dignity and smaller numbers, the dignity arising from the longer term of office and the greater comparative power of each individual legislator because of the larger district which elects him. — The theory upon which legislation proceeds from a law-making body is, that that body is placed in a situation of such altitude above the surrounding individual and personal interests of the community, that its members can see general interests as contradistinguished from personal interests, and by general regulations denominated laws hold the special and personal interests in check and compel them to work harmoniously for the public weal. In so far as that theory is carried into practice the laws that emanate from such bodies are, unless proceeding from a wrong point of view, generally wholesome and beneficial. If the organization of the legislative body, or the practice which has in time grown up in its procedure, results in the domination of individual or personal interests instead of the general public weal, the laws of that community, received from such a body, are sure to be inharmonious and mischievous. — Laws divide themselves naturally into organic laws, into general legislation, special legislation, public legislation, and local legislation. — The subject of legislation is the whole domain of human activity. Whether it shall extend its field into any particular branch of human activity, or leave it free to the natural law which would in the absence of such legislation regulate it, is a question of expediency, the consideration of which belongs to a different branch of the science of government from that which we are called upon to treat of herein. — Organic laws are the laws made by the sovereign, by which governmental powers are distributed and prerogatives which belong to the sovereign are delegated to agents, either for a definite period or for all time. These organic laws may emanate, like magna charta, from the king; they may be the result of a determination of the sovereign, as represented by the imperial crown, to associate with itself in the exercise of legislative and judicial powers, a larger number of subjects than had theretofore been consulted with reference to matters of government, (in such manner have European governments gradually developed into constitutional monarchies); they may be the result of revolution and civil strife, which throws the sovereign power back into the hands of the people; or they may, by constitutional conventions as in America or constituent assemblies as in France, exercising that sovereign power, represent the sovereign for the time being, and in such representative body formulate and promulge a constitution, placing sovereign power, in their subdivisions of executive, judicial and legislative authority, in individual hands, and prescribe the limits within which such authority is to be exercised. These organic laws are generally declared to be for all time, but subject to amendment in a manner prescribed by the organic law itself — The ultimate sovereignty of the community rests in its people. Whether they are to exercise that ultimate sovereignty in the form of a constitutional convention or in some more constantly acting form, is a question with reference to which it is not needful to lay down rules, as the exercise of that power comes into life, as a general rule, as the result of some great civil strife, or some great crisis, and the necessities that have called it into being prescribe the limitations and form within which the sovereign exercises its power. To these organic laws constant reference must be made for the purpose of ascertaining the powers of the legislature that it calls into being, and it is almost needless to say that whatever contravenes the organic law is void, as being beyond the scope of the authority deputed to the legislative body, and therefore of no effect; in other words, is unconstitutional legislation. — The laws which are not organic emanate from the legislative body, which is itself created by the organic law. The distin-

guishing feature between organic laws and legislative laws is, that one legislature can not bind the hands of another upon general public questions. In the United States it has been, however, held that a legislative measure may create a contract which it is not in the power of another legislature to break without the consent of the other contracting party, but this limitation upon the power of the legislature arises solely from the fact that the constitution of the United States puts a limitation in that particular upon the state legislative power in declaring that no state shall pass any law impairing the obligation of a contract, which also includes inviolability as to its own contracts. — *Public Legislation.* It is the duty of the law-making power to see to it that the laws of a community shall be readily understood, shall be harmonious, and shall press as little as possible upon proper legitimate individual enterprise; that all remedial legislation shall be adapted to its ends, and shall be clear in expression; that all criminal legislation shall define crimes in conformity with existing facts; shall keep pace with the perverse ingenuity of mankind in the discovery of new methods of appropriating other people's property under the form of legitimate business; and shall prescribe punishments of a definite character. All legislation which irritates and does not punish is useless and mischievous legislation. All legislation is as to form subject to rules which can not safely be neglected by the legislator, and the disregard of which has resulted in infinite mischief to society. The elements of every legislative expression consist, 1, in the description of a legislative subject; 2, in the enunciation of the legal action; 3, in the description of the case to which the legal action is limited; and 4, the precedent conditions on the performance or doing of which the legal action operates. — *Legal Subject.* The definition of the person, artificial or natural, who may or may not do a particular thing, who shall or shall not refrain from doing a particular thing; and this subject should be clearly defined. The *legal action* is a definition of the right, the privilege or the power, or the obligation or liability granted to or imposed upon the legal subject. The *description* of the case to which the legal action is limited, is a setting forth of the state of facts which shall create the conditions applicable to the legislative subject, and which shall call into being the right, privilege, obligation or duty. The *conditions* on which the legal action becomes operative are invariably conditions precedent, because a law, although universal as to its subjects and unrestricted as to cases, can nevertheless become operative only upon the performance or non-performance of certain conditions. Example: *Subject*, all persons born in this state above the age of twenty-one; *action*, shall have the right to vote; *description*, at all elections to be held for judges of court of appeals; *condition precedent*, if they shall have registered twenty days before the date of such election. A law may embrace any number of subjects, actions, descriptions or conditions precedent, may fill a volume, and yet the law will be combinations, in one form or another, of these simple elements The first duty, therefore, of the law-maker in relation to a law, after having determined upon its usefulness, is to see whether these various elements of the law into which it may be resolved are correctly described and follow each other in their natural order — *Legislative Methods.* The constitutions of the states of this Union enjoin upon the legislative body many conditions, upon the proper performance of which their legislation will depend as to its constitutionality. Tax laws are required to be passed by a certain majority; bills are required to be read a certain number of times, either by their titles or read through; journals are to be kept; ayes and noes are to be entered therein; a certain number of ayes are requisite for certain kinds of legislation; and in many other particulars the form of legislation is prescribed. The legislative body is required to organize committees; to sit a certain number of days; and to follow certain forms as to methods of enactment. A vast body of rules has been adopted by the legislative assemblies of this country by which their deliberations are governed. Forms are prescribed as to the manner in which bills are to be introduced; what committees are to be appointed; how the speaker is to be elected; what powers he is to exercise; how debate is to be regulated; how communications between the two branches of the legislative body, and between them, or either of them, and other bodies or the executive, are regulated and carried on; how witnesses are to be examined; petitions introduced and acted upon; and divisions determined. Committees are required to report in a particular manner, and the various stages through which a bill passes are carefully prescribed by such rules and are generally followed. The power of amendment is subject to rules; and even the debates, both as to the time which each individual speaker is to occupy and the license he is to have in debate, are subjected to regulation. It would be a mere repetition of any one of the numerous manuals of rules to set forth with greater particularity what these rules are. It may be conceded that they are necessary for the purpose of governing the presiding officer's action, so that his rulings shall not be arbitrary, and to give method and system to the conduct of the deliberative body. These rules are so numerous and so complex, that a leading member of congress stated that it takes at least one session of congress for an intelligent and diligent member to learn the rules so that he may take part in the debate with efficiency. A great part of the time of every deliberative body is taken up with questions arising under the rules, and perhaps necessarily so This is all subtracted from the necessary work of the session. Freedom of debate has ever been regarded as one of the essential requisites of a deliberative body. In the United States this freedom of debate has, however,

been for a considerable number of years subjected to the limitations of the rule known as the *previous question*, a motion which, if supported by a sufficient number of the majority, is made for the purpose of cutting short debate and to compel the presiding officer to put the main question at once with the view promptly to ascertain the will of the house. The French have in their deliberative bodies recognized the same rule by a motion for a *clôture*, or close of the debate. In the English parliament this rule has not until recently prevailed. It was only in consequence of the power exercised by the Irish members on questions affecting the Irish people to prevent legislation by obstructive motions and speeches, that compelled the adoption of a rule somewhat analogous to the *previous question* in the United States and the *clôture* of France, in a motion of *urgency of public business*, which the government may make and which upon the support of two-thirds of the house closes the debate. — The rules adopted in the United States as to methods of enactment are quite inadequate to meet the necessities of modern legislation; and there is not a state in the Union in which the complaint is not well grounded that the laws passed by the legislative bodies are slipshod in expression, are inharmonious in their nature, are not subjected to proper revision before their passage, are hurriedly passed, and impose upon the governors of the states a duty not intended originally to be exercised by them, that of using the veto power in lieu of a board of revision for the legislative body; and so badly is the gubernatorial office organized for any such purpose that the best intentioned governor is compelled to permit annually a vast body of legislation to be put upon the statute book, which is either unnecessary, in conflict with laws not intended to be interfered with, or passed for some sinister and personal ends. — In the United States there is no such thing as real responsibility for the legislation of the session lodged anywhere. Neither in congress nor in the various states is the duty imposed upon any individual or body of men to formulate and to propose public legislative measures. The party in power is supposed to be responsible in some degree for the legislation of a session, but in no state in the Union nor in congress does the political party in the ascendency consider itself charged with the public legislation of a session except in so far as it may have made specific pledges in party platforms as to the redress of some grievance. Under our system of government it frequently happens that one party has a majority in one legislative body while the other party has a majority in the other legislative body, or that the party having control of both chambers of the legislature has no control of the executive, and as both houses and the governor must combine to create a law, all responsibility for legislation is, in such cases, lost by being thus divided. In constitutional monarchies, such as England, the ministry are charged with the duty of initiating public legislation. The absence of any ministry in the states of the Union having relation to the legislature, imposes the task of proposing and formulating laws, either upon private individuals imbued with public spirit, upon others seeking to use the law for their personal ends, or upon the individual members of the legislature seeking to obtain some benefit for their constituencies, possibly for the state, or for some private interests that move them. As there is no consultation between the members of the legislature before they meet in session, by which they might as a body become animated by an *esprit de corps* for the promotion of certain legislative measures during the course of the legislative year, the consequence is, that from the opening of the legislature until its close each individual member proposes whatever law he pleases; it is put into the legislative hopper to be sent to its respective committee, and each important committee has, during the course of a legislative session, many times the measures, thrust upon it for examination and report, that it can with anything like care or deliberation consider, even if it were, as is not generally the case, thoroughly competent to perform legislative work. This absence of responsibility as to public legislation, and the promotion of such legislation exclusively by individual action, have created a degree of mischief quite beyond computation. And when the resources of the country shall have been more thoroughly exploited, and by the growth of wealth and the intricacy of social organization changes in the law become more mischievous and far reaching than now, we shall be forced to adopt in all our methods of legislation a change so great that it will be well nigh revolutionary in character, by creating in every state in the Union either a council of revision or a ministerial body charged with the duty of formulating and proposing the public laws of the session, and made responsible also for their proper enactment. — The influence of the lobby in pressing private and local bills for personal ends has proved so formidable an evil in the United States that many of the states of the Union, within a decade, have, by acts of constitutional conventions or regular amendments to their organic laws directly acted upon by the people, prohibited their legislative bodies from enacting special laws in a variety of cases. The restriction in the state of New York is as follows: "The legislature shall not pass a private or local bill in any of the following cases: changing the names of persons; laying out, opening, altering, working or discontinuing roads, highways or alleys, or for draining swamps or other low lands; locating or changing county seats; providing for changes of venue in civil or criminal cases; incorporating villages; providing for the election of members of boards of supervisors; selecting, drawing, summoning or impaneling grand or petit jurors; regulating the rate of interest on money; the opening and conducting of elections or designating places of voting;

creating, increasing or decreasing fees, percentage or allowances of public officers, during the term for which said officers are elected or appointed; granting to any corporation, association or individual the right to lay down railroad tracks; granting to any private corporation, association or individual any exclusive privilege, immunity or franchise whatever; providing for building, and chartering companies for such purposes, except on the Hudson river below Waterford, and on the East river, or over the waters forming a part of the boundaries of the state. The legislature shall pass general laws providing for the cases enumerated in this section, and for all other cases which in its judgment may be provided for by general laws. But no law shall authorize the construction or operation of a street railroad except upon the condition that the consent of the owners of one-half in value of the property bounded on, and the consent also of the local authorities having the control of that portion of a street or highway upon which it is proposed to construct or operate such railroad be first obtained; or, in case the consent of such property owners can not be obtained, the general term of the supreme court, in the district in which it is proposed to be constructed, may, upon application, appoint three commissioners, who shall determine, after a hearing of all parties interested, whether such railroad ought to be constructed or operated, and their determination, confirmed by the court, may be taken in lieu of the consent of the property owners." — This limitation of the power of the legislature to enact private and special laws creates in its turn an evil far greater than that which it was intended to remedy. Private and local legislation is in itself not a bad thing. One of the advantages of the common law is its adaptation to individual cases. It has infinite power of combining and applying itself to changes of circumstances and of cases. Any unbending, unyielding general rule becomes in time oppressive and mischievous. Equity jurisprudence has arisen simply for the purpose of making even judge-made common law subservient to the necessities of society and to the requirements of justice, which is the object of all law. — It is no demerit of modern legislation that it applies itself minutely to special cases. It would in fact be the greatest merit of any system of laws that they varied exactly as every case varied in its elements. It is general and indiscriminating rules that constitute the harshness of any system of law—rules which, subjecting special classes of persons to unintended and unforeseen oppression, require for their mitigation the arbitrary modifications of the judicial construction of courts of equity. The more a legislature is civilized, the more it measures and considers differences in each class of cases and adjusts the law to their varieties. In this process of modifying and adjusting the law to special cases, Conde, in his essay on legislative expression, says that "The constant action of the legislature and of the judiciary of England has undeniably made a greater and better progress than the institutions of any other country; and to desire a codification or simplification which should destroy these nice adjustments or diminish in any way the specialization of the law; or to propose arrangements to cripple or obstruct its future further extension of specific legislation, would be to sacrifice aptness and certainty in the law to verbal generality, and to supplant the beneficent officiousness of the legislature by the despotic formalities of the methodizer." This criticism upon resorting to the exercise of the power of general legislation instead of meeting the exception by special legislation, is fraught with special meaning to the people of the United States because their general legislation is not watched over by a body of hereditary legislators, as is that of England by the house of lords, or that powerful committee of the house of commons known as the ministry, charged with the duty of promoting the general legislation of a session. The general legislation of this country is in the hands of individual legislators, and by forbidding special legislation in a great number of cases by the recent constitutional changes, the whole body of general law is thrown into the arena of special interests, to be changed, modified or destroyed as special interests may dictate; so that the object which was heretofore sought in the state of New York and in other states by a special law is and will hereafter be sought to be attained in large measure by a change in the general law to meet special cases, thereby creating special legislation in its worst form, to wit, general laws repealed, altered or modified to meet a special case or a special interest Far better would it have been to have followed in that particular the example of England in methodizing legislation. English legislation was not free from corruption and the lobby until methods were discovered and applied by which both the one and the other could be extirpated. As late as 1844 Mr. Herapath, M. P., felt himself at liberty positively to assert that members had not been merely canvassed to support a bill, but that large sums had been spent upon them to secure their support. The "Athenæum" said, about that time, "It is the fashion to assume that our legislators are not now open to pecuniary bribes; it may be so, but we must leave that question to be decided by our children's children If public rumor be not more than usually scandalous and false, there are some curious revelations yet in store for these youngsters, relating to railway bills." One company was able to boast that it had command of one hundred suffrages in the house of commons; and Francis, in his "History of the Railway," says, "that members were personally canvassed, solicitations were made to peers, influences of the most delicate nature were used, promises were given to vote for special lines before the arguments were heard, advantages in all forms and phases were proposed, to suit the circumstances of some and the temper of

others. Letters of allotment were tempting; human nature was frail; and the premium on five hundred shares irresistible." This pressure of private legislation upon parliament began, in time, seriously to interfere with the performance of its public duties, with the passage of general laws, and with the administration of the empire; and in 1847 a code of standing orders was adopted, which, together with certain statutes as to costs and the establishment of the "Gazettes" and the notices for publication therein, now regulate practice in relation to private bills with the same completeness and detail, with the same careful regard as to the rights of parties, as the practice in courts of law is regulated by the supreme court judicature act, or by our own codes of procedure. Fully to realize this very complete system, it is well to follow the course of a private bill through the palace of St. Stephen's. Every bill conferring any power on a special borough, city or town, or upon any corporation or individual or set of individuals, or amending any powers already conferred, is regarded as a private bill; and even bills conferring powers on the metropolitan board of works are regarded as private bills; the bills in relation to the corporation of London are classified as private bills, and indeed all bills which in the United States come under the designation of special and local bills, are denominated private bills, and must pass through the course prescribed by the standing rules. — These bills are divided into two classes. The first class embraces all subjects of enlarging or altering the powers of corporations; or which may relate to a church or a chapel building, burial ground, to cities or towns, to paving and lighting, to county rates, to ferries, to fisheries, to gas works, to lands, to letters patent, to local courts, to markets, to police, to poor rates. The second class includes the making or maintenance of any aqueduct, archway, bridge, canal, cut, dock, drainage, embankment, ferry, harbor, navigation, pier, court, railway, reservoir, sewer, street, tramway, turnpike, tunnel or waterworks; in fewer words, the second class embraces all such bills as involve the exercise of the right of eminent domain. Bills of both these classes must, before parliament meets, be preceded by a notice of intention to apply for the powers they contain, together with the time when copies of the bill will be deposited in the private bills office in the house of commons. If it is a bill of the second class, this deposit must be accompanied by the submission of an accurate engineering and topographical survey of the lands intended to be taken, together with the names of the owners, the value of the lands, and an estimate of cost. A notice long in advance of the session must be published in the London, Dublin or Edinburgh "Gazette," if it affect an English, Irish or Scottish interest, for six weeks prior to the deposit of the bill. If the bill is one of the second class it must also be published in a newspaper having the largest circulation at the nearest point where such land is to be affected or taken. A list must also be deposited of the names of the owners, lessees and occupiers of any property which is to be taken or affected by the powers intended to be granted by the bill. These notices of the intention to apply are published in the month of November. It will be remembered that parliament generally meets in the early part of February, unless specially convened. Two copies of the bill, and in the case of a bill belonging to the second class, two copies of the plan, a book of reference in relation to the plan, and a list of owners, a copy of the list of owners, and copy of the "Gazette" notice, must be deposited in the office of the clerk of the peace in every county or district wherein the improvement is to be made or the powers to be exercised; one copy of each of the same documents at the office of the board of trade; one copy in the parliament office; one copy in the private bills office of the house of commons; a copy of the plans and sections at the parish clerk's office; and in the event of its being any churchyard or burial ground bill, or if any commonable land is proposed to be interfered with, a copy must likewise be deposited in the office of the secretary of state for the home department. On or before Dec. 15 notice must be personally served on the owners, lessees and occupiers of all lands, houses and premises which are to be affected by the provisions of the bill; on or before Dec. 17 a printed copy of the bill must be deposited at the parliament office of the house of lords; and on or before Dec. 21 a printed copy of the bill, with the petition annexed, at the private bills office of the house of commons, and the private bills office of the board of trade. And, in addition to all this, in the case of any canal, railway or tramway bill, or one relating to any public work, requiring the exercise of the right of eminent domain, there must be deposited, on or before Dec. 31, an estimate of expenses signed in duplicate, one for the lords and the other for the commons, at the private bills office, and at the parliament office. An entire list of owners and occupiers must be deposited in the house of lords in the same form as that in the house of commons on or before Jan. 14, a deposit of a sum of money equal to 5 per cent. of the estimates must be made in the high court of justice, and a deposit must be made at the time of the filing of the papers to pay the expenses of the bills in the two houses of parliament. — If the bill is unopposed, it is taken up by officers called examiners, who begin their work on or about Jan. 18, according to such directions as shall have been made by the speaker. Seven days' notice of the proposed examination of the petition and bill is sent out; if the petitioners do not then appear before the examiners the bill is stricken out. If the petitioners appear, which appearance is generally made by the parliamentary agent or solicitor, a judicial inquiry is then made whether the provisions of the standing orders as to notice, publication, deposits of plans and moneys have all been duly complied with, and whether the necessary disbursements for the consideration of

the bill have been deposited, which vary in the first instance from £20 to £30. If upon such examination it appears that the rules of procedure have not been complied with, the bill is thrown out, with the indorsement "standing orders not complied with," and nothing further can be done with the bill during that session. A qualified or conditional opposition may be made by the adversaries to it, upon the question of non-compliance with the standing orders, so as to avoid the necessity of a trial of the bill on its merits. If it can be shown before the examiners that either through negligence or fraud the promoters of the bill have failed to comply with the parliamentary requirements, the bill is thrown out in the same manner as though the examiners had discovered the defects by their unaided inquiry. Assuming that the examiners find that the promoters have fully complied with all these preliminary requirements, the private bill is then referred to the chairman of the committee of ways and means of the house, who, at a conference on private and local bills with the chairman of committees of the house of lords, determines in which house of parliament the bills shall respectively be first considered, and in what order they shall be considered; upon this determination neither parties nor counsel are heard. Thereupon the chairman of the committee of ways and means, with the assistance of the counsel to the speaker, examines all the private bills independently of the question whether opposed or unopposed, and calls the attention of the house and also that of the chairman of committees to all points which may appear to him to require it; and at any time after a private bill has been referred to a committee, the chairman of the committee of ways and means is at liberty to report to the house any special suggestions relative thereto which occur to him to require it, and to inform the house that in his opinion any unopposed private bill should be treated as though it had been opposed, and evidence should be taken to prove the petition and clauses affirmatively. — Before the committee acts upon a private bill, whether opposed or unopposed, it is again submitted to the chairman of the lords committees and his counsel, who amends it, alters it, or recasts it as he may see fit; or if he finds that it is inexpedient, on the whole, that the bill should pass, he indorses it that "the lords will not concur in the passage of this bill," and all further progress thereon is arrested, because the commons, since the existence of the standing orders, have rarely seen fit to urge upon the lords the passage of any private bill when so high an authority as Lord Redesdale, who has been for many years the chairman of its committees, signifies the disinclination of his chamber to consider a special private bill. Hence the suggestions that come down from Lord Redesdale's committee to the promoters or to the house of commons are generally incorporated in the bill in the way of amendments almost without question, as the result of the scrutiny of an upright, careful and conscientious jurist. The bill is then referred to committee; the committee carefully consider its provisions, call in the aid of the parliamentary agent or counsel, who has indorsed the bill, to explain it, assist in its modification if modifications are suggested, and the bill is then reported to the house, favorably or adversely, as the committee may determine. If disapproved of by the committee, as a general rule there is an end to the bill. While the power really exists on the part of the house to disagree with the report of the committee, they recognize the fact that a disagreement is inexpedient as against a committee who have examined with judicial care and impartiality the provisions of the bill. — The chairman of the ways and means committee, and three other members, are appointed by the speaker as referees, who constitute tribunals for the trial of opposed bills. They have power to suggest the increase of their number and to constitute subcommittees. Upon special bills committees those men are generally selected who are specially fitted as experts. They enter into an examination of the question whether the bill is to become a law, and if so, under what modifications, restrictions and safeguards. This committee, therefore, enters upon a real trial of the petitions for and the counter petitions against private bills, to aid the house in determining its course. — The chairmen of these various committees of selection meet together and form a calendar of opposed bills. In the case of bills for which there are regular standing committees of the house, such as railway and canal bills, such committees try them, and do so acting under the suggestions, whether opposed or unopposed, of the board of trade. The standing committees who have in the first instance the power to try the bill, if they see fit so to do, can either do so or place it upon the general calendar of these courts thus constituted for the trial of opposed cases. The trial is, as already observed, upon issues joined upon the petition for the bill and its several clauses, by a counter petition against it, in which the counter petitioners deny the facts set forth in the petition and ask that they may be heard in opposition to the bill. The opposed bill is treated precisely as an unopposed bill as to all the preliminary stages; it passes through the hands of examiners as to compliance with standing orders, the scrutiny of the chairman of committees of the house of lords and the house of commons, etc. When once on the calendar of the general or special committee to which the same is referred, it takes its turn for hearing precisely as a cause which is put upon the calendar of the court awaits its time for trial. — If, as sometimes happens, the private bill is of considerable public importance, when the chairman of the ways and means committee of the house of commons seeks a conference with the chairman of the committee of the house of lords for the purpose of determining which bills should be considered first in the house of lords and which in the house of

commons, then such a bill, if deemed of sufficient public importance, is by the chairman simultaneously introduced in the house of commons and lords and referred to a special joint committee of the houses, who thereupon proceed to try the petition for the bill as a joint court. Evidence is then taken precisely as in a court of justice, although somewhat greater latitude is allowed both to the counsel and to the court. The rule as to hearsay testimony is also somewhat relaxed, but documents are produced, maps examined, experts heard, elaborate arguments of counsel delivered, and every adverse interest allowed a hearing; suggestions are made with reference to amendment, and all proceedings are precisely in the same form as though these committee men were judges. — No man can become a member of the committee to sit upon a special bill without making a declaration in writing that neither the borough that he represents nor he himself individually has an interest in the bill to be considered, and that he will hear all the evidence before voting upon the acceptance or rejection of the bill; thus again recognizing the judicial character of the determination of the committee, and applying to each special case that general rule which applies to the judiciary that they are not permitted to sit in cases in which they have a personal interest. — To secure the full attendance of members of committees it is a standing rule that it can transact no business if two or more of its members are absent. And if a member absents himself more than twice from a committee, his name is taken off that committee, and that of some other member is substituted; and when any incorporated company presents itself before parliament to have any of its powers extended, altered or amended, any body of shareholders, although in the minority, may be heard in opposition to such bill. — At any stage of the proceedings if the promoters of the bill abandon it, the bill is disregarded and thrown out, and the expense incurred down to the point of abandonment is lost to the parties who have promoted the bill. By the 28th and 29th Victoria a complete system of costs was established in relation to contests before committees, so as to make the proceedings still more analogous to those of a court of justice. This gives the power to the committee on a private bill to compel the petitioners to pay the costs where the committee find that the preamble of the petition is not proved, or if on the motion of the opposition any provision for the protection of such opposing petitioner is inserted, or whenever the committee strike out or alter any provision for the protection of the opposing petitioner, and report that the opposing petitioner has been unreasonably or vexatiously subjected to the necessity of defending his rights, by reason of the promoters of the bill not carefully guarding the same in the bill as filed. On the other hand, when the committee report that the opposition has been vexatious and that the promoters of the bill should not have been opposed, so much of the costs and expenses as relate to the trial of the bill may be thrown upon the opposing petitioners. This act, however, very wisely provides that no land owner, who at his own risk and charge in good faith opposes a bill which proposes to take any of his property, shall be mulcted in costs because of the non-success of his opposition. — The expenses in the way of disbursements for filing, for examiner's fees, etc., attending the passage of an unopposed bill, are scarcely ever less than £200. The money is deposited and paid at the various stages of the bill as preliminary to its being further considered and carried through the house; and these disbursements pay the whole expense of parliament—its stationery for public purposes, its speaker's special counsel, its parliamentary draughtsman, etc., as well as the expenses incidental to the consideration of the bill by the committee. — All bills are subjected to being redrafted by officers under the supervision of the speaker's counsel — the parliamentary draughtsman. This speaker's counsel is generally a lawyer of great dignity and attainments. Sir Henry Thring has for many years held this position, and if the bill in question is one to which public attention has been drawn, the probabilities are that it is submitted to his scrutiny and revision, in addition to the revision and scrutiny of Lord Redesdale, the chairman of committee of house of commons and the committee that tries the bill. England's course of procedure, by bringing method into its legislation, has completely done away with the lobby in the sense that it is known in the United States There is a difference of the same character between such a system and the course of legislative action in the vast majority of the states of the Union that there is between the procedure before the supreme court of the United States and before some court in southern Russia or Turkey. — When committees of parliament became courts, a heavy draft was made upon the Westminster bar to supply this new demand for special training for inquiry and debate, and numerous lawyers soon devoted themselves exclusively to the trial and argument of causes before the parliamentary bar. A new class of solicitors, known as parliamentary agents, came into existence, drawn from the same classes of the community as those which supply the practitioners at the chancery or common law bars. These agents prepare briefs for counsel, draw the bills and attend to all the practice part of private bills legislation. Honors and distinction are won as much at the parliamentary as at the law and equity bars, and the silk gown is at St. Stephen's, as at Westminster, the reward of merit. Parliamentary lawyers are not so readily transferred to the bench or the woolsack as are those who practice in the courts of justice; their emoluments are larger, however; hence the parliamentary practitioner acquires pecuniary fortune more readily than his brethren who practice in the courts of justice, and thereby feels himself somewhat compensated for not being

able to look forward to the comfort, ease and social distinction which accompany English judicial positions. — England, therefore, has relieved itself from the pressure which the modern corporations and the growth of wealth have brought upon its legislative functions, by submitting their demands to so careful a scrutiny and trial, and surrounding property with such safeguards that it can dispense with written constitutional guarantees, too frequently inoperative in the United States, to prevent encroachment of accumulated and corporate wealth upon the rights of property not thus consolidated. — A word upon the subject of *Codification.* — There are two classes of codifications: one, codification of legislative enactments; the other, codification of common law. The codification of legislative enactments, when legislation has become so constantly active, varied and so complex, arising from so many different motives, and is so irresponsible as in the United States, is essential from time to time for the purpose of producing harmonious legislation. The question is not open to us as to whether there shall be codes, but simply who shall become codifiers of legislation of this description, and therefore every state must from time to time pass new laws which are in the nature of codifications of the pre-existing ones, simply for the purpose of enabling their courts of justice to determine what the law is. An illustration how mischievous such a state of things may become, is the fact that the court of appeals in the state of New York was compelled in 1875 to declare that it was impossible for it to determine what the condition of the law in relation to taxation and assessment, applicable to the cities of New York and Brooklyn, then was, in consequence of the number and the chaotic condition of the laws in that regard. Codification of the common law is a matter of more delicacy, requiring a higher order of intellect, and should be undertaken only if the codifier is intellectually the superior of the judge; otherwise greater mischief is done by codification of that character than by the general development of the law at the hands of judges. — Legislation is a practical art, and not a science. The ordinary objection that is made to codes, that they are cast-iron systems, is only true if the minds which formulate the codes are of the cast-iron class. If, on the one hand, they have intelligence carefully to state the common law or equitable principle in well-chosen legal phraseology, to limit it and apply it to cases already decided, and to leave the courts free to apply the principle to whatever further cases may arise, codification is an unmixed good. If, on the other hand, narrow-minded or ignorant men undertake the codification of the people's laws, such codification will be mischievous. It is with formulating the laws of the people as it is with the administration of justice—as much depends upon the persons who are to administer or to codify as upon the subject matter of the administration or codification. — An attempt has in recent years been made to deal with the mischief of constant and unwise changes in the law by the adoption of constitutional amendments, by virtue of which, legislative bodies meet biennially instead of annually. This is the merest refuge of imbecility against the evil of bad legislation. The only parallel for this treatment of political distempers is to be found in the treatment of physical ailments which prevailed in the good old days of Doctor Sangrado, who argued, "When man is sick, his blood is bad; tap him of half his blood, and he is about half as sick as he was." Bad legislation comes from the legislature. Have the legislature meet but half the number of days, and you have but half the amount of bad legislation! If the legislature were convened simply for the purpose of doing mischief instead of doing good, this argument would be true, but then it would be wiser not to have them meet at all. The legislative function is one of the most important and useful that can be administered by man. It is the inadequacy of the members of our legislative bodies for the work they have in hand, and the bad methods they have adopted for the performance of that work, which creates the mischief. Let us secure better qualified men and improve the methods, and we shall regard the meeting of our legislative bodies with expectations of benefit instead of with fear and dread. Had some one proposed at the time of the corruption of the judiciary in the city of New York (1870–72), that, for the purpose of remedying the evil of improper and corrupt judicial judgments, Judge Barnard should hold but four terms in the year instead of eight, such a reformer would have had his proposition laughed down. The proposition of biennial legislatures instead of annual legislatures, although it finds more favor with the community than the remedial measure of our imagined New York reformer, is not a whit more intelligent as a cure for our radically defective methods of legislation. The only route to reform as to this subject lies in improving the political methods of the United States so as to secure a better class of legislators; methodizing the work of the sessions by safeguards to interests affected by the proper trials of bills; and finally, fixing responsibility for legislation by the creation, for the nation and in each state, of proper supervisory bodies to which proposed laws shall be submitted and acted upon by men capable of being charged with so important a task as the preservation, amending and modifying the public laws of a commonwealth. SIMON STERNE.

LETTERS PATENT. (See PATENTS)

LIBERALISM. The word liberalism is of modern, almost of contemporary, introduction; but the thing thus designated is ancient, and springs from human nature itself, and from the very best

roots of this nature, reason and benevolence. The word is complex, and admits of different acceptations, all of which, however, imply a certain loftiness of views and generosity of sentiment, and are based upon the idea that humanity, of itself and of its own dignity, by reason of its self-reliance and the capability and right which it claims of liberty and self-government, without, however, imagining itself infallible, can be enlightened by discussion, and improved by the very experience of its errors. — Liberalism is the consciousness which a free man has of his rights, and of his duties as well; it is respect for and practice of liberty; it is toleration and freedom. "Live and let live" might be taken as its motto, but on condition that there be attached thereto no idea of skepticism or indifference, for liberalism professes one faith, faith in progress, the conviction that liberty is good, and tends to good, that truth is reached by discussion, and that indefinite improvement is the natural movement of humanity. — In individuals we can distinguish a liberal temperament, a liberal spirit, and a liberal character. A liberal temperament is a spontaneous disposition to benevolence, generosity and equity; it may be either natural or acquired. A liberal mind necessarily implies a certain amount of education and instruction; such a mind is frank, well-balanced, is master of itself, and concedes to the reason of other men the rights it claims for its own. A liberal character results from the combination of a liberal temperament and a liberal mind; it puts liberalism into practice; it converts into acts the suggestions of sentiment and the orders of reason. Its rule of conduct is, "Do not to others what you would not they should do to you." The true and consistent liberal is the man who demands liberty even for his opponents, with the clear understanding, of course, that he reserves all rights of legitimate defense. — There have always existed, among nations more or less refined, different shades and grades of liberal minds, characters, and professors of liberal sentiments. Still they have usually formed but exceptions to the general rule, and have been found only among very great minds. — Society is liberal when it forbids preventive precautions in everything affecting individual free will, and makes use of repression no more than is absolutely necessary. Therefore is it that the mollification of the penal laws always goes hand in hand with the progress of liberalism. A religion is liberal when it does not excommunicate all other religions, and more liberal still when it urges, heals and strengthens consciences, instead of enslaving or weakening them. Christianity (see the article under this caption), though liberal in its principles, has in history shown itself in turn liberal and oppressive. A state is liberal when it respects the individual and collective acts of citizens as far as they do not encroach upon its own lawful rights, for the state also claims liberty for itself. But in the liberalism of states as well as in that of individuals there are degrees. Before the full bloom come the germs and the first development. There may be a certain liberalism even in what appears to be thoroughly illiberal. A religion intolerant in its principles may be to a certain extent tolerant, that is, liberal, in its practice. An absolute government may be relatively more or less liberal; it manifests a little of this liberality if it does not carry the exercise of its power to excess, and, by benevolence or calculation, allows a certain scope to the liberty of its subjects and to their manifestations of opinion; it is still more liberal if it encourages and extends education, or if it makes use of its power to introduce into its institutions *motu proprio*, liberty or the conditions of liberty. Thus, in our own time, the emancipation of the serfs of Russia was a liberal act of very great importance performed by an absolute government. — On the other hand, a republic may not be liberal, although the republican form of government is in theory the ideal of *self-government;* it is not liberal if it does not guarantee its citizens their liberty, or if it allows the minority to be deprived of their liberty, or even restricted in its enjoyment by the majority, or if, finally, the greater part of those who are called to share in the government are incapable of such participation by their lack of education and of independence. In this last case, moreover, a republican state can scarcely live; the *élite* of the nation are swallowed up in the multitude, and the multitude, incapable of governing itself, voluntarily abandons its personality to a master. Democracy, if lacking in liberal capacity, is always on the very brink of Cæsarism: the history of Rome and of some other countries is proof of this.—Thus we perceive that we must distinguish between a liberal and a democratic spirit. The two are often confounded, and are in fact often found participating together in great political movements, just as they were, for example, in the French revolution. But they can always be distinguished. Democracy attaches itself to a form of government; liberalism, to liberty and the guarantees of liberty. The two may agree; they are not contradictory, but neither are they identical, nor necessarily connected. In the moral order, liberalism is the liberty to think, recognized and practiced. This is primordial liberalism, as the liberty to think is itself the first and noblest of liberties. Man would not be free in any degree or in any sphere of action, if he were not a thinking being endowed with consciousness. The freedom of worship, the freedom of education and the freedom of the press are derived the most directly from the freedom to think. In the economic order, liberalism is the recognition of the freedom of labor and of all the liberties which pertain thereto, including the right of property, which is the legitimate extension of human personality. In the political order, liberalism consists, first of all, in the pursuit of the guarantees of liberty. It does not admit that men are bound, when they associate themselves together and create a political society, to sacrifice some portion of their individ-

ual liberty. Its idea of the social contract is quite different; liberalism regards it as an association of all in order to assure to each his individual liberty. Only it does not confound this liberty with arbitrary power, nor with the right to encroach upon the liberty of others. The liberty which it intends to guarantee is that which is suited to reasonable beings, capable of restraining and governing themselves, and it is precisely with a view to guaranteeing this liberty that it demands laws against license, arbitrary power and encroachments of all kinds, including those made by the state. Its chief desire is to surround the personal liberty of citizens with the strongest safeguards, so as to preserve it against every assault. This is the essential point, and it is not without reason that the English consider *habeas corpus* the very corner stone of their constitution. The right of assembly and association may be considered as an appendix of individual liberty, and should be inviolable, provided it does not aim at the subversion of the state. — The chief guarantee of liberty of every kind is to be found in the constitutional limitation of the power of the state, and in the reciprocal balance of the constituted powers. Liberalism does not, however, any longer put absolute faith in Montesquieu's celebrated formula on the separation of the powers. In constitutional monarchies the executive power and the legislative power are separated merely by an abstraction; in fact, they are united and fused in the person of the responsible counselors of the crown, who are nothing more than delegates of the national representative assembly. The separation of the judicial power from the other branches of the administration is much more important, for the independence of the bench can not be too firmly established. The division of national representation into two chambers is likewise considered an almost essential condition of a liberal government. Liberalism loves to multiply the counterpoises and elements of resistance and equilibrium. The democratic spirit, on the contrary, is a leveling one. — Another difference between the liberal spirit and the democratic spirit is, that the right to dispose of one's self, which is individual liberty, does not necessarily imply, according to the *liberal* doctrine, the right to dispose of the state, that is, to govern the state. Liberalism desires control and discussion; it desires also the progressive extension of political rights and the greater and greater participation of the citizens in the government, but it does not at all admit *a priori* the principle of the government of all by all, which is the aim *par excellence* of democracy. What it considers most important is, that the citizens should be free, and guaranteed their freedom; in other words, to obtain a *maximum* of liberty under a *minimum* of government. It desires that citizens should be masters of their persons and of their affairs, but it admits them to the management of the affairs of the nation only by reason of certain or at least presumed titles. Democracy considers only the right, while liberalism takes into account capacity also. Democracy desires to realize all at once an absolute ideal; liberalism does not recognize this ideal, but it tends to it by successive steps: it is just, in principle, that all should share in the administration of public affairs, but it is not always politic to allow it in practice. Democracy demands absolute equality; liberalism does not absolutely reject a distinction of classes, provided these classes are not exclusive castes. Democracy is revolutionary; liberalism is rather reformatory: it willingly respects historical facts, and does not crush those who oppose and refuse to submit to it, except when this is necessary to defend itself. But it must be active and vigilant, and be ever on the watch for possible and opportune reforms, if it does not wish to be outstripped by the eagerness of the democratic spirit. Democracy neither procrastinates nor reflects; it proceeds by bounds; and liberalism may find itself outstripped if it be at all sluggish. In this case it does not protest against accomplished facts, for it is no more reactionary than revolutionary; but it endeavors, by means of education, to fully instruct its citizens in the rights which they have prematurely acquired, and even under the very reign of democracy it preserves its peculiar character and its *raison d'être*. It knows that democracy can not develop and last except by becoming liberal, and it makes it its duty to render it liberal. The last word of pure democracy is the imperative mandate which is founded upon the false hypothesis of the equal capacity of all, and upon the idea—entirely logical if considered from the point of view of the absolute sovereignty of the people—of the superiority of the governing body over those who are governed. Liberalism never allows the imperative mandate; it does not imagine that all those who have the right to vote are able to govern; it merely recognizes in them the ability to determine who appear to them capable of taking part in the government. It considers election as an homage paid to superiority, and the representative form of government as the government of the nation by the most worthy, who have been chosen for this very reason by their fellow-citizens. A democracy which carries its logic as far as the imperative mandate, and adheres to it, can not last, for it is contrary to the nature of things, which will always avenge itself if it be not respected. — Democracy tends necessarily to a republican form of government; liberalism is not averse to it, and does not desire its downfall when it is established. But it also accommodates itself very well to a constitutional monarchy, and it does not even occupy itself with the famous question, why does the king reign and not govern? This question, which has so frequently been made the subject of controversy, is wrongly formulated and entirely idle. The prince should not, and if he understand his own interests will not, organize a secret government, a *camarilla* behind his cabinet; but from the moment he consults

with his ministers he shares in the government, and his share in it is exactly proportioned to his faculties and to his influence. Whether he persuade his ministers to carry out his plans, or be persuaded to acquiesce in theirs, does not concern any one, since the cabinet assumes the responsibility of the government before the national representatives The true head of the government, whether prince or premier, will always be he whose genius renders him superior to the rest. The true formula of constitutional monarchy is the undivided administration of the government by the crown and the national representatives. The division of influence among those who exercise power is a matter to be determined by talent and authority, and not by formulas. Sir Robert Peel, king of England, would have brought about commercial reform quite as easily as Sir Robert Peel, prime minister, for he would easily have found ministers to serve him and a majority to support them, if public opinion were in his favor. The only difference between a constitutional sovereign and a despot is, that the former can not govern in opposition to public opinion; he may anticipate it or follow it, but he can not oppose it; and the only restriction placed upon him is, that he must abandon his own opinion when this opinion is found not to be in accord with the general opinion, and to change his responsible counselors when his cabinet has fallen into the minority. The duty of parliamentary government is not, as is commonly believed, to rob the sovereign for the benefit of his ministers; but it is always to confer power upon the most worthy, that is to say, upon the man who best expresses the sentiment of the nation and best answers the general needs of the moment. If the sovereign is most worthy, he rules his ministers; he both reigns and governs; if he is not the most worthy, his ministers, who have been elevated to power by public opinion, supply his place and govern him; he does not govern, and reigns only nominally.— The essential thing, from a liberal point of view, is that the state occupy itself only about the general interests, and that these interests be regulated conformably to the general opinion. Under a monarchical form of government the predominance of public opinion is assured by means of the ministerial responsibility; in a republic, by the limited duration of the executive power. Liberalism equally accepts both these forms of government, and moreover, without overlooking the logical superiority of the second, it plainly admits the relative and historical reasons which may in many circumstances prevent it from prevailing over the first. It judges that the almost infallible *selection* by which the leaders of parties rise to power in a constitutional monarchy afford surer guarantees than the republican *election* which always admits of some intrigue, and which does not always give power to the most capable, as has been frequently proven by the presidential elections of the United States. But liberalism is never exclusive; it understands monarchical England as well as the republican United States, and explains the reasons which account for the continuance of monarchy in England, and those which have produced from the same race, upon American soil, a successful republic. But it does not understand a monarchy without ministerial responsibility, any more than it would understand a republic with an executive power whose term of office would be unlimited. In a republic the ministers should not be held responsible, since he by whom they are appointed periodically submits his administration to the verdict of the nation. In a monarchy they ought always to hold office at the discretion of public opinion, for the simple reason that the head of the government is never submitted to this opinion. — Liberalism, although it has the same end in view as the democratic spirit, differs from it both in its philosophical belief and in its methods of procedure. It is, for still stronger reasons, opposed to socialism, which is an exaggeration of democracy. Socialism desires social equality, which is a chimera, and the methods which it imagines, would be, could they be made successful, outrages upon both liberty and property. It does not agree with liberalism upon any point; it ignores or overlooks the organic laws of progress and even the conditions of human nature. Liberalism must, therefore, of necessity, combat socialism whenever it meets with it; it can not enter into its spirit; it can not give it any direct satisfaction; but it is nevertheless forced to admit that socialism, along with much ignorance, allows of a certain amount of lawful aspirations, for it responds to the instinctive feeling of justice and the desire of happiness which are equally inborn in all of us, but to which mankind should resolve to grant only partial satisfaction although more and more approximative. Life, although constantly facilitated and bettered, will always be a struggle for liberalism; but equity, and still more, prudence, bind it not to compromise with socialism, which it could never do, but to watch it and disarm it as much as possible, on the one hand by enlightening it, on the other by applying itself to the economic reforms and social improvements which are compatible with the natural laws of progress. Everything that favors education, labor, economy and the acquisition of property, is liberal. Liberalism is not merely an affair of legislation, it is also and especially a matter of individual initiative. The characteristic principle of liberalism is not to expect anything from the state, but to require a great deal of activity and foresight of the citizens themselves. — We must also call attention to the fact that the liberalism of a society may not be in exact keeping with its legislation. It may happen that there will be more liberalism in the public manners than in the laws. Thus in our times the almost unrestricted liberty which the press enjoys in England is more an affair of manners than of legislation. There are restrictive laws, but general tolerance on the one hand, and the

moderation of the writers themselves on the other, have caused them to fall into disuse. This latter point is essential. A free mind may, if it is generous, go beyond its duty, but should never exceed its rights, and frequently it is not even prudent to do all that it lawfully may. Thus it will secure its own liberty without ever restricting that of others. — We will conclude this brief theoretic exposé with some historical data. — As we have already said, the liberal spirit has always been present and active in the civilized world. In antiquity Solon was a legislator more liberal than democratic; Cicero was a publicist and a liberal statesman. Most of the republics of classical antiquity began with a liberal and well-balanced republic, to turn from that to pure democracy, and fall at last into demagogy, and thence to princely rule, tyranny and Cæsarism. The liberalism of antiquity, however, was marked by the same essential traits as that of modern times. It conceded, especially among the Romans, less to the individual and more to the state. Individual property is to-day more extended, more distinct also and better determined. The modern individual feels that he has rights and relations entirely independent of the state. This change is due in great part to Christianity. Besides, the institution of slavery in ancient times made liberty, even the most elementary, the privilege of the few; and labor, which we honor in itself and in its results, was considered as degrading and servile. From antiquity have come down to us these altogether aristocratic expressions: liberal education, that is, education worthy of a freeman; and the liberal arts, as opposed to the mechanical arts—an opposition founded upon the ancient prejudice against the labor of the mechanic, and which continues in our modern society without any reason for its existence and by the sole force of habit. — Modern liberalism is allied by an incontestable affiliation to the reformation, whose action has by no means been restricted to the domain of religion, nor to countries that have become Protestant. The France of the eighteenth century is greatly indebted to Protestant England for her fund of ideas; Voltaire and Montesquieu both bear testimony to this fact. It is France, however, that deserves the credit of giving to liberal ideas a European extension. England alone, and two states on the continent too small to exercise any great influence, Holland and Switzerland, had at that time (in the eighteenth century) a free government and liberal institutions; but under the impulse of French philosophy, most of the absolute states of the continent, some of their own deliberate choice, others out of pure enthusiasm, or to be in the fashion, allowed themselves to be drawn more or less into the current of liberalism. Joseph II., Leopold of Tuscany, and many other princes, belonged, after their own fashion, to the liberal school. Frederick II. was an example of a liberal absolute monarch. But France, where the movement originated, presented also the most perfect and complete expression of this liberalism before the revolution, which would perhaps have provoked the revolution if Turgot's power had equaled his genius and his will. — The French revolution was itself the grandest and most generous explosion of liberalism of which history makes mention. Resuming, specifying, generalizing all that the eighteenth century and the preceding ages had accomplished, attempted or partially performed, it formulated, in what are called the Principles of '89, the code of the liberal gospel of humanity. The practical result, however, but very imperfectly responded to the theory. Liberalism found itself in opposition to the formidable task which circumstances had imposed upon it, for the very reason that it is of its nature rather reformatory than revolutionary. Contrary to its original plan, the revolution was obliged to completely rebuild a crumbled political edifice and upon ideal foundations, when even if all its ideas had been correct, it would perhaps have been unable to succeed, for political constitutions can not be treated like a geometrical problem, and the concrete world will not allow abstract theory to leave it out of consideration. The constituent assembly itself failed in the construction of a constitutional monarchy, not only because of the weakness of the monarch, but especially perhaps because it adhered too closely to the letter and wished to apply too rigorously the absolute theory of Montesquieu on the division of power and the separation of the executive and the deliberative branches of the government. This was still more strikingly illustrated when the *Contrat Social* had gained the ascendency over *l'Esprit des Lois*. It was principally the influence of Rousseau, combined with false notions of the political state of the ancients, that misled the revolution. The assemblies which succeeded the constituent assembly were democratic to excess, but by no means liberal. There should, it is true, be some account taken of the pressure of circumstances. — It is a noticeable fact that among the various party appellations, so numerous at the time of the revolution, that of liberalism is not found, although no designation could have better served to characterize the constituent assembly as a whole, or certain of its most eminent figures, above all, Mirabeau, who is the statesman of liberalism, *par excellence*. The adjective from which the substantive *liberalism* is derived then had only its ancient Latin and aristocratic meaning. It was not until about the time of Napoleon's first consulate that a party originated who called themselves or were called *liberals;* but this is not the only example afforded by history of a tendency or an opinion existing from all time, which did not receive its proper definition until a given time arrived. We have seen the word *Cæsarism* invented in our own day, which corresponds to an idea anterior even to the proper name from which it is derived, the idea of a democratic society, which is incapable of governing itself, and prefers despotism to anarchy. It may

be said, moreover, in a general way, that all things existed, and may have even existed for a long time before they were named. — The word *liberal* was used for the first time to designate a party, or rather only a coterie, in a wretched epigram of the poet Ecouchard Lebrun (wretched in every sense of the word); which may be freely rendered, so as to retain the point of it, as follows: What is this word "liberal" which some men of a certain calibre are constantly using, whether good or bad? It is the diminutive of *liber* (free). These men of a certain calibre were probably the circle of Madame de Stael and Benjamin Constant, and it is not impossible that Lebrun wished by railing at them to pay his court to the first consul. In any case, this epigram shows that it is a question rather of something new than of men of a certain calibre taken in a bad sense. Sainte-Beuve formally attributes the invention of the term liberal to Chateaubriand, but he does not produce his proofs. The word is found, it is true, in the "Genius of Christianity"; but this work did not appear until 1802, and the epigram of Lebrun appeared earlier than that. Madame de Stael also makes use of the word *liberal* in its new acceptation in "Corinne," which was published in 1807.—The empire was not made for liberalism, nor liberalism for the empire. There existed between them a reciprocal antipathy. The liberals were to Napoleon the worst of ideologists, and found themselves in the midst of the most refractory surroundings. Individual liberty, independence of thought, control discussion; in a word, the dignity of man, which they cherished most jealously, were the very things which Napoleon could not endure. He did not possess the first atom of liberalism, but, on the contrary, discerned with marvelous penetration all that in democracy is distinct from liberalism. A very striking illustration of this is found in a letter, in which when counseling his brother Joseph, king of Naples, how to govern, he thus describes the results that he expects from the civil code: "Tell me the titles you would wish to give the duchies in your kingdom. They are but mere titles; the principal thing is the value attached to them. They must be pledged for two hundred thousand pounds of revenue. I have also required that all those bearing titles should have a house in Paris, because Paris is the centre of the whole system, and I wish to have at Paris a hundred fortunes, all of which will have grown up with the throne, and will be the only large fortunes, because they are trusts; *and let those that will not be thus considered, be scattered by means of the civil code. Establish the civil code at Naples, and all that will not ally their fortunes to yours will go to ruin in a few years*, and those you wish to preserve will grow strong. *This is the great advantage of the civil code.* * * You must establish the civil code in your kingdom; it will consolidate your power, for by its means all fortunes that are not mere trusts of the crown will crumble, and there will remain no great houses but such as are fiefs to your royal self. *This it is that has ever led me to preach the civil code, this it is that induced me to establish it.*" — The meaning of the emperor was, that the ideal and mathematical justice of the civil code incessantly crushes and destroys acquired fortunes and positions, which have always to be begun anew, and under it the liberal elements never acquire sufficient consistency to offer a check to despotism. All the families, all the citizens, are too constantly wrapped up in their own affairs to be able to devote themselves carefully, independently and disinterestedly to public affairs: their aspirations can but renew the myths of Tantalus and Sisyphus, and despotism remains master of the field. This opinion of Napoleon is not without weight, and, following an instinct which is perfectly just, a part of the contemporary liberal school, without complaining of the right of primogeniture, demand the liberty of making a will. Equal division is much more democratic, and more conformable to the rules of abstract justice, but it is contrary to liberty, it violates the principle of property and the authority of the father of the family; it is productive of evil consequences both social and political. It is beneficial to the public weal that all have not their fortune to make, and that there are persons independently situated, whose position is firm and stable, who can resist the central power. The general interests should be intrusted to those who have no need to busy themselves about their own affairs. Moreover, between equal division in the midst of the family and equal division in the more extended family of the state, there is but a difference of more and less, and no difference of principle at all. — Either by a chance coincidence, or being brought over from France, the word "liberal" underwent the same change of meaning in Spain under the empire that it had undergone in France under the consulate, and was at once employed to designate a great political party, which contributed not a little to its acceptation in this sense throughout all western Europe. The Spaniards assign the year 1810 as the precise date of this change of meaning. "Consider for a moment," says Benavides, in his discourse delivered upon his reception into the royal Spanish academy, "two words of most frequent use in modern times, *liberal* and *liberty*. Down to ten years ago liberal meant generous, splendid, magnificent; all Spaniards agreed upon this signification, and no one had the least doubt upon the subject." The Spanish liberals were the authors and defenders of the constitution of 1812, which was abolished by Ferdinand VII. in 1814, re-established in 1820, and violated anew in 1823 They are also called the constitutional party, and it is a noticeable fact that from 1815 to 1830 the words "liberal" and "constitutional" have been synonymous, not only in Spain, but also in France, and in different neighboring states. Germany, particularly in the smaller states, had her liberals. The programme of these liberal

parties may be briefly said to consist in demanding constitutional guarantees where they did not exist, and defending them against reaction where they already existed. The democratic movement, properly so called, had then but little importance. The pure liberal opinion was in the ascendant, and was content with a throne surrounded with constitutional institutions. Such has long been the form of government in England; but the English liberals have not on this account been idle; they had other reforms to bring about, especially the emancipation of the Catholics and the reform of the electoral system. — In France, under the restoration, one might almost say that the liberal party was the entire nation. All that were not *ultra* were liberal, or at least called themselves liberal, for we must add that the flag of liberalism covered all sorts of merchandise, and especially a great deal of Bonapartism. The songs of Béranger are the expression of this strange combination of legend and the empire and of the Principles of '89. There were also by the side of such liberals as Royer, Collard and Benjamin Constant, who were content with the *Charte* and the dynasty, on condition that the latter should not conspire against the *Charte*, other liberals who wanted another dynasty, or who even, like Lafayette, favored the republic. The first of these only were consistent liberals, but the ordinances of July created a case of lawful defense, which united all sections of the party in common resistance. — The revolution of July was the grand triumph of liberalism, and its effects, as is well known, were not confined to France; its action was felt even in England, where it brought the liberals into power and hastened reforms. A short time before the year 1848, an impartial witness, de Nesselrode, proved that the position of France in Europe had never been stronger than under the monarchy of July and under the influence of liberal ideas. Unfortunately, victorious liberalism was wanting in grandeur and in self-confidence. It became narrow and timid. The electoral ground, that is to say, the legally recognized territory, remained much too circumscribed, and those who occupied it shut themselves up in it as in a citadel. Liberalism appeared immovable and sterile, the democratic movement took the ascendant, and the governing class expiated its inertness and its lack of foresight by the revolution of 1848. — But liberalism, although overthrown and worsted, did not on this account lose its *raison d'être*. It had never been able to raise any objections to universal suffrage but such as were based upon considerations of its inopportunity. Now that universal suffrage has got in the advance of it, its task should be to pursue and overtake it. In other words, a liberal government, the liberal party, liberal minds, should apply themselves above all things to instruct, enlighten and elevate universal suffrage; in a word, to arm it with the capacity requisite to the proper fulfillment of its duties. — European liberalism will never admit that universal suffrage is infallible, nor that it is the form or the supreme guarantee of liberty, nor that a republic is the only good form of government. It professes, on the contrary, and always will profess that forms may vary according to historical data, and that the interests of liberty are not always directly and necessarily best served in proportion to the number of voters. But universal suffrage once established, it will put aside as illusory and dangerous every thought of reaction or restriction, just as it does under a monarchy; it will reject the expedient of revolution, because it does not wish to try the unknown. But it will not be content with words; it will demand liberty and the guarantees of liberty of the republic, just as it demanded them of the monarchy: it will demand that the state be confined to its lawful limits, and it will not consider the despotism of a convention any better than the despotism of an individual. Contrary to the absolute logic of democracy, it will prefer two chambers of deputies to one single assembly, provided always that it find elements sufficient for a double assembly. In default of such an institution, it would seek other means of establishing an equilibrium, for it knows that a power without a counterbalance necessarily becomes absolute. A. NEFFTZER.

LIBERAL REPUBLICAN PARTY (IN U. S. HISTORY), an abortive offshoot from the regular republican party in 1870–72. — Attention is called elsewhere to the destructive influences of the rise of the republican party in 1855–6 upon the democratic party of the time. (See REPUBLICAN PARTY, I.) In every state the element represented by such men as William Cullen Bryant, S. P. Chase, Lyman Trumbull, and Montgomery Blair, democrats by choice, were forced into the new party by the progressively proslavery attitude of their natural party. (See DEMOCRATIC PARTY, V.) A re enforcement of much the same nature was added to the republican party, after 1861, under the name of "war democrats." A peace democrat in 1864 asserted that a war democrat and a republican were only "two links of the same sausage, made out of the same dog"; there was, however, an essential difference, which became gradually more strongly apparent after the end of the rebellion. The coercive measures, which seemed to the dominant party absolutely necessary to the maintenance of the natural rights of southern negroes, (see RECONSTRUCTION, KU-KLUX KLAN), were such as were likely to wean the originally democratic element from the republican party; and from 1867 until 1871 there was an increasing exodus of this nature, but not sufficient in numbers to influence seriously the enormous popular vote. The passage of the "ku-klux act" of April 20, 1871, and its enforcement, increased this movement so much that it seemed to need only organization and boundaries to become a perceptible current. — The opportunity was afforded by the success in Missouri of a union of "liberal republicans"

and democrats in 1870–71. (See MISSOURI.) Its leading features were universal suffrage and universal amnesty, a reform of the tariff and the civil service, and the cessation of "unconstitutional laws to cure ku-klux disorders, irreligion or intemperance." The leaders of the Missouri fusion, after gaining complete control of their own state, issued a call, Jan. 24, 1872, for a national convention at Cincinnati, May 1 following. In the nature of things the proposed gathering could not be at all representative, for the new party had no organization and no units for representation. The delegates were therefore, in the main, practically self-appointed; and thus there came into the convention another element, thoroughly honest and patriotic in purpose, but entirely foreign to the natural course of the movement. There was no hope of an independent existence for the new party; it could hardly hope to convert the party which it had left by defeating it: its only logical plan was to organize such a course of transit to the democratic party as should put new blood into that party, restore it to its ancient principles, and raise it out of the slough into which it had fallen. But there was also dissatisfaction among republicans pure and simple: in the growth of that party new men had gained control of it, new methods had been introduced, and the resulting "personal government" of the party had created considerable discontent. This feeling—the desire to reform, not to defeat, the republican party—was strongly represented at Cincinnati, and its influence brought the party to an ignominious failure. Its determination not to abandon the protective system, caused the introduction of the ridiculously ambiguous tariff utterance; and its determination to follow republicans only, brought about the fatal nomination of Greeley. If the convention had been homogeneous, the tariff utterance would have been clear and consistent, some original republican of democratic tendencies would have been nominated for president and some acceptable democrat for vice-president, and the ensuing presidential election would at least have been doubtful. — The convention met according to appointment, and selected Carl Schurz, of Missouri, as chairman. A platform in twelve paragraphs was adopted: 1, recognizing the equality of all men before the law; 2, opposing any reopening of the questions settled by the last three amendments; 3, demanding universal amnesty; 4, local self-government, impartial suffrage, and the maintenance of the writ of *habeas corpus*, and 5, civil service reform; 6, "recognizing that there are in our midst honest but irreconcilable differences of opinion with regard to the respective systems of protection and free trade, we remit the discussion of the subject to the people in their congressional districts, and to the decision of congress thereon, wholly free of executive interference or dictation"; 7-12, calling for the maintenance of public credit, a return to specie payments, and a cessation of land grants to corporations. On the first ballot for candidate for president, Charles Francis Adams had 203 votes; Horace Greeley, 147; Lyman Trumbull, of Illinois, 100; B. Gratz Brown, of Missouri, 95; David Davis, of Illinois, 92½; A. G. Curtin, of Pennsylvania, 62; S. P. Chase 2½, and Charles Sumner 1. Curtin and Sumner were withdrawn at once; Brown's vote fell to 2 on the following ballots; Davis' vote fell gradually to 6 on the sixth ballot; and Trumbull's rose to 156 on the third ballot, and then fell to 19 at the end. Adams' vote rose on all six ballots, as follows: 203, 233, 264, 279, 309, 324; and Greeley's as follows; 147, 239, 258, 251, 258, 332. Before the sixth ballot was declared, changes made Greeley's vote 482, and Adams' 187. The former was thus nominated. On the second ballot for a candidate for vice-president, B. Gratz Brown was selected by a vote of 495 to 261 for all others, and the convention adjourned. July 9, the democratic national convention adopted the platform and candidates prepared for it at Cincinnatti. (See DEMOCRATIC PARTY, VI.) — The whole movement had really failed, so evidently that in June the leaders of it endeavored to obtain another convention from which the absolute republican element should be excluded. June 20, a meeting was held in New York city, on the call of Carl Schurz, Jacob D. Cox, William Cullen Bryant, Oswald Ottendorfer, David A. Wells, and Jacob Brinkerhoff, and nominated as presidential candidates William S. Groesbeck, of Ohio, and Frederick L. Olmstead, of New York. But it was too late; the new ticket was not heard of after the day of its announcement, and the Greeley campaign went on to its final overwhelming defeat. (See ELECTORAL VOTES, UNITED STATES.) The result was entirely due to the refusal of democrats to vote for a candidate who was their lifelong and natural opponent, and whom their leaders had evidently only taken as a stalking horse; the only matter for wonder is that the democratic proportion of the total vote fell off but 3½ per cent. under the circumstances (1868, 47.3 per cent., 1872, 43.8 per cent.). — Many of those who had originated the movement returned, before or after the election, to the republican party; others remained in the opposition. The name of the party survived until 1876, owing to the presence of a few senators and representatives in congress who still held to it; but its substance departed with Greeley's defeat, if it had really survived his nomination. The only practical result was the "new departure" of the democratic party for the future; but it can hardly be supposed that this missionary work was the primary object of the Cincinnati convention. — Authorities must be sought in the current newspapers.

ALEXANDER JOHNSTON.

LIBERIA. The republic of this name is situated to the south of Sierra Léone, on that part of the west coast of Africa called the *Seed Coast*. Its territory consists of a series of settlements,

some commercial, others agricultural, stretched along the seacoast for a distance of 960 kilometres, and extending back an unlimited distance into the interior. Its capital is Monrovia, situated on the bay of Cape Masurado and the river of the same name. It was, when first founded, 1821–2, merely a colony of free negroes, which the American colonization society (founded Dec. 31, 1816) established to procure for these victims of color prejudice a better lot than in America, and at the same time to rid the soil of America of an element of its population judged inferior to the white race even by the members of the society themselves. By additions from within and without, the free and Americanized population of Liberia amounted, in 1872, to 19,000 souls, who exercised a political influence over 700,000 negroes (natives, but not savages), scattered over the territory that extends from the sea to the chain of mountains which separates the Liberian territory from the basin of the river Niger in the interior. The primitive colony, governed at first by white men, became, Aug. 24, 1847, an independent republic, governed by a black (or rather a mulatto) head, and was admitted into the family of civilized nations. It has been recognized by England, France, Belgium, Holland, Prussia, the Hanseatic cities, Italy, Denmark, Portugal, and finally (in 1861) by the cabinet at Washington. Its relations with foreign nations have been regulated by a dozen friendly treaties.— The constitution provides for a president, a vice-president, a house of representatives (thirteen in number), elected for two years, and a senate (of eight members), elected for four years. The president may be re-elected. The first president, Roberts, after having administered the government for the colonization society during six years, was elected when the republic was proclaimed, and three times re-elected (1848–56); his successor, Stephen Allen Bensen, was re-elected four times (1856–64); the third president was D. B. Warner (1864–8); the fourth, J. S. Payne (1868–71); the fifth, who again assumed the office in 1872, was J. J. Roberts. Anthony W. Gardner is the present president. — This dignity, like other governmental offices, can be conferred only on a negro. Various ministers form its executive agents. Suffrage is universal. — The judicial power is vested in a superior court, and two tribunals, established, as occasion requires, by the legislature. — In administrative matters the republic is divided into four counties (Monferrado, Grand-Bassa, Sinoë and Maryland), which are subdivided into districts. The civil affairs of the counties are managed by four superintendents chosen by the president with the advice of the senate; those of the districts by municipal magistrates elected by the citizens. — The revenues of the republic amount to about $120,000, of which more than $70,000 are derived from customs duties, and about $50,000 from the various other taxes. The expenses are a little less than this sum. The public debt, contracted for the erection of establishments of general utility, amounts to upward of $600,000, $500,000 of which were borrowed in London in 1871. Since 1874 no interest has been paid on this debt. — Education is furnished in the district schools and churches. English is the official language. Monrovia has a college and library. The wealthier families send their children to Europe to complete their education. Protestantism is the dominant religion. — Labor is obligatory; each inhabitant is obliged to cultivate a piece of land. — The Liberian colony has developed, in spite of the frequent aggressions of hostile negroes from the adjacent country; the Liberians are faithful to the laws which they have adopted, honest in their dealings, religious and moral, to at least as great a degree as other African colonies governed by whites. The Liberians have not, however, escaped all criticism; they have been reproached with reducing to slavery the natives who resist their power, and through the complicity of their citizens, selling them to the slave traders; but severe regulations imposed by the legislature in the session of 1857–58 upon this traffic and upon immigration, exonerate the republic from all participation in acts, which, if they have any real existence, are but the crimes of individuals. — Besides, lawful commerce affords ample opportunity to the activity of the Liberians; it is carried on in Monrovia and in the factories along the coast, subject to moderate import and export duties. The exports aggregate nearly $600,000, composed principally of palm oil, logwood and ivory; but the variety of local products promises a more extended traffic in the future. Rice, coffee, sugar, pepper, indigo, peanuts, arrowroot, maize, etc., grow on its fertile soil. The cultivation of cotton is encouraged by the cotton spinners' association of Manchester. Iron is common, and gold is not rare; there are also indications of coal — By these varied sources of wealth which it is developing from day to day, and still more by the establishment of order with perfect liberty, the little republic of Liberia is a very interesting example of what negro communities may become. Fortunately exempt from the violent traditions which still weigh heavily upon Hayti, owing its foundation to the disinterested devotion of whites, composed of freedmen who were ordinarily the best of the slaves, admitted into fraternal relations of friendship with civilized nations, it will serve as a test of what the negro race can attain to when left to self-government. Its progress thus far warrants the hope that it will continue worthy to rank by the side of the Senegambian colonies which France and England possess and administer in the same region of western Africa.

LIBERTY PARTY. (See ABOLITION.)

LIBRARY OF CONGRESS. This institution calls for notice because of its importance in connection with the copyright system, as well as because it is the great library of the United States government. Established at Washington in 1800, this library has survived two conflagrations, and has risen, in 1882, to 450,000 volumes, besides about 200,000 pamphlets. Its primary uses being for the national legislature, it has been rendered very complete in jurisprudence, political and economic science, and history; and in what are known as *Americana* it has by far the largest collection in the country. Its 10,000 bound volumes of newspapers represent more than a century of journalism in Europe and America. The supreme court of the United States, the heads of departments and bureaus, and the foreign diplomatic corps resident in Washington draw upon its stores; and while not a library of general circulation, it is freely open to the public use. — The librarian of congress is made by law the keeper of all copyright records, and the custodian of all publications deposited with the government in evidence of copyright. The process of obtaining copyright is very simple; the law requires a printed copy of the title of the work before publication, with a fee of fifty cents for record, and fifty cents for certificate of record, followed, within ten days after publication, by two copies of the work, which may be sent free by mail. Prior to 1870 the records of copyright were kept by the clerks of the United States district courts in fifty different places in the states, with the somewhat confusing result that there was no central office of record, and no ready means of answering questions as to literary property. Since the transfer of the entire registry and records to Washington, the status of every publication can be traced as to copyright title. Moreover the deposit of copies in pursuance of copyright is made vastly more complete, and authors and publishers are assured of finding nearly every publication protected by copyright in this national repository. A separate fire-proof library building is soon to be erected, the great collections of literature and science, including the copyright department, having long overflowed the limited space within the capitol. — Copyright in the United States runs to any citizen or resident therein, for the term of twenty-eight years from date of entry; and may be renewed for fourteen years longer by the author, or by his widow or children, making forty-two years in all. The annual number of copyright entries in the office of the librarian of congress considerably exceeds 20,000.

A. R. SPOFFORD.

LICENSE AND LIBERTY have their common origin in the human will, but, at the same time, liberty proceeds from reason, and license from passion. As a consequence, liberty is naturally well regulated, circumspect and moderate, without requiring the intervention of any restrictive law. Liberty, legally unlimited, keeps within the bounds which the general welfare, morality and self-respect assign to it, of its own accord, and almost without effort. It emanates from a sentiment of our own dignity, and is its most powerful safeguard. License knows neither rule nor moderation; it recognizes no law; neither morality nor human respect restrains it It is inspired by caprice, seeks only momentary gratification, and makes no sacrifice in the interests of the future. — Can license always be distinguished from liberty? We believe it can; and the characteristic marks which we have enumerated will enable any person to distinguish the one from the other, if he will but examine the facts impartially. Unfortunately, this impartiality is not always found, and the enemies of progress do not hesitate to attribute to liberty the faults of license. Consequently we have to oppose license as well as despotism, though with different means. We employ firmness, self-respect and love of equality against despotism; against license our only resource is to extend political education and to enlighten men as to their true interests.

MAURICE BLOCK.

LICENSE TAX. A license tax is a tax upon trade, and is paid for the privilege of pursuing an industrial or commercial occupation or a profession. The general idea of a license is that it confers a right that could not exist without the license, but this idea must, when license taxes are considered, be extended. For there are many trades and occupations which are not in themselves unlawful, and which could be followed without any interference by the state, yet which are made subject to a license tax. Thus, in the case of attorneys, notaries, peddlers and plate dealers, whose occupations do not imply any illegality, duties were for many years imposed on such as followed them. In general, license duties are mainly imposed in connection with the police power of the state, and for the purpose of regulating or prohibiting certain occupations which may be injurious to the interests of society in any form or when carried to excess. This idea was embodied in the constitution of the state of Arkansas of 1868, which provided that "the general assembly shall tax all privileges, pursuits and occupations that are of no real use to society; all others shall be exempt." (Art. 10, § 17.) And in carrying out this idea of regulation the tax may be made so pressing as to prohibit an occupation. Thus, a tax of $1,000 imposed on keepers of gaming implements, was clearly intended to be prohibitory, "and its payment would not give the owner the privilege of making use of it, which was illegal under another statute." (State

vs. Doon, R. M. Charlt., 1.) — Where regulation is the object of a license tax, revenue is a secondary consideration; and, in fact, in many instances the charge is only what is sufficient to defray the expense of regulation, and no revenue accrues to the taxing power. And where a grant is made by a state to a municipal corporation of power to issue licenses, it would appear that regulation was the object, unless there is something in the language of the grant, or in the circumstances under which it was made, indicating that revenue was contemplated; and the charge is not then known as a tax, but as a fee. "The license fee for retailing liquors is in no proper sense a tax. Its object is not to raise revenue. It has for many years been thought that this business was one dangerous to the public peace and public morals, and it has been the uniform practice of the country to subject it to regulation, require license from some public functionary before it is engaged in, and to punish as a crime the pursuit of it without a license. The license is part of the public regulations of the country, and the fee is intended rather to prevent the indiscriminate opening of such establishments than to raise the revenue by taxation." (Burch *vs.* Savannah, 42 Geo., 596, 598.) And a like reasoning will apply to charges like those for licenses for marriages, places of public amusement, auctions, draymen, hackmen, and for inspection. The sphere of such duties is limited, for, if generally applied, they become an obstruction to trade; but in the cases of a traffic or occupation which entails upon the government special inconvenience in its regulation, there are just grounds for imposing a special tax upon such occupation or trade; and objections such as that the charge is unequal and invidious, because the rest of the community is not subject to it, or that those taxed are not assessed on the amount of business done, will not hold. There can be little doubt that such taxes or charges, if properly imposed, do tend to diminish the evils against which they are directed; but experience has shown that when prohibition is intended, other and more direct means are to be found in legislative action which is expressly prohibitory than in the circuitous method of imposing a charge difficult or impossible to be borne. When imposed for revenue there is no limit to the taxing power. — A license tax is usually a fixed charge for each occupation, and as such it is an unequal and unjust tax, because if a heavy charge, it weighs more heavily upon those who carry on business on a small scale, or whose services are in little demand. The tendency of such duties is thus to favor the concentration of the business taxed into the hands of the wealthier undertakers, and this tendency is increased in proportion as the duty is increased. Indeed, the first license tax imposed in England was believed to be a protective measure. A duty was imposed on all persons traveling through the country as hawkers and peddlers, and on every horse or other animal used by them. It is supposed that this measure was adopted in the interests of the shopkeepers; for as means of locomotion were very limited, in the remote districts the difficulty and inconvenience of reaching towns where shops existed were such as to cause trade to be carried on to a much greater extent then than now by peddlers, and by imposing a heavy tax on these traveling salesmen they were discouraged and trade brought back to the shops. The intention may be to create such a concentration and even a monopoly, as in the case of the very heavy license fees exacted from pawnbrokers in Dublin, which are said to owe their origin to a purpose of giving a monopoly of the business to a few favored retainers of the court. The concentration thus, directly or indirectly, brought about would assist the supervision of the licensed trade or occupation by the state; but it is an unjust interference with trade, and when the tendency to crush out the small trader is under natural conditions as strong as it is at the present day, legislation should seek rather to aid than to do injury to him. — A license tax is an indirect tax, and is not finally paid by the person whom the state recognizes as the payer; for the latter reimburses himself from his customers. There are certain cases, as was pointed out by Mr. Cliffe Leslie, in which it may prove a direct tax. "A petty retailer, to give real examples, takes out licenses to sell spirits, beer and tobacco; he advances the customs and excise duties on tea, sugar, and the rest of his stock; he pays perhaps sixpence in the pound on his shop; and after all these duties have been advanced, his shop is burned to the ground, or he falls sick and loses his business, or he is defrauded and becomes bankrupt; or a large dealer, to whom the taxes are a 'flea-bite,' takes away his customers; or from one of twenty other causes the return to all his outgoings is ruin. * * There are thousands of poor men who every year embark their little savings or borrowed money in losing ventures of this sort on which they pay taxes; and not unfrequently one cause of their failure is the advantage which wealthier rivals find in those very taxes. Thus, excise and customs duties on commodities, trade licenses, licenses to keep horses and public carriages, etc.,—though treated not only by theorists but even by chancellors of the exchequer, as taxes on consumers alone—are often heavy direct taxes on a working class of producers, over and above the general diminution of wages which the whole system of so-called indirect taxation occasions." ("Fortnightly Review," February, 1874.)—But regulation apart, there is little to recommend an extensive system of license duties, such as is at present in use in France under the name of *patentes*. They are unequal, and all attempts to make them equal have failed. In France and some other countries the charges for licenses to sell alcoholic liquors is graduated according to the population of a place, and the number of retail dealers in each place is limited. In such cases the charge may be regarded as a return for the privilege of selling under a partial monopoly. But when it is attempted to

adjust license duties to the amount of business done, or the profits received, by the payer, all the difficulties that are arrayed against the income tax (see INCOME TAX) are met with, and the tax is no more equal than before. Mr. McCullough says that they are too contradictory of the plainest principles ever to become prominent sources of income; and Paul Leroy Beaulieu, the author of the best work on taxation in the French language, asserts, that the problem of making license duties equal is like that of squaring the circle. — In the United States license duties have been mainly employed by the different states in connection with the police power, and they have been granted also to municipal corporations. The federal government in 1861–2 imposed an elaborate system of license taxes, the main object of which was revenue, and in fact regulation was hardly thought of except so far as was necessary to the collection of the taxes. Under such a system it occurred that many occupations were charged with license taxes under both national and state laws, and many interesting questions regarding the legality of the federal law were raised, and notably in regard to lotteries and liquor dealers, for the former had been declared illegal by the laws of the majority of the states, and the latter were proscribed by some. In 1866 special taxes were imposed in place of license taxes, but the change lay wholly in the name, and the character of the different taxes remained almost unaltered. In 1871 the greater part of the special taxes were abolished, and only those on distillers and dealers in liquors, and manufacturers and dealers in tobacco, were retained, and these last taxes are still in force. For the purpose of showing the number of occupations taxed during the latter years of this system of license taxes, and after many had been abolished, and to show the relative importance of each as a source of revenue, the following table is taken from the report of the commissioner of internal revenue for 1868:

	1866.	1868.
Apothecaries	$ 43,712 86	$ 58,377.46
Auctioneers	89,724.42	97,448.14

WORTHINGTON C. FORD.

LIFE INSURANCE. (See INSURANCE.)

LINCOLN, Abraham, president of the United States 1861–5, was born in Hardin county, Kentucky, Feb. 12, 1809, and died at Washington, April 15, 1865, the victim of an assassination. He was taken by his parents to Spencer county, Indiana, in 1816, and in 1830 removed to Decatur, Macon county, Illinois. Here, in 1835–6, he studied law, and was admitted to the bar, and in 1834 was elected to the state legislature, where he remained until 1841. In 1837 he removed to Springfield. He was a whig representative in congress 1847–9, the only member of that party from his state. Declining a renomination, and defeated as the whig candidate for United States senator in 1849, he continued the practice of law until 1858. During this interval he was so frequently engaged in public political arguments with Douglas, that when the latter returned to Illinois in 1858 to "stump" the state for a legislature favorable to his re-election as United States senator, the republican state convention, June 17, 1858, nominated Lincoln against him. The two engaged in a joint debate in seven towns in different parts of the state, from August until October, which attracted attention in every state. Douglas had long been before the country; this debate brought Lincoln fairly abreast with him. On the popular vote the result was as follows: republicans 126,084, Douglas democrats 121,940, Lecompton democrats 5,091; but Douglas had a majority in the legislature and was re-elected. In 1859, when Douglas was called into Ohio to canvass that state in the gubernatorial election, the republicans at once summoned Lincoln to meet him. Early in 1860 he made many addresses in the eastern states, becoming still more widely recognized as one of the ablest leaders of his party; and in May he was nominated by the republican national convention for the presidency. In November he was elected, and in 1865 he was re-elected. (See REBELLION; HABEAS CORPUS; EMANCIPATION PROCLAMATION; DRAFTS; AMNESTY; FREEDMEN'S BUREAU; RECONSTRUCTION, I.; REPUBLICAN PARTY; ELECTORAL VOTES; UNITED STATES.) — President Lincoln's fame will undoubtedly rest mainly upon his connection with the overthrow of slavery; and yet he was never an abolitionist. In 1837, in a written protest against certain resolutions in the legislature, he declared his belief "that the institution of slavery is founded on both injustice and bad policy; but that the promulgation of abolition doctrines tends rather to increase than to abate its evils." In December, 1860, in a private letter to Alex. H. Stephens, he said, "Do the people of the south really entertain fears that a republican administration would, *directly* or *indirectly*, interfere with the slaves, or with them about their slaves? If they do, I wish to assure you, as once a friend, and still, I hope, not an enemy, that there is no cause for such fears." (Italics as in original.) Aug. 22, 1862, just a month before the promulgation of the preliminary emancipation proclamation, he wrote thus to Horace Greeley:

"My paramount object is to save the Union, and not either to save or destroy slavery. If I could save the Union without freeing any slave, I would do it: if I could save it by freeing all the slaves, I would do it: and if I could do it by freeing some and leaving others alone, I would also do that." His record in intervening years is equally consistent, and is, in truth, a representative northern record. Hating slavery *per se*, believing that "if slavery was not wrong, nothing was wrong," hating the dictatorial recklessness born of slavery, he aimed to combat both within the letter of the law, to yield to slavery the territory, and no more, which had been yielded to it at the formation of the constitution, and to maintain the character of the just man, who "sweareth to his own hurt, and changeth not." Lincoln did not destroy slavery: slavery destroyed itself. Its whole life, after 1793, was a journey toward destruction until it stung itself to death in the midst of the circle of fire which had surrounded it. (See SLAVERY.) — For the reason, mainly, that President Lincoln aimed to be the exponent only of the popular will, to confine his functions as guide and leader to efforts to influence the popular will, but to go no faster or farther than the people were ready to support him, his policy was severely criticised during his administration, and a series of intrigues against his renomination, whose inside history has not yet been fully written, marked the years 1863–4. But the honesty of intention, and the final full success of his policy can not be questioned; and these two elements are surely sufficient to justify it. — The natural greatness and kindliness of his mind and heart have taken an unchallenged place in our history. His second inaugural address, shortly before his death, is one of the finest and most magnanimous of American state papers, and its closing sentence might well serve as his epitaph: "With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle, and for his widow and his orphans, to do all which may achieve and cherish a just and lasting peace among ourselves and with all nations." — The best early life of Lincoln is that by W. A. Lamon; the best for general readers is that by J. G. Holland; the most useful for political students is that by H. J. Raymond. Besides, there is a multitude of other lives of Lincoln, memorial proceedings, sermons and eulogies, for which see Bartlett's *Literature of the Rebellion*, 234. See also authorities under articles referred to above; Carpenter's *Six Months at the White House;* Poore's *Lincoln Conspiracy Trial;* Lowell's *My Study Windows*, 150; 15 *Atlantic Monthly* and 12 *National Quarterly Review* (George Bancroft's articles); *McMillan's Magazine*, February, 1865 (Goldwin Smith's article).

ALEXANDER JOHNSTON.

LIST, AND HIS SYSTEM. Frederick List was born in Reutlingen, a free city of Suabia (Würtemberg), Aug. 6, 1789, and died at Kufstein, in the Tyrol, Nov. 30, 1846. His father, a leather dresser, intended him for his own business, but not seeing in him any inclination for it, he decided to make him a government clerk. In 1816, at the age of twenty-seven, he filled a place in one of the central government offices in Würtemberg, and had gained the confidence of M. Wangenheim, the head of the liberal cabinet. This minister having established in Tübingen a school of administrative science, gave List the chair of political economy. At the same time List, in a journal ("The Friend of the Suabian People") started in Heilbronn in 1818 by some of his friends, demanded real national representation, control of the administration, independence of the communes, freedom of the press, and trial by jury; but, shortly after, the reform ministry gave place to its opponents, and this paper was suppressed. — List states in the preface to his principal work that from this time he conceived his theory with its distinction between *cosmopolitan* political economy and *national* political economy, while at the same time he was urging the abolition of provincial duties in Germany, and the development of the industries and commerce of that country by the means used by other peoples. "But," he says, "instead of pursuing my idea by study, my practical mind urged me to put it to the test of application. I was young then (1819), and I hit on the plan of forming an association of merchants and manufacturers to obtain the abolition of the interprovincial taxes and the adoption of a common commercial system; * * the influence of this society on the formation of a compact between the enlightened and high-minded sovereigns of Bavaria and Würtemberg is well known, as also its effect on the German customs association." — (List declares himself the founder and chief agent of this association. This claim has been disputed in the *Conversations Lexicon* and the "Augsburg Gazette" of December, 1840, and elsewhere. List defended himself against those attacks in his preface, and, later, in the *Zollvereins-Blatt* of Feb. 24 and March 3, 1846. Whoever is in the right, one thing remains certain, and that is, that List was the head and soul of the association.) — At the same time List, to put an end to the petty annoyances he suffered from the government, and possessing considerable wealth, resigned his chair, and six weeks later was elected to represent the city of Reutlingen in the Würtemberg estates, but not being yet thirty his election was declared void. He was re-elected at the end of 1820. List speaks of this period as follows: "Imagination must suppose the year to be 1819 to have the explanation of my conduct. Governing class and governed, baron and burgess, politician and philosopher, the whole German world, in fact, was fabricating new plans of political regeneration. Germany was like a country laid waste by war where the old proprietors, reinstated in their rights and once more masters of their own property, were on the

eve of taking possession again. Some demanded the restoration of the former order of things with all its cumbrous antiquities and superannuated customs ; others, rational institutions and agents completely in accordance with modern ideas. Those who gave ear to wisdom and experience were in favor of an intermediate course. Everywhere societies were being formed for the furtherance of patriotic aims. One of the articles of the federal constitution (the 19th) expressly enjoined the organization of a rational commercial system. I saw in this article the foundation on which the industrial and commercial prosperity of my German fatherland might be built." — List declares that he had to fight on one side the partisans of freedom, whom he represents as forming a powerful party (a statement of which we have grave doubts), and on the other, "differences of opinion, internal dissensions and the absolute want of a theoretical base" in his own camp. (List states, also, that there was great lack of the necessary funds to carry on his agitation while the secret service money of the British government was at the disposal of the advocates of the opposition theory. It will be observed that this calumny is a sufficiently common asseveration with the protectionist school. At the end of the last century the opponents of free trade affirmed on one side of the channel that the defenders of the treaty of 1786 had sold the interests of Great Britain to France. Their comrades on the other side were equally persuaded in respect to the same treaty that the interests of France had been sold to perfidious Albion. At a later period Huskisson was accused of selling himself, Cobden also, his purchaser being, according to them, the Czar Nicholas.) But he affirms that this struggle served to advance his ideas and was the cause of his discovering (this word, somewhat an ambitious one to use of a thing already found out, is his own,) the distinction between the theory of values and that of living forces, that is to say, between wealth and its causes, also the abuse that the school (by this word List means the liberal school) makes of the word capital. — From the first day of his parliamentary life he urged upon the assembly a bill advocating the breaking down of internal barriers and the commercial union of the German states, but, the diet adjourning, his proposition was not discussed. Shortly after the session List drew up a petition which was to serve as a programme for the parliamentary opposition, and which was the cause of prosecution against him. In February, 1821, he was expelled from the diet on the motion of the ministry; suit was entered against him and he was condemned to ten months' hard labor for outraging and calumniating the government, the courts and the administration of the kingdom. How different from the treatment he received from the minister Wangenheim! List took refuge in France. Received with sympathy in Strasburg, he liked the town, and there projected several literary works; among others, a translation, with notes, of J. B. Say's "Treatise," but the political animosity of his country drove him from that retreat, then from Baden, and from canton after canton of Switzerland. Going to Paris in the beginning of 1823, to seek occupation there, Gen. Lafayette offered to take him to America with him. This proposal to emigrate pleased him, but his family and his friends dissuaded him from it. The year after, tired of a life of wandering and confident of the royal clemency, he re-entered Würtemberg, but he was imprisoned in a fortress and only set at liberty (January, 1825) on condition of leaving the country. It was then he formed the resolution of going to the United States. Accompanied by his numerous family he arrived in the summer, and hastened to join Lafayette in Philadelphia. The general received him cordially and invited him to accompany him on a really triumphal tour among the American people. It was thus that he made the acquaintance of Henry Clay and the principal public men of the young republic. — After trying several spots he resolved to settle in Pennsylvania, near Harrisburg, with the intention, at a future period, of founding a school of arts and manufactures, but a fever and other circumstances deprived him of success in making the most of a property which he had bought for a moderate sum, and he accepted an offer made him to edit a German paper in the small town of Reading. It was at this time that he published, on the question of free trade, a series of letters in English in the "National Gazette" of Philadelphia. The question was at that time being vigorously debated in the United States, and List informs us that he had then relations with a protectionist association calling itself the Pennsylvanian society for the advancement of arts and manufactures. This society entertained him, reprinted his letters, and passed a resolution inviting him formally "to compose two works, one scientific, in which the theory should be completely elucidated; the other popular, to spread it in schools." This was in 1827. But fortune turned him from this project and postponed the publication of his principal work till twelve years later. — He discovered, almost accidentally, a coal mine of rich promise, and succeeded in due course in forming a company with a capital of $750,000. The mine was successfully opened up under his direction, and in addition a railway was built in connection with it from Tamaqua to Port Clinton, which landed the produce at the Schuylkill canal. The inauguration of this railway took place in the autumn of 1831. But already List, although he had so much to bind him to America, where he had found wealth and consideration, was longing to return to Europe and Germany. It must be said also that the revolution of July, and the changes it seemed destined to make throughout Europe, had something to do with his resolve. Be that as it may, he obtained from President Jackson a mission in con-

nection with the relations between the United States and France, and the federal government at the same time nominated him to the United States consulate at Hamburg. Arriving in Paris toward the end of 1830, he wrote in the *Revue Encyclopédique* on the economic, commercial and political reforms, applicable to France; and in the *Constitutionnel* on the necessity of a new law on the exercise of the right of public domain. He did not go to Germany. "Of his own accord," says M. Richelot, "List almost immediately resigned the Hamburg consulate on learning that the emoluments of the position were needed by the then occupant of the post." Besides, his nomination quickly gave rise to a protest, instigated as he thought by Würtemberg, from the city of Hamburg, and it was not confirmed by the American senate. He returned to the United States toward the end of October, 1831, but the following year he again landed in Europe, the possessor of a fortune which rendered him independent, with the title, purely honorary, of consul at Leipzig, which put him out of the reach of fresh annoyance from the police of his native country. After spending a year in Hamburg he took up his residence in Leipzig in 1833. — Scarcely had he settled in Germany before he contributed both with pen and purse to the publication of an encyclopædia of political and economic science ("Staats-Lexicon"). He continued at the same time to popularize his favorite idea of a network of German railways which he had already developed in letters sent by him to the "Augsburg Gazette" in 1829, and which he urged with success in a pamphlet "On a system of Saxon railway lines as the basis of a German system, and particularly on the establishment of a line between Leipzig and Dresden." This pamphlet, it is said, led to the formation of a company for the construction of the last named line, to which he gave great assistance as a director. He added fuel to the movement in favor of new routes of communication by the railway journal which he published in 1835. His services, nevertheless, were but poorly recompensed; the citizens of Leipzig confined themselves to offering him for all his trouble and expense a present of $1,500. — Shortly afterward he paid a visit to his own country. His fellow-countrymen received him with open arms, but the government refused him the title of citizen, and would only regard him as a foreigner having permission to reside in the country; and this, too, after the bench of Friburg had declared his former conviction null and void. This treatment chagrined him greatly. In addition to this mortification came the proscription of his railway paper in the Austrian empire and the loss of the greater part of his fortune as the result of the financial crisis in the United States. — To restore his health, which had suffered from overwork and from his troubles, he took a trip to Paris in the spring of 1837. He had the opportunity, during this trip, of being presented to King Leopold of Belgium and to Louis Philippe; he also met Dr. Kolb with whom he renewed his former connection and who opened to him the columns of the "Augsburg Gazette"; he received, too, information of a prize offered by the academy of moral and political science, relative to the restrictions on articles of commerce. List relates that he became aware of the competition by pure chance only a fortnight before the date fixed for giving in the essays, but that he nevertheless decided to commit to writing the main idea of his system, and his composition was ranked third out of twenty-seven given in. — (The question was put thus: "When a nation resolves upon free trade or on a revision of tariff legislation, what facts must it consider, to reconcile most equitably the interests of national producers and those of the mass of consumers?" List seems to insinuate that if he was only given the third place it was because MM. Rossi, Blanqui, and the other judges of the competition were, with the exception of M. Ch. Dupin, prejudiced against him by the principles they held. "There were,' he says, after mentioning those three names, "other judges in this assembly, but were their treatises to be rummaged there would only be found ideas suited for female politicians, Parisian dandies, and other mere dabblers, and lastly paraphrases of Adam Smith's paraphrases: of original thought not a vestige, which was to be regretted." To this M. Blanqui has made answer that at that time he was not a member of the academy. As to the section of political economy, the judge of the competition, it was composed, in addition to Messrs. Rossi and Ch. Dupin, of Alexander Delaborde, Villermé and Passy, who had recently been elected in place of Prince Talleyrand.) — It was this essay, a reproduction of the ideas contained in the Philadelphia letters and amplified in the articles published in the "Quarterly Review" and the "Augsburg Gazette," which became the "National System of Political Economy." List worked there in the bosom of his family, who had rejoined him in Paris, when one of his sons, who had chosen to serve in Algeria, died of fever. Deeply affected by this loss, List turned his steps again in the direction of Germany (summer of 1840). On his return to Leipzig he contributed greatly to the adoption of the line taken by the railway from Halle to Cassel, and on that occasion the university of Jena conferred on him the degree of doctor of laws. — He chose Augsburg as his residence, and produced, in May, 1841, his work which again drew public attention to his name and procured his rehabilitation, after an audience accorded him by the king of Würtemberg. The approaching tariff congress of the zollverein for 1842 brought back the discussion between free trade and protection in Germany. Recovered from a fall in which he broke his leg, List recommenced his propagandism. He proposed to the publisher Cotta to found a special organ for economic questions in general and the system of protection in particular. It

was the *Zollvereins-Blatt*, in which till his death he developed his ideas with talent and energy.— At the same time that he was directing and in part writing this sheet, he made numerous journeys which neither benefited his own treasury nor that of the paper, the possession of which Cotta had given up to him. This consideration had caused him to reflect on the means of giving a fresh impetus to his publication, but it was in 1846 that the league and free trade triumphed in England, and he could not resist the desire to see London on that occasion. He related the impressions he received in the two houses of parliament the night on which the abolition of the corn laws was voted by the house of lords. "Dr. Bowring was my conductor, and said to me, 'Permit me to introduce to you Mr. McGregor.' A well-bred man with an intelligent look shook my hand. 'Mr. Cobden desires to make your acquaintance,' another said to me; and a man still young, with a pleasant face, stretched out his hand to me. 'You have come here, then, to be converted.' 'Yes,' answered I, 'and to ask absolution for my sins.' I remained thus a quarter of an hour bantering with my three great opponents. What political life there is in this country! Here you can see history grow."— List remained three months in London. During his stay he wrote a treatise on the advantages and conditions of an alliance between England and Germany. That was his last production. The insignificant effect it had on English statesmen to whom he had addressed it, discouraged him afresh. It must be said that if his reputation had increased, his fortune had far from kept pace with it; that he had failed to obtain an official position in Würtemberg; that the future of his family caused him great uneasiness; and that he had felt deeply the indifference, the disappointments, the hostility and the humiliations his efforts had exposed him to. His nature was vigorous, but restless, passionate, ardent and feverish, and the joys of success and the disappointments of failure had ended by sapping its vitality.— On his return from England in the autumn of 1846, his family and friends found him changed; his internal complaint had increased. In November his disease got worse. One morning he set out for Munich *en route* to Italy, and some days afterward he was found dead in the neighborhood of Kufstein where he had stopped. Before leaving the hotel he had written to Dr. Kolb a despairing letter of farewell, which foreshadowed the approach of death, and by means of which he was identified. List seems to have committed suicide in a fit of temporary insanity, but the manner of death he died has not been clearly ascertained — In reading the life of List interest is aroused in a life so active and a nature so full of courage and so well intentioned. But it must be regretted that one so bright and intelligent should have gone astray under the double influence of error and vanity, so far as to believe himself the founder of a new and natural economic doctrine, when he only dressed in the language of contemporary prejudice the superannuated theory of a system of commercial protection. List appears in four distinct characters: as a politician, as a promoter of German railways, as a promoter of the zollverein, and as a theorist on protectionist tariffs on the frontiers of the German states We have nothing to do with him as a politician, and will confine ourselves to mentioning that he strove for constitutional guarantees, for municipal freedom and decentralization at a time now deemed remote. We must admire the efforts which List made to draw the attention of Europe in general, and of his fellow-countrymen in particular, to the importance of opening up new means of communication. It would be difficult to decide in regard to this whether he really rendered such service as his partisans have claimed for him. The superiority of railroads was so marked from the first that they were built in the United States and then in England, and it is probable that the European continent would also have taken this forward step even if List's voice had never been heard; for, no one owning the ordinary roads, there could not be formed against the new means of communication any of those coalitions of interests which keep prejudice alive and are a bar to progress. — We shall not say the same of the zollverein, to the formation of which his activity, his talent and his pen were more positively necessary. We have nevertheless two remarks to make on this subject, with the view of appraising List's efforts at their proper value. We would remark, first, to those enthusiastic protectionist admirers of this father of the zollverein, as they call him, that List confined himself to asking for Germany the application of an efficacious measure carried out forty years before in France, as the result of the intelligent teaching of physiocrats; in the second place, that he was powerfully helped in his undertaking by the influence of the political ideas of those German states which rightly or wrongly saw in a customs union a preliminary step toward their administrative and national predominance. — Let us consider for a moment List's claims. List, speaking of his ideas, says in his preface: "This system, defective as it may still seem, does not rest in the least on a vague cosmopolitanism, but on the nature of things, on the lessons of history and on national wants." It will be observed that the founders of political economy also took as their basis the nature of things, historical lessons, and national wants. The starting point then of the innovator is nothing new, and what has now to be considered is, whether he has better observed than they the nature of things, or has better understood the lessons of history and the wants of nations. For our own part, there is no question about it. — List has said: "The loftiest association of individual beings actually realized is that of the state, of the nation; the highest imaginable is that of the human race. We know that an individual is much happier as one of a nation than in a condition of

isolation, similarly all nations would be much more prosperous if united by a sense of right, by perpetual peace, and by free trade. Nature little by little is bringing nations to this supreme unison by inducing them, through its differences of climate, of soil and of productions, to barter with each other; through over-population and over-abundance of capital and talents to emigrate or to found colonies. International commerce, in awakening activity and energy by the new wants which it gives rise to, and by the interchange between nations of ideas, discoveries and appliances, is one of the most powerful aids to a nation's civilization and prosperity. But as yet the union of nations through commerce is very imperfect, for it is broken, or at least imperiled by wars and the egotistical measures of this nation or of that. By war, a nation may be deprived of its independence, its possessions, its liberty, its constitution, its laws, its characteristics, in fine, of the measure of cultivation and well-being which it has already attained; it may even be enslaved. By egotistical acts on the part of foreign nations it may be impeded and retarded in its economic development. It is with communes and provinces as it is with individuals. It would be folly to maintain that commercial union is less advantageous than provincial duties to the United States, or the departments of France, and to the states of the Germanic confederation. The united kingdoms of Great Britain and Ireland afford a brilliant and decisive example of the immense results of free trade between associated peoples. It remains but to picture a similar union between all the peoples of the earth, and the liveliest imagination would fail to grasp the amount of well-being and comfort it would bring to mankind."—List admits then, and it is this portion which protectionists who study his writings are compelled to pass by in silence, that the system of free trade, which he called that of the school, is based on a correct idea, an idea which science must admit and work out, that it may fulfill its vocation, which is that of clearing the way for its practical application; and an idea which practice can not ignore without going astray. List, however, finds two faults with the partisans of free trade: first, with not taking into account nationalities, their interests and the conditions peculiar to them; and secondly, with wishing to conciliate nations with the chimera of universal union and peace; and it is here that through sophism and confusion he has missed his proper logical conclusion, and poses as the discoverer of a system which rests on but frail foundations. Thus, he accuses "the school" of confounding cause and effect, of presupposing the existence of the association of international peace, and thus of concluding in favor of free trade. "Peace exists," he says, "between provinces and states already associated, and from this association comes their commercial union. If, on the contrary, associated states begin with a commercial union, free trade would give birth to the enslavement of nations." List starts manifestly with a subtlety: facility of exchange necessarily brings with it international peace; and it could not be admitted that the one is exclusively the cause, and the other exclusively the effect. On the other hand, admitting the truth of List's rule, it follows that free trade ought to be established between nations which are at peace. — The theory of nationality which List is forced to appeal to to cover the flaws in his logic, while proclaiming free trade between the German states, is a perfect snare; for it is a question incapable of solution to decide what is a German state. In the last analysis List wished to limit German nationality by the line of custom houses; but to begin with, where shall this line stop? That, neither he nor any one else can tell. In the second place, this means of "nationalification," to coin a word, is only legitimate when it increases the wealth of the nation. Then comes the question, is free trade or protection the best for increasing a nation's wealth? a question which is the subject of several articles in this work. List in this matter finds himself in a serious dilemma, so completely is the thesis he undertakes to support at variance with that which he made use of to defend the formation of the zollverein and the suppression of internal duties, and which causes him to cite as an example of beneficial federation the union of Ireland with England and Scotland, while the fanatics of the exclusive system attribute to that union the distress of Ireland, which in reality arises from quite different causes, well understood at the present day. — In addition to the supposed difference between liberal economy, which he calls cosmopolitan, and his system which he calls political economy, List believes himself to have made another great discovery, that of the theory of exchangeable values and productive forces. By exchangeable values he means products, wealth; by productive forces, the causes of wealth, the means of labor, industry. He is pleased to say that economists had confounded all these before his day, and on this account to reproach the economic school; he reproaches it, for instance, with having limited its researches to material wealth, and with having failed to appreciate the importance to a nation of means of improving the physical and intellectual instruments of its labor. It is very evident that if List had been a professor of political economy for more than the one year, and if he had consequently had an opportunity of learning something of it, he would have seen that his invention was no invention at all. — He also makes pretensions to having had new ideas on the division of labor, ideas which had escaped the notice of Adam Smith, and this is the conclusion to which he comes: "International division of labor, as well as national, depends greatly on climate and nature. All countries are not suited for the production of tea as China is, of spices as Java, of cotton as Louisiana, of wheat, wool, fruits and manufactures as are the countries of the temperate zone.

A nation would be devoid of reason to wish to obtain by a national division of labor, or by indigenous production, articles for the production of which it is unsuited by nature, and which international division of labor or foreign commerce can procure for it, of better quality and at a low price; but it would betray a want of culture or of activity if it did not use all the means at its disposal to satisfy its own wants, and to procure by a surplus of production what nature has refused to its own soil." Truly this is new indeed! — The idea of nationality, the theory of productive forces, and that of division of labor, are the bases of the book. It seems then to us that we have said sufficient to expose the absurdity of Dr. List's pretensions to be the founder of a new and national system of political economy. His so-called theory is only an ill-compounded amalgam of protectionist ideas on the subjects of politics and economy; and he is not absolutely faithful to it himself, for he declares positively that free trade is the polar star which should guide nations, for it counsels the freedom from taxation of the natural products of the soil and of raw materials; while with regard to manufactured articles, it advocates the gradual extension of the zollverein, that is to say, the widening of the circle of liberty. It is then only by adopting numerous precautions and reservations that the prohibitory and protectionist school can make use of the so-called national system of political economy, and, all things considered, Dr. List is rather an adversary than a partisan of protection, as it is understood in our time. JOSEPH GARNIER.

LITERATURE. It is very easy to understand that literature must have exercised a powerful influence over the course of historical events, but, on the other hand, it is very difficult to explain in a few pages the nature and extent of this influence. Such a question, if put in a general way, carries with it its own answer. Every one will reply in the affirmative by the force of natural instinct alone, which comprehends at a glance all evident truths, and hesitates only before doubtful truths or the subtleties of the spirit of system. No argument is needed to perceive at a glance that the works of human genius must have exercised an influence over the acts of the human race. But how shall we explain and summarize the history of this influence? Such a subject would require, not an article, but an entire treatise, for the forms of this influence have varied immensely according to nations, civilizations and centuries. Besides, this word literature is a synthetic, generic word, which represents, not one single product of human intelligence, but a host of very different and opposite products. The influence exerted by one kind of literature is entirely different from that exerted by another, and to confine ourselves to the most general divisions of literary works that may be given, it is clear that the action of prose is as diametrically contrary to that of poetry, as preservation is contrary to revolution, and as the past is to the present. There are peoples among whom this action of literature appears from the very beginning of their history and continues ever increasing; there are others, however, among whom it did not appear until very late, and when the greater part of their history was already passed. Finally, as a last difficulty, the illustrious men who impersonate this action of literature are nothing more than the runners of whom Lucretius speaks, who pass the torch of life from hand to hand, consequently when, in order to simplify the question, we wish to consider a given period, we very soon perceive that each one of these illustrious men has ancestors, and that the influence of literature in such or such a century can not be explained without recourse to preceding centuries. Thus we find ourselves confronted by a series of successive relations, which leads us from one effect to another up to a first cause of unknown date and name, which is simply the first man that thought. We are therefore compelled to confine ourselves to certain important generalities. — This influence of literature has always existed, but it was not until almost our own time that it became all-powerful. Literature did not begin to be a real agent distinct from the other great moral agents of humanity until the discovery of the art of printing; and the sixteenth century, which is so near our own time, is the heroic age of this new agent. Until then, with some striking exceptions, literature had always preserved the imprint of its origin. In the old priestly and warlike civilizations literature had been, we might say, everything; but if it was everything it was also nothing. It was the hymn which the priests taught the multitude, the song of war or triumph which celebrated the glory of battle, the prophetic canticle which revealed to man the secret of his destiny and of the destinies of his race; but the enthusiasm, the fervor and the courage which it inspired were not its own. It was not it that spoke, it was religion, party feeling, warlike ardor; in a word, all the great moral agents that have served as guides for mankind and with which it was confounded. It was the voice and the word of divine power, but this word was intimately united to this power, and was not incarnated in a distinct personality in such a manner that we may say of literature, as we say of the mystery of the Christian Word, that it was from the beginning of the world, but was not revealed to men until an appointed hour. — In classical antiquity, that is, in Greece and Rome, the mystery was accomplished, the word became flesh and assumed a distinct personality. Literature, liberated from its divine cradle, begins a profane life outside the sanctuary; the sage is distinct from the priest, the poet is distinct from the prophet, the historian is distinct from the man of war and action. As centuries advance, this individuality becomes all the more positive and pronounced. In Greece the literature of the great epoch is limited to the heroic inspiration of the poems of Homer, and

still retains in its liberty something of the sacerdotal and the sacred; but in Rome this character disappears entirely, and we find nothing of it except in the memory of lost works belonging to the semi-fabulous epochs. There the poet, the historian and the sage are as completely free from all sacerdotal influence as they are in our modern civilization. They are mere individuals dependent on themselves alone, upon their own consciences, who in virtue of this inspiration and of this conscience, assume the right to judge the actions of their contemporaries, and to insist upon their decisions to the best of their ability. Here we find the modern man of letters; literature has now put on the form which it is to wear henceforth. It was in Rome and not in Greece that literature assumed the final character, in which we recognize it to-day, and in which men will continue to recognize it to the end of time, It was in Rome alone that it donned its profane *lay* garb, and, of its own authority, constituted itself sovereign and judge. — Under this two-fold title literature has rendered very great services to humanity, and even to-day we, the latest born, live in part upon its benefits. Its influence, however, was much more intellectual than political. It exercised its power over individuals rather than over the general order of things; characters and minds owed it much, but facts owed it little. On the other hand, this action, although so very limited, exerted over individuals an empire which it has never entirely regained. Literature afterward made its way among the masses, but it never succeeded in exercising the same influence over each individual. The opinion which came to a man through it impressed and imposed itself upon his entire being, while now-a-days our opinions can very easily be distinct from our persons. In ancient times, every stoic was a stoic, every epicurean an epicurean, every peripatetic a peripatetic, mind and morals, heart and soul; his creed was shown in his manner of eating and of saluting a friend, in his manner of understanding and supporting life, in his manner of enjoying its benefits and of contending against its ills. — A new moral force, the greatest which the world had ever known, Christianity, undertook to exert over the masses the beneficent influence which ancient literature had been powerless to make them feel. Then began the period of the middle ages, during which literature recommenced its entire history, or, to speak more correctly, continued it by recommencing it, for no matter what may be said to the contrary, there was not during this entire period any break in the continuous progress of the human mind. Literature lived over again during this epoch the two existences of its past history, not successively, but simultaneously. It was sacerdotal and warlike, and at the same time lay and profane. It mingled with religion and the distinction of castes, while preserving its individuality. The peculiarity of the middle ages, and what constitutes its originality in our eyes and gives its poetic form, is precisely this juxtaposition, nearly always inconceivable and sometimes contrary to the nature of all past forms, from those of the rudest civilization to those of the most refined society. It is not the elements of which the middle ages were composed that are new, but the union of these elements. Literature possessed simultaneously during this period the two characteristics which it had possessed successively in ancient times. — In the fifteenth century, literature recovered its true form, and was enabled to renew the glorious history it had already had in Greece and in ancient Italy. But how powerful soever the movement of the renaissance, it is doubtful whether it would have been sufficient to give to literature the decisive influence which it has acquired in modern times, if the chance of an unforeseen discovery had not come to the aid of the human mind. It is more than likely, in fact, that, without printing, the movement of the renaissance would have resulted only in a repetition of the literary history of Greece and Rome. The influence of literature would as formerly have been felt only by individuals; it would have made the same slow progress as during former centuries. Printing gave it wings. By its means the light of the renaissance was communicated from the people who were the natural heirs of Greece and Rome to the people of the rest of Europe who were still semi-barbarians, by its means the reformation was rendered possible, by its means the reign of *spoken* language and oral tradition was destroyed. By placing before men's eyes the documents of their religious history, it inaugurated the reign of individual religion, and made each man judge and critic of his faith. Until then, man had been taught directly by man, oral instruction had been supreme; printing rendered this direct material communication of man to man useless, and destroyed the power which was necessarily dependent upon spoken thought. Mute signs, which can be multiplied indefinitely, henceforth made the thought of each individual the common property of all men. Then the complexion of everything was changed. Education was no longer at the mercy of chance or favor; any one who desired could obtain it. It is no longer necessary to undertake long journeys to listen to the words of some renowned master; his words, stripped of their material clothing, come in search of us. Hitherto man had but one master, and was in consequence obliged to believe in him blindly; henceforth he is to have a great number, whom he may compare one with another, and be free to choose between them. At the same time that it gives to thought the rapidity of lightning, printing creates equality and emulation in the kingdom of mind. It makes the disciple equal to his master by the faculty which it gives man of choosing and judging between those who offer to teach him; it creates emulation among wise and learned men by obliging them to solicit the favor of the public in order to be heard. Parliamentary rule is thus

inaugurated in the dominion of thought, ideas are accepted or rejected by a sort of universal suffrage, and the kingdom of letters which, previous to the discovery of the art of printing, was a veritable monarchy, may now justly bear the name of a republic —It is a republic in every sense, for, since the renaissance, literature has depended only on itself, and has rid itself of all the influences that weighed it down It has at length obtained the glorious personality which we have seen it so energetically and so gloriously striving for in Greece and Rome. The man of genius is no longer obliged to shelter himself behind any other authority than that of his conscience; he need no longer style himself the envoy of God, or justify his inspiration by claiming for it a heavenly origin; he asserts as a natural law that he possesses a power over his fellow-men, which no one can prevent him from exercising. No man who has anything to say has any further need of investiture in order to speak; he need consult no counselors but his conscience and his heart. Public opinion is become a sort of throne constantly offered to the usurpation of human genius. But three centuries have elapsed since this grand movement began, and it has within this short space of time remodeled everything—manners, government, laws, the sciences, interests. It has put man in possession of himself by revealing to him the true idea of humanity; it has reduced government to merely the first of social functions; it has changed the nature of laws, and from decrees imposed by a mystic authority has made them obligations voluntarily assented to.—The culminating period of this grand movement was, as is well known, the eighteenth century. It was then that, for the first time in all the states of Europe, simple individuals were seen setting themselves up as censors of established laws and institutions, and presenting themselves to the people as the true representatives of moral authority, justice and reason. The astonishing feature in this, and what at the same time serves to show the progress made since the renaissance, is, that these pretensions did not shock or astonish any one. It seemed perfectly natural that Voltaire, Montesquieu and Rousseau should argue against the official representatives of the church and the state. Princes listened with docility to the teachings of philosophers, and in order to satisfy their wishes, themselves undertook to overturn the ancient institutions of their states. In Spain, Portugal, Tuscany, Naples, France and Austria, statesmen and princes governed in accordance with the principles which had lately come into favor, with the opinions of philosophers, and in such a manner as gained for them the applause and congratulations of these new kings, whose mere ministers and agents they were for more than fifty years. The end of this great literary and philosophic movement is well known; the event which was its final result is known by the memorable and terrible name of the French revolution. —To sum up, we may say that modern civilization, taken in its entirety, is the offspring of literature, for literature was the principal cause of the three great events which transformed the whole face of European society: the renaissance, the reformation, and the French revolution. Of these three events, two are the legitimate and immediate offspring of literature, the renaissance and the French revolution. The third, the reformation, had another parentage, and was only the adopted child of literature, but we may say that, without this adoption, the child could never have lived. Besides these three great facts, I see but one other, though it is quite an important one, it is true, and runs through the entire political history of the last three centuries: it is the substitution of the monarchical for the feudal form of government. This great fact, whose origin dates much farther back than the sixteenth century, is not, it is true, the offspring of literature, but literature, however, aided it with all its power, and was its most faithful ally. The most zealous partisans of monarchy, the wisest counselors of royalty, are to be found among the men most intimately connected with the renaissance. Thus, even facts, which do not result directly from the influence of literature, still owe their destiny and fortune in part to this influence, and consequently we may say that the political history of modern times is merely their literary history transformed and enlarged.

EMILE MONTÉGUT.

LOBBY—literally, a covered passage or waiting-room—is in politics applied to the passages, or ante-rooms, surrounding a hall of legislation. Hence, by metonymy, the word has come to mean the men who frequent such places to influence legislatures or their members in the interest of certain measures. This application of the word lobby is almost wholly American. The word itself is ancient, and defined in Bullokar's "Eng. Expositor," 1616, as "a gallery." In England, the lobby of the house of commons is the passage immediately outside the hall, into which the members retire on either side of the house to vote on a division. The ayes go out first, being counted as they pass into the lobby, but no record of individual votes is kept, as is the practice in American legislatures. In a speech by Col. Titus on the exclusion bill in parliament, Jan. 7, 1681, he said, "to trust expedients with such a king on the throne would be just as wise as if there were a lion in the lobby, and we should vote to let him in and chain him, instead of fastening the door to keep him out." This is paraphrased by Bramston in the oft-quoted lines:

> "But Titus said, with his uncommon sense,
> When the exclusion bill was in suspense:
> 'I hear a lion in the lobby roar:
> Say, Mr. Speaker, shall we shut the door
> And keep him there, or shall we let him in,
> To try if we can turn him out again?'"

—British political history is sufficiently full of examples of lobby influence. In Queen Elizabeth's

time a speaker of the house of commons, Sir John Trevor, was bribed by rich merchants to exert his influence in parliament in behalf of certain favors to the municipality of London. It was Sir Robert Walpole who originated the axiom, "Every man has his price." In the memorable railway excitement in England, thirty years ago, the railway lobby, by their combinations and cunning employment of the tide of public opinion, wielded a formidable power in parliament. Railway directors openly boasted of the number of votes they could command in the house of commons. Opposition lines were gotten up mainly to be bought off. Many instances are recorded of railway bills costing from £80,000 to £450,000 to get passed. It was these and other scandals which led to the adoption of the present stringent rule of the house of commons, which provides that every private bill or petition must be in charge of some known and recognized parliamentary agent. No person is allowed to act as a parliamentary agent without subscribing an obligation to observe and obey the rules and orders of the house of commons. He must give a bond in the sum of £500, and be registered, besides having a certificate of his respectability from a member of parliament or member of the bar. Any parliamentary agent who misconducts himself in prosecuting any claim or proceeding before parliament is suspended or prohibited by the speaker from practicing. No written or printed statement is permitted to be circulated in the house of commons without the name of a parliamentary agent attached, who will hold himself responsible for its accuracy.—While there is no reason to doubt that what is known as the lobby has existed in one or another form in the legislative history of all free governments, it is certain that the organization and the power of this indefinite influence in political life has often been grossly exaggerated. In times of partisan excitement, when the advocates and opponents of any measure before the legislative body are full of zeal, wild stories are spread abroad through the press, connecting the names of public men with allegations of bribery and corruption. These stories are in the majority of cases utterly unfounded, and yet are as industriously circulated, to meet a real or fancied public appetite for scandal, as if there were no law of libel in existence. Probably there is no public man of any notoriety in our political history who has not at some time been charged with acting or voting under the influence of the lobby.—What is known as lobbying by no means implies in all cases the use of money to affect legislation. This corruption is frequently wholly absent in cases where the lobby is most industrious, numerous, persistent and successful. A measure which it is desired to pass into law, for the benefit of certain interests represented, may be urged upon members of the legislative body in every form of influence except the pecuniary one. By casual interviews, by informal conversation, by formal presentation of facts and arguments, by printed appeals in pamphlet form, by newspaper communications and leading articles, by personal introductions from or through men of supposed influence, by dinners, receptions and other entertainments, by the arts of social life, and the charms of feminine attraction, the public man is beset to look favorably upon the measure which interested parties seek to have enacted. It continually happens that new measures or modifications of old ones are agitated in which vast pecuniary interests are involved. The power of the law, which when faithfully administered is supreme, may make or unmake the fortunes of innumerable corporations, business firms or individuals. Changes in the tariff duties, in the internal revenue taxes, in the banking system, in the mining statutes, in the land laws, in the extension of patents, in the increase of pensions, in the regulation of mail contracts, in the currency of the country, or proposed appropriations for steamship subsidies, for railway legislation, for war damages, and for experiments in multitudes of other fields of legislation equally or more important, come before congress. It is inevitable that each class of interests liable to be affected should seek its own advantage in the result. When this is done legitimately, by presentation and proof of facts, by testimony, by arguments, by printed or personal appeals to the reason and sense of justice of members, there can be no objection to it. What the legislator most needs is light upon every subject that can come before him; and whatever contributes to his knowledge of the numerous and complicated subjects with which he has to deal, and of which he must often be profoundly ignorant, is of value. The only danger to the legislator lies in hearing only *ex parte* evidence, or in giving credence to the too zealous representations of interested parties, while neglecting to inform himself of the facts upon the other side. — It may be said that there are two well-defined classes of lobbyists. The first consists of that great, selfish, unorganized, greedy and rapacious class, known as "strikers," who are ever ready to trade upon the necessities of claimants, or the fears and hopes of the ignorant, to barter a pretended control of votes for money, and to charge a high price for influence which they do not possess. These men are the harpies and vultures of politics, whose frauds and impudent pretensions have often needlessly involved, not only the legislative body, but all who have sought to be heard before it, in public opprobrium. Men capable of bribing others are always ready themselves to be bribed. The genuine political striker will take anybody's money, whether it is earned or not. If the matter which he professes to be able to carry fails, as it generally does, he hides his own malfeasance under the cry of corruption, raised against other men who have defeated him. Pretending to deal in the votes of members to whom he is not even known, he lures on the ignorant or unwary seeker after "influence," till he has gobbled his profit, sometimes doing a large and

lucrative business on fictitious capital, while his real stock in trade consists only in unfaltering impudence and a colossal power of lying. — The other class of lobbyists are of quite another order. They pride themselves upon being men of honor, superior to the petty arts, chicaneries and falsehoods employed by other men. Their endeavors to influence legislation are open and above-board. They seek to organize a public opinion favorable to their measures, by the industrious collection and publication of facts, the distribution of documents, and the taking of testimony before committees. Their eminent respectability secures for them the acquaintance and often the familiar confidence of legislators. Reputable men in every department of life frequently endeavor to influence legislation, even in matters in which they have no pecuniary interest whatever. That such men should be called "lobbyists," or that their presentation of facts and arguments to members of the legislative body should be stigmatized as lobbying, in an invidious sense, would be palpably unjust. Equally unjust would it be to charge a whole legislature with corruption, because individuals have been bribed, or because (as is more frequent) a herd of importunate suitors dog their footsteps in their daily walks, to promote selfish and private interests. — Much has been said and written concerning the Washington lobby, and the existence of a powerful organized body has been assumed as successfully endeavoring to control our national legislation. Numerous as are the men whose casual employment may justify the application to them of the term lobbyist, the power and influence of the congressional lobby has been greatly overrated. Congress is not a body of venal reprobates ready to be corrupted, but a body fairly representing the average intelligence and morality of the people. Bad legislation, of which we have more than enough, is the fruit of ignorance, not of corruption. It is a notable fact that no lobby scheme can be successful unless supported by a strong outside public sentiment. The press has vastly more power than the lobby, and when controlled in the interest of designing men, it is far more to be feared. Yet lobbying in the interest of private schemes of gain has always existed, and will always exist, while human nature remains what it is. There is no such thing as one organized lobby, but every session of congress witnesses many separate and unorganized attempts to influence legislation, sometimes by individuals, sometimes by associated action. Thus, we have the lobbyist with private claims in charge, whether his own or those of other men. We have pension lobbyists, tariff lobbyists, steamship subsidy lobbyists, railroad lobbyists, Indian ring lobbyists, patent lobbyists, river and harbor lobbyists, mining lobbyists, bank lobbyists, mail contract lobbyists, war-damages lobbyists, back-pay and bounty lobbyists, isthmus canal lobbyists, public building lobbyists, state claims lobbyists, cotton tax lobbyists, and French spoliations lobbyists. Of the office-seeking lobbyists at Washington it may be said that their name is legion. There are even artist lobbyists, bent upon wheedling congress into buying bad paintings and worse sculptures, and too frequently with success. At times in our history there has been a British lobby, with the most genteel accompaniments, devoted to watching legislation affecting the great importing and shipping interests. We have even had a French lobby, more than once, since M. Genet undertook to influence American opinion against the neutrality policy of Washington in 1793. There was what was called a Danish lobby in 1868, having as an objective point Mr. Seward's treaty for the purchase of Denmark's West Indies: but no money was used, save for writing and printing, as all concerned had the sense to perceive that money must fail to secure the enactment of any measure distasteful to congress or unpopular with the people. A little farther back, enormous stories were told of a Russian lobby; how that only $5,000,000 out of the $7,200,000 paid for the purchase of Alaska ever reached Russia. The facts were, that not a dollar was paid to a congressman, but $27,000 was invested in skillful attorneys, and $3,000 paid to one Washington newspaper, while the $2,170,000 was expended by the Russian minister, under instructions from his government, in munitions of war and machinery. In the case of President Johnson's trial by impeachment, in 1868, there was an extensive lobby operating back and forth between Washington and New York, and early knowledge of the unexpected acquittal was traded upon by men outside of congress, but the managers found no evidence whatever that any senator received money for his vote. During the Kansas excitement, in Buchanan's administration, there were two powerful lobbies which struck hands to put two distasteful measures through congress: the Lecompton constitution bill (an administration measure), and the Chaffee India-rubber extension patent, which kept a band of lobbyists in pay at Washington for two years. Both measures failed, though more than $100,000 was spent, and the testimony before the Covode committee of investigation failed to show corruption in a single member of congress. In the case of the Pacific mail steamship subsidy lobby, in 1872, more than $800,000 was expended, of which $300,000 went to an ex-congressman, and remained entirely unaccounted for, and the remainder was divided among lobbyists, journalists and obscure employés for supposed influence in the house or senate. The subsidy, which was passed, was for the annual sum of $500,000, but the grant was repealed two years later, and the ways and means committee reported, on investigation, that no money was found to have been paid to any member of congress. In the Crédit Mobilier scandal of 1868 there was no lobby, but a member of congress sold to a few fellow-members the stock of a railway construction company paying large dividends, on the plea that he "wanted to place

the stock where it would do the most good," meaning to the Union Pacific railroad, a beneficiary of congress, in which he was himself largely interested. Resolutions of censure were adopted by the house in this case. — The earliest instance of lobbying in the history of congress was the case of Robert Randall, in 1795, who combined with Whitney and others to procure from congress a grant of western lands to the amount of twenty million acres, for a merely nominal sum. Four representatives were approached and offered shares in the ring if they would favor the scheme. One member was offered money in hand. Randall claimed to have secured thirty or forty members of the house and a majority of the senate, but subsequently admitted the utter falsity of this pretension. Before the bill was offered he was exposed, through the members whom he had approached, arrested by order of the house, reprimanded by the speaker, and discharged after two weeks imprisonment. — The case of John Anderson, in 1818, was an offer of $500 to the chairman of the committee on claims, "for extra trouble in making a report." The offer was in writing, and was immediately laid before the house by the member, with a motion for the arrest of the culprit, who was imprisoned and publicly reprimanded at the bar of the house. The cases of O. B. Matteson and W. A. Gilbert, congressmen from New York in 1857, were instances of corrupt lobbying on a large scale. The report of a committee of the house, by Henry Winter Davis, chairman, declared Gilbert to have cast his vote on the Iowa land bill for a corrupt consideration, consisting of seven square miles of land and some stock given to him. It also charged him with agreement to procure the passage of a resolution for purchase by congress of certain books, on condition that he should receive a certain sum out of the appropriation. Matteson was proven to have incited parties interested in the Des Moines land grant to use a large sum of money and interest in railroad stock corruptly, to procure the passage of the grant through the house. After long and acrimonious debate, during which J. W. Simonton, a journalist, was imprisoned for refusing to disclose the names of corruptible members, resolutions to expel both Matteson and Gilbert were reported and would have passed, but both members forestalled the vote by resigning their seats. — There is no lack of legal penalties to deter lobbyists from making corrupt approaches to members of congress. By section 5450 of the revised statutes, every person who promises, gives, or procures to be offered, any money or value to any member with intent to influence his vote or decision on any matter pending in congress, shall be punished by fine, and imprisonment not exceeding three years. The same penalties are provided for any member of congress who asks or receives any valuable consideration to influence his vote or decision on any matter of legislation; to which is added forfeiture of his office as a member, and permanent disqualification to hold any office of honor, trust or profit under the United States. The true remedy, however, and the only safeguard against the corruptions of the lobby, is to elect to congress none but tried and approved citizens, who have shown themselves worthy of the confidence of the public. (See LEGISLATION.) A. R. SPOFFORD.

LOCAL TAXATION. (See TAXATION, NATIONAL AND LOCAL.)

LOCO-FOCO (in U. S. HISTORY), the radical faction, 1835–7, of the democratic party, properly of New York, though the name was afterward made national. — The early system of bank charters in New York, without any general law, but by special legislation for each case, gave wide room for favoritism, partisanship and open fraud. In 1798–1800 there were but three banks in the state, at Albany, Hudson and New York city, and the latter was entirely controlled by the federalists, who, it was alleged, refused to accommodate their political opponents. Burr contrived to secure from the legislature in 1799 an act "for supplying the city of New York with pure and wholesome water," one clause of which authorized the company to employ its surplus capital "in any way not inconsistent with the laws and constitution of the United States, or of the state of New York." Under this innocent provision a democratic bank was afterward established. As soon as the democrats gained control of the state, in 1800–1, they, in their turn, chartered party banks; and open corruption in the grant of charters went so far that in 1812 the governor prorogued the legislature from March 27 until May 21, in order to prevent the open purchase of the charter of the bank of America from the legislature. In 1821 the new constitution of the state required a two-thirds vote of both houses to charter a moneyed institution; but this, by increasing the amount of purchase necessary, made the grant of new charters in 1825 still more scandalous. All the difficulty was due to the vicious principle of incorporating companies by special legislation. — In 1834–5, when it had become apparent that the bank of the United States would not be rechartered (see BANK CONTROVERSIES, III.), a mania for new banks in New York revived the former scandals; and the opposition which should have been confined to the *system* of incorporation was at first extended to the corporations themselves. Through the summer of 1835 an organization was effected of democrats in New York city opposed to the banks: their original demand was that no special privileges should be given by charter to any corporation, and they assumed the name of the "equal rights party." October 29, 1835, at a meeting called at Tammany hall to act on the report of their nominating committee, the regular or Tammany democrats attempted to seize control of it, entering by the back stairs as the equal rights men came

up the front. Both parties tumultuously elected chairmen; but the Tammany men, finding their opponents too strong for them, turned out the gas and retired. The equal rights men instantly produced candles and "loco-foco" matches, relighted the hall temporarily, and concluded their work. From this circumstance the whig and the regular democratic newspapers invented the nickname of the loco-foco party, which clung to the new faction, and afterward to the whole democratic party, for some ten years. — In January, 1836, the loco-foco county convention adopted a platform, or "declaration of rights"; it declared that the rightful scope of legislation was only to declare and enforce the natural rights of individuals, that no legislature had the right to exempt corporations, by charter, from trial by jury or from the operation of any law, or to grant them special privileges; that charters were subject to repeal; and that paper money in any form was a vicious circulating medium. The party was steadily beaten in city elections, but its vote increased so far that in September, 1836, it held a state convention at Utica, and nominated candidates for governor and lieutenant governor. These were also defeated, but the party's vote showed no signs of a falling off, and in September, 1837, another convention was held at Utica. This body framed and proposed for general discussion a new constitution for the state, one of whose features was an elective judiciary. — President Van Buren's message, Sept. 4, 1837, at the opening of the "panic session," brought the loco-foco element back to its original party, for, as Hammond exactly states the case, "if it did not place the president in an attitude of war against the banks, it placed the banks in a belligerent attitude against him." The message, in its condemnation of the employment of corporations for purposes which might be obtained by private association, in its opinion in favor of gold and silver as the only government money, and in its declaration that the government revenues ought not to be deposited in state banks, enabled the loco-focos to regard Van Buren as their own leader. They were already prepared to do so by the course of some of the whigs in accepting loco-foco nominations, but acting with the whigs when elected. From this time they were a part of the democratic party, but their continuing influence was apparent, 1, in the passage of the safety fund banking law of April 13, 1838 (see NEW YORK, under BANKING), and 2, in the state constitution of 1846, with its elective judiciary, and its prohibition of bank charters, except by general laws. But from 1837 until the slavery question began to take shape, in 1846–7, the whig speakers and journals were careful to give the name loco-foco to the national party of their opponents, as if to imply their general opposition to the moneyed interests of the country, and to tranfer to them the general charges of agrarianism, "Fanny Wright-ism," and revolutionary designs which had at first been leveled at the loco-focos by both the regular democrats and the whigs. (See BANK CONTROVERSIES; INDEPENDENT TREASURY; VAN BUREN, MARTIN; DEMOCRATIC PARTY, IV.) — See 2 Hammond's *Political History of New York*, 489; Byrdsell's *History of the Loco-Foco, or Equal Rights, Party;* 2 von Holst's *United States*, 396; Jenkins' *Governors of New York*, 591; 2 *Statesman's Manual* (edit. 1849), 1058 (the anti-bank portion of Van Buren's message).

ALEXANDER JOHNSTON.

LOG ROLLING. (See PARLIAMENTARY LAW.)

LOOSE CONSTRUCTION. (See CONSTRUCTION.)

LOTTERY is a game of chance whose origin dates back to the time of ancient Rome. Contrived first as a means of amusement for the people, it was gradually introduced into their customs, then into their laws; individuals used it as a means of speculation, governments as a fiscal resource; and lotteries figure even to-day in the budget of a great many states. — The lotteries organized under the Roman emperors after the manner of those which date from the saturnalia, belong to the system of largesses and amusements by which Augustus and his successors controlled the people of Rome. They were the complement of the representations of the circus, and constituted one of the expenses to be paid from the public treasury. From Rome the use of lotteries extended to the cities of Italy and into distant colonies. The eagerness with which the passion for play responded to this at first innocent appeal, suggested to speculators the idea of establishing lotteries on their own account, trusting to the popular cupidity for their support. Thus lotteries outlived the Roman empire and multiplied in Italy, especially in Venice, Genoa and Pisa, where commerce had, in the middle ages, accumulated great wealth, developed luxury, and cultivated an over-great love for gain. — Lotteries were imported from Italy into France and Germany in the sixteenth century. The instance is cited of a lottery authorized by Francis I. in 1539, to help to defray the expenses of war. Under the following reigns, parliament endeavored to resist them, by addressing remonstrances to the sovereigns, and refusing to record the letters patent which authorized private lotteries. But Mazarin carefully refrained from forbidding the amusement of gaming. The lottery was therefore in great favor in the time of Louis XIII. Finally, under Louis XIV. it was definitely adopted and sanctioned by an edict in the year 1700. "His majesty having noticed the natural inclination of his subjects to risk their money in private lotteries, * * and desiring to afford them an agreeable and easy means of procuring for themselves a sure and considerable revenue for the remainder of their lives, and even of enriching their families, by risking sums so small that they can not cause them any incon-

venience, has judged it opportune to establish at the *Hôtel de Ville* at Paris a royal lottery, with prizes to the amount of ten million francs." France was then involved in negotiations concerning the Spanish succession; it was necessary to prepare for new wars and to husband the country's resources which could not be increased in the way of regular taxes already completely drained by the lamentable expedients of the minister Pontchartrain. It was not, therefore, to gratify the natural inclination of his subjects that Louis XIV. established a lottery, it was merely an expedient of the depleted treasury; and it is amusing to observe with what arguments, as false as they are contemptible, the absolute monarch endeavors to justify the edict of 1700.—After this kind of approval, how could private lotteries, which pretended, after the example of the royal lottery, to offer to good fathers of families an agreeable and easy means of enriching their children, be forbidden? Speculators set vigorously to work, and lotteries were multiplied under every pretext, sometimes for the erection of buildings of public utility, sometimes for the endowment of pious foundations or for the erection of churches. The church of St. Sulpice, in Paris, was built in part from the proceeds of a lottery. This manner of investing money "by intrusting it to chance" had become so popular that it was with the greatest difficulty the government resisted the temptation to establish lotteries itself. If honest Turgot refused to introduce this new item of revenue into his financial plan, his successor Clugny was less scrupulous, and, June 30, 1776, the *royal lottery* was created, to replace all private lotteries. The state thus assumed the privilege of allowing tax payers to play; a privilege as productive for the state as it was ruinous for the people, for it is estimated that during the last years of the reign of Louis XIV. it brought into the treasury a revenue of from ten to twelve millions. — By a law of the 22d *brumaire* of the year II. of the republic (Nov. 12, 1793), the convention abolished the lottery of France "as an invention of despotism to make men silent about their misery, by enticing them on with a hope which aggravates their distress." This suppression lasted but a short time. Four months later a law of the 29th *germinal* of the year II. (April 18, 1794) established the lottery of the *Biens Nationaux*, and finally, by a decree of the 9th *vendémiaire* of the year VI. (Oct. 1, 1797), the directory re-established the lottery on its ancient basis. Governments are like individuals: the want of money demoralizes them. The lottery offered a revenue so sure and convenient that the republicans of the convention, who had exhausted their fiscal resources, began to repent of the laudable inspiration that had induced them to renounce it, and it was again given a place on the budget, of which it was finally deprived only by the law of April 21, 1832, which was promulgated by the government of July. In virtue of this law the royal lottery was suppressed from Jan. 1, 1836, and the same year (1836) a second law, under date of May 21, prohibited private lotteries, which were already beginning to succeed to the inheritance left vacant by the recent suppression of the royal lottery, and which would doubtless have continued much more relentlessly the work of demoralization of which the state would no longer accept either the responsibility or the profits. Lotteries of personal property, the products of which were to be applied to works of charity or to the encouragement of the arts, were excepted from the operation of this law, though subjected to various conditions enumerated later on in the ordinance of May 29, 1844. — Lotteries were interdicted in England by a statute enacted during the reign of George II., and suppressed in Belgium in 1830, but were maintained in most of the countries of Germany, in Holland, Spain and Italy. But, in the course of the discussions which the French legislation provoked, discussions which, as we have already seen, ended in prohibition, we may say that this tax (for it was a tax, and the lottery appears in the budgets under this title) was condemned in principle, and that it will, sooner or later, disappear from all the countries where it still exists — "The legislators who sanction such a tax," says J. B. Say, "vote a certain number of thefts and suicides every year: there is no pretext of expense that can justify provocation to crime." This anathema so energetically pronounced in the name of political economy, is but the echo of moral sentiment. The lottery is nothing else than a gambling house. Now, would any one believe that the state could become the partner of gamblers, hold the dice or the cards, and incite the passions which rage around the gaming table! It is useless to discuss such a question. Every sort of governmental lottery should be absolutely proscribed. — But if it is not lawful for the state itself to engage in lotteries, can it interfere in the carrying on of lotteries organized outside of itself for private speculation? Has it here a right to exercise, a duty to perform; or is it, rather, bound to respect the principle of liberty, by abstaining from all interference in the matter, and allowing every one the privilege to act according to his passion or interest? We do not hesitate to declare that liberty does not seem to us to have anything to do in the matter. In the first place, it is a question of moral interest. Now, the principle of liberty ought to be subordinate to the moral law, which rules and inspires all laws. If it be evident that the lottery is an incitement to one of the worst passions which sway the heart of man, that it encourages base cupidity, and is calculated to provoke public scandal, the legislature naturally interferes, and it would fail of its duty if it did not exercise the right it possesses to prevent and repress evil. From an economic point of view it is equally proper to proscribe a business based upon chance, in which wealth, when acquired, is not the fruit of any labor, is acquired only by another's ruin, and is incapable of creating anything. Finally, if considered politically, it should

not leave open a school of demoralization, which attracts particularly the poorer classes, and which most frequently deceives their credulity and covetousness, encourages in them only the worst instincts, and embitters their poverty with despair. We do not know whether lotteries have ever served to amuse the people; but they certainly corrupt them. — To sum up, lotteries under whatever form, whether governmental or private, are blamable and should be forbidden. England, France and Belgium have acted wisely in proscribing them, and it is to be hoped their example will be followed by those countries in which the lottery, retained for fiscal reasons, still resists the reprobation in which it is held. The legislature should not, under any circumstances, recognize or sanction the triumph of chance.

C. LAVOLLÉE.

LOUISIANA, a state of the American Union, formed from territory ceded by France. (See ANNEXATIONS, I.) By the act of March 26, 1804, all that part of the French cession south of Mississippi territory, and of north latitude 33°, was organized as Orleans territory. The rest of the cession was organized under the name of Louisiana territory, changed subsequently to Missouri territory. (See MISSOURI.) The inhabitants of Orleans territory were authorized to form a state government, by the enabling act of Feb. 20, 1811; and under its first constitution the state of Louisiana was admitted, April 8, 1812. It is curious that the words "slave" and "slavery" are not used directly or by implication, unless the use of the phrase "free white male" may be so considered, in any state constitution until that of 1864, which prohibited slavery. Slavery existed in the state, not by its own organic law, but by the territorial act of congress of 1804, which permitted *bona fide* immigrants into the territory to take their slaves with them. (See SLAVERY.) — BOUNDARIES. The enabling act fixed the following boundaries, which were accepted by the first constitution: Beginning at the mouth of the river Sabine; thence up the middle of the Sabine, including islands, to north latitude 32°; thence due north to north latitude 33°; thence due east to the Mississippi; thence down the Mississippi to the river Iberville; thence along the middle of the Iberville and lakes Maurepas and Pontchartrain to the gulf of Mexico; and thence to the place of beginning; including all islands within three leagues of the coast. By a supplementary act of April 14, 1812, the following territory was added to the state: Beginning at the junction of the Iberville and the Mississippi; thence along the middle of the Iberville, the river Amite, and lakes Maurepas and Pontchartrain to the eastern mouth of the Pearl river; up this river to north latitude 31°; thence due west to the Mississippi, and down the Mississippi to the place of beginning. — CONSTITUTIONS. 1. The first constitution was framed by a convention at New Orleans, Nov. 4, 1811–Jan. 22, 1812. It gave the right of suffrage to adult white male tax payers on one year's residence. Representatives were to hold office for two years, and to be possessed of $500 in land; senators to hold office for four years, and to be possessed of $1,000 in land; and the governor to hold office for four years, and to be possessed of $5,000 in land. The governor was to be chosen by the legislature from the two highest candidates in a popular election. New Orleans was made the capital. 2. The second constitution was framed by a convention at Jackson and New Orleans, Aug. 5–24, 1844, and Jan. 14–May 16, 1845, ratified by popular vote Nov. 5, 1845. Its main object was to restrict the legislature in chartering corporations, and to prohibit state aid to corporations. Its further changes were the omission of the property qualifications for office; the lengthening of the suffrage residence to two years; the choice of the governor by popular vote, with a choice reserved to the legislature in case of a tie; and the location of the capital at New Orleans until the close of the year 1848, and thereafter at some place to be fixed by the legislature, not less than sixty miles from New Orleans, whence it was not to be removed but by a four-fifths vote of both houses. Baton Rouge was the point chosen by the legislature. 3. The third constitution was framed by a convention at Baton Rouge, July 5–31, 1852, and ratified by popular vote Nov. 1, 1852. Its main objects were to secure an elective judiciary for short terms, and to empower the legislature to grant state aid to corporations for internal improvements to the extent of one-fifth of the paid-up capital. Baton Rouge was to remain the seat of government. 4 Jan. 26, 1861, a state convention at New Orleans passed an ordinance of secession, which it refused to submit to popular vote. In the same manner it ratified the constitution of the confederate states, and substituted that title for "United States" in the constitution. 5. The fourth constitution was framed by a state convention at New Orleans, April 6–July 23, 1864, and ratified by a small popular vote Sept. 5. It for the first time mentioned slavery in the state, for the purpose of abolishing it. There was no limitation, except for crime, on white adult male suffrage. The capital was fixed at New Orleans. This constitution remained in force in the state until March, 1867, but was not recognized by congress. 6. The fifth constitution was framed by a convention at New Orleans, Nov. 23, 1867–March 9, 1868, and ratified by popular vote Aug. 17–18. It prohibited slavery; declared the ordinance of secession null and void; declared all citizens of the United States to be citizens of the state, and their paramount allegiance to be due to the United States; and gave the right of suffrage to all adult male citizens on one year's residence· but the disfranchisement of ex-rebels was most searching and vindictive, including even those who had written newspaper articles or preached sermons in favor of the rebellion: these were neither to vote nor to hold office until they had filed with

the secretary of state and published in the official journal a certificate that they "acknowledged the late rebellion to have been morally and politically wrong, and that they regretted any aid and com fort they may nave given it." A committee of seven was appointed as a returning board. New Orleans continued to be the capital. 7. The sixth constitution was framed by a convention at New Orleans, April 21 - July 23, 1879. It made adult male suffrage universal, and prohibited any legislative qualification for suffrage or office. The state capital was removed to Baton Rouge. — GOVERNORS: Wm. C. C. Claiborne (1812–16); Jas. Villare (1816–20); Thos. B. Robertson (1820–24); Henry Johnson (1824–8); Peter Derbigney (1828–30); Andre B. Roman (1830–34), Edward D. White (1834–8); Andre B. Roman (1838–42); Alexander Mouton (1842–6); Isaac Johnson (1846–50); Joseph Walker (1850–54), Paul O. Hebert (1854–8); R. C. Wickliffe (1858–60); Thomas O. Moore (1860–64); James Madison Wells (1864–7); B. F. Flanders (military governor, 1867–8); Henry C. Warmoth (June 25, 1868–73); Wm. Pitt Kellogg (1873–7); Francis T. Nicholls (1877–81); Louis A. Wiltz (1881–5). — POLITICAL HISTORY. For the first twenty years of her existence as a state, Louisiana was nominally democratic; her governors belonged to that party, as well as her senators and representatives, though several of them were afterward whigs. The diversity of interests of the French and American citizens, however, formed the more usual dividing line of politics in the state. The former were at least a strong minority, and a singular evidence of its strength was a provision in the constitution which allowed members of the legislature to debate either in French or in English. The organization of the whig party, one of whose tenets was a protective tariff (see WHIG PARTY), changed the course of Louisiana, and from 1830 until 1850 the state, although not steadily whig, was the most nearly so of the southern states, except Maryland and Kentucky. Its electoral vote was given to Harrison and Taylor, the whig candidates, in 1840 and 1848; in 1844 the state was only carried for Polk, the democratic candidate, by unblushing frauds in Plaquemines parish; and in 1836, 1852 and 1856 the democratic majority in the state was under 2 per cent. of the total vote. From 1833 until 1855 the state congressional delegation was never entirely without a whig representative, and Senator Benjamin, who was elected as a whig, held his seat until his state seceded. The strong whig element in the state was the result of its large sugar planting interest, which desired protection against foreign sugars, and could not hope for it from the democratic party. — In presidential elections the whig vote of the state was hardly decreased until the downfall of the party; in congressional elections the democrats steadily gained after 1850, as slavery became the controlling question in national politics. One New Orleans district continued to send a whig representative while there were whigs to vote for, and then sent an "American" representative, who kept his seat until March 3, 1861, after his state had seceded. Throughout the state the American party took the place of the whig organization after 1855, but with a much smaller vote; and in 1860 the state was practically unanimous for secession. — After the capture of New Orleans by the United States forces, April 25, 1862, the former state government was transferred to Opelousas. From that point it controlled the larger part of the state during the war. June 2, 1865, the new governor under the old régime, Allen, issued a proclamation declaring his administration at an end. — In August, 1862, Major General George F. Shepley was appointed military governor, a provisional judiciary was organized by the president's order, and a substitute for a state government was set in motion; but its authority never extended far beyond the immediate neighborhood of New Orleans. Two members of congress were elected, admitted, and held their seats Feb. 9 - March 3, 1863. Under a proclamation of the president, Dec. 8, 1863, an election for state officers was held Feb. 22, 1864, and Michael Hahn was elected governor. March 15, 1864, he was also appointed military governor by the president. A new constitution, the fourth above mentioned, was framed in 1864, under which J. M. Wells was elected governor and was inaugurated March 4, 1865. In November of the same year, apparently with the intention of introducing the late confederate portion of the state to the new constitution, he ordered a new election for state officers, at which he was again elected as the democratic candidate. Although this government was never recognized by congress, it controlled state affairs until March, 1867. The blacks, who were still disfranchised under this constitution, were much dissatisfied with it, and an attempt made by their leaders to reconvene the convention of 1864 at New Orleans for the purpose of framing a new constitution, or of revising the old one, resulted in the riot of July 30, 1866, in which several hundred negroes were killed or wounded. — In March, 1867, Louisiana, like the other insurrectionary states, passed under military government. (See RECONSTRUCTION.) Its succession of major generals commanding was as follows: Philip H. Sheridan, March 19 - Aug. 17, 1867; Winfield S. Hancock, Aug. 26, 1867 - March 18, 1868; R. C. Buchanan, March 20 - June 25, 1868. On Sheridan's recommendation, Wells was removed from his position as governor, and Benj. F. Flanders was appointed in his stead. Under the auspices of these officials the reconstruction of the state was completed, the fifth constitution, as above given, was framed, Henry C. Warmoth was elected governor, and the state was readmitted June 25, 1868. — For a time the republican majority in the state was undisturbed, though the first legislature had to call upon the federal government for troops. (See INSURRECTION, II.) In July, 1871, the republican party

fell apart. One faction, headed by Warmoth and P. B. S. Pinchback, held the state books and records, and was supported by the "metropolitan police," a New Orleans body of men, which the governor was at liberty to use throughout the state. The other faction was led by W. P. Kellogg, F. F. Casey, collector of the port, and S. B. Packard, the United States marshal for the district; and the latter two obtained control of the party organization by holding its conventions in the custom house building, guarding it with federal soldiers, and refusing tickets of admission to the Warmoth delegates. Most of the succeeding difficulties, which soon entirely banished truth, honor and decency from Louisiana politics, seem to have flowed from this action of Casey and Packard, in prostituting the federal buildings to party use in order to compel the federal government, by defending its own property, to defend them; but the federal government, which refused to remove them from office, must take its share of the responsibility. — Early in January, 1872, the members of the two factions in the legislature had split into two legislatures, the Warmoth body meeting in the Mechanics' Institute, and the other at first in Packard's office, and afterward in the "Gem saloon." Open conflict between them was prevented by the federal troops, and the struggle turned toward the control of the state's returning board, and the consequent control of the next legislature. (See RETURNING BOARDS.) The returning board, as constituted in 1870, was composed of the governor, the lieutenant governor, the secretary of state, and two citizens appointed by name. The governor made removals of state officials and appointments of his friends to their places, in order to secure a majority of the omnipotent returning board; the ousted officials, protesting against the legality of their removal, still claimed to be members of the board; and when each set had formally filled the "vacancies" caused by refusal to act with it, the identity of the body was obviously unascertainable. Two returning boards made their appearance, the Warmoth board and the Lynch board, alike in having the governor as a member and in claiming to be the only real board, but different in all other respects. — After a great number of conventions had been held by various factions, the state tickets were at last narrowed down, in August, 1872, to two: one, headed by McEnery and D. B. Penn, for governor and lieutenant governor, supported by the democrats and liberal (or Warmoth) republicans; the other, headed by Kellogg and Pinchback (who had lately abandoned Warmoth), supported by the Packard (or custom house) republicans. The formal voting took place Nov. 4, and then the real struggle began. The McEnery party, through a state judge, obtained an injunction forbidding the Lynch board to canvass the votes; but their opponents had a more potent ally in the person of the federal district judge, Durell, who not only temporarily enjoined the Warmoth board, Nov. 16, from counting the votes, but afterward committed his rival, the state judge, to jail for contempt. — The governor now complicated the case by introducing a third returning board upon the scene. The state constitution of 1868 allows the governor to hold, until the next session of the legislature, bills whose return by him to the legislature within five days has been prevented by adjournment. A new election law had passed less than five days before adjournment, which provided for a returning board of five persons, "to be elected by the senate." Nov. 20, 1872, the governor at last signed the bill; then, since the senate was not in session to elect the members of the board, he appointed five persons, the so-called De Feriet board, to "fill the vacancies." Durell, Dec. 4, decided that he had jurisdiction under the enforcement laws, and made his injunction permanent. Dec. 5, the governor, abandoning the Warmoth board, issued a proclamation announcing the names of the new legislature as ascertained by the De Feriet board. Dec. 6, Durell issued an order, which declared the governor's proclamation to be a violation of his injunction, and directed the marshal, Packard, to seize the state house and prevent the meeting of any "unlawful assemblages." This Packard did, with the assistance of two companies of federal troops. In this place, the Packard legislature was organized Dec. 7; the McEnery legislature met in the city hall Dec. 9; and Jan. 14, 1873, Kellogg and McEnery were both inaugurated as governor. — Two rival United States senators were elected, and the case thus came before the senate. Its committee reported that there was no government in Louisiana; that the McEnery government was most nearly a government *de jure*, and that the Kellogg government was most nearly a government *de facto;* and recommended the passage of a bill for a new election in the state. The bill failed to pass; congress adjourned without action; and the president recognized the Kellogg government, as he had informed congress, in a message of Feb. 25, he would do unless it acted in the matter. The senate committee's judgment on Durell's actions was as follows: "The orders and injunctions made and granted by Judge Durell are most reprehensible, erroneous in point of law, and wholly void for want of jurisdiction, and your committee must express their sorrow and humiliation that a judge of the United States should have proceeded in such flagrant disregard of his duty, and have so far overstepped the limits of federal jurisdiction." — As congress had abandoned the case to the president, and the president had recognized the Kellogg government, the opponents of the latter at first contented themselves with an organized but peaceable resistance to the payment of taxes. The Kellogg legislature proceeded to enforce collection by use of the militia, and the contest rapidly developed into one of force, marked by such tragedies as those of Grant parish, in April, 1873, and Coushatta, in August, 1874, in which the victims were almost invariably negroes. Nothing but the violent revulsion in

the feelings of the north and west against such horrors enabled the federal government to continue its support of the Kellogg government. Sept. 14, 1874, the McEnery party rose in arms, wiped out for the time every vestige of the Kellogg government, and assumed control. Sept. 17 they surrendered without resistance to the federal forces, acting under instructions from Washington; and Sept. 20 the Kellogg government returned to life. — The election in November, 1874, was accompanied by the usual republican charges against the democrats of violence in the election, and by the usual democratic charges of frauds by the returning board. Both parties, however, seemed to acquiesce in the results, which returned fifty democrats and fifty-two republicans to the lower house. The democrats, on the organization of the legislature, Jan. 4, 1875, seated their candidate for speaker in a hasty and disorderly fashion, and proceeded to seat several members whose election was contested. Thereupon Governor Kellogg sent for Gen. De Trobriand, commanding the federal troops in the city, who turned out the just seated members, and restored the house to the control of the republicans. In giving the essential facts of this affair, which caused intense excitement throughout the country, as a startling novelty in legislative organization, it should be mentioned that De Trobriand had just previously entered the hall once before, to keep the peace, at the summons of the democratic speaker. — In March, 1875, congress, by resolution, approved the president's support of the Kellogg government; and in the following month the McEnery legislature agreed to a compromise proposed by a congressional investigating committee, the "Wheeler adjustment," so called from its contriver, Wm. A. Wheeler, afterward vice-president. Under this arrangement the committee seated a number of members whom the returning board had unseated; the democrats gained control of the lower house of the legislature; but the Kellogg government itself was not to be disturbed, but was to be "accorded all necessary and legitimate support in maintaining the laws." Under this compromise the state remained politically in peace until November, 1876, with one exception. In February, 1876, the democratic house impeached Kellogg for "high crimes and misdemeanors" committed since the date of the Wheeler adjustment; but the republican senate fixed the time of trial at less than an hour's time after the reception of the impeachment, and then acquitted Kellogg for want of prosecutors. — The republican state ticket for 1876 was headed by the name of S. B. Packard for governor, and the democratic ticket by that of Francis T. Nicholls. The returns, as sent to the returning board, showed democratic majorities of about 8,000 for the state ticket, and from 3,459 to 6,405 for presidential electors. Gov. Kellogg, on the other hand, telegraphed north that the republicans had carried the state, and that the apparent democratic majorities were due only to democratic violence in five parishes, or counties, whose vote the returning board would certainly reject. Before the returning board met, Nov. 16, it had become evident that the result of the presidential election depended on the decisions of the returning boards of Louisiana and Florida (see DISPUTED ELECTIONS, IV.; ELECTORAL COMMISSION); and a large number of republican leaders, named by the president, and of democratic leaders, named by the democratic national committee, had arrived in New Orleans from all parts of the country to watch the progress of the count. — The main democratic objections to the action of the board, outside of the constitutionality of the board itself, were threefold: 1. The law of 1872 required the board to be composed of "five persons, to be elected by the senate from all political parties." The democratic member had resigned, and the four remaining members (republicans) acted as the board, refusing to pay any attention to four petitions, Nov. 10, 16, 21 and 22, that a democrat should be appointed to the vacancy. 2. The board held secret sessions, from which even the United States supervisors were excluded, in order to decide the cases of contested elections. 3. The board cast out the votes of sixty-nine polls, embracing a part or the whole of twenty-two parishes, for fraud, violence or intimidation, including 13,236 democrats and 2,178 republican votes, changing the result in the state to about 4,000 republican majority. On all these points, the board rested on the absolute control which the election law gave them over the canvass of the votes, without any power of revision by any other authority. From the canvass the board announced, as elected, the republican presidential electors, state ticket, a majority of both houses of the legislature, and four of the six congressmen. — The democratic members of the legislature, to whom the board had given certificates, refused to meet with the returning board legislature. Jan. 1, 1876, two legislatures were organized in different buildings, and Jan. 8 both Nicholls and Packard were inaugurated as governor. By the returning board's count, neither body had a quorum of the senate, but the republican legislature had a quorum of the house. Open conflict was averted, however, until the new president, Hayes, had been inaugurated. In April he sent an unofficial commission to New Orleans, by whose intervention a number of members deserted the Packard legislature, sufficient to give the Nicholls legislature a quorum in both houses. April 20 the federal troops were withdrawn; April 21 the Packard legislature disbanded; and April 25 Packard himself retired from the contest. Since that time the state has been democratic in all elections, state and federal, but there has been no political action worthy of note, except the formation of a new constitution, the sixth, in 1879. — The state has furnished one president to the United States. (See TAYLOR, ZACHARY.) Among those who have became prominent, rather than notorious, in state politics

are the following: Judah P. Benjamin, whig United States senator 1853–61, and secretary of war and secretary of state under the confederacy; Chas. M. Conrad, whig United States senator 1842–3, representative 1849–50, secretary of war under Fillmore, and a representative in the confederate congress; Benj. F. Flanders, republican representative in 1863, and military governor 1867–8; Randall Lee Gibson, democratic representative 1875–83; Wm. H. Hunt, secretary of the navy under Garfield; Josiah S. Johnston, representative 1821–3, and United States senator (whig) 1824–33; Wm. P. Kellogg, republican governor 1873–7, and United States senator 1868–72, and 1877–83; John Slidell, democratic representative 1843–5, United States senator 1853–61, and confederate commissioner to France in 1861 (see TRENT CASE); and Pierre Soulé, democratic United States senator 1847 and 1849–53, and minister to Spain 1853–5. — The name of the province, from which that of the state was taken, was given by La Salle in 1682, in honor of Louis XIV. of France. — See 2 *Stat. at Large*, 283, 701 (for acts of March 26, 1804, and April 8, 1812); authorities under ANNEXATIONS, I.; 1 Poore's *Federal and State Constitutions;* Martin's *History of Louisiana* (1829); Bonner's *History of Louisiana* (to 1840); Gayarre's *History of Louisiana under American Domination* (to 1861); *Report of Senate Committee on Privileges and Elections* (Feb. 10, 1873); *Report of House Committee on Louisiana* (Feb. 23, 1875); *Senate Journal* (1874–5), 475; *House Journal* (1874–5), 603, 25 *La. ALEXANDER JOHNSTON.

LÜBECK, a free Hanseatic city, situated on the Baltic sea, and forming part of the German empire. This city formerly possessed considerable importance; it was for four years the capital of the Hanseatic league, extending its influence from London to Novogorod, and from Bergen in Norway to the commercial cities of the Rhine and the Danube. But this brilliant epoch in its history has long passed away. Lübeck was, at the close of the year 1882, a city of 50,979 souls, (in 1857 it had 26,672 in the city and 4,045 in the suburbs), and the state does not contain in its entire extent (about 127 square miles) but 63,448 inhabitants. — Lübeck is known as a seaport, and commerce and navigation form its chief industry. This commerce may be estimated at about $50,000,000 a year, imports and exports combined, and over 2,200 vessels enter and sail from its port; in this number are included the arrival and departure of two steamboats daily during the summer months. Fifty ships constitute the force of its merchant marine, thirty of which are steamships. — The political constitution of Lübeck was relatively aristocratic down to the year 1848. While many of the fundamental laws of Germany were being modified through the influence of the French revolution, those of Lübeck also were amended. Since Dec. 23, 1851, a new constitution has been in force in the old Hanseatic capital, the essential provisions of which we give herewith. — The governing power is vested in a senate composed of fourteen members chosen from the citizens of Lübeck, but in such manner that six of the number shall be lawyers and five merchants. The president of this body is styled the burgomaster. During the two years of their term of office, the senators in turn fill the different public offices. The burgesses, one hundred and twenty in number, are elected for six years by their fellow citizens, who are all voters and all eligible to office. The consent of the burgesses is necessary to validate changes in the constitution, to pass or abrogate a law, to impose taxes, to allow the public exercise of an unrecognized form of worship, etc. Finally, the burgesses have a right to share in the management of the public revenue, in that of the churches and of charitable institutions. The burgesses assemble six times a year, and in addition as often as the senate or one-fourth of the deputies (burgesses) require it. A committee of thirty members, chosen from among its own members and elected for two years, meets every fifteen days, and to this committee the senate refers all matters to be discussed by the burgesses; the committee is authorized to decide questions of administration, and other matters of little importance. When the senate and the burgesses can not agree upon the interpretation of a law, they submit the matter to the arbitration of a higher court of appeal, of which there is one in common for the four free cities of Germany, or, in case of urgent necessity, to the decision of a mixed commission, composed of senators and deputies. — The administration of this little state is, for the most part, intrusted to senators or deputies, and the different branches of the service are organized on a footing of rational economy. Lutheranism is the religion of the greater part of the population, but it enjoys no special privileges; liberty of conscience is guaranteed to every citizen. — The revenues of the free city amounted, in 1880, to 2,739,381 marks. The public or state debt amounted, in 1879, to 23,486,045 marks. — BIBLIOGRAPHY. L. SCHWARTZ.

LUXEMBURG. The grand duchy of this name, whose capital of the same name was formerly celebrated as a fortress, is subject to the

king of Holland as its sovereign; but, beyond this, the grand duchy has nothing in common with the Batavian kingdom. The state of Luxemburg has an area of about 2,587 square kilometres, with a population numbering a little more than 200,000, nearly nine-tenths of whom speak German. With the exception of 580 Protestants and about as many Jews, the people profess the Catholic faith. The government is representative. According to the constitution of Oct. 11, 1868, and the electoral law of November 30 of the same year, the legislative body is composed of only one chamber of forty deputies, elected directly by the people in as many election districts, twenty members being elected every third year. The sovereign is represented by a prince of his family, who is styled the lieutenant of the king grand duke. The government is composed of a minister and several directors general. The revenue amounts to about 7,200,000 francs, and is slightly in excess of the expenditure. The grand duchy would therefore have no debt had it not borrowed $240,000 to build railroads. A portion of this debt has been repaid. — Luxemburg has not been favored by nature, and it is not very rich in agricultural wealth, but certain other interests are flourishing, especially the production of iron, which, in 1869, exceeded 924,000 tons (911,165 in 1870), worth about $700,000. The Franco-German war of 1870–71 naturally retarded commerce; but in 1869 the railroad transported 1,624,457 tons of merchandise, 381,030 of which were carried from place to place in the interior of the country, 259,000 were received into the country from abroad, 732,000 were sent out of the country, and the rest was transient freight. The same year the postal service distributed about 700,000 letters, 425,000 copies of newspapers, and 12,000 postal orders, without considering letters containing valuables. There were received into and sent out of the country about 27,000 to 28,000 telegrams. — These figures show that this country is not very important, but its geographical situation and the walls which surrounded its capital gave it for a time an exceptional importance. Entering the Germanic confederation in 1815, the grand duchy remained in it until its dissolution in 1866. After the war between Prussia and Austria, the independence of Luxemburg seemed threatened, and it was feared for a moment that it would become a cause of war between France and Germany. But this difficulty was settled by a treaty, signed in London March 11, 1867, between the six great powers and the king grand duke. We give herewith the articles of this treaty, according to the *Bulletin des Lois*. — Art. I. His majesty, the king of Holland, grand duke of Luxemburg, retains the rights which attach the said grand duchy to the house of Orange-Nassau, in virtue of the treaties which have placed this state under the sovereignty of his majesty the grand duke, his descendants and successors. The rights which the direct line of the house of Nassau has to the succession to the grand duchy, in virtue of these same treaties, are maintained. The high contracting parties accept and take cognizance of the present declaration. — Art. II. The grand duchy of Luxemburg, with the limits determined by the act annexed to the treaty of April 19, 1839, under the guarantee of the courts of France, Austria, Great Britain, Prussia and Russia, shall henceforth constitute a perpetually neutral state. It shall be obliged to observe this same neutrality toward all other states. The high contracting parties pledge themselves to respect the principle of neutrality stipulated by the present article. This principle is and shall continue under the sanction of the collective guarantee of the powers signing the present treaty, with the exception of Belgium, which is itself a neutral state. — Art. III. The grand duchy of Luxemburg, having been made neutral by the terms of the preceding article, the maintenance or establishment of fortified places upon its frontiers becomes unnecessary and aimless. Wherefore it is agreed, with common consent, that the city of Luxemburg, which in the past was considered as a federal fortress, shall no longer be a fortified city. His majesty the grand duke reserves the right to maintain in this city sufficient troops to assure the maintenance of good order. — Art. IV. Conformably to the stipulations contained in articles II. and III., his majesty the king of Prussia declares that his troops now in garrison in the fortress of Luxemburg shall be ordered to evacuate that place immediately after the ratification of this present treaty. He will begin to remove simultaneously the artillery, the munitions and everything which forms part of the equipment of the said fortified place. During this removal there shall remain there only the number of troops necessary to insure the safety of the materials of war and to effect their removal, which shall be completed in the shortest possible space. — Art. V. His majesty, the king grand duke, in virtue of the rights of sovereignty which he exercises over the city and fortress of Luxemburg, pledges himself, on his part, to take the measures necessary to convert the said fortified place into a free city, by destroying what his majesty shall judge sufficient to fulfill the intentions of the high contracting parties expressed in article III. of the present treaty. The work necessary for this purpose shall commence immediately after the withdrawal of the garrison. It shall be effected with all due regard for the interests of the city's inhabitants. His majesty the king grand duke promises, moreover, that the fortifications of the city of Luxemburg shall not be rebuilt in the future, and that no military force shall be maintained or established there. — Art. VI. The powers who sign the present treaty agree that the dissolution of the Germanic confederation having likewise brought about the dissolution of the ties which united the duchy of Limburg, collectively with the grand duchy of Luxemburg, to the said confederation, it follows that the agreements mentioned in articles

III., IV. and V. of the treaty of April 19, 1839, between the grand duchy and certain territories belonging to the duchy of Limburg, have ceased to exist, the said territories continuing an integral part of the kingdom of Holland. — Although separated from Germany as a state, Luxemburg remains united to the revenue system of that country in accordance with the combination agreed upon in the treaty of Oct. 20–25, 1865, according to which the grand duchy formed part of the *Prussian* group as a member of the zollverein. This treaty was confirmed in the convention of June 11, 1872, by which the grand duchy contracted with those managing the railroads of Alsace-Lorraine to manage the Luxemburg lines in place of the French eastern company, and upon the same conditions, to Dec. 31, 1912. And it was expressly agreed by article XIV., that the royal contracting parties should not use their right to denounce the treaty of the customs union (Oct. 20–25, 1865), so long as the Luxemburg railroads should continue under the same management as those of Alsace-Lorraine. We must add that, after it had been declared neutral by the treaty of 1867, the grand duchy was obliged to introduce the restrictions indicated in article II., which read as follows: "The German government pledges itself never to use the Guillaume-Luxemburg railway for the transportation of troops, arms, munitions or stores of war, and not to use it in any war in which Germany shall be engaged, for provisioning troops, in a manner incompatible with the neutrality of the grand duchy, and in general not to allow by means of the management of these railroads, any act that would not be in perfect accord with the duties incumbent on the grand duchy as a neutral state."—BIBLIOGRAPHY. M

MACE. (See PARLIAMENTARY LAW.)

MACHIAVELISM. If there can be two opinions with regard to Machiaveli, there can be but one with regard to machiavelism. Whether or not this political system was that of the man whose name it bears and tarnishes, no one can be found so audacious or so cynical as to defend it openly. There will always be those depraved enough to practice it deliberately and those weak enough to let themselves be drawn into it by self-interest; but the force of public opinion has at least achieved this much, that machiavelism can not be spoken of except to be contemned and repudiated. Kings, even the least scrupulous, have seen fit to oppose it, and have in their public utterances called in question its odious tenets when proposed for their acceptance. Frederick the Great and Voltaire, in the earlier days of their friendship, united in emphatically condemning Machiaveli's "Prince"; and it may not be out of place to give an example of the way in which it was spoken of by them. "How deplorable," writes Frederick, then prince royal (November, 1740), is the situation of a people which has everything to fear from the abuse of sovereign power, whose possessions fall a prey to a prince's rapacity, whose liberty is at the mercy of his caprice, whose peace depends on his ambition, whose safety rests on his falseheartedness, and whose life is the plaything of his tyrannical temper. Such is a tragical sketch of what a state, ruled by such a prince as Machiaveli's, might be." Voltaire, to whom the young man had long previously confided his praiseworthy aims, encouraged him in them, and said (May 20, 1738): "It was for the Borgias, father and son, and for all those petty princes who could only hope to obtain notoriety through crime, to make a study of that diabolical policy; it becomes a prince like you to despise it. Such scheming, fitly classed with that of a Locusta or a Brinvilliers, may have given a passing power to a few tyrants, as poison may procure an inheritance, but it has never made a man either great or happy; that is certain. The only possible result of this horrible policy is misery, both to one's self and to others." — To define machiavelism is easy: it is the surrender of all principles to one, namely interest; the violation, and sacrifice to success, of every law of morality. This simple definition might seem, at the first glance, altogether inadequate, and the awful series of consequences which it embraces might for a moment escape notice, but, pondered carefully, the conviction will be arrived at, that this seemingly simple maxim once adopted as the supreme guide to conduct, there is no crime, however heinous, which might not result from it. Once let the confines of justice and duty be passed, and there remains nothing to hinder the taking of whatever steps may be deemed necessary to attain the object desired; the only real obstacle to the upsetting of all laws, divine or human, being lack of power, whether resulting from the weakness of individual faculties or from external opposition. He is no criminal who confines himself to wishing, and crime carried only to a certain pitch is perhaps even rarer than virtue. Let, however, one false step be taken and others must follow, and, as advance is made, criminality increases, till it equals that of a Cæsar Borgia, Machiaveli's paragon, and the model of his "Prince." Machiavelism begins in falsehood, which it uses as other men use truth. If ordi-

nary falsehood is insufficient for its purpose, it then makes use of the solemn form of lying called perjury to reassure its victims and entrap them the more readily. These are its most innocent means. But as a lie quickly begets distrust and puts men on their guard, recourse must be had to more efficacious means, in short, to violence in all its forms, from the spoliation which weakens, to the assassination, open or secret, which removes them altogether. Here, briefly, is the career of machiavelism, but there are few even among the most hardened who are capable of carrying it out in its entirety; to do that, their conscience must be utterly devoid of every idea of good and evil, and blinded by an unbridled lust for possession and power. In its worst form, when united to the necessary power, no villainy is too great to be dreamt of and accomplished by it. To a first crime committed with impunity are quickly added all the others which passion begets, and which hearts, insensible to the horror of their deeds and no longer in dread of punishment, can execute. As Voltaire has well said, nothing is established by machiavelism, and all success gained by it, when success is gained, is temporary, rarely lasting even the brief lifetime of him who buys it at so high a price. But this remark of Voltaire's is almost as old as machiavelism itself, dating from long ages before Machiaveli was to give to that policy the name which at once describes it and dishonors him. We need but to open Plato's "Dialogues" to find in the "Republic" and the "Gorgias" stray features of the machiavelism of the ancients, treating it with the just scorn which it merits. The admirable passages, so applicable to the despots of every age, and in which they are described in language the truth of which is unalterable, should be read. It is not here that those protests of humanity against oppressors and wrong-doers who are in power ought to be repeated, protests as old as the indignation of honest men against the abominations of crime, but we may quote these last words in which Aristotle sums up his incomparable description of a tyrant: "All those schemes, with so many others of a like nature by means of which tyranny tries to maintain its dominion, are profoundly perverse"; and a little farther on, appealing to the testimony of history, he adds, "and yet in spite of all these precautions, the least stable of governments are oligarchy and tyranny; everything considered, most tyrannies have had but a very brief existence." Machiaveli himself might have seen in his own lifetime to what the duke of Valentinois was brought by so much craft united to so much power: having languished in prison after prison he met his death under the walls of an obscure village in Spain which he had besieged; an end, after all, too good for such as he. But from this example Machiaveli learned nothing, and the "Prince" appeared some time after Cæsar Borgia had expiated his crimes by his downfall and exile. Machiavelism will never perish; changing to suit times, places and peoples, it will live as long as men are vicious, or there is power in the hands of the evil-minded which it is possible for them to misuse. — There have been long and disastrous periods during which all policy, home or foreign, was but a series of machiavelian manœuvres, and during which men considered anything justifiable when used against a foe, either foreign or domestic. The middle ages present an unbroken record of these hateful practices, which all accepted, each endeavoring to turn them to his own advantage. This infernal statecraft, to borrow again Voltaire's expression, reached its climax in the Italy of the fifteenth and sixteenth centuries, and Machiaveli did but frame its code. It was adopted by such men as Louis XI. and Philip II.; it still sullied France under the Valois, and sometimes even under Richelieu. In our own days it remains the only political system known to a number of petty states, but half civilized, given up to an anarchy almost barbarous and wholly corrupt. In the larger states it has had to disappear, or at least to a certain extent to disguise itself in presence of the law of nations and public honesty; notwithstanding which, there have been occasional disgraceful outbreaks, and our own times furnish a notable example which history stigmatizes by the name of the *attentat* (attempt) of Bayonne (see Adolphe Thiers' "History of the Consulate and the Empire," books xxix., xxx, xxxi., Aranjuez, Bayonne and Baylin). The way in which Napoleon I. obtained possession of the Spanish crown is a chain of acts of perfidy unworthy of so great a man, planned against unfortunates without a defense against it, and forged with a skill and a cunning vigor which has never been surpassed by the cleverest adepts of machiavelism. With the murder of the Duc d'Enghien it is, as Thiers justly says, "the second of the two stains which tarnish his glory." (Vol. viii, p. 658.) But, a moralist as well as an historian, Thiers does not fail to point out the punishment which followed the crime, and instances Baylin as the first expiation for Bayonne. The Spanish war gave occasion for, if it was not the sole cause of, Napoleon's reverses and those of France. But such legitimate retribution the outcome of events, like to avenging justice and a warning of Providence, never discourages crime; led away by force of circumstances, and hoping by redoubled adroitness to escape punishment, it is ever ready to renew its dark plotting. Only where there is such refinement of manners as we find in Europe to day, machiavelism must remain within certain limits, and that it may exist at all it is obliged to be less open and less cruel than it was in a coarser and more barbarous age. The best means of suppressing machiavelism altogether is to give it publicity, to let free discussion unveil the real nature of the equivocal acts through the agency of which it hopes to escape the tribunal of public opinion. The first care of a machiavelian policy is to stifle such voices as might complain, and still more such as might judge. Concealment is an evidence of guilt, if not

in fact at least in intention; and honesty, especially when armed with the power to do right, may brave all criticism, for it is little likely to be disregarded, and when it is, it is always easy for it to cause erring minds to retrace their steps. Silence, then, is the necessary condition of all machiavelian power, and one of the safeguards, feeble though it be, which it always aims at securing. Had public opinion been able to discuss in 1808 what was going to take place at the château de Marac between Napoleon and the Spanish Bourbons, there is every reason to suppose that the great emperor would have spared himself and France many a misfortune, and not have sullied his reputation by such base disloyalty. The public conscience would have enlightened and regulated that of the conqueror, and prevented him degrading himself to play the part of a despoiler. It is to be presumed, besides, that he himself saw his error and felt the unworthiness of his conduct. But the Spanish crown was at stake, and the irresistible *omnia pro dominatione* made him believe that in robbing that weak old king he was putting the coping stone of the French empire and of his own policy in place. A great lesson this, but one that will not be very profitable so long as men have more cupidity than virtue, and more passion than wisdom. BARTHÉLEMY SAINT-HILAIRE.

MACHINERY, Its Social and Economical Effects. I. *Economical Superiority, Motive Powers and Limitations of Machinery.* The distinction between a tool and a machine consists principally in the fact that in the case of the latter the motive power does not proceed immediately from the human body, while the former is only an equipment of, or a substitute for, particular human organs. A machine is more complex than a tool. Many machines can be properly compared to a complete laborer. Tools are in their origin more ancient than machines, and as motive powers of the latter, the larger domestic animals were earliest used, then water, next wind, and, last of all, steam was applied. — The indisputable superiority of machines where they compete on an otherwise equal footing with the human hand supplied with mere tools, arises from the fact that they can perform services which would be now too heavy and now too fine for the human hand. An important saving in raw material is also often connected with the greater power of machines. Since machines do not tire, they can work with uninterrupted persistence, and therefore with a superhuman uniformity; and since they never cheat or deceive, they are perfectly trustworthy. As they make the various copies of the same model with the utmost exactness, they permit a greater expenditure of labor and attention upon the original. Besides this, machines work more cheaply than human hands. If this were not so, undertakers would prefer the latter in their enterprises, because, if worst comes to worst, the laborers may be dismissed, but the capital invested in machines is for the most part irrevocably fixed. The same thing is also true of machines as of factories, that within certain limits the relative costs decrease with their increasing size. Even the labor of animals has the advantage over human labor that it is more powerful and cheaper. Their sustenance and dwellings may be ruder than even the rudest which would do for men. Their clothing is the free gift of nature. The portion of their lives which is unfitted for labor is relatively short. Even their dead bodies can be economically utilized. Of the so-called "blind motive powers," water and wind are not only stronger than animals, but absolutely indispensable to the national economy as a whole. Steam, however, where there is an abundance of combustible material, is of all machine powers the most complete, the most obedient to man and the freest from external interruption. Water power is but seldom found concentrated in one place to any great extent, and still more seldom in seaboard localities which are favorably situated for commerce. Consequently the most effective form of large industry—the formation of great metropolises of industry—is possible only with the aid of steam. To what degree the power of man over nature is increased by the various machine powers can be most clearly shown by a comparison of the oar-driven galleys with horse-drawn canal boats, with sail ships and steamships. — The more the production of a commodity depends upon the constant repetition of one and the same operation, the greater is the advantage of the machine. Very different is it, however, where the production demands a series of manifold movements, particularly if the latter must vary with the individual constitution of the object worked upon. Machines are especially adapted for making cloths, because their quality depends chiefly upon having the thread uniformly and evenly woven. If the stuff is well prepared, the machine can work it up much more evenly than the hand. On the railroad, which is smooth, level and straight, a steam engine is used; in the city, where the crookedness of the streets, the crowd of men, the different purposes of travel, compel a thousand irregularities, horses are employed; and in the house everybody goes on foot. Since machines require, as a rule, larger amounts of capital than laborers, and as they fix it more permanently, their use is advantageous only where the products can reckon upon a large market. The more costly the machinery the greater the market by which it is conditioned. Machinery is but illy adapted to the manufacture of costly articles of luxury. As a rule, machinery not only increases the economical superiority of him who applies it, but it also presupposes such superiority—superiority in raw material, natural power, and education in general. In the case of commodities whose price depends mainly upon the cost of raw material, and only to a small extent upon that of manufacture, even a very considerable reduction of the latter will not be able to enlarge the market to such an extent as to

justify the necessary machinery. — Finally, it goes without the saying that where thought or invention is required, a machine can never compete with the laborer. The shortest way out, therefore, for a branch of hand industry which is threatened by the introduction of machinery, is for the laborers to pass over to that artistic branch of industry which is most nearly related to it. It can not be denied, however, that the sphere of machines has been recently very much enlarged and that it is relatively constantly increasing. — II. *The Economical and Social Advantages and Disadvantages of Machinery.* 1. It can scarcely be doubted that for the great public of consumers, or, in other words, for the national wealth as a whole, the advantages of machinery completely outweigh all disadvantages connected with it. The value in use of the national wealth is increased by every successful introduction or improvement of a machine. For the previous quantity of production fewer laborers are needed; since machines, as Ricardo says, are of value only in so far as they save more labor than they themselves have cost. It is, of course, possible that the laborers who have been thus rendered unnecessary should remain idle for the future, but it is not at all probable. Civil society is not ready, as a rule, to pension off the laborers rendered unnecessary by machines with their full previous wages, and so the laborers are impelled, either by necessity or pride, to seek out new spheres of work. Whatever they produce in these is, for the national economy as a whole, a pure gain. Fortunately the new field of labor ordinarily lies very near to the former, as active enterprisers like to apply the capital so saved in the extension of their business. We may say with Hermann, that nature proceeds with economical inventions in the same way as human legislation with patent rights. At first the inventor succeeds in enjoying the sole use of his invention. The public pays him the former prices while his costs of production have become smaller, and so he receives a higher rate of profit than is usual. Competition soon begins to make itself felt, his fellow enterprisers imitate him, and he finds it to his advantage to extend his business and take small profits on large sales rather than large profits on small sales. Thus the price finally falls to the amount of the present costs of production, and the consumers get the ultimate permanent advantage, since they are now able to secure with the same sacrifice far greater enjoyment than before. The cotton industry affords an excellent example of this. As one improvement after another has been introduced, the price of cotton fabrics has steadily declined and their use become more general. Thus, in 1849 one could buy more than eight times as much cotton cloth for a given sum of money as in 1810. The population of Europe increased about 11 per cent. in the years 1836–50, while the use of cotton cloths increased about 85 per cent. — If the consumption of the cheapened commodities increases in exactly the same ratio as their prices fall, the value in exchange of the national wealth remains unchanged; if it increases in a larger ratio, not only does the value in use but also the value in exchange increase. The cotton industry is again a case in point. The average value of English cotton fabrics in 1766 was estimated at £600,000; in 1875, at £95,400,000. Of course, such a development will not always take place. If needles should fall one half in price, their consumption need not increase proportionately or even at all, because sewing is no amusement, and the products of sewing would not become appreciably cheaper on account of the cheapening of needles. The case would become different if the cheapening of the needles enabled us to conquer a foreign market which up to this time had been closed to us. A diminution in the costs of production of decencies or luxuries often increases the number of customers not only in arithmetical but also in geometrical ratio, because in a classification of wealth the number of persons belonging to any class increases as the amount of wealth taken as a basis decreases. The assertion is often made, that products of machinery, though of better appearance than hand-made products, are not so durable. Even if this be so, there is certainly no technological reason why the work of machinery should be less durable than that of hands. On the contrary, the undoubtedly greater uniformity of machines must, in itself considered, be favorable to durability. It is probable, however, that, owing to the greatly increased facility of manufacture by machines, the production of raw material has not kept equal pace. Poorer material has, therefore, been taken, material which could not be worked at all by hand, and consequently even the better work of machines has not been able to make good products out of them. But the fault in such cases ought not to be ascribed to the machines. We can not deny, then, that not only individuals, so far as they are consumers, but also nations in their entirety, have been made richer by the introduction of machinery. — 2. But when we come to consider the distribution of this additional wealth, the advantages of machinery, particularly for the lower classes of wage laborers, are much more questionable. They gain, of course, in their capacity as consumers, and those political economists go too far who overlook the advantage of cheaper clothing and of similar articles of necessity. And yet in highly cultivated lands, where a well-developed division of labor compels the choice of a calling for life, no important machine can be introduced without driving some laborers out of their accustomed field of action. We must remember, however, that machines do not necessarily diminish the demand for laborers, taking the country as a whole. As a rule they open a new demand in one place while they close the old demand in another. The manufacture of the machines themselves requires a large number of laborers. If the demand for the products increases largely, more laborers are

needed in preparing the raw material, in the work of transportation, etc., etc. The actual expansion of any branch of industry which is owing to machines occasions the expansion of other branches which can employ the surplus laborers. If cotton fabrics sink one-half in price, all consumers have one-half the sum of their former expenditures on these commodities available for some other purpose. Different consumers will use it in different ways. One will employ it in purchasing other satisfactions, another in enlarging his business, still another in increasing his income-yielding investments, *i. e.*, as a rule in increasing his loans for productive purposes. In each case a new demand for laborers will ensue, though in very different degrees according to circumstances—to a greater degree, for instance, if the capital saved is applied in building a railroad than if employed in the purchase of foreign wines. Only in case of wanton destruction or idle hoarding of the sums saved would it be possible for no new demand to arise—cases of rare occurrence in machine-using countries. This removal of the laborers to new fields is made much easier for them by the fact that the most effective machines are generally the most costly, and gain ground, therefore, but slowly. The effectiveness of a machine has often caused such an expansion of certain industries that the demand for laborers even in those industries has been actually increased. If for a given quantity of commodities three-fourths of the laborers become superfluous, but the market increases more than fourfold, the demand for laborers in that very industry will become greater. The simple fact of the enormous increase of laborers in all branches of modern industry proves that the use of machinery may increase the demand for laborers. Nor is it true that machinery has lowered the wages of laborers. The English cotton spinner in 1804 could buy with a certain number of hours' labor 117 pounds of flour or 62 pounds of meat; a spinner of the same grade could buy in 1850 with the same number of hours' work 320 pounds of flour or 85 pounds of meat. And it is still true that the English agricultural laborer is more poorly paid than his brother, the factory operative. — We can not always expect such a development. If those who are most immediately benefited by the invention of a machine consume their advantage, reckoned as capital, unproductively, the machine might permanently diminish the demand for labor. On account of the cost of raw material the price of manufactures can not fall in the same ratio as labor is saved by the machine. Whether, therefore, the market can be enlarged to the same or a greater extent depends upon the ability of the remaining branches of the national industry to furnish an increased supply of equivalents; for it is only such a supply of equivalents that constitutes an effective demand. This presupposes also a nation which makes use of the possibility of saving for the actual increase of its capital, and can be spurred on to greater activity by the prospect of more enjoyment. It depends, indeed, ultimately upon the supply of raw material and of the provisions of the laborers. Every industry contains within itself the guarantee of its further progress only in so far as it can exchange its increased production for an increased quantity of raw material and provisions. It is, therefore, the expansive abilities of internal agriculture or of foreign commerce in raw material which determines the answer to this question. The rate of wages depends on the relation between the supply of labor and the demand for it. The supply is, of course, not immediately affected by the introduction of machinery. So far as the demand is concerned, the possibility of its becoming greater is assured by the fact that every economically successful machine increases the national wealth. On the other hand, we must not close our eyes to the fact that the actual demand for labor within the limits of possibilities depends on the will of the enterprisers and the consumers. And indeed the immediate effect of a labor-saving machine is to make capitalists less eager for labor, and laborers more eager for capital. The demand for labor is conditioned not so much by the amount of fixed capital as of that which is circulating. But the construction of a machine means the conversion of circulating into fixed capital. In all such cases, therefore, there are very different and often opposite forces at work, of which now one and now another prevails. The more the middle class, with its modest but extensive consumption, prevails in a people, and the more the newly discovered machines further the production of objects of necessity used by the laboring classes, the more reasonable becomes the hope that wages generally need not sink in consequence of the introduction of machinery. — But even under the most favorable circumstances it will be impossible to introduce any important machine without doing some injury. How many laboriously-acquired arts become in such cases superfluous! Rude clod-hoppers, or even children, can take the place of the strong and skillful laborer. The previous advantage of the latter, forming the main part of his capital, is thereby destroyed. Elderly persons rarely have the necessary elasticity of body and mind to pass from their former business into a new one, even if the latter, considered in itself, is just as easy and pleasant as the former. Perhaps hand laborers do not recognize soon enough how irresistible the revolution is; they hope for a long time to be able to maintain themselves by the side of the machine; they expend the best years of their life and all their savings in endeavoring to do so, and in this way miss every opportunity of getting into some other field. The more rapidly the inventions follow one another, the more frequently do these evils recur; and even the manufacturers themselves are often injured by their old machines, losing a large part of their value through the

invention of new and better ones. This dark side of machinery is not seen in cases where the branch of industry which is to be furthered by it has not hitherto existed in the country; for no laborers are interested in the continuance of the incomplete method. On a Robinson Crusoe's island even the most effective machine would do no damage. We see an illustration of this in the colonies of the European countries. For the same reason, because the laborers could easily change their occupation, because the division of labor was neither so detailed nor so firmly established, the many and exceedingly important inventions at the close of the middle ages made but few men unfortunate or unhappy. — 3. The most injurious influence of machines upon the laborers, and through them upon the national economy as a whole, arises from the fact that they increase the proletary, extensively as well as intensively. They sharpen very greatly the contrast between the rich and the poor in industrial life. Population, as a whole, is generally increased by the introduction of machinery. But this increase occurs mainly in the proletarian population. Every class of men has the tendency to increase the more rapidly, the less the amount considered necessary to the support of a family according to their standard of life. The factory laborer, whose tool is the machine, whose workshop is the factory, who receives his raw material from his employer, and his fixed daily or weekly wages from the same person, does not need any capital to commence business. He contributes nothing to production but his own personal labor, and, indeed, the more complete the machine, the more highly developed the division of labor, the earlier and the easier does he become ready for labor. Most factory laborers are almost as far along at twenty as they can ever hope to get. Why and how long shall they postpone the enjoyment of connubial pleasures? If the brides are also employed in the factories, which tends more and more to become true, then no increase of expenses immediately follows marriage. They hardly need dwellings; they need mere sleeping places, for during the day they live in the factories. Children, in their early years, increase the family burdens, but they soon become able to work in the factories, and are then sources of income. In this way it is not much more trouble to rear a large family than a small one—a circumstance which must increase the number of children the more rapidly, from the fact that those children who once enter the factories rarely ever leave them. — In the idea, which we nowadays connect with the word "proletary," the lack of any prospect of improvement in the future forms one of the most important and disheartening elements. Most factory laborers receive wages enough to enable them to save if they would. But experience proves that they are but seldom inclined to do so. Men will not save to any great extent unless they can employ their savings profitably. Factory laborers find great difficulty in doing this, as they are not much inclined to trust the administration of their savings to others. One would think that the repeated interruptions to factory labor from panics, crises, etc., would impress upon the laborer the necessity of laying by a penny against a rainy day. But crises are irregular. Years may pass without a single day being lost, then come years of depression where the machines are run on half time. The ordinary man is not capable of providing against such emergencies. He yields rather to what he regards as the inevitable; he feeds himself fat in good times, and starves in bad times. Such uncertainty, so far from being a discouragement to population, is very favorable to it. A laborer who needs only a healthy body to support a household easily thinks that his posterity, however numerous, can not be any worse off than he himself — 4. With every step of progress of the factory system the dependence of the laborer upon his employer increases. Pure theory must indeed grant that the factory owner needs in the course of his industry skillful and industrious laborers as much as the laborers need a wealthy and prudent employer. But as a matter of fact this mutual dependence has been thus far a very different one when looked at from different sides. On the one hand the demand for labor on the part of a very few capitalists, on the other the supply offered by great droves of laborers; the employers enabled by their capital to wait their opportunity, for months or even years, the laborers needing employment from week to week. The former need labor in order to make profits; the latter, capital in order to live: the former prudent enough to command a view of all the facts and circumstances of the case, to make their plans accordingly, and to hold to them firmly; the majority of the latter absolutely incapable of any real calculation or planning. And even if there are any wise individuals among the hordes of laborers it is exceedingly difficult to convince the great mass, and still more difficult to execute a plan in the face of hope and fear. How easy it has been for masters to make their resisting laborers unpopular with the public, how very difficult for laborers to do the same for their hard masters! The resolutions of laborers assume almost necessarily a tumultuous or revolutionary character by which even an impartial government is forced to take sides against them, while those of the masters can be taken in the greatest secrecy and are on that account more effectual. Great political and social changes have been necessary in order to make even a few of these relations more favorable to the laborers; such as a far-reaching liberalizing of the state by the extension of the suffrage, freedom of the press, and right of association even in the lowest classes, and consequently a very much greater sympathy not only on the part of the government but also that of educated public opinion with the lot of the laborer, and an increased self-respect on the part of the latter. But even under new conditions the constantly increasing division of labor in the factory

must continually increase the superiority of the directing person, who holds the whole together, as compared with the laborer who forms, as it were, only a small wheel in the great assemblage of machinery. The latter as an individual can be more easily spared than the former. In a word, if every determination of price is to be fixed by a struggle between opposing interests, the contest is, in this case, a very unequal one.—The darkest side of the modern factory system consists in its tendency to loosen the family ties. Many machines require so little human power for their operation that they can be worked by women or half-grown children quite as well as by men. In many cases, indeed, the weak, fine hand is more desirable than the strong and rude one. Now, wherever the labor of women and children is technically as productive as that of men, it is more economical to the capitalist, owing to its much greater cheapness. Even to the families of the laborers themselves the factory work of mother and children is a temporary advantage, if we regard only economical or rather mammonistic considerations. But it is not so in the long run. It is well known that the living expenses, not only of the actual laborers but also of the rising generation, form the minimum below which the rate of wages can not permanently sink. If it falls below this level, laborers fail to keep their ranks full; and if the demand for labor remains the same, wages must rise. Now, the labor of wife and child lowers this minimum below which the wages can not permanently fall. The father can now earn less and still maintain his family. If all laborers would use this opportunity to raise their standard of life, this condition might be maintained. But if they employ it, as experience proves they probably will, to marry earlier and to produce children still more recklessly, they increase the competition in their own field, and the rate of wages will fall to this new and lower minimum. We have already seen that the labor of wife and children is one of the most important incentives to a thoughtless and proletarian increase of population. When this influence has had its full effect, instead of better fed, better clothed and better trained laborers, we simply have more human beings who have sacrificed their childhood and their domestic happiness without obtaining anything more than they had before. And what have they lost withal? If the father ceases to be the supporter of the family, the most natural and undoubted basis of his parental and marital authority is threatened. Here are realized the diseased utopias of the friends of woman's rights —the woman devoted to the same pursuits as the man, independent as he—as a consequence, an enormous number of "wild marriages." No less ruinous is the early economical independence of children who are neither intellectually nor bodily ripe for it. The monstrous and growing importance of saloons and grogshops stands in connection with this loosening of the family ties, in the relation not only of consequence but also of cause. How can the laborer love his home, when in the evening he finds no warm and pleasant sitting room, and at noon no dinner because the housewife must be in the factory all day long? But where love does not bind the family together, it too often happens that the weaker members are abused by the stronger. For selfish parents the most convenient course is to neglect the younger children and exploit the labor of the older ones to the utmost—certainly not a highly developed but a thoroughly diseased division of labor. — The hygienic evils of machinery have often been exaggerated And yet apart from the disadvantages of the extremely one-sided bodily activity necessary for most factory operations, the tendency to the overworking of children is very injurious, and the great number of wounds to which laborers are exposed when working about machines constitutes a serious evil. The general question as to the morality or immorality of factory laborers as compared with other classes has been often discussed, but without any valuable results. The statistics of crime have not been collected with sufficient care and in sufficient detail to make any conclusion based upon them of any value. The crimes of cities are of a different kind from those of the country, but we can not prove from present facts that they are greater or more numerous. — 5. With such evils incident to machinery we need not be surprised that voices have been loudly heard among hand laborers calling for the repression of machines, particularly of new machines. So long as labor was of infinitely more importance in the national economy than capital, so long as the chief industrial cities were ruled by the guilds, even the government used to proceed against new machines under certain circumstances. At a later period, however, when capital and higher intelligence had become more important and more indispensable, the authorities ceased to lend their aid to the jealousy of the laborers. During the eighteenth century the English government often made restitution when the so-called Luddites had destroyed new machines. That envy, however, continued to show itself in private persecution and even in public disturbance for a much longer time. How short-sighted such an opposition to machinery is, becomes evident from its logical consequences. Whoever opposes every device which makes it possible to reach a given end with less human labor, ought to have all transportation carried on by human beings on natural roads, and to condemn all agriculture to be mere scratching of the earth with the finger nails. The widest limits between which the wages of labor may rise and fall, but which they can never permanently pass, and which are determined by the efficiency of labor itself, are enlarged by every new application of machinery. Only in this way is it explainable that English capitalists can afford to pay higher wages and yet sell their products more cheaply than their brothers on the continent. Again, it is wrong to suppose that the many dark sides of

modern industry could not exist without machines. The very uniformity of machines forms a strong barrier to all merely capricious abuse of the weaker. Machines have made the relation between master and laborer less changeable and arbitrary, and therefore, as a rule, morally better, in that they form, on the one hand, a means of bringing troublesome laborers to terms, and, on the other, compel the capitalists to keep their factories running even in dull times, if they do not wish to see their capital invested in machines completely idle, or indeed perish by rust. Besides, the large capitalist (and only he can employ machines to any great extent) can better afford to be generous than the man of small means; and the more prominent a man is, the more he is exposed to the influence of public opinion. Further, we can not deny that machines have relieved men of many mechanical and unhealthful kinds of labor. It is sufficient to compare in this connection the attendance of a water, wind or steam mill with the labor of an ancient corn-grinding slave, or the sailor of a modern sail or steam ship with the oarsman of a galley. If machines, then, up to the present time have diminished the toil of the human race but little or not at all, the reason does not lie in any necessity of nature, but in the social imperfection of man. And the lack of forethought of the lower classes is certainly as much to blame for this as the hardheartedness of the higher classes. It is undoubtedly owing also in part to the fact that modern governments have until very recently unduly favored large industries at the expense of smaller.—6. Many of the plans for improvement amount to nothing more than a proposal that the state shall make a deduction from the profits of the capitalist and add it to the wages of the laborer. This means communism. We may mention three objections to any such plans, without going further into the discussion of communistic theories. Such measures could be helpful only on three conditions: 1, that they should be universal. For if one country alone tried them, capital and brains would emigrate to more favorable localities, and thus leave the laborers worse off than before. 2, that the capitalists should be very numerous and all very wealthy. Neither the one nor the other is the case. Of a hundred manufacturing enterprises which are set on foot, only ten ever amount to anything. Diminishing profits largely would simply send them to destruction faster than ever, and thus increase the power and influence of the few successful ones. 3, that the increase of population should be relatively slower than the accumulation of capital. Compulsory deductions in favor of the laborers would tend to make it increase more rapidly, and the greater the deductions the more unfavorable the result.—Other plans have been proposed which smell too much of the study-lamp to have much prospect of success in practical life. The idea of Sismondi that the capitalists should be bound to take care of their sick and aged laborers, is one of these. The logical outcome of such a plan would be a return to the institutions of the middle ages, which, however beneficent they may have been in their time, have showed themselves unable to exist under modern conditions. The fact that they have fallen away of themselves, decayed internally, not battered down from the outside, proves the impossibility of their resurrection. Some have thought that if the laborers were made participants in the profits and loss of the industry they would be great gainers. Aside from the difficulty of devising any plan of realizing such participation, the fact above mentioned, in reference to the large percentage of failures and bankruptcies in manufacturing enterprises, shows clearly that the laborer would not be much, if any, better off. Co-operative association is, according to some, the panacea for all industrial evils. But the history of co-operation can not be said to be very encouraging. The conditions of modern industry are such that a large business can be successfully carried on under ordinary circumstances only by a close and systematic organization such as associations of laborers are hardly capable of realizing, let alone establishing and maintaining. Whatever effectual remedy may finally be found, certain measures can be undertaken and successfully carried out which may alleviate much of the misery and remove some of the abuses of modern industry. The state can interfere to protect the most helpless classes—children and women—and compel capitalists to observe provisions in reference to the situation, arrangement and ventilation of factories, etc. Nearly all civilized nations have commenced this work, and some have carried it on to a great extent —If a nation is in process of transition to a higher stage of civilization, all the elements of that civilization, looked at from below, appear in the most rosy light. After a nation has once reached that stage it becomes aware that on earth at least there is no unclouded happiness. Men soon forget the pressure of old conditions and exaggerate that of the new. The short-sighted and despairing advise the throwing overboard of all civilization in order to destroy forever its evils—an advice whose ruinousness is only exceeded by its impracticability. The only true remedy consists in developing to their fullest extent the good elements of a higher civilization, with the hope that in a thoroughly healthy society they will so far outweigh the bad elements as to reduce them to comparative insignificance. (See INVENTIONS.) WILHELM ROSCHER.

E J. JAMES, *Tr.*

MADAGASCAR, a large island in the Indian ocean, separated from eastern Africa, by the Mozambique channel, in which are situated the four islands of the Comoren group (Angarija, Mo'ly, Anjouan and Mayotte). Its axis, directed from north-northeast to south-southwest, is about 300 French leagues in length, while its average, but very variable, width is only eighty leagues.

The coast is greatly subject to marsh fevers, during a part of the year; the country rises by a succession of mountains and table lands to the central plateau, which is perfectly healthy. The height of this region does not appear to be less than 2,000 metres, and commands the city of Tananarivoo, capital of the tribe of the Hovas. The coast, winding and irregular, presents a multitude of bays, roadsteads and harbors; the greatest of these indentations is that of Diégo-Souarez, at the north, near Cape Amber. Madagascar by its position commands both routes to India, that by the Red sea, and that by the cape, and owing to the trade winds has easy communication with the islands Reunion and Mauritius, situated 150 French leagues to the east, in the middle of the Indian ocean. Hence its political importance, well understood to-day, one which increases the economic value which it receives from its mineral, vegetable and animal resources. Rice and cattle are the principal articles of commerce. — Madagascar is estimated to contain three or four millions of inhabitants, divided into a multitude of tribes, among which only two have acquired an historical name: the Sakalaves, extended over the whole western coast, and the Hovas, settled on the central plateau, in the district of Emyrne; the first of African origin, the second of the Malay race. The latter, either through their own genius, or the topographical conditions which have excited their activity, acquired, at the beginning of the nineteenth century, a marked preponderance, under the reign of Radama I., who was favored in his projects by the French and the English who appeared at his court. Owing to their counsel and their assistance, he not only subjected to his power the numerous tribes which had been independent up to that time, but he made his people acquainted with the elements of civilization: schools, manufactures, etc. Under the reign of his widow, Ranavalo, who succeeded him in 1828, all moral and religious progress was nearly suspended, but commercial relations kept up the unbroken interchange of ideas, as well as products, which seem to justify the recognition made by France and England, in 1861, of Radama II., son of Ranavalo, as king, not only of the Hovas, but of Madagascar, although a great number of tribes were free from his authority. — The island of Madagascar, after having been visited by the Portuguese, the English and the Dutch, who did not remain there, was approached with plans of final settlement, by the French, in the course of the seventeenth century. A company, to develop its wealth, was formed as early as 1637, and received from Louis XIII., in 1642, the privilege of trading. The numerous trading stores and forts became the instruments of development, and the island even received the name of *Oriental France*. During two centuries, the French flag was maintained alone, with vicissitudes of checks and reverses; and if it was necessary to abandon the French posts, in 1831, the establishment of Sainte-Marie remained in the hands of France, as a permanent declaration of French rights and intentions, that is, rights of sovereignty, not in the sense that France laid claim to the ownership of all the island with reference to the natives, and as mistress of their fortune, but sovereign with reference to foreign powers, which were not to found establishments there without the permission of France. As to her relations with the natives, the treaties which she concluded at different times with the Sakalaves of the western coast, for the opening of ports and the freedom of trade, testify clearly that France never intended to impose her authority by force on all the inhabitants. It does not even appear that the recognition of the chief of the Hovas, as king of Madagascar, implied an express renunciation of the historic rights of France. In the absence of the official version, the most authentic accounts assure us that the representative of the emperor accompanied his recognition with this declaration, "that the emperor, Napoleon III., in recognizing Radama as sovereign of the island, hoped never to be forced again to vindicate the rights of France." — Be this as it may, the elevation of this prince to power, in the month of August, 1861, was followed, as we have said, with two treaties of friendship and commerce, concluded the one with France, the other with England, whose delegates assisted at his coronation. The treaty with France was dated Sept. 12, 1862, concluded at Tananarivoo, between Capt. Dupré in the name of the emperor, and three personages of the Hova court in the name of the king (the commander-in-chief, the minister of foreign affairs, the minister of justice). It comprises twenty-four articles, then an additional article, abolishing import as well as export duties, and was promulgated by imperial decree of April 11, 1863. (*Bulletin des Lois*, 1102, No. 11,089.) The treaty with England is dated at Tananarivoo, Dec. 5, 1862; the negotiator on the side of England was Thomas Conolly Packenham, consul of her Britannic majesty; the representatives of Radama were the commander-in-chief (Rainilaiarivony), the minister of justice (Rainiketaka) and three secretaries of state in the ministry of foreign affairs (Ramarinako, Razanakembana and Clement Laborde, Jr.). The principal clauses of these treaties, which are almost alike, are as follows: Continual peace and perpetual friendship; reciprocal liberty of entering, residing, traveling and trading in the country; a guarantee of privileges, immunities and advantages granted to the most favored nation; freedom of worship recognized to the Malgaches; reciprocal duties on tonnage and importation; abolition of all prohibition of importation and exportation; jurisdiction over foreigners reserved to foreign consuls; inheritances, goods of shipwrecked persons given to those having rights of foreigners. — At the same time that King Radama signed the treaty with France, he ratified and signed a great concession of lands and industries which, some years before, when he was only heir apparent, he had

accorded to Lambert, his representative in France. For the development of this wealth a joint stock company was formed in Paris under the name of *Le compagnie de Madagascar financière, industrielle et commerciale*, and authorized by imperial decree of May 2, 1863. Baron de Richemont, senator, was appointed governor. An exploring expedition was immediately organized, which departed about the end of May, 1863, with Lambert and Dupré, bearers of the ratification of the treaty by the emperor. On arriving in the Indian ocean, the plenipotentiary of France heard of the terrible revolution of the palace which had been accomplished at Tananarivoo during his absence. May 12, King Radama, with thirty of his favorites, were strangled by the party of the former officers and Hova aristocracy, who wished to regain the power and prestige they enjoyed under Queen Ranavalo. His wife, Rabodo, had been proclaimed queen of Madagascar under the name of Rasoherina, and had sworn to a species of constitution. Dupré arrived in the waters of Tamatave during the month of July, and announced to the court of Emyrne that he was the bearer of a ratified treaty, the execution of which he required, as well as the Lambert charter, which a company had acquired. The Hova government refused, unless important modifications were made. After useless negotiations, Commander Dupré was obliged to leave the harbor of Tamatave, convinced of the definite check of his pacific and diplomatic policy, through the persistent opposition of the Hovas. The French consul withdrew. Political relations were interrupted and commercial relations were again restricted by the establishment of customs duties. The influence of the French, grown weak since the death of Queen Ranavalo, and which the treaty of 1862 had re-established only on paper, was henceforth reduced to nothing. The Malgaches went so far as to destroy the manufactory of arms established by a Frenchman, which was called by the queen "the indestructible beauty." The French government still thought of recovering some credit at the court of Tananarivoo. We find in the yellow book, of 1867, that the revision of the treaty of 1862 had been resumed under conditions which justified the hope that the queen would cease to guard the unexplored wealth of her kingdom from the pacific conquests of commerce and industry. The queen, in fact, seemed to consent to a resumption of negotiations; she had brought out from the sanctuary the statue of Kelimalaga, the goddess of international relations, when she died suddenly (1868), and the project was not carried out. Her cousin, Rauroma, succeeded her under the name of Ranavalo II., and the credit of Europeans was strengthened only in one case, which was moreover creditable to their humanity. They succeeded in saving the lives of the authors of a conspiracy formed under the direction of the former ministers of Radama. But these unfortunates were nevertheless confined in a cave where several of them died of hunger. Their wives and children were reduced to slavery; and their goods confiscated. Such was the custom of the country. We mention this fact to show the state of civilization of the Hovas, under one of its aspects. Their religion, their social hierarchy, their penal laws, date from what might be called organic paganism; and in considering the Hovas we might cite as a corresponding example the kingdoms of Italy in the time of Romulus, or those of India at the beginning of Brahmanism, if we had not to take account of their race, which is much less elegant, less artistic and less philosophic than the nations of classic paganism, and much less progressive also. Hence the Hovas would require a number of years, impossible to be determined, to arrive at western civilization, if the latter did not come to them from abroad, and come with as few chances of being accepted as possible, which may be understood from their inferiority. — The Hovas are of the Malay race similar to the population of southern India, Malacca, the Moluccas and the northern islands of Oceanica. This race was transplanted to Madagascar, but the time and circumstances of this transplanting are not known. It is more or less mixed with Caffre, Arab and Malgache elements. A people arrived at this degree of complicated civilization, is perhaps less accessible to a superior civilization than an altogether barbarous one. The Hovas, imbued with the feeling of their own superiority, hostile to strangers, form an aristocracy of a very positive turn of mind, full of resources in politics: generally some noble family has control of the king or the queen, and its influence is the better received by the rest of the nation, the more it succeeds in excluding foreigners. — Slavery was abolished in Madagascar by a proclamation dated June 20, 1877.

JULES DUVAL.

MADISON, James, president of the United States 1809–17, was born at Port Conway, Va., March 16, 1751, and died at Montpelier, Va., June 28, 1836. He was graduated at Princeton in 1771, was admitted to the bar, was a delegate to the continental congress from Virginia 1780–83 and 1786–8, and to the convention of 1787 (see CONSTITUTION), and was a democratic congressman 1789–97. He was secretary of state throughout Jefferson's two terms of office, and on his retirement was elected president. (See FEDER-

ALIST; KENTUCKY RESOLUTIONS; CONSTRUCTION; ADMINISTRATIONS; EMBARGO; CAUCUS, CONGRESSIONAL; CONVENTION, HARTFORD; HENRY DOCUMENTS; DRAFTS, I.; SECESSION, I.; DEMOCRATIC-REPUBLICAN PARTY, I.–III.; UNITED STATES.) — Madison's part in the adoption and ratification of the constitution, and in the organization of government under it, was very large and indeed essential. As soon as the government was fairly organized he took place as Jefferson's most confidential lieutenant in the formation of the republican (democratic) party, and from that time until 1817 his history is closely identified with that of his party. — Madison's ability as a political writer will not be questioned by any one who has read his writings; but his ability was rather judicial than polemical. He never fairly entered the lists against Hamilton but once, in 1793, when Jefferson had written to him thus urgently: "Hamilton is really a colossus to the anti-republican party. When he comes forward there is nobody but yourself who can meet him. For God's sake, take up your pen, and give a fundamental reply to Curtius and Camillus." It must be admitted that in this encounter Madison was very decidedly worsted. Outside of polemics, however, his style is always plain, strong, frank and convincing; and his state papers are of the first rank. — As president, Madison held a different position from any of his three predecessors, "Washington, who ruled superior to party; Adams, who ruled in spite of a party; and Jefferson, who ruled at the head of a party." Madison may be considered the first of the presidents who have been the exponents of a party. It is very certain, for example, that "Mr. Madison's war," as the federalists often called the war of 1812, did not draw its inspiration from Madison at all, even if doubt be cast upon the story that he was forced into it by the democratic leaders in congress. In this, as in many other similar instances, he was the first president to yield in practice to the Jeffersonian theory, as applied to the executive. — See Adams' *Life of Madison;* Rives' *Life of Madison;* Madison's *Writings;* McGuire's *Private Correspondence of Madison;* 5 Elliot's *Debates;* 2 Schouler's *United States*, 279; Madison's messages in the *Statesman's Manual;* and authorities under DEMOCRATIC-REPUBLICAN PARTY, I.–III. ALEXANDER JOHNSTON.

MAGNA CHARTA, the great charter which was granted by King John to the barons of England at Runnymede, A. D. 1215. — With this great charter of personal liberty begins the true history of the English nation, for, as Lord Macaulay relates, the history of the preceding events is the history of wrongs inflicted and sustained by various tribes, which indeed dwelt on English soil, but which regarded each other with aversion such as has scarcely ever existed between communities separated by physical barriers. John having been defeated by Philip of France and driven from Normandy, the Norman nobles were compelled to make England their home. Confined by the sea with the people whom hitherto they had despised and oppressed, they at length began to regard England as their country and the English as their countrymen, and the two races so long hostile found they had common interests to unite them and common enemies to overcome. Both were oppressed by the tyranny of a wicked and despotic king, and the descendants of those who had fought under the Norman William and the Saxon Harold began to intermarry and form closer bonds of union, until the final pledge of their perfect reconciliation was the great charter framed for their common benefit and wrung from their perfidious king by their united and determined exertions. — However circumscribed had been the liberty of the Anglo-Saxons under their ancient form of government, by the introduction of the feudal law into England by William the Conqueror, the whole people had been reduced to a state of vassalage, and their freedom so effectually suppressed, that a great part of them had been cast into a state of abject slavery. At the same time, under John, the Norman barons were compelled to submit to such absolute prerogatives of the sovereign as virtually divested them of that rank and those privileges which men of their class had always enjoyed, and which with bloody valor they had always defended. The power of the crown, long wielded with relentless force, was not easily reduced. Henry I., to aid in excluding his elder brother from the throne, had granted the people a charter in many respects favorable to the personal liberty of the subject. Stephen had renewed and Henry II. confirmed this charter. The king, however, had always ignored its provisions, and exerted the same unlimited authority over the lives and liberty of his subjects. There was a single exception to this stern authority of the sovereign. Arms still remained in the hands of the barons and people, and by combining their power in a settled and united purpose, their liberties might still be vindicated. The oppressions and insults of their rapacious king becoming no less odious to the barons than to the people, and finally enraged at his licentious exactions upon their families as well as his despotic demands upon themselves, they resolved to strike a bold and determined blow for the restoration of their privileges. — Accordingly, immediately after the Christmas holidays in the year 1215, the barons assembled in London, and taking a copy of the charter granted by Henry I., which Langton, the archbishop of Canterbury (who favored their cause), had found in a monastery, they presented it to the king and demanded that he should grant them a renewal of Henry's charter and a confirmation of the laws of St. Edward. To gain delay, the king promised a reply to the barons' demand at the following Easter. The barons assented to this proposition and peaceably retired to their castles, which they provisioned and garrisoned. On the approach of the Easter

festival they assembled a force of two thousand knights, besides innumerable retainers, and advanced to Brockley, near Oxford, the king's residence. At this point they received a message from the king, through the archbishop of Canterbury and the earl of Pembroke, demanding to be informed what those liberties were that they so zealously exacted. Through the king's messengers they presented to him a schedule of articles containing their demands. The king indignantly and imperiously rejected this petition from the barons and people. Immediately thereupon the barons elected Robert Fitz-Walter their general-in-chief, and declared war upon the king. They besieged the castle of Northampton for fifteen days; marched through the gates of Bedford castle, willingly opened by William Beauchamp, its owner; advanced to Ware and held a consultation with the chief citizens of London; and thence to London, where they received a welcome from all the people. From London they made incursions upon the king's domains, and laid waste his parks and palaces. Upon issuing their proclamation to the barons, those who had hitherto preserved a semblance of sustaining the king deserted the royal arms and openly espoused the cause they had in secret always favored. Stripped of his military strength and support, the king was finally obliged to submit to the demands of the barons whom so recently he had spurned from his presence. A conference between the king and barons was appointed at Runnymede, between Windsor and Staines, a place which from this fact has become noted in history. The two parties with their retinues encamped opposite each other, as if in hostile array. After several days' discussion, the king finally signed the charter on the twelfth day of June, A. D. 1215, with great ceremony and solemnity. — The instrument as first drawn by the barons did not contain all of the provisions which were finally embraced in the great charter. It was at first drawn in the interest of the clergy and nobility alone, and did not comprehend that of the people. By this instrument the freedom of the clergy was assured in elections, and the former charter of the king was confirmed by which the royal assent for *leave to elect* and confirmation of such election, was rendered unnecessary. All restraints upon appeals to Rome were removed; no one was to be prevented from leaving the kingdom at his will; and all fines imposed on the clergy, from any cause whatever, were to be in proportion to the amount of their estates and not to benefices attached to their ecclesiastical positions. — To the barons this instrument guaranteed abatements in the rigor of the feudal law. The fine or composition known to the feudal law as a *relief*, which the heir of a deceased tenant paid to the lord at the death of the ancestor, for the privilege of taking up the estate which on strict feudal principles had lapsed or fallen to the lord on the death of the tenant, was established at fixed rates—a knight's at a hundred shillings; an earl's and baron's at a hundred marks, and if the heir to an estate be a minor, he should enter upon it without paying any *relief*, immediately upon attaining his majority. It was ordained that the king should not sell his wardship; that he should only levy reasonable profits upon the estate, without committing waste or injuring the property, and that he should uphold the castles, houses, mills, parks and ponds; and should he commit the guardianship of the estate to the sheriff or any other, he should first oblige him to find proper surety for the protection of the property. While the lands of a minor were in wardship, and not in his own possession, he was not to be obliged to pay any interest on any debt contracted with a Jew. Heirs should be married without disparagement, and before the contraction of the same the nearest relations of the person should be notified of it. A widow should enter upon her dower (a third part of her husband's rents) without paying any relief. She should not be obliged to marry as long as she chose to remain single, and should only give security not to marry without her lord's consent. It was further ordained that the king should not claim the wardship of any minor who holds lands by military tenure of a baron, on the assumption that he also holds lands of the crown by socage or any other tenure. Scutages should be estimated at a rate the same as in the reign of Henry I., and that no scutage should be imposed except by the great council of the kingdom, save in three general feudal cases, to wit: the king's captivity, the knighting of the king's eldest son, and the marriage of his eldest daughter. (A scutage was a tax or contribution levied upon those who held lands by knights' service, originally, a composition for personal service which the tenant owed to his lord, but afterward levied as an assessment. *Blackstone.*) On summoning the great council of the kingdom, prelates, earls and great barons should be called to its session by a particular writ, and the lesser barons by a general summons of the sheriff. The land of a baron should not be seized by the king to satisfy a debt to the crown, if the goods and chattels of the baron were sufficient to discharge the debt. No man should be compelled to perform more service for his fee than he is bound to by his tenure. No knight should be forced to give money for castle guard to a governor or constable of a castle if he be willing to perform the service in person or provide another able-bodied man in his place; and should the knight be in the field himself by order of the king, he should be exempt from all other service of this character. No vassal should be permitted to sell so much of his land as would incapacitate him from performing his service to his lord. — The foregoing were the principal articles of the charter as first drawn by the barons. They were prepared entirely, it would appear, in the interest of themselves and the clergy. Had the charter contained nothing further, in the interest of the people, it would not have promoted the national happiness and freedom, as it would

have resulted alone in augmenting the power and independence of a class already in authority, whose rule might thereby become more absolute and burdensome than that of the monarch. In fact, it would have been merely granting liberal powers and privileges to the kings, clergy and barons by royal charter, while the rigor of Norman feudal law remained in all its repugnancy toward the people, and not the restoration of the laws of Henry 1. to the nation, and the adoption of those other great principles of liberty forming the groundwork of English constitutional law, which have been characterized as an engrafting of Norman feudalism on the "ancient customs of England," such as previously existed under Saxon and Danish free institutions, and in which "ancient customs" were embraced the liberal laws of Edward the Confessor. — The people, however, perceived this weakness of the charter and demanded that other articles, relating particularly to their personal freedom, should be inserted, without which it would have proven of little benefit to themselves and could not have obtained their support. The barons, who relied upon the concurrence of the people to enforce their own demands upon the king, and without which aid they were in a great measure powerless, were thus compelled to insert other clauses of a more extensive and beneficent nature, comprehending the interests and benefits of inferior ranks of men. It was therefore ordained by the charter that all rights and immunities granted to the barons by the king should in like manner be extended by the barons to their inferiors, vassals and dependents. That the king should bind himself not to grant any writ authorizing a baron to levy aids from his vassals, save in the three enumerated feudal cases. That one weight and one measure should be established throughout the kingdom. That merchants should be permitted to transact all business without the infliction of arbitrary tolls and impositions, and that they and all free men should not be debarred from departing from and returning to the kingdom at pleasure. That the ancient liberties, privileges and free customs of London and all cities and burghs should be preserved. That tributes should not be imposed upon them except by the great council of the kingdom. That no town or individual should be obliged to build or support bridges but by ancient customs. That every freeman should be permitted to dispose of his goods according to his own will, and if he die intestate his heirs succeed to them. That no horses, carts or wood should be taken by any officer of the crown without the consent of the owner. That the king's courts of justice should no longer follow him about the kingdom, but should be permanently located; that they should be open to all, and that justice should be no longer refused, delayed or be sold by them. That circuits should be held regularly every year; and that inferior courts of justice—the county court, sheriff's term and court-leet—should meet at their appointed time and places. (A court-leet in English law is a court of record held once a year, in a particular hundred, lordship or manor, before the steward of the leet. *Blackstone.*) That sheriffs should be deprived of the power to hold pleas of the crown, and should not put any one upon trial from rumor or suspicion, but upon the evidence of lawful witnesses. (The office of sheriff in England is judicial and ministerial. His judicial authority was formerly of considerable extent. It is now, however, generally confined to ascertaining damages on writs of inquiry and the like. *Wharton.*) That no freeman should be taken or imprisoned or be disseized of his freehold or liberties or free customs, or be otherwise damaged, nor should the king "pass upon him, nor send upon him, but by the lawful judgment of his peers, or by the law of the land." (In this provision of magna charta was laid the foundation of the writ of *habeas corpus.*) That all who had suffered otherwise in this or the two preceding reigns should be restored to their rights and possessions. That a fine imposed upon a freeman should be in proportion to his offense, and that no fine should be imposed upon him that would prove his utter ruin. That even a villain or rustic should not by any fine be bereaved of his carts, plows and implements of husbandry. This latter clause was the only one inserted for the especial benefit of a class which probably at that time was the most numerous in the kingdom. (Hume's Hist. Eng.) — The incorporation by the people of these latter articles in the charter, not only mitigated the severity of the feudal law toward themselves as well as the nobility, but likewise established justice and equality before the law, confirmed the personal freedom of the subject, and formed the perfect outlines of a strictly legal government. By some historians they are believed to have been those liberal Saxon laws framed by Edward the Confessor. — The king having acceded to these demands of the barons and people, other guarantees were required as a safeguard of the great charter. The king was obliged to agree that London should remain in possession of the barons, and the tower be given into the custody of the primate, until the fifteenth day of the following August, or until the execution of the articles of the great charter To insure that the provisions of this charter should be carried into effect, twenty-five members of a council were to be appointed from their own numbers, as guardians of the public liberties, and their authority was not to be limited in either extent or duration. And it was further ordained that if an attempt should be made to violate the charter, either by the king, justiciaries, sheriffs or foresters, four of these conservators should demand of the king a redress of the grievance. If proper satisfaction was not duly made, the council of twenty-five should then be called together, who, with the great council, were granted the power to compel him to observe the provisions of the charter; and in case of resistance on the part of the king, war should at once be levied against

him, his castles attacked and every kind of violence employed save that of personal injury to himself and his family. All subjects without distinction were obliged, under the penalty of confiscation, to swear obedience to the twenty-five barons; and twelve knights in each county were to be chosen by its freeholders, who were to report such violations of the charter as might require redress. — The twenty-five conservators first appointed, and whose names have been preserved in the historical records of the great charter, were the earls of Clare, Albemarle, Gloucester, Winchester, Hereford, Roger Bigod earl of Norfolk, Robert Vere earl of Oxford, William Mareschal the younger, Robert Fitz-Walter, Gilbert de Clare, Eastuce de Vescey, Gilbert Delaval, William de Moubray, Geoffray de Say, Roger de Mombezon, William de Huntingfield, Robert de Ros, the constable of Chester, William de Aubenie, Richard de Perci, William Malet, John Fitz-Robert, William de Lanvelay, Hugh de Bigod, and Roger de Montfichet. In their hands the sovereignty of the kingdom was virtually invested, and in the exercise of executive authority they were by the act placed superior to the king, as in the affairs of government there was hardly anything happening relating to the observance of the great charter that might not under its provisions fall under their authority. (Hume's Hist. Eng.) — At first the king adhered strictly to all of these regulations, however humiliating to his sense of personal sovereignty, and in a spirit of perfect obedience himself sent writs to all his sheriffs directing them to compel every one to swear obedience to the commands of the twenty-five barons. In these acts, however, the perfidious king strove to disguise his ultimate design. To lull the suspicions of those of his subjects who might still doubt his fealty of purpose, he discharged from his service all foreign levies and affirmed that his government should thenceforth be administered in a liberal and lawful manner, conducive to the happiness and independence of his people. His well-formed purpose was, while outwardly observing these forms, to await a propitious moment and by force of arms overcome the barons, and again enslave the people. He secretly dispatched emissaries abroad to gather a foreign army, promising as a reward of their victory over his own people the spoils of his kingdom. To Rome he sent a messenger and placed before the pope a copy of the great charter which his subjects had compelled him to sign. As his feudal lord of the kingdom, he demanded of the pontiff his papal aid and protection. In response to the king's appeals the pope issued a bull abrogating and annulling the whole charter, prohibiting the barons from exacting observance of it and the king from paying any regard to it; absolving the king and his subjects from all oaths imposed for its observance, and excommunicating every one who should persist in maintaining such disloyal and treasonable demands. — Under the sanction of this decree from the Roman pontiff, upon the arrival of his foreign forces, the king endeavored by proclamation to recall the liberties which he had solemnly granted to the people. The primate, however, refused to publish the sentence of excommunication against the king's subjects, and the clergy, the barons and the people all conspired to defend their chartered liberties. The king was therefore compelled to rely solely upon his foreign levies to restore his ancient powers. With remorseless vengeance he ordered these mercenaries to make war upon his subjects and lay waste the estates, manors, houses and parks of the barons. Villages in ruins and castles in ashes followed the torch and marked the track of the barbarous soldiery. Horrible tortures were employed to make the people reveal the hiding place of their treasures. The king marched through the entire extent of his kingdom from Dover to Berwick, and laid waste the provinces on each side of him. The barons, on the other hand, incensed at the perpetration of such acts on the part of their king, made reprisals no less extreme. They rallied in force, devastated the king's demesnes, and with fire and sword laid in blackened ruins the king's castles, parks and palaces. The whole kingdom was ravaged, the people slaughtered, and society reduced to anarchy. (Hume's Hist. Eng.) In the midst of this desolating war the king died. While engaged in assembling a large army with a view of fighting a decisive battle for his crown, and passing from Lynne to Lincolnshire on the seacoast, purposely avoiding the main road, he lost by an inundation of the road all his treasure, carriages, baggage and regalia. This disaster, joined with the distracted condition of his affairs, increased the disease with which at that time he was suffering, and on reaching the castle of Newark he expired, in the forty-ninth year of his age. By his demise the nation was at once disenthralled. — Henry, the infant son of John, succeeded to the throne as Henry III., with the earl of Pembroke, then mareschal of England, at the head of the government as protector of the realm, he having been chosen to that responsible position by a general council of the barons, assembled at Bristol. — At the suggestion of Pembroke, who appears in history as a wise and far-sighted as well as a broad and liberal statesman, the young king granted a new charter of liberties, confirming all that his father had granted, and bestowing, in addition thereto, other and important concessions. This charter was again confirmed by the king the following year, with an additional *article* preventing oppression by sheriffs, and an additional *charter* known as the charter of forests, abrogating the peculiar and arbitrary laws which had for many years oppressed the people. All the forests which had been inclosed since the reign of Henry II. were disafforested and new rules and regulations adopted for passing through them. Capital punishment was no longer inflicted for forestry offenses, but such offenses became henceforth punishable only by fines and imprisonment. Under

this charter the proprietors of lands recovered the right to cut and use wood from their own estates. Thus through revolution was born these great principles of human freedom, and as the historian Hume remarks: "Thus these famous charters were brought nearly to the shape in which they have ever since stood; and they were during many generations the peculiar favorites of the English nation, and esteemed the most sacred ramparts to national liberty and independence. As they secured the rights of all orders of men, they were anxiously defended by all, and became the basis in a manner of the English monarchy, and a kind of original contract which both limited the authority of the king and secured the conditional allegiance of his subjects."

JOHN W. CLAMPITT.

MAINE, a state of the American Union. Its soil was claimed, in May, 1605, by Weymouth for Great Britain, and by De Monts for France. English colonization was unsuccessfully attempted at the mouth of the Kennebec, Aug. 18, 1607, and for thirty years French and English settlements were made mainly by individual enterprise. Aug. 10, 1622, Sir Ferdinando Gorges and others received from the Plymouth company a patent for "Laconia," or the "province of Maine," the territory between the Kennebec and the Merrimac, about one-sixth of the modern state, and the grant was confirmed by Charles II., April 3, 1639. The name of Maine was given either from that of the queen's French province, or as equivalent to the main land, as distinguished from the numerous islands off the coast; the latter derivation is much the more probable. Massachusetts (see that state) claimed this part of Maine under her charter, and, as Gorges was an Episcopalian and a royalist, the commonwealth period in England gave Massachusetts fair opportunity to enforce her claim. Commissioners were sent, who testified, Aug. 1, 1652, that they had found the headwaters of the Merrimac in latitude 43° 40′ 12″; other commissioners fixed the end of a line, due east of this point, in Casco bay; and other commissioners, late in 1652, were successful in inducing the people to "acknowledge themselves subject to the government of Massachusetts Bay." Jan. 11, 1664, Charles II. ordered Massachusetts to restore the Gorges grant to the heirs, or show cause why not, and for some years the authority of Massachusetts was interrupted. In 1668 it was re-established; and in 1678 Massachusetts purchased the title of the Gorges heirs for £1,250. — The duke of York's grant of March 12, 1664 (see NEW JERSEY), included also the territory between the St. Croix and the Kennebec; and this part of Maine was governed by his deputies until the Massachusetts charter of 1691 formally transferred both the Gorges' and the duke's grants to that colony. From the beginning of the colony's history the French in Acadia asserted claims indefinitely westward into Maine, which were the occasion of angry and sometimes bloody disputes, and were not disposed of until the treaty of Paris in 1763 ended the French dominion in Acadia. — After its formal incorporation in 1691, Maine remained a part of Massachusetts for 130 years. A party was formed in the district soon after the close of the revolution, with the object of obtaining a separation, but the movement made no headway until after 1800, when Maine was as steadily democratic as Massachusetts was federalist. The war of 1812 gave a great impetus to the party of separation, for Maine felt the evils of the war severely, and her territory was occupied by the British up to the Kennebec. An act passed by the Massachusetts legislature, June 19, 1819, submitted the question of separation to the people of Maine, who decided in its favor, July 19, by a vote of 17,091 to 7,132. A state constitution was formed by a convention at Portland, Oct. 11–29, 1819, and ratified by popular vote almost unanimously. The state was admitted by act of March 3, 1820 (see COMPROMISES, IV), to take effect March 15. Another act of April 7, 1820, divided the former congressional representation of Massachusetts, giving thirteen representatives to the old and seven to the new state. — BOUNDARIES. I. *Northeast Boundary.* The treaty of 1783, which recognized the United States as a nation, defined the northeast boundary substantially as follows: From the mouth of the river St. Croix, in the bay of Fundy, up the middle of that river to its source; thence due north to the highlands, or watershed, between the rivers of the St. Lawrence and Atlantic systems; thence along the highlands to the northwesternmost head of the Connecticut river; thence to latitude 45° north; and thence due west to the St. Lawrence. Almost every point named was doubtful, except the St. Lawrence river, and the designated parallel of latitude. Massachusetts had always claimed *over* the highlands to the St. Lawrence, and the claim had been supported by Great Britain as against France; but on the withdrawal of France from Canada the British government had made the highlands the boundary in all its proclamations and instructions to colonial governors After the treaty of peace a British claim grew up that the "highlands" were a line cutting across Maine from Mars hill to the Chaudiere The United States, by the evidence of contemporary maps, claimed as the highlands the watershed parallel to the St. Lawrence, and the claim was confirmed, after the final settlement, by the marking on the so-called "Jay map" (see Gallatin's memoir, cited below), which was used by the American negotiators in 1782–3, and apparently by the British negotiator also, since his (Oswald's) line was marked upon it and disproved the British claim. The only contemporary evidence for the British claim was an apocryphal map of Dr. Franklin in a Paris library. Commissioners named under the treaty of Nov. 19, 1794, (see JAY'S TREATY), fixed the true St. Croix and its source, as at present, though Oswald's line took the St. John, much further east, as the

St. Croix. Efforts were made in 1803, in 1814 (by the treaty of Ghent), in 1827 (by a convention to arbitrate), and through a long series of negotiations from 1830 until 1840, to settle the position of the "highlands" and the true source of the Connecticut river; but the only one which came to any hopeful result was the arbitration of the king of the Netherlands, Jan. 10, 1831, under the convention of 1827, and his award was rejected by both parties. In 1838–9 the territory between New Brunswick and Maine, claimed by both parties, became the scene of a small border war. Maine raised an armed posse, erected forts along the line which she claimed as the true one, and the legislature placed $800,000 at the governor's disposal for the defense of the state; an act of congress, March 3, 1839, authorized the president to resist any attempt of Great Britain to enforce exclusive jurisdiction over the disputed territory; and armed conflict was only averted by the mediation of Gen. Scott, who arranged a truce and a joint occupation by both parties. By this time Great Britain and the United States were both ready to abandon the idea of arbitration, and Lord Ashburton was sent to Washington to arrange a compromise line with Daniel Webster, secretary of state. Commissioners were present from Maine and Massachusetts, and the treaty was concluded Aug. 9, 1842. Besides providing for the suppression of the slave trade and for the extradition of fugitives from justice, it fixed the boundary line to the Rocky mountains; granted free navigation of the St. John river to both nations; confirmed grants of land in the disputed territory to those in possession; allowed to Maine and Massachusetts compensation for territory given up, to be paid by the United States; and altered the northern boundary to its position as understood in 1783, thus giving Rouse's Point to New York, and considerable doubtful territory to New Hampshire. — *β. Western Boundary.* The western boundary of Gorges' patent was to be the Salmon Falls river to its source, and thence by a "northwestwardly line" sixty miles. Massachusetts claimed that the line should run due northwest; New Hampshire, that it should only deviate slightly from a due north line. In August, 1737, a board of arbitrators from the counselors of New Jersey, New York, Rhode Island and Nova Scotia decided in favor of New Hampshire, whose eastern boundary was prolonged as at present to the headwaters of the Connecticut. — CONSTITUTION. Slavery had already been abolished while Maine was a part of Massachusetts. (See ABOLITION, I.) The constitution of 1820, which is still the organic law of the state, therefore made no reference to slavery. It gave the right of suffrage to "male citizens of the United States of the age of twenty-one years or upward"; made the election of governor, senators and representatives annual; fixed the number of the lower house at not more than 200 nor less than 100, to be chosen by towns according to population, no town to have more than seven representatives; fixed the number of the senate at not more than thirty-one nor less than twenty, to be chosen by senatorial districts; provided for a council of seven, and ordered them, with the governor, to examine the returns of legislative elections and summon "such persons as shall appear to be elected by a majority of the votes in each district." Twenty-one amendments have since been made, the following being the most important: fixing the number of the lower house at 151 (1841); forbidding the loaning of the state's credit (1848); granting the suffrage to the volunteer soldiers of the state (1865); authorizing the issue of bounty bonds (1868); directing the formation of corporations by general laws (1876); making the term of the governor and legislature two years, and making the governor eligible by a plurality, instead of a majority (1880–81). — GOVERNORS. William King, 1820; W. D. Williamson, 1821; Albion K. Parris, 1822–6; Enoch Lincoln, 1827–8; Nathan Cutler, 1829; Jonathan D. Hunton, 1830; Samuel E. Smith, 1831–3; Robert P. Dunlap, 1834–7; Edward Kent, 1838; John Fairfield, 1839; Edward Kent, 1840; John Fairfield, 1841–2, Edward Kavanagh, 1843; Hugh J. Anderson, 1844–6; John W. Dana, 1847–9; John Hubbard, 1850–52; W. G. Crosby, 1853–4; Anson P. Merrill, 1855, Samuel Wells, 1856; Hannibal Hamlin, 1857; Lot M. Morrill, 1858–60; Israel Washburn, Jr., 1861–2; Abner Coburn, 1863; Samuel Corry, 1864–6; J. L Chamberlain, 1867–70; Sydney Perham, 1871–3; Nelson Dingley, Jr., 1874–5; Seldon Connor, 1876–8; Alonzo Garcelon, 1879; Daniel F. Davis, 1880; Harris M. Plaisted, 1881–2. — POLITICAL HISTORY. The principal reason for the final separation of Maine from Massachusetts was that the district was as generally democratic as the state was federalist. Before the separation the congressmen and local officers of Maine were usually democratic, but the governors and legislatures of the state to which they belonged were federalist. After the separation Maine continued to be a very reliable democratic state until 1854, with the following exceptions. 1. In 1824 and 1828 the electoral vote of the state was given to John Quincy Adams. In 1840 it was cast for Harrison, the whig candidate, but only by a popular majority of 217 out of a total vote of 93,007. In all other presidential elections the democratic candidates had a clear popular majority. 2. In congressional elections the great majority of successful candidates were democratic. The whigs frequently elected two of the representatives, and in 1840 elected four of the eight, and one of the two United States senators. 3. The governors were as steadily democratic with the exception of Gov. Kent (1838 and 1840). — The only important contest of a purely local nature during this period was upon the enactment of a prohibitory liquor law. A law of this nature, commonly known as "the Maine liquor law," was passed in 1851, and signed by Gov. Hubbard. In 1853 a "search and seizure act" was passed, for the confiscation of

liquors. In 1856 this whole system of legislation was repealed, and a license law enacted; but in 1858 the Maine law, in all its parts, was re-enacted, and has since remained in force. An attempt to modify it, in 1879, was lost in the house by a vote of 127 to 17.—From 1850 there were many signs of party disintegration. The whig vote ceased to grow; the free-soil vote began to develop into larger proportions; and a coalition was gradually formed between the whigs, the free-soilers, and various classes of dissatisfied democrats. In 1852–8 there was no popular majority for governor, and the coalition elected Crosby governor, and William P. Fessenden United States senator. Fessenden was the second anti-democratic senator in the state's history, George Evans (1841–7) having been the first. The election of 1854 resulted in the first great overthrow of the democratic party of the state. The republican party elected the governor, the legislature, and five of the six congressmen, and contested the election of the solitary democratic representative. In the following year the whigs and democrats were reduced to the necessity of forming a coalition against the new republican party, and in this fashion succeeded in keeping control of the legislature and electing the governor, Wells (democrat), there being no popular majority for that office. In 1856 the republicans at last secured complete control of the state: they elected the governor, Hamlin, by a vote of 69,429 to 44,889 for Wells, and 6,659 for Patten (whig), all of the six congressmen, a heavy majority of both houses of the legislature, and the second of the two United States senators. — From 1856 until 1878 republican success was almost invariable, in all elections, presidential, congressional and state, the only exception being the election of a single democratic congressman in 1862 from the southwest corner of the state. The democrats had usually from one-fifth to one-fourth of the legislature, though in 1866 and 1867 they had but fifteen and thirteen members out of a total of 182. Even the "tidal wave" of 1874–5, which gave the democrats control of so many other states, had no greater effect in Maine than to increase the democratic proportion of the popular vote 5 per cent., and the democratic members of the legislature to 73; and at the succeeding election both these deceptive increases disappeared.—It was inevitable that such a prolonged and unbroken control by one party should give rise to discontents among its own members. These came to a head in 1878. In the congressional elections of that year the republicans failed to obtain a majority in any one of the five districts. In the three districts to the west of a north and south line through the middle of the state, the republican candidates were elected by a plurality, through the division of the opposition vote between the democratic and "greenback" candidates; in the two eastern districts the "greenback" and democratic voters formally or practically united, and elected their candidates. For governor there was no popular majority, Selden Connor (republican) having 56,554 votes, Garcelon (democrat) 28,218, and Joseph C. Smith (greenback) 41,871. In such case, by the constitution, the lower house of the legislature was to choose two out of the four highest candidates on the popular vote, and from these two the upper house was to select a governor: an arrangement excellently calculated to tempt the formation of a coalition. In this case the lower house, controlled by the democrats and greenbackers, chose Smith and Garcelon, and the republican majority in the upper house selected Garcelon to be governor. In the election of 1879 the three parties nominated the same candidates as in 1878, and the popular vote was substantially the same; but in the complexion of the legislature there was a very important difference. On the face of the returns the republicans had a majority in both branches of the legislature, and would therefore be able to choose a republican governor. By the constitution and laws the governor and council were a preliminary canvassing board, to give original certificates of election to members of the legislature, subject to revision by the two houses after their organization. In a multitude of town elections, irregularities of every description, changes of initials of candidates, and similar errors, were inevitable, and had occurred at every election. After examining carefully the arguments of both sides in 1879–80, one can only come to the conclusion that precedents in abundance for any desired system of canvassing can be found in the annals of the state. In 1879 Gov. Garcelon and his council certainly strained every possible republican precedent to the damage of the republican candidates, and succeeded in making out a "fusion" (democratic and greenback) majority in the lower house, the pivotal point of contest. Jan. 7 1880, Gov. Garcelon's term expired; two days before, he had authorized and directed ex-Gov. Chamberlain, major general of the state militia, to protect the public property until a new governor should qualify; and the state was thus left practically, though temporarily, under military government. The fusion majority of the legislature met and elected officers, Jan. 7, the republicans refusing to take part. Jan. 12 the republican majority, with and without certificates, took possession of the rooms of the two houses; the state supreme court pronounced in their favor; Jan 16 they elected Davis governor; Gen Chamberlain gave up his authority to him; the fusion legislature disbanded, and the Maine *imbroglio* was over. To avoid any such difficulty in future, the constitutional amendment heretofore given, making the governor eligible by a plurality, instead of a majority, was proposed by the legislature and ratified by the people. In 1880 the democrats and greenbackers formally united and nominated Harris M. Plaisted, who was elected in September over Gov. Davis by a plurality, as follows: Plaisted, 73,713; Davis, 73,544; scattering, 545. In November the republicans secured the electoral

vote of the state, three of the five congressmen, and a majority of both branches of the legislature. The popular vote for presidential electors was 74,039 republican, 65,171 fusion, and 4,408 greenback. The two congressional districts carried by the fusionists were the same districts which they had carried in 1878. The legislature in 1882 is as follows: senate, twenty-two republican, nine fusion; house, eighty-four republican, sixty-seven fusion. — Among the prominent leaders in state politics have been the following: James G. Blaine, Hannibal Hamlin (see those names); Jonathan Cilley, democratic congressman 1837–8, killed in the Graves-Cilley duel; Nathan Clifford, state attorney general 1834–8, democratic congressman 1839–43, attorney general under Polk 1846–8, and justice of the supreme court 1858–81; George Evans, whig congressman 1829–41, United States senator 1841–7; John Fairfield, democratic congressman 1835–9, governor 1839 and 1841–2, and United States senator 1843–7; William Pitt Fessenden, whig congressman 1841–3, whig and republican United States senator 1854–64 and 1865–9, and secretary of the treasury under Lincoln; Wm. P. Frye, state attorney general 1867–9, republican congressman 1871–7, and United States senator 1877–83, Eugene Hale, republican congressman 1869–79, and United States senator 1881–7; John Holmes, democratic congressman 1817–20, and United States senator 1820–27 and 1829–33; Lot M. Morrill, governor 1858–60, and republican United States senator 1861–77, Albion K. Parris, democratic congressman 1815–18, governor 1822–6, United States senator 1827–8, and state supreme court judge 1828–36; Sydney Perham, republican congressman 1863–9, and governor 1871–3; Thomas B. Reed, state attorney general 1870–72, and republican congressman 1877–85; Israel Washburn, whig and republican congressman 1851–61, and governor 1861–2; and Wm. D. Williamson, governor 1820, and democratic congressman 1821–3. — See 1 Poore's *Federal and State Constitutions;* Sewall's *Ancient Dominions of Maine* (1857); 1 Hazard's *Historical Collections*, 45, 442; 1 Coolidge and Mansfield's *History of New England;* Kohl's *East Coast of North America;* Willis' *Laws, Courts and Lawyers of Maine, History of Portland*, and *Documentary History of Maine;* Sullivan's *History of the District of Maine* (to 1795); Williamson's *History of Maine* (to 1820); Varney's *Young People's History of Maine;* Whitman and True's *Maine in the War;* Abbott's *History of Maine* (to 1875); 19 Appleton's *Annual Cyclopædia*, 743 (opinion of supreme court in 1880); (NORTHEAST BOUNDARY) *Documents relating to the Northeast Boundary* (1828); Vose's *Northeast Boundary* (from 75 *North American Review*); *Northeastern Boundary Arbitration;* 13 Benton's *Debates of Congress*, 679, 754; 14 *ib.*, 103, 143; 5 Webster's *Works*, 81; 6 *ib.*, 288, 350; Gallatin's *Memoir on the Northeastern Boundary*, before the N. ALEXANDER JOHNSTON.

MALTA, GOZO AND COMINO. In 1798 the fortunes of war gave these three islands to England, and the treaties of 1815 upheld her possession of them. Their area is 115 square miles; in 1871, when the last census was taken, the civil population was 149,084.—The civil legislation remains very nearly what it was when the English first took possession of the island; the changes are inconsiderable. In 1829 a very important innovation was made in criminal legislation by the introduction of trial by jury. During some years there was no great cause to rejoice over this, as from time to time the jury, through lack of firmness, allowed enormous crimes to go unpunished; but at length this method of dispensing justice succeeded in working properly. In 1838 the inhabitants, without receiving complete political liberty, were granted freedom of the press. So far, the English government and the Maltese population have only cause to congratulate themselves on this measure.—The management of local and municipal affairs is in the hands of a council, one-half of which is chosen by election. In order to give the inhabitants means of making known their desires, several consulting committees have been formed, the members of which are changed every year by rotation.— The revenue is composed mainly of customs duties. It continued to increase from 1838 to 1856, when it reached the sum of £144,795, the expenditures being only £129,776. From 1856 to 1866 the receipts continued to increase, and reached the sum of £196,459, to which corresponded £185,449 expenditures. In 1870 the equilibrium was disturbed, to the detriment of the receipts, which fell far below the expenditures, the former amounting to £158,631, and the expenditures to £171,788. Among the receipts, the customs duties exceeded £100,000; the second place was occupied by the land tax, which produced upward of £30,000. Almost all this revenue was devoted to the civil expenditures of the island; only £6,200 being applied to military outlay — Malta is considered by England less as a colony than as a military post, whose garrison should be kept as strong as possible at all times. (See GIBRALTAR.) In 1851 this garrison was composed of only 3,331 men. Since that time, by successive additions, these figures have doubled. In 1861 the garrison was composed as follows: 5,415 infantry of the line, 636 colonial militia, 782 artillerists, and 283 engineer sappers. The militia artillery of Malta (Royal Malta fencible artillery) is composed of 637 Maltese, 23 of whom are officers. — The commerce of these islands increases continually; still, there is more continuity and regularity in the movement of importations than in that of exportations. The greater part of imported merchandise comes from England. In 1867 the imports rose to £6,395,320; in 1868, to £7,222,760; in 1869, to £4,808,440. In the same

years the exports were £5,256,400, £7,221,320, and £4,187,160. The movement of shipping was, in 1869, 3,695 vessels arrived, with a capacity of 1,367,399 tons; 3,702 ships cleared, with a tonnage of 1,375,208. Since 1862 this movement remained within the following limits, arrivals and clearances combined:

YEARS	Ships.	Tonnage
1862	7,895	2,235,433
1863	6,976	2,119,880
1864	7,361	2,234,517
1865	6,126	2,871,182
1866	7,293	2,976,005
1867	7,543	2,052,593
1868	8,890	3,048,715
1869	7,397	2,742,807

Malta exports chalk, lime, olive oil, oranges, wine, wool, and small cattle; the imports are dry goods, beer, butter, coal, leather dressed and undressed, cotton both in tissue and in thread, iron, woolen and silk stuffs. — BIBLIOGRAPHY. MALTHUS, Thomas Robert, was born at Rookery, near Dorking, in the county of Surrey, England, Feb. 14, 1766, and died at Bath, Dec. 29, 1834. His father, Daniel Malthus, was in comfortable circumstances, but as he was obliged to leave his fortune to his eldest son, he had Thomas Robert enter upon an ecclesiastical career. He first confided him to Richard Graves, author of "The Spiritual Don Quixote"; then he sent him to the Warrington academy, in Lancashire; but this institution not having been able to maintain itself, he had him complete his studies with Gilbert Wakefield, who enjoyed a great reputation in England. At eighteen years of age, young Malthus entered Jesus college, Cambridge; he took his degree there in 1788, and the following year entered holy orders. After remaining at home for some time, he received a curacy in the neighborhood. — This was a time when men's minds were in a state of fermentation in Europe, on account of the philosophic movement and the events of the French revolution. William Godwin, a publicist already well known, had just published his book on political justice, in which he claimed that moral evil and all the calamities of the human race were due solely to the defects of governments, and he proposed the establishment of an equality of conditions as a means to prevent the effects of bad political institutions. This work of Godwin had in England both adversaries and partisans. Among the latter was Daniel Malthus. Thomas Robert, his son, on the contrary, had learned from the study of history and of political economy (Adam Smith had published his book in 1776, and David Hume, who had been received into the family with J. J. Rousseau, had published his essays,) that, if defective governments contribute to make men vicious and miserable, the ignorance and degradation of the lower classes contribute powerfully either to form or to maintain bad governments. Malthus was therefore far from harboring any illusions as to the results which might be expected from public reforms. — Godwin published, in 1797, a collection of essays called "The Inquirer," upon education, morals and literature. One of these essays, upon prodigality and avarice, induced Malthus, then in the prime of youth, to take up his pen, and he answered by an "Essay on the Principle of Population," which he published anonymously, and which must be considered less as a first edition, than as an essay toward the celebrated work printed five years later. — Malthus opposed those writers in whose eyes the perfectibility of men and of political and social institutions was unlimited, and reduced almost to nothing the influence of bad governments; he defended property and opposed the various socialistic systems which had been already produced by utopians and others; he showed that society had never encountered but two obstacles to its progress, vice and misery; and he pointed out as the chief cause of these obstacles the too rapid increase of population relatively to the means of subsistence. — This book, which demolished the utopias and systems imagined for the happiness of the human race by popular writers, and which showed the various social phenomena in a new light, was attacked and defended with spirit, as Godwin's had been before it. This incited Malthus thoroughly to examine the subject once more. He first made use of the works of Hume, Wallace, Smith and Price. He examined what influence the principle of population, which he had brought to light, had exercised over nations in the different epochs of history; and desirous to add to the lessons of the past those of his own, he undertook a journey through a part of Europe. — In the spring of 1789 he departed from England with three other members of Jesus college, Cambridge, (among whom was Daniel Clark, known by his travels in different parts of Europe), and visited Denmark, Sweden and a part of Russia; he subsequently visited Switzerland and Savoy. The result of his travels was the publication of the second edition of the "Essay on the Principles of Population," in 1803, which excited attack even more than did the first. In this work, which was born of the first, but which was new in many respects, Malthus gave a fuller exposition of his ideas by their more complete development, and by the recital of numerous facts borrowed from history and from the situation of different countries; he applied his observations to institutions which had always been considered benevolent, and showed the dangers of an unintelligent philanthropy; he pointed out to the working classes that the best means of permanently raising the rate of wages was to exercise great circumspection in the matter of mar-

riage, etc. We give here only a very slight summary of his ideas, which will be more completely set forth in the article POPULATION. — A year after the publication of his work, Malthus was appointed professor of history and of political economy at the college of the East India company, at Ailesbury, near London; it was also about this time that he married. He fulfilled for thirty years his duties as professor and also as minister of the gospel; and it was during this period of his life that he three times revised his celebrated work, that he meditated upon the questions with which science concerns itself, and that he was led to publish his other writings: upon the corn laws (1814 and 1815), upon rent (1815), upon the principles of political economy (1819), upon definitions in political economy (1827), etc. — Despite its title, the book upon the principles of political economy is not a complete treatise, but only a collection of dissertations relative to the questions to which he had devoted the greatest share of attention, and which he discussed particularly with Ricardo and J. B. Say. He attempted to establish in this book how important it is not to hastily draw general principles from partial observations, and how essential it is to verify general laws by rigorous examination of the facts. He concluded, therefore, that what is absolutely true in principle is far from being always completely applicable in practice, and that, in the imperfect state of society, it is necessary to understand how to sacrifice, in a certain measure, the truth to the needs of prudence and order. This book is far from having had the same celebrity as that on population; this is due, in the first place, to the nature of the subject, and also, in our opinion, to the relative inferiority of the work. But it is enough glory for one man to have discovered a fundamental law, and to have elucidated it by such remarkable research and such profound observations. The dissertations of Malthus, however, have contributed much to the elucidation of many politico-economic principles, and notably to the theory of rent, to which Ricardo's name has been attached. The latter says, in the preface of his "Principles": "In 1815 the true doctrine of rent was published for the first time by Mr. Malthus, in a book entitled, 'An Inquiry into the Nature and Progress of Rent, etc.,' and by a fellow of the university of Oxford, in his 'Essay on the Employment of Capital in Agriculture,' (Dr. West)." M'Culloch had besides pointed out the same doctrine in a writing on the corn trade, published in 1777 by Anderson. This is not the place to examine into the relation of the theory of rent to these times; we only wish here to call attention to the value which Ricardo put upon this part of the works of Malthus, and also to the modesty with which he submitted his own ideas to the public. — What distinguishes Malthus is love of truth. "This love of truth," says Charles Comte, "which never contradicts itself, produced and developed in him the private virtues which distinguished him: justice, prudence, temperance and simplicity. He had a sweet character. He had such a great control over his passions, he was so indulgent to others, that people who lived near him for more than fifty years declared that they hardly ever saw him disturbed, never in anger, never excited, never cast down. No harsh word, no uncharitable expression, ever escaped his lips against a human being: and, although he was more the object of injustice and calumny than any writer of his age, perhaps of any age, he was rarely heard to complain of this kind of attack, and he never retaliated. He was very sensible to the approbation of enlightened and wise men; he placed a great value upon public esteem. But unmerited outrage affected him very little; he was as much convinced of the truth of his principles and the purity of his views, as he was prepared for contradictions and even for the repugnance which his doctrines could not fail to inspire in a certain class. His conversation naturally turned on those subjects which touch the well-being of society, and which he had made the special object of his studies; such conversation found him always attentive, serious, easy to move. He gave expression to his opinions so clearly and so intelligibly, that it was easy to see they were the result of profound reflection. Moreover, he was naturally gay and lively, and as ready to take part in the innocent pleasures of the young as to encourage them and direct them in their studies. He was among the most zealous partisans of parliamentary reform, and desired to see the government enter on the path of progress. Faithful to his political opinions at a time when they were far from leading to fortune, he did not make them a claim to favor when they triumphed; he had no thought of making science a stepping-stone to fortune. When his principles became the foundation of the law which reformed the poor laws, calumny and insult by the enemies of reform were not lacking for him. His adversaries tried to make the responsibility for the defects which they pointed out in the government's measure fall upon him; on the other hand, the partisans of that measure overloaded him with eulogy in the discussions which it gave rise to in parliament; but there the gratitude of his political friends and national munificence stopped. I must add that no one ever heard him complain either of the insults of the former or of the neglect of the latter."— Charles Comte speaks here of the reform of the poor laws. Despite the exaggerations of party spirit in favor of, and against it, Malthus' book vividly impressed all men endowed with a sense of justice, who sincerely desired to better the condition of the masses, and called the attention of men to the dangers of the poor laws. Propositions of reform were made at various times, and notably in 1817 by Mr. Samuel Withbread, and in 1821 by M. J. Scarlett, a learned lawyer; but it was not till 1834 that parliament decided to modify the legislation, after a celebrated inquiry, which confirmed most of the

truths Malthus had proclaimed. — It must have been a great joy to the illustrious economist to see the public action of his country inspired by that one of his opinions which had been most violently attacked. Malthus was then in his sixty-seventh year, and apparently in the enjoyment of very good health. But about the middle of December, 1834, on his arrival at Bath from London, to pass the Christmas holidays with his children at the house of his father-in-law, he became indisposed; a disease of the heart declared itself, and he died on the 29th of the same month. —Malthus is one of those writers whose ideas have been most misrepresented. We have only been able to indicate them here in a very summary manner; they will be more amply developed in the article POPULATION. JOSEPH GARNIER.

MALTHUSIANS. (See POPULATION.)

MANDARINS, magistrates and functionaries of the Chinese empire. This title was invented by the Portuguese established in the Indies, and derived from the Hindoo *mandri* (councilor). The true title is *khan* (chief); it was introduced by the Mantchu Tartars. — There are nearly 100,000 mandarins, classed in eighteen orders. They are councilors of the emperor, ministers, governors of provinces, military commanders, judges, inspectors of letters, etc.; they form various graduated, administrative and judicial tribunals which check each other, and the highest of which controls the acts of the emperor. — The mandarins acquire their hierarchic degrees only after having passed very difficult examinations. The candidates are confined in cells, and there are few examinations which do not last three days; it is not rare, on opening the cells to see the written examination, to find the candidates dead of brain fever. The Chinese profess that places should only be granted to merit. The intention is excellent; but how it is realized is not certain. J DE B.

MANGUM, Willie Person, was born in Orange county, N. C., in 1792, and died at Red Mountain, N. C., Sept. 14, 1861. He was a representative in congress from North Carolina 1823–6, and United States senator 1831–6 and 1840–53. In 1836 he received the electoral vote of South Carolina for the presidency. (See ELECTORAL VOTES, WHIG PARTY.)

MANIFESTO. Taken in its widest sense this word signifies a solemn statement, a public declaration, which one power makes to another of its rights, its grievances, its claims, either before taking arms, to oblige the second to render it justice, or, after having had recourse to arms, to conciliate other nations. It is a proceeding which modern nations seem to have borrowed from the Romans. According to the *fecial law*, the herald at arms, called *pater patratus*, went, protected by his sacred character of ambassador, to demand satisfaction of the people who had offended the republic, and if within the space of thirty-three days such people had not made a satisfactory answer, the herald called the gods to witness the injustice, and returned, saying that the Romans would see what was to be done. This was the preliminary act of the declaration of war. (The Romans doubtless were not its inventors; the use of declarations must be more ancient, or more general.) — There is also the manifesto of a sovereign, of the head of a state, of a government, to a people. But the word more generally employed is proclamation, as is shown by examples drawn from the later revolutions which took place in France. In this case the manifesto is frequently a kind of plea addressed to the tribunal whose decision is final, public opinion. — One of the most celebrated manifestoes of modern history is that which was published, dated Coblentz, July 25, 1792, by the duke of Brunswick-Luneburg, which roused the indignation of all France. In 1859, after the Italian campaign, the emperor, Francis Joseph, addressed under the title, *A manifesto to my peoples*, a document in which he explained, with a sadness which was not without grandeur, the causes which had conduced to end the war. — The manifestoes by which it is sought to lay before other nations or before the public, the rights, intentions, measures of a given state or government, require on the part of those who draw them up, propriety of terms and precision of ideas, without excluding the elevation and warmth of style which constitute eloquence. To prove, to convince, to speak to the mind and the heart, are the two great objects which it is proposed to attain, and in this instance the style is not confined to that austere brevity which is peculiar to other diplomatic documents.

MARKET. (See OUTLET.)

MARRIAGE. Marriage has been defined by a celebrated modern jurist: "The association of man and woman, who unite to perpetuate their species, to mutually help one another to bear the burdens of life, and to share a common destiny." — This great institution, the first foundation of civilization, may be considered from very different points of view. The continuation of the human species, the satisfaction of its most powerful passion, moral affinity consecrated by religion, the union of civil and family interests, sometimes even of political interests, when there is question of persons of elevated rank whose august and at the same time grave mission it is to unite in themselves part of the destinies of nations, such are some of the elements which belong to the institution of marriage and are developed by it in different degrees, according to times and circumstances. — "Philosophers," says Portalis, "consider in this act principally the union of the two

sexes; jurists see in it only the civil contract, and canonists only the sacrament, or what they call the ecclesiastical contract." Let us, in our turn, endeavor to show in a few words the no less important part that political economy should claim in the study of this contract, which forms in some sort the corner stone of human society, and in which it is easy to recognize, at the same time, the principle of population, the support of property, the stimulant of production, and the principal means of the preservation and transmission of wealth. — We can find no instance in history of a people who attained any considerable development that allowed a promiscuous intermingling of the sexes. Common and constant experience shows the relative sterility of libertinism, while at the same time it proves its wretched and abandoned fruits to be much more subject to early death than those of lawful unions. Distaste for marriage has even imperiled nations which had reached quite a high degree of civilization; and the history of Rome, at the fall of the republic, presents the sight of a city the mistress of the world, threatened by her own population with wars, proscriptions and contempt for the institution that was intended to recruit her families and support the state. — In our day a contrary danger has, undoubtedly, preoccupied the minds of a great many economists. In our society, formed under the influences of Christianity and rich in its traditions, the inconsiderate increase of population has been considered a source of dread: legislators no longer apply themselves, like those of Rome and ancient France, to encourage marriage; on the contrary, they have sometimes thought of restraining it; the number of marriages even seems to have decreased. But the very fears of some economists of our day who devote their attention especially to the restricted society of old Europe, themselves prove full well the beneficent power of an institution which, when applied to the whole world, is still so far from having achieved its work of extending and propagating the human species. — Marriage, which peoples the earth, also confers upon each of its parts that reign of individuality which constitutes *property*. Want and personal foresight, which are the generative principles of appropriation, in reality acquire their full intensity only in heredity, which extends the view of the possessor beyond the term of his present existence. Marriage alone, then, gives to the principle of appropriation the full latitude of its horizon. It is marriage which, by the urgent and tender incentive of heredity, develops man's individual property; it is marriage which transforms this property into *patrimony*, and furnishes the most salutary and efficacious stimulant to the production of wealth. Thus the accumulated work of generations, in the different branches of human activity, every day enlarges the majestic basis of civilization in the world. — History frequently confirms, by striking coincidences, this remarkable solidarity between the institution of marriage and that of property, of which theory affords us but a passing glimpse. Sparta, for example, wished to submit the union of the sexes to the direction of the state, and thus reduce this sacred union, so nobly styled by a Roman jurist the *communication of the divine and human law* * * *, to a mere pairing of animals. The Doric city at the same time included property in the agrarian distribution made by Lycurgus. Conjugal faith, the law of paternity, the sentiment of individual property, were destined to be confounded in Lacedemonia in one same sacrifice. — Mark the economy of these great institutions upon which humanity rests. Marriage, which founds property upon the family which it creates, is at the same time eminently fitted, by the fruitful union of the different faculties which it unites, to procure the preservation of the patrimony which it has acquired. The physical strength of man, the ingenious and assiduous care of his companion, present in the preservation of the goods of the family, not less than in the education of the children, a first application of that division of labor which is justly brought forward by political economy as one of the most powerful means of progress in human activity. — The intimate harmony which exists between the institution of marriage and the institution of property has been frequently manifested also by the comparison of the laws relative to inheritance with those which regulated, in such different manner, the conditions of conjugal union and the prohibitions with which different legislators have surrounded it. "When a legislator," says Portalis, "had established a certain order of succession the observance of which he considered important for the political constitution of the state, he so regulated marriage that it was never allowed between persons whose union could disturb or alter this order; we find examples of this solicitude in some of the republics of ancient Greece." A law of Athens, for example, allowed a man to marry his half-sister on his father's side, but not his half-sister on his mother's side, in order to prevent the union under one owner of two estates, and consequently of two inheritances. — Marriage, besides, has not attained everywhere the same economic and moral dignity which it possesses in our modern Christian society. This great institution may be found in the world under two entirely distinct forms, which mark one of the principal divisions in the history of civilization. — Monogamy, which is in our eyes the perfect type of marriage, puts man and woman on an equality, in so far as their moral and physical differences will permit. It was, however, but rarely met with in antiquity as a general and obligatory institution, although the appreciation of its perfection was from the earliest ages acknowledged by many legal enactments. In this respect, as in many others, Roman civilization justly lays claim to the honor of having in some sense prepared the way for the revolution which Christianity completed in the world, and of having powerfully contributed to

inaugurate, by the elevated morality of its laws, the true principles of reason and of social progress. It may be truly said, on the other hand, that the indissolubility of marriage was established by Christianity alone, and that pagan Rome created a sort of permanent exception thereto by the institution of divorce. — Polygamy, to consider it only under its most general form—that is, the form which allows a man several wives—by this very fact unwarrantably subjects the weaker sex to the caprice, fickleness and domination of the stronger. — All the salutary effects of marriage are in part perverted by polygamy, which, however, was the general law of antiquity, and one which is still obeyed by half the world. — The experience of Mohammedan countries proves that polygamy is unfavorable to population, and the Turkish historians themselves show that the Christian families in the Ottoman states are the most numerous. Moreover, the sole effect of polygamy is to concentrate and monopolize, to the advantage of a few, the union of the sexes, which are about equal in number. How can such an institution offer any advantages for the progress of population? If, after having invaded Europe, Mohammedanism has been driven back within the narrow limits of its first conquests, polygamy is one of the chief causes which must ever hold it bound and powerless. — Polygamy does not establish a real family; it places between the children of a common father the influence of maternal rivalry, as a dire germ of inevitable discord. Property itself does not seem to attain its perfect form by the side of this system of conjugal union. With the wife but an uninterested slave, and the family destroyed, individual property seems shaken to its very foundation, and is absorbed, as is ordinarily the case in Mohammedan countries, in the sovereign domain of the head of the state. Human liberty, property and the dignity of the family can exist only by mutually sustaining each other. From an economic point of view, therefore, as well as from a moral standpoint, polygamy is a debasement of marriage, of which monogamy is the only normal and faithful expression. Side by side with the contract which unites their lives there are different forms of agreement regulating the interests of the man and woman joined by the conjugal tie. — From universal community to absolute separation of goods there are numerous gradations admitted by law, which we do not propose to describe here in detail. The economist finds in the system of community of goods between husband and wife, marked advantages for commerce and the circulation of wealth; the moralist sees in it the wife elevated by a greater responsibility, and stimulated by an interest in the common prosperity of the household more positive than that resulting only from conjugal sympathy and maternal solicitude. The jurist, who is acquainted with the anxiety, the fitness, and sometimes with the sad experience of families, is less absolute in his preferences, and often refrains from applying to the circumstances and interests, which he would conciliate, the means necessary to secure the desired result for the sake of the end of marriage and the good of those interested in conjugal union. — Such is the power of this great institution of marriage, that by the morality of the domestic hearth which it consecrates, by the principles of labor and economy which it propagates, by the spirit of property which it nourishes, by its influence over the destiny of the family which it is called upon to regulate, it is of interest everywhere to the progress of the world and the development of civilization. E. DE PARIEU.

MARSHALL, John, was born at Germantown, Va., Sept. 24, 1755, and died at Philadelphia July 6, 1835. He was admitted to the bar in 1781, took high rank as a lawyer, and obtained the militia title of "General Marshall," by which he was commonly known until 1801. In 1797–8 he was an envoy to France (see X. Y. Z. MISSION); after his return he was a federalist congressman from Virginia 1799–1800, when he became secretary of state under Adams. (See ADMINISTRATIONS, III.) He was appointed chief justice of the United States Jan. 31, 1801, and served until his death. (See JUDICIARY; CONSTRUCTION, III.; FEDERAL PARTY.) His decisions are in Cranch's, Wheaton's and Peters' reports, in Peters' condensed reports (covering Cranch's and Wheaton's), and in Brockenbrough's "Marshall's Decisions" (circuit). See 2 Flanders' *Chief Justices;* Story's *Miscellaneous Writings* 639. A. J.

MARYLAND, a state of the American Union. The patent for its territory was first applied for by Sir George Calvert, "baron of Baltimore," and after his death was made out to his son and heir, Cecil, June 20, 1632. Calvert at first intended that it should be called "Crescentia"; but the patent gave it the name of "Terra Mariae, *Anglice* Maryland," by which latter name it has since been known. The name was given in honor of Henrietta Maria, Charles I.'s queen. The proprietorship remained in the Calvert family until its extinction, with the exception of the period 1691–1715, when the crown made Maryland a royal colony because of the asserted disloyalty of the proprietor. In 1771 the last Calvert died, leaving the province to his illegitimate son, Henry Harford; but the revolution which immediately followed put an end to his proprietorship. — BOUNDARIES. The charter gave the colony as a northern boundary the 40th parallel of north latitude; as an eastern boundary Delaware bay and the ocean; as a southern boundary a due east line from Watkin's point to the ocean; and as a western boundary the "Pattowmack" river to its "first fountain," and thence due north by a true meridian. The grant, therefore, evidently embraced the whole of the modern state of Delaware, and a wide strip of southern Pennsylvania, including the city of Philadelphia. Penn claimed the parallel of 39° as "the beginning of the

parallel of 40°," which was to be his southern boundary; and disputed Baltimore's claim to Delaware, since the Maryland patent was for "uncultivated lands," and Delaware was already settled by the Swedes. Penn's influence with Charles II. obtained a verdict in his favor from the board of trade in 1685, but the Baltimore family did not finally submit until 1766. In that year the two proprietors sent Charles Mason and Jeremiah Dixon, two English surveyors, who marked off "Mason and Dixon's line," as decided by the board of trade, placing at the end of each mile a stone with the letter P and the Penn arms on the north side, and the letter M and the Baltimore arms on the south side. (See PENNSYLVANIA, DELAWARE.) The southern boundary was settled with Virginia in 1668; but in 1858 the commissioners appointed to restore it found that it had not been drawn due east, varying slightly to the north. Maryland, however, did not attempt to change the ancient line. On the west, Maryland always claimed the south branch as the true origin of the Potomac; but Virginia has successfully maintained the north branch as the boundary, though the question has never been formally settled. — CONSTITUTIONS. The colony was established as a refuge for Roman Catholics, but absolute toleration was given from the first settlement to the religious beliefs of all settlers. From 1691 until the revolution the Protestants were strong enough to disfranchise the Roman Catholics. The charter was also careful to secure the organization of a popular assembly, which shared the government of the colony. The first constitution was framed by a convention at Annapolis, Aug. 14 – Nov. 11, 1776, and was not submitted to popular vote. The right of suffrage was given to freemen over twenty-one, having a freehold of fifty acres, or £30 in property. The legislature was to be composed of a senate and a house of delegates. (See ASSEMBLY.) Delegates were to be chosen annually, four from each county, two from Annapolis, and two from Baltimore; and were to have £500 in property. There were to be fifteen senators, nine from the eastern shore, and six from the western shore, who were to be chosen by electors chosen by the people, and were to be owners of £1,000 in property. They were to serve five years. The governor was to be chosen annually by the legislature on joint ballot, with a council of five. The choice of the capital was left to the legislature, which selected Annapolis. In 1810 an amendment abolished property qualifications for office, and gave the right of suffrage to white males over twenty-one, on one year's residence. In 1837 several amendments were made. The constitution of the senate was abolished, and a new apportionment of delegates was made; twenty-one senators were now to be chosen, one from each county and one from Baltimore; the governor was made elective by the people; and the legislature was empowered to abolish slavery, with compensation to owners, provided the necessary act should be passed unanimously by both houses of two successive legislatures, with three months' publication between. — The second constitution was framed by a convention at Annapolis, Nov. 4, 1850 – May 13, 1851, and ratified by popular vote June 4, 1851. Its principal changes were as follows: the governor was to hold office for four years, senators for four years, and delegates for two years; a new apportionment of delegates was made; and the legislature was to create corporations by general laws, never to grant state aid to corporations, and never to abolish slavery. — The third constitution was framed by a convention at Annapolis, April 27 – Sept. 16, 1864, and was ratified, Oct. 12–13, 1864, by the following close vote: in favor, home vote 27,541, soldiers' vote 2,633; against, home vote 29,536, soldiers' vote 263; majority in favor, 375. It declared the paramount allegiance of the citizen to be due to the government and constitution of the United States; abolished slavery, forbade compensation to owners by the legislature; made a new apportionment of delegates according to population, disfranchised all persons who had borne arms against the United States or had even "expressed a desire for the triumph of enemies over the arms of the United States"; and applied the disfranchisement clause to the vote on the new constitution itself. — The fourth constitution was framed by a convention at Annapolis, May 8 – Aug. 17, and ratified by popular vote, Sept. 18, 1867. It omitted the disfranchisement clauses, and instead of the "paramount allegiance" clause used the "supreme law" clause of the federal constitution. (Art. VI., ¶ 2.) — GOVERNORS. Thomas Johnson, 1777–9; Thomas Sim Lee, 1779–82; Wm. Paca, 1782–5; Wm. Smallwood, 1785–8; John Eager Howard, 1788–91. George Plater, 1791–2; Thomas Sim Lee, 1792–4; John H. Stone, 1794–7; John Henry, 1797–8, Benj. Ogle, 1798–1801; John Francis Mercer, 1801–3; Robert Bowie, 1803–6; Robert Wright, 1806–9; Edward Lloyd, 1809–11; Robert Bowie, 1811–12; Levin Winder, 1812–15; Charles Ridgely, 1815–18; Charles Goldsborough, 1818–19; Samuel Sprigg, 1819–22; Samuel Stevens, Jr., 1822–5; Joseph Kent, 1825–8; Daniel Martin, 1828–9; Thomas King Carroll, 1829–30; Daniel Martin, 1830–31; George Howard, 1831–2. Jas. Thomas, 1832–5; Thomas W. Veazey, 1835–8; Wm Grayson, 1838–41; Francis Thomas, 1841–4; Thos. G. Pratt, 1844–7; Philip Francis Thomas, 1847–50; Enoch L. Lowe, 1850–54; Thos. Watkins Ligon, 1854–7; Thos. Holladay Hicks, 1857–61; Augustus W. Bradford, 1861–5, Thos. Swann, 1865–7, Oden Bowie, 1867–71; Wm Pinkney Whyte, 1871–5; John Lee Carroll, 1875–9; Wm. T. Hamilton, 1879–83. — POLITICAL HISTORY. From the first organization of political parties in the United States, Maryland was a very reliably federalist state. In this she seems to have been influenced, at least in part, by the general feeling of opposition to the politics of her neighboring state of Virginia, which was the rule until 1860, and which, indeed, seems to have been inherited from colonial times. The

federalist control of the state lasted until 1802, but sometimes by a precarious tenure. In 1797 the legislature was so evenly divided that, while the democrats elected the governor, the federalists elected a United States senator, to succeed the new governor, by a majority of one. With the beginning of the century the current turned the other way. The democrats elected the presidential electors and a majority of the lower house in 1800, a majority of the whole legislature in 1801, and a majority of both houses and of the congressmen in 1802. The democratic control of the state brought about the widening of the right of suffrage in 1810, referred to above. It was preceded by an enlargement of the right of suffrage by statute, which was passed early in 1802 after a two years' resistance by the federalist senate, and then only after an implied threat of a convention to revise the constitution, and abolish the electoral character of the senate. Presidential electors were chosen by districts, and the federalists secured two of the eleven electors in 1804 and 1808, and five in 1812. — July 26–27, 1812, occurred the Hanson riots in Baltimore, occasioned by Hanson's persistence in publishing a federalist newspaper, "The Federal Republican," there. The mob sacked the office, and killed or cruelly beat twenty-five or thirty persons who defended it. Among these was the partisan leader "light-horse Harry" Lee, of the revolutionary army, who was crippled for life. The feeling, which this affair aroused, restored the state to the federalists in the October election of the same year. Their majority in the lower house was so large as to more than offset a unanimously democratic senate, chosen the previous year. The federalist control lasted until the extinction of the party, with occasional democratic successes. As a general rule, however, the federalists were in a popular minority, and their control of the state was due to the features of the state constitution, which gave the growing city of Baltimore but half as much influence in the legislature as the weakest of the counties. — The growth of Baltimore and the western counties made the electoral constitution of the senate very unpopular, but the minority resisted all attempts to change it until 1837, when the amendments referred to under the first constitution above were adopted. These reforms were forced by the refusal of the democratic senatorial electors to qualify and form a quorum in 1836, and by an attempt, June 6, 1836, of a popular convention of Baltimore and other counties to call a convention to revise the constitution, "without the aid of the legislature." The attempt created great excitement, but was never brought to an open election for the proposed convention. — From 1820 until 1852 the popular majority in the state was anti-democratic in every presidential election, though the district system of choosing electors gave Jackson seven of the eleven in 1824. The majority, however, was never large; in 1832 it was but four out of nearly 40,000 votes. During the same period the legislatures were very steadily whig, and consequently the United States senators, and the governors until 1837, were of that party. After 1837, when the election of governor was given to the people, there was but one whig governor chosen, Thos. G. Pratt. In the presidential election of 1852 the democrats carried the state. After the destruction of the whig party in 1854–5 its Maryland organization, taking the name of the American party, controlled the state until 1859, electing the governor, United States senator, four of the six congressmen, and a majority of the legislatures, and casting the electoral vote of the state for Fillmore in 1856. (See AMERICAN PARTY.) In 1859 the democrats obtained a majority of both houses of the legislature, and in 1860 they secured the electoral vote of the state for Breckinridge, but only by a very narrow plurality over Bell, (See CONSTITUTIONAL UNION PARTY.) — At the outbreak of the rebellion in 1860–61, the addition of Maryland to the southern confederacy was warmly desired by the leaders of the secession movement, in order thus to bring Washington city within the pale and into the possession of the confederacy, and make the new government, in the eyes of foreign nations, at least the *de facto* successor of the government of the United States. This desire was shared by many of the state's democratic politicians, who had long been used to the idea of secession as an antidote to abolition, and by many of the younger men. These two classes brought a strong pressure to bear on Gov. Hicks, to induce him to call a special session of the legislature, without which no state convention was constitutionally possible. The governor refused to convene the legislature, and asserted that all the arrangements had already been made to force an ordinance of secession through the proposed convention. — This excitement, however, as in other southern states, was almost entirely confined to the politicians; the people, except in the extreme southern counties, were almost unanimously against secession. The feeling, indeed, was not based upon a disbelief in the *right* of secession (see ALLEGIANCE, II.), so much as on economic reasons, such as the inevitable transfer of the war from Virginia to Maryland, and the immediate loss of $50,000,000 in slave property, but its existence, from whatever cause, can not be doubted, nor should it be denied the fair credit for its results. Any reader can easily estimate the increased probability of European recognition which would have followed a secession of Maryland in February, 1861, the irruption of rebel troops over her territory, and the inauguration of the confederate government in Washington instead of in Montgomery. — The fall of Sumter, the president's call for troops, and the armed conflict in Baltimore (see REBELLION) so moved the disaffected classes that they had actually issued an unauthorized call for a meeting of the legislature at Baltimore, when the governor anticipated it by summoning the legislature to meet at

Frederick, a more loyal city, April 26. When this body met, it was found to be unionist, but more from policy than from principle: in the house of delegates a motion looking toward secession was rejected by a vote of fifty-three to thirteen, and a resolution condemning the war against the south was carried by a vote of forty-three to twelve. In September, 1861, a large number of the members were subjected to military arrest (see HABEAS CORPUS), on strong suspicions of secessionist intentions, and the session came to an abrupt end. The governor, in his message to the new legislature, a strongly unionist body, which met Dec. 3, 1861, expressed his own and the popular condemnation of the dispersed legislature for "passing treasonable resolutions," "squandering the people's money," and "trying to plunge us into the vortex of secession." — Throughout the war the state's congressional representation was unanimously unionist, the pro-southern members of the legislature were a very meagre minority, and even when rebel armies entered the state for its "redemption," their reception was so chilling that they finally treated Maryland as enemy's territory. Nevertheless the early neutral attitude of the state, and particularly the Baltimore riots of 1861, influenced the other loyal states to see with comparative indifference a continuance of military arrests and confiscations in Maryland which is still remembered there with some bitterness. One result of this régime was the adoption of the constitution of 1864. (See ABOLITION, III.) Its disfranchising clauses, which the convention assumed to apply to the vote on the constitution itself, awoke general opposition, and in the next constitution were omitted. The memories of this period have since made Maryland very steadily democratic. In 1868, after the remission of disfranchisement by the constitution of 1867, the legislature became unanimously democratic, and in 1882 the republican vote is but ten out of twenty-six in the senate, and thirty out of eighty-four in the house of delegates. In the Frederick congressional district, however, the republican vote has continued strong; in 1874 and 1876 it was only beaten by seventy-eight and fourteen votes respectively out of about 30,000, and in 1878 and 1880 it elected its candidate, who has been the only republican congressman in the state since 1868. — Chief Justice Taney, and Henry Winter Davis (see those names) are the most prominent Maryland names in our national political history. Among the other leaders of state politics have been the following: Charles Carroll, "of Carrollton," one of the early revolutionary leaders, a signer of the declaration of independence, United States senator (federalist) 1789–92; Samuel Chase, a signer of the declaration, supreme court justice 1796–1811 (see IMPEACHMENTS, III.); J. A. J. Creswell, postmaster general under Grant; Chas. W. Goldsborough, federalist representative 1805–17, and governor 1818–19; Alexander C. Hanson, federalist representative 1813–17, and United States senator 1817–19; Robert G. Harper, United States senator in 1816 (see SOUTH CAROLINA); Reverdy Johnson, whig United States senator 1845–9, attorney general under Taylor, democratic United States senator 1863–8, and minister to England 1868–9; Wm. Cost Johnson, whig representative 1833–5 and 1837–43; John P. Kennedy, whig representative 1838–9 and 1841–5, and secretary of the navy under Fillmore; Joseph Kent, federalist representative 1811–15 and 1819–26, governor 1826–9, and whig United States senator 1833–7; Philip B. Key, federalist representative 1807–13, Edward Lloyd, federalist representative 1806–9, governor 1809–11, United States senator 1819–26, and president of the state senate 1826–31; Luther Martin, at first the leading anti-federalist of his state, but afterward one of the most distinguished federalist lawyers of the country (see BURR, AARON); Wm. Vans Murray, federalist representative 1791–7, and minister to the Netherlands 1797–1801 (see X. Y. Z MISSION); William Pinkney, minister to Great Britain 1806–11, attorney general under Madison, democratic representative in 1816, minister to Russia 1816–18, and United States senator 1820–22; Thos. Swann, democratic governor 1865–7, and representative 1869–79; Francis Thomas, democratic representative 1831–41, governor 1841–4, republican representative 1861–9, and minister to Peru 1872–5; Wm. Pinkney Whyte, democratic United States senator 1868–9, governor 1871–5, and United States senator 1875–81. — See Bozman's *History of Maryland* (to 1660); 1 Poore's *Federal and State Constitutions;* Neill's *Terra Mariæ;* 4 Griffith's *Early History of Maryland;* J. ALEXANDER JOHNSTON.

MASON AND DIXON'S LINE. (See MARYLAND.)

MASSACHUSETTS, one of the original thirteen states of the American Union. I. BOUNDARIES. The present boundaries of the state are the final result of compromises and agreements with all the surrounding states. (See MAINE, NEW HAMPSHIRE, VERMONT, NEW YORK, RHODE ISLAND.) The territory granted by the first charter to the "governor and company of the Massachusetts-Bay" was embraced between points three miles south of "any or every part" of the

Charles river, and three miles north of "any or every part" of the Merrimac river, and extending westward to the Pacific ocean. The southern boundary, between Massachusetts and Connecticut, was run in 1642, according to the terms of the charter; but the line was not run due west, and two towns of Connecticut were considered part of Massachusetts for nearly a century. The present southeastern portion of the state, the counties of Plymouth, Barnstable and Bristol, fell to it on the union of the Massachusetts-Bay and Plymouth colonies in 1691; and the boundary between it and Rhode Island was fixed in 1741. The northern boundary offered more difficulty. Massachusetts' agents traced the course of the Merrimac toward the extreme north; and the colony claimed the whole coast to a point on a line passing "three miles north of the Merrimac." The claim to the district of Maine was not established until 1737. The claims to the jurisdiction of the territory to the west of the present western boundary line were terminated by cessions to New York and to the United States. (See the states named above, and TERRITORIES.) — II. CONSTITUTIONS. The first civil organization was the "covenant" signed on board the Mayflower, Nov. 11, 1620, by the so-called "pilgrims" who were to form the Plymouth colony. They obtained a patent from the Plymouth company, June 1, 1621, and a grant of the land included between lines drawn north from the mouth of Narragansett river, and west from Cohasset rivulet, June 13, 1630; but neither of these transactions was confirmed by the king, nor was a charter granted. Nevertheless, the Plymouth colonists maintained a government of their own (see NEW ENGLAND UNION), and remained distinct until the union of their colony with that of Massachusetts-Bay, Oct. 7, 1791. — The colony of Massachusetts-Bay was chartered March 4, 1628–9, and the English associates, by resolution of Aug. 29, 1629, of doubtful legality, transferred the powers of government from England to Massachusetts. Here the legislative powers were at first exercised by a general meeting of the freemen (church members). In 1634 the general court was made representative, consisting of not more than two delegates from each town. (See BURGESSES.) In 1644 the general court was divided into two coordinate bodies. June 18, 1684, upon a writ of *quo warranto*, the English chancery gave judgment against the colony, and vacated its charter. King James then attempted to govern Massachusetts as a royal colony, appointing first Joseph Dudley, and then Sir Edmund Andros, as governor. April 18, 1689, the people openly revolted and kept the royal officials in prison until the news of James' abdication arrived. The new sovereigns, William and Mary, were willing to enjoy the fruits of James' oppression; they refused to restore the old charter, but granted a new one, Oct. 7, 1691. This charter vested in the crown, instead of in the colony, the choice of the governor; gave that official a negative on the acts of the general court; and united Nova Scotia to the "reall [royal] province of Massachusetts-Bay" Aug. 26, 1726, an explanatory charter gave the lower house of the assembly the right to choose their speaker, subject to the governor's approval, and to adjourn for not more than two days. — From the year 1766 the crown was engaged in a persistent attempt to still further modify the republican features of the Massachusetts charter, and the attempt, equally alarming to every colony, seems to have been the great moving cause of the open conflict which followed. (See REVOLUTION.) A series of mutual provocations on the part of ministry and colony, unnecessary to be detailed here, resulted in the practical abrogation of the charter by an act for the government of the colony, April 15, 1774. It took from the legislature the choice of the council and of superior court judges; gave the appointment of sheriffs to the governor, and the selection of juries to the sheriffs; and forbade town meetings, except for elections only, or by special permission of the governor. Congress approved the resistance of Massachusetts to the abrogation of the charter; the ministry undertook to meet resistance by force; and the organization of a new national government took place. (See CONGRESS, CONTINENTAL; DECLARATION OF INDEPENDENCE.) — Provincial congresses met Oct. 5, 1774, and Feb. 1, 1775, and the last general court under royal authority was dissolved June 17, 1775. July 19 following, a popular general court met at Watertown, and assumed both the legislative and the executive powers. This body, Feb. 28, 1778, adopted a constitution, which was rejected by popular vote March 4. A constitution, drawn up by John Adams, was adopted by a convention at Cambridge, Sept. 1–6, Oct. 28 – Nov. 11, 1779, and Jan. 5 – March 2, 1780, and was accepted by popular vote. It declared the commonwealth to be "a free, sovereign and independent state"; gave the legislature power to compel attendance upon public worship; constituted a legislature, called "the general court," composed of a senate of forty, chosen annually by districts of various sizes, and a house of representatives, chosen annually by towns in proportion to population; provided for a governor, to be chosen annually by the legislature if there was no popular majority, and to be given the title of "his excellency"; limited the right of suffrage by a property qualification of £60; provided for the support of Harvard college, public schools and grammar schools; and gave the governor power to remove judges on address of both houses of the legislature. The constitution went into force Oct. 25, 1780, and the first legislature under its provisions met at Boston on that day. — A convention, Nov. 15, 1820 – Jan. 9, 1821, adopted fourteen amendments, nine of which were ratified by popular vote, April 9, 1821. Their principal changes were the abolition of the property qualification for suffrage; the adoption of a simpler form of an oath of allegiance, without retaining

the declaration of a belief in the Christian religion; and provision for future amendment by vote of the legislature and ratification by popular vote. In this manner amendments have been proposed and ratified by nine legislatures, the most important being the change of the beginning of the political year from May to January (1833); the apportionment of the senators according to population (1840); the establishment of an educational limitation (ability to read and write) upon the right of suffrage (1857); the disfranchisement of aliens for two years after their naturalization (1859), and the abolition of this latter amendment (1863). — In 1851 the popular vote was against the calling of a constitutional convention. In the following year the result was the reverse; and a convention at Boston, May 4 – Aug. 1, 1853, adopted a revised constitution, which was rejected, Nov. 14, by a small popular majority. The organic law of the state is therefore still the constitution of 1780. — The representation of the towns in the lower house has caused a difficulty which has grown with the increase of population. From 1840 until 1857 one representative was apportioned to 1,200, and one more for 2,400 additional population in a town; each town having less than 1,200 inhabitants was to be represented as many years in each decade as the number 160 was contained in the number of its inhabitants; and the apportionment of representatives or representation was to be made by the governor and council after each decennial census. Since 1857 the house is fixed at 240 members; the legislature apportions the representation to the counties; and the county commissioners (or the mayor and aldermen in Boston) apportion the county's representation among representative districts. In the state political conventions, however, town representation is still retained, making these bodies very large in numbers. — GOVERNORS: (from 1775 until 1780 the legislative council); John Hancock, 1780–85; James Bowdoin, 1785–7; John Hancock, 1787–93; Samuel Adams, 1793–7; Increase Sumner, 1797–9; Moses Gill, 1799–1800; Caleb Strong, 1800–7; James Sullivan, 1807–8; Levi Lincoln, 1808–9; Christopher Gore, 1809–10; Elbridge Gerry, 1810–12; Caleb Strong, 1812–16; John Brooks, 1816–23; William Eustis, 1823–5; Marcus Morton, 1825; Levi Lincoln, 1825–34; John Davis, 1834–5, Samuel T. Armstrong, 1835–6; Edward Everett, 1836–40; Marcus Morton, 1840–41; John Davis, 1841–3; Marcus Morton, 1843–4; George N. Briggs, 1844–51; George S. Boutwell, 1851–3; John H. Clifford, 1853–4; Emory Washburn, 1854–5; Henry J. Gardner, 1855–8; Nathaniel P. Banks, 1858–61; John A. Andrew, 1861–6; Alexander H. Bullock, 1866–9; William Claflin, 1869–72; William B. Washburn, 1872–4; Thomas Talbot, 1874; William Gaston, 1874–6; Alexander H. Rice, 1876–9; Thomas Talbot, 1879–80; John D. Long, 1880–82; Benjamin F. Butler, 1882–3. — POLITICAL HISTORY The colonial history of the state has colored all its after history. The government was very democratic, excelled in this respect only by Connecticut, in which the governor was still elective; in intelligence, education and wealth the people were very nearly on a plane, and that a high one; freemen and representatives alike were infinitely more accustomed to dealing with equals than with superiors; and yet the population was so homogeneous that feeling and action were generally in unison, and the establishment of a state church was hardly felt to be a burden. The great force of Massachusetts came from this combination of conscious individualism with unity of action; it was not so much the law that was supreme, as the individual's conscientious interpretation of the law, and the general agreement of the mass of individuals in the same interpretation. There was thus developed a state which fought the battles of Lexington and Concord upon the technical ground of the individual's right to traverse the king's highway unmolested, and which followed them up by the collection of a voluminous mass of affidavits, by spectators and participants, to influence individual opinion at home and abroad. Individualism has always been the law of state politics; Massachusetts democrats have been as tenaciously indifferent to the fact that their party was in a hopeless minority in the state as their federalist and whig neighbors have been to the fact that their parties were in a hopeless minority in the nation; and Massachusetts members of all parties have been pre eminent for a personal dissection of principles to their logical results, regardless of personal, party or other interests This last form of individualism has been variously characterized as fanaticism or as devotion to principle; but its existence has always been an essential factor in Massachusetts politics. — The political history of the state falls most naturally into four periods: 1, 1775–97; 2, 1797–1823; 3, 1823–48; 4, 1848–82. During the first period the agricultural interest was predominant; during the second, the commercial; during the third and fourth, the manufacturing; but, during the fourth, the rise of a moral question to the surface of politics upturned the state parties from the foundations, and for the first time since 1797 placed Massachusetts in sympathy with a dominant national party. — I.: 1775–97. Massachusetts went into and came out of the revolution at the head of the states, though she only stood eighth in population She had brought on the contest by her stubborn resistance to the ministry; she had fought the opening battles and begun the siege of Boston of her own motion; to the prosecution of the war she had contributed 92,563 men, her nearest competitors being Virginia with 52 715, and Connecticut with 42,831; and, though a formal deference was always paid to the leadership of Virginia, it is indubitable that Massachusetts was the backbone of the rebellion, which was mainly sustained by the community of interests, feelings and action between these two states, a community which was not fairly broken for twenty-five years. In both states there was the same

difficulty in ratifying the constitution in 1788 (see CONSTITUTION, II.); but in Massachusetts the weight of ability was so heavily in favor of ratification, and the voters of the state were so much inclined to choose able men as national representatives, that the senators and congressmen were almost entirely federalist from the opening of the first congress. The state was thus represented in congress by such federalist leaders as Tristram Dalton, Fisher Ames, Caleb Strong, Benjamin Goodhue, Theodore Sedgwick, George Cabot, and Harrison Gray Otis; but in the annual state elections for governors and legislatures the anti-federalists maintained themselves successfully until 1797. It would not be accurate to represent the gradual change, which finally made Massachusetts a very reliably federalist state in 1797, as directly due to commercial interest; for in 1797 the western counties, which had been the seat of Shays' insurrection, and which had no commercial interests, were federalist, while the democratic strength lay in and around Boston and in Maine, the commercial portions of the state. It was rather due to the widening influence of the able federalist leaders; but as these were strongly influenced by their sympathies with the commercial interests of the state, it must be confessed that commerce had a great deal to do with the change, directly or indirectly. (See SHAYS' REBELLION, under CONFEDERATION, ARTICLES OF; ESSEX JUNTO; FEDERAL PARTY, I.) — II.: 1797–1823. In 1797 Samuel Adams declined a re-election as governor, and Increase Sumner, a federalist of the Adams school, was chosen in his stead. From that time until 1823 the governors and legislatures were federalist, with the exceptions of Govs. Sullivan, Lincoln and Gerry, and the legislatures of 1806–7 and 1810–12. The majorities, however, were always small: Strong had but 1,600 majority out of nearly 40,000 votes in 1800, and Gore but 3,000 majority out of 93,000 votes in 1809; and in 1806 and 1808 Govs. Strong and Lincoln served with legislatures of opposite politics. In 1804 the general depression throughout the federal party gave the state's electoral votes to Jefferson and Clinton, the democratic candidates; in all other presidential years the state was federalist until 1820, when, like all the other states, it voted for Monroe and Tompkins. — Political conflict in the state grew gradually warmer as the embargo policy was developed and adopted. (See EMBARGO.) The rise of the war feeling, which followed the collapse of the restrictive system, gradually gave the democrats the small percentage of increase necessary to gain control of the state; but it was not until 1811 that they finally elected a governor and a majority of both houses of the legislature. They then proceeded to make a number of changes: the inferior courts were "reorganized," so as to oust the federalist occupants; the church laws were so modified as to allow dissenters from the congregational church to divert their taxes to the support of ministers of their own faith; and the new apportionment of senatorial districts was as unfair as it is apt to be after similar political revolutions. (See GERRYMANDER.) The result was that in April, 1812, ex-Gov. Strong was again nominated by the federalists, and beat Gerry by a majority of only 1,600 out of 104,000 votes; the lower house of the legislature was strongly federalist; but the senate remained democratic for another year. From this time the state remained federalist by an increasing majority. Gov. Strong was re-elected throughout the war, and his annual messages and conflicts with the federal government as to the control of the state's militia made him particularly obnoxious to democrats in other states. The legislature more than kept pace with the governor, although nearly three years were required for it to pass through the stage of resolutions to the point of action. In 1813 the senate adopted Quincy's resolution "that in a war like the present, waged without justifiable cause, and prosecuted in a manner indicating that conquest and ambition are its real motives, it is not becoming a moral and religious people to express any approbation of military and naval exploits not immediately connected with the defense of our seacoast and soil." This may be taken as indicative of the feeling which prompted the many other anti-war resolutions and acts of the legislature until they culminated in the "Hartford convention." (See HENRY LETTERS; CONVENTION, HARTFORD.) At the end of the war Gov Strong retired, and another federalist took his place. The state remained practically isolated in politics from the other states, even from the other New England states, which had formally or heartily renounced federalism. In state elections the federalists were regularly successful; in congressional elections the democrats regularly secured less than one-third of the state's representatives (see MAINE); but the complete nullity of the state in the national councils was so evident as to be a perennial subject of reference in the newspapers of other states as "the result of the Hartford convention." In 1823 even Massachusetts tenacity gave way, and a democratic governor and legislature were elected. The change, however, to which this state was the last to yield, was the development of manufactures, which finally destroyed the federal party elsewhere. (See FEDERAL PARTY, II.) — III.: 1823–48. Gov. Eustis' message congratulated the legislature that "this ancient and respectable state had been restored to the confidence of her sister states" by the late election; and the state senate proceeded to justify the confidence by expunging, in January, 1824, by a vote of 22 to 15, the famous resolution of 1813 against rejoicing over victories. The new democratic state administration at once began to press for payment of the state's claims for militia services during the war. The federalists had never obtained any recognition for them, for the state had refused during the war to allow the control of her militia to the federal government. The new powers were more suc-

cessful. President Monroe advised their payment, in a message of Feb. 23, 1824; but the act for that purpose was not passed until May 31, 1830. — The federalist vote in 1824 was still 34,210 for Samuel Lathrop to 38,650 for Gov. Eustis. In the following year both parties united on Gov. Lincoln, and party divisions disappeared until the rise of the whig party revived them. In the interval the state gave her electoral votes to her citizen, John Quincy Adams, in 1824 and 1828, the popular vote in his favor being 83 per cent. of the whole; in 1832 its electoral vote was cast for Clay; and in 1836 for Webster. In 1834 Gov. Lincoln retired, and a whig governor and lieutenant governor, Davis and Armstrong, came into office. Everett, the successor of Davis, was also a whig, and he retained office until in 1839 he was beaten by Marcus Morton in the closest election of the state's history. The popular vote was for Morton 51,024, for Everett 50,725, scattering 307, Morton's majority 2. In the following year the whigs nominated and elected ex-Gov. Davis, but in the following year Morton was again successful. In 1843 the whigs elected George N. Briggs, and he retained office until 1851. The party proportion of the popular vote may be estimated from a typical year (1846): Briggs, 54,784, Davis (democrat) 33,196, scattering (abolitionist and others) 13,589. In 1844 the democrats nominated George Bancroft, the historian; in 1848, Caleb Cushing; in 1845–7, Davis. — During the latter years of this period the abolitionist feeling in Massachusetts grew into something like the controlling importance which it held soon after 1848. It was strengthened by the arrest of George Latimer, a Virginia fugitive slave, in Boston, in the autumn of 1842, and though the fugitive was released by purchase, the legislature soon after passed the first personal liberty law of the state. (See PERSONAL LIBERTY LAWS.) In 1843 the democratic legislature, elected with Morton, passed resolutions proposing to congress the passage of an amendment to the constitution basing representation in the lower house of congress on the number of free inhabitants. (See COMPROMISES, I.; SLAVERY.) The resolutions were presented in the house, Dec. 21, 1843, by John Quincy Adams, and, coming from a democratic legislature, gave rise to an intense anger among the southern members. The abolitionist vote rose, after 1844, to about one-third of the democratic vote, and in 1845 compelled a choice by the legislature, in default of a popular majority for any candidate; but it showed no sign of any positive and living growth until 1848. — IV.: 1848–82. The original free-soil party had its kindliest home in Massachusetts. (See FREE-SOIL PARTY.) Its leaders, Henry Wilson, J. G. Palfrey, the historian, Horace Mann, the promoter of education in the state, Francis W. Bird, John B. Alley and others made it a more successful party than the old liberty party had been. In 1848 the popular vote for Stephen C. Phillips, the free-soil candidate, exceeded that for Cushing; and, though it fell slightly behind the democratic vote in 1849, it was sufficient in both years to prevent a choice by the people. In both years the whig legislature chose Briggs. These two elections seem to have suggested to Wilson the idea of the famous "coalition campaign" of 1850. The legislature then chosen was to elect a United States senator for the remainder of Webster's term, ending March 4, 1851, and another for the full term of six years from March 4. Wilson's proposition to George S. Boutwell, the democratic leader, who had been his party's candidate for governor in 1849, and was to be the candidate in 1850, was that the democrats and free soilers should run separate candidates for state officers; that they should unite on members of the legislature wherever such a union would be successful; and that, in the probable event of no popular choice for governor and a coalition majority in the legislature, the free-soilers would only claim the election of Charles Sumner, a Boston lawyer, for the long term senatorship, and would give the democrats the rest of the principal offices. The popular vote was for Briggs 57,364, for Boutwell 36,363, and for Phillips 27,803; and the coalition was successful in the legislature, having 27 to 13 in the senate, and 210 to 174 in the house. The coalition agreement was carried out in the election of Boutwell and the state officers and of Robert Rantoul, an anti-slavery democrat, for the short term senatorship, and the free-soilers were further given the presidency of the senate, four of the nine councilors, and one of the state officers; but Sumner's election occasioned more difficulty. Caleb Cushing and other leading democrats opposed it warmly, and implored the democratic legislators not to send this "fireband into the councils of the nation." In the senate Sumner was chosen without difficulty, but one democrat refusing to vote for him; in the house twenty-three democrats voted for another candidate, thus preventing a choice. The balloting continued until April 24, 1851, when Sumner was chosen on the twenty-sixth ballot, one democrat having voted for him and given him a majority. In the next legislature the coalition still had a majority in both branches, and chose Boutwell governor in spite of a plurality of 21,000 for Winthrop, the whig candidate; but in the following year the whigs recovered their majority, and the governorship. In 1853 the whigs elected Washburn, through the legislature; and as this was the last disputed election it is as well to give the popular vote, which was as follows: Washburn (whig) 60,472, Henry W. Bishop (democrat) 35,254, Henry Wilson (free-soil) 29,545. — The anti-slavery feeling in the state had been intensified by the arrest of Sims, April 3, 1851, and of Anthony Burns, May 23, 1854, and their forcible removal from the state (See FUGITIVE SLAVE LAWS.) The free-soilers, at a mass convention, July 20, and a regular state convention, Sept. 7, took the name of the "republican" party (see REPUBLICAN PARTY), and nominated Wilson for governor; but most of its voters, almost immediately after-

ward, fell into the "know-nothing" organization. (See AMERICAN PARTY.) The result of the election was an overwhelming surprise, particularly to the whigs. The popular vote was, for Gardner (American) 81,503, Washburn 27,279, Bishop 13,742, and Wilson 6,483. Nearly all the legislature were "know-nothings": in the house there were but six whigs and one democrat; and all the eleven congressmen were of the same party. Gardner was re-elected in 1855 and 1856: but in 1855 the republican vote rose to 36,521, while his own fell to 51,674; and in 1856 he claimed to be a "Fremont American," and was voted for by the republicans. In the following year the state became republican in all its branches of government, and thereafter remained so until 1874. Governor Banks' first vote was 59,889 to 30,887 for Erasmus D. Beach (democrat), and 37,553 for Gardner. In 1860 Gov. Andrew received 104,527 votes to 35,191 for Beach (Douglas democrat), 23,816 for Amos A. Lawrence (constitutional union), and 6,000 for Benj. F. Butler (Breckinridge democrat). Andrew's majorities remained large during the war, and in 1864 his vote reached 125,281 to 49,190. At the same election there were no democrats in the senate, and but six out of 240 in the house. From that time until 1874 the democratic proportion of the popular vote was always below 40 per cent., except in 1867, when 42 per cent. was given to John Quincy Adams, and in 1873, when 45 per cent. was given to William Gaston. During all this period all the congressmen had been republicans, and the state's electoral votes had been given to the republican candidates. — In the election of 1874 a complete *bouleversement* took place. An attempt to modify the state's prohibitory liquor law at the previous session of the legislature had been defeated by the governor's veto His renomination, and the nomination of Horatio Knight, another prohibitionist, for lieutenant governor, excited opposition and aggravated other dissensions. Talbot was defeated, Knight was only elected by a small majority, but the republicans elected a majority of both branches of the legislature and all the state officers except the governor. Of the eleven congressmen but five regular republicans were elected, four democrats, and two independent republicans. In 1875 the republicans elected Gov. Rice by 83,639 votes to 78,333 for Gaston, and in 1876 Rice's majority was increased. In the latter year but one democratic congressman was elected. — It is difficult to class the "Butler movement," which fairly took shape in 1878, otherwise than as one of general discontent. It is true that Butler (see his name) openly advocated the peculiar ideas of the greenback-labor party in that year; but the party which supported him in the state seems to have cared little for any interests outside of the state. Its existence seems to have been based upon the assertions that there was a dominant "ring" in the dominant republican party of the state, and that the manufacturing and other corporations, with which the state was filled, coerced the votes of their employés by threats of discharge in case of disobedience. The latter influence, it was said, was fast destroying the independence and self-respect of the voters; the former was filling the offices with its dependents, was increasing taxation and the public debt, was enabling its favorites to escape their share of taxation, was instrumental in expending the public money for purposes useful only to its *protégés*, and, by its power to control the committees of the state convention, through the appointment of the presiding officer, had already made reform through the republican party an impossibility. How much truth was in all this it is hard to say, for specific instances are usually conspicuous by their absence from "Butler" speeches; it is at least certain that the charges were supported by nearly half the voters of the state. Butler had been meagrely supported in previous republican conventions as a candidate for governor, when, in 1878, he offered to run as an independent candidate if 20,000 voters should desire it. The names of 51,784 persons were signed to the invitation, and the "Butler campaign" at once began. The leaders of the two former parties ridiculed Butler's "signers" as men of straw; but it soon became apparent that Butler delegates to the democratic state convention were being chosen all over the state. The democratic state committee therefore announced, Sept. 12, that no delegate pledged to a non-democratic candidate was entitled to sit or vote in the convention. On the day appointed for the convention, Sept. 17, at Worcester, the Butler delegates were present first, and seized the hall; the state committee therefore adjourned the convention to meet at Boston, Sept. 28. The Worcester convention nominated Butler, without referring to the "greenback idea" in the platform; the Boston convention nominated Josiah G. Abbott, proclaiming itself the only representative of the national democratic party. Butler had been nominated, Sept. 11, by the greenback convention; and the republicans nominated Governor Talbot, Sept. 18. The struggle was ended, Nov. 5, by the following popular vote: Talbot 134,725, Butler 109,435, Abbott 10,162; and the state legislature and all but one of the eleven congressmen were republican. In 1879 there was no "capture" of the democratic convention. Butler was nominated by a greenback convention John Quincy Adams by the democrats, and John D. Long by the republicans; but the popular vote varied very little from that of 1878. In 1880 Butler declined to be a candidate; Charles P Thompson was selected by the democrats; and the popular vote at once settled to its normal proportions: Long 164,825, Thompson 111,410, H B. Sargent (greenback) 4,864, scattering 1,147 In 1881 the collapse of political excitement, through Butler's withdrawal, reduced Long's vote to 96,609 and Thompson's to 54,586; the other party votes were little changed. In the senate there are thirty-six republicans and four

democrats; in the house 181 republicans, fifty-five democrats, and four independent.—The state has been so prolific of men who have been influential in politics, that any attempt at selection must be a difficult undertaking. Reference should be made to Charles Francis Adams, John Adams, John Quincy Adams, Samuel Adams, Fisher Ames, N. P. Banks, George S. Boutwell, Anson Burlingame, Benjamin F. Butler, Caleb Cushing, Edward Everett, Elbridge Gerry, John Hancock, Joseph Story, Charles Sumner, Daniel Webster, and Henry Wilson (see their names); to the list of governors given above; and to the following: John B. Alley, free-soil leader, republican congressman 1859–67; George Ashmun, whig congressman 1845–51; Bailey Bartlett, high sheriff of Essex county 1789–1830, and federalist congressman 1797–1801; George Cabot, federalist United States senator 1791–6 (see also ADMINISTRATIONS, III; ESSEX JUNTO; CONVENTION, HARTFORD); Rufus Choate, whig congressman 1831–4, and United States senator 1841–5; B. W. Crowninshield (see ADMINISTRATIONS, VII.), democratic congressman 1823–31; Benj. R. Curtis (see JUDICIARY, DRED SCOTT CASE); John Davis, whig congressman 1825–34, governor 1834–5 and 1840–41, and United States senator 1835–40 and 1845–53; Henry L. Dawes, republican congressman 1857–75, and United States senator 1875–87; William Eustis, democratic congressman 1801–5 and 1820–23 (see Administrations, VI.), minister to the Netherlands 1814–18, and governor 1823–5; William Lloyd Garrison (see ABOLITION); Benjamin Goodhue (see ESSEX JUNTO), federal congressman 1789–95, and United States senator 1796–1800; Benjamin Gorham, federalist and whig congressman 1820–21, 1827–31, and 1833–5; Ebenezer R. Hoar (see ADMINISTRATIONS, XXI.), judge of the state supreme court 1859–69, and republican congressman 1873–5; George F. Hoar (brother of the preceding), republican congressman 1869–77, and United States senator 1877–83; Samuel Hoar (father of the preceding), whig representative 1835-7, and the state's commissioner to South Carolina in 1844 (see SLAVERY); Levi Lincoln, one of the democratic leaders until 1823, governor 1825–34, and whig congressman 1834–41; Horace Mann, secretary of the state board of education 1837–48, free-soil congressman 1848–53, and president of Antioch college, in Ohio, 1853–9; Marcus Morton, democratic congressman 1817–21, judge of the state supreme court 1825–40, and governor 1840–41 and 1843–4; Harrison Gray Otis, federalist representative 1797–1801, and United States senator 1817–22 (see CONVENTION, HARTFORD); Wendell Phillips (see ABOLITION); Timothy Pickering (see ADMINISTRATIONS, I.–III.), federalist United States senator 1803–11, and congressman 1813–17; Josiah Quincy, federalist congressman 1805–13, president of Harvard college 1829–45 (see CONVENTION, HARTFORD; WARS, III.; SECESSION, I.; NATION); Robert Rantoul, democratic United States senator 1851, and congressman 1851–2; Theodore Sedgwick, federalist congressman 1789–96, and 1799–1801 (speaker), and United States senator 1796–9. Joseph B. Varnum, democratic congressman 1795–1811, speaker 1807–11, and United States senator 1811–17, Robert C. Winthrop, whig congressman 1840–50, speaker 1847–9, and United States senator 1850–1.—See 1 Poore's *Federal and State Constitutions;* Palfrey's *History of New England;* Wood's *Massachusetts Compendium* (boundaries); Buck's *Massachusetts Ecclesiastical Law;* Fowler's *History of Local Law in Massachusetts;* Washburn's *Judicial History of Massachusetts;* Moore's *History of Slavery in Massachusetts;* Young's *Chronicles of the First Planters of Massachusetts Bay* (to 1636), and *Chronicles of the Pilgrim Fathers of the Colony of Plymouth* (to 1625); Shurtleff's *Records of the Colony of Massachusetts Bay* (to 1686), and *Records of the Colony of Plymouth* (to 1691); Baylies' *History of New Plymouth* (to 1641); *Lowell Lectures on the Early History of Massachusetts;* Frothingham's *Siege of Boston;* Minot's *History of the Insurrection* (Shays'); Hutchinson's *History of Massachusetts* (1749–74); 4 John Adams' *Works*, 213; Bradford's *History of Massachusetts* (to 1820), Barry's *History of Massachusetts* (to 1820); Carpenter's *History of Massachusetts* (to 1853); J. ALEXANDER JOHNSTON.

McCLELLAN, George Brinton, was born at Philadelphia Dec. 3, 1826, was graduated at West Point in 1846, and became a captain during the Mexican war. In 1855 he was sent to Europe, with two other officers, to study the operations of the Crimean war. In 1857 he retired to private life as chief engineer of the Illinois Central railway; and in 1861 he was appointed major general of volunteers from Ohio. May 14, 1861, he was commissioned major general in the regular army, and late in June and early in July he cleared West Virginia of the enemy's forces. In July he took command of the army of the Potomac, and in November, 1861, of all the armies of the United

States. In the latter part of June and the beginning of July, 1862, he fought the series of "seven days' battles" around Richmond; in September, 1862, he won the battle of Antietam; and Nov. 7, 1862, he was relieved of his command, and ordered to report at Trenton, N. J. Aug. 28, 1864, he was nominated for the presidency by the democratic national convention (see DEMOCRATIC-REPUBLICAN PARTY, VI.), and was defeated in November. (See ELECTORAL VOTES.) In 1877 he was elected governor of New Jersey. (See NEW JERSEY.) — See Hillard's, Hurlburt's, Delmar's and Victor's *lives of McClellan;* Barnard's *Peninsular Campaign;* Swinton's *Campaigns of the Army of the Potomac;* 3–5 Scribner's *Campaigns of the Civil War.*

McLEAN, John, was born in Morris county, N. J., March 11, 1785, and died at Cincinnati, Ohio, April 4, 1861. He removed with his family to Virginia in 1789, and to Ohio in 1797; was admitted to the bar in 1807, and was a democratic congressman from Ohio 1813–16, and state supreme court judge 1817–22. He was postmaster general under Monroe and John Quincy Adams (see ADMINISTRATIONS), was appointed justice of the United States supreme court March 7, 1829, and served until his death. (See DRED SCOTT CASE.) His name was frequently brought before the anti-masons, whigs and republicans as a presidential candidate, but he never received any general party nomination. — See Savage's *Living Representative Men,* 373.

McLEOD CASE, The (IN U. S. HISTORY). In 1837, after the suppression of the Canadian rebellion, or patriot war, a number of Canadian refugees and Americans, using New York state as a base of operations, seized Navy island, in the Niagara river, about two miles above the falls and within British jurisdiction, in order to keep the war alive. Col. McNab, commanding the Canadian militia, sent a party, on the night of Dec. 29, 1837, to capture the steamer Caroline, which carried supplies to Navy island. The attacking party found her at a wharf on the American side of the river, captured her, after a conflict in which one American, Amos Durfee, was killed, and sent her over the falls in flames. In January, 1838, the British government, in an official communication to the government of the United States, assumed the entire responsibility for the burning of the Caroline. — In November, 1840, Alexander McLeod, while in New York state on business, aroused intense feeling among the people there by boasting of his exploits in the attack on the Caroline. He was arrested, lodged in jail in Lockport, and indicted in February, 1841, for murder. At first, bail was accepted, but this increased the excitement, and he was remanded to jail. The British minister demanded his release, in a note to the secretary of state, for the reasons that McLeod was acting under orders in an enterprise planned, executed and avowed by his superiors; that the question was one of international law, to be settled by the two national governments; that the courts of New York had not the means to judge or the right to decide such a question; and that the British government could not recognize the state jurisdiction of the case, but must hold the government of the United States responsible for McLeod. — The new president, Harrison, and his cabinet were unanimous in considering the British claim just; but the minister was informed that it was an impossibility to release a person confined under judicial process, except by operation of law. At first the administration hoped that Gov Seward, of New York, would order the prosecuting officer of the state to enter a *nolle prosequi.* The governor, however, refused to inferfere, but directed that the trial, March 22, 1841, should take place before the chief justice of the state. The president then directed the attorney general of the United States to proceed to Lockport, see that McLeod had skillful counsel, furnish them with the evidence of the British government's official avowal of the burning of the Caroline, and take steps to transfer the case to the supreme court by writ of error, if McLeod's defense should be overruled. — McLeod was brought before the court on writ of *habeas corpus,* and his discharge was asked on the grounds assigned above. The court, however, held that its jurisdiction over the case was complete; that there was no war in existence at the time in any form; that the burning of the Caroline was not an act of magistracy on the part of the Canadian authorities, since it was committed out of Canadian jurisdiction; that all the persons concerned in the affair were "individuals proceeding on their own responsibility," and liable either for arson or for murder; and that the indictment precluded McLeod's discharge upon *habeas corpus.* The opinion of the court was not satisfactory to other and able lawyers. It was adversely reviewed in a pamphlet by Judge D B. Talmadge, of New York; and Webster, in the senate, April 6–7, 1846, used in regard to it the following strong language: "On the peril and at the risk of my professional reputation I now say that the opinion of the court of New York in that case is not a respectable opinion, either on account of the result at which it arrives or the reasoning on which it proceeds." — The case finally came to nothing. McLeod, who seems to have been a liar as well as a braggart, proved an alibi in October, 1841, and was acquitted; and congress, by act of Aug. 29, 1842, provided that if such cases should thereafter arise they should be transferred to the United States courts by writ of *habeas corpus.* (See HABEAS CORPUS.) The British government July 28, 1842, apologized for the violation of territory, and regretted that "explanation and apology was not immediately made"; the American government declared its satisfaction; and the case was ended. — See 3 Spencer's *United States,* 411, 417; 5 Webster's *Works,* 116, and 6:247, 300; Edwards' *Courts and Lawyers of New York,* 305, the case, with the diplomatic correspondence in full, is in 25

Wendell's *Reports*, 483; see also 26 *ib.*, Appendix, 663 (Talmadge's review); but see, *contra*, 3 Hill's *Reports*, 635, and 10 *Democratic Review*, 487; Gould's *Trial of McLeod* (1841); 5 *Stat. at Large*, 539 (Act of Aug. 29, 1842).

ALEXANDER JOHNSTON.

MECKLENBURG. Two grand duchies, situated on the Baltic and forming part of the German empire, bear this name; we shall treat of them together, because they have a constitution and a diet in common, though their territory is divided (with reference to executive power) into two grand duchies. — Mecklenburg-Schwerin has an area of 13,346 square kilometres, and it had, in 1861, 548,449 and in (Dec.) 1871 557,897 inhabitants, of whom more than 540,000 belong to the Lutheran church. In 1880 the population was 577,055. The population in 1871 was distributed among the different parts of the territory as follows: domain lands or *domanium*, 201,829 inhabitants; knights' estates, 133,835 inhabitants; convent lands, 8,826 inhabitants; cities, 200,066 inhabitants; suburbs of cities, 13,151 inhabitants. The importance of these distinctions will be seen further on. — Mecklenburg-Strelitz is composed of two principalities; Stargard on the east and Ratzeburg on the west of Mecklenburg-Schwerin. The area of the two parts of the state is 2,717 square kilometres, and its population, in 1860, amounted to only 99,660 souls (chiefly Lutherans), of whom 48,773 occupied domain lands, 17,371 knights' estates, and the remainder the cities. The census of December, 1871, gave the number of inhabitants as 96,982. In 1880 the population was 100,269. In Mecklenburg a place containing a certain number of inhabitants is not always called a *city*, but a city is a locality represented at the diet. The capital, Neustrelitz, does not appoint a deputy, and if, nevertheless, it is treated officially as a city, this is in opposition to the spirit of the political language of the country. This language has preserved its superannuated character with a constitution whose principal provisions date from 1523, 1572, 1621 and 1755. It is true that, March 23, 1848, the grand duke of Mecklenburg-Schwerin took the initiative of a reform. A new constitution was promulgated Aug. 23, 1849, the former estates were dissolved Oct. 10 of the same year, and the new representative body met Feb. 27, 1850. But Mecklenburg-Strelitz did not agree to this reform, and the equestrian order (proprietors of knights' estates, knights, *Ritter*), recovered from its stupor of 1848, complained to the German diet in session at Frankfort, arbitrators were appointed, and in consequence of their decision a grand ducal decree of Sept. 14, 1850, suppressed the constitution just sanctioned. — Mediæval times were restored in what the equestrian order considered as their rights. In virtue of the pact of *union* of 1523, by which the estates (at that time the equestrian order, the cities and the prelates) declared their opposition for the future to a partition of the country, the two Mecklenburgs had but one diet with annual sessions alternately in the cities of Sternberg and Malchin, both situated in Mecklenberg-Schwerin. The grand duke of this country, who is considered the elder or the first of the grand dukes of Mecklenburg,* convokes the assembly and closes it. The grand duke of Mecklenburg Strelitz may assemble the estates of his territory to discuss their particular interests, for outside the diet the two duchies are entirely separate. — The reformation having abolished the prelates, the estates are now composed of only two orders: the equestrian order and the cities, or, more correctly, the *landschaft, or those outside the equestrian order*. The estates admit of numerous territorial and other subdivisions, but with reference to the grand duke they form a body, a corporation. The equestrian order is composed of all the proprietors (nobles or not) of knights' estates residing in the country. They are more than 750 in number. The cities comprise Rostock, Wismar and thirty-eight others in Mecklenburg-Schwerin, and seven in Mecklenburg-Strelitz; they are represented by members of their municipal councils, and more frequently by burgomasters. All the members of the equestrian order may take part in the deliberations of the diet, but can not be represented there. Those who assist at the deliberations, pay their own traveling expenses and support themselves, since each one exercises a personal right. The representatives of cities, on the contrary, are the mandatories of their fellow-citizens (or are considered to be), and receive a remuneration. Therefore, in a general assembly (*in plenum*), the equestrian order has a great numerical superiority; but the cities have the right of demanding that each order deliberate separately. Moreover, such a numerous assembly is not easily managed, and although there are many dignitaries in the assembly, it is nothing rare to hear several orators speak at once. Each member of the diet enjoys the right of initiative and may present his propositions to the general assembly; but when it is a question of changing the constitution, the proposition must first be submitted to a "limited committee" (*engern Ausschuss*) elected from among the members of the diet and sitting permanently. It will be understood that the constitution means merely *privileges of the estates*. Outside these privileges and finances the government has large powers. Almost all the laws not included in these two categories are termed *indifferent*. Besides, the estates exercise a certain influence on the administration of justice by their right of presentation to certain places of councilors and other special dispositions. — In this organization, that part of the country which is called domain lands, *domanium*, and which has 250,000 inhabitants, is not represented at all.

* At home each one of the two grand dukes is called grand duke of *Mecklenburg* without any distinctive designation. If in 1701 a second line was formed, it was not without opposition, but space does not permit us to give its history.

The two grand dukes, each in his own territory, enjoy power the more absolute since they are considered the proprietors of the soil. It seems to us, also, that the 150,000 inhabitants of equestrian or knights' estates should be added to the non-represented Mecklenburgers. The knights represent themselves and do not give themselves out as *representatives* of their tenants, laborers and house servants. The latter, therefore, find themselves under an absolute government. As an offset, the city of Rostock is almost independent. It is authorized to coin money, and enjoys the right of pardon and of mitigating punishments less than death or forced labor for life.—The decree of Nov. 16, 1867, applicable to the two grand duchies, emancipated the peasants on the domains of the state. In virtue of this decree the peasants on the domains are to acquire the property which they work at present as simple farmers. But to do this they are bound to submit to the following conditions: 1. The peasant to retain his land to the amount of thirty-nine hectares, by paying a sum representing twenty-five times the yearly rental which he has hitherto paid; 2. Farm buildings to be charged to the peasant, the peasant to be credited, in the estimate made of their value, with the sums which he has contributed to their construction; 3. The peasant also to pay for farming implements and cattle, according to a certain rate; 4. The sums coming from the application of these different clauses, with the exception of a part to be collected afterward, to constitute a principal sum not redeemable, with interest at 4 per cent., and a sinking fund of 1 per cent. The peasants on the domains of the state have not the power of choosing between the old and new situation. They must either accept the conditions just enumerated, or vacate the lands which they occupy, the area of which is estimated at 150,000 hectares.—It is plain that a constitution like that which existed up to the present time in Mecklenburg, requires a peculiar social organization. It could not remain altogether intact in view of the movement taking place everywhere in our day, but this remote corner of Germany has been but slightly influenced from without. Except in the cities, the middle class is scarcely represented; great landed proprietors, some tenants and many laborers constitute the population Even in the so-called domain lands, which comprise half the country, there were before 1867 scarcely any of those small proprietors, at once independent and unpretentious, who form the strength of so many other countries. The land belonged to the state, and there were 254 farms on temporary leases, 1,283 on long leases, 4,165 so-called *peasant farms* (*bauerstellen*) generally held on hereditary leases, 7,209 still smaller farmers called *budner*, 2,244 cottagers (*häusler*), or day laborers, to whom were leased houses and gardens for long terms. We pass over certain subdivisions, as 750 mills, farrieries and public houses given on lease.—The ancient institution of guilds continued to flourish on the shores of the Baltic till the introduction of the German constitution; therefore industry is scarcely known in the country; agriculture, too, is worth the attention of the observer only on great estates. Still another distinction should be made. Agriculture is neither skillful nor intensive; it is extensive, that is to say, it is carried on so as to employ as few men as possible. The climate is moist, the earth is soon covered with herbage; it was easy, therefore, to introduce the rotation of crops (*koppelwirthschaft*) common in Holstein. The proprietor prospers by this management, but the estate supports fewer men, since many of the former inhabitants were driven out to be replaced by cattle. We can not congratulate the country on this kind of progress.—The foreign commerce of Mecklenburg (which exports nothing but agricultural products) is carried on through the two ports of Rostock and Wismar. It is fairly active, and reaches perhaps 8,000,000 thalers imports and 7,000,000 exports.—Communal organization exists only in the cities. On equestrian or knights' estates the proprietor unites all powers in himself, and the peasant knows nothing of the commune except payments in money or in kind. In twenty-three cities the burgomasters are appointed by the grand duke, in the others they are elected by the burghers; but in some localities this choice must be confirmed by superior authority. Each city has a municipal council; the cities are free to manage their own affairs, but they must send a copy of their accounts to the ministry, which has them revised. The communal organization, nevertheless, leaves much to be desired; the government has frequently attempted to introduce reforms, but its efforts fail, owing to the resistance of the estates.—Till 1867 the various religions did not enjoy the liberty which is granted them at present in most of the states of Europe Mecklenburgers who are not Lutherans, practiced their religion only by toleration, and it is well understood that Lutherans themselves can not change the least ceremony without the consent of "competent" authority. Mecklenburg was obliged to submit to the law of equality of religions decreed by the constitution of the empire.—There are many benevolent establishments in the country, and praiseworthy attention is paid to primary education. Education is compulsory. Besides, in domain lands every head of a family, whether he has children or not, is obliged to contribute to the school fund. In knights' lands the proprietor, and in cities the municipal council, appoint the teacher. The teachers are poorly paid. Among the conscripts (in 1856) 88 per cent. knew how to read satisfactorily; those who came from knights' estates were the least instructed! Each grand duchy has primary normal schools. There are eight gymnasia in the two grand duchies, and a university in Rostock which dates from 1419.—The judicial organization of the country is very backward. Patrimonial or knights' jurisdiction has been preserved in most of the

cities; the magistrate exercises both judicial and administrative functions. Civil legislation is not uniform in the different parts of the country, but at Rostock there is a supreme court common to both grand duchies. — As to taxes imposed by the estates, they comprise, in addition to ancient tolls, the "ordinary contribution" which is at once a land and poll tax (a personal and property tax) in knights' estates. In domain lands the tax appears under the form of so much per cent. on the rent. In cities the ordinary tax is composed of various levies on lands, houses and professions, to which is added the fifth pfenning for the city. Rostock has a system of its own, which is a kind of octroi.* There is, besides, an "extraordinary tax" which appears also in a direct form, but figures in one place as a land tax, in another as a license, and in a third as a tax on income or capital. The financial system of the two Mecklenburgs is the most complicated labyrinth that can be imagined. The following is the opinion of the government of the country on this subject (official document of 1846). "False in principle, contrary to the most ordinary rules of political economy, the imposts, taxes and tolls hinder and trouble domestic commerce to the profit of the foreigner, weigh upon the poorer tax payer, while the rich may escape their action without infringing the law, render exportation difficult, increase the cost of collecting taxes, without making fraud difficult. * * *." We have enough of this description, but there is reason to think that the events of 1866 and 1870–71 have improved the situation. — The government not being obliged to render an account of the funds which it collects, there is no budget. The revenues of the grand duke of Mecklenburg-Schwerin, before 1866, were estimated at 4,000,000 thalers, of which 2,400,000 came from domain land, 320,000 came from transit dues, 1,000,000 from taxes, and 440,000 from posts and other dues called regalian rights. But the forced connection of Mecklenburg with the tariff system of the empire has abolished the transit dues; it is true, however, that by the same act the grand duchies were relieved from various expenditures. The revenues of the grand duke of Mecklenburg-Strelitz are about 600,000 thalers, 500,000 of which arise from the domains, 82,000 from imposts, and the rest from various sources. The debt of one of the grand duchies is about 9,000,000 thalers, that of the other 1,000,000, a part of which was contracted to build a railway and to redeem the Sound dues. If the reform which we mention above, though far less than is demanded by public opinion in Germany, is realized, there is reason to think that a regular budget will be established in this country which is so backward. — German legislation is in force with reference to the army, the Mecklenburg troops (treaty of February, 1873) forming a part of the ninth army corps of Prussia. — BIBLIOGRAPHY. MAURICE BLOCK.

* By the convention and the law of May 15, 1863, the financial organization of the country was sensibly improved; the tolls (octrois) were abolished and internal barriers replaced by custom houses on the frontiers, which are assimilated to those of Germany since 1867.

MECKLENBURGH DECLARATION (IN U. S. HISTORY). The authorized account of this document is that it was adopted at two o'clock in the morning of May 20, 1775, at Charlotte, by a convention of two delegates from each militia company of Mecklenburgh county, N. C.; that the papers of John M. Alexander, the secretary of the convention, were accidentally burned in April, 1800; that copies of the minutes and declaration were then sent to Hugh Williamson, at New York, the historian of North Carolina, and to W. R. Davie; and that another copy was finally published by the "Raleigh Register," April 30, 1818. From this last publication the declaration first became generally known. — The declaration purports to "dissolve the political bands which have connected us to the mother country, and absolve ourselves from allegiance to the British crown, and abjure all political connection, contract and association with that nation"; to declare that the people of Mecklenburgh county are "a free and independent people," who "are, and of right ought to be, a sovereign and self governing association, under the control of no power other than that of our God and the general government of the congress"; and to establish a revolutionary government for the county. — The declaration is historically suspicious from its use of phrases used in the declaration of July 4, 1776; from the facts that Williamson, and the contemporary writers of this and neighboring states, show no knowledge of it, and that it was entirely ignored in and out of congress at a time when resolutions coming far short of independence were heralded by every newspaper in the country; and from its inability to appeal to any better evidence in support of it than that of dead men, burned papers, and a missing letter of approval from the three North Carolina delegates in congress, two of whom were notorious tories. Nevertheless Bancroft accepts it without hesitation; and the probability is that resolutions, of the kind which were common at the time, were passed May 31, that the "copies" of 1818 were from recollection, with strong traces of the declaration of July 4, 1776, and that the Mecklenburgh "declaration" was not of its purported date, or essentially of its

purported nature. ALEXANDER JOHNSTON.

MEDIATION. In international law, mediation is an act the object of which is to reconcile the disputes of nations. Three kinds of amicable negotiations, however, are distinguished: 1, a third power tenders its good offices to terminate the international dispute; 2, or a third power is selected to make impartial proposals of settlement, the other parties reserving the right of accepting or rejecting them; 3, or it is constituted judge or arbitrator to pronounce a sentence founded on the principles of justice and equity and binding on both parties. So we have tender of good offices, mediation, arbitration; each one of these methods has rules, and implies rights and duties for each power.—The tender of good offices generally springs from a spontaneous sentiment; its object is to prevent violence, by engaging the contending parties to come to an understanding and settle their rights, to offer or accept reasonable satisfaction. This is the first step toward mediation.—Mediation is a commission conferred and accepted for the purpose of conciliation, to procure peace, by softening reproach, calming resentment, and enlightening minds. Its tendency is to effect a compromise of opposing claims, to smooth difficulties raised by interest, self-esteem or passion, and it may lead to arbitration.—Arbitration consists in the choice of one or several judges selected by common consent to decide the dispute and pronounce a sentence which, executory like a treaty, is to serve as a law and rule.—We may remark that the processes of arriving at a settlement of disputes between nations are identical with those applied to the disputes of individuals; but we should not be astonished at this; nations are nothing more than agglomerations of individuals, and these agglomerations can not have, really and logically, other laws than those which govern the individuals composing them. Natural right flows from the same sources. Its principles apply, therefore, to nations as well as to individuals. Vattel could therefore say, with the concurrence of all civilized peoples: "Justice is even more necessary among nations than among individuals, because injustice has more terrible consequences in the disputes of these powerful political bodies. Each nation should therefore render to others what belongs to them, respect their rights, and leave them to the peaceful enjoyment of them. But the difference consists in this, that in civil society there are powers charged with enforcing respect for the rights of each one of its own members, while between free and sovereign nations there is no superior judge on earth before whom they can be summoned to appear in order to await from him the settlement of their disputes." Hence the creation, by the force of things, of this rôle of third powers tendering their good offices, or chosen as mediators, or accepted as arbitrators. EUGÈNE PAIGNON.

MEDIATIZATION. In consequence of the wars of the revolution and the empire, a great number of *immediate* principalities, counties and baronies of Germany, that is to say, such as had no other suzerain than the emperor under whose immediate authority they were, were subordinated to princes formerly their equals; this has been termed mediatization. In other words, their prerogatives, property and honors were left them, and their sovereignty taken away. The federal act of the Germanic confederation recognizes (Art. 14) their exceptional position; the mediatized lords (*standesherrn*) continued to be the equals of sovereign princes, in this sense that the latter might and (may?) without mésalliance, intermarry with them (*ebenbürtigkeit*); and they enjoy certain immunities for themselves and their families, such as exemption from military service. Several decisions of the federal diet have recognized for the princes the title of *durchlaucht*, (serene highness), and to the counts that of *erlaucht*, (excellency). Several German states granted them other privileges; they are, for instance, nearly everywhere hereditary peers. Since the dissolution of the Germanic confederation their situation has not been so well defined. In a case tried in Berlin in February or March, 1872, the court refused to recognize the right of privileged jurisdiction in the case of two lords. (They had been members of the board of management in a joint stock company which had failed.)—The number of mediatized rulers is somewhat considerable. There are fourteen in Austria, twenty-nine in Prussia, twenty-two in Bavaria, thirty-five in Würtemberg, eight in Baden, and nineteen in the grand duchy of Hesse. But it is proper to remark that some are mentioned twice, in this sense, and that several houses, such as those of La Tour and Taxis, figure in a number of states. Further, Prussia granted the title of *standesherrn* to twenty-eight other houses of princes and counts. Among mediatized rulers we find the names Aremberg, Croy, Bentheim, Sayn-Wittgenstein, Salm, Solms, Wied, Esterhazy, Schwarzenberg, Windischgraetz, Fugger, Hohenlohe, Ottingen, Waldburg, Loewenstein, Stadion, Leiningen, Furstenberg, Leyen, Isenburg, Erbach, Stolberg, and others. M. B.

MEMORANDUM is a term which has survived from the Latin, which had been introduced as a neutral language in the composition of letters, negotiations and treaties in times before Louis

XIV. In the reign of that monarch the French language became usual in the relations of states. By memorandum was described a species of diplomatic note containing a brief statement of the condition of a question and a justification of the position taken by a government, or the acts emanating from it. — "In monarchic states," says Martens, "the minister of a foreign power may sometimes negotiate directly with the king, either orally, or by laying before him memoirs, etc.; but more frequently he is obliged to enter into a conference with the minister of foreign affairs, or with one or more commissioners whose appointment he has obtained. Conferences are held sometimes at the residence of the minister, sometimes at that of the commissioner, sometimes at a third place. Frequently the minister presents a memoir, a note or another document, which contains in writing the substance of what he has stated orally, and as a rule these papers should be signed. Several states have taken the wise resolution of never deliberating on a point unless the foreign representative has presented the substance of it in writing, in the form of a memoir or a note. But, generally, a minister would not be obliged to return in writing the substance of what he had presented orally, or what he had read, or to sign the copy or the protocol which might have been drawn up; he agrees sometimes to give a *verbal note*, an *aperçu de conversation*, etc. But such papers are not usually signed; as also it is not customary to sign confidential memoirs, and court declarations are sufficiently authenticated by the memoir with which the foreign minister accompanies them" — The nature of the memorandum demands a pure and exact style, showing a cool thinker rather than a rhetorician. It should rivet the attention; in a word, it should express fitly and with unbroken logic, what should be said, and nothing more; it should avoid circumlocution, idle phrases, ambiguous or uncommon words; such should be the character of diplomatic writings. Ill-chosen expressions may lead to irritation or complications, by wounding power in its dignity or its interests.

EUGÈNE PAIGNON.

MERCANTILE SYSTEM. The theory of the balance of trade and the consequences which were drawn therefrom constitute what is called the mercantile system, because the whole of this system tends to consider foreign commerce as the most productive branch of a nation's labor. It is supposed that a nation can sell more than it buys, in a way to ruin neighboring nations by absorbing their precious metals by the greatest possible exportation and the least possible importation. This false theory still prevails in the minds of the masses, and still serves as a rule for many administrations and governments; it forms the basis of the economic ideas of all the writers of the eighteenth century, who did not belong to the physiocratic school or to that of Adam Smith; it is still appealed to in our days by statesmen, and by all those who, by conviction or for financial considerations, defend prohibition, high tariffs and custom impediments. — We have not to detail here, still less to refute, all the consequences of this fundamental error, which would necessitate a full course in political economy, and which would lead us to repeat what is already found in many articles of this Cyclopædia. We will limit ourselves to saying that the mercantile system is in opposition to the true notion of money and of production, to the nature of markets and the mechanism of the operations of commerce, and we will refer the reader more particularly to the articles, BALANCE OF TRADE, COMMERCE, EXCHANGE, OUTLET, MONEY, PRODUCTION OF WEALTH, EXPORTS AND IMPORTS. — All sciences have begun in error; and the mercantile error is found in antiquity. It is plain from a passage in Cicero,* that the exportation of precious metals was often prohibited under the republic, and this prohibition was often renewed, although very uselessly, by the emperors There is perhaps no state in modern Europe which has not formally interdicted the exportation of gold and silver. This exportation was, it is said, prohibited by the English laws before the conquest, and different statutes having the same purpose were passed at that time One of these statutes (3 Henry VIII., chap. i.), approved in 1512, declared that any person who transported metallic specie, plate or jewels, to a foreign country, if it was discovered, would be liable to a confiscation equivalent to double the value of the merchandise transported. — In 1848 when Rossi became minister of the pope, one of his first cares was to repeal the legal provisions which forbade the exportation of coin from the Roman states. About the same time, and a few days after the revolution of February in France, the commissary of the department of the Rhone opposed, by a decree, the exportation of coin from that department! — It is known that commerce, during the fifteenth and sixteenth centuries, developed rapidly, on account of the direct relations of Europe with India by the cape of Good Hope, and the force of circumstances brought about the substitution of a more ingenious and less barbarous system for the gross system of the absolute prohibition of the exportation of coin. Indeed the exportation of gold and silver money by India was advantageous and was practiced notably by the East India company. This company was accused on this point of ruining the kingdom, by taking out of the country its gold and silver; but its defenders, Thomas Mun among others, claimed that this exportation was advantageous, because the commodities brought from India were chiefly re-exported into other countries, from which was received a larger quantity of coin than that required in the first place for the pay-

* "In a great number of cases, before and since my consulship, the senate has very wisely decided that the exportation of gold could not be allowed." (Oration for L. Flaccus, ch. 28.)

ment of these commodities in the east. — It is from this time that the first theoretical essays on economic and commercial questions date. Mun wrote in 1635 or 1640; after him came, in England, Josiah Child, Dr. Davenant, the authors of the "English Merchant," and J. Steuart; in France, Melon and Forbonnais; in Italy, Genoiesi, who were, in the eighteenth century, the most distinguished writers, who defended, with more or less extensive restrictions, the principles of the mercantile system. — The analyses of the physiocrats, and, later, those of Adam Smith, completely refuted this false idea, which all the treatises on political economy place among scientific heresies; but upon this point, we repeat, practice is about three-quarters of a century behind theory The point of departure of this theory rests in this fact, that, since ancient times, money had principally consisted of gold and silver specie. From this fact it was concluded that the possession of money exclusively constituted wealth; the use of money for a long time prevented the perception of the true nature of purchase and sale, that is to say, of exchange, and confounded wealth with the instrument of exchange and the measure of this wealth. The consequences of this error have been formidable for humanity. They have, in fact, led men to misunderstand the freedom of labor, the advantages of the division of employments among nations; led them to create at the frontiers customs barriers to protect certain branches of work, but which hurt all; to direct most industries into unnatural ways; to give to governments a surveillance which they should not be allowed to exercise; to create a barbarous legislation, and to cast discord among nations. "It is no exaggeration," says Storch, "to affirm that very few political errors have produced more disasters than the mercantile system. Armed with power, it has imposed ordinances and prohibitions where it should have protected. The method of making regulations, which it has inspired, has been the cause of vexations of a thousand kinds to industry, to turn it from its natural paths. The mercantile system has persuaded each nation that the well-being of neighboring nations was incompatible with its own; hence was born that reciprocal desire to injure and impoverish each other, and with it that spirit of commercial rivalry which has been the immediate or remote cause of the greater part of modern wars. It is the mercantile system which has driven nations to employ force or cunning to extort from the weakness or ignorance of rival nations treaties of commerce which have been of no real advantage for themselves. It is this system which has presided over the formation of colonies, for the purpose of giving to the mother country the exclusive enjoyment of their commerce, and to force them to have recourse only to the markets of the mother country. Where this system has produced the least evil, it has retarded the progress of national prosperity; everywhere, besides, it has caused torrents of blood to flow; it has depopulated and ruined many countries, to which it might have been supposed it would have furnished in the highest degree power and wealth."

JOSEPH GARNIER.

MESSAGE (IN U. S. HISTORY), a written communication to congress by the president. Regular messages are sent at the opening of each session of congress; special messages, whenever an occasion for them arises. During the administrations of Washington and John Adams the messages were delivered orally by the president to the two houses assembled together; since that time they have been delivered in writing, through the president's private secretary, and then printed by order of congress for general distribution. (See EXECUTIVE.) A. J.

MEXICO forms a triangle whose apex pointing southeast terminates the North American continent. It reaches to that ridge, 1,428 miles long, known as the isthmus of Panama; and includes the most northerly of the passes which exist in that immense embankment and offer a means of passage between the two oceans which wash the shores of the new world, namely, the pass called after Tehuantepec, a town on the Pacific coast. Mexico, however, extends beyond the pass or the isthmus of Tehuantepec; the peninsula of Yucatan, which is farther south, belongs to it also, thus making it contiguous to Central America, which is composed of five independent states, the most important being Guatemala, and of the English colony of Balize. Mexico, then, chiefly extends lengthwise in an oblique direction from 15° to 33° north latitude, lying southeast to northwest, from Cape Catoche in Yucatan to the bay of San Diego in the peninsula of California, a distance of not less than 1,863 miles. Its narrowest part is the isthmus of Tehuantepec, where the width in a direct line is only 136 miles: from Vera Cruz to Acapulco through Mexico, which is indirect, is 341 miles. Farther north, from the mouth of the Rio Bravo del Norte to the anchorage off the town of Sinaloa, following the line of latitude, is a distance of 683 miles. — Mexico, since the diminution it suffered at the hands of the United States, possesses a superficial area of 743,948 English square miles, less than half its size when ruled by Spain, and is about three and a half times as large as France. The greater part, as is shown by the preceding data, is in the torrid zone, the populated portion being almost entirely so. Northward the race of peaceable Indians, who by learning to work and embracing Christianity have entered the pale of civilization, disappear; and the population of European origin, although the more numerous, is scanty. Its increase is hindered by the incursions of savage Indians who are opposed to labor, and in particular those of the Apache nation, with regard to whom the United States, deeming them incapable of being improved, now openly pursues a policy of exter-

mination.— *The Climate of Mexico and the Productions it favors.* By its peculiar configuration Mexico is spared the disadvantages common to tropical countries. That portion of the earth's surface which bears the name of the torrid zone is in general unsuited to white men on account of its extreme heat, but even there the warmth of the sun may be modified by the elevation, that is to say, by the height of the land above the sea level. As the altitude increases, the temperature lowers, till at last, even at the equator, the limit of perpetual snow is reached. The greater part of intertropical Mexico forms a high table land, having a gradual slope on the one side to the Atlantic and on the other to the Pacific, intersected by valleys more or less deep, and studded with mountains and hills. This Mexican plateau enjoys many advantages, among which one in particular is worthy of note, that with the exception of a few isolated summits here and there, its elevation makes it admirably adapted to Europeans, and well suited to the cultivation of the products of the temperate zone, such as cereals, maize, the vine and the olive. On entering Mexico from the south, the central Cordillera of the Andes, which traverse the new world throughout all its length as though they were its spine, spreads out until it occupies almost the entire space between the two oceans; forming a plateau raised above the sea level to a height which, a little north of the isthmus of Tehuantepec, is about 4,900 feet, while at Pueblo, Mexico and Guanaxuato, it varies from 6,800 feet to 7,500 feet. Farther north the elevation is less than at Mexico. — The city of Mexico is built at the foot of two mountains, both covered with perpetual snow, Popocatepetl and Istaccihuatl, the former of which is 17,800 feet high. Setting aside these formidable earth masses and a few others distributed over the plateau, the high districts are for the most part a sort of plain stretching far into the north; the distance this table land extends, from north to south, is at least 1,500 miles, that is, about the distance between Paris and St. Petersburg.— On leaving the shores of the ocean, whether it be the Atlantic or the Pacific, and going toward the high lands, owing to the rapid change of elevation, a quick succession of different climates is encountered, each having its own distinct vegetation. With good means of communication, it would be possible to go in one day, from sunrise to sunset, from the coast plains, where the heat is suffocating, to a temperature resembling that of Montpellier or Toulouse. At each step, the face of the country, the look of the sky, the appearance of the animals and plants, the manners and occupations of the people, all change. First, the sugar cane is met with, in company with indigo, cacao trees and bananas; then comes the coffee shrub, and in succession the cotton plant, oranges, tobacco, olives, wheat and vines, together with many plants peculiar to the country, such as the liana whose fruit is vanilla, the beautiful plant (genus convolvulus) whose root makes jalap, the smilax whose root is sarsaparilla, and the cactus (*opuntia*) the food of the cochineal insect. On first starting, palms, and all those vigorous trees which in equatorial regions spring up along the seacoast, form the surroundings; in the intermediate region, say about the elevation of Xalapa, the trees have that beautiful, bright green foliage, like that of the liquidambar, which is a certain indication of a country plentifully watered by rivers or by the clouds, and the temperature of which is always moderate; they are succeeded by the oaks, which in turn give way to pines and firs, and lastly the firs remain alone as they do amid the crags of the Alps; the last remnants of vegetation are the lichens which only disappear when the perpetual snow line is reached. Maize thrives in every region. — Sugar planting is as profitable in Mexico as it is in the Antilles; cotton is of excellent quality, and the yield is abundant. Maize produces in a good locality and in a favorable season 800 grains for one. The wheat-growing country in the neighborhood of Puebla and of Toluca, notwithstanding that the farming is of the most primitive description, produces twenty-four or twenty-five grains for one. The banana or plantain is one of the staple food sources of Mexico, and it is well known that no other food plant needs so little attention or in proportion produces, even approximately, so much. — It is customary to divide Mexico into three parts, according to climate and productions, giving to each a characteristic name. The first division, which commences at the seacoast, is distinguished by luxuriant vegetation and excessive heat. Unfortunately many parts of it are devastated by yellow fever, a disease deadly to strangers and even to the Mexicans if from the plateau. It bears the name of the hot district (*tierra caliente*). Next in order is the temperate district (*tierra templada*), the climate of which is a perpetual spring. Xalapa and Orizaba are examples of this delightful country, which has a mean annual temperature of from 18° to 20° centigrade, and the thermometric variation in the different seasons is very slight. It is not only free from the overheated atmosphere and malarial exhalations of the seacoast, but also from the insects, both troublesome and dangerous, which swarm to the torment of mankind over a great part of the hot district. The third and last zone, the cold district (*tierra fria*) is the most extensive. It includes the entire plateau, and even those parts of the two inclined planes immediately adjacent to it It is almost universally agreeable to live in, and the inhabitant of the choicest spots in Europe might almost believe himself at home there. — *The Mineral Wealth of Mexico.* Mexico is naturally wealthy in minerals, and especially so in the precious metals, of which silver is the more abundant. The mines form a line 1,863 miles in length, reaching to the very north of Mexico, and taking a direction from southeast to northwest They are the result of one of those tremendous upheavals which have set their mark on the suc-

cessive periods of this planet's existence. The matrix is in veins, principally consisting of quartz, through which the silver is scattered in very small quantity, so much so that after the separation of the waste from the workable ore, the latter only yields the two or three thousandth part of its weight in metal, sometimes even less, and it is only the extreme abundance of the ore which compensates for its lack of richness. In northern Mexico, and especially on the Pacific coast, the traveler may see long lines of rocks cropping out, these being the quartz veins, the hardness and durability of whose substance has resisted all climatic influences. The number of argentiferous veins is practically unlimited, and their thickness is considerable, therein differing from the silver veins of the old world. Although Mexico has produced a great quantity of silver, it has been a mere sample of the metallic wealth of the country; an opinion which, expressed by the great Humboldt in the beginning of the century, has since been confirmed by every engineer and scientific man who has visited the country. The principal prospecting has been done in the neighborhood of the beautiful city of Guanaxuato, round about Zacatecas, farther north still at Guadalupe y Calvo, and in the opposite direction at Real del Monte. By an ingenious process, the invention of a sixteenth century miner, Bartholomew Medina, the silver is separated almost without the use of fuel from the different and often complex combinations in which it is found, the agent used, with a few other substances of less value, being mercury in the proportion of three pounds of it to two of silver. This process, called cold amalgamation, is of great value, because the country, sparsely wooded in the time of the Aztecs, was completely denuded of its forests by the Spaniards. Medina's process quickly spread from Mexico to all the other Spanish possessions in America, where it rendered the same services and is in use still. — Gold is found in Mexico for the most part in combination with silver, in a proportion small in weight but of considerable value, the value of gold being fifteen or sixteen times that of an equal weight of silver. The gold is removed from the silver ingots by "refining." There exist, however, in addition, gold mines, properly so called, which are generally but not invariably alluvial, like those which, existing in every quarter of the globe, have hitherto yielded by the process of washing the greater portion of the gold possessed by man. But the magnificent gold deposits of California remained unknown and therefore undisturbed as long as the country was in the hands of the Spaniards or of independent Mexico. The provinces of Sonora and of Sinaloa, on the Pacific coast, which are an extension of California, contain, according to incontestable evidence, deposits similar to those of California, both in the form of auriferous quartz and of alluvial detritus. — The Mexican mines have been, since the middle of the eighteenth century, the greatest producers of the precious metals in the world. At the beginning of the nineteenth century, when the war of independence broke out, their yield was from 125 to 130 millions, of which nine-tenths was silver. Since then, the country, distracted by continual revolutions and a prey to anarchy, has seen its mines neglected till the present yield barely equals that of the first years of the century. — If the country were restored to a settled condition, if it had an enlightened and stable government to provide the advantages enjoyed by the most civilized nations for three-quarters of a century, such as laws for the protection of labor, technical schools, and lines of communication, the production of gold and silver in Mexico would increase rapidly. The discovery of the great deposits of quicksilver at New Almaden, in California, is calculated to give a lively impetus to Mexican silver mining; for experience joins with calculation to show that abundance of mercury at a low price is a great incentive to activity among the miners who work the silver lodes. — The destruction of the greater portion of the forests and the entire absence of any mineral fuel must cause the production of other metals, and in particular of iron and copper, to be indefinitely postponed. — *Advantageous Position between the two Oceans.* To the advantages which Mexico possesses in its climate, its soil, the unlimited variety of its agricultural products, and its many gold and even silver mines, it adds that of a topographical situation almost unique. It has on its sides the two greatest and most frequented oceans, the Atlantic and the Pacific. It faces thus at the same time both sides of the old world, and the two most industrious, most civilized and most populous portions of it, one at its western extremity, that is, in Europe, and the other at the eastern, that is, China and Japan. It seems chosen to have intimate connections with both, and even to serve as a highway for much of their commerce. The railroad which is to cross Mexico from Vera Cruz to Acapulco, and is completed between the former city and the capital, will be of great service in opening up communication between the interior of the country and the seacoast, and will be useful to many strangers in spite of its steep ascending gradients, but the greater number will desert it for the line which the people of the United States, by a miracle of boldness and economy, have succeeded in opening between New York and San Francisco, both of which are metropolises exercising great attraction. — The isthmus of Tehuantepec was strongly advocated, before the design of the Central Pacific railway between New York and San Francisco was conceived, as the position for a line of rail which, together with the Panama railway, should make a junction between the two oceans. This route has the advantage of shortening greatly the transit from the eastern to the western slope of the North American continent. Travelers going from New York to San Francisco by sea and one of the isthmuses would gain considerably by taking it as

compared with the route via the isthmus of Panama. — The direct railroad between New York and San Francisco deprives of this special advantage the line of rails that was to be placed on the isthmus of Tehuantepec. In return it seems now highly probable that that isthmus will be crossed by a maritime canal of wide section, adapted for the vessels which transport the merchandise exchanged in such quantity between the Atlantic and Pacific basins. This canal, which is intended to commence in the river Guazacoalcos, a tributary of the Atlantic, and to reach the Pacific through the lagoons near Tehuantepec, is seriously projected now by the company which had before the concession for the railway across the isthmus. The United States government has had the proposed route surveyed, and the decision of those surveys, made in 1870–71, under the direction of Captain Schufeldt, by the engineers Fuatos and Buel and other officers, was that the undertaking presented no extraordinary difficulties. It would be necessary to surmount by means of locks an ascent of 233 mètres; the length would be 237 kilomètres from the island of Tacamichopa in the Guazacoalcos to the port of Salma-Cruz on the Pacific. The watershed would be on the plateau of Tarita. Below the island of Tacamichopa use would be made of the bed of the river Guazacoalcos, which it would be easy to improve. The maritime canal of Tehuantepec promises better for the commerce of the United States than any of the rival schemes proposed, as it would greatly shorten the distance between the numerous and busy ports which the Union possesses on the Atlantic side and San Francisco, already the most important mart of the new world on the Pacific. It would also be the most convenient route to Japan, Hongkong or Shanghae. — *The Population of Mexico.* The population of Mexico consists chiefly of the descendants of the indigenous race subdued by Cortez. This industrious and disciplined people rapidly embraced Christianity after Mexico was conquered. Whether voluntary or on compulsion, conversion was general. The Catholic clergy skillfully availed themselves of the similarities existing between Christian theology and that of the Aztec religion. Since that time the indigenes, called Indians through the mistake of Columbus who fancied he had found India, have remained submissive. In a very few instances and during periods of extreme suffering, isolated outbreaks of rebellion have occurred, but, very different in this from the Indian tribes once spread over the whole United States, the Mexican Indian regularly cultivates the soil either for himself or as the servant of some white man, does his day's work in one of the few manufactories which have been established, or labors of his own free will in the mines, where he gives surprising proofs of his physical development. There are numerous half-breeds, the offspring of intercourse between the whites and the Indians, who, under the Spanish dominion, were called *castes.* The number of negroes, or of those sprung from them through unions with whites or Indians, is very small. Formerly there were several thousand black slaves, but they were for the most part set at liberty on the commencement of the war of independence in 1810. — On the western slope of Mexico, in the neighborhood of the city of Acapulco, whose magnificent harbor was the port of arrival and departure of the solitary ship called the Galion, which once a year made the round trip between Mexico and China and the countries which lay on the route, Malays may be met with, the descendants of those who came by that way to settle in the country, but they have not increased. The proof that the Chinese, who are so industrious, who make such intelligent and steady workmen, might easily be attracted to the country and would acclimatize themselves there, is seen in the fact that they are taking root both in California and Australia in spite of the bad treatment they are subjected to in those places. — The dominant race till now has been the white, although in point of numbers it constitutes only one-sixth or one-seventh of the population. It is not without some admixture of Indian blood, as, since the time of Cortez and indeed at that great man's instigation, lawful marriages have been contracted between the two races: several of his companions in arms, and those not the least distinguished, having united themselves before the altars to the converted widows of Mexican chiefs who had fallen in the struggle. The ascendency of the white race is not absolute. The classes of mixed blood and even pure-blooded natives have furnished eminent men to the country who have risen to the highest honors. Guerrero, who was president, was of mixed Spanish and Indian blood, and President Juarez was a full-blooded Indian. — The number and composition of the Mexican people in 1810, according to the statistics of Don Francisco Navarro y Noriega, whom Humboldt mentions as being reliable, was as follows:

Europeans, and Creoles of European origin	1,097,928
Indians	3,676,281
Castes or mixed races	1,338,706
Total	6,112,915

At the present time the population of Mexico is estimated at about nine millions. — *Mexico since the Conquest by Hernando Cortez.* Mexico was, before the European invasion, the most powerful state of the new world. It was the farthest advanced in both the useful and the decorative arts, in science and in literature. This civilization, while in many respects to be admired, was marred by some horrible practices, in particular by that of human sacrifice. Several peoples in succession ruled the country, the last and cruelest being the Aztecs, to which race the emperor Montezuma, in whose presence Hernando Cortez found himself, belonged. — The Spanish conquest was achieved by a succession of battles and of deeds of daring which commenced on the day the Spaniards disembarked (Holy Thursday, 1519)

and terminated Aug. 13, 1521, on which date the last quarter of Tenochtitlan, or Mexico, was carried by assault, and the young and valiant Guatemozin, the last Aztec emperor, was taken prisoner. The Spaniards at once set to work to organize this vast acquisition. The Indians, notwithstanding their conversion, were, with the exception of the nobles and of the people of Tlascala, shared as slaves, or nearly so, between the conquerors and people of all sorts who flocked from Spain to join them, or who were sent there by the crown. This system went by the name of *repartimientos*, a word which indicated quite sufficiently what was done. They portioned out these wretched Indians as though they were herds of cattle, making them till the ground and labor in the mines. This régime, when applied to the islands of Hispaniola or San Domingo, speedily resulted in the extinction of the aborigines. In Mexico the race to be dealt with was hardier and possessed greater vitality. The enforced labor decimated but did not utterly destroy it. It must be said, also, that in this case the clergy labored indefatigably in behalf of the unfortunate Mexicans, and their efforts were crowned with success, upheld as they were by the court of Spain. This latter looked upon the sentiments of Christian charity which Queen Isabella manifested toward the aboriginal peoples of America, and which she, when on her death-bed, commended to her successors, as an inalienable bequest. At a later period the courts of justice or *audiencias*, and the viceroys, among whom were many distinguished men, were the interpreters of the royal views, and ameliorated the evils under which the Indians were crushed by the colonists or by the feudal chiefs who were blinded by avarice. The clergy regarded the task of protecting those unfortunate creatures as a special duty assigned them. In this an example was set to the whole of the new world by the bishop of Chicopas, Bartholomew Las Casas, who, at the time of the barbarities practiced on the natives of Hispaniola, made Europe and America ring with his outspoken denunciation of them. At an early period the Spanish court modified greatly the régime established in Mexico as elsewhere. The *repartimientos* were abolished, and their place taken by *encomiendas*. This was, as nearly as possible, serfdom substituted for slavery. The Indian and his family were attached to the soil instead of depending on the individual caprice of a master. One portion of the Indians remained exempt even from the *encomiendas* in certain villages, access to which was forbidden to the whites. During the reign of Charles III., an enlightened prince, and one who gave his mind to benefiting his people, fresh abuses and deeds of violence came to light, and these seeming intolerable to the court of Madrid, the *encomiendas* in turn were swept away. The native had now no master but the king, but he was obliged to pay an annual tribute, and he continued in a state of pupilage all his life. He was declared incapable of transacting business whenever the sum in question exceeded five piasters. This was done on the supposition that it would act for the protection of the Indians, but the avaricious cunning of the whites still found means of oppressing them, and the more so that they were more unarmed and less free to do it. Intendants, civil governors created by the same prince in 1776 were placed at the head of each province, and invested with considerable power under the authority of the viceroy. Their duty was to administer the affairs of the country in general, and in particular to act for the protection of the Indian. — The Indian nobility or caciques were exempt from the degrading condition of minority to which the other Indians were subject. From the time of Cortez they had been placed on a par with the Castilian nobility, but no care had been taken to educate their descendants. They had ended by lapsing into a condition of barbarity. Of their ancient superiority they only retained the habit of making exactions from their miserable fellow-countrymen. — The numerous class of half-breeds were scarcely better treated than the full-blooded Indian. They too paid tribute, but were, however, free from the state of perpetual pupilage which the Indian was forced to submit to; but they were none the less kept in a condition of degradation. — The class of creole whites, that is to say, whites born in Mexico, suffered under a policy of suspicious surveillance. To those who by their own effort or by inheritance possessed wealth in mines, or in vast agricultural territories, titles of nobility were given; those who were less rich got commissions in the militia and decorations. Neither class was admitted to any share in the government or administration of the country. All that was granted them was the privilege of becoming members of the municipal bodies or *ayuntamientos*. Numerous, and, from their large possessions, influential, this class was profoundly discontented. There was no despotism clever or adroit enough to make the son of a father born in Spain and of a mother equally Spanish admit that there should exist a gulf between him and his parents or between him and an elder son who happened to have been born in Spain. It was useless to inspect all printed matter entering Mexico, with the object of preventing the circulation of any books unless approved by the inquisition; truth has a diffusive force which sets at naught the arbitrary decrees of the most absolute power or the watchfulness of the subtlest inquisition. An antagonism, at one time suppressed, at another outspoken, existed between the creoles (*criollos*) and the natives of Spain, who were distinguished by the name of *Gachupines*. — Ideas of independence were introduced into Mexico by the excitement caused by the independence of the United States and the French revolution, and sank deep into men's minds in spite of the barriers with which government surrounded the people; and the events which took place in the peninsula in 1808 giving the needed opportunity,

by the total eclipse of the legitimate royalty from which the whole system emanated, an explosion followed. The independents, commanded by priests, first Hidalgo and then Morelos as their generals in chief, gained in the beginning important advantages, but they soon suffered severe disaster. A Spanish officer of great merit, Calleja, who was afterward viceroy, made them pay dearly for their early successes. Their armies were beaten and dispersed, their chiefs taken and executed. In 1815 the triumph of the Spanish authority seemed everywhere complete, but it was only so in appearance. The creoles, the chief of whom had in consequence of the atrocities committed by the independents made common cause with the Spaniards, rallied at last from all quarters to their country's flag. The signal was given by one of them, who had distinguished himself with the Spanish armies, Colonel Iturbide. This chief, to whom the viceroy Apodaca had entrusted an imported body of troops, proclaimed independence Feb. 24, 1821, and published a programme which has since been famous, by the name of the Iguala plan (so called from the small town where it was issued). The whole country, every class, gave in their adhesion to it. Independence was henceforth an accomplished fact, and from that time it has never again been questioned. — The proclamation of independence was only the beginning of the greatest trials. The Iguala plan provided that Mexico should henceforward form a perfectly independent monarchy, the crown of which was to be offered to the king of Spain on condition of his residing in the country, and in the event of his refusing, to the infantas, his brothers. The court of Spain utterly rejecting this proposal, Iturbide had himself proclaimed emperor, but seated on the throne in May, 1822, in May, 1823, just one year later, he embarked at Vera Cruz, condemned to exile. The Mexican congress, a permanency since the emancipation gained by the Iguala plan, adopted the republican form of government, and believed it could do no better than copy the federal constitution of the United States, which, suited to the manners and antecedents of the former English colonists, jarred with the customs and prejudices of the Mexicans. The republican constitution, long in elaboration, was published in October, 1824, and the president elected was General Victoria, one of the most intrepid heroes of the war of independence. After four or five troubled years had passed, the horrors of civil war commenced, and the country, since then, has gone from revolution to revolution, from catastrophe to catastrophe. It has been by turns a federal and a simple republic. In the former case, the provinces have not only borne the name of states, but have also possessed a sort of independence with a distinct governing body, on the plan, more or less closely followed, of the United States; in the latter, the central executive has had the entire control, subject really or nominally to the decisions of a congress, consisting, like that at Washington, of two chambers There has even been, apart from any foreign intervention, a thinly disguised effort to establish a monarchy. It was made by General Santa Anna after his return to power in 1853, who planned to have himself elected president for life with the right at his death of naming his own successor. But the attempt proved abortive, and a revolution overthrew Santa Anna in 1855. — During the greater part of the time the federal form of republic has been the prevailing one, and is in existence at the present date. But it is impossible to give the provinces an independent existence such as is possessed by the different states of the American Union. This system has no root in Mexico's past and as a matter of fact the governor of Mexico always has a dominant influence, which, when the country comes to possess passable means of communication, will most assuredly increase — So great has been the political instability of Mexico since it became independent that the presidential chair changed occupants forty-six times between Oct. 10, 1824, and the French invasion, General Santa Anna's name appearing on the list five times. General Santa Anna was, from the declaration of independence until the movement of 1867, the most prominent figure in the country and the mainspring of the events occurring in it. He contributed more than any other to the overthrow of the emperor Iturbide; he, however, judged it inexpedient to accept the presidency till 1834. Forced again and again to relinquish power, he always regained it, and retained it longer than any of his rivals, steering skillfully between parties, soothing each in turn and using them one against the other.— In the midst of the turmoil of events and the incessant storm of personal pretensions, it is possible since the independence to single out two parties having distinct characteristics in complete opposition to each other, which by their antagonism furnish an inexhaustible incentive to revolution. These are, the conservatives and the reformers or liberals, neither, unhappily, knowing any moderation. The first named cling to ancient ideas and old forms of government, the second are saturated with modern theories, and admire in particular the principles of the French revolution of 1789, grafted on some of the federal principles of the United States. The ground on which they joined issue was the connection between church and state It was not that the clergy had been at first hostile to independence; with the single exception of the dignitaries of the church, who were almost to a man Spaniards, they had favored the party of independence, and had even taken an active part in the insurrection, giving it its first leaders, Hidalgo, Morelos and Matamoras, and to the last they continued to support it. But this was not done without making both open and secret reservations. The plan of government sketched by the priest Morelos maintained the prerogative of the church and its absolute control over consciences. The Iguala plan, in accordance with which independence was definitely estab-

lished, provided in its first article that one of the bases of the organization of the country should be the Roman church, catholic and apostolic, and that no other should be tolerated. In respect to its possessions, which were enormous, the Mexican church flattered itself that they would be respected, and it is not unreasonable to suppose that one of the accessory causes of its adherence to the party of independence is to be found in the system inaugurated by the court of Spain at the commencement of the century, of taking possession of the capital of the Mexican clergy and replacing it by annuity bonds which were deservedly protested against. This was actually done to the extent of 58,000,000 francs. — Independence once achieved, the Mexican liberals, who had received their education from the works of the French philosophers and publicists, entered with ardor the course in which they had been preceded by the liberals of France, and in due course by those of the two great peninsulas of southern Europe, Spain and Italy. They openly favored freedom of worship, which the Catholic clergy, in obedience to orders from Rome, rejected with all their power. At the same time the liberals proposed to vest in the state, which was without resources, the possessions of the church. With sound reason Mexican liberals wished, in view of possible claims on the part of Rome, to give the state the guarantees which form part of French public law, and notably such as make the publication of bulls, briefs and other official utterances of the holy see conditional on obtaining the previous sanction of the government. The liberal party also comprehended in its programme the innovations of the Code Napoleon and the French concordat of 1801, such as the civil character of marriage, the abolition of perpetual vows, the abolition of ecclesiastical tribunals, the closing of monastic institutions, the limitation or confiscation by the state of church property, etc. By degrees, overstepping French bounds, it ended by allying itself to the system adopted by the United States, which entirely divorces government from religion and the state from creeds. There has been on this account a complete rupture between the liberals and the clergy. The latter formed the centre and nucleus of the conservative party, with which a great number of the landed proprietors and a section of the Indian population have identified themselves. — After alternate successes and reverses, the liberals at last completely got the upper hand, and the French army found them in power when it entered Mexico. President Juarez, and the party which sustained him, relied on the constitution, which explicitly enjoined freedom of worship. Laws had been passed, which, with certain reserves in their favor, declared the lands and buildings belonging to the clergy to be sequestrated to the state, and under those laws many sales took place. — The political difficulty which has hitherto proved insurmountable in Mexico consists in this, that up to the present time it has not only been impossible to make the two parties walk in harmony, but even to find common ground on which they would tolerate each other. They shun each other absolutely. The liberal party aims at a perfectly commendable object, but does so for the most part without enlightenment and without tact; this object being to establish in Mexico a political system founded on the general principles which modern civilization has adopted in the countries where it has reached its highest development, namely, those of western Europe and the United States of North America, while imitating more particularly such peoples as have an affinity to Mexico in having a resemblance or community in their origin, their traditions, their manners or their language. What are called in France the ideas of 1789, with the deductions which she has drawn from them, and which Spain and Italy have accepted, are the basis of this party's programme. All that portion of this programme which concerns religion, or rather the relations of church and state, is rejected as sacrilegious by the conservative party, which the court of Rome sustains here, and excites by all means in its power. The doctrines of 1789 advocate entire religious liberty, abolition of perpetual vows, and the suppression of church courts; and Juarez, on regaining power after the retreat of the French armies, brought back with himself the constitution whose offspring he was, and vindicated liberal tenets on the subject of religion. His successor, President Lerdo de Tejado, followed his footsteps closely. The liberal party seems to have entered on an indefinite lease of power. It directs its efforts toward remodeling the state on the type of the advanced nations in Europe or the American Union, a work infinitely difficult of accomplishment when regard is paid to the materials on which it has to work and the tools at its disposal. — Mexico needs a moderator who could force or persuade the opposing parties to accept a compromise; some one to reproduce in Mexico what was accomplished in France by the first consul, when he formulated a *modus vivendi* to which an overwhelming majority acceded, and which appeased the dangerous dissensions having their origin in religion. But on this occasion the holy see gave its sanction to the proposed plan, encouraged it, and ordered its acceptance. In Spanish America, on the contrary, the Roman court has not hitherto admitted any compromise, and has declared its intentions in public documents, among which may be cited the allocution, dated Dec. 15, 1856, of Pope Pius IX. on the state of religion in the republic of Mexico, and that of May 6, 1863, on Spanish America in general. Of the same tenor is the concordat signed at Rome, Sept. 26, 1862, with the republic of Ecuador, a document which might have been penned by Hildebrand; as is also the encyclical of Sept. 17, 1863, to the bishops of New Granada. Unfortunately there is no one among the Mexicans who could present himself to them with the authority and prestige which the first consul enjoyed in France. — The history of Mexico, since

its independence, has been marked by many noteworthy incidents, viz.: 1. The invasion by the Spanish brigadier, Barrades, in 1829, to reconquer the country—an attempt which failed totally; 2. The Texan war, in which Santa Anna, wishing to recover that province from the American citizens who had taken possession of it, was defeated and taken prisoner at San Jacinto in 1835, with the result that this province, much larger than France, was lost to the Mexican republic; 3. The war of 1838, in which France took the chateau of Saint Jean d'Ulloa; 4. The war of 1847–8, when the army of the United States, after fighting numerous battles, took the city of Mexico, thereby obtaining the cession to the American Union of California and New Mexico. — But of all events in Mexico's history, the most important was the attempt, made by France in 1862 and the following years, to re-establish monarchy in Mexico in favor of an enlightened and generous prince, the archduke Maximilian of Austria, who, after being installed there, saw himself abandoned by the French arms, and believing it his duty to remain at his post in defense of the Mexicans who adhered to him, was defeated, and fell into the hands of Juarez' government, which had the barbarity to hand him over to a military commission, by order of which he was shot at Queretaro, June 19, 1867 — This expedition, foolishly conceived to begin with, badly organized, badly conducted, and which had such a fatal issue, was one of the greatest mistakes made by modern French policy. The object aimed at was, to raise the party of the great landowners and the clergy, by giving it the new throne as a bulwark: an insane project, as, at the time it was sought to carry it out, that party was so wrecked that so far from being able to make any headway against its opponents, it lacked the very cohesion necessary to maintain its existence, and either could not or did not know how to concentrate on behalf of its unfortunate prince what little power remained to it. The court of Rome, on whose fervent and cordial co-operation the emperor Maximilian thought himself justified in counting, betrayed his hopes and stood aloof from him. — Mexico is at present comparatively tranquil, and laws are better kept or less unknown. Military men seem satisfied that the supreme magistracy should rest in the hands of a civilian. Public education is extending and improving in every department, from the highest to the lowest. Efforts are being made toward the development of public works. The railroad from Mexico to Vera Cruz, opened in January, 1873, promises great results for the agriculture of the country, the export of whose rich and varied produce it will greatly facilitate. Mining is receiving a fresh impetus. But a vast amount of ability, wisdom and firmness will be necessary before the unsettled habits, contracted during half a century of civil discord, are finally relinquished, and the passions which then had free vent are brought under proper control. Highway robbery flourished in Mexico when it was a Spanish colony, and the courts of justice were very severe, but it has increased enormously, the very trains on the Mexico & Vera Cruz railway being sometimes stopped and robbed. There still remains, therefore, much in the way of progress for Mexico to effect before it can equal the condition of the civilized states whose peer it wishes to be, or raise itself to the level of the political institutions it has adopted. — Mexico is divided into twenty-seven states, one territory (lower California), and one federal district made up of the city of Mexico and its environs. The total revenue of the central government, in 1873, was estimated at over fourteen millions of dollars; the imports rose, in 1870, to twenty-three and the exports to twenty-six millions of dollars.*—

* A revolution took place in 1880, which overthrew Gen. Porfirio Diaz and installed in his place Gen. Gonzales. The administration is carried on by a council of six ministers, viz., of justice, finance, the interior, army and navy, foreign affairs, and public works. — The revenue is more than two-thirds derived from customs duties, and about one-half of the expenditure is for the maintenance of the army. The expenditure has for many years exceeded the revenue. In the budget estimates for the financial year ending June 30, 1879, the revenue was estimated at $16,128,807 and the expenditure at $22,108,046. — The public debt of Mexico, external and internal, was estimated at $425,500,000, but no official returns regarding it have been published since 1865, when the total debt was calculated at $317,357,250. The government of the republic does not recognize any portion of this debt, except the 6 per cent internal Mexican debt, and the interest on that has not been paid for many years. The following is an abstract of the debt as published in 1865:

ITEMS	Capital	Annual Interest
Old English three per cent loan as per settlement of 1851	£10,241,650	£ 307,205
Three per cent. stock, created in 1864 for settlement of overdue coupons of old loan	4,864,800	145,944
Six per cent. Anglo-French loan of 1864	12,365,000	741,900
Six per cent. lottery loan of 1865	10,000,000	----------
Interest, £600,000; lottery prizes, £120,000, sinking fund, £250,000	----------	970,000
Six per cent internal Mexican debt, *circa*	7,000,000	420,000
Admitted claims of foreigners, bearing interest at 6 per cent	6,000,000	360,000
Amount due to French government for war expenses, March 31, 1865	13,000,000	----------
Annual payment to France on account of war expenses, as per Paris convention of 1864	----------	1,000,000
Total	£63,471,450	£3,945,049

— The population of Mexico in 1875 was estimated at 9,343,470 souls of which more than one-half were pure "Indians."— The chief articles of export are silver, copper ores, cochineal, indigo, hides, mahogany and other goods: articles of import are cotton and linen manufactures, wrought iron and machinery. More than two-thirds of the entire trade of Mexico is carried on with the United States, and the remainder with France, Germany and Great Britain. The total imports in 1876 were of the estimated value of $28,485,000, and the exports were estimated at $25,435,000, (the export of silver alone valued at $15,000,000). —Mexico had 1,050 miles of railway open for traffic in 1881. The Inter Oceanic railway, across the isthmus of Tehuantepec, sixty miles long, was to have been opened at the end of 1882. In June, 1881, the total length of telegraph wires was

MICHEL CHEVALIER.

MICHIGAN, a state of the American Union, formed from the northwest territory. (See TERRITORIES, ORDINANCE OF 1787.) The territory of Michigan, as formed by the act of congress of Jan. 11, 1805, was enlarged by other acts until that of June 28, 1834, when it embraced all the territory north of Missouri, Illinois, Indiana and Ohio, and between Lakes Erie and Huron and the Missouri river. According to the provision of the ordinance of 1787, which directed congress to admit new states, with a population of 60,000 at least, from the northwest territory, Michigan began its applications for admission as a state in January, 1833, claiming to have reached the constitutional limit of population; but congress paid no attention to the applications, and the bills for admission, which were introduced, were not acted upon. Finally a convention, called by the territorial council, framed the first constitution, referred to below. The question of the southern boundary was very embarrassing to congress, which finally passed the act of June 15, 1836, to settle the northern boundary of Ohio and to admit Michigan when its convention should assent to the boundaries provided by congress. A convention called by the territorial legislature, Sept. 28, 1836, refused to ratify the new boundaries; but another convention, Dec. 15, 1836, chosen by the people of their own motion, ratified them, and this was accepted as sufficient by congress. The state was then admitted by act of Jan. 26, 1837. Objections were made to the counting of Michigan's electoral votes in 1837, on the ground that the electors were chosen before the state was admitted, but they were counted "in the alternative." (See ELECTORS.) — BOUNDARIES. The first constitution claimed for the new state the same boundaries as those established for the territory of Michigan in 1805—the southern peninsula of Michigan, with the southern boundary a few miles farther south than at present. The act of June 15, after so fixing the northern boundary of Ohio and the southern boundary of Michigan as to give the disputed territory to the former state, added to the new state, in compensation, the whole of the *northern* peninsula of Michigan also, with a western boundary as follows: from the mouth of the Montreal river in Lake Superior, up the main channel of the Montreal to the middle of the lake of the Desert; thence by a straight line to the nearest headwater of the Menomonee river and up that fork to the Menomonee river; thence down its main channel to the centre of the most usual ship-channel of the Green bay of Lake Michigan, and through that channel to the middle of Lake Michigan; thence down the middle of Lake Michigan to the northern boundary of Indiana, and east and south, with the Indiana line, to the Ohio line. The eastern and northern boundary was that between the United States and Canada. — CONSTITUTIONS. The first constitution was framed by a convention which met at Detroit, May 11 – June 29, 1835, and was ratified by popular vote, Nov. 2. It prohibited slavery; gave the right of suffrage to white males over twenty-one, on six months' residence; provided for a house of not less than 48 nor more than 100 representatives, to be chosen annually, and a senate one-third as numerous, to serve two years; and fixed the governor's term at two years. — The second constitution was framed by a convention held at Lansing, June 3 – Aug. 15, 1850. Its principal modifications were that it fixed the capital permanently at Lansing, where the legislature had already established it; it fixed the number of senators at 32, and of representatives at not less than 64 nor more than 100, and it forbade the creation of corporations, except under general laws, the giving of state credit to corporations, and the passage of laws to license

10,580 English miles. The postoffice carried 4,406,410 letters in 1879-80. At the end of June, 1881, Mexico had 873 postoffices.

the selling of intoxicating liquors. It was amended in 1866 by giving the right of suffrage to voters absent from the state during time of war in the military service of the United States; in 1870 by empowering the legislature to fix maximum rates for transporting passengers and freight on railroads, and by prohibiting the consolidation of parallel or competing railroads, and in 1876 by abolishing the prohibition of license laws.— GOVERNORS. Stevens T. Mason, 1836–40; William Woodbridge, 1840–42; John S. Barry, 1842–6; Alpheus Felch, 1846–8; Epaphroditus Ransom, 1848–50; John S. Barry, 1850–52; Robert McClellan, 1852–5; Kinsley S. Bingham, 1855–9; Moses Wisner, 1859–61; Austin Blair, 1861–5; Henry H. Crapo, 1865–9; Henry P Baldwin, 1869–73; John J. Bagley, 1873–7; Charles M. Croswell, 1877–81; David H Jerome, 1881–3.— POLITICAL HISTORY. In presidential elections Michigan was democratic until 1856, except that in 1840 it was carried by the whigs for Harrison by a very small majority. In 1856 it was republican, and in subsequent elections it has always been the same, the popular majority not varying much from 6 per cent. of the total vote. The congressional and state elections have been governed by much the same laws. The senators, congressmen, (see APPORTIONMENT), legislatures and governors were democratic until the end of 1854, with the following exception: the whig success in the election of 1840 included not only the electoral vote of the state, but the congressman from 1851 until 1853, two United States senators and the governor (Woodbridge) — Early in June, 1854, the "anti-Nebraska" state convention of Michigan formally adopted the name "republican" for their party, the name having been recommended to the consideration of several of its members by a letter of Horace Greeley, of New York. The state was carried in the election of 1854 by the party which its state convention had baptized, and since that time the governors, legislatures and United States senators have all been republican. In 1881 the democrats have but 15 of the 132 members of the legislature on joint ballot. The congressmen have been almost as invariably republican: the only exceptions have been the elections of 1854, 1858, 1862, 1870, and 1876, in each of which a single democratic representative was chosen; and the election of 1874 in which three democratic and liberal republican representatives were chosen. In the congress of 1881–3 all the nine representatives are, as usual, republican.— In local politics there has been little worthy of note, except in 1853, when a "Maine liquor law" was adopted by a popular majority of nearly two to one, and in 1870–72, upon questions in regard to the railroads of the state. Until 1870, under acts of the legislature, towns, cities and counties had issued bonds in aid of various local railroads. In 1870 the state supreme court decided that the whole system of bond issues was outside of the legitimate field of taxation, and was unconstitutional. The legislature therefore proposed three amendments, two of which, referred to under the second constitution above, were ratified by popular vote. The third, which was intended to legitimize the bond system of the past and to authorize its continuance, was rejected by a heavy popular majority. —Among the political leaders of the state have been the following: Kinsley S. Bingham, democratic representative 1847–51, first republican governor of the state, and United States senator 1859–61; Austin Blair, the war governor of the state, and republican representative 1867–73; Julius C. Burrows, republican representative 1873–5 and 1879–85; Lewis Cass (see his name); Zachariah Chandler, first republican United States senator 1857–75 and 1879–81, and secretary of the interior under Grant. Isaac P. Christiancy, justice of the state supreme court 1858–72 and chief justice 1872–4, United States senator 1875–9, and minister to Peru 1879–81; Omar D. Conger, republican representative 1869–81, and United States senator 1881–7. Thos W Ferry, republican representative 1865–71, and United States senator 1871–83; Jacob M. Howard, republican representative 1861–2, and United States senator 1862–71; Jay A Hubbell, republican representative 1873–83; Robert McClelland, democratic representative 1843–9 governor 1852–3, and secretary of the interior under Pierce; Charles E. Stuart, democratic representative 1847–9 and 1851–3, and United States senator 1853–9; Alpheus S. Williams, major general of volunteers 1861–5, minister to San Salvador 1866–9, democratic and liberal republican representative 1875–9; and William Woodbridge, whig governor 1840–41, and United States senator 1841–7. — The name of the territory and state was given from that of the lake on its border, an Indian word. It is probably a compound of the Algonquin word "gan" (lake) with the Chippewa prefix "mitcha" (great). The popular name for its people is "Wolverines."— See 1 Poore's *Federal and State Constitutions;* 2 *Stat at Large*, 309, 5 .48, 144 (for acts of Jan. 11, 1805, June 15, 1836, and Jan 26, 1837, respectively); 12 Benton's *Debates of Congress*, 701, 749, and 13 : 29, 65, 185, 255; Sheldon's *Early History of Michigan* (to 1815), J H. MILAN DECREE. (See EMBARGO, in U. S. History.)

MILITARY COMMISSIONS, and the Trial of the Conspirators for the Murder of Abraham Lincoln, President of the United States. When war prevails in a portion of country occupied or threatened by an enemy, whether within or without the territory of the United States, crimes and military offenses are often committed

which can not by the rules of war be tried or punished by courts martial, and which at the same time are not within the jurisdiction of any existing civil court. The good of society demands that such cases be tried and punished by the military power, by referring them to a duly constituted military tribunal composed of reliable officers, who, acting under the solemnity of an oath and the responsibility attached to a court of record, examine witnesses, pass upon the guilt or innocence of the arraigned parties, and determine the degree of punishment to be inflicted for the violation of law. — The powers of these tribunals have not been defined, nor any mode of procedure established by statute law, but the rules which apply to courts martial are held to be applicable to military commissions, and they are subjected to review and confirmation in the same manner and by the same authority as courts martial.—With respect to the jurisdiction of military commissions, it is held that all military offenses which do not come within the statute referring them for trial before a court martial, must be tried and punished under the laws of war, by military commissions. It is also held, that many offenses which in time of peace are civil offenses, become in time of war military offenses, and must be tried by a military tribunal even in places where civil tribunals exist. In fact, jurisdiction over capital offenses committed by parties not in the military or naval service of the United States, under certain circumstances has been claimed and exercised by military commissions, and parties thus convicted have, by the approval of the higher authority, suffered the penalty attached to the commission of such crimes. The constitution of the United States provides the right of trial by jury to persons held to answer for capital or otherwise infamous crimes, except when arising in the land or naval service. This is referred to as conclusive against the jurisdiction of military courts over such offenses when committed by citizens. It is, however, laid down as a rule by Benet (p. 208) that while the letter of the article would give force to such a declaration, yet in construing the different parts of the constitution together, such interpretation must give way before the necessity for an efficient exercise of the *war power* which is vested in congress by that instrument. It is also held by the same authority, that this principle has been recognized by the legislation of the country since an early period in its history, by the adoption of the fifty-seventh article of war, in the fact that it has from the beginning rendered amenable to trial by courts martial, for certain offenses, not only military persons, but all persons whatsoever. This article was first adopted by the congress of the confederation, and remained unchanged at the formation of the constitution. — A military commission is not restricted in its jurisdiction to offenses committed in the state or district where it sits, or the place where the offense was committed, as are the criminal courts of the country, but extends to any military department in which, on account of facilities for obtaining evidence, or for other good reasons, it may be convenient to bring a case to trial. During the war of the rebellion a great number and variety of offenses against the laws and usages of war, committed mostly by civilians, (Winthrop's Digest, p. 328), were tried and punished by military commissions, to wit: unauthorized correspondence with the enemy; blockade running; mail carrying across the lines; drawing a bill of exchange upon an enemy; dealing in confederate securities or money; manufacturing arms, etc., for the enemy; furnishing articles contraband of war to the enemy; publicly expressing hostility to the government of the United States or sympathy with the enemy; entering the federal lines from the enemy without authority; violating a flag of truce; violating an oath of amnesty or of allegiance to the government; aiding prisoners of war to escape; unwarranted treatment of federal prisoners of war; burning and destroying bridges, railroads, steamboats, and cutting telegraph wires used in military operations; recruiting for the enemy within the federal lines; engaging in *guerrilla* warfare; assisting federal soldiers to desert; resisting or obstructing an enrolment or draft, impeding enlistments; conspiracy by two or more to violate the laws of war by destroying life or property in aid of the enemy. — Of the ordinary crimes over which jurisdiction has been assumed by military commissions, especially during the war of the rebellion, are to be enumerated as most frequent, attempts to defraud the United States, misappropriations of public money and property and embezzlement of the same, bribery of and attempts to bribe United States officers breach of the peace, rape, arson, receiving stolen property, burglary, riot, larceny, assault and battery with intent to kill, robbery, homicide, and the crime known as "murder in violation of the laws of war." A recent illustration of this latter clause, was the principal offense of the Modoc Indians, tried by a military commission in July, 1873, which, as a treacherous killing of an enemy during a truce, was charged as "murder in violation of the laws of war." — From such jurisdiction, however, are very properly excepted such offenses as are clearly within the legal cognizance of the criminal courts of the country, when such courts have been left in the full operation of their usual powers, upon the establishment of a military government, or the *status* of martial law Such was the condition of the courts in the District of Columbia during the war of the rebellion, as at no time was the operation of the civil courts impeded or in anywise interfered with during its existence, and ordinary criminal offenses committed therein by civilians or soldiers, not excepted by the act of March 3, 1863, were in general and particular, taken cognizance of by the courts of said district.—Likewise in a state or district where a military government has not existed or martial law been proclaimed, or, if it has existed or been proclaimed, has ceased to be exer-

cised, and the regular criminal courts are open and in full operation, the supreme court of the United States has decided that a military commission, in the absence of special authority by congress, can not assume jurisdiction of a public offense, although the *nation* be still involved in war. (*Ex parte* Milligan, 4 Wallace, 1; Milligan *vs.* Hovey, 3 Bissell, 13; *In re* Murphy, Woolworth, 143; Devlin *vs.* U. S., 12 Ct. Cl., 271; XII. Opin. Att'ys Genl, 128.) — The case, however, claiming the greatest attention as the most noted of all such illegal trials in the history of the United States, is that known as "The Trial of the Conspirators for the Assassination of Abraham Lincoln, President of the United States," and the attempted assassination of certain other public officers and members of the government. This is more clearly set forth in the executive order promulgated by the president, relating to the trial of the accused, and dated

EXECUTIVE CHAMBER.
WASHINGTON CITY, May 1, 1865.

Whereas the Attorney General of the United States hath given his opinion:

That the persons implicated in the murder of the late President, Abraham Lincoln, and the attempted assassination of the Honorable William H. Seward, Secretary of State, and in an alleged conspiracy to assassinate other officers of the Federal Government at Washington City, and their aiders and abettors, are subject to the jurisdiction of, and lawfully triable before, a Military Commission:

It is *ordered:* 1st. That the Assistant Adjutant General detail nine competent military officers to serve as a Commission for the trial of said parties, and that the Judge Advocate General proceed to prefer charges against said parties for their alleged offenses, and bring them to trial before said Military Commission; that said trial or trials be conducted by the said Judge Advocate General, and as Recorder thereof in person, aided by such Assistant and Special Judge Advocates as he may designate: and that said trials be conducted with all diligence consistent with the ends of justice; the said Commission to sit without regard to hours.

2d. That Brevet Major General Hartranft be assigned to duty as Special Provost Marshal General, for the purpose of said trial and attendance upon said Commission, and the execution of its mandates.

3d. That the said Commission establish such order or rules of proceeding as may avoid unnecessary delay, and conduce to the ends of public justice.

(Signed) ANDREW JOHNSON.

Whereupon the following special order was issued from the office of the adjutant general of the army, to wit:

WAR DEPARTMENT, ADJ'T GENL'S OFFICE,
WASHINGTON, May 6th, 1865.
SPECIAL ORDERS No. 211.
Extract.

* * * * * * * *

4. A Military Commission is hereby appointed to meet at Washington, District of Columbia, on Monday, the 8th day of May, 1865, at 9 o'clock A. M., or as soon thereafter as practical, for the trial of David E Herold, George A. Atzerodt, Lewis Payne, Michael O'Laughlin. Edward Spangler, Samuel Arnold, Mary E. Surratt, Samuel A. Mudd, and such other prisoners as may be brought before it, implicated in the murder of the late President, Abraham Lincoln, and the attempted assassination of the Honorable William H. Seward, Secretary of State, and in an alleged conspiracy to assassinate other officers of the Federal Government at Washington City, and their aiders and abettors.

Detail for the Court.

Major General David Hunter, U. S. Volunteers.
Major General Lewis Wallace, U. S. Volunteers.
Brevet Major General August V. Kautz, U. S. Volunteers.
Brigadier General Albion P. Howe, U. S. Volunteers
Brigadier General Robert S. Foster, U. S. Volunteers.
Brevet Brig General James A. Ekin, U. S. Volunteers.
Brigadier General T. M. Harris, U. S. Volunteers.
Brevet Colonel C. H. Tomkins, U. S Army
Lieutenant Colonel David R. Clendenin, 8th Ills Cavalry.
Brig General Joseph Holt, Judge Advocate and Recorder.

By order of the President of the United States.

(Signed) E. D. TOWNSEND,
Assistant Adjutant General.

Immediately thereafter the commission met pursuant to the foregoing orders, and all the members were duly sworn. The Hon. John A. Bingham and Brevet Col H L. Burnett, judge advocate, also appeared, by direction of the judge advocate general, as assistant or special judge advocates, and were likewise duly sworn. — The accused were then severally arraigned on the following charge and specification: "Charge against David E. Herold, George A. Atzerodt, Lewis Payne, Michael O'Laughlin, Edward Spangler, Samuel Arnold, Mary E. Surratt, and Samuel A. Mudd. For maliciously, unlawfully and traitorously, and in aid of the existing armed rebellion against the United States of America, on or before the 6th day of March, A. D. 1865, and on divers other days between that day and the 15th day of April, A. D. 1865, combining, confederating and conspiring together with one John H. Surratt, John Wilkes Booth, Jefferson Davis, George N. Sanders, Beverly Tucker, Jacob Thompson, William C. Cleary, Clement C. Clay, George Harper, George Young, and others unknown, to kill and murder, within the military department of Washington, and within the fortified and entrenched lines thereof, Abraham Lincoln, late, and at the time of said combining, confederating and conspiring, president of the United States of America, and commander in-chief of the army and navy thereof; Andrew Johnson, then vice-president of the United States aforesaid; William H. Seward, secretary of state of the United States aforesaid, and Ulysses S. Grant, lieutenant general of the army of the United States aforesaid, then in command of the armies of the United States under the direction of the said Abraham Lincoln; and in pursuance of and in prosecuting said malicious, unlawful and traitorous conspiracy aforesaid, and in aid of said rebellion, afterward, to wit, on the 14th day of April, A D. 1865, within the military department of Washington aforesaid, and within the fortified and entrenched lines of said military department, together with said John Wilkes Booth and John H. Surratt, maliciously, unlawfully and traitorously murdering the said Abraham Lincoln, then president of the United States, and commander in chief of the army and navy of the United States as aforesaid; and maliciously, unlawfully and traitorously assaulting with intent to kill and murder the said William H. Seward, then secretary of state of the United States, as aforesaid; and lying in wait with intent maliciously, unlawfully and traitorously to kill and murder the said Andrew Johnson, then being vice president of the United States; and the said

Ulysses S. Grant, then being lieutenant general and in command of the armies of the United States as aforesaid." — Then followed the specification, at great length, designating the combining and conspiring on the part of the accused to maliciously and traitorously kill and murder the president and the aforesaid officers of the government of the United States, and of the army of the United States, designing and intending thereby to deprive the army and navy of the United States of a constitutional commander-in-chief; the armies of the United States of their lawful commander, and to prevent a lawful election of president and vice-president of the United States aforesaid, and by the aforesaid means to aid and comfort the insurgents engaged in armed rebellion against the said United States, and thereby aid in the subversion and overthrow of the constitution and laws of the United States. — The specification further sets forth the time and place of the said murder, and the means and manner of death of the said Abraham Lincoln, president of the United States, the mortal wound having been inflicted by one John Wilkes Booth, in pursuance of the said conspiracy; and further, the aid and assistance rendered unto said Booth by the accused, said Spangler, an employé of the theatre in which the said murder was committed, enabling the said Booth to approach and enter the box in the said theatre in which the president was sitting at the time of the murderous assault; and further, the aid and assistance rendered by the accused, the said David E. Herold, unto the said Booth, while attempting his escape through the military lines of the government aforesaid, and the further attempt to aid in the concealment of the said Booth after the act aforesaid. — The specification further relates the attempt of the accused, in the further pursuance of the said conspiracy, to kill and murder the Hon. William H. Seward, secretary of state, and the time, place and manner of the murderous assault. And in further prosecution of said conspiracy, the act of George A. Atzerodt, of lying in wait, on the night of the murder of the president, and about the hour of the same, with intent to kill and murder Andrew Johnson, then vice-president of the United States. And further, the act of the accused, Michael O'Laughlin, of lying in wait at the same hour of the aforesaid murder of the president, with intent to kill and murder Ulysses S. Grant, commander of the armies of the United States. And further, the attempt of the accused, Samuel Arnold, to aid, comfort and abet the aforesaid murderous acts, in pursuance of the conspiracy, by meeting, counseling and conspiring with the accused upon divers occasions. In further prosecution of the said conspiracy, the specification sets forth that the accused, Mary E. Surratt, did, at Washington city, on or before the 6th day of March, A. D. 1865, and on divers other days and times between that day and the 20th day of April, A. D. 1865, receive, entertain, harbor and conceal, aid and assist the said John Wilkes Booth and the other accused, with the intent to aid and abet them in the execution of the same, and in escaping from justice after the murder of the said Abraham Lincoln as aforesaid. And in further prosecution of the said conspiracy, the accused, Samuel A. Mudd, did, at Washington city, on or before the 6th day of March, 1865, and upon divers other days between that time and the 20th day of April, 1865, aid, assist, entertain, harbor and conceal the said John Wilkes Booth and the other accused, with knowledge of the conspiracy aforesaid, and with the intent to aid them in the execution of the same, in escaping from justice after the murder of the said Abraham Lincoln as aforesaid. — To the specification, all the accused severally pleaded "Not guilty," also to the charge, "Not guilty." — The several accused applied for permission to introduce counsel; and their applications were granted. — All of the accused, severally, through their counsel, asked leave to withdraw, *pro tempore*, their plea of "Not guilty," heretofore filed, in order that they might plead to the jurisdiction of the commission. The application being granted, the defendant, Mary E. Surratt, and all others of the accused, severally offered a plea to the jurisdiction of the commission, as follows: "Mary E. Surratt, one of the accused, for plea, says that this court has no jurisdiction in the proceedings against her, because she says she is not, and has not been, in the military service of the United States. And, for further plea, the said Mary E. Surratt says that loyal civil courts, in which all the offenses charged are triable, exist, and are in full and free operation in all the places where the several offenses charged are alleged to have been committed. And, for further plea, the said Mary E. Surratt says that the court has no jurisdiction in the matter of the alleged conspiracy, so far as it is charged to have been a conspiracy, to murder Abraham Lincoln, late president of the United States, and William H. Seward, secretary of state, because she says, said alleged conspiracy and all acts alleged to have been done in the formation and in the execution thereof, are, in the charges and specifications, alleged to have been committed in the city of Washington, in which city are loyal civil courts, in full operation, in which said crimes are triable." Signed, on behalf of the accused, by her counsel. — The judge advocate then presented the following replication:

> Now come the United States, and, for answer to the special plea by one of the defendants, Mary E. Surratt, pleaded to the jurisdiction of the Commission in this case, say that this Commission has jurisdiction in the premises to try and determine the matters in the Charge and Specification alleged and set forth against the said defendant, Mary E. Surratt. (Signed) J. HOLT,
> Judge Advocate General.

The court overruled the pleas of the accused to its jurisdiction. — The accused then severally made application for *severance*, and asked to be tried separate from those charged jointly with them, for the reason that they believed that their

defense would be greatly prejudiced by a joint trial. The commission overruled the application for a severance. — The accused then severally pleaded: To the specification, "Not guilty," and to the charge, "Not guilty." — The commission adopted and promulgated its rules of proceeding, and thereupon began taking testimony by calling for the prosecution, Richard Montgomery, Sandford Conover and James B. Merritt, whose testimony was taken during the secret session of the commission, and for a time suppressed. The evidence of these parties related to the action of prominent men connected with the confederacy. The first effort of the government was to establish the general conspiracy alleged in the charge and specification. To this end sixteen witnesses were called, among whom were Richard Montgomery, Sandford Conover, James B. Merritt (the three witnesses before mentioned), General Ulysses S. Grant, Henry Von Steinacker, William E. Wheeler, and Hon. Chas. A. Dana. — The prosecution presented the testimony of Lieut. William H. Terry, William Eaton, and Col. Joseph H. Taylor, with respect to a secret cipher found among Booth's effects. Hon. C. A. Dana testified to finding key to cipher in Secretary Benjamin's office at Richmond, Va. Charles Duell and James Ferguson testified to alleged assassination letter, Charles Dawson to the "Lou" letter addressed to Booth, and Samuel K Chester with respect to Booth's confession as to the plot to capture the president.—For the purpose of connecting Jefferson Davis with the assassination, the prosecution presented the testimony of Lewis F. Bates, J. C. Courtney, James E. Russell, Rev. W. H. Ryder, and others. Edward Frazier testified to the alleged payment of parties by Secretary Benjamin, of certain sums of gold for burning steamboats. Col. Martin Burke testified to alleged confession of Robert C. Kennedy, of plot to burn New York city. G. J. Hyams, W. L. Wall and A. Brenner testified to the alleged introduction of small-pox by Dr. Blackburn into the north, by means of infected clothing. Seven witnesses testified to the alleged starvation of Union prisoners. Three witnesses testified to the alleged mining of Libby prison by confederate authorities. Twenty-nine witnesses testified with respect to the assassination and attending circumstances. Fifteen witnesses testified with regard to the pursuit and capture of Booth and Herold. Four witnesses testified to papers obtained from confederate archives, being proposals to "rid the country of some of her deadliest enemies," by parties who wanted a consideration therefor. Twelve witnesses testified on behalf of the government in the endeavor to establish the guilt of Edward Spangler, one of the accused. Fifteen witnesses testified on behalf of the government in the endeavor to establish the guilt of George A. Atzerodt, one of the accused. Eighteen witnesses testified on behalf of the government in the attempt to establish the guilt of Lewis Payne, one of the accused. Twenty-two witnesses testified on behalf of the government in the endeavor to establish the guilt of Dr. Samuel A. Mudd, one of the accused Thirteen witnesses testified on behalf of the government in the endeavor to establish the guilt of Michael O'Laughlin, one of the accused. Seven witnesses testified on behalf of the government in the endeavor to establish the guilt of Samuel Arnold, one of the accused Twenty-one witnesses testified on behalf of the government in the endeavor to establish the guilt of Mary E Surratt, one of the accused. The prosecution closed, and the defense began by impeaching the testimony of H. Von Steinacker, a witness called by the government to prove the general conspiracy. Before the trial began, and during its progress, large rewards were offered by the government for testimony that would establish the conspiracy and convict the accused parties. While certain testimony of great importance to the government was thus obtained, there crept into the case, by this means, the evidence of parties who had committed perjury to obtain the proffered reward. In this class of testimony was that of the party named Von Steinacker. This individual swore that he was an engineer officer in the topographical department, on the staff of Gen. Edward Johnson, and that altogether he was in the confederate service three years. That in the summer of 1863 he saw Booth and two civilian companions in the camp of the second Virginia regiment, and was formally introduced to them. That there was a secret meeting of the officers and the three civilians That the plan of the proposed assassination was discussed and approved, and that it was further agreed to send certain officers on "detached service" to "Canada and the border, ' to release rebel prisoners, to lay northern cities in ashes, and, finally, to obtain possession of the members of the cabinet and kill the president. — The counsel for the defense of Mary E Surratt, becoming possessed of evidence that would establish the perjury of this party, presented to the commission, in due form, their allegations impeaching his veracity and character as a witness for the government. By the testimony of witnesses whom they had summoned, they proposed to show that he was originally a deserter from the federal service; that early in the war he had enlisted as a private in Blenker's regiment of New York volunteers; that having been condemned by a court martial for stealing an officer's arms and equipments, he had escaped within the confederate lines, and, enlisting as a private in the confederate service, had been detailed as a draughtsman by Oscar Heinrichs, an engineer officer on Edward Johnson's staff; that while serving in that capacity he was convicted by a confederate court martial for stealing an officer's coat and arms; that at the battle of Gettysburg he was captured within the Union lines, and escaped by representing himself as in possession of the dead body of Major H. K. Douglas, of Edward Johnson's staff, then alive. The commission refused to entertain the motion to permit

the allegations to go upon the record, proof to be adduced in support of the same; and, on motion of the judge advocate general, the whole proceedings were stricken from the record. While the counsel for the defense were not permitted to fully establish his character as a witness, they were, however, allowed to attack in part his credibility as such, and for that purpose called Gen. Edward Johnson, who testified that Von Steinacker was never an officer on his staff. Oscar Heinrichs being called, testified that he was an engineer officer on the staff of Edward Johnson; that he was acquainted with the witness, Von Steinacker; that he was an enlisted man in the confederate service, detailed by himself as a draughtsman. Major H. K. Douglas, whose "dead body" Von Steinacker represented he had in his possession at the time of his capture at Gettysburg, was also called, and testified that he was wounded at the battle of Gettysburg, taken prisoner, and held as such for nine months, and did not see Steinacker again after that engagement. All of these witnesses swore positively that neither Booth nor the other conspirators ever made their appearance in their camp, and that no officers of their command were ever sent on "detached service" to burn northern cities, capture the members of the cabinet and kill the president. That there were no secret meetings of the officers with Booth or other civilians at any time. They each testified that Von Steinacker had repeatedly stated that he was a deserter from the federal service. — The counsel for the defense of Mary E. Surratt further called and examined in her behalf thirty-one witnesses whose testimony related to her character as a loyal woman; her ignorance of the plot to either abduct or kill the president; her expressions of gratification at the ultimate success of the Union arms and the speedy close of the war; her kindness to Union soldiers and a large body of escaped government horses which she retained and fed at her own expense for a considerable time, and surrendered to the government without remuneration; the nature and object of her visit to Marlborough Court House on the day of the murder of the president, not as an agent of Booth to deliver arms to Lloyd at Surrattsville, as alleged by the government, but to obtain the means, in obedience to a summons from Mr. Calvert, to meet a pecuniary engagement so as to avert the peremptory sale of her property, by foreclosure; the meeting of Payne and the officers at her house on the morning of the second day after the murder, and her failure to recognize him; of the character of testimony for the prosecution and their impeachment; the intoxication of Lloyd on the 14th of April, the day of the alleged visit to bear arms; impeachment of the testimony of Weichman, principal witness for the prosecution, his own guilt in meeting with the conspirators; the deeply religious character of Mrs. Surratt, her unbounded charity, and the utter improbability of any knowledge of, participation in or consent to any plot to either abduct or assassinate the president. — The counsel for the defense of David E. Herold called in his behalf nine witnesses, whose testimony related to the weakness of his intellect, his admiration for Booth and his susceptibility to his influence. The counsel for the defense of Edward Spangler called twenty-three witnesses, whose testimony related to his character, the nature of his relations to the theatre, the use of the rope found in his box, and the impossibility of criminal relations with Booth on the occasion of the murder. The counsel for the defense of George A. Atzerodt called in his behalf fifteen witnesses, whose testimony related to his character; of his conversations with regard to the assassination of Lincoln, Seward and Grant; of his superlative cowardice, as rendering it impossible for him to perform the part required of a conspirator. The counsel for the defense of Lewis Payne called in his behalf nine witnesses, whose testimony related to his attention to the sick after the battle of Gettysburg; his mental condition, indicating insanity; his examination with regard to his insanity, and causes and indications of his insanity, mental and moral; Payne's own admissions; his desire to die; his splendid physical condition; the affray in which Payne saved the lives of Union soldiers. The counsel for the defense of Dr. Samuel A. Mudd examined in his behalf seventy-four witnesses, who testified with respect to his reputation as a citizen and as a master; of his loyalty, of the professional character of services to Booth while attempting to escape after the perpetration of the deed; and impeaching the testimony of witnesses for the prosecution. The counsel for the defense of Michael O'Laughlin called in his behalf nine witnesses, who testified with respect to his visit to Washington on the 13th and 14th of April, and their presence with him on those days, his presence with others at the house of the witness Purdy at the hour of the assassination; and his presence at the Penn house the balance of the same night; Booth and O'Laughlin schoolmates; the voluntary surrender of O'Laughlin to the authorities. The counsel for the defense of Samuel Arnold examined eight witnesses in his behalf, who testified to his whereabouts from March 21 to April 1; concerning his visit to Fortress Monroe on April 1; his employment as a book-keeper; his confession in Marshal McPhail's office; his employment at the time of his arrest. — This closed the evidence for the defense. There were, in all, three hundred and forty witnesses examined, including prosecution and defense; a large proportion of them being recalled, many as often as three or four times. — Upon the conclusion of the testimony, argument upon the jurisdiction of the commission was presented by the counsel of Mary E. Surratt. An argument on the plea to the jurisdiction was also presented by the counsel of Samuel A. Mudd. The counsel for David E. Herold, Edward Spangler, Mary E. Surratt, George A. Atzerodt, Lewis Payne, Samuel A. Mudd, Michael O'Laughlin,

and Samuel Arnold, then presented the several arguments for their defense. — The special judge advocate, Hon. John A. Bingham, then presented the reply of the government to the "several arguments in defense of Mary E. Surratt, and others, charged with conspiracy and murder of Abraham Lincoln, late president of the United States, etc." — After a continuous session of nearly two months, upon the conclusion of the various arguments for the defense and the prosecution, June 30, 1865, the commission met with closed doors, all the members being present, also the judge advocate and assistant judge advocates (the counsel for the defense being excluded) and proceeded to render judgments in the cases. — Upon the consideration of the cases of the accused, David E. Herold, George A. Atzerodt, Lewis Payne and Mary E. Surratt, the commission found the said accused, upon the specification, guilty, except "combining, confederating and conspiring with Edward Spangler"; of this, not guilty. Of the charge, guilty, except "combining, confederating and conspiring with Edward Spangler"; of this, not guilty. And the commission thereupon pronounced the following sentence, to wit: "And the commission do therefore sentence her, Mary E. Surratt, and him, David E. Herold, George A. Atzerodt and Lewis Payne, to be hanged by the neck until they be dead, at such time and place as the president of the United States shall direct; two-thirds of the members of the commission concurring therein." — Upon the consideration of the cases of the accused, Michael O'Laughlin, Samuel Arnold and Samuel A. Mudd, the commission adjudged them guilty of part of the charge and specification, and thereupon pronounced the following sentence: "The commission do therefore sentence the said Michael O'Laughlin, Samuel Arnold and Samuel A. Mudd, to be imprisoned at hard labor for life, at such place as the president shall direct." — Upon consideration of the case of the accused, Edward Spangler, the commission adjudged him guilty of part of the charge and specification, and thereupon pronounced the following sentence: "The commission do therefore sentence the said Edward Spangler to be imprisoned at hard labor for six years, at such place as the president shall direct." — The proceedings of the commission were thereupon laid before the president for his action upon the findings and sentences, all of which were approved and made known in the following executive order:

EXECUTIVE MANSION, July 6th, 1865.

The foregoing sentences in the cases of David E. Herold, G. A. Atzerodt, Lewis Payne, Michael O'Laughlin, Edward Spangler, Samuel Arnold, Mary E. Surratt and Samuel A. Mudd, are hereby approved, and it is ordered, that the sentences of David E. Herold, G. A. Atzerodt, Lewis Payne and Mary E. Surratt be carried into execution by proper military authority, under the direction of the Secretary of War, on the 7th day of July, 1865, between the hours of 10 o'clock A. M. and 2 o'clock P. M. of that day. It is further ordered, that the prisoners Samuel Arnold, Samuel A. Mudd, Edward Spangler and Michael O'Laughlin be confined at hard labor in the Penitentiary at Albany, New York, during the period designated in their respective sentences.

(Signed) ANDREW JOHNSON,
President.

(This order was afterward, to wit, on the 15th day of July following, so modified as to direct that the said Arnold, Mudd, Spangler and O'Laughlin be confined at hard labor in the military prison at Dry Tortugas, Florida, during the period of their respective sentences.) — On the same day the following order was issued by the war department in accordance with the direction of the president:

WAR DEPARTMENT, ADJUTANT GENERAL'S OFFICE,
WASHINGTON, July 6th, 1865.

To Major General W. S. Hancock, United States Volunteers, Commanding the Middle Military Division, Washington, D. C.

Whereas, By the Military Commission appointed in paragraph 4, Special Orders No. 211, dated War Department, Adjutant General's Office, Washington, May 6, 1865, and of which Major General David Hunter, United States Volunteers, was President, the following persons were tried, and after mature consideration of evidence adduced in their cases were found and sentenced as hereinafter stated, as follows: [here follow the findings and sentences in the cases of David E. Herold, G. A. Atzerodt, Lewis Payne, and Mary E. Surratt;]

And whereas the President of the United States has approved the foregoing sentences in the following Order, to wit:

EXECUTIVE MANSION, July 6th, 1865.

The foregoing sentences in the cases of David E. Herold, G. A. Atzerodt, Lewis Payne and Mary E. Surratt are hereby approved, and it is ordered, that the sentences in the cases of David E. Herold, G. A. Atzerodt, Lewis Payne and Mary E. Surratt be carried into execution by proper military authority, under the direction of the Secretary of War, on the 7th day of July, 1865, between the hours of 10 o'clock A. M. and 2 o'clock P. M. of that day.

(Signed) ANDREW JOHNSON,
President.

Therefore you are hereby commanded to cause the foregoing sentences in the cases of David E. Herold, G. A. Atzerodt, Lewis Payne and Mary E. Surratt to be duly executed, in accordance with the President's Order.

By command of the President of the United States
E. D. TOWNSEND
Ass't Adjutant General.

This order was promulgated about 5 o'clock P. M., July 6, 1865. In a final attempt to save the life of their client, the counsel for Mrs. Surratt, at 2 o'clock A. M., July 7, appeared before Judge Wylie, one of the justices of the supreme court of the District of Columbia, at his residence in the city of Washington, and at that early hour presented for his judicial action the following petition for a writ of *habeas corpus* in her behalf, to wit:

WASHINGTON, D. C., July 7, 1865.

To the Hon. Andrew Wylie, one of the Justices of the Supreme Court of the District of Columbia:

The petition of Mary E. Surratt, by her Counsel, most respectfully represents unto your Honor, that on or about the 17th day of April, A. D. 1865, your petitioner was arrested by the Military Authorities of the United States, under the charge of complicity with the murder of Abraham Lincoln, late President of the United States, and has ever since that time been, and is now, confined on said charge, under and by virtue of the said military power of the United States, and is in the special custody of Major General W. S. Hancock, Commanding Middle Military Division, that since her said arrest your petitioner has been tried, against her solemn protest, by a Military Com-

mission, unlawfully and without warrant, convened by the Secretary of War, as will appear from paragraph 4, Special Orders No. 211, dated War Department, Adjutant General's Office, Washington, May 6th, 1865, and by said Commission, notwithstanding her formal plea to the jurisdiction of the said Commission, is now unlawfully and unjustifiably detained in custody and sentenced to be hanged on to-day, July 7th, 1865, between the hours of 10 o'clock A. M. and 2 o'clock P. M. Your petitioner shows unto your Honor, that at the time of the commission of the said offense she was a private citizen of the United States, and in no manner connected with the military authority of the same, and that said offense was committed within the District of Columbia, said District being at the time within the lines of the armies of the United States, and not enemy's territory, or under the control of a Military Commander for the trial of civil causes. But, on the contrary, your petitioner alleges that the said crime was an offense simply against the peace of the United States, properly and solely cognizable under the Constitution and Laws of the United States, by the Criminal Court of this District, and which said Court was, and is now, open for the trial of such crimes and offenses. Therefore, inasmuch as the said crime was only an offense against the peace of the United States, and not an act of war; inasmuch as your petitioner was a private citizen of the same and not subject to military jurisdiction, or in any wise amenable to military law; inasmuch as said District was the peaceful territory of the United States, and that all crimes and offenses committed within such territory are, under the Constitution and Laws of the United States, to be tried only before its criminal tribunals, with the right of public trial by jury; inasmuch as said Commission was a Military Commission, organized and governed by the laws of Military Courts Martial, and unlawfully convened without warrant or authority, and when she had not the right of public trial by jury as guaranteed to her by the Constitution and Laws of the United States, that therefore her detention and sentence are so without warrant, against positive law and unjustifiable: Wherefore she prays your Honor to grant unto her the United States most gracious writ of *habeas corpus*, commanding the said Major General W. S. Hancock to produce before your Honor the body of your said petitioner, with the cause and day of her said detention, to abide, etc., and she will ever pray. MARY E. SURRATT.

By her Counsel.

Judge Wylie granted the writ, making upon it the following indorsement:

Let the writ issue as prayed, returnable before the Criminal Court of the District of Columbia now sitting, at the hour of 10 o'clock A. M. this 7th day of July, 1865.

ANDREW WYLIE,
A Justice of the Supreme Court of the District of Columbia.
July 7, 1865.

At half past eleven o'clock, on the morning of the 7th of July, Maj. Gen. Hancock, accompanied by Att'y Gen. Speed, appeared before Judge Wylie in obedience to the writ, and made the following return:

HEADQUARTERS MIDDLE MILITARY DIVISION,
WASHINGTON, D. C., July 7th, 1865.

To Hon. Andrew Wylie, Justice of the Supreme Court of the District of Columbia:

I hereby acknowledge the service of the writ hereto attached and return the same, and respectfully say that the body of Mary E. Surratt is in my possession, under and by virtue of an order of Andrew Johnson, President of the United States and Commander-in-Chief of the Army and Navy, for the purposes in said order expressed, a copy of which is hereto attached and made a part of the return; and that I do not produce said body by reason of the Order of the President of the United States, indorsed upon said writ, to which reference is hereby respectfully made, dated July 7, 1865. W. S. HANCOCK,

Major General U. S. Vols., Commanding Middle Division.

The president's indorsement upon the writ is as follows, to wit:

EXECUTIVE OFFICE,
July 7, 1865, 10 A. M

To Major General W. S. Hancock, Commander, etc.:

I, Andrew Johnson, President of the United States, do hereby declare that the writ of *habeas corpus* has been heretofore suspended in such cases as this, and I do hereby especially suspend this writ, and direct that you proceed to execute the Order heretofore given upon the Judgment of the Military Commission, and you will give this Order in return to the writ. ANDREW JOHNSON,

President.

The court ruled that it yielded to the suspension of the writ of *habeas corpus* by the president of the United States; and under this illegal suspension of the "writ of writs" the prisoner, Mary E Surratt, together with Herold, Payne and Atzerodt, were executed upon the scaffold. — There are two important incidents connected with the closing scenes of the trial which became known to the writer,* and are of great interest. It was at first proposed to acquit Mrs. Surratt, or at least to spare her life. Objection was made by the judge advocate general, who proposed, in its stead, that the same judgment should be rendered by the commission as in the cases of Payne, Atzerodt and Herold, with a recommendation to the president for mercy in her case. This course was adopted, the judgment rendered, and the recommendation signed by nearly all of the members of the commission. This recommendation was not placed before the president with its findings at the time they were presented for his approval, as Andrew Johnson subsequently averred, upon his honor, that he never saw the recommendation until two years after the execution, when, upon sending for the papers in the case, he found it among them, in a detached form. — The other incident is the declaration of Payne, made on the morning of the execution to Gen. Hartranft, the special provost marshal, and by him transmitted forthwith to the president. The statement, as taken down by him, is as follows: "The prisoner Payne has just told me that Mrs Surratt is entirely innocent of the assassination of President Lincoln, or of any knowledge thereof. He also states that she had no knowledge whatever of the abduction plot, that nothing was ever said to her about it, and that her name was never mentioned by the parties connected therewith." Gen. Hartranft indorsed upon this declaration these significant words: "*I believe that Payne has told the truth.*" It was, however, of no avail. Her death had been decreed. JOHN W. CLAMPITT.

MINES. The importance of mining as a source of national wealth and an element of progress in civilization scarcely needs explanation. Each of the three great productive industries exploits a natural kingdom for the benefit of man. What agriculture does for the vegetable, and the chase (as a modification of which we may rank the raising of cattle, poultry and fish) for the ani-

* The writer was of counsel for Mrs. Surratt.

mal, mining does for the mineral or inorganic world. Its products are, in general, less perishable than those of agriculture, and hence more convenient for storage, export, manufacture, etc. On the other hand, its sources of supply are not perpetual, and, once exhausted, can not be renewed. A wasteful agriculture, or a reckless destruction of forests or of animal species, such as food fishes, can not inflict upon a nation such irretrievable loss as the exhaustion of its mineral resources. Moreover, these resources are not equally distributed among nations. Those who possess and utilize them — especially in the cases of coal and iron — secure great industrial and commercial advantages. Hence, vigor in the development and economy in the use of mineral resources have always been urged as a national duty. — For those who seek to refer the actual practice of nations to general principles, this argument may suffice to justify the special relations which so many governments have assumed toward the mining industry and the ownership of mineral deposits, as distinguished from agriculture, and the ownership of land. At an earlier period the sovereign's peculiar right to the metallic treasures of the earth was referred to a divine ordinance. A survey of the history of mining and mining jurisprudence shows, however, that its characteristic features in different nations have been the result of various local causes, rather than of general principles, dogmatically applied. — Probably the first metals used were those which occur in a native state, such as gold, silver and copper. The two former, being lustrous and malleable, and resisting oxidation under ordinary circumstances, became in the earliest periods of which history speaks, and have remained to this day, objects of high esteem and a convenient medium of exchange and measure of value. Bronze, or ancient "brass," was very probably discovered accidentally through the fusion of impure ores of copper. Its use appears to have antedated in many nations — perhaps not everywhere — that of iron. Without this latter metal, apparently, the extensive ancient workings for gold and copper, discovered by several travelers in Siberia, were conducted by a nomadic race, before the irruption of the Tartars. These operations resembled those of the prehistoric miners of this continent, *e. g.*, the copper miners of Lake Superior, the mica miners of North Carolina, the turquoise miners of New Mexico, etc. They are cited here as among the evidences that the industry of mining was in the beginning, like every other, carried on by individuals, and probably without permanent ownership of the land. — The Phœnicians had abundance of metals, but not to any considerable extent in their own country. They both mined and traded in the Mediterranean countries for gold, lead, silver and iron, and even sailed as far as Great Britain, where they obtained tin. But the claim of the sovereign to all such treasures appears to have been asserted only as one of the rights of the conqueror. When a country was conquered, not only the mines, but all other forms of property, were at the victor's mercy. Extensive mining operations were carried on by the Egyptian kings, of whose cruel administration of these works Diodorus, quoting partly from Agatharcides, gives a pathetic picture. It is probable that the greater portion of their miners were purchased slaves, though convicts and prisoners of war furnished a part. To prevent conspiracies and escapes, the different gangs were placed under overseers who were not their countrymen. They were forced to labor naked, under dreadful hardships and severities. The stronger ones hewed the rock in the mines, the half-grown youths carried it to the surface, persons over thirty years of age (so soon was their vigor destroyed) were set at the easier task of crushing it in mortars, and the women and old men ground it fine in hand mills. — The mining of the ancient Greeks is divided into three periods: the first comprising the working of mines in the islands, begun by the Phœnicians; the second, the operations on the mainland, principally those of the Athenians; the third, the development of important mines in the provinces of the Macedonian Philip, which subsequently fell, with the rest of the Greek mines, into the hands of the Romans. During the first period, the proprietors of the island mines were chiefly the petty rulers of the islands. Gold, silver, copper and iron were the products. Perhaps the only mention of the payment of anything like a royalty is that which records the annual tribute of one-tenth the revenue of the gold and silver mines of Siphnos, sent to the shrine of the Delphic Apollo. In later times, this payment having been discontinued, the mines were drowned by the rising of the neighboring sea — a result attributed to the wrath of the neglected god. In the second period the administration of the Athenian mines appears to have begun with the working or leasing of them by the republic. Before the Persian war the annual income from this source (about $30,000 at the beginning of that war) was distributed among the citizens. Afterward, on the advice of Themistocles, this distribution ceased, though the state still received payments from the mines. Probably the more ancient mines, as the property of the republic, were rented on special terms, but the general code encouraged the enterprise of private adventurers by remitting taxes on gross production, and inviting both citizens and friendly aliens to work under the light royalty of one twenty-fourth part of the net profits. The labor was performed by slaves, hired from their owners. The overseers, and probably, in many cases, the lessees themselves, were slaves also. The slave miners of Athens amounted to many thousands. Once, at least, they revolted, and, taking possession of Mount Sunium, made it the base of many destructive raids upon Attic territory. A certain governmental supervision was exercised over mining. An official director of mines granted permits for "prospecting"

(*i. e.*, searching for ore), and there were laws determining the dimensions of mining "claims." — In western Europe mining was carried on at an early day by the tribes subsequently tributary to Rome. The Etruscans obtained iron from Elba; the Salassians, in Lombardy, turned the course of the Po, and extracted gold from its bed. The tribes of Gaul were producers of gold, silver, copper and iron, and the Britons of gold, silver, iron, lead and tin. For the latter metal the Phœnicians traded with them secretly; and the Romans, by following the Phœnician ships, solved at last the mystery of the Cassiterides. But the most abundant ancient supply of nearly all the metals named was furnished by Spain. The Spanish, Sicilian and Sardinian mines, operated by the Carthaginians, furnished the wealth by the aid of which Carthage paid her numerous mercenaries and waged her costly wars with Rome. — The first two Punic wars delivered into the power of Rome the mines of Sicily, Sardinia and Spain. Those of Asia Minor, Greece, Macedonia, Asia, Egypt, Gaul and Britain were afterward added, about in the order named, by successive conquests, and became thus the property, not of private citizens, but of the state. Yet the Roman law secured the "mineral right" to the landowner, when the land was held by complete title; and doubtless many mines in Italy and elsewhere, outside the conquered provinces, were so held by individuals. The situation was therefore somewhat like that of the United States, which owns the mineral rights of the public domain only, while the private owners of land in any state or territory own its mineral contents also, according to the Roman and the later English common law. — The Romans at first farmed their revenues, and under this general policy awarded leases of their mines periodically. Ordinarily the lessees employed as workmen purchased slaves. The system was in the highest degree wasteful and ruinous, as well as cruel. The lessees, anxious only to gain as much profit as possible during their limited term of possession, robbed the mines without regard to economy or permanence and security. Vast numbers of slaves (Polybius speaks of 40,000 in a single district in Spain) were kept constantly at work, with a severity of discipline not surpassed by that of the early Egyptians. During the period between the close of the first Punic war and the establishment of the empire, the production of metals under this system was immense; but it ended with the practical exhaustion of many of the mines. The emperors effected considerable reforms. They worked the mines through responsible officials, instead of leasing them out to speculators; and since the government could not well purchase such vast numbers of slaves as had previously been owned by private mine lessees, a system securing a sort of feudal service from the inhabitants of the mining regions was gradually introduced, and the slaves who continued to be employed were rather convicts than purchased barbarians or captives. At the same time the emperors appear to have encouraged private enterprise in the discovery and exploitation of new mines. Trajan allowed the Dacian gold mines to be worked by an association (*collegium aurariorum*); and Valentinian I. gave free permission to prospect for metals, under obligation of paying to the crown a portion of the subsequent profit. But before these measures could completely restore the prosperity of the mining industry of the empire, the irruptions of the barbarians practically destroyed it. The Byzantines held out longest; but after the seventh century they surrendered their mines to the conquering Arabs. Those of Asia Minor, Thrace and Greece were the last which the empire retained. The Arabs in Spain, the Franks in Gaul, and the Goths under Theodoric in Italy, gleaned something for awhile in a rude way from the abandoned mines. But beyond some hints of this, history is silent on the subject, until some centuries later, when an entirely new principle—that of the German "mining freedom" (*bergbaufreiheit*)—bringing with it a new and active mining industry, makes its appearance in Europe. — This is first seen as a local custom, prevailing with remarkable uniformity at all the ancient centres of German mining, and securing to every citizen in the community the right to mine wherever, as the first discoverer of metalliferous deposits, he could do so without encroaching upon mining rights previously acquired. The exact origin of this custom is not known; but it is highly probable that it sprang out of that early form of communism, the *markgenossenschaft*, in which the *mark* was held in common, and redistributed annually among the inhabitants for the purposes of agriculture. Such a redistribution of mining rights could not be fairly made, since the operations of mining (much slower and more laborious then than now) often required years of preliminary development, and the skill required was not possessed by all. Naturally, therefore, the habit would be formed of permitting those to own the mines who had the knowledge to find and work them, and of making their tenure dependent on their perseverance in this work. In this existence of an estate in minerals, entirely independent of the estate in the surface and soil, lies the distinctive character of the German mining law. It doubtless existed as far back as the tenth century in Saxony and Thuringia. The earliest written records of it are much later, as will be seen, but they are elaborate and complicated codes, and bear internal evidence of the antiquity already attached to the immemorial customs which they reduce to systematic form. The German miners, adventurously penetrating into the Roman and Sclavonic countries, carried their *bergbaufreiheit* with them; and the earliest of their codes which we possess were issued in Latin or German in those colonies. The first is the mining treaty of 1185 between Bishop Albrecht of Trent, and the German immigrants. The

Iglau code, published about 1250, was rapidly extended over Moravia, and was adopted within twenty-five years at Schemnitz, in Hungary. The code of Schladming, in Styria, dates from 1307; that of Massa, in Tuscany, is half a century earlier. All these are supposed to have had a common origin in the *bergrecht* of Freiberg, in Saxony, *i. e.*, in the unwritten customs of Freiberg or of the Harz, whence the first miners went to Freiberg in the twelfth century. The Freiberg code itself can not be traced back of 1232, in written form. A brief summary of the Iglau code will suffice to indicate the nature of all. This curious document is in Latin, and bears the seals of Wenzel, king of Bohemia and Moravia, and his son, the margrave of Moravia. After a pious and wordy prelude, it ordains that certain officials shall fix the boundaries of mining claims, and defines the dimensions of these and the conditions on which the possessory title of the miner may be acquired and maintained. The full size of the surface granted to a single mine, when unoccupied space permits, is 479 feet along the course of the vein by 196 feet in width. A certain proportion of the claim is set apart for the king, another for the town, or the original owner of the land. Special rights of administration and judgment are accorded to the mining courts of Iglau, and various principles and methods are laid down for the decision of intricate cases of conflicting claims. The thrifty burghers of this "mining city" (*bergstadt*) won fame and profit by keeping the provisions of this code a secret, and acting, under their guidance, as arbitrators in questions of mining jurisprudence referred to them from other provinces. One of the most frequent causes of dispute was the privilege conferred upon the party driving a deep adit, which, by drawing the water from the mines of other parties, and by facilitating their ventilation, was held to entitle the owner to a share in their profits. To secure this reward, and other incidental "adit privileges," the adit must be a certain distance below any other similar work, and must be prosecuted under certain conditions. — The above will sufficiently show the general nature of the medieval German mining law. It should be added that gold and silver only (including ores containing one of these metals) were at first the objects of it. Other minerals were the exclusive property of the landowner. — Simultaneously with the public appearance of the codes, which, as has been said, embodied customs already old, arose the conflicting claims of the emperor and of the territorial sovereigns. The latter, as the actual owners of many of the mines, and the possessors of general tax-laying authority over the rest, had vantage-ground, which in the course of time they strove to extend. But the emperors had to create their claim out of little or nothing. Frederick I., on the strength of a parliamentary decree applying to Lombardy only, and speaking of the *argentaria* and salines as sources of royal income, attempted to include the German mines in the same category of *regalia*, and by the ingenious device of granting the mines of Trent to the bishop (who had them already), secured a *quasi* recognition of his prerogative, as a precedent. In fact, the emperors seem at no time to have intended to take possession of the mines, but only to establish the right to get revenue, independent of the local legislatures and sovereigns, from this convenient source. Meanwhile, the territorial rulers saw their advantage in promptly adopting and employing for their own interest the theory of "royalty"; and finally the owners of the soil made themselves heard, asserting their rights (upon which constant encroachment was attempted) to certain non-precious metals. The thirteenth century presents a confused conflict among emperor, prince, landlord and miner. The famous "golden bull" of Charles IV. (1356) simplified the conflict by surrendering the claims of the emperor to the electors, and by excluding also the landowner, and putting all metals, precious and base, together with salines, under one rule, namely, the right of the territorial sovereign. The practical result was the exercise of mining royalty by all the princes, whether electors or not; but the "golden bull" was only a "quit claim" deed of this right The sovereigns were left to assert it as best they might, against the ancient, wide-spread democratic principle of "mining freedom." The issue of this conflict was different in different states. In the main, however, the essential victory remained with the miners. The princes granted the right of free exploration, and the right of the discoverer, reserving to themselves only the usual tribute, and the police and magisterial jurisdiction The basis of mining rights was however, nominally, the grant of the prince, not the ancient mining customs of the people; and hence, in not a few exceptional cases, the sovereign exercised the power which had thus established "mining freedom" to set it aside, granting whole mining districts without reference to the discovery right. One of the first steps taken by sovereigns to confirm by exercise their rights of royalty, was the endowment of certain cities and districts with peculiar privileges on account of their mines. Turin and Vallensasco, in Italy; Truro and Penzance, in Cornwall; and many localities in Hungary, Silesia, Switzerland, Sweden, etc., are instances outside of Germany. In the latter the mining cities were very numerous. The famous seven mining cities of the Harz, and the "ancient and honorable free mining city of Freiberg," in the realm of the Saxon counts of Meissen, as well as many other privileged cities of Saxony, important mining centres down to recent times, may be cited as examples. — In the sixteenth and seventeenth centuries an elaborate system of jurisprudence grew up in Germany, varying somewhat in the different states, and affected with occasional exceptions, yet based in the main upon the principles above described. It included free, or nearly free, exploration (build-

ings not being imperiled, and damages to surface or to agriculture being chargeable to the explorer); the immediate "denunciation" (*muthung*) of a discovery made; the issue of a preliminary permit; the survey, location and regular lease of the mining ground, after the deposit had been sufficiently exposed; the obligation to prosecute the work continuously, unless natural causes, such as foul air or excess of water, prevented; the payment of royalty (usually one-tenth or one-twentieth of gross product) to the elector; the division of a mining enterprise into shares (*kuxe*, usually 128 in number); the furnishing of mine timbers by the crown forester, or by private owners under agreements and regulations supervised by the crown officers, etc. The driving of adits was the privilege of the prince, but it was very generally conceded to private parties, with the appertaining advantages and revenues. It was common to give the prince, "by ancient usage," one-eighth of the stock in every leased mine. He was, however, liable to assessment like any other stockholder, and forfeited his stock by non-payment. Mining leases covered a certain area of the surface and a space below the surface, either bounded by vertical planes or by surfaces parallel with the dip of the vein. The first was called a square location (*gevierdtfeld*) and the second an inclined location (*gestrecktfeld*). The possessor of an inclined location was generally allowed to work about twenty-one feet (three and one-half *lachter* or fathoms) into the hanging wall (roof) of his vein, and an equal distance into the foot wall (floor), and to extract all ore found within these limits, as well as in the vein proper, which he might follow indefinitely downward (*in die ewige teufe*). The simple square location was applied to beds, masses, and even to true veins, when they dipped not more than fifteen degrees below the horizontal. — The principle of mining freedom took little root in Great Britain; and perhaps the sole trace of it now remaining is the custom of "tin-bounding" in Cornwall and Devon. The number of Cornish mining terms which betray a German origin, shows that the enterprising German miners of the middle ages probably found their way to that region, and left their mark upon both institutions and language. There is reason to believe, however, that the British crown at one time laid claim to all mines. Certainly it has from time immemorial claimed by prerogative all gold and silver, and not until the reign of William and Mary was the enjoyment of tin, copper, lead or iron mines, even though their ores contain intermixtures of the precious metal, secured to the subject. The ground of the claim to gold and silver was thus quaintly stated from the bench in the celebrated "case of mines," in the reign of Elizabeth: "The common law, which is founded upon reason, appropriates everything to the persons whom it best suits, as common and trivial things to the common people; things of more worth to persons of a higher and superior class; and things most excellent to persons who excel all others: and because gold and silver are the most excellent things which the soil contains, the law has appointed them, as in reason it ought, to the person most excellent, and that is the king." The right to mines of pure gold or silver, or of either of these, mixed with other metals than tin, copper, lead or iron, appears to be still a royal prerogative, but it is not exercised; and perhaps there are no known cases in which it could be exercised. Practically in Great Britain (and absolutely under the English common law as held in this country) the mineral right of whatever kind originates in the ownership of the soil, although it may be alienated and separately conveyed by the act of the owner, who must, however, to make such conveyance effective as a basis for mining, expressly grant also the right to enter upon his land, dig and carry away the minerals, etc. The exception above mentioned, namely, the custom of tin-bounding in Cornwall and Devon, is spoken of as already "ancient" in a charter granted to the tinners of those districts in the third year of King John. It was thus defined in a modern case at law (Rogers *vs.* Brenton, 10 Q. B., 26): "That any person may enter on the waste land of another in Cornwall, and mark out by four corner boundaries a certain area; a written description of the land so marked, with metes and bounds, and the name of the person for whose use the proceeding is taken, is recorded in an immemorial local court, called the stannary court, and proclaimed at three successive courts held at stated intervals; if no objection is successfully made by any other person, the court awards a writ to the bailiff of the court to deliver possession of the said bounds or tin-work to the bounder, who thereupon has the exclusive right to search for, dig and take to his own use all tin and tin ore within the described limits, paying to the landowner a certain customary proportion of the ore raised, under the name of 'toll-tin.' The right descends to executors, and may be preserved for an indefinite time, either by actually working and paying toll, or by annually renewing the four boundary marks on a certain day." The custom in Devonshire, it is said, is a freehold interest descending to the heir, and unaccompanied by the obligation to pay any toll to the landowner. It would probably be held void in law, since even the Cornish custom was pronounced by Lord Denman, in the case above cited, to be sustainable only by actually working and paying toll. Bounding, he says, is a direct interference with the common law right of property; and a custom, to have such force as that, must be not only immemorial but reasonable—as the custom of holding tin-bounds without working would not be. The practice has now fallen into disuse; but the stannaries court (created by the consolidation of the several stannary courts) survives, with both common law and equity jurisdiction, concurrent with that of the ordinary courts, in matters arising out of mining. The only mining legislation of Great Britain at the present day is that which supports a school of mines,

provides for the collection of mining statistics, maintains inspectors, and imposes certain regulations for the order and safety of the miners. Two statutes (35 and 36 Victoria, chaps. 76 and 77, 1872) contain these regulations.—The mining laws of Australia and Canada follow the principle of English law, modified by old grants of the crown, and by the fact that in these colonies large areas of unoccupied public land exist, on which the local governments may authorize mining upon such terms as they may choose. Their leases or sales of mining rights on such lands are simply acts of the landowner under the common law.—The new codes of mining law in the German states (beginning with that of Prussia, adopted in 1866, which the others more or less closely imitate,) express two tendencies: the one, toward a wider recognition of the rights of the landowner, the other, toward a withdrawal of the government from undue interference with mining, and a reduction of its burdens of taxation and tribute. The inclined location is no longer granted; and the miner is confined to the space inclosed by vertical planes drawn through his surface boundaries. The permission of the landowner is necessary to preliminary explorations; though he may be compelled by the decision of the authorities to give such permission, yet only upon receiving a bond of indemnity. A mining grant is not forfeited by ceasing to work it, unless the authorities, for sufficient reason, insist upon the resumption of work, in which case the grantee has a right of protest and appeal, and six months' grace The numerous fees, royalties and tithes of former times are done away, and in their place a moderate tax is imposed; in Austria, Saxony and Bavaria, a tax on net profits; in Prussia, a tax on the value of the products of 1 per cent. for the general treasury of the state, and 1 per cent. to cover the expenses of supervision. Iron mines are generally, if not universally, free of royalty to the state. Benefit societies for miners (*knappschaftsvereine*) are established by law. Bog iron ore; gold nuggets in the soil (in Prussia); gold placers (in Bavaria); coal (in Saxony and some other states); iron (in Silesia); salt and salines (in Hanover); mineral springs and amber (except in East Prussia and West Prussia, where amber found in the sea or on the beach belongs to the state) are exceptions to the mining law, and belong to the landowner.—A brief notice of the mining laws of France will suffice, first, because the mining industry of that country is limited (though in 1810, when the statute of Napoleon was promulgated, the productive mines of Rhenish Prussia belonged to France, and these mines were actually worked according to French law until 1865); secondly, because the French system, unlike the English, the German and the Spanish, has had little to do with the development of our own mining law. By the decree of 1791, after the abolition of feudal rights, the mines and mineral deposits of France were declared to be the property of the nation, and the government was authorized to make "concessions" of them, such concessions to be always temporary only, and the preference to be given to the landowner, to whom was moreover expressly reserved all that part of every mineral deposit lying within one hundred feet of the surface. These provisions amounted nearly to a prohibition of general mining. The law of 1810 declared, in accordance with the Code Napoleon, that the property in minerals goes with the property in land, but that the government may separate the two, granting the mineral right, even in perpetuity, to another than to the landowner, on the simple condition of a tribute paid to the latter. *Mines* only are subject to these conditions. In this class certain underground workings are included; *minieres* (open works) and *carrieres* (quarries) are left to the landowner. The tax paid to the state is 2 per cent. of the gross product.—The Spanish ordinance of mines, published in 1783, has been substantially in force ever since in Mexico, and was the law in the territories which the United States acquired from Mexico by conquest and purchase. It asserts the right of sovereignty over all species of metals, and authorizes the concession of mining rights only so long as the mine is worked. It is also very full in its directions as to the manner of mining, attempting to correct, in this way, the tendency to reckless robbery of mines, inevitable under such tenure. The size of claims (invariably "square locations") is regulated by the dip of the vein as shown by a shaft thirty feet deep; the length of the claim along the course of the vein being 200 yards (*varas*) and the width from 100 to a maximum of 200 yards, according to the dip, the smallest width being granted to a claim on a vertical vein, and the greatest on a vein departing forty-five degrees or more from the vertical These measures are so calculated that under the most frequent circumstances (the dip varying from forty-five degrees to sixty degrees from the horizontal) the vein will pass out of the claim at the vertical depth of 600 feet, at which depth, the ordinance naively remarks, it is commonly much exhausted. It need hardly be said that the introduction of steam engines and the construction of deep adits has long since rendered it possible to mine to the depth of over 3,000 feet. The taxation of Mexican mines has always been heavy, especially in the form of the export tax on bullion. Spain did for her western provinces what Carthage and Rome had done for Spain, and the spirit of her legislation, the desire to wring as much plunder from the rich mines as possible, has lingered in the land. It is believed that a more liberal treatment of the mining industry, with the view of attracting and protecting foreign capital, will hereafter obtain.—We are now prepared to explain the history of the relation of our own government to the mining industry. It is based entirely upon the common law. True, the early English colonial grants asserted some crown rights in the metals. Thus the great charter of King James to the London and Plymouth companies (1606) provided that

one-fifth of the gold and silver, and one-fifteenth of the copper, which might be discovered, should belong to the crown. But long before the revolution, the right of landowners to all minerals beneath the surface appears to have been recognized. Before the adoption of the federal constitution, the confederate congress, in prescribing a form of grant or patent for lands in the western territory, reserved "one-third part of all gold, silver, lead and copper mines within the same for future sale or disposition." It was not, however, until the acquisition of the lead regions of the upper Mississippi, under the Louisiana treaty with France, in 1803, that the question assumed practical importance. Under the power given by the constitution to congress to dispose of the public lands, the lead mines were reserved from sale, and in 1807 the president was authorized to lease them for not more than five years. The policy of reserving from the operations of ordinary grants of public land mineral lands and lands containing known salines or mines, has continued to the present time, and is incorporated in all the formal statutes relating to the subject. It is held, however, that land not officially set apart as "mineral," and not known to contain salines or mineral deposits, being once conveyed by the government to a private purchaser or settler, all subsequently discovered mineral deposits belong to him. The attempt to lease the mines on the public domain, shown in the act of 1807 above mentioned, was the first and last experiment of our government in that direction. The leases covered tracts at first three miles square (afterward reduced to one mile) and bound the lessees to work the mines with due diligence, and return to the United States 6 per cent. of the ores obtained. The first leases were not issued until 1822, and the product did not become considerable until 1826, when it began to increase rapidly. After 1834, however, in consequence of the immense number of illegal entries of mineral lands at the Wisconsin land office, the miners and smelters refused to pay rents any longer, and the government was unable to collect them. Meanwhile, by a forced construction (afterward declared invalid) of the act for leasing the lead mines, hundreds of leases were granted to speculators in the Lake Superior copper region, where a wild excitement prevailed from 1843 to 1846. In the latter year, the bubble burst; the issue of permits and leases was suspended as illegal; and in acts passed in 1846 and 1847 the policy of selling the mineral lands outright was adopted by the government. The act of July 11, 1846, authorized the sale of the reserved mineral lands in the states of Illinois and Arkansas, and the territories of Wisconsin and Iowa, at an increased rate of $1.25 per acre, as a minimum, but still reserved them from pre-emption. The act of March 3, 1847, creating the Chippewa land district in Wisconsin territory, ordered a geological survey, granted pre-emption to parties in possession of lead mines by occupation from discovery, or by lease under the United States, by paying $5 per acre, and provided for public and private sales at the same price. The act of March 1, 1847, ordered the sale of the copper mines in the state of Michigan, after a geological survey; precedence to be given to lessees of the government, who need pay but $2.50 per acre, the minimum at public sales being $5. The act of March 3, 1849, organizing the department of the interior, transferred to it the powers exercised under the preceding act by the treasury, and still earlier by the war department, with regard to the mines of the United States. The act of Sept 26, 1850, repealed the acts of 1847, and placed the mineral lands within the districts referred to on the same footing, as to sale, private entry and pre-emption, as other public lands of the United States, saving the rights of the lessees. — The application of the policy of sale to the public mineral lands west of the Missouri encountered peculiar embarrassments, arising from two main causes. Large portions of this territory were acquired from Mexico; and the United States, in assuming sovereignty, assumed also, it was held, the ownership of the metals which pertained to sovereignty under the Spanish ordinances. In the case of existing Spanish agricultural grants, not expressly conveying the mineral right, that right would thus belong to the United States, not to the grantees. But our courts finally held that when such a grant was confirmed by a United States patent, the mineral right was thereby conveyed to the grantee, whether it had been originally so conveyed to him by the grant or not, because the United States patent gives a full title in fee according to the common law. By this decision a great source of difficulty was removed, although certain evils resulted from the acquisition in this way, by agricultural grantees, of much larger areas of mineral land than could have been acquired under the ordinary operations of our laws. A second and more extensive difficulty in disposing of the mineral lands in the Rocky mountains and on the Pacific slope arose from the fact that, under the excitement beginning with the discovery of gold in California, and continuing as a motive power ever since, population rushed into these regions in advance of the public surveys, indispensable to an orderly sale of the lands. The government was taken by surprise; and for nearly twenty years it permitted miners to enter upon the public lands, dig and carry away gold, silver, copper, quicksilver and other valuable minerals, without attempting to assert its dominant ownership. A system of possessory titles, good as against all claimants except the United States, grew up under local customs and regulations, which the subsequent legislation of congress recognized, as a matter of temporary policy, to a mischievous extent. — The first mining on the Pacific coast after the acquisition of the region by the United States, was the "gulch" and "placer" mining for gold in California. (It is difficult to fix exactly the dates of the beginnings of mining in the different territories. The

following list is approximately correct: The rediscovery of gold in California—previously known to hunters, Indians and Jesuit missionaries—took place in 1848. Gold mining began practically in Arizona in 1850, in Oregon in 1852, in Colorado in 1859, in Idaho and Montana in 1860. Quicksilver mining on a regular scale began at New Almaden, California, about 1851. Hydraulic mining began in California about 1853. The mining of silver ore from the Comstock lode, in Nevada, in the neighborhood of earlier gold diggings, began about 1853.) — The placer miners of California early adopted local rules with reference to the size of their claims, and the use of the water necessary to work them. Since the country was swarming with eager adventurers, it was natural that actual occupation should be recognized as necessary to maintain title, and that abandonment should work forfeiture in favor of some new comer. As to the size of claims, they were usually restricted according to the nature of the deposit, as a "gulch," "creek," "bar," or "flat" digging, etc. In gulches and creeks, however, it was common to grant to each claimant a certain number of linear feet along the stream by the whole width, whatever it might be. When the miners proceeded, by an easy transition, to "quartz mining," *i. e.*, to the development of the quartz veins which they had discovered as the sources of the accumulated wealth of the placers, they carried over to this new industry such of the placer rules as they could conveniently apply, and, in particular, the two above mentioned, of necessary continuous occupation and of a single definite dimension of claim. Very likely there were among them German miners who remembered the *gestrecktfeld* of their fatherland. At all events, it was this, and not the square location of Mexico, that was generally adopted in the quartz mining camps, and has been incorporated into the federal statutes. The principle of recording claims, and deciding conflicts in favor of priority of record, is another feature of the American mining customs, as of all German mining codes. — Unfortunately, there was no uniformity in the customs of different localities. The inhabitants of a certain district held a mass meeting, declared the boundaries of their district as they chose (usually not encroaching on any other already established, unless by way of division of a district found to be inconveniently large), fixed the size of claims and the amount of work necessary to hold them, elected a recorder, and adjourned—to meet again and alter their laws if they should see fit. Often the first settlers (three men have been known to hold a mass meeting, and thus fix the limits and laws of a new district) arranged matters more liberally for themselves than for the hundreds who rushed in afterward; and with the larger population there came the imperative reform. The records were, in many places, carelessly kept, laying the foundation for much litigation and opening the door to fraud. — As has been remarked, the United States passively allowed this system or chaos of local customs to exist for many years. The miners on the public lands were technically trespassers; yet by a series of decisions in the state courts, and finally in the United States supreme court (3 Wallace, 97), it was held that their possessory rights, as against all claimants except the United States, were capable of being transferred, taxed, and valued in money. Finally, an act of congress (July 27, 1865,) declared that actions for the recovery of mining claims should not be affected by the paramount title of the United States, but should be judged according to the law of possession. The principle was recognized again in the act of May 5, 1866, concerning the boundaries of Nevada, in which the possessory titles of citizens holding mining claims were recognized, with a distinct proviso that they should not be considered as titles in fee. The act of July 25, 1866, granting the right of way and other important privileges to the Sutro tunnel (draining the Comstock lode in Nevada), excepted from its grants that lode and all others then in actual possession of other persons, unless the same should be abandoned or forfeited under local laws It also provided—the first and last instance of the kind in our federal legislation—that the mines "drained, benefited or developed by the tunnel" should be subject to certain payments in return. This general principle is found in Spanish ordinances (Tit. X , Art. 3), which provide for rewards and royalties to the constructors of adits, or for the assessment of mines benefited thereby, in the proportion of the benefit derived, to pay the expense of such construction. A similar feature is found in the German codes. The act of July 26, 1866, was the first general law on the subject of the mines on the public lands. It declared (Sec. 1), that the mineral lands, surveyed or unsurveyed, were open to exploration and occupation by all citizens or those who had declared their intention to become citizens, subject to such regulations as might be prescribed by law, "and subject, also, to the local customs or rules of miners in the several mining districts, so far as the same may not be in conflict with the laws of the United States"; (Sec 2), that any person or association claiming a vein or lode of quartz or other rock in place, bearing gold, silver, cinnabar or copper, having expended thereon not less than $1,000, and having a good possessory right under the local laws or customs, might file a diagram, conforming in dimensions to the said customs, "enter such tract and receive a patent therefor, granting such mine, together with a right to follow such vein or lode with its dips, angles and variations to any depth, although it may enter the land adjoining, which land adjoining shall be sold subject to this condition"; (Sec. 3), that the application and diagram should be posted and advertised for ninety days, to permit the presentation of adverse claims, after which (there being no adverse claims) the survey should be made, covering one lode only, and the patent issued on payment

of $5 per acre and costs; (Sec. 4), that the survey might be varied from the rectangular form to suit the circumstances and local customs, but "no location hereafter made shall exceed 200 feet in length along the vein for each locator, with an additional claim for discovery to the discoverer of the lode, with the right to follow such vein to any depth, together with a reasonable quantity of surface for the convenient working of the same, as fixed by local rules," and "no person may make more than one location on the same lode, and not more than 3,000 feet shall be taken in any one claim by any association of persons"; (Sec. 5), that local legislatures might provide rules for working, "involving drainage, easements and other necessary means"; (Sec. 6), that the appearance of adverse claims should cause a stay of proceedings for patent, until these had been settled by the courts. The remaining sections refer to additional land districts, rights of way for roads and ditches, the use of water (determined by priority of possession for mining, agricultural or other purposes), and the rights of settlers upon agricultural lands under the pre-emption and homestead laws. — The act of July 9, 1870, provided for similar proceedings as to "placers," ("including all forms of deposit excepting veins of quartz or other rock in place"), such claims not to exceed 160 acres for each person or association, and to be sold at $2.50 per acre. — The act of 1866 proved defective in practice, not only as to certain administrative details, but also in three important particulars: it covered mines of gold, silver, cinnabar and copper only; it left too much latitude to the mining customs, to which it nevertheless gave the full rank of law; and it was obscure as to the nature of the title conferred by the patents granted under it. The last point requires a brief further explanation. The terms "tract," "patent," "land adjoining shall be sold," etc., and the provision for payment by the acre, all pointed to a title in fee; but the usage of miners, the conditions of such localities as Virginia City, Nevada, (where a large town had been built, and town lots were daily bought and sold, on the land comprising the Comstock vein outcrop), and finally, in accordance with these influences, the construction of the statute by the highest courts (overruling in some instances contrary decisions below), settled the title to apply to the vein only, with the surface as an easement for convenient working. Entering upon the surface of another's patented claim, to explore for veins alleged to be other than the vein named in the patent, was therefore no trespass. — The act of May 10, 1872, now incorporated in the revised statutes, corrected the three defects above named, as well as others less important. It extended (Sec. 2, or Rev. Stat., Sec. 2320) the privileges of location to lodes bearing gold, silver, cinnabar, lead, tin, copper or other valuable deposits. It overruled in some particulars the local customs, providing (Sec. 2) that 1,500 feet should be the maximum length of a mining claim, 300 feet on each side of the middle of the vein at the surface the maximum, and 25 feet on each side the minimum, width; that no location should be made before the discovery of the vein within the limits of the claim (abolishing the custom of locating so-called "extensions" of neighboring mines); that the end lines of each claim should be parallel. It declared (Sec. 3, or Rev. Stat., Sec. 2322) that all lode locators in good standing under local regulations not in conflict with United States laws, should "have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes and ledges [these terms are synonymous] throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations," but that this right of possession outside the location should be confined between vertical planes extending through the end lines of the location, and should not authorize the owner to enter upon the surface of a claim owned or possessed by another. It prescribed (Sec. 5, or Rev. Stat., Sec. 2324) that locations and records should be made in a certain way, and that on all claims located after the date of the act, $100 worth of labor should be performed annually as the condition of possessory title, until patents should be taken. On claims located before the act, $10 worth of labor for each one hundred feet along the vein was required annually to maintain title. The time for the first annual expenditure on this class of claims was subsequently extended (act of March 1, 1873) to June 10, 1874, and again (act of June 6, 1874) to June 10, 1875. These concessions relieved individual cases of hardship, but served to prolong for some years the mischievous practice, under local customs and rules contrived for the purpose, of holding large numbers of claims without either working or purchasing them. Since 1875 this practice is extinct; the annual work (called by our western miners "assessment work") required by the United States law making it too expensive a speculation. — Thus, by a long and irregular course, the mining law has reached a form unprecedented as a whole in history, yet resembling in details here and there some features still maintained, or already discarded, by foreign nations. It grants to locators, and the United States patent to mineral land confirms, a peculiar right, which may be summed up as the ordinary common law right to the surface and all beneath it, *plus* a certain addition and *minus* a certain deduction — the addition being the right of the locator to follow veins of which his land contains the apex, downward, between the end planes of his location into his neighbor's land; and the deduction being a similar right possessed by the adjoining neighbor. The meaning of the terms "vein, lode or ledge," "top or apex," etc., which the law does not define, has been more or less completely

settled by the courts. By the act of February 18, 1873, deposits of iron or coal are excepted from the act of 1872, as are all the public mineral lands in Michigan, Wisconsin and Minnesota. The act of May 5, 1876, excepts also Missouri and Kansas. A separate act (March 3, 1873, Rev. Stat., Sec. 2347–2352) provides for the pre-emption, entry and purchase of coal lands, 160 acres by an individual, or 320 (or under certain conditions 640) acres by an association, at a minimum price of $10 per acre for lands more, and $20 per acre for lands less, than fifteen miles from a completed railroad. Under these provisions, speculation in coal lands by the parties engaged in building railroads in Colorado, Utah, Montana and Arizona is now active. That the United States mining law is in many respects still defective can scarcely be denied. The large amount of costly litigation under this system, as compared with the almost total absence of mining litigation proper in the older states, under the common law system, is a striking and unanswerable fact. In 1879 a special public land commission, consisting of the commissioner of the general land office, the director of the geological survey, and three civilians appointed by the president, was authorized by congress to consider the whole question of the land laws, surveys, etc. This commission, consisting of J. A. Williamson, commissioner, etc., Clarence King, director, etc., and Messrs. Thomas Donaldson, A. T. Britton and J. W. Powell, made an elaborate "preliminary report" in February, 1880, including a large amount of testimony, and the draft of a new land code recommended to congress. As regards the mineral lands, its most important features are the final abolition of mining districts and district officers, the sweeping adoption of "square locations," *i. e.*, the ordinary common law system now obtaining in the older states, and certain provisions tending to force possessory owners to become purchasers within a reasonable period. No legislative action has been taken; and it is doubtful whether the prejudices of the mining communities will permit so radical a change. The committee's report and accompanying documents will remain, however, a treasury of information on this subject. — One means for encouraging the mining industry has been employed by all civilized governments, namely, the collection and publication of mining statistics. In this country the several states have performed the work most irregularly. Pennsylvania, New Jersey, Ohio, Indiana, Michigan, Nevada, California, and perhaps some other states, at present keep up more or less complete statistical bureaus. The federal government began by doing it very imperfectly in the census and in the statistical bureau of the treasury; then, more carefully, for the public lands in and west of the Rocky mountains, through special commissioners reporting to the secretary of the treasury (1866–76); then through the reports of the director of the mint at Washington and of the various topographical and geological surveys of the interior and war departments. There is now a perceptible tendency, on the part especially of those states which have done the least, to develop their own resources and industries, to extend the national geological and statistical work, heretofore confined chiefly to the national lands, into the states. The surrender of state sovereignty, when it comes in the form of a deliverance from state responsibility and expense, seems to have no terrors, even for the sternest opponents of centralization. — The police regulation of mining operations is, in the United States, confined to the protection of the lives of workmen, and does not extend to the prevention of waste or the securing of permanence in mining. It is exercised, if at all, by state and local authorities only. — Hon. A. S. Hewitt, in a presidential address before the American institute of mining engineers, in June, 1876, gives a table, prepared by the writer, showing the production of leading metals and minerals in the United States during the first century of national independence. The following table has been constructed from that, by condensation, correction and addition, bringing it to the end of 1881. It claims approximate accuracy only, but may serve to show the growth of the mining industry of the country.

PRODUCT OF LEADING MINERALS IN THE UNITED STATES.

— The following table is intended to show the general extent of the mining industries of the principal European states. It is mostly from official

* The ton in this table is the gross ton of 2,240 pounds avoirdupois. The flask of quicksilver is 76½ pounds avoirdupois. The barrel of petroleum is 42 gallons.

sources, and gives the product of the year 1879. The units employed are, for everything but gold and silver, metric tons of 1,000 kilogrammes, equal to 2,205 pounds avoirdupois, nearly; for gold and silver, kilogrammes (one kilogramme equals 2,679 pounds or 32,151 ounces Troy). With the exception of coal and salt, the table represents the product of metallurgical rather than mining industry, and does not record, therefore, the crude ores which are exported from certain countries. The export of iron ore from Spain was, in 1879, about 2,700,000 tons; and several hundred thousand tons were exported from Algiers. Chili exported, in 1879, 49,390 tons of copper, of which 80 per cent. was in bars and ingots, 17¼ per cent. in regulus, and 2¾ per cent. in ores. Australia produced, in 1879, 8,133 tons of tin, and Banca and Billiton about 10,000 tons.

PRINCIPAL MINERAL PRODUCTS OF LEADING EUROPEAN STATES IN 1879.

* Average for five years, 1875–9. † Estimated. ‡ Including litharge. ‖ Average of three years' reports, 1878-80.

The omissions in the above table do not always indicate a complete absence of product. They are sometimes due to the absence of returns. But it is believed that in all such instances the amount is trifling.

—The following miscellaneous statistics may also be of interest in this connection. The production of lead in 1881 is estimated (in metric tons) as follows: Spain, 120,000; Germany, 90,000; England, 67,000; France, 15,000; Italy, 10,000; Belgium, 9,000; Greece, 8,000; Austria, 6,000; Russia, 1,500; United States, 110,000; total, 436,500; which is nearly the whole ascertainable product of this metal in the world—that of Asia being unknown, and that of Australia and South America insignificant. The European product of spelter (metallic zinc) for 1880 is estimated (in metric tons) as follows: Germany, 99,405; Belgium 65,000; England, 22,000; France, 13,715; Austria, Poland, etc., 3,200; total, 203,330. Great Britain produced, in 1881, about 10,000 metric tons of tin; Australia and Tasmania, 12,000; and Banca and Billiton, 11,000. — Bibliography. The following works may be consulted with profit on the subject of this article: Classic authors, particularly Strabo, Pliny and Diodorus; Dr. J. F. Reitemeir's *Geschichte des Bergbaues und Hüttenwesens bei den Alten Völkern*, Gottingen, 1785; Count Kaspar Sternberg's *Geschichte des Bergbaues und der Berggesetzgebung des Königreichs Böhmen*, Prague, 1838—this work contains the full text of the oldest German mining code, that of Iglau; the *Journal für Bergrecht*, Bonn, monthly; the *Annales des Mines*, Paris, monthly; Councillor R. Klostermann's *Das Preussische Berggesetz*, also the editions and commentaries of Oppenheim and Huysson; the codes and commentaries of Hesse, Nassau, Saxony, etc.; the German Cyclopædias of Zedler, Halle, 1733, Meyer and Brockhaus, Leipzig, 1877, and later—articles *Bergbau, Bergrecht, Bergherr*, etc.; R. P. Collier's *Treatise on the Law Relating to Mines*, London, 1849, Philadelphia, 1853; Prof. J. D. Whitney's *Metallic Wealth of the United States*, Philadelphia, 1853; J. A. Rockwell's *Compilation of Spanish and Mexican Law in Relation to Mines, etc.*, New York, 1851—there is a larger work on the subject by Gen. H. W. Halleck; Gregory Yale's *Legal Titles to Mining Claims and Water Rights in California*, San Francisco, 1867; the Reports of the United States Commissioner of Mining Statistics, Washington, 1867–76; the Reports of the various United States Geological Surveys, and of the Director of the Mint; George A. Blanchard and Edward P. Weeks' *Law of Mines, Minerals and Mining Water Rights*, San Francisco, 1877; Henry N. Copp's *United States Mining Decisions*, Washington, 1874, *United States Mineral Lands*, Washington, 1881, and *Land Owner*, Washington, monthly; the Report of the Public Lands Commission, Washington, 1880; Hon. A. S. Hewitt's *A Century of Mining and Metallurgy in the United States*, Trans. Am. Inst. of Mining Engineers, vol. v., Easton, Pa., 1877. Several parliamentary "blue-books" contain much information as to the administration of mines in Great Britain. The writer's views on the United States mining law in its different stages will be found more at length in the successive Reports of the Commissioner of Mining Statistics; a communication to the Public Lands Commission, appended to its report; a paper on the *Eureka-Richmond Case*, Trans. Am. Inst. of Mining Engineers, vol. vi, 1878; and the files of the *Engineering and Mining Journal*, New York, weekly. The above list might be indefinitely extended, particularly as to foreign authorities; but the works named will be found to contain abundant further references for those who desire to pursue the subject still more widely or deeply.

R. W. Raymond.

MINISTRY, the body of officers of state who compose the executive government of a sovereign or supreme ruler of a kingdom or empire — Formerly, and as lately as the reign of Charles I., under the English system of government, the king's privy council constituted his executive advisers. This council existed at a very early period of English history. At first it was a small committee, chosen by the king from the parliament, then called the "great council," and was possessed of much power, a part of which was the right to inquire into all offenses against the state, and to commit offenders for trial before the proper courts of law. It was composed of the chancellor, the treasurer, the justice of either bench, the escheator, the sergeants, some of the principal clerks of chancery, and some bishops, earls and barons, nominated by the king. This court has long ceased to exercise the function of advising the king on matters pertaining to the executive government, having grown too cumbrous for such practical work. A smaller body, called the cabinet, composed of from eleven to seventeen of the leading members of the ministry in power, has taken its place. This committee of the ministry, or cabinet, is merely a deliberative body; yet eminent public men have claimed for it, under the British constitution, a defined and acknowledged power for carrying on the executive government of the country. Its members, as a body, have no power to issue orders or proclamations, but all the weighty measures that call for the attention of the government, relating to the interests of the people, both at home and abroad, are considered by the cabinet, who determine what legislation shall be initiated by the ministry of which they are the principal members. — At the head of the ministry is the premier or prime minister, called first lord of the treasury, to whom is entrusted the selection of his associates in the ministry and the subordinate members of the government. He is generally a statesman of great national prominence, and the leader of his political party. As he is ordinarily called by the sovereign to the position of chief of the government on account of the triumph of his political party on some measure of great public interest, he selects his associates in the government from among leading men of his own party, so that his administration may conform to the will of the popular majority, as represented by a majority in the house of commons. He himself is placed in the executive branch of the government as the first lord of the treasury, and its other necessary heads are the lord chancellor, the chancellor of the exchequer, the secretaries of state for home, foreign, colonial and Indian affairs, the secretary for war, the lord president of the council, the lord of the privy seal, and the first lord of the admiralty. Ministers holding the offices of president of the board of trade, president of the poor-law board, vice-president of the committee of council on education, postmaster general, chancellor of the duchy of Lancaster, and chief secretary for Ireland, have or have not seats in the cabinet, according to circumstances. It depends, in every case, upon the position of the minister in the ranks of statesmanship, and, to some extent, on the importance of the measures affecting his department which the prime minister intends to propose for legislation. — There are many important officers of the government who do not possess seats in the cabinet, to wit, the attorney general and solicitor general for England; the lord advocate and solicitor general for Scotland; the lord lieutenant, attorney general and solicitor general for Ireland; the first commissioner of works, the lord chamberlain, and others. The prime minister sometimes holds the chancellorship of the exchequer in addition to the office of first lord of the treasury. — Cabinet meetings are usually held on the summons of any member of the ministry; their proceedings are secret, and no record is preserved. Each measure relating to the public service is committed for action to the head of the department to which it properly belongs. The members of the government have seats in parliament, and the prime minister endeavors, in forming his ministry, so to distribute the great offices of state, that when a principal secretary has a seat in one house, the under secretary shall be a member of the other. It is the custom for ministers to make periodic statements in parliament concerning the business of their departments, and they may at any time be called upon to explain their conduct. (See INTERPELLATION.)— Under the British constitution the sovereign is not held personally responsible for the acts of the government, no matter how disastrous they may be to the interests of the country. That responsibility rests with the ministry, which originates nearly all the great measures that become law, and is therefore sponsor for their beneficial application and result. The government of England being in part representative, the will of the people is indicated by parliamentary majorities. The executive government is presumed to represent the popular will, therefore the ministry and the popular house of parliament must accord in opinion; and if they do not accord, or if a ministry does not possess the confidence of the house of commons, a want sometimes expressed by a vote of censure, either the prime minister dissolves parliament and appeals to the country or the ministry ceases to exist. In the latter case each member resigns immediately, and a new government is formed by the appointment of a new prime minister, who proceeds to form a new ministry by direction of the sovereign. It is true that the sovereign possesses the power to dismiss his ministers whenever they cease to command his confidence, but he seldom exercises this power, as such a change would be useless without the support of the house of commons, who, by refusing their support could in a measure destroy the functions of government. Parliament is sometimes dissolved and the ministry dismissed by the sovereign, and

an appeal made to the country, to which a response is given in the political complexion of the succeeding house of commons. By this means the crown may temporarily overcome the parliamentary will. This course, however, is seldom pursued by the sovereign, as at best the victory would be ephemeral. As the result of such an arbitrary act, an unfriendly parliament would doubtless be elected, and the ministry and government stand as in the beginning. Sometimes it may become necessary for the public interests that parliament should be dissolved, and an appeal be made to the people by sending the members of the house of commons back to their constituency to be judged for their work. Were this power not vested in the sovereign there might be a danger of destroying the proper balance of the constitution, so necessary in a mixed form of government, by parliament becoming permanent, repealing the act of 1 Geo. I., c. 38, which limits the session to seven years, and assuming all the functions of government; an example of which is to be found in the long parliament, which Charles I. consented should not be dissolved until it dissolved itself. — When a ministry resigns on account of differences between itself and parliament, all the adherents of the ministry holding political office resign with it, and also the great officers of the court, and those of the royal household who have seats in parliament, in either house; also, the three junior lords of the treasury, the two secretaries of the treasury, the four parliamentary under secretaries of state, the paymaster general, the master general of the ordnance, the surveyor general of the ordnance, the five junior lords of the admiralty, the first secretary of the admiralty, the chief commissioner of Greenwich hospital, the president and parliamentary secretary of the poor-law board, the vice-chamberlain, the captain of the gentlemen at arms, the captain of the yeomen of the guards, the lords in waiting, the mistress of the robes, the treasurer of the household, the chief equerry or clerk marshal, the judge advocate general, and the lord chancellor for Ireland. — In 1839 Sir Robert Peel being commissioned by the queen (Victoria) to form a new cabinet, the Melbourne ministry having resigned, he demanded that the change of administration should include the resignation of the chief appointments held by the ladies of her majesty's household. This demand the queen refused, and Sir Robert Peel declined to undertake the formation of a government, and Lord Melbourne was restored to his position of first lord of the treasury. The duke of Wellington accorded with Sir Robert Peel in the opinion that the change suggested was necessary to establish perfect proof of her majesty's confidence in the new ministry. The ministry of Lord Melbourne, immediately after their recall, assembled in council and adopted certain resolutions of a very stringent and positive character in opposition to the proposition of resignation of the ladies of the queen's household on any change of ministry. — The resignation of the ministry occurs almost invariably upon a disagreement with the house of commons on some public measure, or upon a vote of "want of confidence." There have been many ministerial resignations of a notable character, but space forbids an extended review. The resignation of the duke of Wellington, Nov. 16, 1830, was memorable for the advent of the celebrated reform ministry of Earl Grey. This leader introduced at different sessions three reform bills, each of which was rejected by the house of lords, or nullified by amendments. On the rejection of the *third* measure by the house of lords, the bill having passed the house of commons by a large majority, the ministry of Earl Grey resigned. This act was followed by a week of intense excitement, when the government resumed office, on the king granting them full powers to create a sufficient number of peers to overcome the adverse majority in the lords. The Melbourne ministry followed, and resigned in 1834. Sir Robert Peel succeeded, and resigned in 1835. The Melbourne ministry again came into power, and resigned in 1841, upon a vote of "want of confidence." Sir Robert Peel came again into office, and again retired in 1846, having been defeated on the "Irish protection of life bill," giving place to a whig administration under Lord John Russell, who resigned in 1852. Lord Derby then became prime minister, but almost immediately gave way to Lord Palmerston, who remained in office six years and went out in 1858, on the defeat of the "conspiracy bill." In 1859 he was again recalled, and remained first lord of the treasury until he died, in October, 1865. Russell again came into power, as Earl Russell, but resigned the year following on account of parliament rejecting his reform bill of that year. Lord Derby then became the head of the new ministry, and remained for two years only, resigning in 1868. He was succeeded by Disraeli, who assumed office in February, 1868, and retired in December of the same year, a general election, necessitated by the passage of a reform bill extending the suffrage, having resulted in a large liberal majority. The ministry of Mr. Gladstone then came in and continued till 1875, when it resigned, and Mr. Disraeli became, for the second time, first lord of the treasury, and remained at the head of the government, the latter part of the time as Lord Beaconsfield, until the adverse elections of 1880. Mr. Gladstone then, for the second time, assumed the reins of government by appointment of the queen, and with a liberal ministry is now in power. — In the United States the council of executive advisers is called the cabinet. It is composed of the heads of the various departments of the federal government, and consists of the secretary of state, secretary of the treasury, secretary of war, secretary of the navy, secretary of the interior, the attorney general and postmaster general. They are appointed by the president at the incoming of each new administration, and seldom a single member of a previous administra-

tion is retained in the cabinet of a new president, although he may be of the same political party which elected his predecessor. — The office of minister is unknown to the constitution of the United States. By long-established custom, originating from the habit of the presidents of obtaining advice on public matters of grave interest from the heads of the departments, and for that purpose assembling them at the presidential mansion as the most convenient place, the American cabinet has sprung into existence. Under the constitution and laws of the United States they have no seat assigned them in either house of congress. Under our form of government the president is held responsible for the character of his administration, and therefore no necessity exists for an individual member of the cabinet to possess a seat in congress. Still many argue that the law should be changed and members of the cabinet be assigned to seats in congress for the purpose of explaining matters pertaining to the proper administration of their individual departments, as being conducive to a better administration of public affairs. A bill to this effect was introduced in the senate of the United States during the session of the 46th congress, but without favorable action being taken thereon. — As the president is held responsible for the "good conduct" of each member of his cabinet in the performance of his official duties, the power necessarily exists with the president to remove at his pleasure any or all of the members of his cabinet. It is true that the constitution and laws provide that this shall be done "by and with the advice and consent of the senate." Still so inseparably is the right connected with the means of enforcing a proper administration of public affairs, that it is regarded as an inherent right of the office, and the senate invariably consents to the personal wish of the president with regard to his official family. The action of the senate in confirming new appointees to cabinet honors is therefore merely *pro formâ*. This prerogative of the president is seldom used save in individual cases. In the case of the administration of President Andrew Jackson, however, the whole of the cabinet was removed, by requesting their resignations. A wide difference in law or custom prevails in the United States from that in England, with regard to the matter of resignation on account of parliamentary differences, or parliamentary votes of want of confidence, etc. While in England the custom is absolute that a ministry must resign when censured by a vote in parliament, in the United States congress might pass many votes of censure, or refuse to pass many favorite measures of the administration strongly recommended by themselves and the president, without in the least affecting the integrity of the cabinet. Its members would pay but little attention to any demand that congress might make for their resignation or removal, but a single indication on the part of the president of his desire to terminate their official relations, would instantly compel the resignation of that member of the cabinet. Should he prove contumacious and decline to resign at the verbal wish of the president, in that case, as in the case of a member of President Grant's cabinet (Jewell, postmaster general) during his second presidential incumbency, he would *by letter* request the same, which act is equivalent to removal, inasmuch as the president states his purpose in direct terms of appointing a successor to his office. — The duties of the cabinet, other than as advisers to the president, are of an important and widely varied character. As heads of their various departments, they are held by the executive responsible for the proper administration of their separate divisions of executive labor. It is a part of their province as chiefs of departments to construe and enforce the laws of congress pertaining to their individual branches, and often to disburse large sums of money Frequently they originate important measures which are recommended to congress by the president in either his annual message, or by transmitting their reports to him to the congress of the United States. It is generally understood that the secretary of state originates our foreign policy, and the secretary of the treasury that of finance. The secretary of the interior controlling to a very considerable degree our home interests and policies, is always an important officer, as is the postmaster general and the attorney general, as all must concede; and in time of war the most important of all are the secretaries of war and navy, who virtually control the armies and navies of the Union, and are therefore responsible to the president, and through him to the country, for the success and honor of our arms. In addition to this, each member of the cabinet, as the head of his department, is obliged to submit to congress an estimate of expenses necessary for its efficient operations for each fiscal year.

JNO. W. CLAMPITT.

MINNESOTA, a state in the American Union. That portion east of the Mississippi was a part of the territory ceded by Virginia, and was left out of the limits of the last entire state formed out of the northwest territory. (See TERRITORIES, ORDINANCE OF 1787, WISCONSIN.) That portion west of the Mississippi was a part of the territory ceded by France; it was successively a part of the territories of Missouri and Iowa, and was left out of the limits of the state of Iowa, as finally organized. (See ANNEXATIONS, I.; MISSOURI; IOWA.) By act of March 3, 1849, the two portions, with the modern territory of Dakota, were organized into the territory of Minnesota. An enabling act, for those inhabitants within the modern state of Minnesota, was passed Feb. 26, 1857. — BOUNDARIES. The boundaries assigned by the enabling act, and accepted by the state constitution, were as follows: "Beginning at the point in the centre of the main channel of the Red River of the North, where the boundary line between the United States and the British possessions crosses the same; thence up the main channel of said river to that

of the Bois des Sioux river; thence up the main channel of said river to Lake Traverse; thence up the centre of said lake to the southern extremity thereof; thence in a direct line to the head of Big Stone lake; thence through its centre to its outlet; thence by a due south line to the north line of the state of Iowa; thence east along the northern boundary of said state to the main channel of the Mississippi river; thence up the main channel of said river, and following the boundary line of the state of Wisconsin, until the same intersects the Saint Louis river; thence down said river to and through Lake Superior, on the boundary line of Wisconsin and Michigan, until it intersects the dividing line between the United States and the British possessions; thence up Pigeon river, and following said dividing line, to the place of beginning." — CONSTITUTION. Two constitutional conventions, one composed of republicans and one composed of democrats, were organized under the enabling act. Both met July 13, 1857, and, having finally come to a mutual understanding, agreed upon the same constitution, and adjourned Aug. 29. The joint constitution was ratified by an almost unanimous popular vote. It forbade slavery, "feudal tenures of every description," and leases of agricultural land for more than twenty-one years. The governor's term was fixed at two years. The right of suffrage was given to white male citizens over twenty-one, on a residence of one year in the United States and four months in the state. The capital was fixed at St. Paul, with a permission to the legislature to remove it. Under this constitution the state was admitted by act of May 11, 1858. The following amendments were made to the constitution in subsequent years: in 1858 the governor was allowed to issue not more than $5,000,000 in bonds, secured by a pledge of the faith and credit of the state, to aid certain railroads within the state; in 1860 the foregoing amendment was expunged, and the levy of any tax to pay the interest or principal of the bonds issued was prohibited, unless the levy should be ratified by a popular vote; in 1868 the word "white" was struck out of the suffrage clause; and in 1876 the legislature was empowered to allow women to vote at school elections. — GOVERNORS. Henry H. Sibley, 1858; Alexander Ramsey, 1858–62; Stephen Miller, 1862–6; Wm. R. Marshall, 1866–70; Horace Austin, 1870–74; Cushman K. Davis, 1874–6; John S. Pillsbury, 1876–82; I. F. Hubbard, 1882–4. — POLITICAL HISTORY. The political history of the state may be briefly summed up in the statement that it is and has always been a republican state. Its electoral votes have always been cast for republican candidates, and all its governors, United States senators and congressmen have been republicans, with the exceptions of the first governor, Sibley, Senator Rice, and the congressman from the second district in 1879–81, who were democrats. The republican majority in the state has been steadily increasing, as shown by the votes for governor in the following years 1865, 17,335 to 13,864; 1875, 46,175 to 35,373; 1879, 55,918 to 41,583. The only reasonably close election was in 1869 when the republican vote was 27,348 to 25,401. The legislature has always been republican in both branches, usually by a two-thirds or greater majority. In 1874, an exceptional year, the republican majority was only twenty-one to twenty in the senate, and fifty-four to fifty-two in the house, but it immediately and rapidly increased again until in 1881 it was twenty-nine to twelve in the senate and eighty-six to twenty in the house. — The most important question in state politics has been that of the state's railroad bonds. The original constitution prohibited the loaning of the credit of the state to any corporation. The desire of the people for railroad improvement led them in April, 1858, to adopt the amendment noticed above, under the constitution: the vote in its favor was 25,023 to 6,733. Under this amendment $2,275,000 in bonds, guaranteed by the faith and credit of the state, was issued and transferred to third parties. In the panic which immediately followed, the railroads defaulted, and the state foreclosed on their lands, road beds and franchises, which were transferred to new railroads and have developed the present railroad system of the state. In 1860 the new amendment, practically repudiating the bonds, was passed. In 1869 a bill to set aside 500,000 acres of land for the payment of the bonds passed both houses, but was not signed by the governor. May 2, 1871, a proposition to submit the claim of the bondholders to arbitration was submitted to a popular vote and was defeated, 21,499 to 9,293. Governor Pillsbury omitted no opportunity, from his inaugural, Jan. 7, 1876, until October, 1881, to urge upon the legislature the duty of some provision for the payment of the "dishonored bonds," and their final settlement is largely due to his unremitting exertions. The act of March 1, 1877, authorized the issue of new 6 per cent. bonds at the rate of $1,500 for $1,750 and accrued interest. Bonds were not to be issued until the people should ratify an amendment setting aside 500,000 acres of land to secure their redemption. The amendment was defeated, June 12, by a vote of 59,176 to 17,324. In 1881 most of the bondholders offered to surrender their bonds on payment of one-half their face value; and the legislature accepted the terms, March 2. Soon afterward the state supreme court decided that the repudiation amendment of 1860 was void, as it impaired the obligation of a contract; and that the legislature was competent to pay this, as a legal and valid indebtedness of the state. In October the arrangement was consummated, and the long suspended debt was canceled. — Apart from this question, interest in state politics has been confined to occasional attempts to remove the state capital, a bill for which purpose was passed and vetoed in 1869, and to attempts to organize distinct farmers' or temperance parties. None of these last have as yet met any great success. — Among the more promi-

nent leaders in state politics have been the following: Ignatius Donnelly, republican representative 1863–9, and democratic candidate for representative in 1878; Mark H. Dunnell, republican representative 1871–83; S. J. R. McMillan, justice of the state supreme court 1864–74, chief justice 1874–5, and United States senator 1875–87; Alexander Ramsey, whig representative from Pennsylvania 1843–7, governor of Minnesota territory 1849–53, and state 1858–62, and secretary of war under Hayes; Henry M. Rice, democratic United States senator 1858–63; Henry H. Sibley, governor in 1858, and democratic candidate for representative in 1880; Wm. D. Washburn, republican representative 1879–85; Wm. Windom, republican representative 1859–69, United States senator 1870–81 and 1881–3, and secretary of the treasury under Garfield. — The name of the territory and state was given from that of its principal river, an Indian word, said to mean "sky-tinted water." — See 2 Poore's *Federal and State Constitutions;* 9 *Stat. at Large*, 403, 11 : 167, 285 (for acts of March 3, 1849, Feb. 26, 1857, and May 11, 1858, respectively); Smith's *Constitutional Convention of* 1857; Neill's *History of Minnesota* (1858); Gale's *Upper Mississippi* (1600–1867); *Tribune Almanac* (1859–81); *Messages of Gov. Pillsbury* (Jan. 7, 1876 – Oct. 12, 1881); Porter's *West in* 1880, 250. ALEXANDER JOHNSTON.

MINORITY REPRESENTATION. (See REPRESENTATION.)

MISSISSIPPI, a state of the American Union. Its territory consists mainly of land ceded by Georgia to the United States in 1802, a strip about twelve miles wide along the northern edge being a part of the South Carolina cession of 1790. (For both see TERRITORIES.) That part of the state from the parallel of 31° north to an east and west line passing through the mouth of the Yazoo river seems rightfully to have been ceded by Great Britain to the United States in the treaty of 1783; but it was claimed by Georgia, and was included in her cession. The portion of the state south of the parallel of 31° was ceded to the United States by France in 1803. (See ANNEXATIONS, I., II.) — The act of April 7, 1798, for the appointment of commissioners for the Georgia cession, authorized the president to form a territorial government in the ceded territory like that of the northwest territory (see ORDINANCE OF 1787), "excepting and excluding the last article of the ordinance." (See SLAVERY.) In this way the cession became slave territory, and subsequently a slave state. The organization of Mississippi territory was formally completed by the supplemental act of May 10, 1800. The name of Mississippi was given to the territory, and subsequently to the state, from the name of the river which was its western boundary, an Indian word signifying "the great river," or "the whole river," not "father of waters" as it is usually translated. By an enabling act of March 1, 1817, the inhabitants of the western part of the state (see ALABAMA) were authorized to form a state government. — BOUNDARIES. The enabling act prescribed the following as the boundaries of the new state: "Beginning on the river Mississippi at the point where the southern boundary line of the state of Tennessee strikes the same; thence east along the said boundary line to the Tennessee river; thence up the same to the mouth of Bear creek; thence by a direct line to the northwest corner of the county of Washington; thence due south to the gulf of Mexico; thence westwardly, including all the islands within six leagues of the shore, to the most eastern junction of Pearl river with lake Borgne; thence up said river to the 31st degree of north latitude; thence west, along the said degree of latitude, to the Mississippi river; thence up the same to the beginning." These boundaries were accepted by the first constitution of the state. — CONSTITUTIONS. A convention at the town of Washington, July 7 – Aug. 15, 1817, formed the first constitution, which was ratified by popular vote. It confined the right of suffrage to free white males, twenty-one years of age or more, on a residence of one year in the state and six months in the county. The legislature was composed of a house of representatives chosen for one year, and a senate for three years. Property qualifications were imposed as follows: on the governor the possession of 600 acres, or $2,000 worth of land; on senators 300 acres, or $1,000 worth; and on representatives 150 acres, or $500 worth. The governor was to hold office for two years, and was to remove judges on address of two thirds of both houses. The legislature was forbidden to pass laws for the emancipation of slaves without consent of their owners, unless a slave should render some distinguished service to the state, in which case the owner was to be paid a full equivalent; or to pass any laws to prevent immigrants from bringing their *bona fide* slaves into the state; but was to have full power to prevent the bringing of slaves into the state as merchandise. In capital cases slaves were never to be deprived of the right of trial by jury. Under this constitution the state was admitted Dec. 10, 1817. — The second constitution was formed by a convention at Jackson, Sept. 10 – Oct. 26, 1832, and was ratified by popular vote. Its principal changes were as follows: no property qualification for office or suffrage was ever to be required; representatives were to hold office for two years and senators for four years; the capital was fixed at Jackson; the legislature was empowered to direct in what courts suits against the state were to be brought; the introduction of slaves for the buyer's own use was permitted until 1845; and the provision for a jury trial for slaves was omitted. — A state convention at Jackson, Jan. 7, 1861, passed an ordinance of secession, Jan. 9, which was not submitted to popular vote. Another convention, Aug. 14–26, 1865, made two amendments to the constitution, the second of which prohibited slavery thereafter in the state, and empowered the legislature to provide by law for

the protection of the freedmen, and to guard against the evils that might arise from their sudden emancipation.—A reconstruction convention at Jackson, Jan. 7–May 15, 1868, formed a constitution, which was at first rejected by popular vote, June 28, but was afterward ratified, Nov. 30–Dec. 1, 1868. Its more important changes were as follows: all citizens of the United States, resident in the state, were to be citizens of the state; no property or educational qualifications were ever to be required for electors, and this provision was not to be amended before the year 1885; slavery was forbidden; "the right to withdraw from the federal Union on account of any real or supposed grievances shall never be assumed by this state, nor shall any law be passed in derogation of the paramount allegiance of the citizens of this state to the government of the United States"; the governor's term was lengthened to four years, and he was given the power to call forth the militia to suppress "riots," as well as insurrections; the right of suffrage was to be limited to such persons as could swear that they were "not disfranchised in any of the provisions of the acts known as the reconstruction acts of the 39th and 40th congresses," but this was not to apply to persons whose disabilities should be removed by congress, provided the state legislature concurred therein; no one was to hold office who was not a qualified elector as aforesaid, or who in any way voted for or aided secession or rebellion; and the ordinance of secession was declared null and void. (See RECONSTRUCTION.)—GOVERNORS. David Holmes, 1817–19; George Poindexter, 1819–21; Walter Leake, 1821–5; David Holmes, 1825–7; Gerard C. Brandon, 1827–31; Abraham M. Scott, 1831–3; Hiram G. Runnels, 1833–5; Charles Lynch, 1835–7; Alexander G. McNutt, 1837–41; Tilghman M. Tucker, 1841–3; Albert G. Brown, 1843–8; Joseph W. Matthews, 1848–50, John A. Quitman, 1850–52; Henry S. Foote, 1852–4; John J. MacRae, 1854–8; William McWillie, 1858–60; John J. Pettus, 1860–62; Jacob Thompson, 1862–4; Charles Clarke, 1864, until superseded in 1865; Wm. L. Sharkey, provisional, 1865–6; Benj. G. Humphreys, 1866–8; Adelbert Ames, provisional, 1868–70; Jas L. Alcorn, 1870–74; Adelbert Ames, 1874–8; John M. Stone, 1878–82.—POLITICAL HISTORY. The electoral vote of the state has always been given to democratic candidates, except in 1840 and 1848, when it was given to Harrison and Taylor respectively, whigs, and in 1872, when it was given to Grant, republican; in 1864 and 1868 the vote of the state was not counted. (See ELECTORAL VOTES.) The whig party of the state, though usually unsuccessful, was always a strong minority, polling about 45 per cent. of the total vote; and so late as 1856, when its organization had taken the name of the American party, it still polled 41 per cent. of the total vote.—During the same period the state elections were almost as steadily democratic. The whigs were a strong minority in both houses of the legislature, and occasionally, as in 1841, 1842 and 1852, obtained a majority in one or both houses. Until 1842 the two representatives in congress were chosen by general ticket, and in 1837 the whigs elected both; with this exception the state's representatives were democratic. After 1842, when congressmen were chosen by districts, the only exceptions to the general rule were the elections of one whig representative in 1847 and one pro slavery know-nothing in 1855. After 1856 the opposition to the dominant party became steadily weaker; in 1855 it had polled 27,694 votes to 32,638, while in 1859 the proportion was but 10 308 to 34 559. In 1860 the democrats controlled both houses of the legislature by majorities of 27 to 4 in the senate and 86 to 14 in the house. Two political contests of this period deserve more particular mention.—*The Union Bank Bonds.* At the session of the legislature in 1837 an act was passed "to incorporate the subscribers to the Mississippi Union Bank." As the constitution required in such cases, it was published to the people, and re-enacted Feb 5, 1838. The act provided for the issue of $15,500,000 in state stock to the bank, as capital, as soon as a corresponding amount in private subscriptions should come in. A supplementary act of Feb. 15, 1838, changed the conditions to an immediate issue of $5,000,000 of state stock, prior to private subscriptions, and this was the change which was afterward alleged to be unconstitutional. The stock was issued and sold at a heavy discount through the bank of the United States, but the sale was sanctioned by the legislature in 1839. It was not until July 14, 1841, that the governor, McNutt, who had signed the acts mentioned, and had ordered the issue of the remaining $10,500,000 to the bank in 1839, declared his belief that the first issue of $5,000,000 was unconstitutional and void. The question of their payment at once became a political one, T. M. Tucker, who had opposed the first issue in the legislature, heading the opposition to its payment. In 1841 Tucker was elected governor, and thereafter the repudiation of the first issue was made final. A resolution of the legislature in 1842 denied that the state was under any obligation, legal or moral, to redeem the bonds; and in 1875 an amendment to the state constitution forbade the legislature to make any provision for their redemption.—*The Davis-Foote Campaign.* In 1850 the time for secession seemed to be close at hand. (See SECESSION.) Of the two United States senators of the state, Jefferson Davis was the leader of the pronounced secessionists, and Henry S Foote of those who were against the *advisability* of secession. (See ALLEGIANCE, II.) Both resigned, and began a joint canvass for the governorship in 1852, in order to bring the issue plainly before the people. Davis polled 27,729 votes to 28,738, and was beaten for the time. At the same time Davis' party had a majority (21 to 11) in the senate, and Foote's a majority (63 to 35) in the house. The anti-Davis party had a popular majority of 28,402 to 21,241 on the question of a state convention.

— RECONSTRUCTION. The close of the war of the rebellion found very little semblance of government in the state, which had suffered enormously during the war. Preparations had been made to aid Gov. Clarke in reorganizing civil government, when his functions were suspended by the appointment of Wm. L. Sharkey as provisional governor, June 13, 1865. Under his guidance the reorganization was completed, Gov. Humphreys was elected Dec. 2, and the whole state government began operations Dec. 16. Its functions were again suspended by the act of March 2, 1867. (See RECONSTRUCTION.) In no state was congressional reconstruction more relentlessly opposed than in Mississippi. Maj. Gen A. C. Gillem, military governor of the state, succeeded in forming a convention, but the constitution which it formed contained so many severe restrictions upon the rights of suffrage and of office holding by those who had taken part in the rebellion as to intensify the opposition. The state appealed in vain to the United States supreme court against the reconstruction acts, and a majority of its voters rejected the constitution. Adelbert Ames was then appointed provisional governor, Humphreys' functions being suspended. At the beginning of 1869 four years had been lost, the state was in about as bad a plight as in 1865, and there seemed to be little hope for the future adoption of the obnoxious constitution. The act of congress of April 10, 1869, therefore ordered a new election in the state, and authorized the president to submit the disfranchising clauses and the test oaths to a separate vote, but required the new legislature to ratify the 15th amendment, as well as the 14th, before readmission. In the election, though the constitution was adopted by a vote of 76,186 to 38,097, and all the radical republican candidates for governor, state officers and congressmen were elected, the proscriptive clauses were struck out by very heavy majorities. The new legislature, in which the republicans had majorities of 26 to 7 in the senate and 82 to 25 in the house, ratified the amendments, and the state was readmitted Feb. 17, 1870. March 10 the governor was inaugurated. — The republican majority in the state, mainly colored, was unbroken for five years. For a time the democrats made a peaceable but very apparent inroad upon it. In 1871 they came within two votes of a tie in the house, and in 1872 they carried one of the six congressional districts. In 1875, however, driven to desperation either by the peculation and fraud of negro officials, or by the pent-up wrath of a five years' peaceable struggle on even terms with a former slave race, the white democracy resorted to what was elsewhere called "the Mississippi plan." Open violence seems to have had little or no share in it. Midnight rides by companies of red-shirted horsemen, an occasional volley from harmless pistols, and the careful dissemination of startling rumors among the black population, furnish a combination of influences sufficient to explain the sudden decrease in the negro vote. At the election of Nov. 2, 1875, the republican party of the state went by the board. The democrats carried five of the six congressional districts, and, what was of more importance to them, both houses of the legislature; their majority in the senate was 26 to 11 and in the house 97 to 20. Feb. 25, 1876, the new legislature, after getting rid of the other state officers, impeached Gov. Ames for "inciting a war of races" in several specified instances. March 28 the governor offered to resign if the impeachment was dropped. This arrangement was carried into effect, and J. M. Stone, president of the senate, became governor Since that time the state has been democratic in all elections, and in 1880–81 there was but one republican in the senate out of thirty-seven and seven in the house out of 120. (See INSURRECTION, II.) — A new element of opposition, the national party, or greenbackers, has developed in the state, and under that organization it has been possible for white voters to make head against the dominant party without becoming identified with a negro party. In 1880–81 this new element had two members in the senate and fourteen in the house, and polled a considerable vote in three of the congressional districts. In 1881 it combined with the republicans, and was only defeated in the state election by a very narrow majority. Its possible future results are only a matter for speculation. The republican party of the state, however, is by no means dead. In 1880, it is alleged, it carried the notorious "shoe-string district" (see GERRYMANDER), and was only "counted out" with great difficulty. — Jefferson Davis (see his name) is the only citizen of the state who has become notably prominent in national politics. Among the other leaders of the state are the following: William Barksdale, democratic representative 1853–61, killed at Gettysburg; Albert G. Brown, democratic representative 1839–41 and 1848–53, United States senator 1854–61, and confederate states senator 1862–5; Henry S. Foote, United States senator 1847–52, and governor 1852–4 (see TENNESSEE); L. Q. C. Lamar, democratic representative 1857–61 and 1873–7, and United States senator 1877–83, George Poindexter, democratic representative 1817–19, governor 1819–21, and United States senator 1830–35; Sergeant S. Prentiss (see WHIG PARTY), whig representative 1838–9; John A. Quitman, major general in the Mexican war, governor 1850–52, democratic representative 1855–8; Jacob Thompson, democratic representative 1839–51, and secretary of the interior under Buchanan; and Robert J. Walker, democratic United States senator 1836–45, secretary of the treasury under Polk, governor of Kansas in 1857, and financial agent to Europe under Lincoln. — See 1 *Stat. at Large*, 549, 2:70, 3:348, 472 (for acts of April 7, 1798, May 10, 1800, March 1, 1817, and Dec. 10, 1817, respectively); 2 Poore's *Federal and State Constitutions;* Monette's *History of the Mississippi Valley* (to 1846); *Tribune Almanac*, 1838–81; *Nine Years of Democratic Rule in Mississippi* (1838–47); 10

ALEXANDER JOHNSTON.

MISSOURI, a state of the American Union, formed from the Louisiana purchase. (See ANNEXATIONS, I.) — BOUNDARIES. When the territory of Orleans, afterward the state of Louisiana, was organized (see LOUISIANA), the entire remainder of the new purchase was organized, by act of March 3, 1805, as the territory of Louisiana, and its name was changed to Missouri territory by act of June 4, 1812. (See also ARKANSAS.) March 6, 1820, an enabling act was passed (see COMPROMISES, IV.), authorizing the formation of a state government by the people of Missouri, within the following boundaries: "Beginning in the middle of the Mississippi river on the parallel of 36° north latitude; thence due west to the Saint François river, and up that river to the parallel 36° 30′ north latitude; thence due west to a point where the said parallel is intersected by a meridian line passing through the middle of the mouth of the Kansas river, where the same empties into the Missouri river; thence due north to the intersection of the parallel which passes through the rapids of the river Des Moines; thence east to the middle of the channel of the main fork of the Des Moines river, down the Des Moines to the Mississippi, and down the Mississippi to the place of beginning." The northern boundary line of the state was long undecided. Iowa claimed that the rapids in the Mississippi, called by the French explorers *La rapides la riviere Des Moines* were the point through which the parallel above referred to was to pass; Missouri argued for certain rapids, or ripples, in the Des Moines itself, some twenty-five miles farther north. In the dispute between the two states military force was repeatedly threatened, and once employed, and a Missouri sheriff was arrested and imprisoned. Acts of congress, for the purpose of ascertaining the true boundary line, were passed June 18, 1838, July 20, 1840, March 3, 1841, and June 17, 1844; but all were unsatisfactory and unsuccessful. Another act of Aug. 4, 1846, referred the whole question to the United States supreme court. Its decision was in favor of Iowa, and this was confirmed by act of Feb. 15, 1848, and ended the dispute. On the other hand, by the act of June 7, 1836, congress extended the state on the west to the Missouri river, thus giving it, says Benton, "an addition equal in extent to such states as Delaware and Rhode Island, by its fertility equal to one of the third class of states." By the Missouri compromise this was to have been forever free soil, but this act made it part of a slave state. — CONSTITUTIONS. The state's first constitution was adopted by a convention at St. Louis, June 12–July 19, 1820. It forbade the legislature to pass emancipation laws without consent of owners, or to prevent immigrants from bringing slaves with them; it ordered the legislature "to prevent free negroes and mulattoes from coming to and settling in this state under any pretext whatsoever"; it fixed the governor's term at four years; and it directed the permanent seat of government to be located on the Missouri river, within forty miles of the mouth of the Osage. The capital was laid out accordingly, and named Jefferson City; and the legislature held its first session there, Nov. 20, 1826. — The constitution was presented to congress at its next session, and the "free negro clause" revived the excitement which had been allayed by the Missouri compromise. The bill for the state's admission passed the senate; in the house a proviso was added that Missouri should abolish slavery; and the two houses disagreed. Another compromise was finally adopted, March 2, 1821, by which Missouri was to be admitted on the fundamental condition that the legislature should pledge the faith of the state that the "free negro clause" should never be executed. June 26, 1821, the legislature passed a "public and irrevocable act" in the terms required; but a long preamble declared that the action of congress was palpably unconstitutional and grossly insulting to the state, that the people of Missouri did not intend to respect or be bound by the condition, but that the act was passed as the only means of securing immediate admission. President Monroe chose to consider this measure of compliance as sufficient, and declared Missouri admitted by his proclamation of Aug. 10, 1821. — The amendments to the constitution of 1820 were mainly in the direction of an entirely elective judiciary. A new constitution was framed by a state convention, Nov. 7, 1845 – Jan. 14, 1846, but was rejected by popular vote. — The state convention which was called in 1861, with the hope of securing an ordinance of secession, proved to be the most extraordinary convention in the history of any state. It held five sessions, Feb. 28–March 22, 1861, July 22–31, 1861, Oct. 10–18, 1861, June 2–14, 1862, and June 15–July 1, 1863. Circumstances (see political history below) made the convention a revolutionary governing body for the state, even when the legislature was in session; it abolished or suspended state offices, abrogated state laws, disfranchised voters unable to take a test oath of past loyalty, changed, suspended or forbade elections by the people, and even abolished slavery after July 4, 1870. — After the close of the war within the state a new constitution was framed by a convention at St. Louis, Jan. 6 – April 10, 1865. It abolished slavery; it excluded every person who had "ever been in armed hostility to the United States," or who had ever committed any one of a long list of offenses against the government, from the right of suffrage, from holding any office of honor, trust or profit in the

state, in any corporation, or in any school; it provided for a registration of "qualified voters"; and it ordered a comprehensive test oath of past loyalty to be taken by all applicants for registration or aspirants to office. All these provisions were the result of a deep-seated resentment against the politicians who in 1861 had endeavored to hurry the state into secession against the wish of its people, and had thus made it the theatre of an unusually savage and desolating warfare. Nevertheless, the popular majority in favor of it was only 43,670 to 41,808. — All the disfranchisement clauses were wiped out by an amendment ratified Nov. 8, 1870. A new constitution was framed by a convention at Jefferson City, May 5 – Aug. 2, 1875, and was ratified Oct. 30, by a popular vote of 90,600 to 14,362. It increased the governor's term to four years; it forbade special legislation on a great number of specified subjects; it forbade the contracting of debt by the legislature for more than $250,000 in any one year, unless the act should be approved by a two-thirds majority of the qualified voters of the state, at an election for that purpose; it forbade the creation of corporations except by general law; and it made a residence of one year in the state, sixty days in the precinct, or declaration of intention to become a citizen, the only restrictions upon manhood suffrage. — GOVERNORS. Alexander McNair, 1820–24; Frederick Bates, 1824–8; John Miller, 1828–32; Daniel Dunklin, 1832–6; Lilburn W. Boggs, 1836–40; Thomas Reynolds, 1840–44; John C. Edwards, 1844–8; Austin A. King, 1848–52; Sterling Price, 1852–6; Trusten Polk, 1856–60; Claiborne F. Jackson, 1860–61; Hamilton R. Gamble, provisional, 1861–4; Thos. C. Fletcher, 1864–8; Jos. W. McClurg, 1868–70; B. Gratz Brown, 1870–72; Silas Woodson, 1872–4; Chas. H. Harding, 1874–6; John S. Phelps, 1876–80; Thomas T. Crittenden, 1880–84. — POLITICAL HISTORY. The state entered the Union during the "era of good feeling," and struggles for office were at first rather personal than political. The governors, senators and congressmen were fully in sympathy with the Monroe and Adams administrations, and the electoral vote of the state was cast for Monroe in 1820 and for Clay in 1824. Since that year the state has been democratic in all general elections, except during the period 1862–70, referred to below, including the two presidential elections of 1864 and 1868, when the state was republican. Until 1860 all the governors and legislatures were democratic, the proportion of the state vote being very steadily about 55 per cent. democratic and 45 per cent. opposition (whig until 1855, and American or know-nothing thereafter); the only exception was in 1852, when, after forty-eight ballots, a coalition of free-soil democrats and whigs elected the speaker of the house. — In the early history of the state there is little of general political interest until about 1849–50, when the disruption of the state democratic party took place, and the leadership of it was wrested from Senator Benton. Benton's followers had for some half dozen years been known as "hards," mainly from the "hard money" ideas of their leader, while his democratic opponents were called "softs." In 1849 the "softs" carried through the legislature the "Jackson resolutions of '49," which pledged the state to co-operation with the other slaveholding states against any attempt to exclude slavery from the territories. Benton denounced the resolutions as secessionist and treasonable, refused to obey them, and appealed to the people. His party in the state was led by F. P. Blair, B. Gratz Brown, Richard A. Barrett and Arnold Krekel; the "softs" by Sterling Price and Claiborne F. Jackson; and the whigs by Samuel Woodson and Thomas Allen. The result was that Benton was beaten, lost his senatorship, and, after serving a term in the house of representatives, was beaten in the election for governor in 1856, polling a smaller vote than either the "soft" or the know-nothing candidate. From that time the whole party machinery was in the hands of the "softs," or pro-slavery party. — A state convention met at Jefferson City, Feb. 28, 1861, to "consider the relations" between Missouri and the federal government. The act calling the convention had stipulated that no ordinance of secession should be valid until ratified by popular vote; but this was needless, as the convention proved to have a Union majority. March 4 the convention again met at St. Louis, listened to a secession commissioner from Georgia, and refused to join in the secession movement. But, though the convention and the popular majority were unionist, the state officers, the legislature and the leading "soft" politicians were strongly secessionist. Preparations were busily made to levy war against the United States; these were defeated by the energy of the federal general, Nathaniel Lyon; and in May the state became the theatre of open war. When the state convention reassembled, July 22, 1861, at Jefferson City, it found the state government suspended. The governor, the lieutenant governor, the president of the senate, the speaker of the house, a majority of the legislature and a part of the convention itself, including its president, Sterling Price, had fled the state, after an unsuccessful attempt at armed revolution. The convention, therefore, as the only representative of the people of the state, assumed the powers of government. July 30 it declared vacant the offices of the governor, the lieutenant governor and the members of the legislature, and appointed a provisional governor, Hamilton R. Gamble, and a provisional lieutenant governor, Willard P. Hall, who retained their positions until 1864. Aug. 5, 1861, Gov. Jackson, by proclamation, declared the independence of Missouri; and Nov. 2 the secession remnant of the legislature, at Neosho, voted the state into the southern confederacy and elected senators and representatives to the confederate congress. (See CONFEDERATE STATES.) The legislature which

met Dec. 29, 1862, had a majority in both branches in favor of the abolition of slavery in the state, and the state convention passed an ordinance of gradual abolition in 1863. (See ABOLITION, III.) By this time the forces of the state had been disciplined so thoroughly that they were able to defeat a rebel army under Shelby; and the state convention finally adjourned and left the ordinary state government in operation. The electoral vote of the state in 1864 was given to Lincoln by a popular vote of more than two to one, and the "radical republicans" elected the governor, the other state officers, a heavy majority of the legislature, and eight of the nine congressmen. — A new state convention met at St. Louis, Jan. 6, 1865, finally abolished slavery (see ABOLITION, III.) and formed a new constitution. Its most noteworthy features were the disfranchisement of any person who had taken part in any manner in the rebellion, the establishment of a rigid "oath of loyalty" and the provision that no person could vote, hold any state, county or municipal office, teach in any school, preach, solemnize marriage or practice law, unless he could take the stipulated oath that he had never committed any of the long list of offenses for which disfranchisement was made the penalty. The attempt to carry this test oath into effect was resisted throughout the state by ministers of all denominations, by teachers, lawyers and others, and before the end of the year the oath itself was pronounced unconstitutional by the United States supreme court, as an *ex post facto* law. The attempt to enforce it was then abandoned, except in the registration law of 1868, which empowered the registrars to reject the names of persons guilty of enumerated offenses, even if they offered to take the oath. In 1868 the "radical republicans" again elected their state ticket, presidential electors, a majority of the legislature, and six out of the nine representatives in congress. — In 1870 the feeling against the disfranchising clauses of the constitution had become so strong that it split the dominant party. The "liberal republicans," headed by Senator Carl Schurz and B. Gratz Brown, desired "universal amnesty and universal enfranchisement," both of negroes and former rebels. In the republican state convention, Sept. 2, the majority of the committee on resolutions made a report conveying the views of the "liberal republicans." It was rejected by a vote of 349 to 342, whereupon 250 of the delegates withdrew, organized a separate convention, and nominated Brown for governor and a full state ticket. The liberal ticket, supported by the democrats, was successful by a popular vote of 104,771 to 62,854. The liberals and democrats also elected a majority of the legislature, and six of the nine congressmen. At the same election an amendment to the constitution was ratified, abolishing the test oath and disfranchisement clauses. (For the national development of the liberal movement see LIBERAL REPUBLICAN PARTY.)—In 1872 the fusion of liberal republicans and democrats elected the state ticket, the Greeley presidential electors, a majority of the legislature, and nine of the thirteen congressmen. Since that time the state has been democratic in all elections, and in 1874 the republicans even dropped their party name, assuming for the time that of the "people's party." In 1876 and 1880 the electoral vote of the state was given to the democratic candidates by heavy popular majorities. In the congressional elections of 1880 the democrats elected eight congressmen, four of the others being "republican greenbackers" and one republican. In almost all the congressional districts the struggle at this election was very close and doubtful: one of the representatives received a majority of but two votes out of 41,552, and the majorities of several others were exceedingly meagre —Among the citizens of Missouri who have become prominent in national politics are Thos. H. Benton, F. P. Blair and Carl Schurz. (See those names.) The following also should be mentioned: David R. Atchison, United States senator 1843–55, and a prominent pro-slavery leader in the Kansas struggle (see KANSAS); Edward Bates, national republican representative in congress 1827–9, afterward prominent as a whig politician in the state, president of the whig national convention in 1856, and attorney general under Lincoln; Henry T. Blow, minister to Venezuela 1861–2 and to Brazil 1869–71, and republican representative 1869–71; James O. Broadhead, a whig leader until the downfall of that party, an active union leader during the rebellion, and provost marshal of the state; B. Gratz Brown, United States senator 1863–7, governor 1870–72, and liberal republican candidate for vice-president in 1872; John B. Clark, democratic representative 1857–61 (expelled), and senator in the confederate congress; John B. Clark, Jr., democratic representative 1873–83; F. M. Cockrell, United States senator 1875–87; John B. Henderson, one of the Douglas democratic leaders in 1860, and United States senator 1862–9; Lewis F. Linn, United States senator (democratic) 1833–43; Jos. W. McClurg, republican representative 1863–8, and governor 1868–70, Sterling Price, democratic representative 1845–6, brigadier general in the Mexican war, governor 1853–7, and confederate major general; Jas. S. Rollins, whig candidate for governor in 1848 and 1856, and republican representative 1861–5; and David Wagner, chief justice of the state supreme court 1865–80.— The name of Missouri was given from that of its principal river, an Indian word, said to mean "muddy water," the original form of the word being Minneshoshay.— See 2 *Stat. at Large*, 331, 743, and 3 *Stat. at Large*, 545, 645 (for the acts of March 3, 1805, June 4, 1812, March 6, 1820, and March 2, 1821, respectively); 6 Benton's *Debates of Congress*, 711; 6 Bioren and Duane's *Stat. at Large*, 666 (for Missouri's assent); 7 Benton's *Debates of Congress*, 129 (for the president's proclamation); Cutts' *Treatise on Party Questions*, 73; 1 Benton's *Thirty Years' View*, 8, 626; 2 von Holst's *United States*,

ALEXANDER JOHNSTON

MODUS VIVENDI. The law of nations formulates the laws, rules and usages in force among the different states. But that these laws, rules and usages may be considered as in force, it is necessary that the states should have recognized each other, that is to say, it is necessary that they should mutually consider each other as states. Now, it may happen, for one reason or another, that a government does not wish to, or can not, morally, recognize a given state; if this state is situated at a distance, it has only to be ignored; it is treated as if it did not exist. There may be then, it is true, some difficulties for such subjects of the government as are obliged to visit such a country, and who have to put themselves under the protection of another state, but there is no difficulty between the two governments. The case is not the same when the two powers are contiguous. It is then impossible for them to ignore each other, they must live together, and then it may be desirable to establish a *modus vivendi.* Generally such a situation is settled by a war, but when Cavour first used this expression in 1860, war between Italy and the pope was morally and politically impossible. After the installation of the Italian government at Rome, it was necessary to seek a *modus vivendi* for the relations between the king and the pope. — This expression, of which we find no trace in treatises on international law yet published, is of quite frequent use at present, and, the word being found, the situation would appear to be more frequent than during the past, the more so since war is not so easily decided upon, when it is necessary to put millions of men on foot and expend billions of money.

MAURICE BLOCK.

MOHAMMEDANISM is the most recent of the great religious creations of humanity.* Instead of the mystery in which the other religions hide their origin, this one was born in the full light of history; its origin is visible. The life of Mohammed is as well known to us as the lives of the reformers of the sixteenth century. The fundamental principles alone of Islamism will be presented here, with the political or social revolutions which it has produced. — Islamism has in reality but two dogmas: the unity of God, and the prophetic office of Mohammed. Mohammed was no more the founder of monotheism among the Arabs than he was of their civilization and literature. The worship of the supreme Allah seems to have always formed the basis of the religion of the Arabs. The Semitic race has never conceived the government of the universe in any other form than that of an absolute monarchy. Numerous superstitions, tainted with idolatry and varying from tribe to tribe, had changed, however, among the Arabs the purity of the patriarchal faith, and after coming into contact with more firmly organized religions all the better minds of Arabia aspired to a higher worship. In the sixth century that country, till then inaccessible, was thrown open on every side. The Syrians introduced letters. The Abyssinians and the Persians reigned alternately in Yemen and Bahreïn. Whole tribes had embraced Judaism; Christianity had large churches at Nedjran, in the kingdoms of Hira and Ghassan. A species of vague toleration and syncretism of all religions was finally established; the ideas of one God, of paradise, of the resurrection, of the prophets, spread by degrees even among pagan tribes. The Caaba became the Pantheon of all the worships, and when Mohammed excluded images from the holy house, in the number of the exiled gods was a Byzantine madonna, painted on a column, holding her son in her arms. The cere-

* The data which we possess for even an approximate estimate of the number of the followers of Islam are altogether inadequate In one place we find the Mussulman population stated at 270,000,000; in another it is reduced to 120,000,000. On account of the total absence of statistics and of serious censuses in Mohammedan countries we are unable to decide between numbers so different. Islamism has made very great progress in the interior of Africa and in China. There are no documents to show the number of these new followers, which increases every day. Strange phenomenon! Islamism is the religion which in the nineteenth century makes the greatest conquests. Mussulman missionaries setting out from Cairo and Muscat enter every part of Africa and find the most cordial reception among the negro populations. The favor which the monotheistic belief finds in certain parts of China, and the change which it effects in the minds of the population, are astonishing. — The great division of Islamism (Shiites and Sunnites) seems at first sight to arise merely from a disagreement concerning an historical question; the Sunnites admit the authority of the first three caliphs, Abou-Bekr, Omar and Othman, while the Shiites admit the rights of Ali alone, and reject the legitimacy of all the dynasties which took the place of the descendants of Ali. But this division is in reality more serious. The rights of Ali were merely a pretext taken up with avidity by the more independent portions of Islam, to escape from what they considered unendurable in orthodox belief The Persian provinces especially embraced the worship of Ali with eagerness, since it offered them an occasion to hate the Arabs, to turn their maledictions on them for the murder of Hussein and Hassan, and to develop the mystical and mythological side of the Iranian imagination On close examination we shall find that a Shiite is not a real Mussulman, in the Arabic sense of the word, and, if I may say so, in the Semitic sense. He allows images; he delights in an epic literature, full of exploits of ancient pagan heroes, a species of demigods; the legend of Mohammed, as related by him is more like a poem on the Hindu-Krishna than the history of a prophet of God. In future this difference will no doubt become more marked. The Shiite world is swarming with sects tinged with Sufiism, the basis of which is a pantheistic unbelief, summed up in these words: "Of a truth we come from God, and shall return to him." It has long been observed that Persia is not seriously Mussulman; under the mantle of official hypocrisy nearly every Persian hides a sectarian attachment, a secret thought, which in a way has its source in the Koran

monies of the Caaba, the processions, the sacrifices in the valley of Mina, the belief in purgatory (Arafat), were established in all their details long before Mohammed. The prophet merely consecrated these ancient usages and sanctioned them by a strict proclamation of the doctrine of future rewards and punishments. The symbol of Islamism, at least before the relatively modern invasion of theological subtleties, scarcely went beyond the simplest elements of natural religion. "There is no God but God, and Mohammed is his prophet." This is the whole Mussulman dogma. — Islamism being the least mystic of religions, its influence must be studied especially in the civil and political sphere. The new religion was an advance, so far as Arabia was concerned. It is true, that nothing could equal the charm of that society shown us by the Kitab el-Agâni and pre-Islamite poetry; never has human life been freer, more joyous, more noble, for a few. But it was a terrible anarchy. The weak children and women were scarcely protected. Although there were women at that time in Arabia who were their own mistresses, choosing their husbands and having the right to send them away whenever they pleased, no idea of an equality of rights existed. Mohammed established the right of women to inherit from their parents, restrained polygamy, even represented monogamy as a state of life agreeable to God. He recommended humanity toward slaves, advised their emancipation and abolished a multitude of inhuman practices. He desired each of the faithful to give one-tenth of his goods in alms. The Koran has become the text and the only source of the new law. It is at once a book of theology and a civil code—a collection of common law. Hence the fatal consequence, as we see, that in Islamism the civil law can never be separated from religion. No order, no methodical plan existed in the drawing up of this fundamental book. The Koran is a collection of Mohammed's discourses and orders of the day. Nothing could be more dissimilar, more contradictory. Entrusted at first to the memory, the surats (chapters of the Koran) were collected during the caliphate of Abou-Bekr, and underwent a second revision under that of Othman. This text has come down to us without essential variations. — It does not appear that Mohammed's vision extended beyond the horizon of Arabia, or that he thought his religion might suit others besides Arabs. The conquering principle of Islamism, the idea that all the world should become Mussulman, appears to have originated with Omar. Governing after the death of Mohammed under the name of the feeble Abou-Bekr, at the moment when the work of the prophet, scarcely outlined, was on the brink of dissolution, he arrested the defection of the Arab tribes, and gave the new religion its universal character. He was the Paul of Islamism. In the circle of the primitive believers, among those of Mecca who had followed the prophet to Medina, and those of Medina who had aided him, the faith was almost absolute, but if we leave this little group, which did not exceed a few thousand men, we find in all the rest of Arabia nothing but very thinly disguised incredulity. The Mussulman faith had met, among the rich and proud families of Mecca, a centre of resistance which it could not entirely overcome. The other tribes of Arabia embraced Islamism only through force, without troubling themselves about the dogmas which they had to believe, and without attaching much importance to them. Certain parts of Arabia became completely Mussulman only at the beginning of the present century through the Wahhabite movement. — The party of sincere Mussulmans found their strength in Omar; but after his assassination the opposing party triumphed by the election of Othman, nephew of Abou-Sofian, the most formidable enemy of Mohammed. The entire caliphate of Othman was a violent reaction against the friends of the prophet, who saw themselves excluded from affairs and violently persecuted. They never gained the upper hand afterward. The provinces could not endure that the little aristocracy of Medina and Mecca should arrogate to itself alone the right of electing a caliph. Ali, the true representative of the primitive tradition of Islamism, was, during his whole life, an impossible man, and his election was never seriously considered in the provinces. Persia alone espoused his cause through opposition to the Semitic spirit, and rendered to the least pagan of men a worship full of paganism. — The accession of the Ommeyads brought these tendencies into full play. This family, which had become Syrian in habits and interests, was welcomed on every side. Now the orthodoxy of the Ommeyads was greatly suspected. They drank wine, practiced the rites of paganism, cared nothing for tradition, nor for the sacred character of the friends of Mohammed. Thus is explained the astonishing spectacle of the first century of the hegira altogether occupied in exterminating the real fathers of Islamism. By all ways we arrive at this singular result, that the Mussulman movement was produced almost without religious faith. Hence the state of uncertainty in which all the dogmas of the Mussulman religion are found till the twelfth century; hence that bold philosophy openly proclaiming the sovereign rights of reason; hence the numerous sects bordering sometimes on the most open infidelity — Karmathians, Fatimites, Ismailites, Druses, Hashbishins, secret double-meaning sects, joining fanaticism to unbelief, license to enthusiasm, the boldness of the freethinker to the superstition of the devotee. It was only in the twelfth century that Islamism really triumphed over the undisciplined elements which were seething in its bosom; this it did through the advent of the Ascharite theology which was more severe in its methods, and by the violent extermination of philosophy. This philosophy presents the example of a very high culture suppressed almost in-

stantaneously and nearly forgotten by the people who created it. The caliphs of Bagdad, in the eighth and ninth centuries, had the glory of opening that brilliant series of studies which holds so large a place in the history of civilization, through the influence which it exercised on Christian Europe. The caliph Hakem in Spain renewed this noble spectacle. The taste for science and fine arts established in this favored corner of the earth a toleration of which modern times can scarcely show an example. Christians, Jews, Mussulmans, spoke the same language, chanted the same poetry, took part in the same studies. All the barriers separating men were thrown down; all labored with one accord at the common civilization. The mosques of Cordova in which students were numbered by thousands became active centres of philosophic and scientific studies. The schools of Kaïroan, of Damascus, of Bagdad, of Bassorah, of Samarcand, initiated, on their part, the Mussulmans into that liberalism of manners and thought which people deprived of political liberty often demand of high intellectual culture. — No great dogmatic idea presided at the creation of the Arab philosophy. The Arabs merely adopted the entire Greek encyclopedia such as the world accepted it toward the seventh and eighth centuries. At that time Greek science played among the Syrians, the Nabatians, the Harranians, the Sassanide Persians, a rôle very similar to that which European science played in the east during the last half century. Though developed on a traditional basis, Arabic philosophy reached, especially in the eleventh and twelfth centuries, a real originality, and the intellectual growth represented by Arabic scholars till the end of the twelfth century was superior to that of the Christian world. But it was unable to pass into institutions; theology in this direction opposed an impassable barrier to it. Mussulman philosophy always remained an amateur or a court functionary. As soon as fanaticism alarmed the sovereigns, philosophy disappeared, its manuscripts were burned by royal command, and Christians alone remembered that Islamism had had its scholars and its thinkers. Islamism revealed by this circumstance how incurably narrow its genius was. Incapable of transformation, or of admitting any element of civil or citizen life, it tore from its bosom every germ of rational culture. This fatal tendency was combated while Islamism was controlled by the Arabs, a keen and intellectual race, or by the Persians, a people very much given to speculation; but it had unlimited sway as soon as barbarians (Turks, Berbers, etc.) assumed the guidance of Islam. Then the Mussulman world entered that period of ignorant brutality from which it issued only to fall into the gloomy agony in which it is struggling before our eyes. — Mohammed invented nothing either in politics or religion. He established that unity of the nation which included all the Arab tribes, and which the aristocrats of Mecca had commenced for their own benefit. The creation of an executive council superior to the council of elders, the collection of alms destined to support pilgrims, the keeping of the keys of the Caaba, the management of the waters, and the discovery of the wells of Zervzen, had given the Coreishites an undisputed hegemony over Arabia, but the political bond was still lacking. Mohammed united the tribes in a sacred group. He proclaimed absolute equality among his disciples, and said, "My assembled believers can not err in a choice." Thus sovereignty departed from the oligarchy of the Coreishites and the assembly of the allied sheiks; it entered, by divine inspiration into the Mussulman church, into the assembly of the saints of Ismail. This was theocracy in the etymological sense of the word—the government not of priests, but of God himself. This political equality found its exercise in the election of the chief who was to lead the Mussulmans to the holy war, but it stopped there. Of all democracies this was the most disposed to settle into a military dictatorship, and besides there was no question of legislative power in this society; the law was already framed, and bound to be eternal. — When Abou Bekr appeared in the assembly to recite the prayers, after the death of Mohammed, he did not ascend the pulpit; he remained some steps lower. So did Omar and Othman. The caliphs (vice-prophets) never looked on themselves as inspired. The title emir-almouminin, which Omar took, indicated clearly what he wished to be: the prince of the faithful, the commander of the holy war. The first caliphs, however, were not distinguished from the last of the Arabs except by authority. The distinctions which then existed among the Mussulmans were altogether moral; the degree of relationship with the prophet and religious merit were the titles which determined the order of inscription in the divani (census-list of the faithful) for the division of the fruits of conquest. — The Ommeyads created a more formidable aristocracy; the divani became in their hands the list of military rewards; in return, the holders of these benefices insured them the right of succession to the caliphate. The chiefs of Islam then exchanged the democratic dictatorship of the earliest vicars of the prophet for the despotism of the kings of Persia and the exarchs of Byzantium. The Mussulman like the Roman republic perished from extension. This second Roman people could not escape the slow and invincible influences of the conquered races. Twenty years after Mohammed, Arabia was humiliated, overshadowed by the provinces; a century later, the Arab genius was almost completely extinct; Persia triumphed through the accession of the Abbassides; Arabia disappeared forever from the world's stage; and while its language was to bear civilization from Malaysia to Morocco, from Timbuctoo to Samarcand, forgotten, pressed back into its deserts, it became again what it had been in the days of Ismail. — Liberty took refuge in the colonies of Africa and Sicily, far from the

presence of the hereditary caliph, though under the menace of his Valis. The Arab colonies had elective magistrates, municipal assemblies, which decided on peace and war. This political civilization, troubled, however, by factions, by the endless anarchy of the Arab character, lasted till the invasions of the religious conquerors, the Fatimites and the Almoravides. — In Asia the inability of the Arabs to form regular armies, and the consequent introduction of Turkish guards, the concentration of all powers in the hands of the *emir el-Omra* reduced the caliphate to the most deplorable degradation. The revolt of the feudaries and the Mongol invasions filled the Mohammedan world with blood. When the power of the Osmanli Turks had absorbed all others, peace was established, and Turkey was dangerous only to Persia and Europe; but this centralization soon brought on that terrible corruption which has reduced the Ottoman empire to a state of debasement out of which no human effort can raise it. — Under the caliphate as well as under the dynasties which rose "like clouds of dust from his feet," one guarantee alone remained to the Mussulmans, the law sent down from heaven. This law, which, for the Shiites, adherents of Ali, is reduced to the Koran, includes, in addition, for the Sunnites, the traditional sayings of the prophet, collected by his intimates, the decisions of the first four caliphs and the four great Imams. The legislation of the Turkish epoch is further increased by the decisions of 200 jurisconsults assembled under Mohammed II., and by the code of Soliman. The articles of faith of Néséfi define supreme power as follows: "It is the right and the duty of the Imam to see to the observance of the precepts of the law, to enforce legal penalties, to defend the boundaries, to raise armies, to collect the tithes, to put down rebels and brigands, to preside at the public prayer of Friday and the feasts of Bairam, to judge citizens, to settle misunderstandings among subjects (rayahs), to receive legal proof in legitimate cases, to arrange the marriage of minors of both sexes who are deprived of natural guardians, and to settle the partition of lawful booty." This power is exorbitant, but it is not absolute. Even in Persia Saadi wrote: "The cadi obeys the vizier, the vizier the sultan, and the sultan the law which the people themselves obey." Some canonists deny the sultan the right of making organic laws to assure the execution of the sacred law. The latter is placed under the guardianship of judges and jurists, who form the first two orders of the Mussulman clergy, and are superior to the ministers of worship. These interpreters of the law have often obeyed the precept of the Koran: "Oppose the violation of the law," and the sheik-ul-islam has frequently been as great by his resistance as a prætorian prefect under the Roman emperors. — The public law of the east seems to have always conferred on the monarch an unlimited power over his functionaries, and in general over all who have the misfortune to approach him. Other citizens are usually safe, and in many respects freer than Europeans. This cruel law of exception originated in the condition of the ancient ministers in the east, chosen from among the slaves of the seraglio, and in the situation itself of the monarchs, strangers to everything in the realm; "first prisoners of the palace," as Montesquieu says, and servants of the hatreds of their ministers so long as their own ignorance continues, and they are incapable of mastering their rage when they discover that they have been deceived. This deplorable policy has governed all the monarchies of the east, and Islamism has changed it in no regard. — The perpetual interference of the sovereign in affairs of inheritance has caused Europeans to suppose that Mussulman princes were owners of all the real property, or that they could not maintain their luxury except by confiscations, after the manner of the first Cæsars. Other authors have solved the question in a more mystic sense, and assured us that according to the Koran the land belongs to God. The origin of Mussulman property must be found in the special code of the holy war. The ownership of lands possessed by the Arabs before the conquest, the ownership of lands abandoned by infidels and divided among believers, is as secure as the title to land can be in the west, and is transferred by sale, donation or inheritance. The Koran and the Sunna recognize, besides, complete ownership of desert lands recovered by labor. "If any man brings dead land to life," says Mohammed, "it belongs to him." In every country buildings and trees are the objects of a true and complete ownership; but it is not the same with the soil on which they stand. Entire tribes, as the Metnalis of Syria, are merely usufructuaries; the sultan in such cases is the great landed proprietor. As to the Christians, former owners of the soil, they enjoy a tenant right which is almost equivalent to ownership. Once out of Arabia and launched into the world, the Arabs would have become faithless to the holy war if they had settled down permanently. It was necessary to deprive them of the pretext. The hereditary possession of land was left to the vanquished on condition of laboring and paying tribute. Abandoned land was given by the state to new settlers. As the choice between conversion and extermination was given to idolaters, and between conversion and tribute to the "people of the book," (that is, to nations having a revelation—Christians, Jews, Sabians), the former were converted, and the latter paid tribute. This tribute included a land tax and poll tax, the ransom of their lives and the price of their personal safety. The newly converted did not enjoy immediately the same rights as their conquerors, and were treated as subjects at first. The original inhabitants were thus riveted to the soil under the supervision of the victorious army. These warriors, collectors of taxes, organized in a hierarchy, lived on domains, which were frequently extensive, and mistaken by Europeans for feudal

estates, though they were merely financial districts. But one essential thing was really wanting to make this a feudalism: property in land.— While the Arabs were the leaders of Islamism, sciences, letters, philosophy, and even arts to a certain point, were able to unite the conquerors and the conquered. But under Turkish rule all fusion became impossible. The Turks took Islamism much more seriously than the Arabs had. The prescriptions of the law and of jurisprudence against tributaries were enforced in all their rigor. The rayahs were obliged to distinguish themselves from the Osmanli by their dress, to yield them the inside of the walk, to pay the tribute without delay and with deference, under pain of "being taken by the throat and treated as enemies of God." They retained their religion, it is true, their communes, their civil laws and the right to be judged by priests of their own nation; but all the vexations which conquerors could inflict on the conquered without threatening their lives or violating the pact of settlement were heaped on the heads of the rayahs. This treatment was called *avaniah*. Such abuse of power did not prevent the aristocratic race, however, from showing many examples of probity in intercourse with men, of devotion to the country, of modest dignity and noble politeness. Strangers to arts, to sciences, and frequently to every exercise of thought, they despised those industrious nations which were unable to conquer, while the enslaved, descended from superior races, from nations which had held the sceptre of three continents, retained the consciousness of their ancient nobility, of their present activity, and gave the conquerors contempt for contempt. — Once settled in a country, the Mussulmans have always disdained to convert the inhabitants. The proselytism and fanaticism of the Turks and Berbers themselves were but a frightful revenge for the crusades and the expulsion of the Moors from Spain. The Israelites and tributary Christians have only suffered persecutions when the Mussulmans thought themselves insulted or menaced; at such times they felt the whole fury of apathetic and ignorant masters whose toleration was exhausted. It must even be admitted that this situation has become still more critical since Europe has begun to exercise a pressure upon the internal government of Turkey, and by imposing on Mussulman society reforms opposed to the spirit of Islamism, has asked it to commit suicide. The indissoluble and fatal union of religious law and the civil law is the greatest obstacle to every political innovation. The law, equal for Mussulmans alone, can regard infidels with disdainful tolerance only, and can not fill the abyss between the children of God and their enemies which divides the reprobate from the elect. — Islamism is evidently the product of an inferior, and so to speak, mediocre combination of human elements. This is why it has been a conqueror only in the middle stage of human nature. Savage races have not been able to rise to it, and, on the other hand, it has not sufficed for peoples who possessed the germs of a more vigorous civilization. Its too great simplicity has everywhere been a bar to a really fruitful development of science, of lofty poetry, of delicate morality. — If it be asked what the future of Islamism will be in presence of an essentially aggressive civilization, and destined it seems to become universal as far as may be permitted by the infinite variety of the human race, it must be confessed that nothing enables us to form precise ideas on this subject. If, on the one hand, Islamism loses, not its existence, for religions do not die, but the moral and intellectual government of an important part of the world, it will not succumb to the attacks of another religion, but to modern sciences with their modes of reasoning and criticism. On the other hand, it seems—if we consider only its dogmas and constitution—to possess in its simplicity hidden powers of resistance. It has neither popes, nor councils, nor bishops divinely instituted, nor a well defined clergy; it has never sounded the formidable abyss of infallibility. What can criticism attack? it is sometimes asked. Its legend? This legend has no more sanction than the pious beliefs which may be rejected in the bosom of Catholicism without becoming a heretic. Its dogma? Reduced to its real limits Islamism adds nothing to natural religion but the prophetic office of Mohammed and a certain conception of fatalism which is less an article of faith than a general turn of mind susceptible of proper direction. Its morals? In morals it offers the choice between four sects equally orthodox, among which the moral sense has a fair share of liberty. As to worship, when freed from accessory superstitions, it can be compared for simplicity only with some of the purest sects of Protestantism. Have we not seen in the beginning of the present century, in the very country of Mohammed, a sectary call forth the vast political and religious movement of the Wahhabites, by proclaiming that the true worship of God consists in prostration before the idea of his existence, that the invocation of any intercessor with him is an act of idolatry, and that the most meritorious act would be to raze the tombs of the prophets and destroy the mausoleums of the Imams? — Symptoms of a much graver nature are revealed at Constantinople and in Egypt. In those places the contact of science and European manners has produced a libertinism which is concealed only to avoid shocking the people. Sincere believers who feel the danger do not hide their alarm, and denounce European books of science as containing fatal errors and subversive of all religious faith. We may persist, however, in believing that if the east could succeed in overcoming its apathy, and pass the limits which to this time it has been unable to pass in the matter of rational speculation, Islamism would not oppose a very serious obstacle to the progress of the modern spirit. The absence of theological

centralization has always left Mussulman nations a certain amount of religious liberty; and Mussulman orthodoxy not being defended by a permanent autonomous body, self-recruited and self-governed, is vulnerable. But it must be confessed also that, in certain parts of the Mussulman world, in Syria for example, ignorance and fanaticism are extreme; and it can not be conceived how minds so narrow can ever be opened to a broad idea or a generous sentiment. — It is superfluous to add that, if a religious reform should appear in Islamism, Europe should not interfere except by its influence in the most general manner. It would ill become her to wish to regulate the faith of others. While propagating actively her own dogma, which is civilization, she should leave to nations the infinitely delicate task of accommodating their religious traditions to their new wants, and respect the most indefeasible right, as well of nations as individuals, that of presiding over the revolutions of their own conscience in the most perfect liberty. ERNEST RENAN.

MONARCHY. The time is past when the word republic appeared necessarily to mean liberty, and monarchy, slavery. We have no longer to learn that there are tyrannical republics and free monarchies. Consequently, the preference to be given to a republic to a monarchy, or to a monarchy to a republic, no longer appears to us with the same absolute character as to some publicists who have gone before us, and to several generations which preceded us. As soon as it is a question of men placed in very different conditions of enlightenment and virtue, of political skill, of physical circumstances and social condition, the problem becomes altogether relative. It is reduced to the single point, of knowing which of the two forms of government, in the given situation, gives better protection to the liberty of citizens and the safety of property; which is best fitted to make the country great. It is a question which the instinct of nations seems to solve more surely than political science. Not that the reasons indicated by the latter to determine one choice or another are devoid of force. But if they are separated from each other, it will be found perhaps that there is not a single one, taken alone, which is absolutely decisive. Thus, Montesquieu, when he affirms that vast territories require a monarchy, maintains what is generally true, but very far from being an absolute truth, since two examples, gigantic, so to speak, the Roman republic and the United States of America, contradict him. Neither does the species of relationship which is established between centralization and monarchy, appear to rise to the height of necessary and universal law. In addition to the contrary example of the Roman republic, it would be necessary to admit that the converse is not absolutely true, since England is at once a country of decentralization and constitutional monarchy. If with the author of *l'Esprit des lois* we lay down the principle that virtue is necessary to a republic, it may be answered with many commentators that it is necessary to all governments. And still we think that Montesquieu's view was correct, and that his thought, true when applied to aristocratic republics, becomes still truer when applied to democratic republics, which require for self maintenance a particularly large amount of energy, moderation, political capacity on the part of the people; all or very nearly all of whom are called to take part in the government. Without drawing a regular comparison between a republic and a monarchy, we may say that the republic presupposes more confidence in human nature, and the monarchy less. Monarchy itself is a precaution taken against the sum of error and evil contained in societies which it proposes to protect against the outburst of ambitious and disorderly passions. Moreover, we do not intend to make this study a plea, but an examination. We shall interrogate both publicists and facts. We shall seek for the foundation of monarchy, and under what exceedingly varied aspects it was presented to nations who adopted it, and to writers who discussed it. It is only after this attempt, purely experimental and historical, that we shall try to say what this form of government may and should be among modern nations. — *Origin of Monarchy.* It is not to be doubted that historically, royalty has its roots deeper in the past of the human race than any other form of government. Several of its partisans have gone so far as to see in it the only natural government, because one God governs the universe, and one sun illuminates our world. They have also produced examples from the animal kingdom, such as that of the bees. We attach little importance to these analogies which are sometimes puerile, and often deceptive, for it can not be clearly seen why, if bee-hives are on the side of monarchy, ant-hills, elephant troops and beavers should not be summoned in support of a republic. There is much more force in the opinion which considers that royal power finds its primitive type both in the family which admits only one chief, and in the unity of military command; that it has its origin in a superior capacity which may impose itself by force, or be accepted without effort, in case of necessity, or even obtain the sanction of a positive election. Whichever one of these origins presided at its cradle, it is by inheritance that the image of royalty is in a certain sense rounded and finished. When royalty had taken possession of nations, it was forced to abandon the temporary form which made of it, to use Aristotle's word, merely an "irremovable leadership." Thus it was able to produce those powerful dynasties of the Egyptians, Medes and Assyrians. Hereditary royalty supposes generally a state of society already formed, for example, ownership in land transmitted in families, that is to say, conditions of stability. The ideal and tradition of inheritance appears to us attached to power in virtue of the following reasons: 1, natural assimilation of authority with

property in material things, which pass from the father to the children, an assimilation which in the feudal period went so far as to confound proprietorship with sovereignty, 2, the innate desire of heads of families to transmit their dignities and the enjoyment of their powers to their children or their relatives; 3, the prestige which in the eyes of certain nations surrounds certain names consecrated by habitual respect; 4, the political fortune of other chiefs who in a certain way are grouped around and connected with the royal establishment; 5, finally, the military force aiding all these causes. It would be difficult to say what part in the establishment of hereditary royalty was taken, in those remote ages, by social foresight, which finds in the permanence of supreme authority, in the bosom of a single family, a guarantee of good order, to such a degree that this consideration at last appears as the most decisive argument in favor of the monarchic form. It must not be supposed, moreover, that the idea of divine right, which has played so great a part in the history of royalty and which is held in such high esteem by certain modern apologists of this form of government, was foreign to the formation of hereditary royalty in those remote ages. The theory may be new enough; the idea is very old. Not only did it not await Bossuet, and de Bonald, but it was far earlier than the anointing of Pepin and of Charlemagne, as well as the benefit which their successors were to draw from it. As far back as we go, we find that religion surrounds the cradle of royalty with a mystic halo. The kings of Homer descended from gods or demigods, and are the objects of a sort of religious veneration. The same was the case with the kings of Rome. Many barbarous peoples appeared convinced that the families of their kings were descended from the families of their gods. Odin passed as the father of an entire royal race. Without doubt other governments besides those of royalty have placed themselves under the cover of religion. If Numa pretended to be inspired by the nymph Egeria, Lycurgus laid claim to be inspired by the oracles, and Solon had his laws consecrated by the Delphian Sibyl. But if this applies to all legislators, it is true, in a still higher degree, of royalty, whose age, which seems lost in the dimness of the past, and whose perpetuity, which seems to repeat eternity itself upon earth, render it peculiarly venerable. In every land, therefore, the belief appears that kings are the images of gods or of God upon the earth. This is not a purely Christian but a universal idea, and old as the world. — Among the origins as well as among the conceptions of royalty, we shall not omit that in virtue of which the king appears as the living law, as the very personification of the state, which is an advance of the same idea, as the image itself of the sovereign people. All nations have beheld in the sovereign the living law, but the idea of seeing in him a delegate and a representative of the sovereignty of the people is a Roman idea. It is the theory of the imperial monarchy which jurists applied to the monarchy of France, and which several publicists have repeated. "The Abbe Dubos," writes Montesquieu, who opposed his system, (*Esprit de lois*, book xxx., chap. xxiv.), "wishes to remove every kind of idea that the Franks entered Gaul as conquerors. According to him, French kings merely put themselves in the place and succeeded to the rights of the Roman emperors."—It is evident that the temptation to base the legitimacy of the monarchy on one or another of these origins has exercised a mighty influence on writers occupied theoretically with royalty, and especially with modern royalty. Some have insisted on its characteristics of antiquity and hereditariness. They held that what was oldest in power was necessarily the most legitimate. Others dwelt upon what they called its divine character. Still others, remembering the royalty of barbarous times, were especially struck by the fact of election. Beginning with the sixteenth century, a period in which the doctrine of the sovereignty of the people appeared most prominently in speculative and even in active politics with the Protestants and members of the league, there is an entire class of minds for which popular election becomes the title itself of legitimacy and the only foundation of royal power. An entire collection of books might be cited which testify to the predominance of this theory. The "Treatise on Political Power," by John Poynet, bishop of Winchester; *De Jure regni apud Scotas*, by George Buchanan; the *Franco-Gallia* of the jurisconsult, Hotman; the *Vindiciæ contra tyrannos* of Hubert Languet, and so many other Protestant works which found an echo among the Catholic publicists and preachers in their struggle against Henry III., exhibit this thought most clearly: that election is the original and real title to royalty, and that the sovereignty of the people, from which it emanates, may withdraw the powers granted and crush wicked princes. Whatever may have been the interest of these controversies about the origin of royalty and the historical basis which gives it legitimacy, we think there is no value in their common claim of establishing the legitimacy of the monarchic order which has its real title in its necessity. National sovereignty, beyond a doubt, has the right to rise up and depose kings and reigning families. But national sovereignty itself has no power over what is good, just, proper and expedient according to places and times. It has no power over the nature of things. It must come to an agreement with good sense, reason, justice, experience, the laws of necessity. Otherwise it will build upon sand. It can no more give life to an impossible republic than it can give morality and usefulness to a tyrannical monarchy. Above election, as well as above the right of succession, there is a certain thing, the necessity of a power strong enough to protect society against the conflict of discordant forces, and to which unity is indispensable in order to make itself promptly and surely obeyed. When monarchy renders

this service, and renders it better than any other form could, its legitimacy is beyond a doubt. What is more legitimate than a power, the necessary protector and depository of public order, of general justice, of public interest? What is more legitimate than a great magistracy, the centre and connecting bond of society? Now, these are the features under which "modern royalty has appeared to the eyes of nations," and through which it "has acquired their power by obtaining their adhesion." — Criticism has rendered such complete justice to the legitimacy of a monarchy founded on divine right, a theory by which the pretension is raised of making power the inalienable property of a royal race, said to have received it from the hands of God himself, that there is no need of dwelling on it here. Besides, history shows that the claim of divine right has never saved a dynasty. Let royal families proclaim that they reign *by the grace of God*, as well as by the will of the people, there is no exception to be taken to this, as soon as it is understood that there is not a single form of government which can not place itself under the words: *Omnis potestas a Deo*. All power not issued from brute force contains a divine element; this element is justice. In this sense and from this point of view it is sacred. It ceases to be sacred only in becoming unjust and oppressive. "God," writes Pufendorf, "who certainly wishes that men should practice the moral law, has commanded the human race, through the lights of reason, to establish civil society, and, consequently, a sovereign power which is the soul of that society. In other words, he wishes an end without indicating at the same time the necessary means to arrive at it." In this sense, just power representing justice is divine, as the objects of men and of society are themselves divine. But if the end is immutable, the means are changing and various. It is of small import that a family was necessary at a certain time in history, or even during a succession of centuries, if it is no longer needed, if it is merely the worn-out instrument of accomplished designs. De Maistre himself, such a resolute partisan of legitimacy, seems to recognize this in the following significant passage in one of his letters: "If the house of Bourbon is finally proscribed, (de Maistre means by God and not by the people), it is well that the government should be consolidated in France; it is well that a new race should commence a legitimate succession; whether it is this or that race is of no importance to the universe." — In conclusion: reigning families, like royalty itself, draw their origin from that force of things which is made up of circumstances above the will and purely free choice of nations. Kings are not chosen by chance. The reasons which elevated in turn the Merovingians and the Capetians in France were not arbitrary. Later, when age has consecrated a family, it is not easy to supplant it. A people does not invent its dynasties, it finds them. — *Forms and Various Kinds of Monarchies.* The classification of the various forms in which a monarchy may appear has sensibly varied with publicists who wrote on this subject. Each one of them has had its partisans and its detractors. Aristotle, who first applied an analytical genius to the accurate observation and strict classification of governments, placed royalty among the good governments, though he preferred, as did almost all the political writers of antiquity, and Plato, his master, aristocracy, on which he founds the perfect city. He recognizes five kinds of royalty. ("Politics," book iii., chap. ix.) The first kind, whose type is presented to him by the Spartan royalty, appears to be, he says, the most legal; it is not absolute mistress. It may be sometimes hereditary and sometimes elective. The second species is the royalty established among certain barbarous nations, especially Asiatics, with the characteristics of absolute power, though legitimate and hereditary. The third kind of royalty is an elective tyranny, for a term of years or for life, of which the ancient Greeks offer us more than one example. "A fourth kind of royalty," continues Aristotle, "is that of heroic times, accepted by the citizens and hereditary by law. The founders of these monarchies, benefactors of nations, either by enlightening them through the arts, or in guiding them to victory, by uniting them or winning for them permanent states, were called kings out of gratitude, and transmitted their power to their sons. These kings had supreme command in war, and offered all the sacrifices in which the ministry of the pontiffs was not indispensable; besides these two prerogatives, they were sovereign judges of all disputes, sometimes without oath, and sometimes with. The formula of the oath consisted in lifting the sceptre." There is finally a fifth kind of royalty, where a single chief is master of all. "This royalty has intimate relations with family power; as the authority of the father is a sort of royalty over the family, so the royalty of which we speak here is an administration of the family type applied to a city, or to one or more nations." Aristotle declared that he would stop to examine this last form; in it he recognized the pure image of monarchy, finding, like Hobbes (*Imperium*, chap. vii.), of a later time, no real royalty except absolute royalty. The Greek philosopher found no difficulty in condemning this form of government after such an examination, although he supposes the monarch to whom this power is given to be as virtuous as enlightened. He proves the superiority of fixed equal, impartial laws, over the arbitrary will of a single man; he claims for the majority, even when composed of individuals inferior to that eminent individual, the honor of a greater safety in judgments and superior incorruptibility. The great political philosopher might, and even should, it would seem, not have neglected to discover whether royalty was by nature incompatible with that fixity of laws and those guarantees of liberty which he desires above all. The example of the constitution of Sparta

put him upon the way to do this. Why did he, in mentioning it with praise, not stop to analyze it? Besides, did Aristotle understand clearly the conditions of monarchy—he who, in order to put forward the elective system, absolutely condemned hereditary power, which he thought offered but few chances of bringing to the succession men worthy of the virtuous monarch, and capable of reigning after him? Experience, which the profound author of "Politics" habitually takes as guide, does not confirm this preference given to the elective monarchy. Is it not enough to recall that the elective system, applied to royalty in the Roman empire, and later in the kingdom of Poland, produced internal dissensions and degradation of the state? Is it not enough to recall the fatal events in unfortunate Poland, fatal to its nationality, in order to pronounce aloud its condemnation? Rousseau, who violently opposed hereditary royalty in the *Contrat social*, believed that he corrected the ordinary drawbacks of monarchic election in Poland, by proposing a drawing by lot among the life senators, of three names, from which the same assembly should choose the one they preferred, without adjourning the session. (*Gouvernement de Pologne*, chap. xiv.) It is more than doubtful whether such a means, which would have put all the chances on the side of mediocrity, would have succeeded in suppressing the defects of a system which it professed to correct. This strange mixture of chance and election would have succeeded only in creating a royalty of chance, without prestige and without permanence. — Machiavelli has not tried to classify different kinds of royalty, but the different species of *principalities*, a more extensive subject, since he includes even ecclesiastical principalities. He seems, besides, to pay more attention to distinguishing them by the means which were used to found them, than by their intrinsic characters. The author of "The Prince" treats in a special manner civil principalities, that is, those which are based upon the free suffrage of their citizens. This is the kind of monarchy which he prefers. The advice he gives such principalities bears the stamp of a remarkable elevation of character, and proves that the evil maxims, which he nowhere presents as the beau ideal of politics, but which he has the fault to give out with the culpable coldness of a man who subjects morality to politics, are addressed only to those who have become masters of sovereignty by treason and crime. Chapter ix. of "The Prince" is devoted to describing the duties of the monarch who has arrived at power through the free choice of his subjects. For Machiavelli, consequently, there are two kinds of royalty, independent of usurpation. In one case the nobility call a man to supreme power in order to resist the people; in the other, the people wish to have a protector against the insolence and the tyranny of the nobles. He prefers the last; but in the first as in the second case, he wishes the monarch to take up the cause of national interests, and set up, for this purpose, his sole and sovereign will. In reality, the power of the state is the constant thought of Machiavelli, his only idol is the unity of the nation rising above the ruins of anarchic forces. — A disciple of Aristotle, in many points, Bodin did not follow his master in his method of classifying the different forms of royalty, and however inferior he may be to him in genius, it may be said that on this point, as on several others, he is superior to him. Bodin distinguishes three forms of monarchy, ("Republic," book xi.): first, the monarchy of lordship, in which, he says, "the prince has become master of property and person, by the right of arms, and governs his subjects as the father of a family governs his slaves"; secondly, the tyrannical monarchy, "in which the monarch, disregarding the laws of nature, treats free persons as slaves, and the property of his subjects as his own"; thirdly, the royal or legitimate monarchy, "in which the subjects obey the laws of the monarch, and the monarch the laws of nature, *natural liberty and rights of property remaining with the subjects.*" This last trait, brought forward and discussed by John Bodin in twenty passages of the "Republic," shows in the happiest manner the characteristics or at least the conditions of modern monarchy. He recognizes it as legitimate, only on condition of becoming reconciled with the rights of liberty and property, and guaranteeing them. What a distance between this liberal theory and that which was current under Louis XIV. and Louis XV., which claims that kings are the owners of all property, the mere use of which is enjoyed by the subjects, through a sort of toleration or concession altogether voluntary! Bodin opposes the conception of a *mixed* monarchy brought forward by several publicists and particularly by Hotman, who stated that the best government is that which "associates and tempers the three elements, royalty, aristocracy and democracy." Sovereignty, according to the author of the "Republic," endures neither division nor limit. He attacks, therefore, in very precise terms, "*this sovereignty played for by two parties, of which sometimes the people and sometimes the prince would be master, which is a striking absurdity, incompatible with absolute sovereignty, and contrary to the laws and to natural reason.*" Bodin, nevertheless, is really a partisan of limited monarchy; he trusts in the barrier of parliaments, as well as the virtue of the prince in the exercise of his power; but he is ignorant of that which has been sought for so much since his time under the name of constitutional guarantees. In the last analysis Bodin depends on morality to moderate royalty; as Bossuet, at a later time, depended on religion. — It is surprising that Montesquieu, coming after Aristotle and the learned author of the "Republic," did not seek to establish any strict classification of the different forms of monarchy. Perhaps he was turned away from this by the error which he committed

in making despotism a government apart. He would have been obliged to classify despotism with monarchy, as a form of its abuse, and he would have then been obliged to renounce his classification of three governments which he gives as original· the republican, the monarchic and the despotic. But Montesquieu recognized a monarchy which he said had liberty as its direct object: that is, the English monarchy, and monarchies which "tend only to the glory of the citizens, the state, and the prince," (*Esprit des lois*, book xi., chap. vii.)—a somewhat vague statement. He explains exhaustively *why the ancients had no very clear idea of monarchy*. it is even the title of one of his chapters. "The ancients," he says (*Esprit des lois*, book xi.), "were not acquainted with the form of government founded on a legislative body made up of the representatives of a nation." And further on: "The ancients, who were unacquainted with the distribution of the three powers in the government of a single one, could not form a correct idea of monarchy." Thus, with Montesquieu, monarchy is moderate government *par excellence*. — If we combine the ideas put forth by the political writers just examined, and if we understand the spirit of what we see or of what exists to-day in monarchy, its different forms may be classed, we think, much more simply according to their fundamental characters. Doubtless there is, to begin with, a great and essential difference between elective monarchy and hereditary royalty. But this distinction would be too insufficient. The most essential would be that which recognizes two kinds of monarchies, absolute and limited monarchy. Absolute monarchy is not necessarily despotism (see ABSOLUTISM), but leads to it. We shall not, of course, for instance, commit the injustice of comparing the ancient French monarchy with an oriental despotism. Still, it is impossible for us to grant that before 1789 French monarchy was anything but absolute. Tempered in fact, that we admit, by parliaments, by the barrier of opinion, by tradition, by various powers which grew up at its side, French royalty was nevertheless absolute legally, because it was able to silence with a word all resistance, which it did more than once. The essence of absolute monarchy lies entirely in the more or less complete concentration of the three powers, executive, legislative and judicial, in the hands of the prince. The moderate monarchy is that which finds its limits in the distinction of these three powers, sanctioned by a positive constitution, and in the establishment of one or more bodies with rights apart from the monarch. Hence, moderate monarchy really appears only among representative governments. Whether it finds its limit in the aristocracy, in a democracy, or in a combination of both, it deserves to be called moderate, and may for this reason subserve liberty. — *The Marks and Part of Monarchy among Modern Nations.* Several important consequences follow, it appears to us, from the considerations which we have presented: it follows that monarchy can no longer, under the protection of a pretended divine right, be the object of a kind of superstitious worship, whatever may be the prestige inseparable from the exercise of sovereign power and royal personages; it follows also that force is not the only origin of royal power, and that it would be unwelcome in presenting itself at present as the title of monarchy in view of the universally admitted right of nations to dispose of themselves; finally, it follows that election, which does not create eternal legitimacy, is not a sufficient title to invest sovereigns with an absolute power, since there are, above the right of the people as well as above the right of the king, original rights, which we have reduced to two, the liberty of the citizen and the security of property. Order in a civilized society is synonymous with the maintenance of justice, which enforces the liberty of all, and makes one man respect the liberty of the other. Nations seek in monarchy a defense against the anarchy or the oppression which surrenders the weak to the strong. Monarchies, therefore, follow in their way, which, in a certain number of cases, is the best, the same end as republics and other governments of every class, which is to permit and assure the free development of all useful action, and to confine evil within the narrowest limits without curtailing legitimate and fruitful liberty. This, to our thinking, is the sense of the maxim, already old, that "Kings are made for the people"; a maxim which requires other guarantees than the purely moral obligation, imposed by duty on Christian princes, as Bossuet thought; a maxim which seeks its sanction in an organization of power, intended to make royalty a simple means of the public good. Between monarchy and peoples no other tie is conceivable than that which may be called an alliance of reason. Not that this tie should be devoid of affection, not that it should be necessarily reduced to the cold and formal relations between the sovereign and the nation, dictated by simple expediency, but it can no longer have its origin in a species of chivalric devotion. The only legitimacy of governments is the general interest. The only organ which gives expression to this interest is the national sovereignty. When the latter accepts the monarchic form, it does not intend to abdicate; it only wishes to regulate itself. It arms itself, so to speak, with precaution against its own errors, it condemns itself to prudence by foresight; it places a barrier before the disorder which it fears. No more, no less. — Notwithstanding this character of modern royalty, quite rational and subordinate to public utility, there are publicists who declare monarchy to be illegitimate in itself, we do not say merely, be it noted, who declare it fatal in its consequences, open to attack as a wrong combination, from which evil alone can come, but who declare that it is contrary of itself to justice, to law, and to reason. It is not long since we heard it maintained in the press and from the tribune that a republic is the only legitimate

form of government, while monarchy, even when accepted, can never be legitimate, because a people can not establish it, without alienating its will and disposing of future generations without having the right to do so. Such, in substance, is the creed of that school of which Rousseau is the mouthpiece and which goes further than its master, for Rousseau recognized, although with regret, that monarchy is fitted for certain nations. It appears to us that the most scrupulous devotion to the dogma of popular sovereignty and even the preference given republicanism do not imply such consequences. A nation does not surrender its will by establishing a monarchy for the sake of order, liberty, and national unity. It is a singular paradox to maintain that the national will is not expressed quite as clearly in allowing a form of government to continue, as by overthrowing it, quite as well by persistence as by caprices. Why should not a people wish, if it judges proper, to retain the monarchic form, one century, ten centuries, for all time? In what are the present generations of men slaves to those who established it? Is it sought to be denied that there are legitimate revolutions? Let us acknowledge the fact: the right of resistance is eternally implied in all the constitutions of this world. There have been glorious insurrections, there have been revolutions with which are connected the most beautiful memories of the human race. All peoples have placed some of these fearful and salutary crises among the greatest events of their history, and those who introduced and directed them in the number of their greatest men. All have dated from them their political regeneration, and a new era of prosperity and greatness. But wisdom forbids the declaration of a permanent revolution under pretext of national sovereignty. It forbids us to consider this necessary evil as a harmless expedient. It forbids fickle desires and an adventurous imagination, which end by creating a sickly want that is never weary of appealing to the emotions and to chance. The risk in revolutions is really terrible. If men do not issue from them more worthy and more noble, they become more degraded. If moral and political beliefs do not receive new life from them, they give way. If interests are not strengthened by them, they lose by them. Revolutions destroy the countries which they do not save. This is why it is wisdom in nations to detest and avoid revolutions, consenting to them only in cases of the most absolute necessity. The argument that monarchy is equivalent to an abdication of national sovereignty, can not bear serious criticism. — Publicists of the too exclusively republican school find hereditary monarchy to be an odious fiction, incompatible with the reason of modern nations, because it gives rights to mediocrity, stupidity, vice, and even crime. They maintain that heredity not only permits such an evil, but that it produces it by the corruption which is fatally connected with young princes. One would think they were commenting on the saying of the young Denys, to whom his father, while reproaching him for some shameful act, said: "Have I given you the example of such deeds?" "Ah!" answered the son, "your father was not a king." — Monarchic publicists, obliged now to address not feeling, but reason, do not deny these drawbacks of heredity. They do not injure their cause by attributing to the institution which they defend more perfection than it possesses, or than is compatible with human weakness They answer: Yes, heredity is a fiction, a convention; it has immense drawbacks, but what if it has greater advantages? Is not the existence of a family having the tradition of power a good thing? Charlemagne, Saint Louis, Henry IV. and many others were legitimate heirs. May not the existence of mediocre princes even have its advantages, either because they leave the government to able ministers, or liberty takes advantage of them to extend its conquests and strengthen its rights? — Hereditary royalty is the image and the consecration of perennial power. This is its object. Now, duration is one of the first elements of force. Only that is loved and feared which has a lengthened existence. The right of monarchical succession does away with the dangerous intervals left by election, and it has the inestimable advantage of withdrawing from elections this element of permanence which should be presented by the institutions of a great country. It gives, to home and foreign politics, that coherence and continuity, that mixture of strength and prudence, the condition of all greatness and repose, which republics produce only with much greater effort, whenever they do succeed in producing them. Finally, continue the defenders of monarchy, is it just, is it honest, to speak of the right of succession under constitutional governments in the same way as under absolute governments? Is it not the very object of constitutional governments to prevent bad princes from doing evil, to support the mediocre, to obtain as much as possible from the good, to prevent the greatest from becoming so powerful as to put themselves above the law? Doubtless there remain the drawbacks connected with minorities and regencies, but these are passing evils, and not of frequent occurrence. Constitutional governments, which create great powers by the side of royalty, thereby diminish the dangers to minorities so much to be feared under absolute monarchies. It is the merit of this form of government to endure, that royal authority should not have at all times the the same degree of intensity and energy. And, most important, it presents no breaks, and its ever present image is a barrier against anarchy and the claims of usurpers. To close the argument of the right of succession, sometimes add the partisans of the monarchic form, would not another consideration have weight which has never had more effect than in our day? Is not hereditary royalty, up to a certain point, the consecration and the safeguard of other hereditary rights still more sacred, that of the transmis-

sion of property for example? You speak in a tone of irony while pointing out a child subject to the most humiliating infirmities of nature: "There is a king!" Are you not afraid that others will appear, saying with the same contempt: "See that wailing child; that is a landlord!" — We have endeavored to sum up the arguments of monarchic publicists in their most striking and correct passages, dwelling only upon those which agree with the nature and conditions of modern society. We shall now indicate how the rôle of monarchy may and should be conceived in this society. — The royal power appears with two necessary characteristics in the new conditions created for European societies by the liberal spirit and the ascending movement of democracy: it should be limited and restraining. Neither powerful enough to pass its bounds, nor so disarmed as not to be able to accomplish its mission efficiently: such should it be and remain under pain of inevitable forfeiture. — There is no need of stopping for any length of time to show that monarchic power should be limited, and that it can not be otherwise than limited. The paternal monarchy of de Bonald is only a dream. Benjamin Constant, an almost contemporaneous publicist, stated very justly, "The direct action of the monarch decreases inevitably in proportion to the progress of civilization. Many things which we admire and which seem very beautiful in other epochs, are inadmissible now. If you imagine the kings of France dispensing justice to their subjects, at the foot of an oak tree, you will be moved by the spectacle, and you will revere this lofty and simple exercise of a paternal authority; but what would be seen to-day in a judgment given by a king without the assistance of tribunals? The violation of every principle, the confusion of all powers, the destruction of judicial independence." (*Du Pouvoir royal*, vol. i., p. 295, edition Laboulaye.) Another reason will prevent modern nations from yielding to absolute monarchy, and this reason is supported by experience. Centuries ago experience condemned simple governments through the mouth of Polybius, though he was far from possessing the numerous and terrible proofs of the dangers inherent in them which are at our disposal. It is a maxim of Polybius, that "every simple form based on a single principle, can not last, because it will soon fall into the defect which is peculiar to it." (Polybius, book vi., § 10, phrase cited by Barthelemy Saint-Hilaire in the preface of the "Politics" of Aristotle, p. 115.) The theory of checks and balances sanctioned by the great names of Plato, Aristotle, Polybius and Cicero, and supported by the practice of some of the greatest constitutions of antiquity, gains force from the nature of modern societies which are so complicated in their elements. Of course there is no perfect equilibrium in a state; a system of checks and balances always meets serious difficulties in application; but it is necessary to tend toward this system, or be condemned to the excesses of a single power, whether of a king, aristocratic clique, assembly, or popular dictatorship; this is an insupportable tyranny, after eighteen centuries of Christianity have shown us the limits of the state, and several centuries of philosophy have made us proud and exacting in regard to our rights, when also the habit of individual and political liberty has made the latter dear to us in proportion to the benefits which it is intended to secure. — Limited or constitutional monarchy was the desire of France as soon as she reflected on her destiny. This must be recognized as an historical fact, even when one's preferences seem to settle on the republican form. As soon as the notion of right is disseminated in a nation, as soon as its interests are multiplied and increased, the need of escaping from the absolute power of a single man and a single family, this need which has always exercised the upper class, descends from the aristocracy to the masses; and as the former demand privileges, the latter want liberties, with this difference, that a nobility may sell itself to royal power, while a nation does not yield itself up, at least for a long time. It is said, of course, that the assistance formerly given by royalty to the middle and lower classes against feudal oppression, that the admission of men of common birth to the highest civil and military dignities, reached such a point under the ancient monarchy that the duke de Saint-Simon characterized the reign of Louis XIV. as a reign of *vile bourgeoisie*, have themselves contributed to favor the establishment of absolute power. This can not be disputed; but how can it be disputed either that everything which increased the classes devoted to the professions called liberal or to industrial labor tended to liberate them? The more the feeling of their value was developed, the more considerable and prevalent became their attention to their affairs, the less were they tempted to yield their persons, their labor and their property to the oppressive action or to the capricious direction of arbitrary power.* If, from the fifteenth century, a Philip de Comynes was able to proclaim the principle, that "neither the king nor any one else has the power to levy taxes without the consent of his subjects"; if these positive maxims, which even then were not new, could be transmitted in the writings of publicists and in the documents of states; what must it have been in the eighteenth century, after an immense development of industry and enlightenment, and in view of a neighboring nation whose tempting example gave brilliant proof that the monarchic power might be limited without prejudice to order and to the great advantage of public liberty and general prosperity? In allowing the monarchy to remain, the revolu-

* "Arbitrary power," writes Benjamin Constant, "exercised either in the name of one or of all, pursues man through all his forms of repose and happiness." (*De l'Esprit de conquête et de l'Usurpation*, chap. xi.) See the following chapter of the same work on the effects of arbitrary power on morals, intelligence and industry.

tion of 1789 could only allow it tempered or limited in its powers, since it did not admit it for its own sake, but for its supposed service to national unity, liberty and order. And this was not the effect of a passing excitement. It was the fruit of long mental labor, and was the object of persevering and inflexible will. Even in 1804, when France, weary of the anarchy which had harassed her, took refuge in the arms of military power, surrounded with the most brilliant prestige of genius and glory, she stated, while doing so, what sort of a monarchy she wished to establish by raising a new family to the throne. "France," said the tribunate, from which originated the proposition to raise the first consul to the throne, "France is justified in expecting from the family of Bonaparte, more than from any other, the maintenance of the rights and the liberty of the people and all the institutions fitted to guarantee them." "The French have conquered liberty," said the senate in its message of May 4, 1804, in adopting this proposition; "they wish to preserve their conquest, they wish repose after victory. This glorious repose they would owe to the hereditary government of one who, raised above all, defends public liberty, maintains equality, and lowers his fasces before the sovereign will of the people which proclaimed him." This is the government which the French nation wished to give itself in the days of '89, the souvenir of which will be ever dear to patriots, and in which the experience of centuries and the experience of statesmen inspired the representatives which the nation had chosen. It is necessary that liberty and equality should be sacred, that the social pact should be safe from violation, that the sovereignty of the people should never be misunderstood, and that a nation should never be forced to resume its power and avenge its outraged majesty. The senate, in a memoir which it appended to this message, dwelt upon the dispositions which according to it seemed proper to give French institutions "the necessary force to guarantee the nation its dearest rights, while securing the independence of the great authorities, a free and intelligent grant of taxation, safety of property, individual liberty, liberty of the press and of elections, responsibility of ministers, and inviolability of constitutional laws." Ten years had not passed before these demands reappeared; they became the rallying cry of all France, which imposed them as a condition *sine quâ non* on all its governments. The first restoration, the hundred days, the second restoration, the eighteen years of the government of July, 1830, were attempts to satisfy these persistent demands; and if they have appeared to suffer some interruption on the morrow of revolutions, which profoundly disturbed minds as well as events, it was only to resume at once their career with a daily increasing force. We do not speak here of the second empire, whose constitutional changes are so near us, and therefore can not be discussed with the impartiality of history. — The necessity of a moderating power is a second truth, which seems little open to question. Let us not forget that the object to be attained is always this: not to allow the establishment of tyranny, neither the tyranny of an oppressive majority nor that of a minority, neither one in the name of a democracy nor one in the name of an aristocracy. Place all power in a single assembly, and experience shows the perils of this combination, which delivers, without guarantee, the rights of citizens to a power without check. If the assembly is dissolved, to what dangers are not liberty and order subject during the interval which separates this assembly from that which is to follow! If the assembly is excessively long-lived, what a number of other perils in case public opinion does not go with it! Place power in two assemblies, how are you to prevent a conflict between them from becoming envenomed and bringing on revolutions? How are you to hope that an executive power, itself very liable to change, and dependent as the ministerial power, would have sufficient authority? The necessity of a moderating power is such that republican states themselves do not always neglect to form it. Doubtless it is very weak in the United States. It is nevertheless true that the president is armed with a veto power. This veto, at least, forces the legislature to reconsider the question, and this time it can prevail only by a majority of two thirds. The veto, besides, is a sort of appeal to the people. The executive power then pleads its case and presents the reasons for its action. Besides this precaution, to which he refers, de Tocqueville points out, in the federal organization of the United States and in a peculiar combination of moral and political circumstances, the causes which serve, though imperfectly, as a counterpoise to the tyranny of the majority. The necessity of a moderating power appears still more urgent in a greatly centralized government. It is not enough to answer all difficulties by the sovereignty of the people. The people are not always assembled; do not govern directly. Even when it is admitted that the sovereignty resides in the nation, all difficulties are not settled by that answer. Powers are various, and from their diversity arises struggle. The great task of royalty in the eyes of modern nations is to prevent these struggles of powers and parties from degenerating into disorder and revolution. This is why representative governments leave an important share of power to royalty, while reserving the last word to the nation, which in grave questions pronounces by means of elections, and which divides political power. It is not true, then, that in making royalty chiefly a moderating power, its fall is proclaimed. On the contrary, much force is necessary to fill such a rôle. This neutral power, elevated above accidents and struggles, interfering only in great crises, at least in a visible and striking manner, should have lofty prerogatives. The first of these is to execute the law. But that is not enough unless there be added the power of co-operation

in framing it. The monarch does this by appointing one of the two legislative chambers; such at least is the order established by the different French constitutions; he co-operates by the appointment of ministers, who represent him in the chambers; he co-operates by the right of proposing the law, dissolving the elective chamber, or refusing his sanction. This right of absolute and not simply a retarding veto, has inspired one of the most remarkable discourses of a genius so profoundly political as Mirabeau. He was not afraid to surrender liberty in maintaining it. He thought that in spite of appearances liberty would gain by it, as well as the force necessary to the royal power. The same opinion was upheld by a no less jealous adherent of public liberties, Benjamin Constant. The participation of the monarchic power in the framing of laws is, in the eyes of this celebrated publicist, an essential part of this rôle of moderator which occupies us at present. "If," says he, "in dividing power you place no limits to legislative authority, it happens that one class of men make the laws without troubling themselves about the evil which they cause, and another class execute these laws while believing themselves innocent of the evil which they cause, since they did not contribute to make them. * * When the prince assists in framing the laws and his consent is necessary, their vices never increase to the same degree as when the representative bodies decide without appeal. The prince and the minister are enlightened by experience. When they are not guided by the feeling of right, they will be by the knowledge of what may come to pass. The legislative power, on the contrary, never comes in contact with experience. The impossible never exists for it. It only needs to will; another authority executes. Now, to will is always possible: to execute is not." (*Esquisse de Constitution*, chap. ii.: *Des Prérogatives royales*, p 183, Laboulaye.) The same writer afterward establishes that a power obliged to give its support to a law which it disapproves, soon finds itself without force or consideration; and that besides no power executes a law zealously which it disapproves; that the royal sanction aids free governments in preserving themselves from the danger of multiplying laws, which is the disease of representative states, because in these states everything is done by law, while the absence of laws is the disease of unlimited monarchies, because in them everything is done by men. — All publicists, as well as all constitutions, add to the prerogatives inseparable from monarchy the most touching and the most popular of all rights, the right of pardon. The right to make war, to conclude treaties of peace and alliance, are naturally connected with the executive power. This right, besides, is generally limited by discussions of the chambers, by the power which they have of voting taxes, and in a parliamentary government by ministerial responsibility. Up to recent times, this responsibility of ministers to the assemblies appeared to the legislator as one of the most essential conditions of a free government. He had thought that in representative monarchies the irresponsibility of a monarch is a consequence of his inviolability, and important both to liberty and public order. If the monarch is responsible, it was said, what is the use of the right of succession? Is not his moderating power destroyed? Royalty becomes a party. It descends into the arena. It is no longer a judge and arbitrator in the combat. It is exposed to all the chances of the struggle, the end of which may be an overthrow. Besides, it is added, to whom is the monarch responsible? To public opinion? But what absolute prince is not? To revolutions? But what sovereign of the east is not? Is there the slightest difference between such a responsibility and the irresponsibility of former sovereigns? — We do not intend to trace in full the programme of a monarchy which might suit modern nations, for this does not enter into our subject. It was enough to indicate its essential traits in a work intended to place before the eyes of the public the elements of politics. We have merely undertaken to show once more that if there is a monarchy founded on prejudice, there is one which rests on reason and which is capable of bearing examination. For a still stronger reason we shall not discuss the assertion, so often put forth, that representative monarchies are merely compromises between principles long at variance—compromises destined to disappear one after another, and give way, with the exclusive triumph of democracy, to the universal establishment of the republican form. Now we have either shown nothing, or we have shown that republics themselves, if they are to exist, can not dispense with certain limitations, and that a people has not fewer precautions to take against the excesses of democracy than against those of any other principle. Otherwise there would be no stop on the incline till the direct government of the people by itself was reached; the tyranny of numbers would be introduced in the name of popular sovereignty. Who knows the secret of the future? If European nations should arrive at such a degree of political maturity as to solve, under the republican form, better than has hitherto been done, the difficult problem of reconciling order with liberty, who could regret it? The great question before us is, not whether the future will be called republican or monarchic, but whether it will be free. (See ABDICATION, ABSOLUTISM.)

HENRI BAUDRILLART.

MONEY AND ITS SUBSTITUTES. After the discovery of gold in California, and before the government had established a mint there, private parties manufactured coins of the weight and fineness of American gold coin, and even of subdivisions as low as twenty-five cents. These were not counterfeit, the inscriptions upon them being different from those upon the coins manufactured by the government. They denoted ex-

pressly that they were made by private individuals; and, being so, they were, of course, not legal tender. Yet, as they contained the same amount of gold as the government coins, and as the public had confidence that the makers would not cheat by putting in a less quantity, they passed as readily as the money coined by the government, and were in fact worth as much, not merely in California, but in every part of the world. Prior to the issuing of these coins, the California miners and merchants conducted their exchanges by means of "dust"; that is, gold in the form in which it was found in the *placer* diggings and river washings. This gold passed from hand to hand by weight or by guess-work. A sack of flour was worth so many grains, a barrel of sugar so many, a quarter of beef so many, a pair of boots so many, etc. Obviously, it was a great convenience to dispense with the trouble of weighing gold every time a man wished to buy or sell anything. The government was a long way off, and busy about other things, and knew little of its newly acquired possessions on the Pacific. It had received as yet but slight information of the needs of the settlers. It allowed them to go their own way, and do pretty much as they pleased; and, in fact, no harm resulted from this private coinage. Whenever a want arises in human society, somebody will come forward to supply it. California wanted coins to take the place of "dust"; private individuals got the necessary machinery together, and established a shop to manufacture coins. They naturally adopted the forms and weights to which the public were accustomed. If California had been an English colony, they would have adopted the form and weight of English coins; if French, they would have taken those peculiar to that nation. But, in fact, the forms and subdivisions of the metal were of no importance to the value of the coins: this depended wholly upon the weight and fineness of the substance coined. In due time the government set up its own mint in California, and the private coiners disappeared because there was no further use for them.—Now, it is a perfectly scientific use of terms to call these early California coins and dust packages "money"; and the illustration serves our present purpose as well as a hundred examples which might be drawn from the pages of ancient history. The literature of the subject is overwhelming in extent and variety; but reading the whole of it would give no clearer idea of what money is, in the scientific sense, than observing the successive processes by which the isolated settlers of California carried on their exchanges with each other: first, dust; second, private coins; third, government coins. It is scientifically accurate to say that all three were money; although in the modern acceptation of the term a distinction is made between coin and bullion, the word "money" being more commonly applied to the former. — *Different Kinds of Money.* Now, supposing that California, instead of being rich in gold, had been equally rich in furs or tobacco, and had possessed no gold at all, all the other circumstances of her early settlement being the same: how would trade have been carried on? We need not resort to any abstruse chain of reasoning to answer this question, since we know, from the history of our own country, exactly what was done in like circumstances. Our ancestors in Maryland and Virginia, before the revolutionary war, and for some time after, in default of gold and silver, used tobacco as money, made it money by law, reckoned the fees and salaries of government officers in tobacco, and collected the public taxes in that article. It is a curious instance of the survival of old customs, that certain fees of court officers in the District of Columbia are computed in tobacco money to this day.* — Coon skins, beaver skins, musket balls, and almost everything else possessing value, and not too difficult to handle, have been used at various times in our own country as money; in some cases being legal tender, and in others not. Furs and skins of various sorts are still employed as money at some of the trading posts of the Hudson's Bay company. Chevalier tells us, that as late as the year 1866 hand-made nails were used as money in certain secluded villages in France. When Cortez invaded Mexico, he found the people using grains of cacao as money for small transactions. Salt, leather, olive oil and dried fish have been employed as money in modern times. According to some writers, cattle serve the purposes of money among the tribes of central Asia now, although others maintain that they merely constitute a standard of value; that is to say, a camel is reckoned to be worth so many head of cattle, a horse so many, a tent so many, when camels, horses and tents are bartered against each other, the cattle themselves not being used as a medium of exchange, or brought into the transaction, except for purposes of reference. — *Evolution of Metallic Money.* Following the observed course of trade from the earliest times and through all stages of civilization, it will be seen that money must needs have some utility and exchange value of its own; it must be serviceable to human wants, and must be the creation of labor. Anything possessing these attributes may serve the purpose of money. Some things will serve these purposes better than others. Some are more durable, more portable, more

* This anachronism in finance was discovered by the writer in the course of an examination of the laws of Maryland relating to tobacco currency. In October, 1780, a law was enacted fixing the rate of tobacco fees at 12s. 6d. per hundred weight. In 1806 all tobacco fees were abolished in Maryland, and federal money substituted for them. But meanwhile the District of Columbia had been ceded to the United States; and the old Maryland laws continued in force there, except as specifically changed by congress. Changes were made in the District by piecemeal; and it so happens that the fees of the clerk of the supreme court of the United States, in cases where the government itself is a party, are still computed in pounds of tobacco, and settled at the treasury by the old statutory valuation of tobacco. The fees of the marshal of the District of Columbia were computed in tobacco down to a recent period.

divisible, and steadier in value, than others: in a word, some things are more convenient than others to answer the needs of mankind as instruments of exchange. Mankind have experimented upon nearly all the substances in nature to ascertain what things are the most convenient. They have held no general congress to decide the question by voting; nor would such congress, if held, have been able to decide anything. They have experimented precisely as they experimented with stone, bronze and iron as cutting instruments in their daily life, discarding the worse instrument and adopting the better, from time to time, as the inferiority of the one and the superiority of the other became manifest. Although the early American colonists used tobacco, coon skins, beaver skins, musket balls and other inconvenient things as money, they did so from no want of knowledge that gold and silver were far preferable. They had no gold and silver, or not sufficient for their needs. What little they had they were obliged to send abroad to pay for indispensable articles. As soon as they became rich enough to buy gold and silver, or to retain what they produced, they abandoned the tobacco and coon-skin currency. Generally speaking, it is accurate to say that mankind have educated themselves by slow degrees to understand what substances and things are most suitable to answer the purposes of money. The precious metals came into use in the earliest historic period. Silver was employed as money in the time of Abraham, and then passed by weight. Iron, lead, tin, copper and bronze were successively used by the Greeks and Romans, but were displaced at an early day by gold and silver, except for very small transactions. It would require more space than we have at our disposal to go into the history of these changes. We may say, briefly, that the human race learned by experience that metallic substances were better adapted to serve their needs as money than other substances, and that gold and silver were better adapted to this end than any other metals. The reason why they are so may be explained in a few words.—*Attributes of the Precious Metals.* 1. These metals possess much value in little weight; they are portable; they can be carried in one's pocket in sufficient quantity to answer ordinary needs. Their superiority in this regard over tobacco, beaver skins and the other kinds of money we have mentioned, including the baser metals, is apparent at a glance. 2. These metals can be divided and subdivided to any extent without losing any part of their value, whereas most of the other things we have described lose very much of their value by being cut in pieces. Ten gold dollars are always equal to an eagle, and can be converted into an eagle, or the eagle can be converted into ten dollars, at a trifling expense. 3. These metals are not subject to loss by exposure to the atmosphere or by the lapse of time, and to very little wear and tear by handling. They do not rust or decay, and very few substances in nature produce any injurious or corroding effect upon them by contact. 4. They are susceptible of receiving a fine impression in letters and figures denoting their value, and are not easily counterfeited; that is to say, they are well fitted to be coined. 5. They are homogeneous—always of the same character. There is no such thing as inferior gold or inferior silver. There is good iron and bad iron, good tobacco and poor tobacco. Cows were once receivable for taxes in Massachusetts, and Professor Sumner remarks that the poorest cow was always tendered to the tax gatherer; and thus the public treasury became the owner, eventually, of nearly all the scrawny cattle in the colony. Nothing is well suited to answer the purposes of money if there are degrees of goodness in different lots of the same article. 6. These metals possess value apart from their utility as money. They are useful in the arts and for purposes of ornament. Undoubtedly their use as money stands for the larger part of their value at the present time. If they should cease to be used as money, and the whole existing mass of both metals be thrown upon the market to sell for what the gold and silver smiths could afford to pay for them, they would fall enormously, and the further production of them would cease. But because these metals are so well adapted to serve as instruments of exchange and measures of value, their use as money will continue; although, as the world advances in civilization, the actual handling of coin or bullion tends to diminish rather than to increase. Although their use as money now constitutes the chief part of their value, it was their utility for other purposes which caused them to be first selected and employed as money. It is quite impossible to conceive that mankind would choose, as their measure of all values, an article which was itself of no value, and to which they attached no importance. Gold and silver have been chosen to the office of money by the process of natural selection. We might say that they have been self-elected, and we might add that no money which is not self-elected is good money. Anything which requires the aid of the sheriff to make it go, is emphatically bad money.—*Stability of Value.* These metals are also very stable in value—a circumstance which arises from the fact that there is so large a stock existing in the world at all times in comparison with the quantity annually yielded by the mines, or lost by wear and tear. The amount of gold in the world, coined and uncoined, may be assumed to be equal to $5,000,000,000, and of silver nearly as much. The annual addition to this stock is about $150,000,000, or, say, 1½ per cent. of the whole. The loss by abrasion is supposed to be not more than 1 per cent. in twenty-five years. The loss by fire and shipwreck, and other accidents, is probably greater than the loss by abrasion; but there are no data for determining what the aggregate amount may be. It is evident that the existence of so great a mass of these metals, with so little disturbing force

in the way of increase or diminution, must (other things being equal) give them great steadiness of value as compared with articles of which the quantity is susceptible of great variation of supply. It is not denied that variations in the value of these metals do occur, measured by the amount of commodities they will buy; but these variations are so small that they can only be detected in long periods of time. The value of an ounce of gold is the average amount of other things, useful or necessary to mankind, which it will buy; and this average must be ascertained by taking a sufficiently long period to exclude errors arising from the elasticity of prices—the alternation of what are called good times and bad times, periods of speculation and periods of panic. In striking this average we must also make allowance for the progress of mankind; that is, for the cheapening of production by new inventions and discoveries: for, although a given weight of gold or silver will now buy only one-eighth as much food or labor as it would five centuries ago, it will buy a much greater quantity of clothing, fuel, books, iron, transportation, light, and other comforts brought into existence by the ingenuity of successive generations of men; that is to say, the value of the precious metals as compared with food is much less than it was in the year 1400, but is greater as compared with nearly everything else. — *Supply and Demand.* The law of supply and demand governs the value of these metals as of other things. The two principal events in modern times which have affected the value of gold and silver were the discovery of America in 1492, and the discovery of gold in California and Australia in 1848–9. The annual production of the precious metals before the discovery of America, according to Professor Soetbeer, was less than $1,000,000 per annum. In the sixteenth century it rose to $11,000,000, in the seventeenth to $22,000,000, and in the eighteenth to $55,000,000, per annum; but this increase, great as it was, was surpassed in the years immediately following the discoveries in California and Australia. The annual production of the two metals rose to more than $200,000,000 in 1852, of which $174,000,000 was gold; and the average production from 1849 to the present time has been not far from $160,000,000 per annum. There was a great and permanent rise in general prices during the century following the discovery of America. The amount of gold and silver in circulation in the year 1600 was probably four or five times as great as it had been a century earlier, and the prices of agricultural products in western Europe rose in a corresponding ratio; that is, they quadrupled in 100 years. Difficult as it is to trace cause and effect in dealing with the prices of commodities and the quantity of money existing at different times, there is a general agreement among economists and historians that the great and permanent rise of prices in Europe in the sixteenth century was produced by the influx of the precious metals from America, and that it was proportionate to such influx. Mr. J. S. Mill, writing in 1847, considers this the only case in which a rise of prices up to that time could be shown to be due to an increased supply of the precious metals. The progressive advance in prices was checked in the seventeenth century, probably by the great increase of trade, which, beginning in Holland, extended to Germany, Sweden, England, France, India and America, and which is supposed to have counteracted the influence of the new supplies of money by an increased demand for it. Adam Smith says that the rise of general prices consequent upon the influx of silver from America ceased about the year 1636, and that during the remainder of the century there was a decline of prices, taking the average price of wheat as a standard, and that this decline continued during the first half of the eighteenth century. This decline in prices must have been much greater but for the introduction of bills of exchange and other substitutes for money, the nature of which will be explained hereafter. — Notwithstanding the increasing use of bank facilities and bank paper to effect the exchange of property without the intervention of the precious metals, the growth of trade outran the supply of money during the first half of the present century to such a degree that general prices declined, according to Prof. Jevons, 60 per cent. between 1809 and 1849. The production of gold in California and Australia arrested the downward movement, and caused a reaction, and a rise of prices estimated by statisticians at 20 to 40 per cent. Prof. Jevons estimates the rise from 1849 to 1857 at 31 per cent. Mr. W. L. Fawcett ("American Handbook of Finance") concludes that the advance of prices due to the new supplies of gold has been equal to 40 per cent. — *Definition of Money.* We are now prepared to give the scientific definition of money. Money is a substance possessing attributes which fit it to serve as a common measure of value, and which make it, in the estimation of mankind, an equivalent for all other kinds of property. We can conceive of other measures of value which are not in themselves valuable; as, for instance, a scale of prices in which all kinds of property are compared with each other, showing how many sheep ought to be given for a horse, how many pounds of coffee are equal to a barrel of flour, etc. But such a scale of prices would not be an equivalent. It would not be rendering an equivalent if I should obtain a beefsteak from my butcher, and tender him in return nothing but a scale of comparative prices, showing him how much sugar he ought to be able to procure in exchange for a beefsteak. Again: we can conceive of other equivalents which are not good measures of value; we have already described some of them. The house in which I live is the equivalent of some thousands of bushels of wheat; but it is not a good measure of value, because it is not divisible or portable, and because it is liable to decay and eventually to become worthless. It is a mistake to say that money is only a sign or representative of

value. This is true of the various substitutes for money; but it is not true of money itself, whether the kind of money employed is a piece of gold, a beaver skin, a block of salt, or a dried codfish. Each of these things possesses its own utility in the way of serving human wants. The piece of gold serves human wants by answering the need of men for an instrument of exchange and a measure of value as effectually as a beaver skin does by protecting his body from the cold. True, you can not eat gold, or wear it on your back, neither can you eat or wear a paving stone; yet the paving stone is valuable in the way of promoting human intercourse and traffic, and so is the gold. It would be just as absurd to say that a paving stone is a sign of value as to say that gold is a sign of value. It is sometimes said, that, if mankind would come to an agreement to accept some other thing as a universal equivalent and measure of value, that other thing would be just as good money as gold. The answer is, that mankind will not come to any such agreement. Mankind have already come to an agreement upon this subject, not by treaty, not by convention, not by the action of their governments, but by tacit consent founded upon experience. They have brought into requisition various substitutes for money which are of vast and increasing advantage to trade and industry; and so far as these have come into use by tacit consent, founded upon experience, they will prove lasting and beneficial. None of these substitutes, however, possess the character of equivalency, nor do any of them serve as measures of value. The bill of exchange, the bank check, the bank note, which I give to my creditor, is in itself nothing but a piece of paper with ink marks upon it. Its original value as paper is destroyed by the ink marks. It gives to him the right to obtain a sum of money, or goods equivalent to that sum; but it is not money. We are not now stickling about the names of things, and drawing distinctions where there is no difference. As the subject of this paper is money and its substitutes, it is necessary, first, to obtain a clear idea of what money is, in order that we may the better obtain an idea of what its substitutes are, and how great a service they have rendered, and are capable of rendering, to human society. — *The Unit of Value.* We have seen that mankind have tentatively and experimentally used a great number of things as money, and have finally chosen gold and silver as the best, and have come to such a world-wide agreement upon this point, that all men act upon it as readily and unconsciously as they draw atmospheric air into their lungs. Every operation in life that is not purely intellectual is an operation of dollars and cents. I can not walk down town without wearing clothes and shoes, and these are matters of dollars and cents. I can not sleep without a bed to lie in and a roof over my head, and these are matters of dollars and cents. Dollars and cents are the measure of the exertion I must put forth to supply my daily wants. Under both law and practice in this country, the dollar is twenty-five and eight-tenths grains of gold nine-tenths fine; and, however numerous and multifarious may be the existing substitutes for money, however vast may be the exchanges effected by banks and clearing houses and by paper instruments of every kind, twenty-five and eight-tenths grains of gold nine-tenths fine is the measure of every dollar in the whole mass. The amount of labor required to produce this dollar at the mines is equal, in the average, to the amount required to produce a dollar's worth of wheat, cloth, iron or other commodities. — While, strictly speaking, nothing should be called money which is not in itself an equivalent and a common measure of value, the word has a much wider signification in common usage, being employed to designate anything which possesses the efficiency of money. Thus it is used to describe not only gold and silver but bank notes, government notes (redeemable or irredeemable), checks, drafts, bills of exchange, bank deposits and wealth generally. We say that a man has a great deal of money when we mean that his possessions would realize a large sum if converted into money. When we speak of the money market we mean not the market for gold and silver considered as metals—that is quite a different affair—but the demand and supply of loanable capital. The London money market is said to have £120,000,000 in ready money available for loans, although the whole amount of gold and silver within reach is not more than one-fifth of that sum. Such use of the word money includes the scientific definition of it and much more. The custom of calling these various things money because they possess all the efficiency of money is fortified by a certain amount of reason, and is at all events too firmly rooted in popular acceptation to be dislodged. It is only needful to point out in what respect the scientific definition of the term differs from the language of everyday life. — *Other Definitions.* The word most commonly employed to signify metallic money is *specie.* The word *cash* is used to signify ready money as distinguished from one's potential resources or from future payments. The word *currency* is properly used to designate that which is current as distinguished from that which is uncurrent. It is equally applicable to specie or to paper. Dollars, whether of coin or of paper, are *current* in the United States, but pounds sterling, francs and marks are not. Before the national banking system came in force in this country there was a vast deal of "uncurrent funds" floating about in the shape of bank notes redeemable at their place of issue, but nowhere else. Wherever these notes were accepted at par by banks they were current. At all other places they were uncurrent, and could be converted into current funds only by returning them to their place of issue for redemption, or by submitting to a "shave" equal to the cost and trouble of so returning them. Here again

custom has made a definition of its own of the word currency. As commonly used in the United States it means the paper circulation as distinguished from coin. Bankers frequently tell us that "currency is scarce," meaning that bank notes and greenbacks are scarce, although gold may be plentiful. We often hear of the "demand for currency to move the crops," which signifies that the paper circulation is in request for this purpose in preference to coin, on account of the greater ease of handling and transporting it. Such use of the word is clearly a perversion of its original and derivative sense, and is objectionable upon that ground, but is probably too firmly fixed in the vocabulary of commerce in this country to be uprooted. *Money of account* is the commercial unit of value at any particular place. It may or may not correspond with the legal unit of value, and may or may not be legal tender. The gold dollar of twenty-five and eight-tenths grains nine-tenths fine is the money of account in the United States at the present time; anything which is the equivalent of it, or is resolvable into it at par, being accepted by all banks and clearing houses. Silver dollars are legal tender, but are not money of account, although they are commonly accepted in small transactions. During the war and the suspension of specie payments, the greenback was money of account and gold was a commodity, notwithstanding the fact that the gold dollar was then, as it is now, the legal unit of value. The government establishes the legal unit of value, and declares what shall be legal tender; commerce, through the instrumentality of banks and clearing houses, declares what shall be money of account. It is as little in the power of government to prescribe a money of account for the business community as it is in the power of the business community to declare what shall be legal tender. — *Bi-Metallism.* We have thus far classed silver and gold together under the common designation of "the precious metals," as constituting one instrument selected by mankind to serve as a measure of value and an equivalent in exchange. But it follows from what has been said, that, unless these metals bear a fixed ratio of exchange with each other, they can not both be a correct measure of value. If they vary with respect to each other, one of them will be chosen as the standard, and the value of the other will be reckoned as so many units or parts of the standard. Which one of them shall be chosen will depend, not upon the action of governments, but upon the preference of the people as exhibited in their daily practice. All that government can do is to declare what shall be legal tender in settlement of past debts. As to the trade which goes on from day to day, and as to future contracts and undertakings, it can do nothing to change or modify the practice which the convenience of business may dictate. Government can enable me to pay my last month's grocer's bill in silver, paper, leather or anything which it sees fit to make legal tender; but it can not compel the grocer to sell me another bill of goods, except for gold or the equivalent of gold, if he chooses to demand it. Usually governments will conform their legal-tender laws to the practice of business, departing from it only under a real or supposed necessity, as when, for instance, they desire to make forced loans from their subjects by issuing their own notes in exchange for the property of citizens. — For a period of about 200 years prior to 1872 silver and gold were used in most parts of Europe and America indifferently and alternately as money, in a ratio between fifteen and sixteen of silver to one of gold. The public convenience was served by such use. If we are asked why the public convenience was served by the two metals then, and is not equally served now, we can only say that it was probably because trade had not then assumed such proportions as to make the weight and bulk of silver felt as a serious inconvenience to business, and because the variations in the market value of the two metals were comparatively slight. The largest variation in the period mentioned was that caused by the great gold production of California and Australia, viz., an advance in the gold price of silver equal to 1.656 per cent., the ratio of the two metals having fallen between the years 1851 and 1859 from 15 46 to 15.21. In 1861 the ratio again stood at 15.47. It is immaterial, in a practical point of view, whatever be its scientific interest, to inquire what has caused civilized mankind to prefer the single gold standard to the double standard—as immaterial as it is to know whether the north pole is surrounded by solid ice or by an open sea. As a matter of scientific concern, it is undoubtedly important to investigate these questions. It would be an addition to the sum of human knowledge to know exactly why our forefathers liked silver well enough to use it as money of account, that is, money in terms of which all other things are reckoned, and why we do not. I have my own opinion as to these reasons. I look upon the transition from the double standard to the single gold standard as a step in the world's progress brought about by natural selection, by the same process which led to the adoption of iron in place of stone implements for cutting, the same which led men to adopt the precious metals as money, instead of the more bulky and perishable articles which were formerly used. I hold that all arguments which do not address themselves to this point of view are a waste of breath. Volumes upon volumes have been written to show that it would be better for mankind to return to the double standard. Two international conferences have been assembled at Paris to consider the question, and a third is now talked of. These conferences are and will be useless; because they can not persuade the commercial world to do what its interests are opposed to, or to desist from doing what its interests favor. That its interests do favor the single gold standard is sufficiently proved by the fact that the single gold standard

has come to pass. Most of the arguments for the double standard go upon the presumption that there is some virtue in legal-tender acts to compel people to keep their accounts and make their trades in a kind of money which they do not like. But really a legal-tender act, as already said, exhausts itself upon what is past and gone: it exerts no force upon the present or the future. During the whole period of suspension of specie payments in this country (from Jan. 13, 1862, to Dec. 18, 1878), the business of ascertaining the gold value of greenbacks was carried on daily and hourly in the New York gold exchange, except during the brief period when congress attempted to close the gold room by law, with the disastrous result of putting up the premium much higher than it would otherwise have been. — In 1873 silver began to decline rapidly in value, as compared with gold, partly by reason of its demonetization in various parts of Europe, partly in consequence of increased production in the United States, and partly in consequence of a falling off in the demand for silver in India. The decline since 1873 has been equal to 15 per cent. So great a decline was well calculated to stir up doctrinaires and busybodies to put things to rights by printing essays and passing resolutions. But it is equally well calculated to confirm all other people in the notion that a metal so liable to depreciate is not a good recompense for their labor, or a fair equivalent for their property. I have yet to see the bimetallist who governs himself in his daily business by any different principles from those of the mono-metallist. Both act as though they considered gold money preferable to silver money. It is only in academic discussions, on the lecture platform, in congress, and in Paris conferences, that you learn that silver is as good for trade as gold. Elsewhere, perfect unanimity exists that gold is better for trade than silver, and better than silver and gold together. It is this conjoint, simultaneous, involuntary preference of civilized men, expressed, not by words, but by acts, day by day, year in and year out, for gold money as against silver money, that has brought about the single gold standard in the commercial world. Nothing short of a like preference expressed in like manner will ever bring back the silver standard or the double standard. If the bi metallists in the Paris conference had set about persuading the public *not to prefer gold*, instead of trying to bring the sheriff to the aid of silver, they would have been pursuing their end by rational means, whether the end was exactly rational or not. By following the opposite policy, they kept the cart before the horse all the time, and of course made no headway. — It would take more space than we have at our disposal to go over the heads of the dispute between the bi-metallists and their opponents. It is worth remarking, that none of the evils prophesied to flow from the general adoption of the gold standard in the commercial world have come to pass. It was said that the United States could not possibly resume specie payments on the single gold standard; but, if we could do such a wonderful thing, they said that it would put such a strain on the gold resources of the world, that prices would be greatly and permanently lowered, and severe distress would be inflicted upon mankind. Yet the United States did resume specie payments on the gold standard, and now Italy has got herself in readiness to do the same thing; and general prices have not declined, but, on the contrary, have been rising continuously since 1878. — *Substitutes for Money.* It has been already remarked, that, as civilization progresses, the actual handling of coin and bullion tends to diminish rather than to increase; its place as a medium of exchange being filled by other and more convenient instruments, while its function as a measure and standard of value remains in force all the same. This brings us to the second part of our theme, the substitutes for money. Mr. W. L. Fawcett very pointedly says, that "the proportion of actual coin money in use in the traffic of any country is the measure of the imperfectness of its banking system."— Exactly at what period in the world's history bills of exchange came into use is not known. Operations having some resemblance to banking can be traced in the history of ancient Greece and Rome; and there is abundant evidence that the governments of the ancient world— Greek, Roman, Carthaginian and Chinese—knew how to obtain loans by the issue of representatives of money made of leather, iron or tin, upon the same principles that modern governments obtain them by the issue of paper. Bills of exchange were used to a limited extent in the fourteenth and fifteenth centuries: they came into extensive use about the beginning of the seventeenth century, and their employment has increased progressively and prodigiously to the present time As money is a labor-saving machine to avoid the inconvenience and uncertainty of barter, bills of exchange are likewise a labor-saving machine to avoid the use of money. It was found in practice that the goods sold by Germany to Sweden, for instance, would pay for the goods sold by Sweden to Germany—the one would offset the other without the employment of money, provided the individual sellers of German goods could find the individual buyers of Swedish goods, and swap their claims and obligations. A common place of meeting for such buyers and sellers would in due course have led to the establishment of banks to adjust these transactions by the simple process of writing debit and credit here and there in a set of books. And, in fact, this came to be and still is the principal function of banks. But banks had their beginning, historically speaking, in another set of causes. The old banks of Venice, Genoa, Sweden, England and France were established, in the first instance, to extend financial aid to their respective governments. The banks of Barcelona, Amsterdam and Hamburg were founded for purely commercial purposes.— The multifariousness of the coins of the middle ages, and their uncertain value, were the

plague of commerce. They consisted of crowns, florins, ducats, pounds, dollars, etc., more or less debased by the action of monarchs, and more or less worn and clipped. The main object of the early banks was to receive these heterogeneous coins from traders, and give in return the full-weight money of the locality; so that a bill of exchange drawn on Venice, for instance, for so many ducats, might be readily paid in ducats, instead of a miscellaneous assortment of coins, good, bad and indifferent, which must needs be examined and certified by an assayer before the payee would accept them: in other words, the early banks of Venice, Amsterdam, etc., created a "money of account" in their respective localities; or, if they did not actually create it, they preserved it. Bank money, in those times, always commanded a premium over street money, because its value was always guaranteed, always fixed, never variable. The miscellaneous coin deposits of merchants were credited to them on the bank's books at their ascertained value in ducats; and they could draw out the corresponding sums in ducats at pleasure, or could discharge their own debts by turning over to others the sums standing to their credit on the bank's books, without drawing out any money whatsoever. — *The Evolution of Banking.* We have not time to recite the history of banking development; but one can see how natural the transition would be from the sort of bank we have described to the modern bank. Thus, for instance, the merchant who had made a deposit of coin would soon perceive that the bank's certificate of deposit was more convenient to handle, and less exposed to robbery, than the coin itself; and so bank notes would come into existence. The first bank notes were merely certificates issued against a corresponding amount of coin or bullion: they were like warehouse receipts, issued against grain, cotton or other property taken on storage. The bank itself would soon perceive that a certain portion of the deposits would always be on hand, since some persons would always be sending in as much as others were drawing out, and that this average amount on hand could be profitably employed in the way of loans, for which interest could be obtained. Experience would show that these loans must be secured by pledges of property, in order to guard against loss; and inasmuch as bills of exchange are brought into existence by the sale of property, and are in fact title deeds to property in transit, they would constitute the best security for such loans. Consequently the discounting of bills of exchange—that is, furnishing ready money to the seller of the goods, and collecting it from the buyer at the agreed time of payment—would be the most natural employment of the banker's balance of deposits on hand. Then, seeing that the bills of exchange were regularly paid at maturity, and that new lots were coming in as the old ones were going off, it would be very natural to regard the bills themselves as deposits, and to credit them as so much money to the accounts of the merchants sending them in, and to call them, in a general way, "money." For all the purposes of the banker they are money, because he can send them to the places where they are payable, and either get money for them, or pay his own obligations with them. For all the purposes of the merchant they are money, because he can draw his checks against them, and pay his debts with them. What really happens here is, that the various bills of exchange arising in all parts of the country, or of the commercial world, representing goods bought and sold, offset each other. Barter is going on, as it must have gone on before any money whatever was invented, but with this difference, that, instead of men swapping directly a stone hatchet for a dozen arrow heads, or a day's labor for a haunch of venison, they now swap by a recognized standard of value (viz., the gold dollar of twenty-five and eight-tenths grains), but do not bring the dollar itself into requisition, or only to a very limited extent. The dollar is the common denominator, but the denominator is used only for purposes of reference. Thus it happens that the balances settled at the New York clearing house in one week may amount to one thousand million dollars—a sum larger than the whole amount of gold, greenbacks and national bank notes in circulation in the United States. All the checks, drafts and bills of exchange that go to the clearing house are loosely termed "money," because they answer nearly all purposes for which money is ever used. They are really the signs and evidences of commodities bought and sold. The only difference between the three kinds of paper instruments here named—checks, drafts and bills of exchange—is a difference of locality or territoriality. The check is usually payable in the same town or city where it is drawn; the draft is payable in a different town or city in the same country; and the bill of exchange is payable in some other country. Checks are usually payable at sight; drafts and bills of exchange may be at sight, or a certain number of days after sight. These differences are unimportant as regards the principle we are considering. — *Primitive American Banks.* It is seen, therefore, that a bank is really a place where swapping is done by wholesale, where merchants and producers, buyers and sellers, meet to exchange their various goods and services without the use of money. The subject is somewhat complex, and perhaps an illustration will serve to make the facts clearer. In my younger days, which were passed in a small town in the then territory of Wisconsin, there was a country store at which all the new settlers did their trading. Money was very scarce, what little the people had being sent off to the government land office at Milwaukee, to pay for the land which had been entered under the pre-emption laws. The country store sold dry goods, groceries, etc., and bought wheat, pork, butter, eggs, and whatever was produced for sale in the neighborhood. A rude warehouse was attached to the store to hold the

bulkier products; and a line of teams was in motion, carrying the surplus farm products from this store to Milwaukee, some eighty miles distant, and bringing back to it the goods required by the community. Each head of a family in the town had an account on the books of the storekeeper, where he received credit for what he brought in for sale, and was debited for what he took away. And so things went on from year to year. After a while other stores were established which did business in the same way, giving people the benefits of competition. In course of time money became more plentiful in consequence of the community sending more wheat, etc., to Milwaukee, than the value of the goods they brought back; and gradually the stores were enabled to buy wheat and pork, and sell molasses and other things, for cash, or on short time. Now, the store we have described united the functions of a merchant and a banker. It was the place where all the buying and selling in the community was done by writing debit and credit opposite each man's name, according as he brought in one kind of property, and took away another kind, without the use of money. This is the simplest representation that can be given of the sort of business transacted by a modern bank. There are hundreds and thousands of these country stores in the west to-day, whose proprietors would probably be amazed to be told that they are bankers, but who are performing, unconsciously, all the functions of bankers, except that of issuing circulating notes. In the case of which I have spoken, remittances to Milwaukee by individuals other than the storekeeper were commonly made by buying the storekeeper's drafts on his correspondent in that city, just as we now buy bank drafts. — It will be seen that there was a circulation of the goods and products of the community carried on by means of the store, and that the store itself furnished the capital needed to set the business going, and tide over the interval between seed time and harvest. Now, what does the modern bank do other than this? The modern bank does not deal directly in merchandise. It furnishes capital to merchants, and settles their balances exactly as the country storekeeper settled those of his customers. The bank, instead of having a warehouse in the rear to receive grain and provisions, and shelves to hold dry goods and hardware, and a lot of teams carrying things here and there, intrusts these functions to warehousemen and merchants, to railways and steamships, holding paper instruments which are the warrants and certificates of the property itself. We need not trace the various ramifications of banking. They are all resolvable by the principles of the country store. The bank's deposits are composed mainly of these warrants and certificates, called, in the language of commerce, "checks," "drafts," and "bills of exchange." — *The Genesis of Bank Notes.* As mankind progress in civilization, the tendency and unconscious effort is always going on to dispense with the use of money, and to carry on trade by swapping. It is thus that bank notes come into existence. Farmer A, we will suppose, sells to miller B a thousand bushels of wheat, and receives a check for one thousand dollars. If farmer A wishes to pay off a mortgage to C, or to buy a hundred sheep from D, he can turn over this check in payment, and the swap will be complete. No money will be used, but each of the parties will have obtained what he wanted just as effectually as though a bag of gold had been passed around from one to the other, and even more economically; but if A wishes to pay the wages of his farm hands, and to send his son to college, and to go on a journey himself, he must receive pay for his wheat in something that will circulate from hand to hand in small sums. Swapping must come to an end, and money must be brought into requisition, unless the miller draws, say, two hundred checks of five dollars each, and unless the miller's credit is so well and widely known that everybody will accept his checks. But this very rarely happens. What does happen is, that the farmer takes his check to the bank, and the bank gives him its notes for the amount. These notes will be accepted universally, because everybody knows they will be paid on demand. Thus swapping is still carried on, notwithstanding the subdivision of the check into a number of small checks, or bank notes, or tickets—it makes no difference what we call them. The miller, in this case, has deposited his draft on New York, or his bill of exchange on Liverpool, for the last lot of flour he sent forward into the world's circulation; the bank has credited him the amount; and, when his check came in, it issued a lot of tickets saying, virtually, that "the bearer of this ticket is entitled to the value of one two-hundredth part of a lot of flour, in existence somewhere, and can receive that value whenever and wherever he chooses. He can receive it at this bank's counter in gold, or he can receive it in property at any store, hotel, railway office, or other place of business, where the standing of this bank is known." — "*Credit Money.*" Much confusion has been introduced into this subject by the use of the phrase "credit money," as applied to bank loans, bank deposits and bank notes. Many people, and even some writers on political economy, use this phrase as though it had a definite signification, whereas it would puzzle the best of them to define it, or to tell what they mean by it. The only credit money in this country is the legal-tender greenback. This has nothing behind it but credit — the government credit, a good credit, but credit pure and simple. It may be said the government has a lot of gold somewhere to redeem these greenbacks with: so it has (since Jan. 1, 1879); but the fact remains that the greenback is based upon credit, and not upon property. So is the bank of England note, up to fifteen million pounds. This amount of notes the bank of England puts out on the credit of the government.

But bank notes, ordinarily, are not credit money: they are property tickets, representing the swapping of goods and services, as already shown. Of course, we are now speaking of good banking, not of swindling or slovenly banking. The history of this country furnishes a great many examples of bad banking, to which the phrase "credit money" might be properly applied; but these cases are now rare. Still less is the phrase "credit money" applicable to bank loans and deposits. What is loaned and deposited under the conditions of good banking is property in circulation. I repudiate utterly the phrase "credit money," as applied to other money than greenbacks or government issues. — Few words in the English language have been more vilely abused than this word "credit." If I have a wagon that I do not wish to use for a year, and I lend it to my neighbor at an agreed rate of hire, I have extended to him a credit. If I have no wagon, but have the money to buy one, and lend this money to my neighbor, who buys a wagon, agreeing to repay me with an agreed rate of interest, I have equally extended to him a credit. What I have done in either case is to lend him a wagon. He could make better use of it than I could for the time being; and therefore the world is better off. It is all the same, whether I lend the wagon or whether a bank lends it. Range the world over, and you will find nothing different from this, in point of principle, in the nature and employment of credit. Credit never brings a cent's worth of property into existence, except by putting tools and implements already existing into the hands of those who can make use of them, and who could otherwise not obtain them; but, by accomplishing this, it becomes a mighty engine of human progress. All notions implying that credit of itself, in any form whatever, calls wealth into existence by prestidigitation, are fantastic and mischievous. "Credit instruments," which we hear spoken of so frequently, are instruments for facilitating the transfer of tools and other reproductive capital from the hands of those who have them, but can not use them, to those who have them not, but can use them. A savings bank is a credit instrument of this sort; an ordinary bank of deposit and discount is such an instrument; a draft, a bill of exchange, a bank note is not such an instrument: it is, as shown, a ticket for circulating property, entitling the holder to such and such a share of the world's existent consumable commodities. When these commodities are consumed, and cease to exist, the corresponding tickets cease to exist also, and new ones only come into life as new commodities are produced. The drafts and bills of exchange are paid and canceled, and the bank notes come home to be redeemed. The notes may not be actually canceled. In order to save the cost of printing, and the trouble of signing a new lot, the old ones may be reissued, when called for, by the same kind of business needs which led to their first issue. It obviously makes no difference, except in a mechanical sense, whether, in the case of a second issue, the old notes are again used, or new ones are put out. — *Bank of England Note System.* It has already been remarked that the only credit money in existence is government money—greenbacks in this country; bank of England notes, up to the fifteen million pounds' limit, in Great Britain, etc. It has been shown how the greenbacks are entitled to be called credit money, and how bank notes differ from them as to their origin, the causes which bring them into life, and which lead to their ultimate extinction. Bank of England notes are of two kinds as to their origin, although, in external appearance, there is no difference between them. In the year 1844 it was estimated, or rather ascertained, by the public authorities, that eleven million pounds of bank notes, of the denomination of five pounds and upward, would circulate in the hands of the people at all times—in bad times as well as good times—performing the ordinary functions of internal traffic. The government owed the bank eleven million pounds, borrowed a long time before. It said to the bank, "You may issue this amount of notes without any gold reserve whatever, because experience shows that gold will never be demanded so long as the issue is not in excess of eleven millions, and so long as the public have confidence in your ultimate solvency; and, of course, you will be solvent to this extent, because we owe you that amount. We will not pay you any interest on the amount we owe you (this eleven millions), because you will get interest from the borrowers of these notes. If the business requirements of the country call for more than eleven millions at any time, you may issue them to any extent, provided you have five gold sovereigns in your vaults for every five pound note so issued in excess of the eleven millions." This is the famous "currency principle" which is identified with the name of Sir Robert Peel. Eventually, the amount of uncovered issues was raised to fifteen million pounds by the dying out of country banks then in existence, which were issuing notes of their own, and which it was deemed best not to disturb. But the principle was not altered in any way by turning over their note issuing privileges to the bank of England. — This so-called "currency principle" proceeded upon a totally different plan from that which we have described as the natural mode of creating and issuing bank notes; which latter is commonly called the "banking principle." The banking principle, as shown, is simply the swapping of property by retail, the swapping by wholesale being carried on by checks, drafts and bills of exchange. The banking principle requires that an equivalent of every bank note shall be in existence, circulating through the community in the form of pounds of sugar, barrels of flour, legs of mutton, etc. The currency principle requires nothing of the sort: it merely says, that, "since people prefer paper to gold for ordinary use, when they are satisfied of the goodness of the paper, we (the government) will give them paper up to the amount of their average requirements, and take

the corresponding amount of gold or property unto ourselves." This is virtually what our government has done in the case of the greenbacks. — The bank of England act has been much lauded; and so high an authority as Prof. Jevons esteems it "a monument of sound and skillful financial legislation." It appears to me to be plausible and specious rather than scientific. What is to be said in favor of it is, that the government gets the profit on the sum represented by the uncovered notes, and that the security to the note holder is always perfect. But the government could equally get the profit on the notes by taxing them when issued by banks, and it could furnish equal security by requiring the banks to deposit government bonds or consols, as is done in the case of our national banks. What is to be said against it is, that it does not conform to the natural course of things; the evolution by which bank notes, as swapping instruments, are brought into existence, forbidding any swapping beyond fifteen million pounds, unless done by means of checks and bills of exchange. For all above this sum it requires that gold be first bought. It is arbitrary and rigid. It proceeds upon the theory that human wisdom (the wisdom of the year 1844) is a better regulator of the circulation than the silent and unperceived course of trade which creates its instruments of exchange as it goes along. It is not a sufficient answer to say that the bank act has worked well; since human society readily adapts itself to its environment, whether good or bad. Deprived of the use of the bank note, which arises naturally in the mode described, British trade has availed itself of the check system to a prodigious extent. In London but little more than 2 per cent. of the business done is transacted by means of coin and bank notes together, the remainder being represented by checks and bills of exchange. — *Greenbacks and National Bank Notes.* Our greenback system is akin to the issue department of the bank of England, so far as relates to the fifteen million pounds of bank of England notes. Congress having recently passed a bill to authorize the issue of gold certificates, in small denominations, to persons depositing gold in the treasury, the parallel is still closer as regards the issue of circulating notes. An illustration used by Mr. George S. Coe, president of the American Exchange bank, New York, showing the unphilosophical character of the "credit money," embodied alike in the greenback and the uncovered bank of England note, seems to me perfectly conclusive as to the point we are considering. Bills of exchange, says Mr. Coe—want of space compels me to condense his argument—bills of exchange are the world's international currency, drafts and checks are the currency of domestic wholesale traffic, and paper notes are the currency of retail trade. How absurd it would be to draw a lot of bills on Liverpool without sending any equivalent property to Liverpool to balance them! Suppose a syndicate of bankers in New York, about whose solvency there could be no question, (or the government itself), should draw three hundred and fifty millions of such bills, and sell them to the public without sending a cent's worth of wheat, cotton or other property abroad to correspond with them: the bills would go to England in due course, and be paid, and the proceeds would come back to us in the shape of English goods. Under the circumstances, the English bankers would be obliged to draw back on the American bankers for an equal sum. But suppose the American bankers, instead of paying the English drafts, should tender the holders of them a fresh lot of bills of exchange on Liverpool: what would be the effect of this on the trade of the two countries? Obviously it would throw the whole traffic into dire confusion. We should have received three hundred and fifty million dollars' worth of property without rendering any equivalent. We should simply owe that amount of money to England. Undoubtedly England is able to lend us that amount in the usual way in which time loans are negotiated, but not, by any means, in this way. Perhaps we should be able to invest that sum advantageously in our new country, after due consideration; but this is not certain. At all events, we could not do so in a hurry. Clearly the trade of the world would be subjected to a wrench like that caused by throwing a stone into a delicate and complicated piece of machinery.— Apply this analysis to the drafts and checks floating about in our own country, and the same result is reached. Apply it to the paper currency, and it comes to the same thing, so far as this currency is not backed by property circulating alongside. It is not necessary to follow any particular note around, and see what course it takes, how long it stays out, and when it comes back to its place of issue. When trade is brisk, the notes, if issued according to the banking principle, will be plentiful: when trade is slack, they will find their way home for redemption. This is as it should be. But, if there is no property in circulation corresponding to the notes, the currency will be rigid and inelastic. It will bear no relation to the wants of trade. — *The Future of our National Banking System.* The bank charter extension act passed by congress in the summer of 1882 makes no considerable change in the national banking system. But a great change is impending, to be brought about by the payment of the national debt, which now constitutes the security of bank note issues. Whether other adequate security can be provided when the bonds are paid off, is still an unsolved problem. It is certain that other bond security is not obtainable. Good state bonds are even scarcer than national bonds, and are, like the latter, in the course of redemption, so that even if we were to consider that class of bonds admissible as a substitute for those of the United States, they could not be had in sufficient amounts. Other sorts of bonds, municipal or corporate, are out of the question, as security for bank notes. Not only

do they not, even the best of them, enjoy the stability of market value requisite to insure perfect confidence; but since the selection of securities would rest with officers of the government, it would eventually become a part of the political dispensation, and the choice would be more or less governed by "influence" and "pressure." Nothing would more surely undermine and destroy the system than to admit politics and favoritism into the category of forces prescribing what particular bonds of cities, towns, railways, gas companies, or what not, should be received. — The conclusion is inevitable that when the national bonds are paid off, or when they become so scarce that the banks can not obtain them, or so high in price that no profit can be made in issuing circulating notes upon them, the national bank-note system must end unless the capital of the banks themselves, and the responsibility of the shareholders, can be relied upon as sufficient. It is plain that if the bank has in its own vaults the capital heretofore invested in the United States bonds which it has deposited in the treasury, its ability to redeem its notes will be perfect. The question is, how to insure that it shall always have this capital within reach. It would be quite reasonable to provide that the liability of bank shareholders should be unlimited as to circulating notes. This would insure watchfulness on the part of all solvent shareholders over the loans and discounts and other investments of the bank's capital. It would be reasonable also to make note holders preferred creditors of failed banks, giving them the first lien on the assets. The unlimited liability of shareholders has always served to prevent depreciation of the notes of Scotch banks, and an examination of the cases of bank failures under our national system would probably show that no loss would ever have resulted to note holders if these two requirements had been in force, even without the bond security held at Washington. — It is necessary, however, not merely to insure the solvency of the bank notes, but to so convince the public of the fact that no doubt shall ever arise, so that in cases of failures, few or many, the notes shall continue to pass freely, without question and without examination. To attain this end it would be necessary that all the national banks should agree to receive at par the notes of all other national banks under the same terms and conditions of central redemption which are now prescribed by law, or perhaps with some improvement upon existing methods of redemption. With such a guaranty and balance wheel, added to the reasonable safeguards previously mentioned, there would be no need of bond security for bank notes to be held in pledge at Washington. But the mutual insurance system could not be forced upon the banks by law. It would not be just to make one bank responsible for another bank's debts against its will. The system must be entered into voluntarily or not at all. It is for the bankers of the whole country, through their central organization, to find the ways and means to preserve the excellent system which we now have, so immensely superior to the old state system, or to any possible state system. The problem is not so difficult as it seems. We have been so long accustomed to bond security for bank notes that any other system is to most people unthinkable. But, in point of fact, it exists nowhere else in the world, although the bank of England system has points of resemblance to it, as already shown. At all events, it would be a great mistake for us to perpetuate or prolong a national debt merely to furnish security for bank notes. While the debt exists, while the government has not the means of paying it off, and relieving the tax payers of the annual interest charge, it may be usefully employed as security for the holders of bank notes, but to tax the people longer than is necessary for this purpose would be indefensible, and would furnish good ground for the charge made against the national banks that they oppress the community. That charge is now without foundation. The banks have neither created nor protracted the national debt. So long as the debt exists, it is immaterial who holds it, whether national banks, savings banks, trust companies, life insurance companies, or private persons. In a paradoxical world, nothing more whimsical can be found than the unpopularity of the banks arising from the fact that their notes are secured by government bonds. Before the war their notes were either not secured at all, or were less perfectly secured; yet they were exposed to no such loss of popularity. They were always popular so long as their notes were good. — The comptroller of the currency, in his annual report for 1882, strongly opposes the plan here suggested for continuing the national bank note system after the public debt shall have been paid off, believing, as he does, that it is impracticable to secure any general concurrence among the banks to receive, and thus mutually insure, each other's notes; and believing, also, that the popularity of the present system would be made use of to perpetrate extensive frauds upon the public. Better would it be, he thinks, that the system should perish when the debt is extinguished, than that the admirable features which have given it such a hold upon public confidence should be seized upon by swindlers as a means of defrauding the people. His views are entitled to great weight, by reason of his personal authority, as well as for the intrinsic force of his argument. It can not be doubted, however, that with the extinguishment of the national bank system the old state bank system, or systems, would be revived. We have therefore to choose between the latter and some modification of the former, and we must make our choice before the expiration of many years. HORACE WHITE.

MONGOLS. In ethnology, the Mongolians include those races of men after the Aryans, Semites and Hamites, numbering nearly half the human race. They are characterized by easily

recognizable physical traits: the lateral projection of the cheek, and depression of the nasal, bones; broad and flat faces; imperfectly arched eyebrows and oblique eyes; tawny skin; and lank and thin hair, especially on the face; though in certain states of civilization these traits are modified or disappear. Under the general classification of Mongolians are included the variety of races included in the Chinese empire, Burmese, Siamese, Japanese, Turks, Magyars, Lapps, Finns, Esquimaux and Samoieds. In history they are known as the founders of the Median and early Chinese empires, as Scythians and Huns, and as Mongols, Tartars (Tātars) and Turks. The original home and place of departure of the Mongolians is central and eastern Asia, between the fortieth and fiftieth degrees of north latitude. More than any other division of mankind they are nomads, though in many instances they have forsaken their pastoral habits to found nations and empires.—The history of the Mongols proper begins with Genghis Khan (1162–1227), who, as the leader of a small horde in the region southeast of Lake Baikal, speedily united many tribes, and then moved to the conquest of China. His sons and grandsons continued the work of conquest until, by 1250, the whole of central Asia and part of Europe, from the Pacific ocean to the frontiers of Germany, were united under one empire. Though this empire soon broke up, a second tide of Mongol invasion, under Tamerlane, in the fourteenth century, overflowed Persia, Turkistan, Hindostan, Asia Minor and Georgia. This new empire soon in turn disintegrated; but the Mogul empire in India was in the sixteenth century founded by a descendant of Tamerlane. Though the Mongol power in Europe was broken up, and most of the Mongol tribes driven out, yet the Turks, true to the spirit of their progenitors, maintained the energy of conquest for centuries, and then "camped out" in Europe, instead of settling on the soil to improve it. The Magyars are, perhaps, the only people of historic Asiatic origin who have been thus far converted to Christianity and become European in their tastes and habits. The Mongolian peoples of central-western Asia are being gradually subdued by the Russian arms and made subjects of the czar; these military movements being but the continuation of a policy begun four centuries ago. The Mongolians of Mongolia proper number about 2,000,000, and are governed by chieftains who claim descent from their great founder Genghis Khan. Though subjects of China, they are allowed great freedom. In religion the peoples of Mongol origin are followers of Confucius, Lao Tszê, Buddha, Mohammed and Christ. Their languages are now usually classified under the head of "Turanian." See Howorth's *History of the Mongols*, London, 1876–80. W. E. G.

MONOPOLIES. Until political economy had established as a fundamental truth, and political science accepted as a rule of action, that each individual in a community is naturally free to pursue his own happiness as in his judgment he may deem most expedient, limited only by the like right on the part of his neighbor, it was almost impossible to arrive at any clear ideas upon the subject of monopoly. Roman jurists as well as English common law lawyers, after magna charta, formulated declarations of rights, which vitiated claims of monopoly and declared them to be contrary to natural justice; yet so long as government was arbitrary and unlimited in its sovereignty—the very fountain and source of all power over the individual subject, without restraint and limitation—it certainly was difficult to establish axiomatically and philosophically any limitation upon the right of the government to create monopolies. It is only when terms are set to the power of encroachment by the government itself over individual enterprise or the pursuit of happiness, that the principle can be invoked, that that impairment of individual liberty which government itself can not justly work it can not authorize others to bring about. For instance, the constitutions of the several states all contain provisions that the public burden shall be borne equally, and that no man shall be deprived of his life, liberty or property except by due process of law, and some of the state constitutions contain, in express terms, the provision of magna charta that "no man shall be deprived of his free customs and liberties," in other words, he shall not be deprived of the right to devote himself to any legitimate occupation, and to reap the natural reward of success therein. It is, therefore, clearly incompetent for a government so limited to create an artificial organism, or to permit the growth of an artificial organism, which would in effect distribute the public burdens unequally, or which in its practical effect and working prevents persons from reaping the natural reward of industry and superior intelligence in any vocation which they may have chosen. In modern times, beginning with magna charta, government thenceforth became, as to English-speaking people, not an arbitrary imposition upon a people, but a trust to be exercised for the benefit of the citizen, within the terms of limitation set by the people to the power of government. That there were great interregnums of arbitrary power exercised in England is not to the purpose, because English lawyers have long regarded the expressions of judicial opinions during the reign of the Tudors and some of the Plantagenets as non-authoritative common law doctrines as to the rights of English citizens.—We can only get rid of much loose talk which ordinarily surrounds the subject of monopoly and anti-monopoly by defining what is meant by a monopoly. The derivation of the word shows that its original meaning implied the exclusive right to sell a commodity. Its derivative meaning can no longer be strictly defined, but is applied to many forms of social manifestations, which all come under one or the other of the following heads, or under several of them. 1. Any grant by law to an in-

dividual or combination of individuals, to perform a particular service or supply a commodity, and the exclusion of others from performing or supplying the same. 2. Any grant by law to any particular person or combination of persons, to perform a particular service which in its nature makes it impossible for others to render a like service or an equally efficient service. 3. Any legal exemptions of natural or artificial persons from the burden or duties which are imposed upon other persons or corporations in the commonwealth. 4. Trade marks, copyrights and patents. The foregoing are legal monopolies. — Qualified or incidental monopolies, arising from the organization of modern society, are: 1. The engrossing of a business by an individual or combination of individuals, who, by means of the vastness of the capital invested, drive out competitors, not by a superior service, a better commodity or lower normal price which is the operation of the natural law of competition, but by losses deliberately incurred which they can bear and the competitor can not, to be recouped by excessive charges when the competitor is made harmless. 2. The exclusive possession or occupation of certain peculiarly favorably situated portions of land. 3. All industrial enterprises of a community involving expenditure of large capital for plant used in the supply of any article which is consumed or devoted to service rendered at the place and in connection with the plant or machinery by which it is supplied, and the supply of which article or convenience or service can be indefinitely increased without a proportionate increase in plant and capital. 4. The natural or cultivated aptitude or faculty to supply a commodity or render a service so far superior to others that the competitive standards of price are no longer applicable. Great artists, orators, lawyers, actors, etc., come under this head of personal monopoly. 5. What may in course of centuries grow into a monopoly, and that of an extremely burdensome character, is the individual ownership of land. — At the very outset we must recognize the fact that the greatest monopoly of all existing in society is the monopoly of government. This monopoly arises from the primal necessity of human beings for security, and government is the only furnisher of security, and allows no one else to attempt to meet the same want. It levies its own remuneration on its own conception of right, in the shape of taxes for the service performed by it; questioning its authority is deemed to be treason; and, in addition to furnishing security, government seems to have a standing option to perform whatever other services it sees fit for the community, at such prices as it may see fit, and in many instances, even in the United States, avails itself of this privilege. Thus, in addition to rendering the service of security which involves the establishment of executive and legislative offices, the organization of a judicial and police system, the building of forts and the maintenance of an army and navy, it undertakes to facilitate the opening of intercommunication between people by the building of highways and canals, deepening harbors, carrying letters and packages, and furnishing educational facilities. It claims and exercises the right to be the exclusive supplier of coined money and currency, and by tariff, bounty and tax regulation and impositions, rearranges and readjusts all the commercial and industrial occupations of the people, and for many peoples supervises and regulates the religious beliefs and institutions as well as their temporal interests; and yet all governments are frequently compelled to extend their own monopoly into new fields, for the purpose of diminishing corporate and personal monopolies which exist in the community, the pressure of which may be more burdensome because less equally distributed than that which is exercised by governments. — Although theoretically the people of the United States are masters of the situation, and determine upon the objects and expenditure of government, the will of the people is acted and reacted upon by so many influences, and is expressed by so many volunteer spokesmen upon the rostrum and in the press, and political parties that claim to be composed of the whole people are so viciously organized, that what is the true will of the people can as yet not accurately nor even approximately be ascertained. The will of the people is so often entrapped, misconstrued and misstated by interested parties who find their profit in explaining public opinion by manufacturing it or vending a spurious article, and our political methods are so defectively organized, that there is as yet no way to arrive in a populous community at a veritable expression of the popular will. It becomes, therefore, of much importance to consider, in the case of any particular movement against an industrial or natural monopoly, whether it will result in the destruction of the monopoly, or in its becoming changed into a governmental monopoly, which is as yet, even in the United States, a very different thing from giving back to the people the power which theretofore had been absorbed by the monopoly — Monopolies were instituted originally as part of the prerogative of the sovereign, either to reward favorites or as a means to replenish the exchequer. Even the grants to municipal corporations of courts-leet and the right to raise their own taxes, "to pay scot and bear lot," were frequently granted in return for a mere money remuneration. Frequently the grants arose to humble the power of some great nobleman in whose territory the burgh or city securing municipal rights was located, not because his exactions pained the royal heart, but because it made the lord of the manor too powerful a subject. Trade monopolies were granted during the middle ages because, in the first place, arbitrary regulations were the rule. All mundane as well as religious matters were supposed to require regulating. Liberty was regarded as the most baneful of influences, and wherever it existed it was immediately

eliminated, and the persons who theretofore exercised some free trade or free calling were subjected to stringent regulations. In that way every avocation was subjected to artificial bands; the number of persons permitted to pursue it was limited, and the governments of Europe down to the middle of the eighteenth century far surpassed our modern trades unions in the minuteness and unreasonableness of the regulations they constantly prescribed and enforced. Another reason for regulating trades by monopoly grants during the middle ages, was because the persons following them could thus be subjected to a stricter inquisition as to their modes of life and their habits of thought; and as ecclesiasticism was the most potent stimulant of governmental activity during the middle ages, the regulating of the trades was a correlated part to the regulating of the faith. These restrictions, however, being universal, almost wholly lost the nature of monopolies, because, in a nation where all is regulated and all circumscribed, though there is an immense waste of energy and probably stagnation in enterprise and a checking of the growth of wealth, monopoly conditions can scarcely be said to exist, except in so far as certain special trades or avocations may be more remunerative than others, and a limitation of the number engaged therein result in extraordinary gains. A survival of such trade regulations is the limitation of the number of persons who are permitted in France to follow the calling of stock brokers. And likewise in Germany surviving limitations in exceptional employments and functions indicate what was the universal condition during the middle ages. — Of trade monopoly Bentham says, "I know of but one opinion relative to it: oppression in the instance of the individuals excluded from the occupation thus engrossed, and excessive earnings in the instance of the partakers of the privilege; whence the alternation of penury with excessive plenty in a rank of life where sensual excesses supply the demand for occupation in a vacant mind, and enhancement of prices in every article connected with the subject matter of the monopoly; such appear to be the consequences to the several parties interested, to individuals excluded, individuals favored, and the community at large." — Notwithstanding the general justice of Bentham's criticisms of trade monopolies, it must nevertheless be conceded, when viewed historically, that their existence for a limited period is not only explicable but justifiable. At the times when the seas swarmed with pirates, and the navies of Europe had not yet successfully made head against them, it required extraordinary inducements to venture capital in trades beyond the high seas; and nothing short of a monopoly or exclusive privilege would tempt men, in international commerce involving shipments by sea, to take risks which can scarcely be realized by business men in these days of bills of exchange and commercial bills of lading, of insurances and steamers, and safety upon the high seas from all possible attack except that of the elements. — It must also be remembered that the merchants' companies opened at the outset their corporations to all who were willing to bear with them equal risks, and that therefore, while trading was prohibited, in such cases as the Dutch and East India companies, with the countries over which their dominion extended, to all persons not members of the merchants' companies, yet as they extended the benefits of their operations to those who were willing to share with them their risks, it was scarcely in the nature of a monopoly. It was necessary that all trades should be done under the merchants' flag because, notably in the case of the East India company in England, the company protected its traders by an army, and considerably contributed toward the expenses for the maintenance of a fleet to protect merchandise on the inward and outward passages. — The greatest abuse connected with monopolies of a trading character were those which arose from the necessity for revenue on the part of kings. Precisely as offices were sold to the highest bidders, trade privileges were sold to the highest bidders, and numberless monopolies arose and continued long after the period of necessity that had given them birth had passed away, eating out, by exactions and taxations, the commercial life of the people. The East India company had become in time so powerful, so many of the returned rich India merchants interested in the profits of the India company were sent to parliament, and the influence of their wealth permeated so many different strata of society, that the struggle to deprive that company of its exclusive privileges and to throw the empire of India open to free trade lasted almost a hundred years. The Hudson's Bay company still exercises, in a modified form, the privileges that have been granted to it, on the theory that such exclusive privileges were necessary; they doubtless were, at first, to induce men to venture their lives and their capital in so desperate an enterprise as the trapping and capturing of fur animals in the inhospitable territory of British America, thousands of miles from the protection of the British fleet or British soldiers, among hostile Indians and savage animals. — Under the head of grants by law to an individual or combination of individuals to perform a particular service, and the exclusion of others from performing or supplying the same, may be enumerated such industries of a country as are fostered and "protected" by means of a tariff so high as to exclude foreign competition. Although the inhabitants of the country as to which such a system of protection prevails are free to engage in such industry, yet exclusion by law, of sources of supply from countries more favorably situated for production, operates, as to the increase of price in the protected article, as a monopoly, in the same manner as a patent or a positive prohibition against the non-protected from purchasing the same commodity at a lower rate. In time, competition between the protected manufacturers or producers tends to

lower prices, but this is an incident which is true of almost all monopolies, however onerous, not confined to a single individual. The Paris stock exchange, limited by law to sixty members, produces the same result as to competition between those members in enabling persons who desire to deal in stocks to get their business done at a rate that is not so exacting as to deter them from making operations. Monopolists scarcely ever charge what it is possible to charge even when in combination, simply because they would thus destroy the source of their business, because substitutes for their protected article or service would come into existence, or people would be content to do without it. — Under the second class of grants by law to persons or combinations of persons, to perform a particular service or supply a commodity which in its nature makes it impossible to others to render a like or an equally efficient service, many disguised monopolies are granted in all countries. If a company or combination of individuals is organized for the water supply of a city, for gas supply, or for the building of warehouses along the river front, with special privileges to condemn land for such purposes, the possession of the field in the case of water and gas companies, and the power to select at the outset the most favorably located points for warehouses of which there may not be many at the river frontage of a city, may each in itself give to such persons or company an exclusive right, although in terms the law does not make it exclusive. The same would be true of a bridge company, if there were but one or two eligible points along the river where such a bridge or bridges could be constructed. Although other companies might come into the field, they would do so after the first company had possession of the more eligible sites, and under such disadvantages that the first company, unless properly controlled by law, has a perpetual monopoly in having that power of oppression which the second or other company can not enjoy. — A legal exemption from the burdens that all citizens naturally should bear, such as taxation, the bearing of arms, or the performance of other duties as citizens, operates precisely in the same manner as a grant of special privileges. It is immaterial, in fact and in principle, whether the person has the special privilege of taxation either through the power of charging more for a commodity than it is worth or for a service than can be obtained for it under the law of competition, or whether the person or persons or corporation is exempted from the duty which others are called upon to bear, because in either case an inequality is created which gives to the privileged class opportunities for development and for the acquisition of wealth which others do not equally enjoy, and which is counter to the fundamental principle as embodied in magna charta, that "no man shall be deprived of his free customs and liberties." In this country such exemptions have been granted in years past to banks, and more recently to railway corporations, and are most generally granted to educational and religious institutions. That there is no difference in principle between a direct grant of money and such exemptions is capable of mathematical demonstration, and yet in many states where the requirement of the constitution is that taxation shall be equal, that there shall be no state church, and that there shall be no privileged class, such exemptions have been held to be constitutional exercises of power, either from want of courage on the part of the judiciary to offend the powerful interests which enjoy such immunity, or from want of sufficient politico-economical knowledge to enable the judicial mind to see that such immunities are in point of fact of the nature of monopoly grants. — In the case of trade marks, copyrights and patents, the state grants legal monopolies on an entirely different theory from the grant of monopolies of a trading character. A trade mark is a property which even at common law has been recognized as a matter capable of individual ownership on the part of him who has created a good will therein; and although copyright (the right of an author to the exclusive possession of his intellectual product) is supposed to exist by virtue of law alone, yet even in such a case it is doubtful whether a careful analysis would not show that while the thoughts embodied in the author's works are, from the instant they are divulged, the common property of mankind, yet that form in which the author sees fit to put those thoughts is the special property of him who has given those thoughts that form. Kant insists most ingeniously that there is a natural right of property in an author's work independent of law, on the ground that a man has a right to make his speech to the community and that he alone can make it, and that no man may make it for him. When he prints that speech he simply multiplies his message to society, but he does not change the nature of his right. He alone is authorized, no matter in how many copies, to make that speech; and the publisher to whom he deputes that right is his mere agent in the multiplying of the speech; and while others may make speeches of a similar nature, no man can put the author's name to a speech that he did not make or did not authorize the making of; and therefore there is a natural right of property in the author to the speech as long as the author's name is connected therewith. Hence, if Kant's position is correct, copyright is the mere giving of legal sanction to a natural right of property, and does not partake of the nature of monopoly. — Patents, while they give a monopoly of the process or device to the inventor, on the other hand, destroy monopolies to a much greater degree than they create them. A man's right to his secret or trade is a well-recognized common law property right. In the absence of patent laws, every one making an invention would swear his employés to secresy, and would attempt as long as possible to keep the advantage of his process or his invention within the

knowledge of those only on whose loyalty he can depend. This right he has at law; the inadequate protection, however, that the law can afford to such secrets of trade, and the injurious effects upon the industrial progress of the world which the maintenance of such secrets has had, have induced society almost everywhere in the civilized part of the world to say to the inventor, "Publish your discovery to the world to the fullest possible extent; if you tell the whole truth as to your discovery we will secure to you the exclusive right to its use for a certain number of years, so that the world may have the benefit of the knowledge of the discovery or invention." Though doubts have been entertained at times as to the wisdom of patent laws, their utility, weighed as against the inconvenience of their absence, has on the whole been conceded by the leading publicists of the world. — As to all monopolies created by law, whether created in terms by the law or incidental to the law, it is the duty of the state to see to it that they do not become oppressive. An adherent, be he never so blind a one, to the *laissez-faire* doctrine of political economy, can not insist that in case of monopolies created by law the state shall let such monopolies alone. It is the constant duty of the law-making power to circumscribe the special organisms which it calls into being, for the purpose of keeping them within proper bounds and to prevent their too rapid and mischievous growth. Cases of greater difficulty, however, arise as to how society shall deal with monopolies which are qualified or incidental, and arise from the social organization. Where a business has grown to such proportions in the hands of certain individuals or combination of individuals that they can crush out competition by losses deliberately incurred by them, and which they can easily bear by reason of their enormous accumulation of capital, and which, therefore, drives out of business those who, though equally capable of rendering the service of supplying the commodity, are incapable of bearing the losses thus imposed, presents a problem which has not as yet been solved by modern society. The most flagrant and at the same time the most conspicuous example in this country, is that which is known as the "Standard oil combination." Originally a corporation with a capital not larger than that of many of its competitors, its managers, by securing special freight rates from the great trunk lines to the seaboard for their crude petroleum and the refined article, which was then manufactured by them at Cleveland, Ohio, obtained so great an advantage over their competitors that they had, on the one hand, the producer in their toils, and, on the other, so effectually destroyed their rivals in the business of refining that 90 per cent. of the enormous business done in refined petroleum in the United States, and which amounted in 1880 to 367,000,000 gallons, representing a value of $31,000,000, was engrossed and monopolized by the Standard oil combination. It is idle, because it is wide of the truth, to say that they were either superior refiners or superior producers. They simply were less scrupulous or more alert than their neighbors in making combinations with the railways, who, in violation of all proper business interests connected with transportation, and of their duty to the state, entered into a compact with them to deprive of a market others equally favorably situated for production and refining, so that the Standard oil company could purchase other refineries at any price they saw fit to pay for them, and in numerous cases purchased them simply to dismantle them so as to prevent production. When this combination, by such methods, became so powerful as to control a capital variously estimated at from ten to twenty millions of dollars, and now estimated at something like fifty millions of dollars, they openly dictated terms to the railways which prior to that time they had been in collusive combination with, and obtained exclusive control over their transportation facilities from the producing points to the seaboard. Not content with that condition of affairs, they determined to abandon the railways altogether, and constructed their own pipe lines to tide waters. Here is an industrial monopoly not created by law, which has no legal sanction for its performances or exactions, but which, nevertheless, operates precisely in the same manner as though a law had been passed placing the producers of oil in their possession, to be taxed at their own will, requiring the railway companies to charge them but such rates as they see fit to pay, prohibiting other people from engaging in the business that they are engaged in, and dismantling and destroying the works of those already engaged therein. Were such a law proposed to be enacted, the community would cry out that it was monstrous, far exceeding, in tyrannical outrage upon the community, anything that had ever been attempted by the Tudors. Yet in this free country, where all trades and occupations are supposed to be open to competition, this mischievous result has been achieved. It is clearly, therefore, the duty of the law-maker, under the principle of *salus populi suprema lex*, to insist that it is no part of the law of competition that men shall use their capital deliberately to ruin other people, and the legislator should prevent the existence of conditions which enable such unfair advantages to be obtained, to check them when they are likely to be obtained, and to undo the mischief if, by reason of the neglect of the law-maker, it has been permitted to be created. The state has a right to step in, and does step in, to protect all classes of the community who are supposed not to deal on equal terms with those with whom they are thrown in contact: clients as against lawyers, wards as against their trustees, infants as against persons of full age. Therefore some kind of protection must be afforded by law to industries which are likely to be subjected to an influence, under the guise of competition, so baneful and sinister as the one which has been exercised by the Standard oil company.

—Many other sinister combinations have existed and do exist in this and other countries. That of certain chemical manufacturers may be instanced, in which by losses deliberately incurred they have driven competitors out of the field and have maintained for a great number of years the monopoly of a market and extraordinary prices for their products, simply because they had incidentally acquired so vast a capital before their competitors came into the field that that which was a small percentage of loss on their whole business for a given year would result in utter ruin and bankruptcy to such competitors. In the rapid growth of capital in modern society these sinister forms of the exercise of its power must be carefully watched, and should become the subject of preventive legislation. — An exclusive possession of certain peculiarly favorably situated portions of land is one of those monopolies which it is extremely difficult to deal with under the modern theory of absolute ownership in land, modified only in so far as the right of eminent domain may justify its being taken for public use. The owner of a piece of property in Wall street or Broad street, New York, or upon the river frontage, has a perpetual monopoly in higher rentals, of the enjoyment of which it is difficult to deprive him without shaking one of the very foundations of society—the recognition of property in land. In most instances the burden borne by the community for the rental of such favorably located spots of land does not appear onerous, because the landlord adjusts the burden somewhat to the profits which can be made by occupation, whole or partial, of such bits of land. It is easy, however, to imagine a case where a peculiar spot of land may give its individual owner such power of exaction over the community that it is not to be borne. Should the harbor of New York fill up in such a manner that but few docks are accessible to ships of heavy draft, and those few docks belong to private individuals, it might then become necessary, for the purpose of preserving the commerce of the country or the city, for the community to step in and exercise right of eminent domain, take the land at a valuation and give it to the public at a moderate rate, or to apply the doctrine laid down by Lord Ellenborough, in a case decided in 1811, where the question of "reasonable charges" came before him on the part of the warehousemen on one of the London docks. Lord Ellenborough in that case determined, that wherever a man had so peculiarly favorably situated a piece of property that he had power to exact monopoly rates, it was part of the doctrine of the common law to limit him to reasonable rates so as to prevent him from taking an undue proportion of other men's wealth, because the policy of the English law frowned upon monopoly and favored freedom. — That enterprises such as railways have a tendency to become monopolies, although their building is quite free in the United States, arises from the nature of such enterprises. The proportion of fixed charges to mere operating expenses dependent upon the rate of business is so great in the railway, that it may almost indefinitely increase its business without at all in proportion increasing its expenses after it has once been constructed. The existing line can, therefore, almost always outbid a competitor for business as to the rate at which it sees fit to do it. As the service is consumed at the spot where it is created, and is rendered without a relative increase of expenditure for the purpose of rendering it, there is in such a case, in the nature of things, a monopoly created which demands the constant exercise of legal restraint. Although railways may be increased in number from given points, yet even when an active competition for a time prevails, the number of those railways will necessarily be so few that their interest to combine, as against their tendency to compete, will outweigh competition, and combination becomes the general result of almost all competitive railway building. After combination has been effected, the community is confronted with the fact that its service is no cheaper than it was before; that its business is done by two or three lines instead of one which previously rendered the service; that one line would have sufficed to have done the whole business, and that there is a loss of capital to the community represented by the building of the second or third line. This capital is lost because the community has failed to do its duty to limit the charges of these transporting corporations, which are enabled to earn extravagant rates of charge by the growth of the community, upon a limited business; and so large is the income, as compared with the cost of the same, that new capital is tempted into the same field for the purpose of dividing the business with the existing line, not because there is any necessity for the rival line because the existing line is incompetent to perform the work, but simply because of the profit made by the existing line upon the work performed by it; so that upon a given amount of business yielding on an expenditure of ten millions of dollars a million and a half a year profit, it will pay capitalists a fair rate of interest to expend another ten million dollars for the purpose of taking seven hundred and fifty thousand dollars net profits out of the existing line and dividing it upon the ten million newly invested. If the community were to reduce the profit of the existing line, by legal enactments, it is clear that the ten millions of dollars invested in the building of the second line would not be so invested, but would be available to the community for other purposes. No service is done to the community by the building of the new line between two given points, if prices remain the same to the community, and the business is subsequently divided between the two roads, but the ten millions of capital are diverted from other employments. If in consequence of competition between the two lines the price of carriage is reduced, the community is the gainer to the extent of such reduction; but if, after the new line

is built, a combination is made between the two roads to maintain prices so that both may earn dividends upon their capital, the community has lost for other purposes the ten millions unnecessarily invested—a very serious loss indeed. This has so frequently been the case that it is no longer a hypothetical illustration, but one taken from facts within the knowledge of every man who has observed the course of railway construction and railway wars and railway combinations in the United States; and while it is true that a competing line does touch, at intermediate points, territory which is not touched by the line previously existing, and thus incidental benefits are conferred, those incidental benefits by no means outweigh the enormous waste of capital which has been occasioned by railway construction for mere purposes of dividing business, with combination as to rates. — Gas companies and water companies stand precisely in the same relation to the community as railway companies. They have the power to exact monopoly rates simply because the plant once supplied gives to the persons or corporation who supply it an extraordinary power over others who propose to come into the business. Those who come into the business, come not to supply a superior article at lower rates as in ordinary businesses, but to divide the field; and they soon discover that to divide the field profitably they must maintain rates, and therefore two mains are frequently laid side by side in large cities by gas companies where one would suffice to supply all the necessary gas. The community is no better served; the same rates are maintained as to gas that have existed theretofore, and the same poor commodity furnished, because the individual householder does not stand in a position of equality with the corporation that supplies him, and the injustice to which he is subjected is so small to him individually, although amounting in the aggregate to great profits to the corporation, that it scarcely pays him to conduct a fight. The community, therefore, in such cases is generally the loser, as to capital, of all that portion of plant which occupies the same field that is already occupied with means of abundant supply on the part of the existing corporation before the competitor came in — The same rule applies as to water supply. Hence, in all such cases it is the duty of the community, through its law-making and judicial powers, to prevent waste of capital. This can be accomplished by regulation as to price and regulation as to quality of commodity or service to be supplied. The ground of such regulation is not simply that some of these corporations exercise the right of eminent domain, but is based on the principle well recognized at common law from its earliest development, that where parties do not stand in equal position to make a contract it is the duty of the state to see to it that the contract is fair, and where parties who do not stand toward each other in equal position, from the nature of circumstances are compelled to make a contract, it is the duty of the state to prescribe the terms of such contract. A trader along the line of a railway is compelled to make his contract with the railway corporation from the nature of his business and the nature of the business of the railway. It is the duty of the state to see to it that he is not unjustly discriminated against, and that others do not obtain terms which he himself does not get. — During the great railway investigation in the state of New York the one underlying principle as to traffic charges which the managers of the two great leading railways of this country insisted upon during the whole course of that investigation was, that they had a right to charge what the traffic would bear; in other words, that they had a right to charge all that they could under the given circumstances enforce the payment of. Throwing aside all question of the fact that the railway corporation exercises the right of eminent domain, and that it is a common carrier, it is peculiarly and specially subject to legal restraint on the grounds mentioned by Lord Ellenborough in his decision already referred to, that its position is one of advantage toward the person dealing with it. The parties do not stand in equal relation as to contract. This is a doctrine which, even in private businesses where the parties do not stand on equal ground at the time when the contract is made, prevents contracts from being enforced in favor of the superior who made the most of his situation. In the middle of the night a citizen needs the service of a doctor to save the life of his child. There is but one physician within miles, and before he can secure the services of another his child may die. He is a rich man. Were the doctor to exact, as the condition of his leaving his house, half of the wealth of the man, "because that is what that service might bear" under those peculiar circumstances, and the victim were willing to make a contract to give it to him, any properly constituted court of equity would give him relief, and if he had paid the exorbitant demand he could recover it back. But so little restraint have industrial and carrier corporations in the United States been subjected to that not only have they in the past but they even now claim that they are to be regarded as entirely private enterprises to be left free from legal interference, and that as the basis of their treatment of the traveler and freighter they will, when they can, apply the monstrous doctrine that they have the right to take advantage of their position as against them, and exact the last farthing of the amount that the traffic will bear. — Monopolies of this industrial character are more difficult to deal with in the United States than in any other part of the civilized globe. Not only have they already attained such proportions that the legislative machinery of many states is under their control, but they also have extended their influence into the business of politics, and so largely control the politicians of the country that every attempt to subject them to proper supervision has, because of that overshadowing influence which they have already acquired, proved thus far well nigh fruit-

less. Their influence does not rest, however, only in the fact that they have the machinery of politics under their control. The public press, particularly in metropolitan centres, is in part owned or controlled by persons holding large interests in such enterprises, and thus public opinion is vitiated upon these subjects to a degree not easily understood. Another difficulty in subjecting them to proper control and exercising the right of the public upon these subjects, is the well-grounded suspicion of the community that the monopoly of the politician is one not less dangerous than that of the industrial and carrier enterprises, and that to subject to governmental control the great corporations in the state, involving hundreds of millions of dollars of capital, is simply to substitute a master no more scrupulous without capital in the place of one which is at least restrained and made conservative by the possession of capital. One of the reasons why the reform of our civil service, reform of our methods of legislation, and reform in our representative system, are so imperatively demanded, is because such reforms lie at the basis of all other reforms, and that under existing conditions the public will not and can not trust its law-making, executive and judicial powers so long as there is a feeling that they are not free from corruption, and that the power that they exercise will be exercised for their personal ends and not for the public weal. There is scarcely a state in the Union in which the adjournment of its legislative body is not hailed with delight, nor its convening regarded with dread by the citizens of the state, and so long as this feeling is justified, it is almost hopeless to clothe such legislative bodies with power sufficiently great to hold other sinister powers in check. Such a transfer of power is quite fairly regarded as making a leap into the dark. — Another difficulty in the United States, in dealing with the existing industrial enterprises, is fundamental. Railways extending from state to state, from one side of the continent to the other, overleaping state lines and disregarding them, renders each state powerless to deal with corporations of this character as a whole, and it can only deal with the section it happens to have control over, and the power of the United States has as yet not been sufficiently concentrated to deal with the subject adequately. In our loose organization of government—intentionally made loose at the time of the adoption of the constitution of the United States—as the monopoly power that was then to be apprehended was that which arose from government itself, government was, therefore, intentionally and deliberately weakened, and it has therefore become a prey to almost any powerful interest that sees fit for the time being to capture it; and thus while the framers of the constitution took great care that there should be no laws of primogeniture, that perpetuities shall be prohibited, that no nobility should be created, so that capital, honors, fame and even distinguished services shall give to their possessor only a temporary benefit, and that such capital, honors and fame shall all be again distributed by the natural process of death into the body of the community, they did not foresee that the great moneyed corporations of the community would prove more attractive than patents of nobility, would be more potent than the fame of leaders of armies, would concentrate capital more powerfully and continuously than by the process of mortmain and perpetuities, and would be more dangerous to the body politic as to its freedom than an aristocratic class. — With power to exact monopoly rates incident to that kind of superior personal ability embodied as to oratory in a Webster, as to art in a Meissonier, as to acting in a Rachel, as to forensic ability in a Choate, no quarrel can be made. These phenomenal abilities commanding phenomenal prices for their services are entitled to what they earn, because no man is required to pay who does not think he will obtain what he deems an equivalent service or pleasure. Monopolies which arise from natural advantages we can therefore dismiss from the purpose of this article. With the exception of trades union regulations we know of no human society or class of men who object to the remuneration which these masters receive in their respective professions. Of course these advantages are of infinite gradation; exist between two bricklayers as well as between two lawyers; but it is only in the case of great special aptitudes that command attention that these distinctions become so characteristic that they partake of a monopoly element, and as the monopoly dies with the individual who possesses the power, and frequently exists but for a short span of years, it is one, as we have said, with which we can find no fault and which does no harm. — As to the subject of ownership in land, which has recently again come up for discussion as a monopoly, by the revamping of arguments which Proudhon presented with most *esprit*, suffice it to say that the individual monopoly in land is in the present organization of society the only possible condition on which land can safely be held. The only alternative which is or can be presented by those who object to the monopoly in land on the part of the individual, is that of the ownership by the community. The ownership by the community means the ownership by the government. The ownership by the government means substantially the control of such ownership by those who have for the time being possession of the reins of government; and government is as yet so utterly defectively organized, so little even in free countries does it represent either the will or the interests of the whole people, and so far are the incumbents of official positions from subordinating their own personal interests and the interests of their families and friends to that of the public weal, that such ownership by the public, which in other words means control by the politician of all the landed property of the community, would create a tyranny so burdensome and so intolerable, and cre-

ate unequal taxation so monstrous, that nothing in modern history would at all form a parallel. Imagine Tweed and his gang of thieves, when they had control of the treasury of the city of New York, at the same time controlling every lot of land in the city of New York as to who was to occupy it and at what rental, and picture the utter impossibility of dislodging him and them from power, and how such ownership by the state or community as represented by Tweed and his junta would have been exercised. Indeed it appears to the writer to be the vainest of occupations during any period of time about which we need to give ourselves any concern, in a country where land is still so easy of attainment, and at so cheap a price, to speak seriously of monopoly of land as being likely to become burdensome; and to suggest public ownership as an alternative, against the monopoly of private property, before an entirely different condition of political morality will prevail, seems puerile. It may be conceded at the outset that the ownership of land is a monopoly, but it is a monopoly which society is compelled to recognize from the necessity of the case so as to prevent a much worse monopoly from taking its place. We need not, therefore, shut our eyes to the fact that in the remote future the time may come when individual ownership in land may become a burdensome monopoly. It is to be hoped, however, that when that time does come, those who then are uppermost in the field of politics and of government will be so vastly superior in character and mind to the present prevailing politicians and so-called statesmen that the ownership in land may then safely be transformed from a personal into a governmental monopoly.

SIMON STERNE.

MONROE, James, president of the United States 1817–25, was born in Westmoreland county, Va., April 28, 1758, and died at New York city, July 4, 1831. He was graduated at William and Mary in 1776, served in the continental army, studied law with Jefferson, and was a delegate from Virginia to the continental congress 1783–6. He was a democratic United States senator 1790–94, minister to France 1794–6, and governor of Virginia 1799–1802. He was again minister to France in 1803, to Great Britain in 1803, and to Spain in 1805. In 1811 he again became governor, and thence became secretary of state during the rest of Madison's two terms. He became president in 1817, and was re-elected in 1820, coming short but one of a unanimous electoral vote. In 1831 he removed to New York city. (See X. Y. Z. MISSION; ANNEXATIONS, I.; EMBARGO; QUIDS; CAUCUS. CONGRESSIONAL; INTERNAL IMPROVEMENTS; MONROE DOCTRINE; DEMOCRATIC PARTY, IV.; ELECTORAL VOTES; UNITED STATES.) — In his earlier political life Monroe was decidedly more ultra than the more conservative Madison, and his "View of the Conduct of the Executive" shows him to have been a democrat rather than a republican. In 1808–9 he was Madison's unsuccessful rival for the presidency, but afterward entered his cabinet and succeeded to his office in due course. His presidency was marked by a disappearance of old political issues. (See ERA OF GOOD FEELING.) — Monroe's correspondence is still in the department of state at Washington, inedited; but it has been used by Schouler, as cited below. See Monroe's *View of the Conduct of the Executive, The People the Sovereigns,* and his messages in the *Statesman's Manual;* Adams' *Life of Monroe;* Waldo's *Tour of President Monroe in* 1817; 2 Schouler's *United States;* and authorities under articles above referred to.

ALEXANDER JOHNSTON.

MONROE DOCTRINE. Soon after the overthrow of the empire of the first Napoleon, the rulers of Russia, Austria, France and Prussia formed an alliance for mutual protection, not against aggression from foreign powers, but against revolutionary movements within their own states. At a congress held by the allied powers at Troppau (1820) it was agreed that the main purpose of the alliance should be to maintain the principle of the legitimacy of the existing dynasties; and that if this principle were threatened in any country in Europe the allied powers should preserve it by actual and armed interference. Popular risings having taken place in Piedmont and Naples, they were put down by the armed forces of Austria, in pursuance of measures taken at the congress at Laibach (1820), and the revolution in Spain against Ferdinand VII. was suppressed by French armies, in consequence of resolutions taken at the congress of Verona (1822). — At the first two congresses the English government, then represented by Castlereagh, had, although not strictly one of the allied powers, participated in and sanctioned the proceedings. But at the point of starting for Verona Castlereagh committed suicide, and George Canning, becoming secretary of state, disapproved of the Spanish intervention. After the restoration of the Spanish king, Canning thought he had reason to believe that the principle of intervention would be also applied to the reduction of the American colonies of Spain, which ever since 1810 had been successively drifting into open revolt. These colonies had freed themselves from the colonial bondage which fettered their trade with the outside world, and England had largely profited by their independence. That independence had already been recognized by the United States, and both interest and sympathy made the latter strongly opposed to any effort toward reconquest on the part of Spain. — In the summer of 1823 Mr. Canning mentioned his suspicions to Mr. Rush, the American minister in London, and expressed his great desire to have the United States join with him in endeavoring to thwart the object of the allied powers. Speaking of a cabinet meeting held in September, 1823, Mr. J. Q. Adams, then secretary of state to Mr. Monroe, says: "The subject for consideration was the confidential proposal of Canning, secretary of

state, to R. Rush, and the correspondence between them relating to the project of the holy alliance upon South America. The object of Canning appears to have been to obtain some public pledge from the United States ostensibly against the forcible interference of the holy alliance between Spain and South America, but really or specially against the acquisition by the United States of any part of the Spanish possessions." ("Memoirs of John Q. Adams," by Chas. F. Adams, vol. vi., p. 177.) For Mr. Rush's dispatches of Aug. 23, 1825, see "The Court of London, 1819–1825," by R. Rush, republished by his son, London, 1873. Mr. Adams thought lightly of the matter, (see his diary of September, October, November, 1823, *passim*), but Mr. Monroe and other members of the cabinet, particularly Mr. Calhoun, were, as Mr. Adams says, "very much in fear that the holy alliance would restore all South America to Spain." Upon long and careful consideration it was finally agreed to express some disapprobation of the scheme in the message; and the passage relating to this subject, and also another relating to the claim of Russia to part of the northern Pacific coast, was much debated, and also submitted as finally adopted by the cabinet to Mr. Jefferson and Mr. Madison. The annual message of 1823 contained the following sentences in regard to the first point: "We owe it to candor and to the amicable relations existing between the United States and the allied powers to declare, that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. *With the existing colonies or dependencies of any European power we have not interfered, and shall not interfere; but with the governments which have declared their independence and maintained it, and whose independence we have, on great consideration and just principles, acknowledged, we could not view an interposition for oppressing them, or controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the United States.*" In another part, with reference to the Russian claim of occupation, and also, perhaps, as Mr. Adams suggests, with reference to a supposed cession by Spain of part of its colonies, in case of success, to other European powers, which might colonize some of the sparsely settled Spanish possessions, the following expression occurs: "The American continents should no longer be subjects for any new European colonial settlement." In these passages is found what has since been called the "Monroe doctrine." The Russian claim was soon amicably settled, as was also a similar controversy with Great Britain on the same Pacific coast by the treaty of Washington in 1846. It was afterward contended that the allied powers never had any such intention as Mr. Canning supposed, and France publicly disavowed any such purpose. Mr. Adams also disbelieved it. There can be no doubt, however, that something like an interference was suggested by the new ministry of the restored king of Spain. It appears from the "Memoirs of Prince Metternich," but recently published, that as lately even as in the summer of 1824, and several months after Mr. Monroe's message became known in Europe, a note was addressed to the allied powers, by the Spanish minister of foreign affairs, proposing a conference to be held at Paris, to take into consideration the regulation of Spanish American affairs, and to which England should be invited. France, Austria, Russia and Prussia adhered to the plan, but the invitation was met by Canning with an "almost brutal" refusal. (*Memoires de Metternich*, vol. iv., p. 97, and note, Paris, 1881.) Considering the great power then exercised over the whole of Europe by the allied powers, and the submission everywhere yielded to them, even in many instances by England herself, this declaration on the part of the United States, then comparatively a weak power physically, by Mr. Monroe, was a bold patriotic manifestation, and the spirit which dictated it will ever be highly appreciated, as it was at the time, even in Europe, by all the liberal classes. It strengthened England in her opposition to European intervention, and hastened her recognition of the independence of the Spanish American colonies.— The meaning of this declaration was very plain. Some of the colonies founded by Spain on this continent had declared themselves independent, and had thus far successfully sustained that independence. The United States having recognized their independence, there is reason to believe that the allied powers contemplated interference between those independent governments and Spain according to the system of intervention which they had proclaimed in Europe, and just carried out with so much success. Against this intervention the government of the United States might feel bound also to intervene. Nothing was said about the United States abandoning the neutrality which it had hitherto observed between Spain and her rebellious colonies. If Spain would reconquer them she might try, but the United States would not permit that to be done with the assistance of the allied powers, who were bent not only on sustaining and propagating absolute monarchical government in Europe, but also on introducing that form of government into the new world by their system of intervention. — This was the view Mr. Jefferson took in his reply to Mr. Monroe, when the message had been submitted to him. He expressed himself as follows: "I could honestly, therefore, join in the declaration proposed that we aim not at the acquisition of any of those Spanish American possessions; that we will not stand in the way of any amicable arrangement between them and the mother country; that we will oppose with all our means the forcible interposition of any other power, as auxiliary, stipendiary, or under any other form or pretext, and most especially their transfer to any power by conquest, cession or acquisition in any other way."— To leave no doubt upon the

true construction of the Monroe declaration, and to do away with false impressions, which had even then begun to prevail with some, the house of representatives in 1825 passed the following resolution: "That the United States ought not to become a party with the Spanish American republics, or either of them, to any joint declaration for the purpose of preventing interference by any of the European powers with their independence or form of government, or to any compact for the purpose of preventing colonization upon the continents of America; but that the people of the United States should be left free to act in any crisis in such a manner as their feelings of friendship toward those republics, and as their own honor and policy may, at the time, dictate." In other words, the United States should not be fettered by any doctrine or programme, but left free to act as occasion might require. Mr. Calhoun, one of the advisers of Mr. Monroe, and who took most interest in the declaration, (see Adams' "Memoirs and Diary" of September–December, 1823, *passim*), speaking of the Monroe doctrine, in the debate in the senate on the question of the acquisition of Yucatan, asserted most emphatically that "the United States was under no pledge to intervene against intervention, but was to act in each case as policy and justice required." (See note 36 to p. 97, Wheaton's "International Law," by Dana.) A resolution introduced by Mr. Clay, January, 1824, in the house of representatives, "deprecating European combinations to resubjugate the independent American states of Spanish origin," and thus giving support and emphasis to the declaration in the message of December, 1823, seems never to have been acted upon, and was not referred to any committee. — Mr. Benton, in his "Abridgment of the Debates of Congress, 1789–1856," vol. vii., p. 470, accompanies the paragraph of Mr. Monroe's message given above, with an extensive note in which he says: "This paragraph contains the doctrine so much quoted then and since as the 'Monroe doctrine'; and the extent and nature of which have been so greatly misunderstood. It has been generally regarded as promising a sort of political protection or guardianship of the two Americas—the United States to stand guard over the new world and repulse all intrusive colonists from its shores. Nothing could be more erroneous or more at war with our established principles of non-interference with other nations. The declaration itself did not import any such high mission and responsible attitude for the United States; it went no further than to declare that any European interference to control the destinies of the new American states would be construed as the manifestation of an unfriendly spirit toward the United States. This was very far from being a pledge to take up arms in the defense of the invaded American states; and the person of all others, after Mr. Monroe himself, and hardly less authoritative on this point—Mr. Adams, his successor in the presidency—has given the exact and whole extent of what was intended by the declaration." Mr. Benton concludes this note as follows: "The occasion for the Monroe declaration was this: Four of the powers which overthrew the great emperor, Napoleon I. —Russia, Austria, Prussia and France—having constituted themselves a 'holy alliance' for the maintenance of the order of things which they had established in Europe, took it under advisement to extend their care to the young American republics of Spanish origin, and to convert them into monarchies, to be governed by sovereigns of European stock, such as the holy alliance should put upon them. It was against the extension of this European system to the two Americas that Mr. Monroe protested, and being joined in that protest by England, the project of the allies was given up."—Since that time there never was any real occasion to press the Monroe doctrine into service. It went into the domain of past history. The only time, perhaps, when apparently there was a similar concatenation of circumstances to those of 1823, was when an auxiliary army of French and Belgians invaded Mexico, to assist Maximilian, of Austria, in securing to himself the imperial throne offered to him by a powerful faction of the Mexican people. But even then, Mr. Seward repudiated the "Monroe doctrine" as not applicable to the circumstances. —In a dispatch to Mr. Motley, the American minister at Vienna (Oct. 9, 1863), who had expressed great alarm at the expedition of Maximilian, and sought instructions as to asking the emperor of Austria for explanations, and had also referred Mr. Seward to the Monroe doctrine, Mr. Seward instructed the minister not to interfere, using these remarkable words: "France has invaded Mexico, and war exists between the two countries. The United States hold in regard to those two states and their conflict the same principles that they hold in relation to all other nations and their mutual wars. *They have neither a right nor any disposition to intervene by force in the internal affairs of Mexico, whether to establish or maintain a republican or even a domestic government there, or to overthrow an imperial or foreign one, if Mexico shall choose to establish or accept it.*" —In a popular and much wider but indefinable sense, the Monroe doctrine means what Mr. Benton said was a misconstruction of it, that is, a sort of political protection or guardianship of the two Americas, to be exercised by the United States.

G. KOERNER.

MONTANA, a territory of the United States, formed of part of the Louisiana cession. (See ANNEXATIONS, I.) It consists of 143,776 square miles, bounded north by British Columbia, east by Dakota, south by Wyoming and Idaho, and west by Idaho. It was organized by act of May 26, 1864, its territory being taken from Idaho. Its population in 1880 was 39,159. Its capital is Helena, and its governor in 1882 is Benj. F. Potts. — The act of May 26, 1864, is in 13 *Stat. at Large*, 85.

ALEXANDER JOHNSTON.

MONTENEGRO, a principality formed of a group of mountains on the west of Turkey, between Herzegovina on the north, Albania on the east and south, and Dalmatia on the west; on the latter side it is only separated from the basin of Cattaro and from the Adriatic by a strip of Austrian territory one league wide. Its area is 3,550 English square miles. The country is composed of Tsernagora, old Montenegro, and the Berdas, mountainous districts annexed at different times, and the annexations effected in 1878, including Dulcigno. The land bristles with pointed cliffs, and is intersected by walls of rocks; there is no easy communication with the world outside, except by the way of Lake Scutari. The capital is Cettigne, situated in Tsernagora. The population, which was estimated at 25,000 in the seventeenth century, and at 100,000 in 1835, in 1879 had increased to 250,000. — The principality of Montenegro dates from 1485, when the Turks succeeded in destroying the kingdom of Serbia. The last of the Serb princes of Zeta, Ivan Tchernojevitch, being unable to hold the country, went to Tsernagora with his most faithful companions, added intrenchments to the natural defenses, and established his residence at Cettigne together with the episcopal liege. Thirty years later, power fell to the bishop; a third prince, George, married a Venetian, who, soon becoming disgusted with the rude and austere life of Montenegro, persuaded her husband to forsake the principality for a life in Venice. — The history of this country is simply a succession of stubborn conflicts between an indomitable little people and the neighboring pashas. The Montenegrins were always glad to serve the Venetians and Austrians as auxiliaries against the Turks, and when, abandoned in the treaties, they were left to their own resources, they continued nevertheless in a state of persistent hostility. Completely defeated in 1623, they were obliged to pay the haratch; but at the commencement of the eighteenth century when Russia began her policy of aggrandizement, she found in these eternal enemies of Turkey natural allies by the community of origin and religion During the campaign of the Pruth the Montenegrins massacred 30,000 Turks. Vengeance did not delay its appearance; sword and flame spread desolation through Montenegro, and of the population there remained but the remnant which had escaped to the highest summits of the mountains and toward Cattaro. On the withdrawal of the Turks, however, the desert which they had made was repeopled; the principality was reconstituted under the protection of Russia. At the congress of Paris, Prince Daniel demanded absolute independence, hereditary power, and an outlet for the country by the cession of a port on the Adriatic. England had these demands set aside. Turkey, emboldened by this act, launched an army on Montenegro, and sustained a sanguinary defeat at Grahova. An international commission was intrusted with the tracing of new boundaries; but Prince Daniel was assassinated in 1860; fortune changed; and the victorious porte had a military road constructed across the country, with blockhouses occupied by Turkish troops. On the representations, however, of various powers, the blockhouses were demolished, and the porte, while preserving its sovereignty, consented to the maintenance of the territorial and administrative *statu quo* of Montenegro. This country, therefore, is semi-sovereign. Its constitution underwent considerable changes in the middle of the present century. The bishops (*vladikas*) being vowed to celibacy, had to designate their successors by will; then every new prince, monk or layman, was obliged to go abroad to be consecrated by a Greek metropolitan. At the death of Peter II., in 1851, his successor, Daniel, declared that to remove these difficulties he resigned the spiritual power, and his resolution, submitted to the assembled people, was sanctioned almost unanimously. Peter II. undertook to give more power to the government by beginning a centralization which his successor completed. Families descended from a common ancestor continued to form a tribe, *plemya*, but instead of being submitted to the patriarchal government of an hereditary chief, each plemya received as chief a captain appointed by the prince, paid by the state and liable to be deposed at any time. In each village of a plemya was established, in like manner, a lieutenant, dependent on the captain. The plemyas were distributed into eleven districts, called *nahias*, four of which formed old Tsernagora, and seven the Berdas. At the head of each nahia was placed a senator, intrusted with its administration, and with dispensing justice, and subject to the prince in the same way as the captains and lieutenants. — In 1855 Prince Daniel promulgated a code, in which he succeeded very skillfully in reconciling the ancient customs of the country with the new duties which were imposed on it. This code, which forms a political constitution in ninety-three articles, as well as a collection of civil and criminal law, has effected immense progress. Besides the prince, there is a senate, composed of sixteen members, intrusted with deliberating on public affairs on which the prince asks its advice; passing judgment on offenses involving more than 100 francs fine, and deciding on appeals from judgments rendered by the captains of the plemyas. The president, vice president and members are appointed by the prince; they receive a salary and are lodged at the expense of the state. The assemblies are held at Cettigne, in a long, thatched building, divided into two parts, one of which serves as a stable for the asses and mules which bring the senators from the villages, and the other as the hall for deliberation. — Every inhabitant from seventeen to fifty years of age is obliged to render military service at the first call of the prince. It is calculated that in this way 25,000 men are in a condition to bear arms; but as only three-fourths of them can be put into the field, the prince designates the nahias which are to furnish their contingents, or fixes the number

of men to be taken in each nahia. Each individual furnishes his own arms, and, taking as many cartridges as he finds, and as much provision as he can carry, sets out for the place of muster. There are no quartermasters' departments or camps; the men sleep without tents where they can; they eat if the women bring them provisions, or if they make raids. The senator of the nahia is the commander of its contingent; he has lieutenants under his orders who are chiefs of the villages, and each commands 100 men; under these are corporals who command ten men. There is a permanent and paid military body for the purpose of maintaining order, the *perianiks*. These soldiers are distributed in the nahias, under control of the senators and lieutenants. They are also connected with the guard of the house and person of the prince; for this purpose fifteen of them are always at Cettigne, and are changed every month. — The industrial productions consist only in a powder mill established by Peter II., in woolen stuffs, and in cloth of gold or silver, which the women spin and weave. The rearing of cattle is the chief occupation of the inhabitants. There are few cows, but many sheep and goats which form an article of exportation, together with honey, sumac wood, trout and other fish, smoked or salted. Daniel had a great number of mulberry trees planted, and silkworm cocoons figure among the exported products. In the nahias, sheltered from the north winds on the side of Lake Scutari, fruits and vegetables are produced in abundance; also wine and tobacco Arable lands, however, are rare; every space with productive earth is surrounded with a wall of dry stones and planted carefully with Indian corn, rye, barley, oats and vegetables. Potatoes, introduced in 1780, are produced abundantly, and sold in the market of Cattaro. In exchange for their products, the Montenegrins obtain from the neighboring countries necessary manufactured articles, which, owing to the simplicity of their manners, are few; they are chiefly tools, coffee, salt, lead and arms. — Wars, and the new organization of the country, have increased the public expenses and necessitated additional taxation. The receipts are made up of the personal tax, customs duties, the products of the farming of spirituous liquors and sumac wood; the total amounts to about 120,000 francs, which does not entirely cover the expenditure. The prince has his civil list, obtained in part from the fisheries and the product of several farms. To these receipts, which amount to about 70,000 francs, is added an annual subvention of 8,000 ducats, which he receives of Russia, and which makes a total of about 166,000 francs. But custom imposes on him heavy expenditure; he has presents to make, assistance to give; he aids in filling the deficit in public receipts, and in case of famine he imports grain from abroad. The finances still retain the character of the ancient régime of the vladikas. — BIBLIOGRAPHY. MORAL AND POLITICAL SCIENCE. J. B. Say, in the passages which we quote below, has defined the nature, object and utility of moral and political science in such a manner that there can be no need of our adding anything upon the subject. — "The general laws which constitute political and moral science exist in spite of disputes on the subject. This is so much the better for those who would discover these laws by means of judicious and continued observation, demonstrate their connection, and deduce the consequences which result from them. They flow from the very nature of things, just as certainly as the laws of the physical world; we do not imagine them, but find them; they govern the men who govern others, and can not be violated with impunity. The general laws which regulate the march of things are called *principles*, as soon as it is a question of applying them; that is to say, as soon as they are made use of to judge of circumstances, and serve as a rule of action. The knowledge of these principles alone insures the success of this march, which is constantly and successfully directed toward a good end." — After defining the experimental method, the same writer adds: "The natural, physical and mathematical sciences must be the first to share the progress which method renders possible: the facts upon which they are based affect the senses more directly; it is more difficult to deny them; their investigation does not wound any interest; a man may study physics in the Austrian states without exciting the alarm either of the prince, the nobles, or the clergy. The same can not be said of moral and political science. Its study is proscribed in all countries that are governed in the interest of a few, and Napoleon prohibited it in all the institutions of France, as soon as he became all powerful. Vain effort! If moral and political science is, like other sciences, based upon

* The constitution of Montenegro was somewhat changed in 1879. The executive power rests with the reigning prince, while the legislative power is vested in a state council of eight members, one-half nominated by the prince and the other half elected by the male inhabitants, who are bearing or have borne arms. By the "administrative statute" of 1879, the country was divided into eighty districts and four military commands. — There are no official returns of the expenditure and revenue of Montenegro. The former is estimated, however, at 180,000 Austrian florins and the latter at 300,000 florins per annum. There is no public debt.

realities, it shares in the progress which the human mind owes to experimental methods; but is it based upon realities? If we consult experience and repeated observations, many moral facts may acquire a certitude equal to that of many physical facts. We see them, and see them repeated a thousand times; by means of analysis we know their nature, their formation and their results; we can not doubt their reality. After weighing gold and iron several times, we are convinced that gold is comparatively heavier than iron; this is an indubitable fact; but it is no less real a fact that iron is less valuable than gold. However, value is a purely moral quality, and one which seems to depend upon the fleeting and changeable will of men. Nor is this all. The spectacle of the physical world presents to us a series of phenomena, linked one to another; there is no fact which has not one or several causes. All other things being equal, the same cause can not produce two different effects: the grain of corn which I plant does not produce at one time an ear of corn, at another a thistle; it always produces corn. When the land is mellowed by cultivation and fertilized by manure, the same field will, with an equally favorable season, produce more than if the land had not been treated in this way. Thus it is that like causes always produce like effects. Now, it may be readily perceived that the same is true in political economy A fact is always the result of one or several facts which have gone before it, and are the causes of it. The events of to-day have been brought about by those of yesterday, and will exert an influence over those of to-morrow; all have been effects and will become causes, just as the grain of corn, which, being a product of last year, will produce the ear of corn of this year. To pretend that any effect whatever in either the moral or the physical world happens without a cause, is to pretend that a plant may grow without the seed having been sown; it is to suppose a miracle. Hence has originated the expression *the chain of events*, which proves that we regard events as links which are connected one with another. — But what certainty have we that a fact which goes before is the cause of one which follows, and that a series of links connect these two with one another? We attribute an event which we witness to a certain circumstance that went before it; but may we not be mistaken? The circumstance that preceded the event was perhaps not the cause of it. It is because it does not know the true causes of events that the human mind seeks for supernatural causes, and has recourse to superstitious practices and charms, the use of which was so common in times of ignorance; useless and sometimes injurious practices, which always have the deplorable effect of turning men away from the only means whereby they can attain the end desired. — A science is complete in its relations to a certain order of facts, in proportion as it is possible for us to point out the bond which unites these facts to one another, and to connect effects with their real causes. This is achieved by scrupulously studying the nature of each thing that plays any part whatever in the phenomenon which we desire to explain; the nature of things discloses to us the manner in which things act and the manner in which they support the actions of which they are the object; it shows us the relations and connections of facts one with another. Now the best way to ascertain the nature of a thing is to analyze it, to see in it everything that it contains, and nothing but what it contains. — To produce values, we do not act upon insensible beings only, nor do we employ only material properties. We have more to do with men who have wants, desires and passions, and who are subject to the laws which are imposed upon them, some of them by their nature as men, others by society, of which they are members. To guide us in our labors all these laws must be known, and to be known they must be studied. This is the object proposed by moral and political science, whose end is to study moral and social man. These laws are very numerous in the social state, because in this state our relations with men and things are extremely numerous. This study embraces not only the laws which flow from our moral nature or our physical wants or from our means of satisfying them, but also the laws of the body politic, civil and criminal legislation. — In speaking of the laws to which men and things are subject, note that I do not examine in virtue of what right such or such a law is imposed upon them, nor in virtue of what duty they submit to them. The *fact* and not the *right* is what we are considering here. I call *law*, whether in physics or in morality, every rule from whose influence we can not withdraw ourselves, without concerning myself with the question whether that rule be equitable or not, or whether it is baneful or beneficial, questions which are the object of a different study from that which we are now considering (political economy). — The knowledge of the nature of things, moral and physical, and of the laws which flow therefrom, can be acquired only by numerous observations, repeated experiments, comparisons and combinations beyond number. All this requires profound meditation and assiduous study. The more science is extended and perfected, the longer and more difficult this study becomes; for a science extends because it comes to consist of a greater number of observed relations and of a greater number of laws discovered or recalled to memory. When the branches of human knowledge are very numerous, the life of man is not long enough to learn even one single order of facts and laws, that is, one single science. A savant, therefore, is thought to have used his time and faculties well, and to have rendered sufficient service to his fellow-men, if he has thoroughly mastered a single branch of a single science. Pythagoras and Thales knew all that could be known in their time. Aristotle wrote the best books of his age on politics, morality,

belles-lettres, and natural history; but if he lived in our day, not only would he have to renounce *belles-lettres* to study all there is to be learned of natural history, but, supposing that he wished to make himself a master of one single branch of natural history, such as botany or mineralogy, he would be obliged to limit himself to a superficial acquaintance with the other branches. To become famous in mineralogy, he would have to leave to other savants the study of animals and plants. Thus only could he hope to extend the sphere of that branch of knowledge which he had cultivated." J. B. SAY.

MORALITY, Agreement of, with Political Economy. Something more than a century ago, some men of genius, in searching for the causes of the wealth of nations and giving a systematic exposition of the phenomena observed, laid the foundations of a new science under the name of political economy. Since that time, and under the influence of studies of this nature, incontestable improvements have been accomplished in every civilized country; and if we were to enumerate all the reforms brought about and the abuses abolished by political economy, and all the fruitful applications of the principles newly brought to light under this name, we should proclaim that the science of Smith and of J. B. Say, of Droz and Bastiat, of Malthus and Ricardo, deserves one of the highest places in public esteem. Inoffensive in its nature, intended to render prosperity as general as possible, reaching, so to speak, a material demonstration of the precepts of justice taught by religion and philosophy, political economy should be above all attack: it has, however, met with numerous and violent adversaries. They not only contest its efficacy; they often question even the morality of its tendencies. This reproach, however unjust it may be, is too grave to be despised. We shall therefore inquire here as to the cause of these accusations, and what foundation they have. — The attacks directed against political economy come from three entirely different sources. First, there is in the religious world a certain number of persons who, having heard it spoken of as a science whose end is the *creation of wealth*, imagine that it must be contrary to the self-denial taught by the Gospels. More zealous than enlightened, these persons overlook the fact that it is a question not of the selfish enrichment of certain individuals, but of the production of goods indispensable to the human species, in order that it may perpetuate itself according to the direction of Providence, and develop according to the laws of eternal justice. A second group of adversaries is made up of utopists. These latter, never having taken the pains to study the theories which they assail, are convinced that political economy reigns and rules in our contemporary society. Hence, they hold it responsible for the grievances, more or less manifest, of which they complain. They execrate the principle of *laissez faire*, as if the operations of industry met with no obstacles; they blame the principle of *laissez passer*, as if there were no barriers between nations. The adversaries of the third class are the most formidable to the science, because, from a narrow and restricted point of view, their complaints have some appearance of reason, and they have the faculty of identifying their private affairs with the most respectable interests; they are those who profit by monopolies and privileges condemned by political economy. They seldom take the trouble to ascertain whether a reform will not be as advantageous for themselves as for those who demand it. In their eyes a fact sanctioned by time is equivalent to a right. They intrench themselves in abuse, as in property that belongs to them; to attack them in this position is to assail great principles; it is aiding anarchists to disturb social order. Thus we find, among the enemies of political economy, men who declare themselves exclusively religious, and men who are innovators in religion; men who would render society stationary under pretext of preserving it, and others who would not fear to overturn it under pretext of improving it. Doctrinal extremes, instinctively irreconcilable, they agree marvelously in declaring deceitful, dangerous and immoral, a science which none of them has ever studied. — With an inconsistency which it is well to point out, those who, starting from opposite standpoints, agree in accusing political economy do not perceive that they arrive at conclusions utterly contradictory to the sentiments which they profess We see pretended apostles of progress sacrificing economic liberty, which is the pledge of individual liberty, and the instrument of social amelioration. As to those who present themselves as the exclusive guardians of old laws and old beliefs, they distinctly declare that the means best calculated to enrich society are irreconcilable with the precepts of rigorous morality. Political economists entertain a nobler and more cheering conviction. They are convinced that the science with which they are occupied is the surest auxiliary of morality. To prove the affinity of the two sciences, it is sufficient to point out the economic principles engendered, so to speak, by the moral duties which form the basis of human society. — Man has duties to fulfill toward himself, toward his neighbor, and toward God. The spark of life which he received from his parents, and which he is to transmit to his descendants, is a deposit which he can not dispose of as he pleases. But it is not enough for man to preserve his life. It is the will of Providence, which has placed infinite resources within his reach, that he shall perfect his organism, by procuring for himself the well-being compatible with the laws of his country and the sentiment of his own dignity. In proportion as he increases his physical power, he ought to enrich his mind and soul, and develop in particular his special gifts, in order to render himself more useful to the community in which he lives. Man's duty to himself is in a certain sense but the means of

accomplishing his duties toward his neighbor. Being evidently created for society, he owes himself unreservedly to his family, because the family is the constitutive element of all society. He should study, when at home, to make it easy to command there when it is his duty to obey, and to facilitate obedience there when his turn has come to command. Just as the individual is the atom in the family, so the family is in turn the unit in that vast family which is called a nation. Filial devotion to paternal authority is the most elevated conception of country. This ideal implies two duties of the citizen. to respect the law, and cause it to be respected, without which there is no country; and to contribute by every means in his power to render the law like the guardianship of the head of a family, that is, just but mild, and generous without ceasing to be provident. The instinct of family and the love of country, while deeply rooted in our nature, and usually strengthened by personal interest, may, however, degenerate into a stern and selfish passion. The corrective of this kind of egotism is to be found in man's duties toward all his fellow-men, whether superiors or inferiors, compatriots or foreigners, friends or enemies. If every man owes it to himself to improve and ennoble his own life in proportion to his faculties, it follows that he should not offer any obstacle to the fulfillment of this same obligation on the part of his neighbor. The right of the individual results from the duty of each toward all. Every offense against this natural law, every encroachment upon this legitimate share of liberty to which all have an equal right, is a crime against morality. Not to do unto others what we would not wish done to us, was the negative virtue of antiquity. Christianity goes farther, and prescribes devotion to others' well-being, that is to say, an active and disinterested virtue. The measure of duty, which varies for each one, is proportioned to his faculties. When a swarm of children enter the house, the eldest who has given his hand to his little brothers and watched over them by the way, has no greater merit in the eyes of the father of the family: this is a picture of Christian fraternity. Responsibility increases with strength and intelligence; each one owes his like all that he has received from the common Father. — Finally come the duties of man toward God, which are the basis and the crowning of his other duties. In order to strengthen his empire over himself, and to acquire greater influence over others, man must elevate his soul to the idea of a power infinite in its wisdom and in its goodness; he must frequently encourage himself with the thought, that in accomplishing what little good he may be able to do, he is conforming himself to the views of Providence. — Man's entire code of duties may, therefore, be summed up in a few words. To preserve his life and develop his faculties; to devote himself to his family, and to recognize a second family in his country; to respect in others the rights which he claims for himself; to elevate himself to God, as the source of all good thoughts. such are the moral laws dictated by religion or recommended by philosophy. It still remains for us to examine what mysterious links unite these precepts with the axioms of political economy. — Man's destiny on earth is to purchase each day of his existence by labor. Without the aid of human hands, the fruits would rot upon the branches, and the trunk upon its roots; vegetable parasites, stagnant water and the slow decomposition of refuse matter would dispute air and space with animate beings; mankind would soon disappear. Man is then, so to speak, the responsible guardian of the works of the Creator. It is in accordance with this title that his first duty is to preserve himself by employing the resources which nature has placed at his disposal. Thus it is that morality and political economy start from the same point. The former ordains that man should insure his life to himself by productive labor; the latter inquires which are the laws of *production* best fitted to the preservation of the human species. — Created physically and morally perfectible, man still owes it to himself to increase his own prosperity within the limits of decency and justice, because it is to be desired in the universal order that the individual perfect himself physically, and develop the useful faculties, the germs of which are implanted in him. But how shall we increase each one's contingent, unless by favoring the *exchange* of products and services in society? How shall we develop individual talents but by the *division of labor?* — Science has proved that useful labor would soon be suspended, if we did not reserve from the fruits of each enterprise the elements of a subsequent enterprise. The more men save in a country, says political economy, the easier and more fruitful industrial activity becomes. But if a man were to think only of himself, would he look beyond the necessities of his old age? Would he take any interest in the works which are to come after him? He would not. If he curtails his consumptions, and restrains his fancies, it is because he belongs to his wife, his children, and to descendants whom he may not see but about whom nevertheless he thinks. Here the economic law of saving corroborates the instinctive sentiment of family. — Pursuing their analysis still further, economists show that these amounts saved by each man from his products are not ordinarily preserved in kind; but are changed into goods that will keep, and are invested in something that is productive of revenue, as land, houses, materials of industry, rents or money. Sometimes also men give what they have saved to acquire a trade or an art, which constitutes a sort of life annuity. All these accumulated values, whether material or personal, constitute, as the indispensable instruments of public prosperity, what science calls national capital. The idea of country is closely allied with this notion of *capital;* for country does not mean the soil we tread upon nor the air we

breathe; it is a moral sympathy based upon a certain solidarity of interests; it is a mutual guarantee under the protection of a common law. Now, when science demonstrates the necessity of capitalization, when it introduces the varying principle of emulation in *individual property*, it strengthens the legal measures taken instinctively in every country to secure to every man the fruit of his labor. It encourages that love of country which moralists prescribe, by promising it, as a recompense, the collective enrichment of society. — Nevertheless, powerful men, by whom the laws are nearly always made, naturally endeavor to secure exceptional advantages for themselves. To this tendency, which is the source of revolutions, morality opposes the duty of respecting in others the rights which we claim for ourselves. Political economy reaches the same conclusion, when, studying the phenomena of the *circulation and the distribution of wealth*, it shows the public misery caused by the unproductive consumption of governments, by the injustice of monopolies established for the benefit of certain privileged individuals, and by the obstacles arbitrarily opposed to the exercise of individual faculties. These demonstrations of science tend to introduce into governmental practice this great precept of ancient wisdom: "Do not unto others what you would not that they should do unto you"; a precept which Christianity has exalted by rendering it: "Do unto others as you would they should do unto you." — In the last analysis, all the investigations of political economy lead to this maxim: *Freedom of labor* at home, and *freedom of exchange* with foreign nations. What is the moral significance of this axiom? That God has varied the gifts of individuals and the products of countries in order that men and nations may be necessary one to another. He has established a wonderful equilibrium between their wants and their faculties, so that their wants are better and better satisfied in proportion as their faculties obtain freer scope. He wished that the incessant exchange of products and services should become the pledge of fraternity between citizens and of peace among nations. Once convinced that misery is not the inevitable portion of the greater part of mankind, but that prosperity might, on the contrary, become general, if providential harmony were not incessantly broken in upon by ignorance or merciless cupidity, it is impossible not to have within one's self a feeling of gratitude which purifies the heart and elevates the mind; there is no consideration better calculated to recall man to his duties toward God. — The parallel which we have just drawn will probably be received in some places with a smile of incredulity. We shall be told that "from what has been said of political economy and morality, it does not follow that the two sciences tend to the same end. This may be all the more doubtful since there are divergent tendencies among those who call themselves economists." The objection is sufficiently specious to make an impression upon the ignorant; it is, however, easily refuted. Men ordinarily form a wrong idea of political economy. The vulgar opinion is, that it is an arbitrary indication of the measures which are judged capable of contributing to the material prosperity of nations, and that consequently its teachings must vary according to the standpoint which one takes. If this were true, it would be prostituting the name of science to apply it to political economy. The physician does not invent the laws of nature; he observes, analyzes, and makes known the results of his discoveries, from which may result in practice either good or ill results. In like manner the political economist confines himself to analyzing, in an abstract and disinterested manner, a series of special phenomena which, in the order of productive labor, result from the instincts, wants and aptitudes of mankind. In this difficult labor each one can proceed well or ill, draw legitimate or doubtful conclusions. There is, in reality, but one political economy, despite its different applications, just as there is only one law of physics or chemistry, despite the eccentricities of certain savants. How then can we distinguish the true from the false? Morality itself will become for the man, acting in good faith, the criterion of truth. — We repeat, economic philosophy has not created the essential laws of production: they have been dictated by eternal wisdom. The thinker's task is merely to show that human labor becomes more effective, and that this labor renders prosperity more general in society in proportion as men approach in it to the divine law. It is evident that the surest means of increasing social prosperity must be at the same time the most conformable to absolute justice. The progressive amelioration of the condition of mankind can be only the result of increasing morality. To suppose that it could be otherwise would be to wound conscience still more than reason: it would be offering an insult to Providence The conformity of the doctrines of economy with moral law is the best criterion of their truth. It is interesting to apply this test to the arbitrary systems which are opposed to rational political economy. — To revert, for example, to the two systems mentioned in the beginning of this article, that of utopian innovators and that upheld by the partisans of despotic immobility, we see the leaders forcibly enrolling individuals in a fictitious organization, in which, under promise of rendering them prosperous in spite of themselves, they begin by despoiling them of their freedom of action. Now these systems which reduce man to the condition of a machine are subversive of all morality, since morality is based upon the proposition that man, created free and responsible for his acts, deserves merit or blame within the limit of the duty which has been taught him, or which his mind has conceived. In a communistic utopia with equality of wages, no matter what the exertion and service of the workman, as men would no longer incur the responsibility of their idleness,

there would be so flagrant a violation of moral law, that the falseness of the economic principle of this utopia might be asserted *a priori*. — Let us now interrogate those pretended conservatives who in reality do not dream of preserving anything but their autocracy. What conceptions do they oppose to the teachings of the economic school? What are their ideas upon the development of society? Giving an exaggerated extension to this simple word of the Gospel, "There will always be poor among you," they make a theory of the inequality of social advantages, and this inequality, as they conceive it, is not that natural inequality which is to a certain extent necessary as a means of exciting emulation. They desire to establish an hierarchical classification, in which the mission of one class would be to consume a great deal in order to afford the other the opportunity to pass their lives in laboring for the powerful ones of the earth. Ignoring, and that designedly, the distinction made by economists between productive and unproductive consumption, they assert that all expenditures, of whatever nature, enrich a country. The ideal of political institutions therefore consists, according to them, in creating a class so opulent that the crumbs which fall from their banqueting table shall suffice to satisfy the multitude. Nor can we be accused of exaggerating the opinion which is opposed to us in order to ridicule it. We find the following in a work entitled *Traité d' Economie Politique*, by Saint-Chamans, an interpreter of the schools which style themselves exclusively conservative and religious. "We fear that men may be scandalized to see us boast of luxury, incite all classes to expense, and blame thrift and the wise economy of the father of a family: but it must be borne in mind that we are in this work considering a special object considered apart, the wealth of nations. * * Let religion command simplicity and modesty in our manner of life, let the wise moralist condemn the superfluities of luxury, let the prudent man impose economy upon himself for the sake of his children and of his own future, and there can be nothing better than to follow these counsels. * * We merely say that this virtuous and wise conduct is not the way to reach progress in general wealth, nor the well-being of the suffering classes." What then are the means of relieving those who are suffering? J. B. Say, in exposing the injury caused by unproductive consumption, has shown that the treasure wasted in ruinous fancies might be much better utilized as reproductive capital, and that we should not see nearly so many men without shirts and shoes regarding with envious eyes persons dressed in velvet and jewels, if a larger proportion of the sums devoted to superfluities were invested in useful enterprises. Saint-Chamans replies to this illustrious economist: "The poor man has shoes because the rich man has gold buckles, and the poor man wears a shirt because the rich man is clad in velvet." Do not luxury and prodigality in the upper classes, and passive submission and fatalism under the name of resignation in the needy multitude, afford a double chance of securing corruption of morals? Thus does the author whom we have just quoted declare ingeniously enough that his theory upon the enrichment of nations has nothing in common with morality. Nations are thus left to choose between poverty and immorality. An admirable conclusion, truly! — We have then the touchstone by the aid of which we may discover the purity of economic doctrines. The false doctrines are those which, when pushed to their extreme consequences, will lead to immorality. The true doctrines are those which we find always absolutely conformable to the laws of morality. Let this test be applied to history, and we shall find that nations come nearer to economic truths whenever they introduce moral principles into their organization, and increase in material prosperity in proportion as they approach political economy. Considered from this height, the study of this science becomes one of the most honorable as well as one of the most useful employments of the human mind, and to describe it by a definition worthy of its noble tendencies, it might perhaps be called "morality in its application to labor."

ANDRÉ COCHUT.

MORALITY, Political. There is but one morality, as there is but one geometry. Moral rules, logically expressed, are self-evident propositions, which, like all necessary truths, compel conviction, and they have never been disputed except with a wrong intent. — Hence the words political morality do not designate a particular morality, but universal morality applied to politics. Interest and passion have never deformed truth more than in this matter. But in attacking the distinction between good and evil, interest and passion attack their enemy. Doubtless there may be sincerity with error, even in morals. Duty in itself has not been disputed, but men have not always been agreed either as to its principle or its applications. The first point belongs especially to philosophic discussion, the second depends more upon the general state of enlightenment and manners. It is for these two reasons that notwithstanding the immutability of moral distinctions, a certain diversity, and consequently a certain progress, is possible in estimating the use which must be made of them. In this, as in everything else, prejudices may exist, and one of the most widespread, as well as most stubborn and persistent, is that which withdraws politics from morality, or subjects it to a morality different from that which is universal. — This is not what we have learned from the political writers of antiquity. As Montesquieu remarks, they were greatly superior to moderns by the moral character which they gave to social science. The leaders of the great schools are of one mind. Plato thinks that the good is the object of the state. He founds his republic on a system of education conformable to true philosophy; he considers

law as worthy of the name only in so far as it is reason itself. According to him, power exists only to lend physical force to reason. According to Aristotle, virtue did not found the state, but it is its final cause, being the object of society as well as of the individual; what is required of the laws, is to establish the reign of reason. They are the expression of the general will only because it is supposed that the latter is wiser and juster than the will of a single man or a small number of men. We know what importance Aristotle attaches to sociability. Therefore he goes so far as to regard morality as only a part of politics. Society is founded on justice, said Zeno; right reason, which commands and which forbids, is the law which rests on the nature of things, and which consequently extends from God to man. — If the ancient republics were not always constituted nor especially governed in conformity with these principles, it was, first of all, because no ideal can be fully realized upon earth; secondly, because customs and prejudices upheld many grave errors in morality; and, finally, because in free states popular passions sometimes mislead the public conscience. But political morality in the Greek and Latin world always remained superior to what it was everywhere else. Even at Rome it often struggled successfully against the violence of a harsh and ambitious people. Later, when all was enfeebled and corrupted, philosophy continued to protest against the examples and the principles of the government of the Cæsars. Unfortunately, wearied with its own powerlessness, it soon took refuge in private life to save the dignity of the man in the absence of that of the citizen, and Christianity, which for various reasons gave the same example, by abstaining from interference in the affairs of the state, by preaching contempt for human affairs, contributed to the decline of public morality. Both permitted the establishment of the odious doctrines brought forward by the jurisconsults of the empire in aid of despotism. Their science, under the last form which it received at Byzantium, became, and long remained, the corrupter of political society. Morality was proscribed by it the day when the maxim of Ulpian was proclaimed: *Quidquid principi placuit legis habet vigorem.* This doctrine, the scourge of modern monarchies, has not ceased to produce evil in Europe, and its tradition is not yet obliterated. — Nevertheless the philosophy of the middle ages, drawing inspiration from that of antiquity, honorably but vainly opposed this maxim. We know what was said by St. Thomas Aquinas and Ægidius of Rome. The church, either to defend the honor of Christian morality, or to vindicate its own authority, often opposed praiseworthy censures to the abuses of power and legislation; and it was a pope, Pius V., who, on the eve of St. Bartholomew, first defined "reasons of state" to be *a fiction of wicked men.* At the same time, the renaissance, by restoring to the human mind the liberty which it had long lost, caused to prevail independent philosophy, which dared to consider matters of state and questions of government as within the province of the human mind. Machiaveli, in approaching them with great critical profundity, it is true, was far from having immediately re-established truth in all its rights; he went too far in the way of taking prudence for wisdom, and success for arbiter between powers and parties; he gave his name to politics separated from morality. At least he admitted that morality was an art which had its rules, which governments were obliged to observe; that the object of their existence was not the satisfaction of the governing power; and that, finally, the governed had duties toward the state. Better inspired, or less carried away by false models, other publicists appeared, who, far from sacrificing everything to adroitness, have made these very simple truths more and more popular, that governments are created for society and not society for governments; that justice is the law of laws, and consequently the rule of society as well as of individuals, and of governments as well as of society. In this manner the grand thought of the sages of antiquity re-entered the political world: that justice is the mistress of all things, both mortal and immortal. — From these truths may be deduced all the rules for the application of morality to politics. They may all be reduced to the principle of justice. Even the duties which moralists connect more willingly with the principle of love, assume another character when they are fulfilled by government. It is not a question of sentiment, but a strict obligation for powers, instituted by the consent of society, to aid in contributing, so far as their authority permits, to its happiness; and citizens may demand public well-being of the state as a debt. For a much greater reason have they a right to everything which assures these rights themselves: their liberty, their dignity. Those who believe that public utility is the only rule of the laws and of power, neglect to remark that there can not be for the legislator and for the government any necessity but a moral one of providing for the public utility. Duty, therefore, bears on politics as upon everything else, and respect for legitimate interests is itself not an interest, but an obligation. — It is no longer disputed in principle that legislation should be in accordance with morality. The civil laws of all civilized peoples have been, for about a century past, purified from almost everything which they might have contained contrary to equity, honesty and humanity. What still remains to be removed is of small import in comparison with what has disappeared. — It is a little more difficult to establish the reign of morality in politics, properly speaking: let us denote by this term everything which concerns the constitution of the state, or the conduct of the government. It can not be said that the question of the constitution to be given to a country is purely a question of morality. We should consider what the situation of the country is, its beliefs, its manners, its

opinions, its wants. What duty prescribes is to give it the best institutions possible, considering all these circumstances. Morality does not command the choice by way of preference of a monarchy, or a republic, but of that one of the two which appears most suited to gain the national consent, to attain the good of the state, of the public and of the citizens. Every impossible government is, by this fact alone, a bad government. But it does not follow that a government is good, provided it is possible. Thus, power absolute in itself is bad, and no circumstance can correct its essential viciousness. It is beyond the rights of human nature to exercise it. It is contrary to the rights of human nature to accept it. He who accepts it is a usurper; he who bestows it degrades himself. The institutions which limit it are guarantees of public honesty. We might show, if space permitted, that constitutional principles are all connected with some principle of morality under the form of simple utility. It is a recognized principle, for example, that all powers should not be united in the same hand, and especially that judicial should be separated from executive power. It is not so evident at first what relation such a rule can have to morals; an ancient prejudice, and long popular, upheld a system altogether opposed to this. For a long time the right of dispensing justice was considered as an attribute of royalty, and St. Louis is still spoken of as dispensing justice in the woods of Vincennes. But if experience proves that every man intrusted with governmental action, daily struggling with the difficulties and necessities of politics, is destined to attach himself exclusively to the interests of his power, and to consider as mad or guilty the man who opposes it, and to become devoted to the success of his ideas and his measures, it is evident that he can not be a disinterested, impartial and just judge, in all cases in which he thinks his authority concerned; and consequently it is just, that is to say, obligatory, to give to others the right of judging.—This brings us to the question of the rights of morality in the conduct of government—a more difficult question, and one which has divided sincere minds. It seems to be solved, however, by the principles which have just been established. Governments, after all, are not really things, but men, and how can we raise the question whether men should act honestly on all occasions? That they should so act will not be disputed in the great majority of cases. Cruelty, spoliation, iniquity, treason, corruption, even colored by the pretext of political utility, will not find apologists; but if we leave generalities, differences of opinion commence, and it is certain that history, in all its pages, even in those which can be read without shame and indignation, shows us governments prompt to attribute to themselves rights which neither private morality nor ordinary justice would avow. Hence the idea that there are two kinds of morality, one of which, political morality, has no resemblance to the other. The almost always improper use which has been made of the phrase "reasons of state," could not have been introduced and tolerated for so long a time, unless through a specious application of the suspicious adage, "The end justifies the means"; so suspicious, in fact, that no one would dare to use it publicly in order to defend an action of doubtful character. But under forms less evident and more dignified, it is the essence of the thought which authorizes all the questionable measures of government. Public utility, the interest of the state, the dignity of the crown, the safety of the republic, the maintenance of order or tranquillity, are the reasons which are given by men, both to others and to themselves, to obtain absolution for acts which, stripped of this pretext, would be acknowledged as reprehensible. It can not be denied that in many cases the gravity of the motive is so much superior to the gravity of the fault, that the indulgence of nations and historians who judge them is conceivable. In the most virtuous private life, two duties of unequal importance may be found in opposition, and one must prevail over the other, which would be to do a wrong for the sake of a greater good. But it is necessary that the choice should be between two duties, and not between an interest and a duty. Now in politics, interest, being or appearing public, easily acquires, even in the eyes of honest men, the importance of a duty, and lulls the scruples of the statesman to such a degree that he makes it a matter of conscience to sacrifice his conscience. To one placed on this incline, the danger of slipping is so great, the bad examples are so numerous, the sophisms so easy, that we do not hesitate to think that, in the ordinary practice of government, the dictates of morality remain absolute, and that no public interest authorizes an action which can not, at any given moment, be publicly avowed. — A distinction should be made. Of course society is not an individual; the state is not a private person Public powers are, therefore, within the circle of their attributes, clothed with prerogatives denied to citizens. They are force at the service of reason and justice. They are authorized therefore to employ force, almost as private persons themselves are, when the right of natural defense leaves them no other means of saving justice, violated in their persons. For a greater reason, the state, representing the right of all, is authorized to employ force, when necessary, and force itself is organized and regulated for this purpose in advance. Although the prerogatives, which the law grants it, exceed the rights which it recognizes as belonging to individuals, they are just and legitimate, and morality recognizes them in every well-constituted state. — The execution of laws is not open to condemnation unless the laws themselves are. It is, therefore, only in cases unforeseen by the laws, or rather in the cases in which a certain conduct is legally optional or even legally prohibited, that the question just indicated can arise.

In the first case it is impossible to lay down a rule. The law is supposed to be disinterested; it permits action or abstention; a choice must be made. Here are the living problems of practical politics. In order to solve them in one sense or another, we can only consult experience, reason, conscience; we must have serious motives and pure intentions; we must be attentive in our examination and sure in our convictions. With these conditions we can dare to act, come what may. If we are wrong, the wrong is excusable. The best means of convincing ourselves whether the conditions are fulfilled, appears to be to ask ourselves what we should say if summoned to explain our conduct before an independent public. This rule shows well enough what the responsibility of depositories of authority is in governments in which free discussion obtains. — Finally, there are cases in which, the laws being silent or opposed, we should have to examine whether certain circumstances would authorize action outside the laws. Acts of this kind are called, when they are accomplished by governments, *coups d'état;* when by peoples or parties, revolutions. (See these words.) Here it is the law which is in question, not morality. It is self-evident that if it can ever be permitted for people or prince to rise above the law, a just cause is needed, and the law of duty should assume more power in proportion as the written law has lost its power. Neither words nor celebrated examples are wanted to authorize successful iniquities or even useful crimes. "If right is to be violated," said Julius Cæsar, "it should be in order to reign." This hypothesis must be rejected, and the answer given that right is inviolable. "Little morality kills big morality," said Mirabeau. And it may well have been that he was lacking in big morality because he was lacking in little morality. "This is worse than a crime," said an expert, "it is a blunder." Now crimes are the only irreparable blunders. Finally comes the formidable maxim before which Montesquieu himself bowed down: "The safety of the people is the supreme law." The safety of the people is not above justice.

CHARLES DE RÉMUSAT.

MORMONS (IN U. S. HISTORY), a sect mainly located in Utah territory and the territories in its immediate neighborhood, to the number of about 150,000, but having also about 60,000 converts in other parts of the United States and in foreign countries. — I. ORIGIN. Joseph Smith was born in Sharon, Vt., Dec. 23, 1805, and in 1816 removed to Palmyra, N. Y., with his parents. As a boy he bore no good reputation for industry, thrift or honesty, but about 1820 he professed to have become converted. He claims to have had a revelation, Sept. 21, 1823, of God's will that he should revive the covenant of Israel. He was told that the lost tribes of Israel had wandered to America and had there grown numerous, powerful and wealthy; that they had degenerated and fallen before their enemies; that, before their final extinction, one of their prophets, Mormon, had written on gold plates an account of their history, prophecy and doctrine; and that his son, Moroni, the last of the race, had buried the plates in the "hill of Cumora," about four miles from Palmyra. On the following day he was allowed to see the plates, under angelic guidance; and Sept. 22, 1827, he was allowed to take them from their 1,400 years' burial. They were written in the "reformed Egyptian character," which could only be deciphered by Smith through the aid of the Urim and Thummim, an enormous pair of spectacles. The plates disappeared after Smith had translated them, but eleven witnesses averred that they had seen them. — It is asserted that one Solomon Spaulding, living in 1812 in Conneaut, Ashtabula county, Ohio, wrote the book of Mormon as an historical romance, under the title of "The Manuscript Found," its Jewish-Indian machinery being suggested by the prehistoric mounds in the neighborhood; that at his death in 1816 it was in possession of one Patterson, a Pittsburg editor, who intended to publish it, and with whom Sidney Rigdon, one of Smith's first disciples, was a compositor; and that at Patterson's death in 1826 it disappeared, to reappear in 1828–30 as the bible of a new sect. When Smith's book was published in 1830 its identity with Spaulding's was at once declared by the widow and neighbors of Spaulding, who had repeatedly heard it read. — II. DOCTRINE. The sect is a secret society with an hierarchical organization. At its head is the president, with two subordinates; then the twelve apostles, the seventy disciples, high priests, bishops, elders, priests, deacons, and teachers. The whole forms a despotism of the president, tempered by the continual necessity of yielding to the other officers in order to avoid revolt. The distinguishing features of the sect are polygamy; materialism; baptism for the remission of sins and for the dead; a belief in the inspiration of the head of the sect; and a liberal dedication of themselves, their property and their services to the advancement of the sect at home and abroad. They hold that those who define God as a spirit, "that is, as *nothing*," and worship him as such, are as much atheists as those who deny that there is a God; and they maintain that God is a material being, "having body, parts and passions," but of infinite power. These doctrines they derive from the following sources: 1. In addition to the Bible they accept the book of Mormon as authority in matters of faith. This book is written in imitation of biblical language, but is marred by numerous inaccuracies, violations of common grammatical rules, and anachronisms. All these the Mormons acknowledge, but hold that the defects of Smith's early education do not at all detract from the truth of the message which he was only the instrument in delivering. 2. Furthermore the sect accept the "revelations" given by God to their spiritual head. These pertain to every point of polity and social economy, but the un-

failing promptitude with which they appear when needed seems as yet to have awakened no general suspicion of their genuineness among the Mormons. The most tremendous of these "revelations" was that which, in 1843, sanctified polygamy, in direct contradiction to the book of Mormon itself. Up to that time, in theory at least, monogamy had been the Mormon law for both leaders and people; but the sudden elevation of the leaders to uncontrolled power, and their inability to control their passions, changed the whole basis of the sect's existence. The revelation was first proclaimed by Young, Aug. 29, 1852, and was at once denounced as a forgery by the widow and sons of Joseph Smith, who joined in the anti-polygamous schism known from its leader, Gladden Bishop, as the "Gladdenites." 3. The sect has also its canon of inspired books and epistles, which expands with the growth of the church. The authority of these, however, rests rather on agreement than on any internal claim of inspiration. — III. HISTORY. Smith's first converts were of his own family and neighbors, and from the beginning he gave these as a name, "The Church of Jesus Christ of Latter Day Saints." Their first organized conference was held at Fayette, N. Y., June 1, 1830, the church then numbering some thirty members. Their early leaders were Joseph Smith, his brother Hyrum Smith, Oliver Cowdery, Sidney Rigdon, and William W. Phelps. In 1831 the whole church removed to Kirtland, Ohio, as a halting place on their road to Independence, Mo., which Smith intended to make their final headquarters. Arrangements were at once made to build up the Missouri refuge, and the sect then soon numbered nearly 2,000. Their assumptions of superiority, their intolerance of "gentiles," and probably also their anti-slavery opinions, made them obnoxious to the people of Jackson county, Mo., who mobbed and outraged their leaders, and in 1838 violently expelled the whole colony. Early in 1839, now numbering about 15,000, they settled in Illinois, just above the Des Moines rapids on the Mississippi, and founded a city called Nauvoo. Among their new accessions were Brigham Young, Orson Hyde, Heber C. Kimball, and Parley P. Pratt. — Nauvoo at once became an *imperium in imperio*, having its own government, revenue and army, of which "Lieutenant General Smith" was absolute head. As in Missouri, they became unpopular. Stories of their refusal to allow the execution of state writs, and of their gross immoralities, explained and confirmed by the "revelation" of 1843 as to polygamy, fired the surrounding country against them, so that in June, 1844, Governor Ford, of Illinois, took the field in person, with a militia force, to keep the peace. Upon his pledge of the honor of the state for their safe-keeping and fair trial, the two Smiths and two other leaders surrendered and were lodged in jail at Carthage. During the evening of June 27 a mob of 200 disguised men overpowered the guard and shot and killed both the Smiths. — Brigham Young became president in Smith's place by the unanimous vote of the twelve apostles and the acquiescence of the sect, and hurried forward the building of the great temple in which the sect took an especial pride. But Nauvoo was now fairly besieged, and open war was varied by arson and secret murder on both sides Jan. 20, 1846, the "high council" announced that a final home was to be sought beyond the Rocky mountains. The migration began in the following month, but in September the impatient people of the neighborhood poured in and drove out the little remnant with fire and sword. In May the temple had been solemnly consecrated, and the next day dismantled to the walls. — It was not until 1848 that this extraordinary migration was ended, and the Mormons were fully settled at Salt Lake, in Utah. It had been managed with consummate skill. The younger men had been steadily pushed ahead to plant crops which were to be gathered by, and to support, the main body. In this manner, in spite of individual suffering, the main body successfully endured two winters on the plains, and in 1848 organized that government of their own, far from the "gentiles" of Missouri and Illinois, to which they were to give the still illegal title of "the state of Deseret." — In 1850, after the organization of the territory (see UTAH; COMPROMISES, V.), Young was appointed governor by President Fillmore, but he was soon found to be infinitely more a Mormon than a federal officer. The federal laws for the government of the territories were contemptuously disregarded whenever they clashed with the Mormon peculiar institutions. Shocking stories were told of the cruelties perpetrated by the "Danites," or Mormon "destroying angels," upon intruding gentiles. One of these, the massacre of about 100 emigrants at Mountain Meadows in 1857, was peculiarly atrocious in its details, but was not punished until 1877, when John D. Lee was condemned to death by shooting for his share in it. The impossibility of obtaining a successor to Gov. Young without efficient federal support led the president, in 1857, to order Col. A. S. Johnston, with a force of federal troops, to enter Salt Lake City. Sept. 15, by proclamation, Young forbade the entrance of the soldiers, and ordered out his own troops for resistance. Johnston wintered among the mountains, and finally entered the city. June 10, 1858, President Buchanan informed congress that the Mormon difficulties were over. They really, however, were not. The enormous power of the hierarchy was constantly exerted to "freeze out" gentile traders, control federal grand juries, and neutralize federal laws. — The connection of Salt Lake City with the Union Pacific railroad, in May, 1869, at last brought the Mormons again face to face with the enemies from whom they had so often escaped. A new corps of federal judges, determined to suppress polygamy, entered the territory; the grand juries passed out of Mormon control; and indictments for polygamous practices became common. Convictions, however, were

practically impossible, owing to the secrecy of the sect's workings, and the difficulty of obtaining evidence to convict. This difficulty has not yet been surmounted. The Edmunds bill, which was passed March 14, 1882, practically disfranchises every one guilty of polygamy in the territories, and makes the practice a misdemeanor, but its result remains to be seen. April 26, 1882, George Q. Cannon, a Mormon, who had for many years represented his sect and territory in congress, was unseated by the house. Aug. 29, 1877, Brigham Young died, and was succeeded in the presidency by John Taylor. — The essential difficulty in the Mormon question is not so much present as prospective. By the constitution of the United States, the subjects of marriage and divorce in the states are exclusively under the control of the states themselves. If, then, Utah ever becomes a state, its legislature becomes omnipotent over these subjects. In the hope of this consummation, it seems probable that the Mormon leaders will submit with patience to any present disfranchisement, since the political control of a territorial government, subject to a federal governor's veto and to the control of the federal congress, is comparatively an unimportant matter. The true solution of the question seems to lie in the adoption of an amendment giving congress the exclusive power, by general laws, to legislate on marriage and divorce. With such an absolute bar to hope for the future, the Mormon leaders would probably be compelled to a monogamous revelation. — The name Deseret is understood by Mormons to mean "the land of the honey-bee." The name Nauvoo signifies "beautiful." The following extraordinary derivation for the name Mormon was seriously given by Joseph Smith himself: the Egyptian *mon*, good, and the English *more;* hence Mormon, "more good." — (See *The Book of Mormon* (4th edition, 1854); *Millenial Star; Times and Seasons; The Gospel Reflector; New York Prophet; Doctrines and Covenants* (1854); *Voice of Warning* (1854); Jacques' *Latter-Day Saints' Catechism* (1870); Hyde's *Mormonism* (1857); Mrs. Ferris' *Mormons at Home* (1852), Ferris' *Utah and the Mormons* (1856); 3 *Atlantic Monthly* (campaign of 1857); Ludlow's *Heart of the Continent* (1870); Stenhouse's *Rocky Mountain Saints* (1873); *United States Revised Statutes*, § 5352; Tucker's *Origin and Progress of Mormonism* (1867); Gunnison's *History and Doctrines of the Mormons;* Smucker's *History of the Mormons; Harper's Magazine* and *Century Magazine* for January, 1882. ALEXANDER JOHNSTON.

MOROCCO, Empire of, a Mohammedan state, which occupies the northwestern corner of the African continent, from which it received its Arabic name of *Maghrib* (West), which it still bears in the Mohammedan world, and which was extended in the middle ages to all Mohammedan Africa of the west. The area of Morocco is about 219,000 English square miles. The estimates of its population vary from 2,500,000 to 8,000,000; 5,000,000 is probably about correct. Its political organization is the simplest in existence. The sultan is the whole government. There is neither above nor beside him a written law (except the Koran and its commentaries), nor council of the empire, nor ministry. No discussion, no publicity, no control, no report or returns, still less a press to annoy him in his autocracy It is the most perfect example of personified power. Some servitors, secretaries after a fashion, are the instruments of his will; one of these, whom we may honor with the title of minister of foreign affairs, and who resides at Tangier, where all the European consuls live, is intrusted with the management of the relations with foreign powers. The sultan places commanders at the head of his troops, and governors over the cities, both of whom receive their orders directly from him and report to him. The administration is reduced to almost as great simplicity as the government. A chief issuing what orders he pleases, and a herd which obeys, in trembling, on pain of death, or at least confiscation and imprisonment, is the whole administrative system of Morocco. This state, which borders on civilization through Algeria, Spain, and its commerce with Europe, has not been penetrated so far by any of those flashes of civilization which begin to illuminate, more or less clearly, all the other regions of Islamism: Tunis, Egypt, Turkey, Persia; a contrast which is both a singular spectacle and a scandal. — Supreme power has for three centuries remained in the hands of a single family, entitled *Sharifs* because they claim to be descended from Mohammed, a genealogy which no one thinks of discussing, and which redoubles the respect which the people yield the sultan. The latter takes advantage of this to make himself a caliph of Islam in the west, on an equality with the sultan of Constantinople in the east; thus uniting in himself a double power, spiritual and temporal. On the death of one of these princes, his heir, on assuming power, finds himself in conflict with his brothers, and frequently with rebellious tribes. The rivalry of brothers and relatives is a more prominent trait among Mussulman dynasties than among Christians, because the rules for the transmission of power are not derived from the Koran. Mohammed neither designated his successor, nor indicated any rule of succession; this was the cause of intestine wars which divided his disciples and his posterity. The omission was remedied by choosing the eldest surviving descendant, but this rule, whose authority is sanctioned neither by law nor custom, is not respected by the excluded descendants, whenever ambition possesses them. In Morocco the risk of civil war is increased by the custom prevailing among its sovereigns, of marrying a large number of the daughters of great families, in order to create a support among the wealthy and powerful. On this account nearly all the new reigns begin by the armed protest of some relative. — Tribal rebellion is another permanent character of the situation, connected with

the one just mentioned, because claimants do not fail to excite that traditional spirit of independence which is favored by the physical features of the country. Morocco is divided into two almost equal parts, communication between which is difficult, on account of the long and lofty chain of the Atlas mountains which run from northeast to southwest; on the west the Tell, on the east the Sahara: these are two countries, and, as it were, two different peoples. Besides, a branch of the Atlas range turns to Rabat, and cuts the Tell in two parts, which communicate only by a narrow passage in which Rabat is built, between the mountain and the sea. Hence, a new division singularly favorable to revolts, and which explains why the kingdom of Fez or of Mequinez at the north, and that of Morocco at the south, constituted, for long periods, independent and almost always hostile states.—The history of the empire turns in great part on the struggles in these three great territorial regions between the sultans, wishing to establish unity, and their undisciplined vassals: they recall by many traits the feudal period of European monarchies, in which civilization finished by giving to unity such instruments as roads, the printing press, posts and a regular system of administration, the use of which is feared by the Mohammedan mind. Struggles with Spain began toward 1859. Commencing in the neighborhood of Ceuta by misunderstandings which might have been amicably removed, the war was ended by the capture of Tetouan and a treaty of peace, or rather by a capitulation which was signed April 26, 1860, and which secured numerous advantages to the victorious army, among others, a tribute of 100,000,000 francs, and the cession of the port of Santa Cruz de Mar-Pequeña, opposite the Canary islands. The pecuniary obligations of Morocco not having been fulfilled, a new treaty became necessary in 1861, and finally a loan was raised, which England negotiated with Morocco to release her from Spain, England taking Spain's place in collecting the customs duties given as guarantee. These more or less bloody incidents are merely episodes of that implacable hostility which, sometimes smouldering and sometimes active, always exists between the people of Morocco and that of Spain, scarcely separated by the straits of Gibraltar, but profoundly opposed to each other in memory of the Moorish dominion in Spain followed by the expulsion of the Moors by the Spaniards. This irritation is maintained by the sight of the Spanish flag floating over the four presidios (Ceuta, Peñon de Velez, Peñon de Alhucemas and Melilla) and the Zafarine islands. Morocco is now at peace with the other nations of Europe, rather through the absence of all immediate contact than in virtue of the numerous treaties concluded to regulate peace and commerce. Among the latter it is proper to mention that of Tangier, concluded with France Sept. 10, 1844, which is most favorable to France. England obtained, Nov. 9, 1856, two treaties, one political, the other commercial, which secured important advantages. But, up to 1872, no influence was able to obtain the establishment at Fez, the capital of the empire, and near the emperor, of diplomatic representatives of Europe. France, first of the European nations, obtained from the emperor the right of accrediting near him a minister plenipotentiary (M. Tissot), whose reception was attended with a certain *eclat*.—The ports which serve as commercial communications with Europe are eight in number: in the Mediterranean, Tetouan; in the straits, Tangier, on the ocean, in going from north to south, Larache, Rabat, Casablanca (Darbeida), Mazagan, Safi, Mogador (Soueyra), Santa Cruz of Barbary or Agadir (not the Santa Cruz ceded to Spain), the best anchorage on the coast, is unfortunately closed to commerce. On the side of Algeria which joins Morocco on the east, commerce with Tlemcen, Lalla-Maghrnia and Nemours is established through Tafilet, Figuig, Teza and Oudjda. In the middle ages this route had acquired such an importance that Tlemcen became a city of 100,000 inhabitants, and the capital of the kingdom; but wars between the two states, and, in our day, the Algerian duties, have thrown the commercial current northward toward the Mediterranean and the straits, in spite of the almost impassable barrier of Rif, and on the west toward the ports of the ocean, to the great loss of France and the gain of England. These two nations have most of the trade with Morocco, but especially England, which possesses in Gibraltar a very convenient station for contraband as well as legitimate trade. Next in order follow Spain, Belgium and the Netherlands. Commerce has in Morocco a field of operation whose area is estimated at from fifty-three to seventy-five millions of hectares, peopled with from five to six millions of inhabitants, Moors, Berbers, Arabs and Jews. Commercial operations amount to a sum of from forty to fifty millions of francs, which gives only seven or eight francs per head, and indicates extreme barbarism. The returns of 1871 place the imports at 22,830,000 francs, and the exports at 19,530,000 francs. England represents the greater part of these figures: thirteen millions of imports, and fifteen millions of exports. These low figures are the consequence of a brutalizing government, hostile to all agricultural, industrial and social progress, obtaining its revenues from monopolies, exactions, prohibitions and confiscations; turning one of the most beautiful, well-watered and fertile countries in the world into the home of the poorest and most unfortunate of people. For want of security for life and property, and a regular freedom of exchange, traffic is reduced to almost nothing. Its elements, however, are very numerous. Morocco abounds in cereals (wheat and barley) of as good quality as in Algerian Tell; almonds, olive oil, fruits, vegetables, wax, bark, animals, leeches, etc. Numerous flocks furnish wool, skins and other valuable articles; the wool finds its princi-

pal sale in the French market for common cloth. By way of the Sahara caravans arrive, some of which come from Soudan, bringing gold dust, ostrich feathers, gum, ivory, blue stuffs and citrons. In return, the ports of Morocco receive from Europe, cotton stuffs, sugar, tea, spices and drugs, raw and woven silk, cloth, arms and ammunition, hardware, iron, and especially money from France, whose merchants do not, like those of England, endeavor to pay in merchandise rather than money. From this unequal competition it results that English commerce has acquired a preponderance in Morocco which France and Spain, owing to their position, might compete for with advantage. The abolition of custom houses on the Morocco frontier of Algeria might be an efficacious means of establishing this equilibrium. The movement in the ports during 1870 was 1,307 ships arrived, with a tonnage of 201,127, and 1,306 ships cleared, with a tonnage of 200,336. The flags which hold the first rank are those of England (617), Spain (363), and France (172). — All efforts to obtain precise information about the budget are vain. *L'Annuaire de l'économie politique* (year 1863) gives a first résumé, which places the receipts at 2,600,000 piastres (of 5 francs 25 centimes) or 16,000,000 francs, and the expenditures at 990,000 piastres, or a little more than 5,000,000 francs. If we notice that this valuation puts the tax paid the sultan at merely two francs a head, we shall accept it only with reserve. The fiscal income, if not the expenditures, must be much greater in a country of arbitrary government like Morocco. It appears clearly enough, however, from the harsh conditions which the emperor signed in his last treaty with Spain, that there was little reality in the mysterious mountains of treasure which were said to be accumulated at Mequinez. Two-thirds of the expenditures are devoted to maintaining the negro guard, made up of slaves brought from Soudan, and to the payment of certain troops more or less regularly equipped and disciplined. There is no navy, notwithstanding the extent of the coast; the inhabitants of Sale never devote themselves to the sea except in view of piracy, which the mountaineers of Rif practice from time to time. — Such, in its prominent traits, is Morocco, the last remnant of the powerful empires founded by the successors of Mohammed in the west of Europe and Africa. After having reigned, under the Almoravide and Almohade princes, from Timbuctoo to the heart of Spain, Islamism, driven back step by step, has concentrated in this remote corner of Barbary its prejudices, its fanaticism, its hatreds, and also whatever virtues of hospitality and bravery it retains. The conquest of Algiers by the French separated this branch from its trunk and roots, and we may foresee a near future when, in Morocco also, the political power of the Koran will yield in an unequal struggle against civilization, unless it consents to receive its light and join in its progress. — BIBLIOGRAPHY. MORTON, Oliver Perry, was born in Wayne county, Ind., Aug. 4, 1823, and died at Indianapolis, Nov. 1, 1877. He was graduated at Miami university in 1843, was admitted to the bar in 1847, and was elected circuit judge in 1852. In 1856 he was defeated as the republican candidate for governor; in 1860 he was elected lieutenant governor, but by a previous understanding the governor, Lane, was elected United States senator by the legislature, and Morton became the war governor of Indiana. In this position he displayed great energy and fertility of resource, and was re-elected in 1864. From 1867 until his death he was United States senator from Indiana, and one of the leaders of the national republican party. — See Walker's *Life of O. P. Morton*.

A. J.

MOSAISM. This name is much more applicable than that of Judaism to the dogmas and institutions of the Pentateuch, which, after having formed the national and religious existence of the Hebrew people, still regulate to-day the beliefs and the morals of that people, scattered, to the number of at least five or six millions, over the whole surface of the earth. Judaism designates only a particular state of that ancient religion from which Christianity and the Mussulman belief sprang: it is the spirit which animated it and the forms which it adopted after the return from the Babylonian captivity, when it was no longer acknowledged except by the inhabitants of the ancient kingdom of Judah or the Judæans (*Ἰουδαῖοι*, Judæi), which our language, disfiguring the name, calls the Jews. Mosaism, on the contrary, so called from Moses, its principal founder (*Moseh* or *Mosheh* in Hebrew), embraces all the elements of which the faith and legislation of the Israelites have been composed from their origin up to the present time. — Thus understood, Mosaism, while recognizing in Moses the author or promulgator of its general constitution, commenced its existence long before that great man, and has continued it, modifying or completing it, long after him, for, at this present time, after nearly four thousand years, it can not withdraw itself from the influence of modern ideas. People often speak of the immobility of Judaism, with

the evident intention of extending this accusation of immobility to all Mosaism. This is a grave error. No religion, especially when complicated with a civil legislation and a political constitution, has remained long free from changes and transformations. The contrary could take place only among a petrified people, in a race of men who had absolutely forgotten the use of will or of intellect. Now, the Israelites have never been in such a position, even in the midst of the harshest servitude, and Mosaism has never checked the internal workings of its institutions, while ever guarding, for its basis, this precept of the prophet: "Ye shall add nothing to it nor take anything away from it." — The immense career which it embraces may be divided into four principal periods. The first begins with Abraham and extends to the departure from Egypt; this is the epoch of the patriarchs. The second is filled by the promulgation of the laws, ordinances and prescriptions, which the last four books of the Pentateuch contain, and which in the eyes of faith are considered as having been drawn up by Moses under the inspiration of God; this is the epoch of the law, properly so called, of the written law or of the *Torah*. The third belongs to the prophets, who succeeded Moses, and who form an uninterrupted chain, up to the end of prophecy. Finally, in the fourth, we find the doctors, who, under pretext of interpreting the law and protecting it against transgressions, overloaded it with a multitude of disciplinary regulations and accessory doctrines; this is the epoch of the *oral law* or of tradition, which begins about the third century before Christ, and ends with the Talmud, about the fifth or sixth century of our era. — The particular characteristic of the patriarchal epoch, is to show us monotheism as a patrimony, as a spiritual heritage, destined to pass from father to son in the same family until a time foreseen by divine wisdom. It was to Abraham that the only God, the living God, first revealed himself, and Abraham made him known to Isaac, and Isaac to Jacob. The head of the family was invested with sacerdotal dignity; he was priest, as he was king, because there was no other authority than his, and his worship, freed from all rules, consisted of prayers and of sacrifices. Morality itself held but a small place in this primitive religion; it was natural morality, reduced to the practice of justice and to gravity of manners, preserved in spite of polygamy. — After the departure from Egypt, when the Hebrew family had become a people, the obscure tradition, which it had kept up to that time and by the force of which it had remained united, was soon changed into a religion all at once national and universal: universal by a fund of imperishable truths; national by the particular forms under which it had to be preserved among a race solely devoted to that pious ministry, *a nation of priests*, as they called themselves. It was given to Moses, one of the greatest legislators who has ever appeared on earth, to accomplish this wonder. It was through him that the God of Abraham, Isaac and Jacob became veritably the eternal God, the God of the universe, Jehovah, the God of gods and the King of kings. It was he also, who, conceiving the human race as a single family, of which the house of Israel was only a feeble branch, drew from this idea a code of morals for the use of all ages and of all races. But in order that the people to whom he confided this deposit should not let it escape from their hands, it was necessary, in some way, to isolate it from the rest of the world and to insure its duration by the vigor of its legislation. This thought was evidently the source from whence flowed most of the prescriptions of the Pentateuch. — To separate the spirit from the letter, the invariable substance from its transitory form, the universal dogma and morality from the national worship, was, sometimes unwittingly, the aim of the prophets who succeeded Moses. All the efforts of their eloquence tended to this end, to place justice, rectitude, charity, purity of soul, circumcision of the heart, above exterior practices; to show as an abominable work before God the prayers, the fasts and the sacrifices which were not accompanied or preceded by good actions; and to let their people see a time, more or less near, when all the nations of the earth, adoring the Eternal, would form only one family. There were some even who hastened the accomplishment of this prediction by carrying the word of Jehovah to the foreign races who were ignorant of or despised it. — The doctors (*nomodidascaloï*) or rabbis, as they were commonly called (from *rabbi*, my master), the authors and the interpreters of the oral law, who, under different names, so much the more venerated as they live nearer our own age, form an uninterrupted chain for more than eight centuries: they were the theologians and the jurisconsults of Mosaism. They tried to fix the dogmas, to regulate the thousand details which belong to the external practice of religion, to determine in advance in the name of a tradition which they made reach back to Moses, all possible applications of the law. Hence, that voluminous collection, which is called the Talmud (that is to say, the study, or rather the science, the science *par excellence*) and which is composed of two parts: the Mishna or the second law, and the Gemara or the comments. Hence, also, three classes of doctors, who are distinguished only by the time in which they lived or the work in which they took part: the Thannaïm or authors of the Mishna, the Amoraïm or their immediate disciples, and the Sabouraïm or those who, having lived last, were obliged to summon reason (*sabara*) to the aid of tradition. It is to these latter that the drawing up of the Gemara is principally due. — We may reproach all these teachers of God's people with having stifled, in some sort, the text of the law under the enormous mass of their commentaries, and with having too often degraded the spirit of it by a multitude of minute regulations. But the honor must be left them of having prevented their

beliefs and their morals from sharing the ruin of their nationality; of having preserved their religious unity from the destruction which overtook their political unity; of having created in advance, with a power of duration unparalleled in history, the only authority which was able to bind together the scattered remnants of their race: we refer to the tradition accepted as a second law descended from Sinaï, and which regulates even the smallest details of the life of an Israelite. This authority, after all, is not so immutable as it is supposed to be; for it is a purely lay authority, exercised by the learned, by doctors, and it is a principle of the Talmud, that every provision adopted by one synod can be repealed by another. Without any doubt the traditions, which have been added to the Holy Scriptures, the Mishna and the Gemara, bear the traces of their origin; they are the work of the sect of the Pharisees. But the Pharisees, from the time that they appeared on the scene, carried all the nation with them and might be taken for the nation itself. The Essenes formed only a feeble minority, whom a contemplative and monastic life maintained in isolation until the day when they were confounded with nascent Christianity. The Sadducees, who were not more numerous, even less so perhaps, were the Epicureans of Mosaism, since they denied the resurrection and the future life. They were the rich and the great of the earth, who, satisfied with their lot in this world, did not care much about the other. Now, the men of this description count for nothing in any belief; all beliefs reject and deny them, as they deny all beliefs. As for the Samaritans, who rejected not only the Talmud, but the canonical books, with the exception of the Pantateuch and the book of Joshua, they are reduced to-day to a score of families, who vegetate at Sichem in misery and ignorance, and must soon disappear. Although they pretend to be the descendants of the ten tribes, which formerly formed the kingdom of Israel, they belong to Mosaism neither by their origin nor their faith. Sprung from one of those foreign races which established themselves upon the territory of the ten tribes dispersed by conquest, they were always the enemies of the Jews, their neighbors, and their worship, whose seat was Mt. Gerizim, was only a rival worship of that of Zion.— The most essential dogma of Mosaism, that from which it has never varied, is the belief in one only God, in a living God, Creator and Preserver of all beings, whose power is subject to no rules and no limits, except his own wisdom; it is a spiritual monotheism, which no religion of antiquity approaches, neither the pantheism of India, nor the dualism of Egypt and Persia, nor the polytheism of the Romans and the Greeks. We often hear it maintained that the God of Moses and of the Old Testament is only a national God, who, like the kings of the earth, exercises his authority over one people alone, and who chose a capital, by designating Jerusalem as the only place worthy of possessing his sanctuary. Nothing is more contrary to the letter and the spirit of the Holy Scriptures; for when they first mention the name of God, it is to tell us that he created heaven and earth, light and darkness, the stars of the firmament, vegetables, animals and man. He is, according to the words of the Pentateuch, the God of minds, who animates all flesh, that is to say, the principle of intellect and of life, who is upon the earth and in the heavens, and before whom there is no other god. When Moses asked God by what name he should be called, that he might inform his brothers who were plunged in ignorance and servitude, he received for answer these sublime words: "I am who am," that is to say, the only Being to whom existence really belongs, the eternal Being who has always been and who always will be, as his name Jehovah or Yaveh indicates. He is the eternal Being, immaterial, infinite; this is why he has forbidden his being represented to the eyes, and why all images are prohibited in his temple. He is the Judge as well as the Master of the earth. "I, even I, am he," he says by the mouth of his prophet, "and there is no god with me: I kill and I make alive: I wound and I heal: neither is there any that can deliver out of my hand." (Deut., xxxii., 39.)— There is no inference to be drawn from the anthropomorphical figures under which he often appears in the history of the Hebrew people and in the visions of the prophets. To uncultured men it was necessary to speak a language that they might understand, that of the imagination and of the senses. There is, besides, such majesty and such eloquence in these figures, that it is difficult to conceive a more sublime and more complete manner of making the multitude comprehend the existence of a Creator. The detractors of the Bible often cite the words of Jephthah, when he sought to repulse the attacks of the king of Moab: "Wilt not thou possess that which Chemosh thy god giveth thee to possess? So, whomsoever the Lord our God shall drive out from before us, them will we possess." (Judges, xi., 24.) But Jephthah was far from being a prophet. He was an ignorant adventurer, who spoke to an idolatrous king the only language which was common to both.— The temple of Jerusalem was, for the tribes recently become masters of the holy land, a pledge of political and religious unity. For it must not be forgotten that the nationality of the Hebrew people was confounded with their religion, and that many altars, many temples independent of each other, must necessarily have divided it, as the schism of Samaria abundantly proves. But the prophets did not cease to announce that the house of Jehovah would be a house of prayer for all nations: that a time would come when his name would be invoked over all the earth: that his word would break through the walls of Jerusalem to enlighten the world. From the time of the patriarchs, when he appeared for the first time to Abraham, he predicted to him that all the families of the earth would be blessed in him. (Genesis, xii., 3.) The God of the Bible, the God

of Mosaism, is therefore at once the all-powerful Master of the universe, since he created it, and the Father of the human race; a free God, personal and spiritual. — Man, according to the Holy Scriptures and according to teachings and tradition, bears in himself the same marks. He was created, says Genesis, in the image of God; and since in the words of the Decalogue, it is forbidden to represent the divinity under any visible form, this resemblance must be understood in a spiritual sense. It is thus, in fact, that it is understood in the Pentateuch. All the moral qualities which Moses wished to develop in the souls of his people, he represents as divine perfections which man should seek to imitate "Ye shall be holy: for I the Lord your God am holy." (Leviticus, xix., 2) "The Lord God, merciful and gracious, longsuffering, and abundant in goodness and truth." (Exodus, xxxiv., 6) "Circumcise, therefore, the foreskin of your heart and be no more stiffnecked, for the Lord your God is God of gods and Lord of lords, a great God, a mighty and a terrible, which regardeth not persons, nor taketh reward: He doth execute the judgment of the fatherless and widow," etc. (Deuteronomy, x., 16–18.) The serpent himself, when he promises to Adam and Eve that their disobedience will render them like their Creator, speaks only of a spiritual resemblance, which consists in the knowledge of good and evil. (Genesis, iii., 5) But all these qualities suppose liberty. Hence, liberty is formally recognized in the Old Testament, commencing with the books of Moses. We see there that God speaks to man as to a creature entirely master of his own actions; he shows him in the future the rewards and punishments which will follow his conduct, according as it shall have been good or bad. — From the idea which Mosaism has formed of the divine nature and of human nature flows all its morality. Christ summed it up with admirable precision when he said: "Thou shalt love the Lord thy God with all thy heart and with all thy soul and with all thy mind. This is the first and great commandment. And the second is like unto it: Thou shalt love thy neighbor as thyself. On these two commandments hang all the law and the prophets." How, indeed, is it possible not to love God, if God is for us not that abstract and intangible being that pantheism adores, or the blind force of nature which under a thousand different forms pagan mythology invokes, but the living model of all beauty and of all moral perfection, the personal principle of life, of thought and of liberty? How is it possible not to love man if he be the reflection of that eternal ideal, and if it be true, as the Scriptures affirm, that he is the image of the Creator? Therefore, neither Moses, nor the prophets, nor the doctors, ever tired of insisting upon these two precepts. "And thou shalt love the Lord thy God with all thine heart, and with all thy soul, and with all thy might." (Deuteronomy, vi., 5.) It is the author of the Decalogue who thus expresses himself, and these sublime words have become the *credo* of the synagogue. Every Israelite repeats them morning and evening, adding to them these words: "Hear, O Israel: the Lord our God is one Lord." (Deuteronomy, vi., 4.) These words were in the mouth of the celebrated Akiba, when he died by the most horrible tortures in the reign and by the orders of Hadrian. Says the Psalmist: "As the hart panteth after the water brooks, so panteth my soul after thee, O God. My soul thirsteth for God, for the living God." (Psalms, xlii., 1, 2.)— The love of man for his kind and for human nature in general, is prescribed with no less force in the books of the Old Testament. Moses was the first to say, "Love thy neighbor as thyself", and this maxim may be considered as the most complete expression of devotion and of right, of charity and of justice, of what one owes to others and to himself. Far from absolutely excluding love of self, it lays down the love of self as the rule and the type of the love which should be borne for others. Far from prescribing, like Indian morality, the annihilation of the individual, the sacrifice of the human person, it is precisely the human person which it defends and protects under the imperative form of a general law emanating from God. It exacts that the human person shall be dear to us for the dignity which is in it, without distinction or exception, without difference between ourselves and our fellow-men.— The universal application of this precept has been contested in vain by those who maintain that it is applicable to the Israelites alone. Did not Moses teach, in Genesis, that all men descend from the same primitive pair, and consequently that they all form one family, that they are all brothers? Moses also said: "Love ye, therefore, the stranger: for ye were strangers in the land of Egypt." (Deuteronomy, x., 19.) "But the stranger that dwelleth with you shall be unto you as one born among you, and thou shalt love him as thyself; for ye were strangers in the land of Egypt." (Leviticus, xix., 34) He does not stop there; he wishes men to love even their enemies, and what is more still, to fly to their aid when they are in trouble, and to work with them for their deliverance. We read in Exodus (xxiii., 4, 5,) these beautiful words: "If thou meet thine enemy's ox or his ass going astray, thou shalt surely bring it back to him again. If thou see the ass of him that hateth thee lying under his burden, and wouldst forbear to help him, thou shalt surely help with him." We search in vain all the holy books of the Hebrew people, and we do not find this maxim which the *Sermon on the Mount*, in the Gospel (Matthew, v., 43,) attributes *to the ancients:* "Thou shalt love thy neighbor and hate thine enemy" The authors of tradition have shown themselves on this point the worthy successors of Moses and the prophets. Hillel the Elder, who died about half a century before Christ, summed up in these words the obligations of the law, of which he was one of the most illustrious interpreters: "What you do not wish one to do to

you, do not do to others; this is all the law, all else is but the commentary on the law." — The articles of the Decalogue, which forbid theft, murder, adultery, false testimony, envy, are only the rigorous consequences of this principle; for we are commanded to love our fellows as ourselves, and for a much stronger reason should we abstain from doing them any evil. But the actions proscribed by the Decalogue are not the only ones which incur the reprobation of the Hebrew legislator. The Pentateuch formally condemns all acts of violence, all injury by action or by word, and even all grudge in the heart. (Leviticus, xix., 17, 18.) It condemns not only adultery, but debauchery and prostitution. It pushes severity so far as to exact the burning by fire of the daughter of a priest whose manners shall have become a public scandal. (Leviticus, xxi., 9.) It condemns not only theft, but the abuse of property, such as the action of receiving as a pledge from a poor borrower the instrument of his labor or the garment which covers him. It condemns not only false testimony but calumny, backbiting and lying. — We experience some difficulty when we pass from these admirable precepts to the civil laws of Moses. But it must be remarked that there is an immense gap between the civil laws of a country, however advanced it may be in civilization, and the universal rules of morality. Civil laws, to be practicable, are obliged to accept at least a part of the prejudices, of the passions and of the habits of the nation, for which they are intended. Civil laws, among all peoples and in all times, are nothing more than a compromise between the fact and the right, between the state of culture, of morality, of external security, which a nation has reached, and the absolute exigencies of conscience or the ideal proposed by religion. How, for example, can we reconcile with the mildness of the Gospel the punishments pronounced against criminals by all Christian nations? How can we reconcile with evangelical purity that sort of guarantee offered by the police to the profligacy of morals? It is still worse when we pass from the civil order to international relations, where force is the sole guarantee, we may even say the sole measure, of right. It is not astonishing, therefore, that Moses, at once moral legislator, civil legislator and political chief of his nation, offers us a similar contradiction, and one even more obvious, because of the difference in times, manners and customs. — *The faithful of Mosaism in the midst of other Religions; their Emancipation.* It is impossible, with the best will in the world, to see in the dispersion of the Israelites among other nations, a supernatural effect of the death of Christ; for this dispersion commenced and was almost accomplished many years before our era. From this epoch, the greatest part of the nation lived outside of Palestine, scattered through the three divisions of the ancient world. Without speaking of the ten tribes led away by Salmanazar and which were confounded with the other peoples of his empire, the *Jews* themselves, that is to say, the ancient inhabitants of the kingdom of Judah, did not consent to return with Zorobabel and Esdras. When Alexander the Great destroyed the Persian monarchy, he found a great number of them in Babylonia. It was in Babylonia itself, at Sora, at Pombeditha, at Nehardea, that they founded their most celebrated academies. There was a large number of them in the Greek colonies. They formed a considerable part of the population of Alexandria, whither Alexander the Great attracted them, by according to them the same privileges as to his Macedonian subjects. Ptolemy Soter almost depopulated Judæa in the interest of his own states; and if it is true that a hundred and twenty thousand of these exiles returned to their own country, there still remained enough of them to enable Osias to conceive the idea of building at Leontopolis a rival temple to that of Jerusalem. It was during their sojourn in Egypt, under the government of the Lagides, that the Jews became familiar with the language, the manners, the civilization and the philosophy of the Greeks. It was from this intercourse that the version called the Septuagint, many apocryphal books of the Bible, and the writings of Philo, sprang. The policy of the Seleucides in Syria was the same in regard to the Jews as that of the Ptolemies in Egypt. They attracted crowds of them to Seleucia, to Antioch, to Ctesiphon, to Phrygia and Lydia. Thence they spread into Ionia and most of the islands of the Archipelago. At Rome also, after the taking of Jerusalem by Pompey, there was a Jewish colony, which numbered, in the time of Augustus, more than eight thousand persons. The dispersal of the Jews before the Christian era, is attested by the Acts of the Apostles. We read there (ii., 5, 9,) that on feast days there came together at Jerusalem, Jews of all languages and of all nations, Parthians, Medes, Elamites, the inhabitants of Mesopotamia, of Cappadocia, of Pontus, of Phrygia, of Pamphilia, of Egypt, of Libya, of Arabia, of Cilicia, of Crete and of Rome. But we know that the destruction of the Hebrew nationality was not complete till after the destruction of Jerusalem by Titus, and above all after the emperor, Hadrian, just after the insurrection of Barchochebas, had built upon the ruins of the holy city a new city, entry into which was interdicted to the descendants of Israel, under pain of death. — Palestine remained no less, even after this event, the religious mother country of the Jews. The cities of Tiberia, of Sephoris, and Diospolis, were the seats of so many theological academies, in which the Talmud of Jerusalem was being elaborated, while in the academies of Persia that of Babylon was being prepared. But the mass of Israelites scattered throughout all the extent of the empire, passed through alternate periods of repose and suffering, according to the humor of the masters of the world, or of the subordinate tyrants who occupied their place in the provinces. Confounded with the first Christians,

they had the honor, for a long time, of suffering with them for a cause which was common to them, that of the one God, proclaimed both by the Old Testament and the New. — The hardships endured by the Israelites under Greek or Roman rule had a purely political character. The laws of the empire gave the right of believing what one wished or what one could; but religion being a national institution, they would not allow one to neglect to honor it publicly, or, still less, to affect to despise it. Such were not the persecutions which awaited the followers of the old law under the reign of the Christian princes, above all during the Catholic fervor of the middle ages. These latter were inspired by religious hatred. Hence they were much more terrible; for they added to the barbarity of the times what there is most implacable in fanaticism. Moreover, men are less worthy to be accused than the situation itself. The Christian nations, convinced that all was finished, that the word of the Scriptures was accomplished, that the liberator promised to the human race had come, were naturally irritated against that stubborn race who persisted in proclaiming the contrary. Manners were not mild enough, nor faith evangelical enough, to make men put in practice those beautiful words dropped from the cross: "Father, forgive them; for they know not what they do." On the other side, the Jews did not recognize in the dogmas of the Trinity and of the Incarnation the severe monotheism of their ancestors, neither did they admit that the rude age in which they lived, that that age of oppression, of violence, of servitude for some, of despotism for others, of war for all, was the age of peace and of universal liberty predicted by the prophets, the age when swords were to be changed into plowshares; and the Jews felt their attachment for their faith increase by reason of the sufferings which they endured for it. Excluded from all the professions, from all the recognized honorable conditions, excluded even from the ranks of servitude, as much despised by the slave bound to the soil as by the nobility and the middle class, having no other resource than to trade in money, a trade declared infamous in the name of Aristotle and the Holy Scriptures, they lived as enemies in the midst of that society, which, not content with loading them with outrages, periodically decimated them by frightful butcheries. — This state of things was prolonged until the sixteenth century. Then a policy, more intelligent than that of the middle ages, appreciating the services which the Jews were able to render to finance and to commerce, commenced to assure them a pleasanter condition of things. It was thus that, under Henri III., the Spanish Israelites, expelled by the edict of Ferdinand and Isabella, or flying from the stakes of the inquisition, obtained permission to establish themselves, with an entire liberty of conscience, in the cities of Bordeaux and Bayonne, where they gave a vigorous impulse to the commerce of France with Italy. Another portion of these exiles went to the Netherlands, recently freed from the yoke of Philip II., and they took an honorable part in the industrial activity of the cities of Amsterdam and Rotterdam. Others were received with the same consideration by Denmark, and brought the same advantages to it, to the free city of Hamburg, and to the European colonies recently founded in North and South America. The electors of Brandenburg, knowing how to profit from the faults of their neighbors, also attracted to their states the Jews persecuted in the rest of Germany. But the greatest part of this change was the work of the reformation. Christian unity being broken, and the new communions, brought forth by the preaching of Luther, Calvin and Zwingli, having forced the Catholic powers to treat with them on an equal footing or to suffer them in their midst, the principle of toleration entered little by little into the statutory provisions, into the manners and into the public law of Europe. The Jews were not slow to reap the fruits of this toleration. The Protestant countries—above all, Holland, England, from the time of the protectorate of Cromwell, and North America—treated them with a benevolence hitherto unknown, and little by little admitted them to the rank of citizens. — To the principle of toleration introduced by the reformation were joined the principles of liberty, of humanity, of universal right, so dear to the eighteenth century. It was under the influence of these ideas, which, although not new, received a new application, that the emperor of Austria, Joseph II., proclaimed his edict of toleration in 1782; that the constitution of the United States of America admitted, in the fullest measure, freedom of conscience; that the Grand Duke Léopold I. introduced the same reform into Tuscany; that King Louis XVI. issued his decree of 1784, and paved the way, with the aid of Malesherbes, for a more efficacious reparation. It was at this same epoch, and under the same inspiration, that Dohm in Germany and the Abbé Grégoric in France demanded the complete assimilation of the Israelites to their Christian fellow-citizens. This desire was only accomplished by the constituent assembly of 1789. Jan. 28, 1790, it passed a first decree which recognized the rights of active citizens to the Israelites of the south of France, known under the names of Portuguese, Spanish or Avignonese Israelites. A second decree of Sept. 27, 1791, proclaimed solemnly the emancipation of all the Israelites, inhabitants of France, without distinction of origin. — All the French constitutions, which followed that of 1791, sanctioned the same principle. The victorious eagles of the empire bore it successfully into all the countries of Europe, even into Spain and the states of the church. Naturally this triumph lasted no longer than the régime to which it was due. But the seed was sown in men's minds, and we see it today bearing fruit everywhere. The Israelites of Germany, of Austria, of Italy, of Belgium, of

Portugal, of Switzerland and Denmark, are now citizens like those of France, of England, of Holland and of the United States. It will be the same everywhere where civilization shall have attained the height it has in these countries. — Wherever it has been proclaimed, the emancipation of the Israelites has produced the same effects. It has changed pariahs into useful, laborious and intelligent citizens, who serve society and civilization in all the spheres of human activity; in the arts, in the sciences, in industry, in commerce, in politics and in war. There is not a free country which does not count Israelites among the notable men from whom it draws the most honor. AD. FRANCK.

MUNICIPAL BONDS, instruments issued for the payment of money by municipal corporations, such as counties, cities and towns, negotiable in form and clothed with the attributes of commercial paper. These bonds usually run from ten to thirty years, and ordinarily have interest coupons attached to them, which are separately negotiable, and may be enforced by the holder without producing or even proving an interest in the original bond. There is no country in the world where these securities have been issued in such quantities as in the United States, whose total municipal indebtedness was estimated, in 1876, to amount to over a thousand million of dollars. — The authority to issue such securities is not incidental to the ordinary powers of municipal corporations, but must be conferred by express legislative grant. Whether or not the state legislature has the power to confer authority, in the absence of express constitutional provision, to issue these bonds for purposes not strictly public, as, for example, in behalf of railroads, is a question which has long been combated in the highest courts of various states, as well as in the United States courts, and both sides of the question are supported by strong arguments of reason and common sense. As the question involves the power of taxation, and as the state constitutions invariably contain inhibitions upon taxation other than for public purposes, it is of vital importance, in considering the validity of such securities, first to determine whether the purpose for which they have been issued is a public purpose within the constitutional phrase. — The various questions relating to this peculiar class of commercial paper did not assume great importance before the civil war. Before then the issues of such bonds had been for purposes, for the most part, undoubtedly "public," such as the erection of town halls, the construction and maintenance under corporate supervision of water works, roadways, etc. But when, at the close of the war, a large non-producing population were scattered throughout the rich agricultural regions of the west and northwest, and became producers in their turn, there soon arose, in those fertile but sparsely settled districts, the urgent necessity of better means of communication with the great distributing points and centres of trade. Railroads were demanded by the farmers of the grain-bearing areas at the west and northwest, in order to put their products upon eastern markets. But the construction funds had to come, in the main, from eastern capitalists; and the farmers, in order to meet the then paramount want, were ready to pledge the corporate credit of their towns and counties to any extent. — It is a curious social fact that a body of men, acting as an aggregation, will often commit themselves to a line of conduct which as individuals they would strongly condemn. It is not, therefore, to be wondered at that the honest farmers of the great northwest, while despising the owner of a small holding who would mortgage his crop before sowing the seed, should have been so ready to plunge their communities into corporate debts of extraordinary amount, especially when the pay day was put at twenty or thirty years in the future. Judge Dillon, who formerly sat as United States circuit judge in the eighth circuit, where numerous cases involving the validity of such securities arose, declares "that he has known of a newly organized county government, whose population did not exceed 10,000, vote in behalf of a single railway company bonds to the amount of $300,000," bearing interest at the rate of 10 per cent.! "And," he adds, "instances are not infrequent where bonds have been issued to greater amounts than the assessed value of all the taxable property at the time within the municipal or territorial subdivision"! ("Dillon on Municipal Bonds," 5.) For a time this sort of financiering was an apparent success. The demand for railway facilities was undoubtedly based on an imperative want, and it did not take long for this demand to work its way into local politics, as soon as the popularity of schemes for "developing the resources" of this region or that began to be seen. Occasionally a conservative voice could be heard protesting against what has been described by the supreme court of the United States as "the epidemic insanity of the people," "the mania for running in debt for local improvements," (Mercer County *vs.* Hackett, Wallace, 96), but such opposition to the universal clamor was futile, and only exposed the objector to local and political unpopularity. Thus bonds to the amount of hundreds of thousands of dollars were issued by communities which had scarcely begun to assume municipal duties, and interest-bearing securities were negotiated, involving heavy taxation, by towns which existed little more than on paper. The interest in most cases was at first met with reasonable promptness. The bonds were generally disposed of to non-resident buyers, selling at absurdly low rates, in cases where no ordinance forbade their disposal at less than par—and few municipalities were wise enough to set a minimum selling price. Towns and counties were often so eager to lend the aid of their municipal credit to proposed railroad schemes, that, in many cases, an out-and-out donation of bonds was voted

in behalf of the railroad company, instead of the usual stock subscription payable in bonds. The railway officials would then sell the bonds, generally in large amounts to banks, brokers or "syndicates," and often at a great discount, to secure the necessary construction funds, and the long-needed railway would then be built. It is thus a matter of record that more than one railroad has been laid in sparsely settled districts only to be abandoned when the funds to support it had failed, and the expected traffic fell far below the hopes of the sanguine promoters. In the six states of Illinois, Wisconsin, Iowa, Minnesota, Nebraska and Kansas there was an increase in the mileage of railroads of from 6,992 miles in 1867 to 17,645 miles in 1873—an increment of no less than 254 per cent.! While in the western states and territories alone, during the five most active years of railway construction, not less than five hundred millions of dollars were expended in building railroads. (See article by Mr. Charles Francis Adams, Jr., in "North American Review," vol. 120.) — It was about 1870 that these prodigal communities began to feel the weight of their obligations. The proceeds of their indebtedness had been spent in "improving" their lands, but there lay a sting in the galling fact that the debts themselves were, for the most part, in the hands of foreign holders, who now began to press for their dues. Pay day was drawing near, when the principal would become due, and, in the meantime, the interest coupons had to be taken up with harassing regularity. Towns and counties, which had been only too ready to pledge their corporate faith for hundreds of thousands, began to cast about for ways of meeting the payment of the hundreds due as interest; and when this was found to involve a regularly laid "interest tax," which meant just so many dollars from every tax payer's pocket, the idea of a further demand by way of provision for a sinking fund, with which to meet the principal became unbearable, and, before a quarter of the coupons had been taken up, men who would have scorned to employ dishonest means to avoid their personal debts, were anxiously seeking to escape from debts, which, acting together in a corporate capacity, they had just as honestly incurred. — The word "repudiation," in its now common significance, is said to have been used for the first time by the governor of Mississippi, in a message to the legislature of that state, in January, 1841. He alluded to a plan which had been suggested, of *repudiating* certain bonds of the state issued in support of a banking institution, and which had been sold, contrary to the law regulating their issue, at less than their face value. The state legislature set a noteworthy example to succeeding generations of law-makers less sensitive for the honor of their commonwealth than they. They resolved as follows: "That the state of Mississippi will pay her bonds and preserve her faith inviolate. That the insinuation that the state of Mississippi would repudiate her bonds and violate her plighted faith, is a calumny upon the justice, honor and dignity of the state." — Unfortunately the worthy example set by the Mississippi legislators of 1841 has not been followed in their own and some other states. The political huckster was only too quick to learn that a policy of repudiation, so far from exciting the indignation of his constituents, if boldly supported by glib and specious argument, was one of the surest claims to local popularity. Indeed, these interest-burdened communities were so hot to rid themselves of the weight of debt which they had undertaken, that any scheme for resisting the non-resident, and therefore "grasping," "avaricious" and "bloated" bondholder, was certain of a strong popular indorsement, even though based upon palpable fraud. This state of public sentiment, and the action to which it led, were simply parts of a natural sequence. It may be safely laid down as a general proposition, which the student of municipal affairs can readily verify, that whenever a community assumes obligations of a public character which unexpectedly become so heavy as to oppress the private individual, repudiation follows as an inevitable consequence. It was thus with the communities above referred to. Public meetings were held and resolutions passed, urging town and county officers to refuse to take up the interest coupons as they came due, and plainly intimating that a compliance with the law and a non-compliance with the demands of the voters would involve a loss of place at the ensuing election. The effect of such proceedings may be readily guessed. Payments were not met, often through actual lack of funds, but often, too, in accordance with the orders of the voters in town hall assembled. The bond question became a political question, and, in certain districts of Iowa and Minnesota, resolutions were passed by nominating conventions which virtually pledged the nominees to the policy of repudiation. The bondholders were driven to their legal remedies, and various methods were tried to enforce their rights. Suits were brought against municipal officers to compel the payment of over-due interest, and when the treasury of the town or county showed a lack of the necessary funds, an application would be made for a mandamus compelling the assessment of a special interest tax. The defenses raised to such actions were founded upon all sorts of pretexts, but they may be generally resolved under two heads: 1, those which pleaded want of power on the part of the municipality to issue the bonds in question; 2, those which alleged various irregularities or defects in the exercise of the power. The decisions of the lower state courts were almost invariably in favor of invalidating such bonds, so strong was the feeling against them; and it is notorious that in certain districts, judges, on the one hand, lost their seats because their decisions maintaining the public credit were so obnoxious to the popular demand, and, on the other, owed their elevation to the bench, to the explicit understanding that they

were pledged to decide against the validity of these securities, in such cases as might come before them. — The "Grangers," or "Patrons of Husbandry," a secret order, modeled after the manner of the "Odd Fellows," directed their energies to the accomplishment of two great results: lowering the rates of railway transportation, and "wiping out" railroad or municipal bonds. One of their officers, who represented the Northwestern Farmers' convention, before the Windom committee on transportation rates (U. S. senate, 1873), when it was suggested to him that the United States supreme court might declare unconstitutional any act changing rates from five cents per mile to three cents per mile, where the charter allowed five cents per mile, was for "wiping out the supreme court, and getting one that would decide it." This is precisely what the people of the "granger" states did, *i. e.*, reversed the decision of their judges upon the question of the validity of town and county bonds, by electing others pledged to a construction of the law favoring their views. A striking instance of the way in which an elective judiciary may be influenced by an erroneous and mischievous popular sentiment, is to be found in such a decision, referred to by the United States supreme court, in the case of Gelpcke *vs.* Dubuque, 1 Wallace U. S. Rep., 206, as "standing out in unenviable solitude and notoriety." The opinion of the federal court concluded with these words: "We shall never immolate truth, justice and the law because a state tribunal has erected the altar and decreed the sacrifice." (See Mr. Adams' article, above referred to.) On another occasion, in 1875, the same court, referring to the great commonwealth of Minnesota, said: "The faith of the state, solemnly pledged, has not been kept; and were she amenable to the tribunals of the country as private individuals are, no court of justice would withhold its judgment against her."— Unfortunately, popular opposition to the payment of municipal debts has not been confined to the granger states. In the opinion of the federal bench, if not elsewhere, even the New York court of appeals has lent its sanction to schemes of repudiation, by declaring certain bonds void upon grounds which the United States supreme court has pronounced unsound, (see Starin *vs.* Bank of Genoa, and Gould *vs.* Sterling, 23 N. Y. Rep., 439, 456); while the most flagrant case of refusal to meet a municipal debt justly incurred is to be found in the recent (March, 1882) action of the people of Greenwood, Steuben county, New York, who by threats and force actually prevented the sheriff from collecting an interest tax in favor of bonds whose validity had been sustained by the highest court of the state. To enforce the tax the governor was compelled to issue a proclamation declaring the town to be in a state of insurrection! When cases involving the defenses mentioned above came to be submitted finally to the scrutiny of the federal judiciary, the rights of innocent holders of these bonds were firmly upheld. The sound and honest reasoning upon which the supreme court of the United States based its decisions in these cases may be summarized, briefly, as follows: 1. The power of municipal corporations to issue such securities is derived only from express legislative grant, and is not to be implied; and the legislature may grant this power if not prohibited, either expressly or by necessary implication, by the constitution of the state or by that of the United States. 2. Where authority to issue such bonds exists, no mere defect or irregularity in the exercise of that power will suffice to invalidate the security in the hands of an innocent purchaser. This second point is one upon which the supreme court and the highest appellate courts of several states, notably the New York court of appeals, are still at odds, the latter insisting, with strong show of reason, it must be admitted, that if the purchasers of such securities are not required to verify their bonds, except by the recitals upon their face, and the act authorizing their issue, the door is at once thrown open to the fraudulent schemes of official rascality. Judge Dillon himself, who, in his decisions, has invariably "set a face of flint against repudiation in all its forms," admits that "the frauds which unscrupulous officers will be enabled successfully to practice, if an implied and unguarded power to issue negotiable securities is recognized, and which the corporation or the city will be helpless to prevent, is a strong argument against the judicial establishment of any such power"; and he suggests this query, "Do not the decisions of the supreme court of the United States lead to this conclusion, 'that where the power to issue bonds is given upon the condition of a previous vote in favor of the proposition, the public or municipal officers can, *where no vote whatever has been taken or the proposition been voted down*, bind the county or municipality by the false recitals in such unauthorized bonds, provided they are issued by the officers entrusted by the statute with the power'?" A query which has been emphasized by the conduct of the mayor of Adrian, Mich., who sold to various New York bankers forged bonds, the *power* to issue which existed as recited on their face, although no authority had been given by popular vote. It is a serious question whether the bonds are not binding upon the town under the decisions of the United States supreme court, which has declared against the repudiation of such bonds even by municipalities which have been deceived and defrauded in their issue. (See New York papers, Feb. 13, 1882, *passim*) — There is no doubt, that, but for the position assumed by the highest tribunal in this country upon the question of municipal bonds, dealers in this class of commercial securities would be subject to far greater risks than they are at present. It is well for them, however, to bear this much in mind, that want of power to issue is a good defense even against a purchaser in good faith. In other words, such purchaser is bound to know whether or not the legislature has expressly authorized the par

ticular issue by the municipal officers executing the same; although he is under no obligation to examine the records of the town or county in whose securities he proposes to deal, in order to see whether or not the declarations upon the face of such bonds are true as to the performance of the details in the exercise of that power, when those declarations have been duly verified by the municipal officers named in the legislative act. — The lesson of 1868–73 has been a bitter one for the people of many promising towns and counties, and it will be years before some of the more prodigal communities recover from the load of taxation recklessly but voluntarily assumed. Grass grows upon the track, and ties rot along the line of more than one railroad in districts whose inhabitants will, for years to come, pay interest on money spent in its construction. GEORGE WALTON GREEN.

MUTSUHITO (meek or peaceful man), the reigning emperor of Japan, and the 123d ruler of the line of mikados, was born Nov. 3, 1850, in the palace of Kiōto. His father was the emperor Komei, and his mother Fujiwara Asako. At his father's death, Jan. 30, 1867, he was declared mikado, and on the re-establishment of the ancient government, Jan. 3, 1868, became sole ruler, without regent or shōgun ("tycoon"). He saw Europeans for the first time at his audience with the foreign envoys, March 23, 1868. On April 6, in the presence of the imperial court, and the leaders of the restoration, he took that oath which lies at the foundation of the government of Japan, and which has been made the basis of political progress since 1868. The text of the oath, which seems to be steadily transforming Japan from an absolute despotism to a constitutional monarchy, is as follows: "1. The practice of discussion and debate shall be universally adopted, and all measures shall be decided by public argument. 2. High and low shall be of one mind, and social order shall be thereby perfectly maintained. 3. It is necessary that the civil and military power be concentrated in a single whole, the rights of all classes be allowed, and the nation's mind be completely satisfied. 4. The uncivilized customs of former times shall be broken through, and the impartiality and justice displayed in the working of nature be adopted as a basis of action. 5. Intellect and learning shall be sought for throughout the world, to establish the foundations of the empire." On Feb. 7, 1869, the national capital was removed to Tōkiō, and the mikado was soon afterward married to Haruko, a lady of the noble house of Ichijō, born in 1850. No issue of this marriage has yet appeared. In case of death or failure of offspring from the imperial concubines, twelve in number, an heir is chosen from one of the four Shin-no, or families of imperial blood, Katsura, Arisugawa, Fushimi, and Kanin. In October, 1881, Mutsuhito issued a proclamation, in which, after reviewing the successive phases of government, occur these words: "It is my duty to develop the manner of administration as the times alter. I intend to establish a national assembly in 1890." [This article is inserted mainly as an addition to that on Japan.]

N

NATION, Definition of. The words *nation* and *people* are frequently used as synonyms, but there is a great difference between them. A *nation* is an aggregation of men speaking the same language, having the same customs, and endowed with certain moral qualities which distinguish them from other groups of a like nature. It would follow from this definition that a *nation* is destined to form only one *state*, and that it constitutes one indivisible whole. Nevertheless, the history of every age presents us with nations divided into several *states*. Thus, Italy was for centuries divided among several different *governments*. The same was the case, and in a measure is still the case, with Germany. The *people* is the collection of all citizens without distinction of rank or order. All men living under the same *government* compose the *people* of the *state*. In relation to the *state*, the *citizens* constitute the *people;* in relation to the human race, they constitute the *nation*. A *free nation* is one not subject to a foreign *government*, whatever be the constitution of the *state;* a *people* is *free* when all the citizens can participate in a certain measure in the direction and in the examination of public affairs. Empires, such as the Roman empire was, such as the Russian empire and the Austrian empire of to day are, may, therefore, comprise a great number of different *nations*, but they are composed, in reality, of only one *people*. Notwithstanding the diversity of *nationalities* united under the government of the house of Hapsburg, there is one Austrian *people*, since the constitution of 1859 granted certain political rights to the population The *people* is the political body brought into existence by community of laws, and the *people* may perish with these laws. The *nation* is the moral body independent of political revolutions, because it is constituted by inborn qualities which render it indissoluble. The *state* is the *people* organized into a political body. (See NATIONALITIES, PRINCIPLE OF.) HÉLIE.

NATION, What is a?* The idea of a nation, though apparently clear, has been greatly misapprehended. Human society exists under forms

* This article may serve as a pertinent criticism on those on NATION, and NATIONALITIES, PRINCIPLE OF, (which see): at the same time it is, so to speak, their complement.—ED.

most various. There are great agglomerations of men, as in China, Egypt, and ancient Babylonia; tribes, as among the Hebrews and the Arabs; cities, like Athens and Sparta; unions of different countries, as in the Achæmenidian, the Roman and the Carlovingian empires; communities without a country, where the members are held together by a religious bond, like the Israelites and the Parsees; nations, like France, England, and most of the modern European autonomies; confederations, as in Switzerland and America; and relationships, such as race, or rather language, established among the ancient Germans and among the Slavonians; all of which are modes of grouping which exist, or have existed, and which can not be confounded with one another without most serious consequences. At the time of the French revolution it was supposed that the institutions of small, independent cities, like Sparta and Rome, could be made applicable to our great nations of thirty to forty millions of people. In our day a more grave error is committed. Race is confounded with nation, and a sovereignty is attributed to ethnographic, or rather linguistic, groups, analogous to that of the peoples actually existing. Let us try to attain some precision on these difficult questions, where the least confusion in regard to the sense of the words, at the beginning of the reasoning, may produce in the end the most fatal errors. — I. Since the termination of the Roman empire, or, better, since the breaking up of the empire of Charlemagne, western Europe has been divided into nations, some of which have, at certain periods, attempted to exercise a hegemony over others, without ever succeeding, however, in establishing a lasting supremacy. That which Charles V., Louis XIV. and Napoleon I. were not able to do, no one in the future will probably succeed in accomplishing. The establishment of a new Roman empire, or a new empire like that of Charlemagne, has become an impossibility. Europe is too large for any attempt at universal domination to be made without speedily provoking a coalition which would compel the ambitious nation to retire within her natural boundaries. A sort of balance is established for a long time. France, England, Germany and Russia will still be, for some hundreds of years, notwithstanding the changes of fortune they may experience, historic individuals, essential pieces on the chess-board of the world, whose positions constantly vary, but which are never wholly lost. — Nations, thus understood, are something quite new in history. Antiquity was not acquainted with them. Egypt, China and ancient Chaldea were in no degree nations. They were herds led by a son of heaven or of the sun. There were no Egyptian citizens, any more than there are Chinese citizens. Classic antiquity had municipal republics and kingdoms, confederations of local republics and empires: it hardly had a nation as we understand the word. Athens, Sparta, Tyre and Sidon were little centres of an admirable patriotism; but they were cities with a relatively small territory. Gaul, Spain and Italy, before they were absorbed by the Roman empire, were collections of tribal groups which were often leagued together, but without central institutions and without dynasties. Nor were the Assyrian and the Persian empires, or the empire of Alexander, fatherlands. There were never Assyrian patriots; the Persian empire was a vast feudalism. Not one nation can trace its origin to the colossal fortune of Alexander, which was nevertheless so rich in consequences to the general history of civilization — The Roman empire was much nearer being a fatherland. In return for the great benefit of a cessation of wars, Roman domination, at first so hard, was very soon liked. Here was a great association the synonym of order, peace and civilization. In the latter days of the empire there was, among lofty souls, among enlightened bishops, and among the lettered, a true sentiment of "Roman peace," as opposed to the menacing chaos of barbarism. But an empire, twice as large as France is to-day, could not form a state in the modern acceptation of that word. The separation of the east from the west was inevitable. The attempts at a Gallic empire, in the third century, did not succeed. It was the Germanic invasion which introduced into the world the principle which, later, served as a basis for the existence of nationalities. — What did the Germanic peoples in fact do, from their great invasions of the fifth century to the last Norman conquests in the tenth? They made little fundamental change in the races; but they imposed dynasties and a military aristocracy on more or less considerable parts of the former western empire, which parts took the names of their invaders. Hence a France, a Burgundy, a Lombardy, and later, a Normandy. The ascendency which the Frankish empire rapidly gained, reproduced for a brief period the unity of the west; but this sway was irremediably broken toward the middle of the ninth century. The treaty of Verdun marked out divisions immutable in principle, and from that time France, Germany, Italy and Spain have traveled by ways, often circuitous and venturesome, to their full national existence, such as we behold it to-day. — What is it that in fact characterizes these different states? It is the fusion of the peoples which compose them. In the countries we have just enumerated there is nothing analogous to what will be found in Turkey, where Turk, Slave, Greek, Armenian, Arab, Syrian and Koord are as distinct to-day as on the day of the conquest. Two important circumstances contributed to this result. The first was, that the Germanic peoples adopted Christianity when they came into near contact with the Greek and Latin peoples. When the conqueror and the conquered are of the same religion, or rather, when the conqueror adopts the religion of the conquered, the Turkish system, of distinguishing men solely by their religion, can no longer exist. The second circumstance was, that the conquerors forgot their own language. The

grandsons of Clovis, Alaric, Gondebald, Alboin and Rollo already spoke Romanic. This fact was itself the consequence of another important fact, viz., that the Franks, Burgundians, Goths, Lombards and Normans had with them very few women of their race. For several generations the chief men married only German women; but their concubines were Latin, the nurses of their children were Latin; all the tribe married Latin women; consequently the *lingua francica* and the *lingua gothica* had but a short existence after the establishment of the Franks and Goths on Roman lands. It was not so in England; for the Anglo-Saxon invaders had, without doubt, women with them; the British population fled, and besides, the Latin was no longer, or indeed never was, dominant in Britain. If the Gallic had been generally spoken in Gaul, in the fifth century, Clovis and his followers would not have had to abandon Germanic for Gallic. — Hence this capital fact, that, notwithstanding the extreme violence of the manners of the German invaders, the mould which they imposed became, in the course of centuries, the mould of the nation itself. France became quite legitimately the name of a country into which only an imperceptible minority of Franks had entered. In the tenth century, in the first *chansons de geste*, which are so perfect a mirror of the spirit of the times, all the inhabitants of France are French. The idea of a difference of races in the population of France, so manifest in Gregory of Tours, does not appear at all in French writers and poets subsequent to Hugues Capet. The distinction between noble and serf is as marked as possible; but the difference is not at all a difference of race; it is a difference of courage, of habit, and of education, transmitted by heredity: the idea that it all originated in conquest occurs to no one. The false system according to which the nobility had its origin in a privilege conferred by the king for great services rendered the nation, so that every noble was one upon whom the title had been conferred, was established as a dogma in the thirteenth century. — The same thing occurred after nearly all the Norman conquests. After one or two generations the Norman invaders were no longer distinguishable from the rest of the population. Their influence had, however, been profound. They had given the conquered country a nobility, military habits, and a patriotism which it did not previously possess. — Forgetfulness, and historic error even, are essential in the formation of a nation: hence progress in historic studies is frequently attended with danger to nationality. Historic investigation brings to light the deeds of violence which occurred at the beginning of all political organizations, even those whose results have been most beneficent. Unity is always produced brutally: the union of northern and southern France was the result of terror and extermination continued for nearly a century. The king of France, the ideal type, so to say, of a secular crystallizer, who has made the most perfect national unity that exists; the king of France, seen too near, lost his prestige: the nation he had formed, cursed him; and to-day, none but cultured minds know what he was worth and what he did. — It is by contrast that these great laws of the history of western Europe become sensible. In the enterprise which the king of France, partly by his tyranny and partly by his justice, brought to so admirable a termination, many countries were stranded. Under the crown of St. Stephen the Magyars and the Slaves have remained as distinct as they were 800 years ago. Far from fusing the various elements of its domains, the house of Hapsburg has kept them distinct and often opposed to one another. In Bohemia the Czech element and the German element are superposed like oil and water in a glass. The Turkish policy, of separating nationalities according to their religion, has had results far more serious: it has caused the breaking up of the Oriental empire. In a city like Salonica or Smyrna there will be found five or six communities, each of which has its own memories, and between which there is scarcely anything in common. Now the essence of a nation is, that all the individuals must have many things in common, and also that all must have forgotten many things. No French citizen knows whether he is Burgundian, Alain, Taïfale, or Visigoth: every French citizen must have forgotten St. Bartholomew's night and the massacres in the southern provinces in the thirteenth century. There are not ten families in France which can furnish proof of Frankish origin, and besides, such proof would be essentially defective, because of the thousand unknown crossings which may derange all the systems of the genealogists. — The modern nation is then a historic result of a series of facts all tending to the same end. Sometimes unity has been realized by a dynasty, as was the case in France; again, it has been by the direct will of the people, as in Holland, Switzerland and Belgium; at another time, by a general spirit slowly vanquishing the caprices of feudalism, as in the case of Italy and Germany. A profound reason for their existence has always led to these formations. Principles, in such cases, make their way by the most unexpected surprises. We have, in our day, seen Italy unified by its defeats, and Turkey broken up by its victories. Every defeat advanced the cause of Italy; every victory was a loss to Turkey, for Italy is a nation, and Turkey, outside of Asia Minor, is not one. It is the glory of France to have proclaimed, by the French revolution, that a nation exists by its own act. But what, pray, is a nation? Why is Holland a nation, while Hanover or the grand duchy of Parma is not? How is it that France continues to be a nation, when the principle which created her has disappeared? How is Switzerland, which has three languages, two religions, and three or four races, a nation, when Tuscany, for example, which is so homogeneous, is not a nation? Why is Austria a state and not a nation? In what

does the principle of nationalities differ from the principle of races? These are points upon which a reflecting mind likes to come to a definite conclusion. The affairs of the world are hardly ever regulated by reasoning on this sort of questions; but the men who study them like to bring reason to bear on these matters and to clear away the confusion of superficial minds in their regard. — II. According to certain political theorists a nation is above all a dynasty, representing a former conquest, which was at first accepted and then forgotten by the mass of the people. According to these theorists the grouping of provinces effected by a dynasty through its wars, its marriages and its treaties, ends with the dynasty which brought it about. It is quite true that most modern nations have been made by a family of feudal origin, which has married on the soil and has been in some sort a nucleus of centralization. The limits of France in 1789 were neither natural nor necessary. The large belt which the house of Capet had added to the narrow strip of the treaty of Verdun, was properly the personal acquisition of that house. At the time when the annexations were made, people had no idea of natural limits, or of the rights of nations, or of the consent of the provinces. The union of England, Ireland and Scotland was likewise a dynastic fact. Italy was so long in becoming a nation only because, among its numerous reigning houses, none, before our century, made itself a centre of union. Strange to say, it took its royal title* from the obscure island of Sardinia—a land scarcely Italian. Holland, which created itself by an act of heroic resolve, nevertheless contracted a close marriage with the house of Orange, and would incur actual peril if at any time that union should be endangered. Is such a law, however, absolute? Doubtless not. Switzerland and the United States, which have been formed as if from conglomerates of successive additions, have no dynastic base. To discuss the question concerning France, it would be necessary to have the secret of the future. Let us simply say that that great French royalty had been so decidedly national, that the very day after its fall the nation was able to hold together without it. And then the eighteenth century had changed everything. Man had returned, after centuries of abasement, to his former spirit of respect for himself, to an idea of his rights. The words fatherland and citizen had recovered their meaning. Thus was accomplished the boldest deed which has been done in history, a deed which may be compared with what it would be in physiology, to attempt to make a body, from which brain and heart had been removed, live with its previous identity. — We must then admit that a nation can exist without the dynastic principle, and even that nations which have been formed by dynasties, may be separated from that dynasty without ceasing in consequence to exist. The old principle, which only took account of the right of princes, can no longer be maintained; besides the dynastic right, there is the national right. On what shall this national right be based? by what sign shall it be recognized? from what tangible fact shall it be derived? — 1. From race, say many confidently. Artificial divisions, resulting from feudalism, princely marriages, and diplomatic congresses, are of short duration; but race is permanent. It is this that constitutes a right, a legitimacy. The Germanic family, for example, according to this theory, has the right to take back the scattered members of Germanism, even though its members do not ask to be again united. The right of Germanism over a certain province is stronger than the right of the inhabitants of that province over themselves. Thus a sort of primordial right is created, analogous to that of kings by right divine; for the principle of nations, is substituted that of ethnography. This is a very great error, which, if it should prevail, would prove a loss to European civilization. The principle of the primordial right of races is as narrow and full of danger to true progress, as the principle of nationality is just and legitimate. — In the ancient tribe and city the fact of race had, we acknowledge, a primary importance. The ancient tribe and city were only an extension of the family. At Sparta and at Athens all the citizens were more or less connected by blood. It was the same with the Israelites, and it is still so in Arab tribes. In the Roman empire we find the situation wholly different. Formed at first by violence, then maintained by interest, this great agglomeration of towns and provinces absolutely unlike, gives a most serious blow to the idea of race. Christianity, with its universal and absolute character, works still more efficaciously to the same end. It becomes intimately allied with the Roman empire; and, by the effect of these two incomparable agents of unification, the ethnographic reason is left out of the government of human things for centuries. The invasion of the barbarians was, notwithstanding appearances, one step more in this direction. The division of the barbarian kingdoms had no ethnographic significance; they were governed by the power or the caprice of the invaders. The race of the population they subjected to them, was to them wholly a matter of indifference. Charlemagne did again in his way what Rome had already done: he made a single empire composed of races most diverse. The authors of the treaty of Verdun, while coolly tracing their two great lines from the north to the south, had not the slightest concern about the races of the people on the right and the left. The changes of frontier effected after the middle ages were also independent of any ethnographic tendency. If the policy followed by the Capetian house succeeded in grouping, under the name of France, nearly all the territory of ancient Gaul, this was not the effect of any tendency these countries might have to re-

* The house of Savoy owes its royal title to the possession of Sardinia (1720).

unite with those of the same race. Dauphiny, Bresse, Provence and Franche-Comté had no longer any remembrance of a common origin. All Gallic consciousness had ended in the second century of our era, and it is only through the views of the learned that people have, in our day, found again retrospectively the individuality of the Gallic character. — The ethnographic consideration has then counted for nothing in the constitution of modern nations. France is Celtic, Iberian, Germanic. Germany is Germanic, Celtic and Slave. Italy is the country where the ethnography is the most perplexing. Gauls, Etruscans, Pelasgians, Greeks, not to mention other elements, are there crossed and intermingled in an inexplicable manner. The British isles, taken as a whole, present a commingling of Celtic and German blood, the proportions of which are extremely difficult to determine. The truth is, that there is no pure race, and that to make politics depend on ethnographic analysis, is to base it on a chimera. The most noble countries, England, France and Italy, are those whose blood is the most mixed. Is Germany an exception in this respect? Is it a purely Germanic country? It is an illusion to suppose so. All the south was Gallic. All the east, from the Elbe, is Slavic. And are the parts that it is claimed are really pure, so in fact? Here we touch upon one of the problems upon which it is most important to have clear ideas and to prevent misapprehension. — Discussions upon races are interminable, because the word race is taken by philological historians and by physiological anthropologists in two senses altogether different. To anthropologists, race has the same meaning as in zoölogy; it indicates an actual descent, a blood relationship. Now the study of languages and history does not lead to the same divisions as physiology. The words brachycephalous and dolichocephalous have no place in history or in philology. In the human group which created the Aryan languages and discipline, there were already brachycephalous and dolichocephalous individuals. The same may be said of the primitive group which created the languages and institutions called Semitic. In other terms, the zoölogic beginnings of humanity were vastly anterior to the beginnings of culture, of civilization, and of language. The primitive Aryan, primitive Semitic and primitive Turanian groups had no physiological unity. These groupings were historic facts which took place at some epoch, say some fifteen or twenty thousand years ago, while the zoölogic origin of mankind is lost in impenetrable darkness. What is philologically and historically called the Germanic race, is certainly a very distinct family in the human race. But is it a family in an anthropological sense? Assuredly not. Germanic individuality appeared in history only a few centuries before Christ. Evidently the Germans did not spring from out of the earth at that time. Before that, fused with the Slaves in the great undistinguished mass of Scythians, they had not a separate individuality. An Englishman is indeed one type of mankind. Now the type that is very improperly called the Anglo-Saxon* race is not the Briton of the time of Cæsar, nor the Anglo Saxon of Hengist, nor the Dane of Canute, nor the Norman of William the Conqueror; he is the resultant of them all. The Frenchman is not a Gaul, a Frank, nor a Burgundian. He is what has come out of the great caldron, where, under the direction of the king of France, the most diverse elements have worked together. An inhabitant of the isle of Jersey or of Guernsey does not differ at all in origin from the Norman population of the neighboring coast. In the eleventh century the most penetrating eye could not have perceived the slightest difference on the two sides of the channel. Insignificant circumstances prevented Philippe-Auguste from taking these islands with the rest of Normandy. Separated from each other for nearly 700 years, the two peoples have become not only strangers to each other, but wholly unlike. Race, then, as we historians understand it, is made and unmade. The study of race is of capital importance to the savant who devotes himself to the history of mankind. It has no application in politics. The instinctive consciousness which has guided the making of the map of Europe, has taken no account of race, and the first nations of Europe are nations of essentially mixed blood — The fact of race, important as it is at the origin, continually loses its importance. Human history differs essentially from zoölogy. Race is not everything in it, as with rodents and the feline tribe, and we have no right to go through the world feeling the crania of people, and then taking them by the throat and crying out: "You are of our blood; you belong to us!" Besides the anthropological characteristics, there are reason, justice, truth and beauty, which are the same for all. The ethnographic policy is not safe. You employ it to day against others; then you see it turned against yourself. Is it certain that the Germans, who have raised so high the standard of ethnography, will not see the Slaves come and analyze, in their turn, the names of the villages of Saxony and Lusatia, to find traces of the Wiltzes and Obotrites, and to demand an account of the wholesale massacres and public sales of their ancestors caused by the Othos? For all, it is well to forget. — Ethnography is a science of rare interest; but, to be free, it should be without political application. In ethnography, as in all studies, systems change: that is the condition of progress. Should nations, then, change with the systems? The limits of states would then follow the fluctuations of science. Patriotism might depend on a more or less paradoxical dissertation.

* The Germanic elements are not much more considerable in the United Kingdom than they were in France at the time when it possessed Alsace and Metz. The Germanic language has predominated in the British isles only because the Latin had not entirely supplanted the Celtic idioms there, as it had in Gaul.

One might say to a patriot: "You are mistaken; you are shedding your blood for a certain cause. You think you are a Celt: you are not, you are German." Then, ten years later, he might be told he was a Slave. In order not to pervert science, let us exempt it from giving advice on these problems, where so many interests are at stake. We may be sure that if we charge it with furnishing elements for diplomacy, we shall many times detect it in the crime of compliance with the demands of diplomacy. It has something better to do: let us ask of it simply truth.— 2. What has just been said of race applies also to language. Language invites to union: it does not compel it. The United States and England speak the same tongue, but do not form one nation. So with Spanish America and Spain. Switzerland, on the contrary, so well constituted, since it was made by the consent of its different parts, contains three or four languages. There is in man something superior to language: it is *will*. The will of Switzerland to be united, notwithstanding the variety of her idioms, is a fact much more important than a similarity of language, often obtained by vexatious interference.— A fact honorable to France is, that she has never sought to secure unity of language by coercive measures. People may have the same feelings, the same thoughts and the same affections, without speaking the same tongue. We just spoke of the disadvantage of making international policy depend on ethnography. There would not be less in making it depend on comparative philology. Let these interesting studies be given entire liberty of discussion; let us not mix them up with anything that would disturb their serenity. The political importance attached to languages comes from the fact that they are regarded as signs of race. Nothing could be more erroneous. Prussia, where German alone is now spoken, spoke Slave a few centuries ago; the country of Wales speaks English; Gaul and Spain speak the primitive idiom of Alba Longa; Egypt speaks Arabic; examples are innumerable. Even in their beginnings, similitude of language did not involve similitude of race. Let us take the proto-Aryan or proto Semitic tribe. In it were slaves who spoke the same language as their masters. Now the slave was then very often of a different race from that of his master. We repeat: these divisions of Indo-European, Semitic and other languages, created with such admirable sagacity by comparative philology, do not coincide with the divisions of anthropology. Languages are historic formations, which give little indication of the blood of those who speak them, and which, in any case, can not bind human freedom when there is question of determining the family with which one will form a life and death alliance. — This exclusive consideration of language has, like the too great attention given to race, its disadvantages. One who exaggerates it, shuts himself up in one determinate culture, called national; he limits himself, he becomes immured. He leaves the open air one breathes in the vast field of humanity, to shut himself in conventicles of compatriots. Nothing is worse for the mind; nothing more hurtful to civilization. Let us not abandon this fundamental principle, that man is a reasonable and moral being, before being separated by any language, before being a member of any particular race, an adherent of any special culture. Before French, German or Italian culture, is human culture. See the great men of the renaissance: they were neither French, nor Italian, nor German. They had found, by their study of antiquity, the secret of the true education of the human mind, and they devoted themselves to it body and soul. How well they did! 3. Now can religion present a sufficient basis for the establishment of a modern nationality. At the beginning, religion pertained to the very existence of the social group. The social group was an extension of the family. The religion, the rites, were family rites The religion of Athens was the worship of Athens itself, of its mythical founders, its laws and its customs. It implied no dogmatic theology. This religion was, in all the force of the term, a state religion. One was not an Athenian if he refused to practice it. It was, at bottom, the worship of the Acropolis personified. To swear on the altar of Aglauros,* was to take an oath to die for one's country. This religion was equivalent to what the act of drawing lots, or of swearing by the flag, is among us. To refuse to participate in such a worship was what it would be in modern society to refuse military service. It was to declare that one was not Athenian. On the other hand, it is clear that such a worship had no meaning for one who was not of Athens; so no proselytism was used to compel strangers to accept it. The slaves of Athens did not practice it. It was the same in some of the small republics of the middle ages. One was not a good Venetian if he did not swear by St. Mark; one was not a good Amalfitan if he did not hold St. Andrew above all the other saints of paradise. In these small communities, that which later became persecution and tyranny was legitimate, and of no more consequence than is among us the fact of wishing the head of a family joy on his birth-day, or of greeting him with "happy new year!" on the first day of the year.— What was true in Sparta and Athens, was already so no longer in the kingdoms which had originated in the conquest of Alexander, and especially was no longer so in the Roman empire. The persecutions of Antiochus Epiphanes to bring the east to the worship of Jupiter Olympus, and those of the Roman empire to maintain a pretended state religion, were a fault, a crime, a veritable absurdity. In our day the situation is perfectly clear. There are no longer masses believing just alike. Every one believes and practices in his way, what he can, as he wishes. There is no longer a state religion; one may be French

* Aglauros was the Acropolis itself, which was devoted to saving the country.

English or German, while being Catholic, Protestant or Israelite, or while practicing no religion. Religion has become an individual matter; it concerns the conscience of each person. The division of nations into Catholic and Protestant no longer exists. Religion, which, fifty or more years ago, was so considerable an element in the formation of Belgium, keeps all its importance in the internal tribunal of every person; but it is almost entirely outside of the reasons which mark the limits of peoples. — 4. Community of interests is assuredly a powerful bond among men. But are interests sufficient to make a nation? I think not. Community of interests makes commercial treaties. There is a sentimental side in nationality; it is body and soul at the same time: a zollverein is not a fatherland. — 5. Geography, or what is called natural boundaries, certainly plays a considerable part in the division of nations. Geography is one of the essential factors of history. Rivers have led the races; mountains have arrested them. The former have favored, the latter have limited, historic movements. Can one say, however, as certain parties believe, that the limits of a nation are written down on the map, and that the nation has a right to adjudge itself what is necessary to round out certain contours, to reach a certain mountain or river, to which one attributes, *a priori*, a sort of limiting faculty? I know of no doctrine more arbitrary or more fatal. By it all violence is justified. And in the first place, is it mountains and rivers which form these pretended natural boundaries? It is incontestable that mountains separate; but rivers unite rather. And then all mountains could not carve out states. Which are those that separate and those which do not separate? From Biarritz to Tornea there is not a mouth of a river which has, more than another, the characteristics of a boundary. If history had so determined, the Loire, the Seine, the Meuse, the Elbe and the Oder would have, as much as the Rhine, that character of a natural boundary, which has caused so many infractions of the fundamental right, which is the will of men. People talk of strategic reasons. Nothing is absolute; it is clear that many concessions must be made to necessity. But it is not necessary that these concessions go too far. Otherwise, every party will lay claim to his military exigencies, and there will be endless war. No, it is not land any more than race that makes a nation. The land furnishes the *substratum*, the field for the struggle and the labor; man furnishes the soul. Man is everything in the formation of the sacred thing called a people. Nothing material is sufficient for it. A nation is a spiritual principle, resulting from the profound complications of history; a spiritual family, not a group determined by the configuration of the soil. We have just seen what will not suffice to create such a spiritual principle: race, language, interests, religious affinity, geography, military necessities. What more then is wanted? — III. A nation is a soul, a spiritual principle. Two things which, in truth, make only one, constitute that soul, that spiritual principle One is in the past, the other in the present. One is the possession in common of a rich legacy of memories; the other is the actual consent, the desire of living together, the disposition to continue to give value to the undivided inheritance they have received. Man is not improvised. The nation, like the individual, is the outcome of a long past of efforts, sacrifices and devotion. The worship of ancestors is the most legitimate of all; our ancestors have made us what we are. An heroic past, great men and true glory are the social capital on which the idea of a nation is based. To have a common glory in the past, a common will in the present; to have done great things together, to desire to do still more; these are essential conditions for being a people. One loves in proportion to the sacrifices to which he has consented, the evils he has suffered. One loves the house he has built and which he transmits. The Spartan song: "We are what you were; we shall be what you are," is, in its simplicity, the abridged hymn of every fatherland. In the past, a heritage of glory and of regrets to share together; in the future, the same programme to be realized: to have suffered, enjoyed and hoped together; these are worth more than common custom houses and frontiers in conformity with strategic ideas; these can be understood, despite diversities of race and of language I said just now, "to have suffered together." Yes, suffering in common unites more than joy. In the matter of national memories the griefs are worth more than the triumphs; for they impose duties, they command effort in common. — A nation is then a great solidarity, constituted by the sentiment of the sacrifices that have been made, and by those which the people are still disposed to make. It supposes a past; it is, however, summed up in the present by a tangible fact: the consent, the clearly expressed desire of continuing the common life The existence of a nation is (if the metaphor be permissible) a continued plebiscitum, as the existence of the individual is a perpetual affirmation of life. This is, to be sure, less metaphysical than divine right, less brutal than the claimed historic right. In accordance with the ideas here submitted, a nation has, no more than a king, the right to say to a province: "You belong to me, I take you." To us, a province is its inhabitants. If any one has a right to be consulted in that matter, it is the inhabitant. It is never for the real interest of a nation to annex or to retain a country against the will of that country The wishes of nations are, in fact, the only legitimate criterion, that to which it must always return. — We have driven out of politics metaphysical and theological abstractions. What remains, after that? Man remains, with his desires and needs. One may say that secession, and, in the end, the crumbling away of nations, are the consequence of a system which puts these old organizations at the mercy of wills often

little enlightened. It is clear that in such a matter no principle should be pushed to excess. Truths of this kind are applicable only in a very general manner. Humanity desires change; but what does not change? Nations are not eternal. They had a beginning, they will have an end. A European confederation will probably supply their place on that continent. But such is not the law of the age in which we live. At the present time the existence of nations is well, and even necessary. Their existence is the guarantee of liberty, which would be lost if the world had only one law and only one master. By their diverse faculties, which are often in opposition, nations serve in the common work of civilization. Isolated, they have their weaknesses. An individual who should have the faults held as desirable qualities in nations; who should cherish vainglory, and be in this regard jealous, egoistic and quarrelsome; who would bear nothing without drawing his sword, would be the most insupportable of men. But all these particular discords disappear when the whole is considered. — To recapitulate. Man is not the slave of his race, his tongue, his religion, or of the courses of rivers or the direction of mountain chains. A great aggregation of men, of sound mind and warm heart, creates a moral conscience which is called a nation. While this moral conscience proves its power by the sacrifices which the abdication of the individual requires for the benefit of a community, it is legitimate, and has the right to exist. If doubts arise with regard to boundaries, consult the people on the disputed territory. They have a right to have their opinion considered in the matter. This will bring a smile to the great politicians, those infallibles who pass their lives in deceiving themselves, and who, from the height of their superior principles, take pity on our low views. "Consult the people—pshaw! what innocence! Those are only worthless ideas which aim to substitute for diplomacy and war means of infantine simplicity." We can wait until the reign of politicians has passed: we can suffer the disdain of the powerful. Perhaps, after much ineffectual groping, people will turn back to our modest empiric solutions. The way to be right in the future, is to know at certain times how to be resigned to being out of fashion.

ERNEST RENAN.

E. J. LEONARD, *Tr.*

NATION, The (IN U. S. HISTORY). I. 1732–89. It has been suggested elsewhere (see DECLARATION OF INDEPENDENCE), that the American Union of states, so far as human agency is concerned, is not so much the creature of design as the result of necessity. Every influence conspired to produce it, though the concurrence of settlement by Englishmen within just the zone, from Florida to the great lakes, whose climate was most kindred to that which they had left, was undoubtedly the great fact which colored all that came after it. Had it been otherwise—had a strong colony of alien blood, French, for example, instead of a weak colony of kindred blood, been interposed between New England and Pennsylvania—who can tell how long it would have taken to combine the whole mass into one nation? Perhaps—indeed, almost certainly—the several elements would have gone on forever on their separate way, out of harmony with that law of nature which seems to have marked out the central zone of the continent as the habitat of a single nation, and so failing to reach the high possibilities of their existence. Whatever evidence of design this concurrence may show, of human design there is no trace. Anxiety to keep the golden treasure land which Columbus had opened; the temporary heat of a Canadian summer; the treachery of a pilot; anxiety to avoid the neighborhood of the Spaniard on the south and of the Frenchman on the north: these, and an infinite variety of other influences, took each people to its appointed place, or kept it there. — The last of the distinct English colonies was founded in 1732. (See GEORGIA.) Beginning with this date it is necessary, first, to lay special stress on the fact of the general homogeneity of the invading army of whites which is now firmly fixed upon the Atlantic coast, with a westward stretch of 3,000 miles of wilderness before it. From Florida to the bay of Fundy, everything is English. Almost in the centre there is a break, the former Dutch colonies, New York and New Jersey, but the break is more apparent than real. Even before their conquest by the English, seventy years before, they had been almost overcome by a steady influx of English colonization and influence, and a half century of possession has made this influx completely overmastering. If we look to language, which is the surest test, we find English everywhere predominant in New York and New Jersey, and very commonly to the exclusion of the Dutch. The Dutch pastors have already been forced to preach alternately in English and in their own language. Whitefield, in 1739, finds no break in his work by reason of alienage of people or language in New York or New Jersey, nor can we. There had been a break, indeed, but the union had taken place so naturally and so thoroughly that the line of fracture was already almost undistinguishable. Within its foreordained limits, the whole population is practically of one blood and language. — In civil government there is the same homogeneity. All acknowledge the same king and the same common law; all have kept up their own parliaments and parliamentary government, no matter whether it be by their king's free grace or by stress of circumstances; all are free from any trace of nobility or privileged classes. — In social economy the conditions are the same. In spite of the inevitable variations in non-essentials, the fundamental facts of family life are the same everywhere, and persons or families, who remove from one colony to another, fit into their new places as naturally as into the old. Instances, such as that of Franklin, are too numerous to require special reference.

No one feels himself to be less "an Englishman" because of his removal from Massachusetts to Pennsylvania or from South Carolina to New York. — In religion the conditions are the same: all the colonies are Protestant. Maryland alone is nominally Catholic; but the absolute toleration of its proprietors has from the beginning opened the doors so widely to Protestant immigration that the Puritan settlers in 1655–6, and a "Protestant defense association" in 1689, were able to seize the government and disfranchise the original Catholic settlers until the revolution. — A population so prepared by juxtaposition, by continuity, by natural boundaries, and by homogeneity of blood, language, civil government, social economy, and religion, may be divided by the king's decrees into separate "colonies," but the decrees of a higher power than the king have already made them one nation. So long as their attention is exclusively taken up by the busy activities of immigration and settlement, they will ignore their fundamental union; but the very first necessity that impels them to national action will result, not so much in the formation of a single nation, as in a demonstration of the fact that that nation is already in existence. So early as 1643 a partial union had been begun (see NEW ENGLAND UNION), but the Indian dangers which impelled it were not sufficiently formidable to perpetuate its existence, and the people gradually subsided again into political quiescence. The first real pressure toward national action, and that only exerted upon the northern portion of the people, came from the inevitable conflict with the French in Canada. — The English settlements have been already compared to an invading army, moving toward the west. On the north another people, the French, had already begun a similar invasion, but with far inferior prospects of success. Its primary base, the valley of the St. Lawrence, was comparatively narrow, and in winter almost inaccessible; its line of march was contracted, and by natural limitations was bent toward the southwest at Niagara; and from that point it lay directly across the path of advancing English migration, which, in full column, was to strike the French line in flank and at its weakest point. The result of a conflict under such conditions might have been easily foreseen; the French line was broken at the first shock, and the English swept on to the Mississippi. (See WARS, I.) But the conflict itself was an impelling force to another attempt at union (see ALBANY PLAN OF UNION), and it is noteworthy that a part of its design was "that the colonies would by this connection learn to consider themselves, not as so many independent states, but as members of the same body." The frame of government which was proposed gave the legislature distinctly national powers, but reserved to the crown the prerogatives which were then a part of the theory of the British constitution. Though the plan failed of adoption, the common efforts of the northern colonies throughout the war gave form to the national idea. Virginia, New York, New Jersey and New England troops, fighting side by side with British troops, learned to make the essential distinction between an Englishman and a provincial, or American; and, that lesson once learned, the rest was easy. The only necessity was that a new occasion should be found for national action. — The policy of the British ministry, at and immediately after the peace of 1763, was singularly unfortunate. By forcing France to surrender her Canadian provinces, it relieved the English colonies from the threatening danger which had long made British protection seem essential to their security. By initiating the attempt to transform a strictly British parliament into an imperial parliament, with absolute power of taxation over a British people not represented in it, it forced into existence the most pressing of all occasions for national action in America. (See REVOLUTION.) The two influences, acting together, finally precipitated the formation of a distinct national *government* in 1775. — In 1765 the first body which can be considered representative of the colonies in general held its meeting; but its proceedings were not legislative, and were confined to declarations and petitions. (See STAMP-ACT CONGRESS) On the revocation of the stamp act the dawning national spirit again subsided — The renewal of the scheme of parliamentary taxation, and, still more, the assertion of the right of parliament to abrogate civil government in America at its pleasure by the abolition or alteration of charters, roused the national spirit at last to something like a self-conscious existence. In 1774 the continental congress first met; in 1775 it became a real national assembly; in 1776 it took the unretraceable step of renouncing allegiance to the crown. (See CONGRESS, CONTINENTAL; DECLARATION OF INDEPENDENCE) — Franklin, in 1770, laid down as the ground of justification of the American resistance to parliamentary taxation, that "the several colonies have equal rights and liberties, and are only connected, as England and Scotland were before the union, by having one common sovereign, the king"; and this has been taken as a text for the modern doctrine of state sovereignty by those who forget that the king was an integral and essential part of the sovereignty of each colony, and that, through him, the "sovereignty" of the colonies was itself in common from the beginning. (See STATE SOVEREIGNTY.) The warfare of the revolution was not at first aimed against the king's share of the sovereignty at all, but against the usurped domination of parliament. Until July 4, 1776, then, the king remained sovereign of America *de jure*, but a *de facto* national assembly had united into one, by their own consent, the dominions which he had originally made separate. (See DECLARATION OF INDEPENDENCE, ALLEGIANCE.) The course of events may be summarized by saying that the transformation, by general popular will, of the continental congress into a revolutionary national assembly, after the first blood-

shed, April 19, 1775, made George III., though without his own consent, king of one American nation, instead of thirteen, as before; and by the declaration of independence, and its successful establishment by war, this last sovereignty was wrested from him and passed to a stronger than he, the people of the United States. There it must continue to be vested until some stronger power shall disturb or change its location. — According to this view of a much debated question, April 19, 1775, must be taken as the formal date of the birth of the new nation. All proceedings before that date are to be construed, so far as possible, by the municipal law of the thirteen commonwealths, as recognized parts of the British empire. All the great events after that date, the declaration of independence, and the ratification of the articles of confederation and of the constitution, must be considered mere municipal proceedings of a nation already in existence, which, however, still found it most natural and convenient to work through and by the state form of organization. But the intermediate event, the origin of the nation itself, is to be viewed under neither head, but in the light of admitted principles of international law. The above described merging of the separate sovereignty of the colonies, the crown being a part of each, into a common sovereignty of one nation and a king, did not take place by overmastering foreign force, as in the case of Poland; nor by the wholesale purchase of a venal national assembly, as in the case of Ireland; nor by the actual sale of the alienated sovereignty by its former sovereign, as in the case of Louisiana; nor by the conquered nation, as the price of a treaty of peace, as in the case of Alsace and Lorraine; but by the free and irrevocable consent of the whole people. When the merger had taken place, and when his share of the sovereignty of the whole mass had been wrested from the king by the whole people, the title of the new sovereign was as valid as that of the old. Argument, at any rate, can hardly prevail against it. Such a power as that of a nation, when once set free, is not to be conjured back into a bottle again by the words of any master of dialectics. — In its original form, that of the so-called "continental congress," the new national government was at first revolutionary and not limited by any organic law. (See CONGRESS, CONTINENTAL.) The first attempt to frame an organic law for it was defective by reason of the survival of very much of the state sovereignty of the British colonial constitution, the evils of the survival being even aggravated by the elimination of the crown's share of the sovereignty, which had formerly been the common bond of union. (See CONFEDERATION, ARTICLES OF; STATE SOVEREIGNTY.) The situation was tersely and exactly described in Hamilton's striking sentence: "A nation without a national government is an awful spectacle." It was not until 1789 that a true national government, automatic, complete in all its parts and functions, having jurisdiction over individuals, and fitted to claim and enforce its rightful place as a member of the family of nations, was at last organized by the adoption of the constitution. (See CONSTITUTION, II.; JAY'S TREATY.) From that time began the seventy-six years' struggle between the national idea and the particularist state feeling, which ended in 1865 with the final establishment of the former as an integral principle of American politics. — II. 1789–1801. The word "nation" and its derivatives were by no means favorites in our early political history. Instead of them, use was almost invariably made of vaguer phrases, such as "the people," "the public," "the public welfare," "the established government," "the union," "the confederacy," "our common country," "the community." Even when the invidious word occasionally crept into use, its sense was almost invariably geographical rather than political. The underlying feeling in regard to it may be gathered from an extract from the debate in the house of representatives, Aug. 15, 1789, on the proposed amendment prohibiting an establishment of religion. "Mr. Madison thought, if the word 'national' was inserted before 'religion,' it would satisfy the minds of honorable gentlemen. Mr. Gerry did not like the word 'national,' and he hoped it would not be adopted by the house. It brought to his mind some observations that had taken place in the conventions at the time they were considering the present constitution. Those who were called anti-federalists at that time complained that they had injustice done them by the title, because they were in favor of a federal government, and the others were in favor of a national one. Mr. Madison withdrew his motion, but observed that the words 'no national religion shall be established by law' did not imply that the government was a national one." This negation of nationality as a permanent political fact, was not confined to one party, but was a common feeling, expressed in plain words by some, and in significant silence by others; and debates can only be understood as the deliberations of voluntary partners, who were joint in action, but several in interest, and each of whom had in view a possible withdrawal from the firm if his interests were unpleasantly violated. — But, however common this feeling, it was not quite universal. The nation had not only been born, but had forced its way into its own place, and though the great mass of the people were willfully or naturally blind to its existence, there were a few who saw the germ clearly, and foresaw its possible development. Chief among these was Washington: his habits of mind, early training, breadth of view, and utter lack of sympathy with the politicians of his own state, combined to make his politics entirely national; while the absolute confidence which the people at large reposed in him made him extremely effective. Second to him in effectiveness, though far beyond him in political ability, was Hamilton, to whose suggestion was due almost every nationalizing measure of the period 1789–95. All his great

measures—the incorporation of the national bank, the assumption of state debts, the creation of a national debt, the protection of domestic manufactures by a high tariff, and the enforcement of an excise law—were intended to develop the germ of nationality: the first four by the creation of interests, albeit selfish interests, which should not be bounded by state lines, but should run throughout the nation, form a bond of union, and struggle as if for their own life against any disintegration of the Union; and the last named by forcing a recognition of national power and laying a precedent for its future use, if it should prove necessary. The support which was given to all of these measures by the federalists tended strongly to the political education of that party, but the education was superficial, not radical. Vining, of Delaware, in the debate on the national bank, referring to "the act by which the United States became a free and independent nation, said that from that declaration they derive all the powers appertaining to a nation thus circumstanced"; and the federalist senate, in its answer to the president, Nov. 9, 1792, calls the excise law "a law repeatedly sanctioned by the authority of the nation." But these two strong expressions, both apparently derived from Hamilton, stand almost isolated among the federalist arguments, which regularly attempted to defend Hamilton's measures on economic, not on national, grounds. In fact, the federalist politicians were as blind as their opponents to the idea that "the nation" was now a political entity, distinct even from "all the states"; and when their economic support of Hamilton's measures proved to be a failure, they were as ready as their opponents would have been to suggest a "dissolution of the partnership." (See BANK CONTROVERSIES, II.; FEDERAL PARTY; SECESSION, I.) The supreme court from the beginning took the Hamiltonian view. In its first great case, Chisholm *vs.* Georgia, in February, 1793, Chief Justice Jay's opinion is a complete synopsis of nationalizing views; and Justice Wilson, after summing up the whole case as comprised in the question "Do the people of the United States form a nation?" answered that they *had* intended "to form themselves into a nation for national purposes." But the business and influence of the court were as yet comparatively small; and it was not until 1816–20 that it became a powerful factor in accomplishing the results which Jay and Wilson had indicated in 1793. (See JUDICIARY, II.)—In the meantime a party had been forming which more exactly represented the feelings of the people. (See DEMOCRATIC-REPUBLICAN PARTY.) Its formal ground of union was a desire for a strict construction of the constitution, but this was really only an answer to the theory of broad construction introduced by Hamilton (see CONSTRUCTION); a more fundamental bond of union was the belief that the states, while forming one nation in respect to foreign nations, were separate, distinct and sovereign as to one another, and, further, that this national relation was continuously voluntary on the part of each and all the states. The idea is thus summed up in Jefferson's letter to Johnson, June 12, 1823: "The capital and leading object of the constitution was to leave with the states all authorities which respected their own citizens only, and to transfer to the United States those which respected citizens of foreign or other states; to make us several as to ourselves, but one as to all others;" and still more fully in Jefferson's letter to Edward Livingston, April 4, 1824: "The radical idea of the constitution of our government is that the whole field of government is divided into two departments, domestic and foreign (the states in their mutual relations being of the latter); that the former department is reserved exclusively to the respective states within their own limits, and the latter assigned to a separate set of functionaries, constituting what may be called the foreign branch, which, instead of a federal basis, is established as a distinct government *quoad hoc*, acting as the domestic branch does on the citizens directly and coercively." From this theory the idea of the United States as a nation was carefully eliminated; it was only "a distinct government *quoad hoc*," dependent for its continued existence on the good will of the states which voluntarily formed it. To the objection that such a union would be worse than unstable, the letter last cited answers thus: "A government held together by the bands of reason only requires much compromise of opinion; that things even salutary should not be crammed down the throats of dissenting brethren; and that a great deal of indulgence is necessary to strengthen habits of harmony and fraternity."—In the beginning some of the leaders of the new party were disposed to treat tenderly, if not altogether favorably, the idea that the obedience of individual citizens to the federal government should also be voluntary; but before 1800 the programme of the republican, or democratic, party had settled down to that which is given above. In its fundamental idea the mass of the people, consciously or unconsciously, believed firmly; and the opposition of the federalists to it was angrier because it was half-hearted. Most of them were nationalist only for party reasons; their alien and sedition laws were distinctly party, not national, measures; and when they lost control of the federal government in 1801 they became a party of outs seeking to get in—a discredited, factious opposition, without a policy and without the desire for one. Hamilton's work was then to be done over again, and done better. The plant which he had tried to force into a premature fruitfulness was to grow into natural and hardy life as an indigenous product of the soil.—III. 1801–15. From the accession of the democratic party to federal power in 1801 its fundamental tenet was to be for the next sixty years the actual or nominal canon of American politics, the Procrustean bed to which all political faiths were to be fitted; and yet during all that

time it was undergoing in one section of the Union a progressive change, the depth and extent of which was first made manifest in the spring of 1861. The first period of this change relates to the department which Jefferson considered peculiarly that of the federal government, that of foreign affairs. — It was easier to announce than to enforce the doctrine that the states were foreign to one another and yet a nation to all other powers. Foreign nations naturally refused to accept the American national coin at any higher value than that for which it passed current in its own country. Democratic politicians during this period frequently used the words "nation" and "national," but not in a sense which was calculated to inspire any large amount of respect in the great European belligerents. Year after year the demands, the remonstrances, the entreaties, almost the prayers, of the "voluntary confederation" met with either denial or silent contempt, until the great democratic leader regretfully echoed Silas Deane's wish that an ocean of fire, instead of water, had been placed between the two hemispheres. Embargoes and non-intercourse laws only served to swell the chorus of denunciation from New England, and to convince the belligerents that the western republic was no more a nation in its foreign than in its domestic relations. (See EMBARGO.) — Eleven years of such experiences were never wholly lost. They roused at last a thoroughly national spirit, which burst the shackles of party, thrust many of the old democratic leaders out of power, converted the rest, and in 1812 declared war against Great Britain. (See WARS, III.; CONVENTION, HARTFORD.) Though the peace of Ghent did not secure a single object for which war was declared, it served a greater purpose: it made the United States a nation in every sense of the word so far as its foreign affairs were concerned. A people with whose frigates British war vessels had learned to refuse battle, except on rigidly equal terms, might claim a place in the family of nations, not by tolerance, but by right. — Even in domestic affairs a step nearly as long had been taken. It was "the nation," not a "voluntary confederation," that had declared war and had carried it to an end, despite all the dreadful possibilities of the great democratic dogma, if New England had ventured to enforce it in practice. The very locality of the last great battle, on the outskirts of the republic, near the distant and only vaguely known city of New Orleans, was a token of empire before which state lines faded away. The close of the year 1815 left the United States a nation, recognized as such by others and apparently on the high road to a similar recognition within its own borders. — IV. 1815–65. The tokens of the rising internal national spirit are abundant for a few years after the war. The experiment of a national bank was again tried. (See BANK CONTROVERSIES, III.) The question of internal improvements at national expense made its appearance. (See INTERNAL IMPROVEMENTS.) The supreme court began a line of decisions in which the national idea was to find its first authoritative enunciation. (See JUDICIARY, II.) Above all, one of the most powerful factors in nationalizing the United States, foreign immigration, had begun its flow. In the ten years ending in 1829, 150,000 had thus been added to the population; and though this was but a small part of the 5,000,000 who were to come before 1860, it was larger than the population of South Carolina, New Jersey, New Hampshire, Georgia, Rhode Island or Delaware had been at the adoption of the constitution. To the immigrant the United States was everything, the state little or nothing; and this stream of nationalism could not but exert in time an appreciable effect on the regions which it covered. But this immigration hardly touched the slave states; it seemed to avoid them as by intuition, and to confine itself to that section of the country in which labor had been freed from every badge of inferiority. — Had this influence of immigration been the only one which was at work to discriminate the two sections, it could hardly have failed finally, though slowly, to make the north completely national, while leaving the negation of nationality as general in the south as it had been throughout the whole country for twenty years after 1789. But a still stronger influence was at work in the south to convert its negation into an angry denial of nationality. Whitney's invention of the cotton gin in 1793 had made slave labor profitable in the extreme south, and slave raising equally profitable in the border states; the whole slave section had one controlling interest in common; state sovereignty had developed into the far more dangerous form of sectional sovereignty; and the south had already assumed the attitude of an *imperium in imperio*, a nation within, and directly opposed to, the nation. (See SLAVERY.) Before 1830 the northern divergence from the original basis of American politics was plainly perceptible to southern politicians, who saw it with an honest and unaffected horror and dismay, entirely unconscious that they themselves were at the same time steadily drifting in the opposite direction. In 1832–3 an attempt was made by South Carolina to arrest the evil by her own sovereign will. (See NULLIFICATION.) It failed, and its failure is a landmark in the progress of the national feeling. It was plain henceforward that no single state, nothing but a sectional collection of states, could ever hope to resist the growing power of the nation. — The current of events was checked for a little, about this time, by that which was in the end to hurry it onward with far greater rapidity, the sudden predominance of democracy in the north. (See DEMOCRATIC PARTY, IV.) At first it brought into power leaders whose only gauge of democracy was state rights; in the end, by increasing enormously the number of voters in each state, it made state lines dimmer, the interests of the state less a matter of personal pride to individual voters,

and thus tended more and more to make the nation more prominent. In the south the existence of a ruling class of slaveholders counteracted the nominal universality of suffrage, and kept the state idea in full vigor. Nevertheless the formal language of the leaders of both the great parties, whig and democratic, until about 1852, agreed very closely on the question of the essential nature of the government: all agreed generally that the Union was a compact, formed by states; all were proud of the "voluntary" character of the Union; all seemed to be equally unconscious that the nation was already fully prepared to vindicate its own existence, and to compel the permanence, voluntary or involuntary, of the Union. Northern politicians, at least, seem never to have suspected the radical change that had taken place in their own constituencies, in which the nationalizing stream of immigration had grown into a mighty river. In the six years ending with 1855, 2,500,000 had been added to the population of the United States from this source, more than in all the thirty years before, more, indeed, than the population of either the whole north or the whole south had been in 1789. — The essence of the long struggle as to the introduction or prohibition of slavery in the territories is simple: were the territories the property of "all the states," or were they the property of "the nation"? (See TERRITORIES.) In the former case, international comity certainly forbade the offensive exclusion of that which any state recognized as property; if the latter, the will of the nation, fairly expressed, was conclusive. The opposition of the free-soil party to the extension of slavery was sectional in its nature, and was intended to curb "the aggressions of the slave power." In the opposition of the republican party the idea that the nation, not "all the states," owned the territories, appeared for the first time. It is but faint in the platform of 1856, where it consists only in a reference to the abolition of slavery "in the national territory," while the democratic platform insists on "the equal rights of all the states" in the territories; but it took clearer form in every successive debate until in 1857 it was the fundamental tenet of the party. This introduction of "the nation" into the controversy was one great reason, wholly disconnected with slavery, for the intense hatred with which the south looked upon the republican party, a hatred which the free-soil party, though kindred in purpose and equally bitter in language, had never excited. And one great secret of the republican party's rapid growth was its success in combining the democratic and the national ideas: the latter gave it a purpose; the former gave it methods which the federal party would have despised, and the whig party had never learned to use, except in the inglorious success of 1840. — In 1861 a section of the Union at last combined to test the question whether their continuance as states in the Union was "voluntary." (See SECESSION, REBELLION, RECONSTRUCTION.) That the answer would be so emphatic, that the masses outside of the slave states had been so permeated by the national spirit, seems to have been totally unsuspected by the leaders of any party. The echoes of Horace Greeley's protest against "a Union pinned together by bayonets," and of his desire that the "wayward sisters" should "depart in peace," if a fair majority of their voters so wished it, had hardly died away when the nation spoke for the first time in our history. The startling contrast between the timidity of the debates in congress in the winter of 1860–61, and the "uprising of a great people" in the following April, only shows that the northern politicians had educated themselves into ignorance of their own supreme national feeling, as well as of that of their constituents. The first shot fired at the flag, the emblem of national unity, tore the bandage from the eyes of both politicians and people; and the war which followed was but the exposition of a fact which had hitherto been hidden under obsolete phrases. There was no basis for the southern reproaches of such democratic leaders as Dix, Douglas and Dickinson, who had been for years lauding the voluntary nature of the Union, and who now threw all their souls into "the suppression of the rebellion." The man had thrown off the shortened garments of the boy. — The life of Josiah Quincy, the most brilliant of the early federalist orators, was prolonged until his ninety-third year (1864). He had been a part of the unsubstantial national edifice which Hamilton's magic had evoked out of nothing; he had seen its fall and disappearance; he had declared in congress, in 1811, that the dissolution of the Union was already accomplished (see SECESSION, I.); he had introduced in the state senate of Massachusetts a resolution refusing to express any approbation of the naval victories of the United States in 1812–13; and he lived to see the great national uprising after the fall of Sumter. Nothing in his life is more suggestive in this connection, than the old man's rejoicing and wondering exclamation in April, 1861: "Now I *know* that we are going to be a great nation! I never felt sure of it before." From that hour the existence of the nation, as an integral element in American politics, is a fact of which every man is bound to take notice. It is no exotic, produced by the forcing of moneyed interests. It is no product of "blood and iron." It is the result of natural, slow, silent, continuous and certain growth. The very slowness of its growth presages the length of its future existence, for the life of nations, like that of animals, may be estimated from their period of childhood. The change from the colonial condition to the nation of the present day, diverse in blood, origin, interests, religion and culture, and yet thoroughly permeated by an intense spirit of nationality, is a fair illustration of the Spencerian formula of progress, "from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity." — In this line of consideration lies also the histori-

cal excuse for the action of the south in 1860–61, and the consequent rebellion. If slavery had never existed in America, both sections would have gone on in a common line of development, admiring the "voluntary" principle of the Union, but never thinking seriously of attempting to enforce it, until some unexpected emergency would finally have awakened both to the fact that national union had taken the place of voluntary association. Slavery was the only element antagonistic to the development of the nation. It had curbed and cramped the progress of the south, and had reduced that section to even a lower plane of national life than that of 1789. The conflict was inevitable; and if the price which was paid was great, the result which was gained was inestimable. The shackles were struck from the limbs, not of the black alone, but of the superior race as well; the south had then no barrier to her indefinite progress in the future; and in 1865, for the first time, we may say that the United States *was*, as well as *were*, a nation. — V. SINCE 1865. The possible future of the nation must be largely a matter of speculation. There is one aspect of the question, however, in which a recurrence to earlier history may be useful. — The preservation of the boundary lines of the states, as they had been marked out in the various grants of the king, has always been made the strongest argument against the national character of the United States. If the continental congress, the articles of confederation and the constitution were the work of the nation, why were the states so carefully recognized as essential features in all of them? He who accepts the nebular hypothesis will not trouble himself with speculations as to the possible constitution of the universe if the original nebula had been governed by a law of square or triangular motion: he will take the law which accounts for all subsequent development. And he who studies the development of the national idea in the United States must be prepared to find it governed by law also, and must take the states as an essential part of the nation. In this way only could American individualism be reconciled to nationality. — It is, therefore, useless to speculate on a possible absorption of state functions by the federal government, the blotting out of state lines, and the formation of a single centralized nation in their place. It would hardly be a complete answer, for all future time, to cite the name of the nation, the United *States*, as a continuing pledge of state existence, or the express provision of the constitution that no state shall be deprived of an equal representation in the senate without its own consent; for in such matters, as Dr. Draper strongly expresses it, "there is a political force in ideas which silently renders protestations, promises and guarantees, no matter in what good faith they may have been given, of no avail, and which makes constitutions obsolete." Had the states no better guarantee for their existence, it might be worth while to consider the question suggested. But a perfect answer may be found in that law which has always governed, which still governs and which will always govern the political workings of the American mind, the law which makes the state formation an inseparable concomitant of national existence. The separate existence of the original thirteen states was undeniably due to the king's will; but, if they had not been in existence in 1775, the nation would have discovered a way to evoke them, as it has since evoked twenty-five others. It chose instinctively to work through the state formation in 1775 and 1787–8: even in the ferment of the rebellion and the reconstruction, its whole energy was bent to the preservation of "an indissoluble union of indestructible states"; and it is an impossibility to conceive a future *American* republic in which the state element shall be lacking. The nation would resist an attempt upon the life of the weakest and poorest state as instinctively and as desperately as it would resist an attempt upon its own. It is conscious in every fibre, that it is a being which, like Milton's angels, "vital in every part, can not but by annihilating die."— (See STATE SOVEREIGNTY, FLAG, UNITED STATES.) The authorities relied upon will usually be found under the articles referred to, but the following should be specially cited: (I.) Lodge's *History of the Colonies;* Frothingham's *Rise of the Republic;* (II) Benton's *Debates of Congress*, 138, 305, 383; 4 Jefferson's *Works* (edit. 1829), 373, 391; (IV.) Bromwell's *History of Immigration*, 174, 175; Quincy's *Life of Quincy*, 523.

NATIONAL BANKS. (See BANKING IN U. S. and BANK CONTROVERSIES.)

NATIONAL CAPITAL. (See CAPITAL, NATIONAL.)

NATIONAL CEMETERIES, for soldiers and sailors, may be said to have originated in 1850. The army appropriation bill of that year appropriated $10,000 "for purchasing, walling and ditching a piece of land near the city of Mexico, for a cemetery or burial-ground for such of the officers and soldiers of our army in the late war with Mexico as fell in battle or died in and around said city, and for the interment of American citizens who have died or may die in said city." The remains of federal soldiers and sailors who perished in the war for the Union, have been interred in seventy-eight inclosures owned by the United States, exclusive of those buried elsewhere—a far more numerous host. In some of these cemeteries, as at Gettysburg, Antietam, City Point, Winchester, Marietta, Woodlawn, Hampton and Beaufort, handsome monuments have been erected, and others are in contemplation. Following are the names and locations of all our national cemeteries, with the number of interments, known and unknown:

LIST OF NATIONAL CEMETERIES.

NAMES AND LOCATIONS.	Known.	Unknown.
Cypress Hills, N. Y.	3,675	76
Woodlawn, Elmira, N. Y.	3,096	----------
Beverly, N. J.	142	7
Finn's Point, N. J.	----------	2,644
Gettysburg, Penn.	1,967	1,608
Philadelphia, Penn.	1,880	28
Annapolis, Md.	2,289	197
Antietam, Md.	2 853	1,811
Loudon Park, Baltimore, Md.	1,627	166
Laurel, Baltimore, Md.	232	6
Soldiers' Home, Dist. of Col.	5,313	288
Battle, Dist. of Col.	43	----------
Grafton, W. Va.	684	620
Arlington, Va.	11,911	4,349
Alexandria, Va.	3,434	124
Ball's Bluff, Va.	1	24
Cold Harbor, Va.	672	1,281
City Point, Va.	3,779	1,374

City of Mexico, Mexico	254	750
Total	170,960	147,495

Excepting those in a few cemeteries in secluded situations, the graves are publicly decorated annually on "decoration days," on which occasions many memorable discourses have been spoken. At Arlington, James A. Garfield made, perhaps, the greatest effort of his life. At Gettysburg, Abraham Lincoln spoke that brief speech which has become immortal. C. C.

NATIONAL DEBT. (See DEBTS.)

NATIONAL PARTY. (See GREENBACK LABOR PARTY.)

NATIONAL REPUBLICAN PARTY. (See WHIG PARTY.)

NATIONALITIES, Principle of. The present generation has witnessed the birth of the *principle of nationalities*, and this new principle has rapidly exercised a great influence on the European situation. Henceforth nationalities will be political elements which must be taken into account, and whether we approve or reject this principle, we can no longer ignore it. — What is the *principle of nationalities?* It has been formulated thus: "The right of each nation to form itself into a people, into a separate state" From this proposition a two-fold consequence is drawn: 1, that the mass of a nation has the right to claim—by arms, if necessary—the detached portions, the groups of individuals belonging (or which are supposed to belong) to the same nationality; 2, that each group of individuals has the right to withdraw—even violently—from the state with which it has formed a more or less legal, political body, for a greater or less period, in order to unite itself to the nation (or the state) toward which (real or supposed) affinities of nationality attract it. — We shall examine further on the legitimateness of this principle. It is of importance, first of all, to inquire, what constitutes a nation, great or small? Is it a community of origin or of race? Men seem to think so sometimes, but we have only to remember the Russians and the Poles, both Slaves, or the Germans and the Scandinavians, who are both of Teutonic race, to reject this explanation. There are many races which are made up of a number of nationalities: the Slavic race, for instance, is made up of Russians, Poles, Czechs, Ruthenians, Wends, and others. The Teutons, the Celts, the Fins, and many other races, are also subdivided into several branches. Neither is it the state, or political community, which forms the nation. Austria includes many nationalities, and the German nationality is subdivided into several states. Is it language that constitutes the nation? A community of language is considered by many authors as the true bond of nationality, and surely arguments are not wanting in favor of this opinion. Community of language is the result, if not of a community of origin, at least of a prolonged union; it is also the cause of uniformity of manners, views and sentiments. The man whose language is not understood is instinctively considered as a foreigner, and for the uncultured man *foreigner* and *enemy* are synonymous. Yet, the

Swiss nationality on the one hand, and Belgium on the other, include populations speaking different languages. It might be also asked if geographical position, community of name, religion, interests or history, constitutes nationality; and we might find some fact to be used in support of, and some serious objection to, the hypothesis that either of these elements was the basis of nationality. Indeed, nationality is composed of all these put together. John Stuart Mill thinks that there is a nationality wherever men are united by common sympathies which do not exist between them and other men, sympathies which lead them to act in concert more readily than they would with others, to desire to live under the same government, and to desire that that same government should be exercised by them or by a portion of themselves. The sentiment of nationality may have been produced by various causes: it is sometimes the effect of the identity of race and stock; frequently a community of language and religion contributes to create it, as geographical limits also do. But the most powerful cause of all is the identity of political antecedents, the possession of a national history, and consequently the community of tradition, of pride and humiliation, collective pleasure and regret are attached to the same incidents of the past. Nevertheless none of these circumstances is indispensable, nor absolutely sufficient *in itself*. — We find that there is no certain sign by which to characterize a nation strictly. In one place the bond is made to consist in a common origin; in another, in the community of language (*wo die deutsche Zunge klingt*); in a third, geographical limits (Belgium, Switzerland); in the east, even in religion. The nation, therefore, is not a physical body or unity, but a moral body; it is not always determined by external facts nor by them alone, but by *sentiment*. — It is important to dwell on this point, because more than one consequence may be drawn from it. For example: the feeling of nationality may exist in the whole nation, or only in the upper or lower classes; it may be dormant or active; it may rest on interests, or be opposed to them; and in each one of these cases it becomes manifest under a different form and with a different energy. Now, the feeling of nationality is weak, strong or exalted, according to the composition of the state. Let us examine, therefore, the different relations and combinations which may be met here. The state may be formed of a single nationality and include the totality of the nation. We do not know whether this case has ever presented itself in history. It did not in Egypt nor Palestine, and we do not know precisely whether it does in Japan. A state may also be composed chiefly of a compact nationality, and have but a small fraction of inhabitants of foreign origin: such, for example, is France, which easily assimilates those elements which it has already filled with its own spirit. In the two preceding cases, the feeling of nationality will be calm and be almost identical with patriotism. This is especially the case when the state includes populations speaking different languages, but united by bonds of affection and sympathy, as the Swiss and the Belgians. The existence of these two nationalities of recent creation—at least in their actual form—is the more remarkable since each fraction of these states may consider itself as a disjointed member of a great nation (French, German and Italian). — The feeling of nationality is more or less exalted in states which contain the majority of a nation, one important part of which is detached from, but seeks to unite itself with, the mass of the nation. Such was recently the condition of Italy, such is still the condition of Greece. The same exaltation of the feeling of nationality may appear in states composed of different nationalities whose forces balance one another, as in Austria, or one of which exercises a greater or less supremacy over the others, as in Russia and Turkey. — Europe presents, in fact, nearly all the combinations which theory can imagine, and this situation could have been established only at a time when the feeling of nationality scarcely existed, and when its principle had not been formulated. What produced this feeling and especially the doctrine based upon it? Reaction against the spirit of conquest. — We do not think we go too far in maintaining that all political principles originate in some reaction. Anarchy engenders principles of order and authority, and renders even despotism tolerable. Absolute power, on the other hand, makes the want of liberty keenly felt, as well as all the guarantees required by it. It is only when deprived of a good, that we understand its value. — Conquests have taken place at all times, and in wars between nations difference of nationality envenomed the struggle; but then the feeling of nationality was only an instinct. In our day, nationality is a thought-out feeling, an idea resting on patriotism, the love of liberty and a whole series of moral wants. The development of the instinct of nationality in Europe into a natural and sometimes imperious feeling was delayed first by Christianity which made all christendom appear as a single nation. Christian feeling was, for a time, stronger than patriotism. In the time of the league, religious parties in France had no scruples in joining Spain against their own country. The German princes, on the other hand, did not hesitate to invite foreigners to aid them in their struggles against the emperor. Religious struggles were perhaps the originators of patriotism by causing a reaction. — The reformation, by breaking the unity of the church, was, in many respects, a great good, from the point of view of the progress of humanity.* A variety of worships is indispensable in order to give birth to the idea of liberty of conscience, which itself must

* A multiplicity of religions is necessary in order to distinguish *religion* from *dogma*, and to avoid confounding the denial of one or another detail of the official *creed* with atheism.

precede the liberty of philosophizing, and even to give birth to the liberty of making discoveries in astronomy, in physics, in chemistry, and, above all, in history. — The spirit of inquiry, it is plain, is essentially aggressive in its nature. When a man has mastered one question, or thinks he has, he passes over naturally to another. Hence religion, philosophy, natural and political sciences, had to be purified in the crucible of inquiry, and the intellectual labor which resulted hastened the reaction which in the eighteenth century rose up against the absolutism of princes, and which broke out in the French revolution of 1789. This revolution was completely foreign to the principle or feeling of nationality; it was even hostile to it. In France, it roused the masses in favor of the unity of the country (*République une et indivisible*); there arose a feeling of hostility even against provincial traditions, and, to put an end to these traditions, the French departments were created; the accusation of *federalism* was a death sentence. Now, French federalism and the spirit of nationality have more intimate relations than is supposed. Strange to say, side by side with or in opposition to a patriotism carried to the point of exaltation, cosmopolitan feelings appeared, and French nationality was solemnly granted to eminent foreigners whose reputation had reached France, but who did not think of leaving their native country. Naturalization was readily given, for "nations are brothers," the armies of the republic making war only on tyrants and oppressors. — And still, whatever may have been said of it, the awakening of the spirit of nationality is derived from the great French revolution in two very different ways. The direct way, natural and glorious, is that which was opened everywhere by the principles of '89. These principles were inscribed on the banner of the oppressed, and, while making them feel more vividly their deprivation of liberty, reminded them that a nation united in spirit almost always attains its ends. The other way may be considered as indirect, since the sentiment of nationality resulted from a reaction against the conquests of Napoleon I. Napoleon caused the birth of a new power by attacking nationality in Russia, by freeing it in Italy, by defying it in Germany and Spain. The sovereigns of these countries were deposed or lowered, and a system of administration was introduced which was French in origin and spirit. The people reacted against these changes. Resistance was popular and spontaneous, for the former governments were absent or powerless; and it was national, for it was directed against foreign institutions. — In a remarkable article by Reinhold Schmid, published in Germany, we find the following passage: "This unceremonious treatment had the precise effect of rousing the national sentiment of Germany, so long dormant, and after the shameful defeat experienced in 1806 by the established government, an endeavor was made to find in the national spirit new power for the war of deliverance. It was a characteristic sign of the times that when Fichte, who had just declared that nationality was an unimportant thing, a narrow idea which the human mind should reject in order to acquire the conception of cosmopolitan liberty, that Fichte, we say, delivered his celebrated 'Address to the German Nation,' in which he made an appeal to the sentiment of nationality by basing on it alone the hope of safety for the country. The possibility of delivering such a discourse, unpunished, at Berlin, under the eyes of French generals and agents, may serve to characterize the spirit of the Napoleonic government; which did not neglect to persecute without mercy, wherever its power extended, every movement against French domination. This fact proves that in France they did not foresee the dangers threatening their supremacy from this quarter. We know, moreover, that Napoleon considered such aspirations as idle fancies of which he needed to take no account." — Let us now quote an authority which may be considered as Italian, at least on account of the interests which he defended, J. de Maistre, (*Correspondance diplomatique*): "Nations are something in the world; it is not permissible to count them for nothing, to trouble them in their customs, their affections, in their dearest interests, * *." And, further on: "It is not hard to unite nations on a geographical chart; but in practice it is very different; there are nations which can not be blended. The Italian mind is in a ferment at this moment." — We know not whether an idea, once born, ever dies. Be this as it may, the idea of nationality did not have time to die out for want of food. After the reaction of Europe against France, came the reaction of Greece against Turkey, that of Poland against Russia, that of Italy against Austria, not to mention facts of minor import. We have just spoken of oppressed nationalities. If these nations had found in their conquerors a spirit of justice and a liberal government, they would perhaps have become accustomed to their new situation in time. Their grievances were numerous, though essentially of the moral order. But it is especially the enlightened classes of a nation which suffer from this kind of grievances, and these classes are too small in number to resist their oppressors successfully. They felt, therefore, the necessity of leaning on the masses, and to rouse their inertia. To overcome their indifference it was necessary to excite them by exalting the national feeling. A book printed in 1821 (*l'Italie au dix-neuvième siècle*, p. 148) says: "The sentiment of national independence is more general and more deeply engraved in the hearts of nations than the love of constitutional liberty. Nations most subject to despotism have this feeling as much as free nations; the most barbarous peoples have it still more vividly than enlightened nations." — Up to 1859 the principle of nationalities did not go beyond the domain of theory, or that of internal affairs; the Italian war introduced it into international law. It behooves us now to exam-

ine more closely a principle which has already caused terrible wars, and which threatens Europe with more than one shock. —"When the sentiment of nationality exists anywhere," says John Stuart Mill, "there is a *prima facie* reason to unite all the members of the nationality under the same government, and under a government of their own; this amounts to saying that the question of government should be decided by the governed. It is hard to imagine what a group of men should be free to do, if not to discover with which of the various collective bodies of human beings it may associate itself." If we consider the question under this abstract form, an answer will not be very easily found to it. Once national sovereignty is admitted, and as the nation is composed of individuals, it is evident (abstractly speaking) that each individual has his share of it and may choose his government. There is no contradiction in the words, and still each one feels that the realization of this theory is impossible. It will be thought, perhaps, that we carry the consequences of the principle too far in applying it to individuals. Mill himself applies it only to "groups of men." But what constitutes a group? Ten, a hundred, or a thousand individuals? No international legislator has the power to fix this number. Moreover if it were fixed, "in practice a number of considerations might be opposed to this general principle." This is what Mill says. He finds two such considerations: one geographical, when a small territory is separated from the common centre by other nationalities, or when, as in Hungary, various nationalities form such a mixture that they, of necessity, are obliged to have a common government. The other consideration is purely moral and social. "Experience proves," says Mill, "that it is possible for one nationality to be melted and absorbed into another; and when this nationality was originally an inferior or backward portion of the human race, the absorption is greatly to its advantage. No one could suppose that it is not more advantageous for a Breton or for a Basque of French Navarre to be drawn into the current of the ideas and feelings of a highly civilized and cultivated people, to be a member of the French nationality, possessing, on the basis of equality, all the privileges of a French citizen, sharing the advantages of French protection, and the dignity and prestige of French power, than to sit morosely on his native cliffs, a half-savage specimen of times gone by, moving unceasingly in a narrow intellectual orbit, without sharing or interesting himself in the general movement of the world. The same remark applies to the Welshman or to the Highland Scotch as a member of the English nationality."—We think the altogether gratuitous supposition of the original inferiority of the Bretons of France or the Britons of England superfluous. Mill might have dispensed with this argument. It is evident that a small group of men always gains from being absorbed by a great nation. This argument presents, besides, a very serious danger, for it might be advanced whenever the stronger wished to conquer the weaker —It is important to state here. the impossibility of deducing a strict right from the principle of nationalities. The most liberal author is obliged to admit limitations. This is not all. John Stuart Mill, and the majority of publicists favorable to nationalities, seem to have forgotten that a state is a sort of mutual association in which there is a solidarity among the citizens who compose it. One may admit this doctrine without being a partisan of the social contract. It is solely in virtue of these mutual obligations, of these reciprocal duties, of this solidarity, that military service may be required of citizens and some be called upon to allow themselves to be killed for all. Now, how can we permit a fraction of a nation to separate itself from the state, to the prejudice of all and without the consent of those who are thereby injured? We admit that there may be cases in which we should be able to dispense with this consent; however, in the public law of Europe the consent of those interested has almost always appeared necessary. Was it not necessary to ratify in the Italian parliament the vote of Savoy and Nice? All constitutions say: Cession of territory can only take place by a law. Cabinets are not deceived in this, but publicists seem sometimes to ignore it. In discussions on the principle of nationalities, men take sides so warmly with one of the parties that they are inclined to neglect to inform themselves what are the rights of the other, and become unjust through excess of justice. No provision of natural law, of that "law superior to all legislative enactment," prevents the union of several nationalities under the same government; once the pact concluded, it can not be dissolved without amply sufficient reason by only one of the parties. Another difficulty might be raised here, which results in a certain degree from the doctrine which we have just indicated. In international congresses it is claimed that decisions should be taken unanimously, and that the vote of one state can never bind the will of another. Might it not be maintained that to be sanctioned by several nations, such a decision needs not a majority to pronounce in a certain sense, but unanimity, as in the case of the verdict of an English jury? A vote which decides nationality is not to be compared to a purely internal decision. Might it not be maintained that, during the vote, there was a kind of suspension of the social bond? Moreover, the force of this consideration has been recognized implicitly for a long time; in cessions of territory it is left expressly to each inhabitant, *individually*, to declare to what country he wishes to belong, without being bound by the vote of his neighbor (if a vote has taken place). This is called option. —We thus see that the principle of nationalities carried too far, leads to absurdity. Nationality is an important political element, but it would be an error to let it dominate all others.

To begin with, its source is of doubtful purity; it does not flow generally from justice or the sentiment of personal dignity, but from hatred of the foreigner, and frequently from ignorance. In the opinion of ancient Greece, all foreigners were barbarians; and in that of Rome, enemies. Is it to be believed that there is reason to withdraw from a country where liberty rules, in order to join a nationality of the same race governed by a despot? A group of men who should act in this manner might be considered as "inferior and undeveloped." And justly. Do such men ask themselves what is the object of the state? The state should satisfy certain moral and material wants of men, and if men are connected with a country which gives them these advantages, they should not leave it to join a state which does not give them, whatever be the affinities of race and language. — The preservation of nationality is of secondary importance. History shows us how often nations have become mixed, changed or modified in character. It seems even that an infusion of fresh blood—even barbarian blood—is necessary to prevent old nations from falling into decay. If purity of race were of use to humanity, Providence or nature would have taken some measure to secure it; while it suffices to be born in a country to share the feelings of its people. We have never understood what interest a small group of individuals without history, embedded in a great and powerful state whose history is their own, could have in obstinately remaining in isolation. On the other hand, a nationality small in number performs an impolitic act in withdrawing from a large state to form an independent community. In the present condition of things it is unreasonable. From another point of view, small states are independent only by sufferance. If the six or seven great powers had a less lively sense of the requirements of justice, or if they could agree on the terms of division, the small states would soon be absorbed. It is not sure that humanity or the progress of civilization would suffer thereby; but it is certain that the creation of new small states would be a derangement of the balance established with such difficulty in Europe, for they would simply change masters. It is of small importance to a conquered city whether its garrison belongs to a neighbor of the east or the west. — From the point of view of the progress of humanity, the present condition being given, the small states are in a marked inferiority compared with the great. From the shock of ideas light comes. It results that the more members a nationality has—other things being equal—the more it will contribute to the advancement of science, and the more ideas it will create. Besides, the languages of great countries are studied, and their discoveries are not slow in entering the common domain of civilization. But who learns the languages spoken by one or two millions of persons? The inventions of these countries will be lost for humanity, if the enlightened members of these smaller nationalities do not take them to London, Paris, Berlin, Vienna or some other great centre. There are languages which seem sentenced to perish, as there are nationalities which must, it seems, be lost in others. And why should this process of fusion which was so useful, even so necessary, twenty, ten, or five centuries ago, be stopped to-day? — The union of several nationalities under the same government could not, moreover, be considered as an evil at a time when Switzerland or Belgium are cited as first among the most happy and prosperous countries. Can not each of the fractions of these peoples preserve its originality if it wishes? History shows us, besides, that composite nationalities are superior to nations free of all mixture. Thus, the Romanized Gaul was superior to the druidic Gaul, and the character of modern France dates from the infusion of Germanic blood. The same advantage appears in all states in which the fusion was complete. In countries where the nationalities brought in contact have remained or become hostile through the fault of the government, the mixture has not had its effect; but let equal liberty be given to all, and the peaceable friction of varied aptitudes will produce its usual result. — The principle of nationalities, as we have formulated it, does not possess absolute legitimateness. While recognizing in each one the right to choose a nationality to which he prefers to belong, we should consider circumstances which exercise a power similar to this right and limit its application, or at least render its exercise harmful to individuals, to nations, and to humanity. In the present state of things, the absolute application of the principle of nationalities is even completely impossible; it would have to struggle against material and moral obstacles sometimes invincible, or at least against powerful interests. One of these interests, with slender right, however, in spite of the number of its partisans, would appear under the form of the theory of *natural frontiers*, and this theory is an excellent criterion in distinguishing sincere adherents of the principle of nationalities from those who look on it merely as a weapon. The theory of natural frontiers is an argument of the conqueror, and the principle of nationalities is opposed to conquest. But there are persons who are in favor both of the frontiers and of nationalities, according to the wants of the moment. If our doctrine were to be summed up in the form of a proposition, we should perhaps say that, generally, the principle of nationalities is legitimate when it tends to unite, in a compact whole, scattered groups of population, and illegitimate when it tends to divide a state. When the two operations must take place at once, the verdict of history will be in accordance with the circumstances of the case. It will not say, Woe to the conquered, but Woe to the mistaken. MAURICE BLOCK.

NATIONALITY, Law of. *Definition of Terms.* The word *nation* is used in two senses. It means

sometimes a "folk" or people, whose natural unity is demonstrated chiefly (but not solely) by the use of a common language, but whose territorial limits do not necessarily coincide with those of any political community. With the nation in this sense, with the natural nation, as it may be termed, the law has nothing to do. The law knows nations only as political communities, as sovereign and independent states. *Nationality*, therefore, as a legal attribute of persons, is connection with a certain body politic, membership in a particular state. — The members of a state are called its *subjects* or *citizens*. The former term, if properly construed, is applicable to the people of any nation, without regard to the form of government; for every state is based upon the subjection of its members to its sovereignty. But the word subject has become historically associated with the theories of feudal and absolute monarchy, and has thus fallen into disfavor. It is officially employed, at the present day, in no constitutionally governed country except Great Britain. We use in its stead the word citizen, which has the disadvantage of a double meaning. For primarily and strictly only the active members of the body politic, the holders of political rights, are citizens; but in the official language of the United States the term citizen includes all persons of American nationality, whether possessed of political rights or not. French and German jurists avoid this ambiguity without using the term subject, distinguishing citizens in the strict sense (*citoyens, Staatsbürger,*) from members of the state or nation (*nationaux, Staatsangehörige.*) — In federal states an additional ambiguity attaches itself to the word citizenship: it is employed to describe membership in one of the several federated commonwealths as well as membership in the nation. No such uncertainty of meaning attends the use of the word nationality. But in the absence of a corresponding concrete term, such as the French *national* and the German *Reichsangehöriger*, we are obliged to make use of the word citizen.

Legal Importance of Nationality. The importance of nationality at civil or private law has greatly diminished in modern times. At ancient law all rights were dependent upon citizenship: the foreigner had no rights, not even the fundamental rights of life and liberty, except by virtue of treaty. Modern jurisprudence, however, has substituted for the national the humanitarian principle: civil rights appertain to man as man, not to man as citizen. The exceptions to this rule, numerous and important a hundred years ago (*droit d'aubaine*, etc.) have now generally disappeared. In several states of the American Union aliens are still unable to own real property unless they have declared their intention of becoming citizens. In several European countries aliens are excluded from the exercise of certain trades and professions. But modern law is everywhere tending toward the rule of the Italian civil code: "The foreigner is admitted to all the civil rights belonging to citizens." — At civil law, accordingly, questions of nationality are seldom material. The same is true of criminal law. Only the citizen, indeed, can be called to account for acts done out of the limits of the state; but as regards offenses committed within the territory of a state, the alien, unless he be an exterritorial person, is subjected as completely as is the citizen to its criminal jurisdiction. — At constitutional law, on the other hand, nationality is of prime importance. It is true that constitutional law concerns itself for the most part with active citizens only; but to be an active citizen, to be held to political duties and to hold political rights, one must first be a member of the nation. The alien, therefore, in the rule, has no vote and is incapable of holding office. On the other hand, he is usually exempted from essentially political duties; *e. g.*, he is not held to military service. Exceptions to these rules may indeed be found here and there in the legislation of single states. Several commonwealths of the American Union permit resident aliens to vote in national as well as in state elections. Nearly all states admit aliens to certain offices: some states, however make such admission a mode of naturalization. During our civil war resident aliens who had declared their intention of becoming citizens of the United States were subjected to conscription. Protest having been made by the representatives of the leading foreign powers, the aliens in question were granted sixty-five days in which to leave the country. The foreign powers interested acquiesced in this arrangement, maintaining, nevertheless, that the action of the American government was in violation of international comity. — More numerous by far than the internal questions of nationality are those which arise in the international intercourse of modern states. International law deals not only with the relations of states to each other, but also with the relations of states to the subjects of other states. Relations of the latter class are governed by the following rules: 1. Every state is bound and entitled to protect its subjects. The obligation to protect is an obligation of municipal law solely, each state according or withholding its protection as it sees fit. The right to protect is an international right, and its content is determined by international law and usage. In considering the limits of this right it must always be remembered that every state is sovereign in its own territory, and that the alien, unless invested by law or treaty with the privilege of exterritoriality, is subjected within its borders to the authority of its laws. In the exercise of the right of protection, the alien's government can demand only that he be recognized and treated as its subject; *e. g.*, that all treaty privileges granted its subjects be extended to him. Beyond this point, protection is a matter of comity, not of right. By the comity of nations, each state is permitted to watch over the interests of its subjects in foreign states: particularly to see that they receive justice. Not abstract justice, how-

ever, nor what the protecting state holds to be justice, but such justice as is afforded by the law of the land. Protection of the alien against the law of the land is possible only by force or threat of force. Such protection may be justifiable, but its justification is not to be found in the law which governs the peaceful intercourse of nations. Such protection is an invasion of a foreign sovereignty; *i. e.*, an act of war. — 2. Every state has the right to expel aliens from its territory. The expelling state may return the alien to the territory of the state to which he belongs (*droit de renvoi*) and the latter state is bound to receive him.

Determination of Nationality. Questions of nationality, whether internal or international, are determined in the first instance by the organic or constitutional law of the state or states interested. Each state decides what individuals compose it: who are and who are not its members. But the application of municipal law to international questions results in this case, as in most cases, in conflicts and uncertainties. It frequently happens that a person is lawfully claimed as subject by two states: it is possible that the same individual may owe allegiance, on different grounds, to as many as three different states. It sometimes happens, on the other hand, that a person is not recognized as its member by any state, that he is "*heimathlos.*" International law is forced to deal with these difficulties; it may not determine to what state the individual belongs; but it must at least decide how he shall be treated.

Plan of Treatment. The law of nationality will be described, in the following pages, I. In its historical development; II. In its present condition, by comparison of existing legislations.

HISTORICAL RÉSUMÉ.

Roman Law. The law which determined nationality in the ancient world is commonly known as the *jus sanguinis*, the law of blood or system of descent. It would be more accurate to term it the *jus familiæ*. The ancient state was based upon the family: it was indeed, originally, simply a collection of families. All persons, therefore, who were members of a citizen family were members of the state. But in addition to the wife and the children born of her, the Roman family included adopted children and slaves. Roman citizenship was accordingly acquired not only through descent from a citizen father, but also by marriage to a citizen, adoption by a citizen, and emancipation from slavery—*manumission*—on the part of a citizen master.— The foreign family, on the other hand, did not cease to be foreign by any term of residence within the limits of the state; the descendants of the "peregrine" remained peregrines to the remotest generation, unless adopted, *i. e.*, naturalized by the state itself. Such naturalization was frequently conferred upon entire communities. All the Italian allies were invested with Roman citizenship during the republican period, and in the third century of the Christian era an edict of Caracalla made all the free inhabitants of the empire citizens. The right of citizenship, however, was not thereby made territorial; the edict naturalized those persons only who were domiciled in Roman territory at the date of its publication; it did not affect peregrines who subsequently acquired such domicile.— The connection between the state and the individual could be severed by either party: the state could exile the citizen, and the citizen, at least during the republican period, could expatriate himself. But since loss of citizenship meant the extinction of all property rights and the dissolution of all family ties; and since the exile, unless adopted by some other state, remained outside of the social pale, unprotected by human law, the Roman right of expatriation meant only the right of choosing exile in preference to death; a right of some significance before the *leges Porciæ* abolished the death penalty.

Early German Law. Membership in the primitive German state—if the word state can properly be applied to those loosely organized and migratory tribes which overthrew and dismembered the Roman empire—was acquired, as among the Romans, by descent. The child derived its civil status from its parents, without reference to its place of birth or of residence. During the period of the great migrations, from the fourth to the sixth century, the German tribes were gradually fused into larger monarchic states. The bond of union in these new states was the royal authority: it was the subjection of the individual to that authority which made him a member of the state. Allegiance thus became the basis of nationality.— Allegiance was primarily established by the oath of the subject: *sacramentum fidelitatis* at Frank law, *hyld-ath* in Saxon England. In return for the allegiance of the subject the king was bound to afford him protection: *mundium*. This reciprocal relation could not be dissolved by the act of the subject; the obligation of allegiance endured so long as the king lived, but was not transferred to his successor. A change of rulers necessitated a renewal of the contract.— When, with the close of the period of the migrations, these new states obtained comparatively fixed boundaries, the royal authority gradually became territorial. The oath of allegiance was retained, but was now exacted as a matter of right. All the inhabitants of the king's territory were held to take the oath on reaching the age of twelve. But habitancy or domicile being a matter not always easy of proof, and the place of birth being in the vast majority of cases the place of habitancy as well, the birth-place naturally became the criterion of habitancy and thus of nationality. It was no longer descent, therefore, which determined nationality, nor voluntary contract; but the fact of birth in the king's territory (*jus soli*).— Such seems to have been the general development

of the German law of nationality on the continent and in England. Such in particular was the legal development among the Franks; and with the establishment of the Frankish empire the law of the Franks became, in this matter at least, the law of continental Europe. It was this law which the Northman Hrolf found in force in the lands of which he made the duchy of Normandy; and through the Norman conquest of England the Frankish law of Normandy became one of the sources of the English common law of allegiance.

Effects of Feudalism. The system of nationality which we have just described was not, as is frequently assumed, of feudal origin. The German theory of allegiance and the feudal theory have something in common, and may perhaps be traced to a common starting-point. They have in common a reciprocal relation of service and protection; and the relation between the German prince and his *comitatus*, as described by Tacitus, was no other than this. But the German law of allegiance was not a product of feudal ideas: its development antedated that of feudalism. It governed the relation between subject and sovereign in that Frankish empire which feudalism helped to destroy. — With the disruption of the Frankish empire there arose in Europe a number of feudal monarchies. Two centuries later the Norman conquest established in England, where feudalism had already begun to develop itself, a monarchy more typically feudal than any on the continent. The effect of the feudal system upon the relation between subject and sovereign was, however, widely different in England and on the continent. In England the bond between subject and sovereign was strengthened. The theory that the king was owner of all the land in the realm made the monarchy more emphatically territorial than before, and gave to the *jus soli* a more logical basis. To the general duty of allegiance was added the special duty established by the vassal's special oath of fealty. But there was no merger of these duties: the feudal obligation did not take the place of the general obligation of allegiance. And, what was more important still, the feudal obligation of the sub-vassal to his immediate lord was not allowed to affect his prior and paramount duty to the king. In the continental monarchies, on the other hand, the obligation of the lower vassals to their immediate lords became in fact, whatever may have been the theory, more important than their allegiance to the king. Many of the most important royal rights were given in hereditary fee to the crown-vassals and by these again to their sub-vassals. Interposing thus a series of liege lords between the king and the people, feudalism weakened and in its extreme development destroyed the bond between the state and the individual: it disintegrated the nation. In Germany, where feudalism actually reached this extreme development, membership in the empire became, except as regarded the crown-vassals or imperial estates, a conception devoid of all practical consequence. The important bond was that which subsisted between the imperial estates as territorial princes and the inhabitants of their territories (*Landesunterthänigkeit*). This territorial subjection was held to be established by domicile. In western Europe, however, feudalism never reached this extreme development. Toward the end of the middle ages the monarchic authority was re-established in France and Spain in greater fullness than before: these monarchies became absolute. The *jus soli* remained the basis of nationality.

Influence of the Roman Law. Although, as we have seen, the practical value of allegiance was greatly lessened on the continent by the operation of the feudal system, the law of allegiance remained theoretically unchanged throughout the middle ages. The Frankish *jus soli* remained the common law of Europe: nationality continued to be determined by the place of birth. — Toward the end of the middle ages came what is known as the "reception" of the Roman law. The codification of Justinian, almost forgotten for centuries, began to be studied in the twelfth century; and before the end of the sixteenth century that codification had become the generally recognized basis of (continental) European law. Primarily, indeed, of private or civil law only; but the influence of the Roman law upon constitutional and international jurisprudence was very great. The leading writers on public law declared the *jus sanguinis*, or determination of nationality by filiation, to be the true system, and denounced as irrational the principle of indelible allegiance. — Already in Grotius' time no civilized state except England held allegiance to be indissoluble in the old Frankish sense. But it must not therefore be supposed that what is to-day termed the "right of expatriation" was generally recognized. Expatriation was not regarded as a right but as a penalty. By emigration and lapse of time, it was held, the subject might lose the rights of a subject and incur the disabilities of alienage. Whether the duties of allegiance were extinguished with the rights was a question which the legislator commonly left open, and which continental jurisprudence can not be said to have definitely decided until the present century. — The influence of Roman ideas upon the law regulating the original acquisition of nationality was also considerable. As the territorial principalities of Germany rounded themselves to independent and sovereign states, and as the conception of *Staatsangehörigkeit* (membership in the state) supplanted the mediæval conception of *Landesunterthanigkeit* (territorial subjection), the *jus sanguinis* became in every case the basis of nationality. France, however, retained the *jus soli* until the adoption of the code Napoleon; Spain, it seems, until about the middle of this century; and a number of European states retain it still, with certain modifications.

English Law to 1870. The doctrine of nationality, at English common law, is purely German. Certain details are more carefully worked out, but

the fundamental principles are the same as at Frankish law.—It is the personal relation of the individual to the sovereign which determines nationality. The Englishman is not subject to the king because he is an Englishman, he is an Englishman because he is subject to the king of England. It was decided in the seventeenth century (Calvin's case, 7 Coke), that all persons born in Scotland after the accession of James VI. (I) to the throne of England were natural-born Englishmen, although the union of the two kingdoms was at that time purely personal. A similar result was avoided in the case of the Hanoverian subjects of George I. and his successors, by the provisions of the act of settlement.—The bond which unites the subject to the sovereign is, as at Frankish law, indissoluble by any act of the subject. "Nemo potest exuere patriam": it is not in the power of the subject, by any act of his own, to divest himself of his allegiance. Blackstone explains and defends this rule on the old German ground: the subject owes allegiance because the king affords protection. Until the thirteenth century it seems to have been commonly believed that the allegiance of the subject was suspended by the king's death, as was the case at Frankish law. But Frankish monarchy was elective, and English monarchy became hereditary; the successor to the English throne inherited with the throne the allegiance of his predecessor's subjects. English allegiance thus became "perpetual"; expatriation was possible only with the express consent of the king. As parliament gradually encroached upon the royal functions it was held that even the king's consent was insufficient to divest a subject of his allegiance; an act of the legislature was necessary. No law permitting expatriation was passed until 1870.—The old German oath of allegiance was exacted as late as the eighteenth century; but it is not the oath but the fact of birth in the king's domain which makes the person a subject. Birth in the king's domain means birth "under the actual obedience of the king." Birth in a place over which the king has ever so valid title of sovereignty is, therefore, of no consequence if the place be not in his actual possession. Nor does birth in the king's territory make the child a subject if the parents be exterritorial persons. Conversely, children born to the king or the king's ambassadors in foreign lands are English subjects.—The common law doctrine of nationality thus reduces itself to two rules. Nationality is determined by the place of birth, and the individual can not change his allegiance. The common law was, however, subjected before 1870 to the following important modifications: 1. It came to be recognized as a rule of common law that the subject might freely withdraw his person and property from the jurisdiction of the crown, unless expressly prohibited by the king or by an act of parliament. But the right of emigration is inconsistent, in principle, with the doctrine of indissoluble allegiance. For the latter doctrine rests on the assumption that the subject owes certain duties to the king, in return for the protection which the king affords him, and that it is not permitted to a debtor to extinguish his obligation at his own pleasure. But by withdrawing his person and property from the domain of the king the subject renders his obligation inoperative; the crown has no means left of enforcing its claim. The Frankish law was therefore logically in the right in considering unauthorized emigration to be an act of treason. Authorized emigration, on the other hand, ought logically to have been regarded as expatriation. But the English law permitted the emigration and held to the theory of the continued allegiance of the emigrant.—2. A series of statutes (25 Edw. III., stat. 2; 7 Ann, c. 5; 4 Geo. II., c. 21; 13 Geo. III., c. 21) conferred English nationality upon the foreign-born children and grandchildren of English subjects. The territorial theory of nationality required that these persons should be considered aliens, and the common law so regarded them. If now the *jus soli* was to be set aside in respect to this class of persons; if the children of English subjects, wherever born, were to be regarded as Englishmen; then the same rule, the *jus sanguinis*, should have been applied to the children of aliens born in England. But here the territorial rule of the common law was left in force; children of aliens born in England were born Englishmen.—3. The bestowal of British nationality upon aliens, a practice evidently inconsistent with the theory of indelible allegiance, began in England at an early period. It was effected either by letters patent from the king, or by act of parliament. Only in the latter case was the alien said to be *naturalized;* naturalization by act of the crown was termed *denization.* Denization was always special, the royal prerogative being directly exercised in each case. Parliament, on the other hand passed general as well as special acts of naturalization. Of the former sort were the acts of 15 Charles II., c. 15, in favor of foreigners engaged in certain trades and manufactures; 13 Geo. II., c. 3, and 22 Geo. II., c. 45, in favor of foreign seamen serving on English ships; 2 Geo. III., c. 25, in favor of foreign Protestants, serving ten years in the royal American regiment or as engineers in America; and other similar statutes. All these acts, however, were restricted in their operation to certain classes or categories of foreigners. No law prescribing the conditions under which any foreigner might be naturalized existed before the present reign.—The denizen, or person naturalized by virtue of the royal prerogative, had not the full civil status of the natural-born Englishman. He could neither take real property by inheritance, nor could his children, born before denization, take from him. Naturalization by act of parliament, on the other hand, operated retrospectively: the alien and his children were placed, as regarded rights of inheritance, in the same position as if the naturalized person had been born a subject.—The political effect of denization and of naturalization was

identical: the alien, in either case, became a British subject. As such he was, in principle, subjected to all the political duties and possessed of all the political rights of a natural-born Englishman. His rights, however, were seriously curtailed by special statutory exceptions. The acts of 12 and 13 Wm. III., c. 2, and 1 Geo. I., c. 4, excluded all aliens, although naturalized or made denizens, from the privy council, from parliament, and from all offices or places of trust, civil or military. — The common law doctrine of allegiance, from whatever other standpoints it might be criticised, was at least simple and consistent. The modifications above described made the English law of nationality complex and inconsistent. The children of alien parents, born "under the obedience" of the English crown, were English subjects; the children and grandchildren of English parents, born in the territory of a foreign state, were likewise English subjects. The subjects of foreign princes were encouraged to forsake their natural allegiance and to make their knowledge and skill tributary to England's national wealth; they were even invited to withdraw from their sovereigns the services due to them alone, and to enter the army and the fleet of Great Britain: conversely, the British subject was permitted to avoid the obligations of allegiance by emigration; Irish subjects of the crown were even encouraged and aided, in this century, in emigrating not to British colonies only but to the United States; and yet allegiance was held to be indelible. The English system of nationality, as it was in 1870, may fairly be called a system of double nationality. It seems, at first glance, inexplicable that a system of law so certain to impose antagonistic obligations upon the individual, so likely to involve the state in international conflicts, should have continued to exist to so late a day. In the actual operation of this system, however, the diplomatic inconveniences were not so great, nor were the perils to which the individual was exposed so serious, as might have been anticipated. — International conflicts were to a great extent avoided, in cases of double nationality, by the attitude of the English government. In its diplomatic practice England is accustomed frankly to recognize the possibility and, when the thing exists, the fact of double allegiance. It concedes to other states, in such cases, the right which it claims for itself: the right of enforcing its own law of nationality in its own territory. The English government, therefore, refuses to protect its subject against another government which claims his allegiance on grounds recognized by English law as establishing nationality. The person who is English by descent is not protected against a foreign state in whose territory he was born and which claims his allegiance under the *jus soli*. The person who is English by the fact of birth on English soil is not protected against the government which claims him as its subject because his father was its subject. The person who is English on either or both of the above grounds is not protected against the state in which he has caused himself to be naturalized; nor is the naturalized Englishman protected against the state to which his original allegiance is due either by the *jus soli* or the *jus sanguinis*. — This solution of the problem of double nationality lessens the difficulties of the state, but not those of the individual. It may easily be inconvenient, even in time of peace, to owe allegiance to two states. In case of war between those two states the double obligation may become a source of peculiar peril. If the *sujet mixte* voluntarily espouse the cause of either state he commits treason against the other. The fact that he was ignorant of his allegiance to the latter constitutes, of course, no defense. According to some English authorities the plea of compulsion, *e. g.*, conscription, is not a sufficient answer. But the law was, in fact, never enforced in such cases. Æneas Macdonald, educated and domiciled in France, but by birth a subject of Great Britain, was condemned to death in 1745 for bearing arms against England under a French commission. But the sentence was commuted into banishment; *i. e.*, he was simply sent home. During the war of 1812, England undertook to put a number of prisoners, by birth English subjects, by naturalization American citizens, upon trial for treason. The American government isolated twice as many English prisoners and threatened reprisal. England selected twice as many again of the American prisoners and threatened counter-reprisal. But it was obviously impossible for a civilized state to initiate, rightly or wrongly, a general butchery of prisoners of war. The prosecutions for treason were not pressed, and the English-born prisoners were eventually exchanged with the rest.— Neither to the state, then, nor to the individual, was the English law of nationality so perilous as it seemed. This negative fact, however, in no wise explains the development and only partially accounts for the long retention of that law. The positive explanation is as follows. In England, as elsewhere, aliens were subjected until the present century to serious civil disabilities. The most serious of these was their incapacity to hold real property. It was to remove this disability that English nationality was first extended to the foreign-born children of English parents: the act of 25 Edw. III. was an act in favor of "children-heritors." It was chiefly in order to escape this disability that other aliens sought and obtained letters of denization or acts of naturalization. It was thus the attempt to mitigate the working of the law of alienage which made the English law of nationality inconsistent. The law, thus modified, might still have been made consistent by the complete rejection of the *jus soli* and the establishment of the rule that English nationality should be extinguished by naturalization in a foreign state. But these further changes in the law could not be made without creating new cases of disability. The abrogation of the *jus soli* would have made children of aliens, born and brought

up in England, incapable of holding land; and the expatriation of an English subject would have entailed the forfeiture of his real property. The reform of the law of nationality was therefore blocked by the necessity of first reforming the law of alienage. This latter reform was long delayed by prejudices now deemed irrational and apprehensions now seen to be causeless; prejudices and apprehensions nevertheless which long controlled the political thought not of England only but of Europe, and from which we have not wholly freed ourselves in the United States. — Both the law of alienage and the law of nationality were reformed in England by the same statute, the naturalization act of 1870, (33 and 34 Vic., c. 14).

LAW OF THE UNITED STATES.

Federal and State Citizenship. When, in 1776, the American colonies separated themselves from Great Britain and became independent states, these new states claimed that the allegiance which their inhabitants had previously owed the British crown was now transferred to them. But these new states were already members of a confederation. It was a declaration of the confederate government which dissolved the bond of allegiance between the colonists and Great Britain, and it was a treaty between Great Britain and the United States which gave that dissolution of allegiance legal sanction. There existed accordingly from the outset, besides the idea of allegiance due to the several states, the idea of a general allegiance due to the United States. With the establishment of the firmer union of 1787 the national idea obtained clear expression. The constitution was declared to be established by "the people of the United States." The constitution mentioned not only state citizens but also citizens of the United States. Which of the two allegiances was prior and paramount was long a mooted question. This question may now be regarded as determined. The United States is a nation, and the allegiance of the individual to his state is subordinate to his allegiance to the United States. The latter relation only will be here discussed. Membership in the single state is not nationality. A word is necessary, however, as to the peculiar relation which exists in the United States between federal and state citizenship. In some federal states the determination of nationality is left to the several states; the members of these states are, as such, members of the nation. In other federal states, as in our own, the federal law determines nationality, and the member of the nation is also member of the state in which he resides. But in no federation except our own can a person be member of a part, a state, without being also member of the whole, the nation. In the United States there seems to be nothing in the constitution or the laws of congress to prevent a person who is not a citizen of the United States from becoming a state citizen under the laws of a particular state; and such state citizenship does not make him a member of the nation. It may, however, enable him to vote for presidential electors and for congressmen; for the right of suffrage is conferred by state law, and nearly all our states confer this right on all their adult male citizens. Fourteen states give the right of voting to aliens who have declared their intention of becoming United States citizens. We have, accordingly, the further anomaly that the right which is usually deemed the criterion of active citizenship may be exercised in the United States by persons who are not members of the nation. The state citizenship of a citizen of the United States is determined, according to the fourteenth constitutional amendment, by domicile.

"*Citizens*" *and* "*Subjects.*" The constitution of 1787 established no rules governing the acquisition or loss of American nationality. The whole matter, therefore, remained governed by the subsidiary law of the land, the English common law. All persons born in the territory of the United States were its subjects; all persons born out of its territory, though of American parents, were aliens. But the constitution did not speak, nor has any treaty concluded by the executive nor any act of congress ever spoken, of *subjects* of the United States. The written law knows only "citizens." — The courts have frequently declared, and still more frequently assumed without declaring, that citizen and subject, citizenship and nationality, are equivalent terms. But, in the famous case of Scott *vs.* Sanford, 19 Howard, 393, Chief Justice Taney expressed a different opinion: gave to the word citizen a different interpretation. He did not assert, indeed, that the word was to be taken in its original and strictest sense, that only the actual holder of political rights was to be considered a citizen; but he asserted that only that portion of the inhabitants of the United States which possessed political power at the period when the constitution was established, only the "dominant race," could be deemed to be citizens. The "people of the United States," in the meaning of the constitution, "are what we familiarly term the sovereign people." Hence a free negro could not be a citizen, since he was one of that "subordinate and inferior class of beings who had been subjugated by the dominant race, and, whether emancipated or not, remained subject to their authority." But of course the free negro, if born in the United States, was born its subject. Hence, in Chief Justice Taney's opinion, there might be subjects of the United States who were not citizens. — Some uncertainty has also been caused by the peculiar political status of the Indian tribes living in the territory of the United States. The members of these tribes have never been regarded as citizens of the United States. But it has been doubted whether they are not its subjects, as being born in its territory. The courts, however, have followed, up to the present time, the theory formulated by Chief Justice Marshall in the Cherokee cases. (5 Peters, 1; 6 Peters, 515.) These tribes are not, indeed, "foreign states,"

nor are their members "foreign citizens or subjects," in the meaning of section two of article three of the constitution. They are not independent nations, for they are under the "protection" of the United States. But they are distinct political communities with which the United States lives on a footing of treaty. The fact that in the exercise of its protecting power the United States practically governs these communities does not alter the legal aspect of the relation. As long as the tribal organization of Indian bands is recognized by the political department of the government as still existing; as long, that is to say, as the national government makes treaties with them, the courts are bound to recognize them as separate nations. (The Kansas Indians, 5 Wallace, 737.) Their members, though born in the territory, are not born "under the obedience" of the United States, and are therefore not its subjects.

Acquisition of United States Citizenship by Birth. Citizenship and nationality being equivalent terms, the acquisition of citizenship in the United States was determined from the outset by the common law of England, *i. e.*, by the *jus soli*. All persons born in the limits and under the actual obedience of the United States were its "natural-born citizens"; and it is in this sense that the phrase is used in section one of article two of the constitution. Conversely, all persons born out of the limits and jurisdiction of the United States, though of citizen parents, were aliens; for the English statutes by which these persons were naturalized were not part of our law. The naturalization act of March 20, 1790, declared that "the children of citizens of the United States that may be born beyond sea or out of the limits of the United States shall be held as natural born citizens; provided that the right of citizenship shall not descend to persons whose fathers have never been resident in the United States" A similar clause appeared in all the subsequent naturalization acts, down to that of 1802. The law at present regulating this matter is the act of Feb. 10, 1855, (Rev. Stat., 1993). This act refers only to the children of citizen *fathers*, and such children are declared to be citizens, not natural-born citizens. There was thus introduced into the law of the United States the same inconsistency which has been noticed in the English law. The children of citizens born abroad are citizens *jure sanguinis*, while the children of aliens, born in the territory of the United States, are also citizens *jure soli*. Such was the law until 1866. The civil rights act, adopted in that year, and the fourteenth amendment to the constitution, adopted two years later, each contains a definition of citizenship. We have, therefore, to examine these definitions, and their relation to each other and to the rule of the common law.— The definition contained in the civil rights act, adopted April 9, 1866, (Rev. Stat. 1992), is as follows: "All persons born in the United States, *and not subject to any foreign power*, excluding Indians not taxed, are declared to be citizens of the United States." This act confirms the *jus soli*, but exempts from its operation: 1. All persons subject to a foreign power. The meaning of the clause is clear, but its practical application presents considerable difficulty. How are our courts to determine whether a person is subject to a foreign power? Our municipal law certainly does not afford any answer to this question; nor does international law. The answer is to be found only in the various municipal laws which govern foreign nations. It can not be that the judge or diplomatic official, who is called upon to decide the question of nationality, is to scrutinize and interpret these foreign laws *ex officio*. Nor can it be that he is to call upon the party asserting citizenship to prove the negative contained in the law It can only mean that if the individual born in the United States show, or if it be shown against him, that another government claims him or according to its law may claim him as its subject, he is then not to be regarded as a citizen of the United States. But until such claim be actually raised by a foreign government, or until it be shown that the law of some foreign state makes such a claim possible, the person born in the United States is to be deemed its citizen. The object of this change in the law is presumably to avoid conflicts of nationality: the clause is inserted in a spirit of international comity. The legislator could hardly have gone further either in the observance of international comity or in the sacrifice of national dignity. Our law is brought into harmony with foreign legislations by being made dependent upon them in its operation. The effect of the statute is to place in doubt the nationality of a person born on our soil of alien parents. *Prima facie*, such person is a citizen; but it is open to him, or to any person attacking his citizenship, to show that he is claimed by his father's country under the *jus sanguinis*. This claim could not in all cases be shown to exist. The father might have lost his foreign nationality before the child's birth; *e. g.*, by absence of a certain duration. Or the person himself might thus have lost his foreign nationality. (See below: Comparison of Existing Legislations, Loss of Nationality.) — 2. The act excludes from the operation of the *jus soli* non-taxed Indians. This is unnecessary; for, as we have seen, these persons are not born under the actual obedience of the United States, and are not citizens by common law.— The definition contained in the fourteenth amendment to the constitution, adopted July 28, 1868, is as follows: "All persons born or naturalized in the United States, *and subject to the jurisdiction thereof*, are citizens of the United States and of the state in which they reside." This definition simply reproduces the rule of the common law. All persons born in the territory of the United States are its citizens, provided they are also born subject to its jurisdiction. But except foreign envoys and the members of their households, and members of Indian tribes recognized by the government as distinct political communities, all per-

sons are subject to the jurisdiction of the United States so long as they are in its territory. In our territory, the alien is "subjected," no less completely than the citizen, to the jurisdiction of our courts (jurisdiction in the narrower sense) and to the general authority of our government (jurisdiction in the wider sense). Aliens, in the language of the common law, are temporary subjects of the state in which they sojourn; they owe the sovereign who harbors them in his domains temporary or local allegiance. The phrase "born subject to the jurisdiction" is therefore precisely equivalent to the common law expression "born under the actual obedience." * — The constitution, then, invests with citizenship all persons born under the jurisdiction or obedience of the United States, without regard to the nationality of their parents or to the opposing claims of foreign states. The civil rights act, as we have seen, declares that such persons are not citizens if claimed as subjects by any foreign power. But it is obvious that where citizenship is conferred by the constitution it can not be withheld by an act of congress. The definition contained in the civil rights act, in so far as it conflicts with the definition contained in the constitution, is therefore void. — The main purpose of the fourteenth amendment was to establish the citizenship of the negro. (Slaughter-house case, 16 Wallace, 73.) The citizenship of the free negro had been denied, in the Dred Scott case, on the assumption that citizenship and subjection were not identical ideas; that a person might be a subject of the United States without being its citizen. In declaring that citizenship is acquired in the same manner in which subjection is established at common law, the fourteenth amendment has placed the equivalency of these terms, and thus the citizenship of the negro, beyond the possibility of a doubt.

Naturalization and Expatriation in the United States. Section eight of article one of the constitution empowered congress "to establish an uniform rule of naturalization." This power was first exercised in the act of March 26, 1790. This act provided that, under certain conditions, any free white alien might be admitted to citizenship by any court of record in the state in which he resided. The conditions were: previous residence of two years in the United States and of one year in the state; good character; and oath "to support the constitution of the United States." The acts of Jan. 29, 1795, and June 18, 1798, increased the term of residence (in the United States) necessary for naturalization first to five and then to fourteen years. The act of 1795 also added a new condition, viz., a preliminary declaration of intention to become a citizen and to abjure the prior allegiance. The act now in force is that passed April 14, 1802. The requirements of this act are: 1. Preliminary declaration (as under the act of 1795) three years before admission. (But the act of May 26, 1824, section 4, permits this declaration to be made two years before admission.) 2. Proof of five years' residence in the United States and one year's residence in the state. 3 Proof of good conduct attachment to the principles of the constitution etc. 4. Renunciation of any title or order or nobility. 5. Declaration, on oath or affirmation, that he (the person desiring admission) will support the constitution of the United States and abjures his prior allegiance. 6. No alien may be naturalized if his government is, at the time, at war with the United States. The first or the second of the above conditions is relaxed or removed: 1, in the case of aliens who have resided three years or more in the United States before reaching the age of twenty-one, (act of May 26, 1824); 2, in the case of aliens who have enlisted in the armies of the United States and received honorable discharge, (act of July 17, 1862), 3, in the case of alien seamen taking service in our merchant marine, (act of June 7, 1872).—The naturalized citizen is not eligible, under the constitution of the United States, to the presidency or vice-presidency; nor may he be chosen as representative until seven years, nor as senator until nine years, after his naturalization. But, with these exceptions, the alien obtains by naturalization the full civil and political status of a native citizen.—The American law of naturalization, as compared with European legislation on this subject, exhibits certain new features. In the old states of Europe there is little foreign influx, and naturalization is an exceptional event. In the new states of America, states established by immigration, naturalization is a constant factor, it may almost be said a normal element, in the national growth. Our law of naturalization is based upon the idea that the alien who comes to our country *to stay*, thereby becomes a member of the body social and must be admitted to the body politic Naturalization in Europe was and is a favor, bestowed upon the individual at the pleasure of the legislative or at the discretion of the executive. Naturalization in America has been, since 1790, a right not to be withheld from any person who complies with certain legally established conditions. Its bestowal is vested in the judiciary, because this is the de-

* The phrase is thus construed in McKay *vs.* Campbell, 2 Sawyer, 118. A dictum of Mr. Justice Miller in the "Slaughter-house case," 16 Wallace, 73, implies a different interpretation. "The phrase 'subject to its jurisdiction,'" he says, "was intended to exclude * * * children of ministers, consuls, and citizens or subjects of foreign countries born within the United States." If this was intended, the intention has not been realized; for the clause can not be so construed as to exclude the children of (non-exterritorial) aliens. Mr. Justice Miller apparently assumes that the phrase "subject to the jurisdiction" means subject to the sovereignty—subject as opposed to alien. If now, for the sake of argument, we grant this; if we read: All persons born in the United States and subject thereto are citizens; how is the word *subject* then to be construed? Who are "subjects" of the United States? The constitution and the laws of the United States afford us no answer; we must have recourse to the common law. But by common law all persons born in the territory of a state and under the actual obedience of its sovereign are its subjects, whatever the nationality of the parents. To make Mr. Justice Miller's construction possible, the sentence should read: All persons born in the United States *of parents* subject thereto are citizens.

partment of government which properly passes upon questions of right. The effect of naturalization was usually restricted, in Europe, to the territory of the adoptive state. This restriction, viewed from the American standpoint, is a wholly unreasonable one. The individual is not naturalized in the United States merely because it is desired to relieve him from certain disabilities attached to alienage; he is invested with the rights of a citizen because he is already one of our people. By naturalization, therefore, he is completely incorporated in our body politic. It seems to us only reasonable that he should everywhere be regarded as we regard him, as an American citizen in the fullest sense of the word. It seems preposterous that the state which he has abandoned should still claim him as its subject. But as soon as our government attempted to obtain from the governments of Europe a recognition of the "right of expatriation," we were confronted not only with the statement that European law knew no such right, but also with the question whether any such right existed at American law. — Before entering upon the discussion of the "right of expatriation," it will be well to determine what the phrase means. Expatriation is the dissolution of that legal relation which we term nationality. It is obvious that a legal relation can be terminated only by operation of law. When we speak of a legal relation as being extinguished by the operation of certain facts, (*e g.*, by the acts of an individual), we mean that the law attaches to these facts the result or effect of extinguishing the legal relation. A right of the individual to expatriate himself can only mean the power of doing something to which the law attaches the effect of expatriation.* The question whether the American citizen possesses the right of expatriation should therefore be stated as follows: Does the law of the United States attach to any acts of its citizens the effect of extinguishing their nationality? The constitution is wholly silent upon this matter; and, until 1868, no act was passed by congress regulating or even referring to expatriation. Until 1868, then, the common law remained in force. But the common law does not give to any act of the individual the effect of expatriation. — Expatriation was pleaded, before 1868, in a number of cases decided by the supreme court. In no case was it held to have taken place. In no case, it is true, was the decision based upon the common-law doctrine of perpetual allegiance. In every case in which the court denied that expatriation had taken place, the decision was based either upon the inadequacy of the acts from which it was claimed that expatriation resulted, or upon the fact that these acts were done in fraud of the law. But if the possibility of self-expatriation has been neither affirmed nor denied in the *decisions* of the supreme court, some of its leading members have clearly indicated their opinion in the matter. The gist of their *dicta* is that in the absence of a law authorizing self-expatriation the American citizen can not divest himself of his allegiance. This was also the opinion of Chancellor Kent. (Comm. II., 49.) — But in spite of the apparent obviousness of this conclusion, and the array of authority by which it is supported, a contrary current of opinion has existed from the very beginning of our national existence. It has been asserted by the majority of our politicians, and by some of our jurists, that the English doctrine of perpetual allegiance has never been a rule of our law. In many cases this opinion rested on the failure to distinguish between emigration and expatriation; in others upon the assumption that emigration necessarily results in expatriation. In the absence of special restraint, it was said, the American may emigrate; *therefore* he can expatriate himself. Those who avoided these errors argued that freedom of emigration was at least inconsistent with the theory of perpetual allegiance. This is doubtless true; it is also true, as these jurists asserted, that the naturalization of aliens and the abjuration of the old allegiance required by our naturalization laws are strikingly inconsistent with the theory that no person by his own act can divest himself of his allegiance. But England also has permitted emigration and has naturalized aliens for centuries, without attributing to emigration or naturalization acquired in a foreign country the effect of extinguishing English nationality. It has never been held, under any system of jurisprudence, that an established rule of law is abrogated by the adoption of another rule perfectly compatible with the first in its operation and inconsistent with it in theory only. — In 1856 Attorney General Cushing furnished Secretary Marcy with an opinion asserting the right of the American citizen to expatriate himself. The opinion was evoked by a question from a foreign minister, which the secretary of state requested the attorney general to answer. Mr. Cushing argued: 1. That the legislation of the United States is inconsistent with the theory of indelible allegiance. This argument has been noticed and the answer indicated. Two rules of law may be inconsistent and yet both may be law. 2. That expatriation is a natural right. Assuming, for the sake of argument, that there are "natural rights" and that self-expatriation is one of them, it in nowise follows that a citizen of the United States may expatriate himself. The law which restricts or denies a natural right may be a bad law, but is not the less on that account law. 3. That the expatriation of the individual by his own act has been recognized by the legislation of several of our states, and "has thus become a part of our public law." Undoubtedly; but not a part of that part of the public law which we are now considering, viz., the federal law. 4. That the separation of the colonies from England

* Expatriation is often confounded with emigration. Expatriation is a legal conception: emigration is simply a fact to which the legal result of expatriation may or may not be attached. Few legislations give to emigration *per se* the effect of expatriation.

was a complete denial of the claim that allegiance may not be cast off without the consent of the sovereign. It is assumed, in this argument, that a declaration of independence made by an entire community is analogous to a renunciation of allegiance made by an individual; and that if one was admissible the other must be. If this analogy be admitted, it may be answered that, until our independence was recognized by England, the dissolution of allegiance effected by the declaration of congress was a *de facto* dissolution only, like that effected by the acts of secession which certain of our states passed in 1861. Such a dissolution of allegiance a citizen may doubtless effect by emigrating and renouncing his obligations to his native country. But the cases which Mr. Cushing compares are not analogous. The American declaration of independence was a revolutionary act Revolutions may create states, but not precedents for the administration of municipal law in those states. — On these grounds, however, Mr. Cushing decides that the rule of the common law is not a part of our law, and that the American may expatriate himself. But in what manner? To what acts of the individual is the law to attach the result of expatriation? To renunciation simply, without emigration? Or to emigration without renunciation? Or only to both combined? Mr. Cushing wisely decides that both renunciation and emigration are necessary, but assigns no warrant of law either for his selection of this method or his rejection of the others. — But why did not congress cut this legal knot by the adoption of a law regulating expatriation? There were two difficulties in the way. It was objected by many of our politicians that the passage of such a law would imply that self-expatriation had not previously been possible. The second difficulty was more serious. In many of our states, no persons except citizens of the United States and such aliens as have declared their intention of becoming citizens are able to hold real property. The expatriation of a citizen would therefore entail the forfeiture of his real estate. The difficulty is the same which so long retarded the reform of the English law. But the difficulty is with us greater. For parliament was able to remove the civil disabilities of alienage before touching the question of expatriation, but congress has no such power. — The only law relating to expatriation which congress has passed up to the present time, is the "act concerning the rights of American citizens in foreign states," approved July 27, 1868. The preamble declares expatriation to be "a natural and inherent right of all people." Then follows the enactment, "That any declaration, instruction, opinion, order or decision of any officer of this government which denies, restricts, impairs or questions the right of expatriation, is hereby declared inconsistent with the fundamental principles of this government." It is difficult to see what effect can be given to this law, as far as the self-expatriation of the American citizen is concerned. The judicial and executive departments of government are instructed to recognize the "right of expatriation," but no light is thrown upon the cardinal question how this right is to be exercised. To what acts of the individual is the effect of expatriation to be attached? Apparently, since expatriation is declared to be a natural and inherent right which may not even be restricted, impaired or questioned, *any acts* which clearly indicate the intention of the individual to put off his allegiance will suffice; *e. g.*, abjuration of allegiance before a notary public. But no one is likely to maintain that this lay in the intention of the legislator. But if some acts are insufficient, what acts are sufficient? — The executive department has proceeded itself to fill the gap in the law; with what legal right will not here be discussed. Protection has been refused to a number of native and naturalized citizens of the United States, resident in foreign states, on the ground that they have expatriated themselves. As far as the department of state can confer it, American citizens may accordingly be said to enjoy (?) the right of expatriation. If the courts, also, shall decide that self-expatriation has been made possible by the act of 1868, and shall themselves proceed, as the executive has done, to determine what acts of the individual constitute expatriation, the right of the American citizen to expatriate himself may obtain practical recognition in another respect. It may be held that the real property of the expatriated American, if situated in a state whose law excludes aliens from the ownership of land, escheats to the state. — The possibility of self-expatriation has been discussed in the above pages with reference simply to the municipal law of the United States. Under the expatriation treaties concluded by our government (see below) the American citizen may undoubtedly divest himself of his citizenship.

FOREIGN RELATIONS OF THE UNITED STATES.

Conflicts of Nationality. When a citizen of the United States is claimed by a foreign state as its citizen or subject, on grounds recognized by American law as establishing nationality, the American government does not ordinarily attempt to protect this double citizen against the foreign state which claims his allegiance. The American government, like the English, recognizes as a rule the right of every state to enforce its law of nationality in its own territory. The son of an American father, born abroad, is not protected against the state in whose territory he was born, if that state claims him *jure soli.* (Consular Regulations, art. XI., sec. 115) The son of an alien father, born in the jurisdiction of the United States, is not protected against his father's state, if claimed by the latter *jure sanguinis.* (Case of François Heinreich.* U. S. For. Rel., 1872, p. 172.) An American citizen who causes or permits himself to be

* Heinreich was an American *jure soli*, but an Austrian *jure sanguinis*. The refusal of protection was, in this case, erroneously based upon the assumption that Heinreich had become *by naturalization* a subject of Austria.

naturalized in a foreign state is, as a matter of course, not protected against the state of his adoption; for, in the view of our department of state, he is no longer an American citizen even within our jurisdiction. But his minor children also, though born before his naturalization and therefore born American citizens, are, if claimed by the father's adopted state, to be deemed its citizens so long as they are in its territory and jurisdiction. ("Santiago" Smith's Children, For. Rel., 1879, pp. 815, 816, 825.) Nor, until 1859, did our government claim the right to protect its naturalized citizens against the states to which these persons owed original allegiance. If the state to which the emigrant belonged by birth chose to consider him as its subject in spite of his American naturalization, it had, within its jurisdiction, the power and the right to treat him as such. Our government, of course, resisted the attempt of England to enforce its law of nationality within *our* jurisdiction, by means of the so-called "right of visitation and search"; and the repeated invasion of our "floating territory" by English officers was the principal cause of the war of 1812. During this war, as we have seen, the attempt of England to place naturalized Americans on trial for treason was met by the United States with threat of reprisal. But this was an act of war, not an exercise of the ordinary right of protection.* The right of protecting our naturalized citizens against the state to which they owed original allegiance was not only never asserted before 1859, but was expressly and repeatedly disavowed by our ministers in foreign countries and by our department of state. But while our government recognized the right of foreign states to enforce their own law of nationality in their own territories, it repeatedly endeavored to secure by negotiation the modification of the foreign law. It argued, with justice, that the individual who had ceased to be a member of the body social ought not to be deemed a member of the body politic. — Comparatively few of the states to which our naturalized citizens originally belonged denied the possibility of self-expatriation. Great Britain, Russia, and some cantons of Switzerland, belonged to this category. The legislations of these states recognized no dissolution of allegiance without the express and special consent of the state. — In Prussia, and in most of the German states, authorized emigration or unauthorized absence of a certain duration (in Prussia, by the law of Dec. 21, 1842, ten years) effected expatriation. By the *Code Napoléon* naturalization acquired in a foreign country was one of the facts to which the law attached the loss of French nationality. But in all the legislations of this second category, expatriation was understood to mean, primarily, loss of the rights of a citizen; and it was by no means admitted that the duties of a citizen were extinguished with the rights. — Our government accordingly endeavored to secure, by reform of the foreign legislations or by treaty, the recognition of the following principles: 1, That naturalization effects expatriation; 2, That expatriation extinguishes not only the rights of the citizen but also the rights of the state over the citizen. — But pending the adoption of these principles, the American government (until 1859) recognized the right of each state to enforce its own law in its own territory, and made no attempt to protect its naturalized citizens against their old governments. In the year 1859 our government changed its attitude. Secretary Cass asserted that the naturalized American, returning to his native country, "returns as an American citizen and in no other character." (Instructions to Mr. Wright, July 8, 1859.) President Buchanan declared, "Our government is bound to protect our naturalized citizens everywhere." (Message, Dec. 3, 1860.) The refusal to recognize the territorial validity of the foreign law was based upon the assertion that the right of expatriation was a right established by the law of nations. The "right of expatriation," in this connection, meant, of course, the right of the individual to divest himself of his obligations to his native country by migrating to and acquiring naturalization in another; and the claim of the American government, legally stated, was this: That international law (independently of treaty) attaches to emigration and subsequent naturalization the extinction of the prior allegiance. But international law, being enacted and enforced by no superior, has no existence except by the agreement of the nations which it governs. A rule, therefore, which was not recognized, a score of years ago, by the majority of civilized states, and to which no effect is given to-day except by force of municipal legislation or of treaty, can hardly be termed a rule of international law. The consensus of civilized nations is *now* so general as to the propriety of its observance that it may easily come to be regarded as a rule of international law a generation or two hence. But it certainly was not such in 1859. Legally, then, the ground taken by the American government in 1859 was indefensible. Politically, it was well chosen; it gave our diplomacy a basis for incessant agitation. The American claim of protection was of course denied, but despite all denials was steadily renewed. In denying the American claim, each foreign government knew itself to be legally in the right; but with each renewal of the controversy it became more obvious that the existing law was inequitable and must be reformed.

The Expatriation Treaties. The principles advocated by the United States first obtained international recognition in the treaty with the North German confederation, negotiated by Minister Bancroft, and signed Feb. 22, 1868. The difficulties between the United States and Prussia had centred in the question of military duty. The Prussian who left his country without authorization, before

* During the war between England and France, at the close of the last century, France was similarly threatened with reprisals in case it should treat as traitors any *emigrés* serving under the English flag. But these persons were not claimed by England as its subjects.

or during the period in which his service was due to the state, was liable, upon his return, to punishment, and, if he was still within the military age, to compulsory enlistment. But if during his absence the Prussian had acquired American citizenship, our government maintained (since 1859) that he was no longer a Prussian and owed the Prussian state no military service. His duties to the Prussian state were terminated at the moment of his naturalization. In fact, our government went further than this, and asserted that the Prussian naturalized in America was not liable to punishment for non-performance of military service, unless that service was actually due at the moment of emigration. — In the treaty with the North German confederation, every point of the American claim is conceded. Not only is it agreed that naturalization shall extinguish the duties of the citizen to his former state, but also that the naturalized citizen shall not be punished except for offenses committed before emigration The extinction of duties effected by naturalization is thus dated back to and includes the act of emigration. The essential provisions of this treaty are briefly as follows. Citizens of the one nation who have become naturalized citizens of the other shall be regarded and treated as citizens of the latter nation, if they have resided uninterruptedly within its territory for five years. (Art. 1) The naturalized citizen is liable, on return to his original country, to trial and punishment for offenses committed before emigration. (Art. 2.) If a naturalized citizen renews his residence in his former country without the intent to return to his adopted country, he shall be held to have renounced his naturalization. "The intent not to return may be held to exist when the person naturalized in the one country resides more than two years in the other country." (Art. 4.) The purpose of the fourth article is obvious. Without some such limitation, the treaty would enable any German, by a temporary residence of five years in America, to escape military duty in his native country. American citizenship would have been sought by persons who had no intention of becoming in reality members of the American people: it would have been sought simply as a means of obtaining a privileged position in a foreign country. The provisions of this article have been criticized because the persons whom it affects seem to be left without any country. They have forfeited their naturalization without regaining their former nationality. But if our naturalized citizen has forfeited his American citizenship it is no concern of ours whether he has regained his German nationality or not, and *vice versa*. The reacquisition of the former nationality is an internal, not an international, question. The matter is therefore left, as it should be, to be settled by each nation for itself. The German government settles it by compelling the naturalized American, at the end of the two years, to reassume German nationality or leave the country. During the same year (1868) Minister Bancroft concluded similar treaties with Bavaria, Baden, Würtemberg and Hesse. Expatriation treaties based upon the same principles were made, in 1868, with Mexico, Great Britain and Belgium; in 1869, with Sweden and Norway, in 1870, with Austria; in 1872, with Ecuador and Denmark. The treaty of 1868 with Great Britain was of a preliminary character, the British government not desiring to anticipate the action of parliament on the question of expatriation A formal treaty was concluded immediately after the passage of the English naturalization act of 1870. — The majority of these treaties correspond with the North German treaty in attaching the effect of expatriation to naturalization *and* five years' residence. The treaties with Belgium, Denmark, Ecuador and Great Britain provide that naturalization shall extinguish the former nationality without reference to any term of residence in the adopted country. All the treaties agree that the naturalized citizen shall not be punished by his original country except for offenses committed before emigration. All the treaties further agree in providing that the naturalized citizen may renounce his naturalization; and the majority of them, like the North German treaty, attach this result to renewed residence in the original country when such residence exceeds two years. But this latter clause does not appear in the treaties with Austria, Baden, Belgium and Great Britain; and under the Mexican treaty the naturalized citizen may avoid the forfeiture of his naturalization by proving his intent to return to his adopted country. A number of the treaties containing the two years clause explain, in the text or in the protocol, that the two years residence in the old country does not of itself re-establish the old nationality. These treaties give to American naturalization, in the vast majority of cases, the effect of extinguishing the original allegiance. Nearly 90 per cent. of the immigrants whom Europe sent us in 1881, and nearly 93 per cent. of the total European immigration to the United States from 1821 to 1881, came from countries with which we now have expatriation treaties. — States with which we have no such treaties, but whose municipal law attaches to a foreign naturalization the effect of expatriation, furnished 5 4 per cent. of our total European immigration from 1821 to 1881; 6.2 per cent. in 1881. In all the states belonging to this category, it is now held that expatriation extinguishes the duties as well as the rights of the citizen. — The rest of our European immigration (1821–81, 1.9 per cent.; 1881, 4.4 per cent.) is derived from Russia and Switzerland. Russia does not permit the individual to expatriate himself without special authorization. Switzerland permits self-expatriation, but does not attach this result to naturalization acquired in a foreign country.

COMPARISON OF EXISTING LEGISLATIONS.

Acquisition by Birth. All modern states, even those which apply the *jus soli* within their respective territories, claim as citizens the children of citi-

zen parents born abroad. But many legislations make the derivative citizenship of the child born abroad dependent upon his return and to residence in the father's country (Portugal, Bolivia, Brazil, Chili, Colombia, Ecuador, Paraguay and Uruguay. Peru requires the inscription of the child's name in the civil register. In the Argentine republic and in Venezuela, the individual born abroad must declare, when of full age, that he elects the nationality of his parents.) The same result is obtained, in other legislations, by attaching to residence in a foreign country without intent to return, or to absence of certain duration, the effect of expatriation. The English act of 1870 permits the child of an Englishman, born abroad, to make when of full age a declaration of alienage. — But although the *jus sanguinis* or principle of filiation is applied by all modern states to the children of their citizens born abroad, no such general agreement exists in the treatment of children of aliens born within their respective territories. Existing legislations may be divided, in this respect, into five classes. — 1. Pure *jus sanguinis*. In Austria, Germany, Hungary, Sweden and Switzerland the child of an alien, born in the territory, is born an alien and remains an alien always unless he becomes naturalized. The conditions under which he may obtain naturalization differ in no respect from those prescribed for the naturalization of other aliens. — 2. Modified *jus sanguinis*. In France the child of an alien, born in the territory, is born an alien; but when of full age he has *droit d'option* of French nationality. That is, he has the right to become a Frenchman if he chooses, and he becomes a Frenchman by declaring that such is his choice. He must also declare that it is his intention to live in France; and if at the date of his declaration he is resident in a foreign country, he must acquire a French domicile within a year. This system, established by the Code Napoleon (Art. 9) has been adopted with slight variations in the legislations of Belgium, Greece, Luxemburg, Monaco, Spain, Rumania, Russia, Turkey and Costa Rica. — 3. Pure *jus soli*. The children of aliens, born in the territory, are born members of the state in Denmark, Norway, Bulgaria, the United States, Hayti, the Argentine republic, Bolivia, Brazil, Chili, Colombia, Ecuador, Guatemala, Peru, Uruguay and Venezuela. But under the laws of some of the above states, the nationality thus established is lost if the child becomes resident in the father's state (Denmark, Norway, Guatemala). — 4. Modified *jus soli*. The children of aliens born in England are natural-born Englishmen, but when of full age may make a declaration of alienage. The same system obtains in Portugal. In Mexico the child of an alien, born in the territory, is an alien as long as he remains under the paternal authority. (At Spanish as at Roman law a person of full age may be subject to the *patria potestas*.) But as soon as he is freed from the paternal authority, as soon as he becomes *sui juris*, he becomes a Mexican unless he reclaims his father's nationality. — 5. Combination of *jus soli* and *jus sanguinis*. The Italian code and the Dutch law of July 29, 1850, take an additional element into consideration, viz., the domicile of the parents. The child born in the Netherlands is a Netherlander if his parents have resided in the kingdom for three years or if they have resided there eighteen months after declaring their intention to establish their domicile there. The acquisition of nationality in this case is definitive: the Dutch law permits no reclamation of the father's nationality. Under the Italian code the child born in the territory is born an Italian if his parents have resided in the kingdom uninterruptedly for ten years; but on reaching full age he may reclaim the nationality of his father. Under both legislations, the children of non-domiciled aliens, born in the territory, are born aliens; but they have the right of electing the nationality of the state in which they were born (*droit d'option*). — A word as to the advantages and disadvantages of the above systems. The *jus soli* or territorial system has the advantage of attaching nationality to a fact easily proved. But it has the disadvantage of imposing nationality, in a certain number of cases, upon persons whom it is absurd to regard as members of the state in which they happen to be born. If the parents were not domiciled in the territory, and if the child is removed to and grows up in the father's country, it is preposterous to regard him as a member of any other than his father's state. The *jus sanguinis* or system of filiation is not open to this objection, but is open to others equally serious. The nationality of the individual can be proved only by showing the nationality of the father; but this depends again upon the nationality of the grandfather, and so on without end. Under the *jus sanguinis*, again, the members of a family originally foreign but established for generations in the state may retain their alien character, if they choose, indefinitely Of course they will choose to do this wherever the burdens of citizenship are greater than the disadvantages of alienage; *e. g.*, in all states where universal and compulsory military service exists. In all such states the *jus sanguinis* will create a privileged class within the population, a class exempted from political duties because of its inherited alienage. This has notably been the result of the establishment of the *jus sanguinis* in France. The *droit d'option* given to all persons born in the territory is seldom exercised. In order to check the rapid and alarming increase of the resident foreign population *born on French soil*, French legislation has been obliged to revert, in a measure, to the territorial system. A law of Feb. 12, 1851, provided that all persons born in France whose fathers were also born there should be deemed Frenchmen, unless on reaching majority they reclaimed the paternal nationality. This law did not have the desired effect. Alienage was regularly reclaimed by the persons in question, and the domiciled foreign population continued to increase. A law amending the law of 1851 was accordingly

adopted Dec. 16, 1874. Under this latter law the individual who desires to reclaim his father's nationality is required to produce a certificate (*attestation*) from the government of his father's state, showing that it regards him as its citizen. This he will rarely be able to do. (See below: Loss of Nationality.)—The disadvantages of the *jus soli* on the one hand and of the *jus sanguinis* on the other are in the main avoided by the Dutch law of 1850, described above. The combination of the two systems in that law seems the most satisfactory solution of the problem yet attained.

Naturalization signifies in the widest sense the bestowal of nationality. So the children of Englishmen born out of the territory were said to be naturalized by the acts of 25 Edw. III., 7 Ann, etc. Commonly, however, naturalization means the acquisition of nationality otherwise than by birth, the bestowal of nationality upon a person who is by birth an alien. But nationality may either be imposed upon an alien *de plein droit*, without regard to his wishes in the matter; or it may be bestowed upon him at his own request (voluntary naturalization).—1. Naturalization is conferred *de plein droit* by all existing legislations upon the alien woman who marries a citizen. At English common law, it is true, marriage did not have this effect; but the rule of the common law has been superseded by statute in both England (7 and 8 Vic., c. 66) and in the United States (Act of Feb. 10, 1855).—Naturalization *de plein droit* is conferred by the laws of Denmark and of Norway upon all persons who become domiciled in the territory of these states. At old Spanish law, the alien who was domiciled in the kingdom, or who resided there under circumstances which showed *animus commorandi* (marriage with a Spanish woman, possession of real property, exercise of a profession, keeping a shop) acquired *ipso facto* communal citizenship (*vecindad*), and these communal citizens were regarded as Spanish subjects. But a law of 1870 enacts that the *avecindados* shall be regarded as Spaniards only when they have caused themselves to be registered as such and have renounced their prior nationality. At present, therefore, the acquisition of *vecindad* is simply a means of voluntary naturalization. The law of the *vecindad* was transplanted from Spain to the Spanish colonies in America; and, until recently, many South American legislations outdid the Spanish model in the matter of compulsory naturalization. But at the present time naturalization has become wholly voluntary in all these states except Bolivia and Venezuela.—A few countries (*e. g.*, Germany and Mexico) impose their nationality upon all persons who enter the service of the state. But in this case the intent of the individual to obtain naturalization may be presumed to exist without any expressed declaration; and this method of naturalization may fairly be termed a voluntary one.—2. Voluntary naturalization is provided for in all existing legislations; but the method, conditions and effects of naturalization vary greatly in different countries. In all the cases where a union of states exists, in Europe, naturalization is left to the single states. This is the case not only when the union is merely personal or the bond of federation loose (the Netherlands and Luxemburg; Russia, Poland and Finland; Norway and Sweden; Austria and Hungary), but also in the firmer federal unions (Switzerland, Germany). But in Switzerland and in the German empire the federal law determines at least the conditions of naturalization. In the British empire each colony has the power of naturalization, and fixes the conditions upon which it shall be granted.—The department of government by which naturalization is conferred is different in different states. Where absolute monarchy exists this power is of course vested in the crown. In constitutional states the right belongs in principle to the legislative, and in many states it is directly exercised by the legislature (Belgium, Bulgaria, Denmark, Luxemburg, the Netherlands, Norway, Rumania, and the majority of the Swiss cantons). In other states naturalization is bestowed by the administrative department, under conditions prescribed by law (England, France, Germany, Hungary and Portugal). In England, besides the naturalization conferred by the secretary of state, naturalization by virtue of the royal prerogative and naturalization by special act of parliament are still possible. A mixed system exists also in Italy, Greece and Spain.—The power of naturalization, wherever vested, is discretionary in all European states. Although the alien complies with all the conditions prescribed by law, naturalization may be refused him. (Except in Spain, where the alien may acquire *vecindad* by his own act, and then by abjuring his prior allegiance may become a Spaniard.) In the United States the theory of naturalization is a different one. The alien who fulfills the legal conditions of naturalization has a right to be naturalized, and naturalization is conferred by the judiciary. The same system exists in the dominion of Canada. In Central and South America, naturalization is bestowed either by the executive or the legislative, and the bestowal is discretionary. But since the institute of the *vecindad* exists in the majority of the Spanish-American states it is usually possible for the alien to acquire naturalization by obtaining domicile and causing himself to be registered as a citizen.—The conditions prescribed by law for naturalization differ widely in different states. Present domicile or the intent to establish domicile in the country is always required, unless in the case of those engaged or intending to engage in the service of the state. Residence of a certain duration is usually demanded, but foreign residence in the service of the state is accepted as an equivalent by France, England and Brazil. Good moral character is generally required, and, in some states, visible means of support (Finland, Germany, Hungary, Portugal, Sweden, many Swiss cantons, Mexico, Chili and Peru).—By naturalization the alien always obtains full civil rights, but not al-

ways the political rights of a natural-born citizen. But the tendency of modern legislation is to establish complete equality between native and naturalized citizens. — Many European states refuse to protect their naturalized citizen against his native country, if the latter still claims him as its citizen. The Netherlands, Luxemburg and Switzerland refuse to naturalize aliens when their naturalization seems likely to produce international difficulties.

Status of the Family of a Naturalized Citizen. 1. *The wife* is naturalized *de plein droit*, in most countries, by the naturalization of the husband. By the laws of England and Italy, however, the naturalization of the husband extends to the wife only when she resides with him in the adopted country. In Germany and in Switzerland the wife may be expressly excluded. In France she must be expressly included, and that at her own desire: *i. e.*, the French jurisprudence repudiates entirely the naturalization of the wife *de plein droit*. — 2. *The children.* The naturalization of the father usually extends to the minor children. But they may be expressly excluded (Germany, Switzerland). They are included only when resident in the father's adopted country (England, Italy, United States). The children are included during their minority, but may reclaim the father's original nationality on reaching full age (Italy, Portugal). — The naturalization of the father does not extend to the children born before his naturalization (Belgium, France, Luxemburg, Russia, Spain, Sweden, Turkey, the Argentine republic and Brazil) But in many of these states the children, on reaching majority, may elect the father's acquired nationality.

Expatriation, or Loss of Nationality. Existing legislations may be divided, as regards loss of nationality, into two classes; viz., those in which expatriation is not possible without the express and special consent of the sovereign, and those which attach the result of expatriation to some act or acts of the individual. — 1. In Russia and in Turkey a woman becomes an alien by marrying an alien, and in Russia a naturalized subject may renounce his naturalization; but the natural-born male subject can not expatriate himself in either state without express authorization. The Russian or Ottoman who emigrates and acquires a foreign naturalization without the consent of his sovereign, exposes himself to sentence of banishment; but although banished he retains his original nationality. — In a number of South American states it is doubtful whether the individual can or can not expatriate himself. The constitutions of these states contain rules concerning the loss of *citizenship* (*ciudadania*), and it is uncertain whether loss of nationality is meant, or merely loss of political rights. The latter seems to be the accepted interpretation in Peru and Ecuador. In these states, then, self-expatriation is impossible. In the Argentine confederation and in Venezuela allegiance is clearly indissoluble by any act of the individual. — 2. The great majority of modern states attach the effect of expatriation to some act or acts of the individual. In many cases it is imposed as a punishment: in Germany, for example, the unauthorized performance of ecclesiastical functions, in Bolivia, Paraguay and Uruguay fraudulent bankruptcy, and in Portugal and Brazil sentence of banishment, entail the loss of the national character. Unauthorized entrance into the service of a foreign government effects expatriation by the laws of France, Italy, the Netherlands, Portugal, Mexico, Hayti, Bolivia, Brazil, Chili, Colombia, Paraguay and Uruguay. In other cases the penal character of expatriation is less marked. It results, for example, from emigration simply (Austria, Sweden), from emigration and renunciation (Italy), from foreign residence without the intent to return (Belgium, Denmark, France, the Netherlands, Norway, Hayti), from a foreign residence of ten years without passport or inscription in the consular register (Germany, Hungary). — Expatriation on any of the above grounds is objectionable from the international standpoint as tending to create *heimathlose*, individuals without any country. — International comity demands that the effects of expatriation be attached to those acts and to those acts only which establish a new nationality. These are: (*a*) voluntary naturalization in a foreign state. This is recognized as a cause of expatriation in all the expatriation treaties concluded by the United States and in the legislations of Belgium, England, France, Italy, Luxemburg, Monaco, the Netherlands, Portugal, Spain, Sweden, Mexico, Hayti, Bolivia, Brazil, Chili, Colombia and Uruguay. (*b*) Declaration of alienage, or reclamation of foreign nationality, made by a person whom a foreign state regards as its citizen or subject. For the cases in which this is permitted, see above: Acquisition by Birth. — In Switzerland, abandonment of the native domicile, possession or prospective acquisition of a foreign nationality *and* renunciation of Swiss citizenship are the conditions precedent of expatriation; but the Swiss citizen who has fulfilled all these conditions is not expatriated until a declaration of expatriation has been issued by the proper cantonal authority. — (*c*) On the part of a woman, marriage to a foreigner. This effects expatriation by the laws of almost all modern states (but not in Brazil, Hayti or San Salvador). — *The status of the wife and children* of an expatriated person is different in different legislations. Most states, of course, apply the same rules in this case as in that of naturalization. (See above: Status of the Family of a Naturalized Citizen.) But the rule laid down by England and Italy in reference to the family of a naturalized person is adopted, as regards expatriation, by three other states: Germany, Hungary and Switzerland. That is, in all these states the expatriation of the head of the family extends to the wife and minor children only when they have followed him to his new home. EDMUND MUNROE SMITH.

NATIONS, in Political Economy. From the earliest historical ages humanity has been di-

vided into a multitude of nations, dissimilar in manners, aptitudes and language, and possessing different institutions. Each of these nations has its own particular physiognomy and its own existence, its *autonomy*. — This phenomenon, which interests in a high degree all branches of moral and political science, must be considered here only from an economic point of view. The economist must first inquire whether the division of humanity into a multitude of nations is beneficial, or whether it would not be better, as some declare, for the human race to form only one community, a universal monarchy or republic. There can be no doubt as to the answer to this question. The division of humanity into nations has its utility, because it develops a principle of emulation of considerable power. There is in each nation a feeling of honor, or a kind of collective self-esteem, which, directed toward useful ends, can accomplish wonders. An example of this was furnished at the universal exposition at London, to which the greater part of civilized nations brought the tribute of their industry, and each made it a point of honor not to be too far behind its rivals. If humanity constituted only a single political assemblage, would not the spirit of emulation, deprived of the stimulant of national honor, be manifested in a less degree? Another drawback, more serious still, would result from the unification of humanity: the faults committed in the government of society would reach much farther than they do in the existing state of affairs. If a bad measure is taken to-day by a government, if a false theory is applied to the management of the affairs of a nation, the evil which results from it is confined to a certain locality. Other nations can refrain from renewing an experience, the results of which have been disastrous. If all humanity, on the contrary, were subjected to a uniform law, would not the evil resulting from the application of a bad measure be universal? And the division of society into nations is no obstacle to progress, which betters the condition of man. When an experiment has resulted successfully with a nation, are not other nations eager to take advantage of it? Are they not most frequently obliged to do so by the pressure of competition? — The division of humanity into autonomous nations may therefore be considered as essentially economic. Besides, this division results from the primitive arrangement of things; it is a natural phenomenon that no artificial combination can destroy nor even sensibly modify. Conquerors, for instance, have dreamt of the utopia of universal monarchy. Have they succeeded in realizing it? Have not those who have approached nearest to it, beheld their gigantic political establishments dissolve by the very force of things? Has not experience taught them that there are limits which no domination can exceed in any lasting manner? Other utopists have dreamt of unity of religion, and some have wished to enforce it by violence; but it was useless for them to employ fire and the sword to compass their design, and they failed. Religious beliefs have continued to reflect the diversity of temperaments, of manners, and of the intelligence of different nations. Others, finally, have dreamt of unity of language, and governments have been known to endeavor to force a uniform language upon peoples of different origin, whom they had united under their rule. The Dutch government, for example, attempted to substitute the Dutch language for the French language in some of the southern provinces of the old kingdom of the Netherlands. What was the result? An aversion was taken to the language required by law, by the populations upon which the government wished to force it, and this experiment, which was contrary to the nature of things, contributed much to the downfall of the government which tried it. Languages like religious beliefs and political institutions, are the expression of the special genius of different nations. The form of institutions and of language can without doubt be modified in an artificial manner, but their substance will nevertheless remain. Although it would be absurd to wish to efface, for the sake of a chimerical unity, the characteristic marks of nationalities, it does not follow that nations must be isolated from and kept in a permanent state of hostility toward each other. The autonomy of nations implies neither isolation nor hostility. Nations are interested in freedom of communication with one another, in order that they may increase in wealth and power; they are still more interested in living in peace with one an other. — These truths, too long unrecognized, have been admirably demonstrated by economists, especially by J. B. Say. To those who pretend, for instance, that a nation can only be enriched by the impoverishment of its rivals, the illustrious author of the *theory of outlets* replies with truth: "A nation bears the same relation to a neighboring nation that a province does to another province, that a city does to the country; it is interested in seeing it prosper, and certain to profit by its wealth. The United States are right, then, for example, in always having tried to encourage industry in the savage tribes; it has been their purpose to obtain something from them in exchange; for nothing can be gained from people who have nothing to give. It is of advantage to humanity for a nation to conduct itself toward others, under all circumstances, according to liberal principles. It will be shown, by the brilliant results it will obtain from so doing, that *vain systems, baleful theories*, are the exclusive and jealous maxims of the old states of Europe, which they with effrontery endow with the name of *practical truths*, because, unfortunately, they put them in practice." — Nothing is more deceitful, adds this judicious economist, than the advantage which a nation thinks it gains by an encroachment upon the domain of another, by the conquest of a province or a colony from a

rival power. "If France had possessed," he says, "at any time whatever, an economic government, and had employed for fertilizing the provinces in the centre of the kingdom, the money which she expended for conquering distant provinces and colonies which could not be kept, she would be much more happy and more powerful. Highways, parish roads, canals for irrigation and navigation, are means which a government has always at its disposal to improve provinces which are unproductive. Production is always expensive in a province, when the expense of the transportation of its products is great. An interior conquest indubitably augments the strength of a state, as a distant conquest almost always enfeebles it. All that constitutes the strength of Great Britain is in Great Britain itself; it has been rendered much stronger by the loss of America; it will be more so when it shall have lost India." — Hence J. B. Say is thoroughly convinced that, when economic intelligence shall be more widely diffused, when the true sources of the prosperity and the greatness of nations shall be better known, the old policy, which consists in conquering new territory to tax its people to excess, in taking possession of new markets to submit them to a selfish and pitiless exploitation, this evil policy of antagonism and hatred, will end by losing all credit. "All this old policy will perish," he says; "ability will consist in meriting preference, and not in demanding it by force. The efforts which are made to secure domination procure only an artificial greatness, which necessarily makes an enemy of every foreigner. This system produces debts, abuses, tyrants and revolutions; while the attraction of a reciprocal agreement procures friends, extends the circle of useful relations; and the prosperity which results from it is lasting, because it is natural." — If, then, economists do not share the illusions of the humanitarian socialists, who would like to unite all nations into a single flock, ruled by an all-governing shepherd; if they do not think that it is a measure of utility to efface, in an artificial manner, the characteristic differences of nations; if they only accept with reservations the beautiful verses of the author of the *Marseillaise of Peace:*

> "Nations! mot pompeux pour dire barbarie!
> * * * * * *
> Déchirez ces drapeaux ! une autre voix vous crie;
> L'égoïsme et la haine ont seuls une patrie;
> La fraternité n'en a pas";

if they think that nations have their *raison d'être* itself in the bosom of civilization, they do not work less actively to demolish the walls of separation, which old errors, prejudices of centuries and barbarous hatreds have raised between nations; they show to nations that it is for their interest to exchange their ideas and their products in order to augment their wealth, their power and their civilization; they condemn war as a bad speculation, as an operation in which the risks of loss exceed the chances of gain; and without being humanitarians or advocates of unity, they show to nations the true methods of realizing practical fraternity. — Errors no less fatal, on the subject of the interior government of nations, have attracted the attention of economists. As once it was the common conviction that a nation could only be powerful and rich by the enfeeblement and impoverishment of its rivals, a singularly exaggerated share of influence and action in the life of nations was attributed to the government. Because the government and society were confounded in primitive communities, when the division of labor had not yet separated social functions, it was thought that it must always be so; it was thought that it was the province of the government to communicate movement and action to the social organism, and make life circulate there; it was thought that nothing could be effected except by the impetus of this sovereign motor. Political economy has done justice to so disastrous an error. — Economists have demonstrated that the functions of government should be simplified and specialized more and more, by virtue of the principle of the division of labor, rather than extended and multiplied; they have demonstrated that communism belonged to the infancy of nations, and that it ceased to be expedient in their maturity. With the coolness of a surgeon who removes a cancer, J. B. Say has shown to what point a government which is not strictly limited to fulfilling its natural functions can cause trouble, corruption and discomfort in the economy of the social body, and he has declared that in his eyes such a government was a veritable ulcer. This figurative expression, *ulcerous government*, employed by the illustrious economist to designate a government which interferes improperly in the domain of private activity, reglementary and socialist writers have frequently cast as a reproach upon political economy. Some even have taken it as a foundation for the assumption that political economy has misunderstood the importance of the mission with which governments are charged in society, and they have accused it of having given birth to the celebrated doctrine of *an-archy*. (See ANARCHY.) But nothing is less merited than such a reproach. Political economy, rightly understood, leads no more to the suppression of governments than it does to the destruction of nationalities. J. B. Say says: "When authority is not a despoiler itself, it procures for nations the greatest of benefits, that of guaranteeing them against despoilers. Without this protection which lends the aid of all to the needs of one alone, it is impossible to conceive any important development of the productive faculties of man, of land or of capital; it is impossible to conceive the existence of capital itself, since capital is only values accumulated and working under the safeguard of public authority. It is for this reason that no nation has ever arrived at any degree of wealth, without having been subject to a regular

government; it is to the security which political organization procures, that civilized nations owe not only the innumerable and varied productions which satisfy their wants, but also their fine arts, their leisure hours, the fruit of accumulation, without which they could not cultivate their intellectual gifts, nor consequently rise to all the dignity that the nature of man admits of."— Political economy is not therefore *an-archic*. Economists are perfectly convinced that governments play a necessary part in society, and it is precisely because they appreciate all the importance of this part, that they consider that governments should be occupied with nothing else. — Finally, economists think that the same practices of scrupulous economy, which are the rule in private industry, should be the rule also in the government of nations. Let us again quote J. B. Say, on this subject: "A nation which only respects its prince when he is surrounded with pomp, with glitter, with guards, with horses, with all that is most expensive, has to pay for it. It economizes, on the contrary, when it accords its respect to simplicity rather than to display, and when it obeys the laws without display."— Causes purely political, and the form of government which they produce, influence the expense of the salaries of civil and judicial functionaries, that of representation, and that which public institutions and establishments require. Thus, in a despotic country, where the prince disposes of the property of his subjects, he alone fixing his salary— that is to say, what he uses of the public funds for his own personal benefit, his pleasures, and the maintenance of his household—that salary may be fixed higher than in the country where it is discussed by the representatives of the prince and those of the tax payers. The salaries of subordinates depend also either upon their individual influence, or upon the general system of government. The services which they render are costly or cheap, not only in proportion to the price paid for them, but also according as their duties are more or less well performed. A service poorly performed is dear, although very little may be paid for it; it is dear if there is but little need of it. It is like a piece of furniture which does not answer the purpose for which it was intended, of which there is no need, and which is a trouble rather than a benefit. Such were, under the old French monarchy, the positions of grand-admiral, grand-master, grand-cupbearer, master of the hounds, and a multitude of others, which served only to add lustre to the crown, and many of which were only methods employed to distribute perquisites and favors. For the same reason, when the machinery of the administration is complicated, the people are made to pay for services which are not indispensable to the maintenance of public order; this is like giving a useless shape to a product, which is not worth more on that account, and is generally worth less. Under a bad government, which can not keep up its encroachments, its injustices, its exactions, except by means of numerous satellites, of an active system of espionage, and by the multiplication of prisons; these prisons, spies and soldiers are an item of expense to the people, who are certainly not happier on that account."— To sum up, political economy recognizes that the division of humanity into nations has its utility, its *raison d'être;* it recognizes that no nation, unless it be composed of angels, can dispense with a government; but, at the same time, it demonstrates that it is for the interest of nations to base their foreign policy upon peace, and their domestic policy upon economy; it demonstrates that it is for the interest of nations to maintain free and friendly relations with one another, and to be governed as little as possible.

G. De Molinari.

NATURALIZATION, the concession by the sovereign power of a state of the rights of citizenship to an alien. This concession, when complete, clothes the alien with all the privileges and subjects him to all the burdens and duties of a native-born subject. Among civilized nations the right is conceded upon the performance of certain prerequisite conditions laid down by the country of adoption, and involves the renunciation, by the naturalized person, of his native allegiance. — The system of admitting foreigners to the privileges of citizenship is a growth of civilization unknown to communities in an early stage of development. Ancient Rome not only refused such rights to aliens, but its polity did not even contemplate the possibility of a Roman attempting to throw off his native allegiance. The title *Civis Romanus* was indelible. A citizen might be deprived of his life, but he could not be deprived of his citizenship—*civitatem vero nemo unquam ulto populo usu amittet invitus.* (Cic. pro. dom.) — The social compact which was involved in the early Roman notion of the state, was one which bound the members of the *civitas* by peculiar obligations, and conferred upon each peculiar and sacred rights. Outside of the sharers in this compact, clothed with their special prerogatives and subject to correlative obligations, all other human beings were grouped as *hostes* or *barbari.* With the development of the trade instinct in the progress of civilization the *cives* were brought into friendly relations with those foreigners who came to Rome for commercial purposes, and to these latter were conceded limited privileges, although for a certain intermediate period they were still regarded as a distinct and separate class, *peregrini*, mere sojourners. Under the *Jus Latinum* private rights were granted to individuals, and a sort of collective naturalization was permitted by the *Jus Italicum* which conferred public rights upon whole towns. Finally, all distinctions were swept away by the edicts of Caracalla, who granted citizenship to all the free subjects of the empire, and, later, by the constitution of Antoninus, by which the free inhabitants of the various Roman provinces were made citizens. The feudal system was even more jealous of native

rights, and under the common law the development of a liberal policy toward aliens was of a very slow growth. In Great Britain, before the statute of 1844, instances of naturalization were extremely rare, the rights of a native-born subject being conferred only by act of parliament. In the time of Charles II. that body was wont to bestow these privileges with greater freedom than at later times. By the act of 1701 the rights which an alien could acquire were considerably restricted. A more liberal policy prevailed during a part of Queen Anne's reign, but popular prejudice was strongly opposed to the naturalization of aliens, and a more stringent act was passed in 1711. — Among continental nations the general practice is to grant naturalization upon petition to the state department or by legislative enactment. In most European countries naturalized foreigners acquire all the civil and political rights enjoyed by native-born citizens. — Questions relating to nationality and citizenship have caused frequent international disputes where the claim to the exercise of sovereign rights by the country of birth has come into collision with that of the country of adoption. It is a well-settled principle of international law that to every nation shall be conceded the right to dictate upon what terms it will clothe an alien with the rights of a native-born citizen. But while conceding this, many authorities upon public law have tried at the same time to admit the equal right of every nation to prescribe the terms upon which it will allow a citizen to dissolve his native allegiance. International law, it has been claimed by many publicists, reconciles these conflicting admissions by subordinating both to the principle of recognizing the absolute supremacy of the laws of each state, within its own territory. Thus, an alien who had procured naturalization, after satisfying all the conditions necessary for the acquirement of citizenship in his adopted country, might, according to such authorities, find, upon coming within the territory of his native land, that he had not fully complied with the conditions which that country had laid down for the expatriation of its subjects; and if, while within her borders, the land of his birth should attempt to exercise sovereign rights, those rights and the obligation of his native allegiance would obtain a recognition within the domain of public law. The reasoning which, it is claimed, sustains this attempted reconciliation is, however, wholly specious, and frequent international disputes have proved it incapable of a practical application. In point of fact, the distinction obtains no recognition in municipal law. Every state arrogates to itself the exclusive right to prescribe the conditions upon which it will admit an alien to its citizenship, and when those terms have been complied with, declares his naturalization complete without looking to see whether or not he has succeeded in expatriating himself in accordance with the local law of his native land. — This claim of sovereignty involves, of course, a recognition of the correlative right in the naturalized citizen to the protection of his adopted country, wherever he may be, and the principal nations of the civilized world are prompt to recognize that right and to afford the protection, when demanded, even against the country of origin. This point has been a most prolific source of dispute between the United States and other countries, owing to the great quantities of immigrants which we annually receive, and the ease with which the mass of aliens can procure naturalization. With Great Britain, especially, the question has more than once involved us in complications of the most serious nature. Until a recent date (treaty of 1870) English judges have insisted that no subject could relieve himself of the duty of allegiance save by the consent of his native country; and American jurists, following the interpretation of the common law which, they claimed, had been unchanged by the revolution, substantially acquiesced in the decisions of the English bench. In point of authority, therefore, English diplomates were far better supported than their American opponents. Yet in the face of the common opinions of English and American jurists, our executive has invariably insisted that the Briton who by naturalization becomes a citizen of the United States was *ipso facto* relieved of all allegiance to his native country; and although England was able to quote against us the opinions of our most eminent judges, she invariably yielded the point when pushed to the issue, conceding in practice what she denied in principle. The doctrine of common sense always prevailed in the end, the concession being made, sometimes for the sake of international comity, and sometimes to avoid the bloody conflict which an insistence on the point involved seemed to assume. A single instance will suffice to illustrate this statement. The first serious dispute of this character arose during the war of 1812, when Great Britain insisted upon treating as traitors native-born Englishmen, naturalized citizens of the United States, who were taken in arms against the mother country. Upon our attempting to retaliate by confining double the number of English prisoners as hostages, we were notified that the British government, by order of the regent, had imprisoned double that number of Americans, who would be treated with equal severity as the prisoners confined by us; and we were threatened, if we should attempt further retaliation, with a prosecution of the war "with unmitigated severity against all cities, towns and villages belonging to the United States." Fortunately none of the prisoners were executed, but an exchange was effected by the convention of July 16, 1814, the British government wisely forbearing to push to the extreme the unreasonable and barbarous doctrine of non-expatriation, a doctrine opposed to the practice of all other civilized nations; for, as eminent publicists have agreed, the right of expatriation obtains everywhere, "save where the state is a jail"—*et ubique licet ubi civitas non caret est.* (Bynkershoeck, *Quæs. Jur. Pub.*, cap.

22.) — The close connection which naturalized Irish-Americans usually keep up with their friends at home, and the fact that numerous Fenian organizations have, from time to time, been started upon American soil, have naturally given rise to many disputes between England and the United States. Irish-Americans, returning to Ireland after naturalization here, have, on certain occasions, been arrested and confined by the English authorities for alleged complicity with treasonable practices, whether proved or suspected, and have relied on their American citizenship to secure them from the operation of the English law authorizing their detention. It has been the invariable practice of our foreign representatives, in considering these applications for intervention, to insist that no distinction should be made between native-born and naturalized citizens of the United States; but at the same time the state department has taken pains to caution our consuls, and our ministers at the court of St. James, from Mr. Adams to Mr. Lowell, while doing all in their power to aid their fellow-countrymen, not to interfere in behalf of those who relied upon a naturalization which they had practically abandoned to protect them in the prosecution of treasonable designs against the government of their native land. That these instructions have been just and reasonable admits of no doubt, despite the clamor of those who insist that in acting upon them our ministers have been wanting in a proper respect for the dignity of American citizenship. We demanded that England should exercise a like discrimination when the relative positions of the two countries were reversed, during the recent civil war, and we insisted upon our right to arrest and imprison British subjects under the suspension of *habeas corpus*, upon reasonable suspicion of their connection with treasonable acts or designs. — During the Fenian troubles of 1867–8 an important amendment was added to our naturalization laws. The arrest in Ireland, of Burke, Warren, Costello, and other naturalized Irish-Americans engaged in Fenian plots, was the signal for a loud outcry against Mr. Adams, our minister at London, for his alleged failure to exert himself actively in behalf of men who were engaged in unquestionably seditious proceedings, and who sought to use their certificates of naturalization to protect them against the law of the land, whose provisions they were openly violating. The course pursued by Mr. Adams, like that recently followed by Mr. Lowell, was wholly in accordance with the usual practice of our government, and received the unqualified indorsement of the state department. He was firm to insist upon the thoroughly American principle, that a naturalized American should be treated upon the same footing as a native-born subject of the United States; at the same time he was too much of a statesman not to know that one who violates the law of the land, whether he be a subject or an alien, can not claim exemption from the penalty, and he was too much of a diplomate not to foresee that an attempt to oppose the principle of territorial sovereignty, without being able to show that the law whose enforcement was protested against was abhorrent to the customs of civilized nations, would only involve the mortifying result of placing his government in a position which ultimately they would be forced to abandon. So far from displaying an un-American weakness in yielding to foreign aggression, his attitude was a model of loyal firmness and diplomatic tact. His representations to the British foreign secretary, backed by the sanction of judicial precedent and international practice, showed clearly enough that he would be firm in resisting any encroachments upon the rights of American citizens, as such, while at the same time he avoided even the appearance of an ungenerous and irritating insistence upon purely abstract principles. He thus paved the way for concessions on the part of Great Britain, which practically yielded the points in dispute, concessions which, certainly, would never have been made if he had adopted the sort of policy outlined by those statesmen who pushed through the barbarous act of reprisal which deforms the otherwise commendable statute of 1868. This clause directs the president, when naturalized citizens of the United States are detained by any foreign government "in contravention of the intent and purposes of this act," "in case no other remedy is available," to "order the arrest and to detain in custody any subject or citizen of the said foreign government who may be found within the jurisdiction of the United States, except ambassadors or other public ministers and their domestics and domestic servants, and who has not declared his intention to become a citizen of the United States." "This strange reprisal," says Phillimore, "after the fashion of the first Napoleon, of seizing and imprisoning innocent foreign subjects, is novel in modern public law. It would be equivalent to a declaration of war against the state to which the subject belonged." (Int. Law, vol. i., § 330, note.) — In junctures such as those which marked the diplomatic relations of England and the United States, in 1848, 1866–8, and 1881, the question of the duty of a state toward its citizens in a foreign country becomes one of great delicacy. The difficulty does not lie in any attempted discrimination between native-born and naturalized citizens of this country. We are bound to insist that none shall be made. But there does arise a difficulty, requiring the soundest judgment and discretion, when the representative of this government in a foreign land has to decide at what precise point it is his duty to interfere and protect his fellow-citizens, native-born or naturalized, from the operation of some law of the country where they happen to be sojourning. Writers upon public law have laid it down as a settled principle that every state is sovereign in its own territory, and that an alien within its borders is under an implied contract, in return for the protection which he

receives, to yield implicit obedience to its laws, whether they be of a permanent or temporary nature. It has been further stated as the enunciation of an established principle, that no state has a right to demand that its citizens while sojourning in a foreign country shall be exempt from the law of that country. While this is undoubtedly true as a general rule, the uniform sentiment of civilized nations requires that the principle, to be correctly stated, should be qualified by certain limitations. A little reflection will make it clear that occasions may well be apprehended when the United States, for example, would not be satisfied, in answer to its protest against the operation of the law of a foreign state upon one of its subjects temporarily residing in that state, with the reply that the law in question was enforced with no more severity upon Americans than upon the subjects of that country. We should have a right to demand, and the practice and sentiment of civilized nations would undoubtedly sanction the demand, that however that foreign state might treat its own citizens, no American should be subject to the execution of a law which in its principle or its operation was opposed to the customs and jurisprudence of the civilized world. It is a difficult thing to say when a law is of such a nature as to justify such interference, and the nation which arrogates to itself the right to decide that a given statute is contrary to the foundation principles of civilized jurisprudence, assumes the weighty responsibility of making good its assertion. Yet a statement of the general principle should involve the contemplation of such a contingency. By a recent (August, 1881) declaration of this character, unaccompanied by the qualifying limitation contended for above, Mr. Lowell, while pursuing, in the main, a course which will commend itself to every fair-minded American, has given his opponents an advantage which they were not slow to seize upon in their attempt to put him in a false light before the country. — Even as late as 1868 it was an open question, at least so far as any settlement between England and America was concerned, whether or not a subject could, without the consent of his native country, throw off his native allegiance. Mr. Vernon Harcourt, writing, over the signature "Historicus," to the "London Times," Dec. 11, 1867, pointed out the inconsistency of both nations in at times denying, and again at times asserting, either expressly or by implication, and as convenience seemed to dictate, the absurd maxim of the feudal law, *nemo potest patriam exuere*. Congress finally declared, by the act of 1868 (U. S. Rev. Stat., § 1999), that "expatriation is a natural and inherent right of all people, indispensable to the enjoyment of the rights of life, liberty and the pursuit of happiness"; and pronounced any declaration questioning this right to be "inconsistent with the fundamental principles of the republic." This statute is undoubtedly declaratory of the sentiment if not the uniform practice of civilized nations, the great majority of whom now concede that when an alien acquires citizenship by naturalization the country of his origin loses all its rights. — Great Britain finally admitted this principle by the treaty of 1870, urged thereto by the recommendations of a royal commission appointed in 1868 to consider this question, among others, relating to naturalization, and which advised her majesty that "the common law doctrine of non-expatriation was neither reasonable nor convenient." — Most of the diplomatic disputes upon the point of nationality which have arisen between the United States and other countries, with the exception of the more important and embarrassing differences with Great Britain, have been those involving the right to exact military duty from naturalized citizens of the United States on their return to their native land. In order to settle definitely all such questions, we have entered into treaties with Austria, Baden, Bavaria, Belgium, Great Britain, the grand duchy of Hesse, Mexico, the North German confederation, Norway and Sweden, Würtemberg and Denmark, which generally provide · 1, that naturalization in accordance with the laws of the adoptive country after a residence of five years shall free the naturalized person from his native allegiance; 2, that the simple declaration of intent to become a citizen shall not have the effect of naturalization; and, 3, that a renewal of domicile in the mother country, with the intent not to return, (and two years' residence is presumptive evidence of such intent), shall work a renewal of the former allegiance. A further provision is included in some of the treaties, to the effect that where the subject has left his native country owing military duty, the right to exact which is complete before his departure, such service may be enforced upon his return in spite of intervening naturalization. Although our state department has tried to make these treaties as nearly uniform as possible, and so drafted as to furnish a general rule applicable to all the contingencies of international intercourse likely to happen, it has, so far, been found impossible to cover every case, and questions relating to the construction of the treaties themselves and to their effect have frequently arisen, and will probably from time to time require settlement. For example, in the recent Buzzi case, before the Spanish-American claims commission, the umpire, Count Lewenhaupt, has decided that the claimant can not appear before the tribunal as an American citizen, not having obtained his naturalization papers in accordance with law. Mr. Blaine protested against this ruling, on the ground that the certificate of naturalization is conclusive. Yet where the fact in dispute is covered by a treaty provision, as, for instance, the clause prescribing a five years' residence before naturalization, it would seem that either of the contracting parties should be at liberty to prove, before such a commission, that the conditions of the treaty had not been complied with in procuring the naturalization in

dispute. It is hardly to be supposed that other nations will not insist upon the right to question our certificates, as to such particulars as are covered by treaty provisions, when it is notorious that in the city of New York alone shoals of aliens have been fraudulently naturalized by the thousand by corrupt and reckless judges. (See Davenport's "New York Election Frauds," vol. i.)—In one respect our laws relating to this subject are less liberal than those of any other civilized nation. We alone have prescribed a certain physical standard, and have ruled out certain indelible race characteristics, declaring them obstacles to naturalization which no attainments, moral, intellectual or political, shall suffice to remove. Until 1870 no one but a "free white person" could acquire citizenship. An attempt by Charles Sumner to amend our naturalization laws by striking out the word "white," so as to "bring our system in harmony with the Declaration of Independence," was defeated by a single vote (23 to 22). The opposition came from those senators who wished to exclude the Chinese, while they admitted the negro by adding a clause extending the provisions of the statutes to "aliens of African nativity and persons of African descent." (Act of July 14, 1870.) We therefore deny this privilege to all save "free white persons" and African negroes. The Chinese, the Japanese, the Malay, and others of a similar ethnological group, are debarred from our citizenship, and our courts are bound to deny them naturalization on the ground of *color* only—an illiberal and un-American discrimination in startling contrast with the declarations contained in the constitutional amendments enacted since our civil war. GEORGE WALTON GREEN.

NATURE OF THINGS. Political economy is not, as has been sometimes said and thought, a collection of arbitrary principles and maxims; it is a science founded upon the observation of the permanent laws of the very nature of things, following the experiential or inductive method, which also guides human investigations in the physical sciences. J. B. Say has expressed with his usual precision this fundamental truth, and we do not think we can do better than reproduce here what he has written upon this subject.—"The manner in which we find things, or in which they happen, constitutes what is called the *nature of things*, and the exact observation of the nature of things is the only foundation of all truth. Hence spring two kinds of sciences: the sciences which may be called *descriptive*, and which consist in naming and classifying things, like botany and natural history; and the *experimental* sciences, which teach us the reciprocal action which things exercise upon each other, or, in other words, the connection of effects with their causes; such are physics and chemistry. These latter require that we should study the intimate nature of things, for it is by virtue of their nature that they act and produce effects; it is because it is the nature of the sun to be luminous, and the nature of the moon to be opaque, that, when the moon passes before the sun, the latter body is eclipsed. A careful analysis is sometimes sufficient to enable us to understand the nature of things; at other times it is completely revealed to us only by its effects; and observation, when we can not have recourse to experiment, is necessary to confirm what analysis was able to teach us.—These principles, which have guided me, will aid me to distinguish two sciences, which have almost always been confounded: political economy, which is an experimental science, and statistics, which is only a descriptive science. Political economy, as it is studied today, is entirely founded upon facts; for the nature of things is a fact, as well as the event which results from it. The phenomena, the causes and results of which it seeks to make known, may be considered either as constant and *general facts*, which are always the same in all similar cases, or as *particular facts*, which happen by virtue of general laws, but where many laws act at once, and modify without destroying one another; as in the jets of water in our gardens, where the laws of gravity are modified by the laws of equilibrium but do not cease to exist on that account. Science can not pretend to make known all these modifications, which are renewed each day and vary *ad infinitum;* but it exposes their general laws, and explains them by examples the reality of which each reader may prove for himself.—There is in society a nature of things which depends in no way upon the will of man, and which we can not arbitrarily regulate. This does not mean that the will of man has no influence upon the arrangement of society, but only that the parts of which it is composed, the action which perpetuates it, are not an effect of its artificial organization but of its natural structure. The art of the cultivator can prune a tree, can train it against a wall, but the tree lives and produces by virtue of the laws of vegetation, which are superior to the art and skill of any gardener. In the same way, society is a living body, provided with organs, which give it life; the arbitrary action of legislators, administrators, military men, a conqueror, or even the effect of fortuitous circumstances, may influence its manner of life, can make it suffer or cure it of its troubles, but can not give it life. Artificial organization has so little to do with producing this effect, that it is in the places where it makes itself the least felt, where it is limited to preserving the social body from the attacks which threaten its proper action and its development, that society increases the most rapidly in numbers and in prosperity. The artificial organization of nations changes with time and place. The natural laws which govern their maintenance and effect their preservation are the same in all countries and in all ages. They were among the ancients what they are to-day; only they are better known now. The blood which circulates in the veins of a Turk obeys the same laws as that which circulates in

the veins of a Frenchman; it circulated in those of the Babylonians as in our own; but it is only since the discovery of Harvey that we have known that the blood circulates, and that we have been acquainted with the action of the heart. Capital fed the industry of the Phœnicians in the same way that it feeds that of the English; but it is only since a few years that the nature of capital, and the manner in which it works, and produces the effects which we observe, has become known; effects which the ancients saw as well as we do, but which they could not explain. Nature is old; science is new. — Now, it is the knowledge of these natural and constant laws, without which human societies could not subsist, which constitutes the new science, designated by the name of political economy. It is a science, because it is not composed of invented systems, of plans of organization arbitrarily conceived, of hypotheses devoid of proof; but of the knowledge of what is, of the knowledge of facts, the reality of which can be established. A science is complete, relatively to a certain order of facts, in proportion as we succeed in determining the bond which unites them, in connecting their effects with their real causes. This is attained by studying carefully the nature of each of the things which play any part in the phenomenon which is to be explained; the nature of things unfolds to us the manner in which things work, and the manner in which they support the action of which they are the object; it shows us the relations and the connection of facts with each other. Now, the best way to know the nature of a thing is to make an analysis of it, to see all that is in it, and nothing but what is in it. For a long time the fluctuations of the tides were observed without man having the power to explain them, or rather to give a satisfactory explanation of them. To be able to assign the true cause of this phenomenon, it was necessary that the spherical form of the earth and the communication established between the large bodies of water should be demonstrated facts; it was necessary that universal gravitation should be a proven truth; from that time the action of the moon and sun upon the sea was known, and it was possible to assign with certainty the cause of the tides. So, when analysis had shown the nature of that quality of certain things which we have called their value, and when the same process had revealed to us what are the component parts of the cost of production, and the influence of such cost on the value of things, we knew positively why gold is more precious than iron. The connection between this phenomenon and its causes has become as certain as the phenomenon is constant. — The nature of things, proud and disdainful as well in the moral and political sciences as in the physical sciences, while it allows any one who studies it with constancy and good faith to penetrate its secrets, pursues its way regardless of what is said or done. Men, who have learned to know the nature of things, can, in truth, direct the acting part of society to the way of applying the truths which have been revealed to them; but, even supposing that their eyes and deductions have not deceived them, they can not know the numerous and diverse relations which make the position of each individual, and even of each nation, a special one, which no other resembles in all its aspects. Science is only systematized experimentation, or, perhaps, a mass of experiments put in order, and accompanied by analyses, which unfold their causes and their results. The inductions, which those who profess science draw from it, may pass for examples, which it would be well to follow strictly only under exactly similar circumstances, but which must be modified according to the position of each. The man who knows most about the nature of things can not foresee the infinite combinations which the movement of the universe is constantly bringing about."

J. B. Say.

NAVIGATION ACT. The famous navigation act promulgated for the first time under Cromwell's administration, and which was perpetuated with various modifications in England up to very recent times, is to-day only a matter of history. But it has occupied so large a place there, it was considered for so long a time as the chief foundation of British greatness, it has been the object of so many commentaries, debates and quarrels, as well within as without Great Britain, that it still merits our attention. — We shall, therefore, after having summarily indicated the object of this act, analyze it in its essential provisions, and relate its history. We shall then see whether it really accomplished, during its existence, the object had in view in passing it. — *Object of the Navigation Act.* The avowed and recognized object of the navigation act was to encourage the British merchant marine, by reserving to it, by restrictive measures against foreign ships, the best part of the carrying trade. Its object in the beginning was also to discourage the Dutch marine, which then acted as carrier for most of the nations of Europe, and the ascendency of which England feared. All the provisions of the act were framed with this double motive. Let us examine the substance of them. — *Analysis of the Original Act.* It would be useless, as well as tedious, to recall here the terms of the original act, which was passed in 1651, an informal and very obscure act, written in the tortuous style which the English laws seemed to affect at that time; or even to quote the wording of that more explicit and clearer act which was substituted for it in 1660, during the reign of Charles II. A concise analysis, accompanied by a few comments, will give a more exact idea of the act than the reproduction of the text itself would give. — This law related to five different subjects, which are ordinarily classified in the following manner: 1, Coasting trade; 2, Fisheries; 8, Commerce with the colonies; 4, Commerce with the countries of Europe; 5, Commerce with Asia, Africa

and America. The following is the way in which these different subjects were regulated by the law. — The coasting trade, that is to say, the navigation from one port to another of Great Britain, was exclusively reserved for English vessels. — As regards the fisheries, the law was less exclusive. It did not absolutely exclude from British ports the products of foreign fisheries; it only imposed upon them double duties. This was sufficient, however, to drive away, little by little, foreign fishermen from the market of the country. — The commerce of the mother country with the colonies and of the colonies with each other was, like the coasting trade, exclusively reserved for English vessels. In this respect the navigation act did not differ from the principles generally admitted at that time, and which have unhappily prevailed until the present time, among most commercial nations. It was a recognized maxim, that all mother countries could and should exclude all foreigners from all commerce with their colonies. This maxim England had already followed previously, when she had the power to do so, and the navigation act merely sanctioned it anew. Let us only add, that, unlike France, which has always reserved colonial commerce for ships of the mother country alone, England granted from that time, to her own colonies, a sort of reciprocity. — As regards commerce with the countries of Europe, the navigation act provided that the importation of merchandise into England coming from those countries should be effected only upon English ships, or upon ships belonging either to the country which produced such merchandise or to the country which forwarded it, that is to say, England excluded from this commerce the intervention of a third party. The exclusion of a third party was not absolute, however; it was enforced only as to a certain number of articles, specially designated in the act, and which have since been called *enumerated goods*. The number as well as the kind of these goods often varied. In the act of 1660 there were eighteen kinds of these enumerated goods; but, after 1792, others were successively added to the list, so that in the law of 1825, which took the place of the old act, there were twenty-eight. This is the number also found in the later acts, and notably in the last, which was passed in 1845; only, the enumerated goods in the act of 1845 are not all the same as those which figured in the act of 1825. It is probable that at all times it was the intention to reserve specially for national vessels the kinds of merchandise which then appeared to be most encumbering. Perhaps, also, in the original law, some of those kinds which the Dutch marine most usually carried were named in preference. To consider, then, only the terms of the navigation act, it would seem that the exclusion of a third party was the only object then had in view in European international navigation. In fact, no provision is found in this law which specially taxed the importation of merchandise by foreign vessels, provided these vessels belonged to the country which produced such merchandise or to the country which forwarded it; according to this, the law of that time was much more liberal than any of those which followed it. But it must be remarked, that as a complement to the act there was the customs bill or customs tariff, adopted about the same time, in 1652, and by virtue of which the merchandise imported by foreign ships was, in all cases, even when the ships belonged to the country producing the merchandise, subject to an additional tax, which most frequently constituted a double customs duty. It is this last provision, foreign to the navigation act properly so called, which gave rise to most complaints on the part of foreigners, and provoked the greatest number of reprisals. It was this provision, too, as we shall presently see, which was destined to disappear first by the successive adoption of reciprocity treaties. — The fifth and last subject regulated by the navigation act was commerce with Asia, Africa and America. In this respect the regulation was simple; it was the absolute exclusion of every foreign vessel. It must not, however, be believed that this last exclusion was more severe than all the others. On the contrary, it was nothing else than the application of the principle previously adopted, of the exclusion of a third party. As there did not exist at that time any nation in Asia, Africa or America which had a national marine, or at least a marine capable of carrying merchandise to the ports of Great Britain, third nations alone would have been able to dispute this carriage with the British marine. By reserving it for English vessels, the law, therefore, merely remained true to its principle; only it applied it here with much greater rigor, by making the exclusion bear upon all merchandise, without distinction of kind. It was for the same reason, and because they had not then any marine of their own, that Muscovy and Turkey, although situated in Europe, were placed on the same footing as the countries situated in the three other parts of the world. Let us add to this, that the native merchandise of Asia, Africa or America could not in any case be imported into England from any country in Europe, even by English ships, unless they had undergone the process of manufacture in that country; a provision, whose purpose it was to discourage in rival nations, and especially in Holland, the system of entrepôts. — Such was the navigation act in its essential provisions. The enforcement of these provisions necessitated, however, many others, which were, so to speak, natural corollaries of the former. From the moment that their treatment varied according to the nationality of the ships, it became necessary to define that nationality and to regulate the conditions of it. It was therefore established that a ship should only be considered as English and should only enjoy the privileges attached to that title, when it had been duly registered, when it belonged wholly to English subjects, and when the captain and three fourths of the crew were

English. In the beginning, it was admitted that such ship might have been built in a foreign country, provided it had become the legitimate property of Englishmen; but this toleration afterward ceased, and it was necessary that all ships, with the exception of those which might be taken from the enemy in time of war, should be entirely built in British ports. Similar conditions were imposed upon foreign ships to establish their respective nationalities. — As regards the coast navigation, the law was still more severe. It was necessary here that the crews should be wholly composed of English subjects. — Whatever we may think of this act and the influence which it exercised upon the development of the British marine, if we compare it with the legislation adopted by most modern nations, we shall find nothing exactly exceptional in its rigorous measures. It is nothing else, at bottom, than the system which we have seen established almost everywhere, with this difference, however, that this system has been greatly modified, since 1825, by the adoption of treaties of reciprocity. — *Successive Alterations of the Navigation Act.* The navigation act, as we have just analyzed it, continued in force without material alteration until after the American revolution, that is to say, during 120–130 years after its publication. It was not even till from 1822 to 1825 that it was replaced by a new law. It was always respected, moreover, even under the new form which it received then. At this last epoch, however, it had already received severe attacks. Let us go back to the time when its first modifications were introduced. — During 130 years England had carried on by means of her own ships all her trade with Asia, Africa and America, without allowing in any case, in this trade, the intervention of foreign vessels. However, war broke out between herself and her colonies in North America; the independence of the United States was declared, and, in 1782, that independence was recognized by the mother country. This produced a new situation, which the navigation act had not foreseen. Henceforth, separated from the mother country, North America could no longer pretend to carry on navigation with the British ports by virtue of its former colonial privileges; and, on the other hand, the act formally excluded, in the commerce with America, all foreign vessels. It was impossible, however, that the United States should remain under the ban of such an exclusion: it would never have consented to abandon all transportation to English ships; it was necessary that the navigation act should yield. After long negotiations between the United States and England, in which different systems were proposed and debated, it was agreed that the ships of the United States, although coming from America, should be allowed, contrary to the tenor of the law, to frequent the ports of Great Britain on the same conditions as those of the old states of Europe. This modification was the first of any importance. Later, similar ones were allowed in favor of the old Spanish and Portuguese colonies of South America, when they became independent of their mother countries; as well as in favor of the black republic of Hayti; so that, the part of the act which related to the commerce with the new world fell gradually to pieces. It must be acknowledged, however, that these successive modifications attacked rather the letter than the spirit of the law, since, in the midst of them all, the prevailing principle of the act, the sacred principle of the exclusion of third parties, was maintained intact. — But the emancipation of the United States had other and very different consequences. The colonial system, a system so severe up to that time, was shaken by it. Although most of the states of Europe had in this regard been almost as rigorous as England, they, considering the great distance between the places, and the uncertainty of supplies coming from the mother country, nevertheless allowed their colonies to receive, in case of need, from ships of foreign countries nearer to them, the things necessary for their subsistence, such, for example, as flour and meat; England alone had refused this toleration, of which she had not till that time felt the absolute necessity. Thanks to the great number of her colonies, to the importance of some of them, and to their proximity to each other, she had been able, strictly speaking, to deprive them of all foreign assistance, by forcing them to rely upon themselves. But from the moment the colonies of North America, the most important of all, were emancipated, this state of things changed. The English Antilles, accustomed to rely upon supplies coming from these former colonies, found themselves left suddenly in the lurch; it was necessary, therefore, to allow, in their interest, new modifications of the navigation act, modifications more grave than the former ones, because they altered the very principle of the law. — At this time commenced, between the government of Great Britain and that of the United States, a sullen struggle, rarely interrupted, and which could end only when the last vestiges of the old system should have entirely disappeared. The people of the United States, accustomed up to that time to carry on trade only with Great Britain and her colonial possessions, and desirous of continuing in this the usual field of their activity, solicited at first of England, as a favor, the preservation of their former relations, offering in return to the British marine exceptional advantages in their ports. This proposal having been refused, despite what there was tempting in it to England herself, the American people changed their tactics: they demanded that at least their ships should be admitted into the ports of the mother country on a footing of perfect equality, that is to say, that the additional tax established by the tariff of duties should no longer be applied to the merchandise imported by these ships. From 1782 to 1792 this very natural demand was incessantly renewed by them, with solicitations even more pressing, sometimes even

with threats followed by action; but it could not prevail against the restrictive and jealous spirit which then ruled in English councils. Finally, weary of these vain solicitations and diplomatic struggles without results, after having tried all means of conciliation, the American government resolutely adopted reprisal measures. Congress passed, in 1792, a navigation act, corresponding in certain respects to the English act; more elastic, however, as it authorized the government to suspend its effects, whenever arrangements concluded with other nations required it. From this moment there commenced, between the United States and England, a veritable tariff war, continued without interruption, in spite of many unforeseen events which changed the state of things, until 1815. Hence, the commercial and maritime relations between the two countries became exceedingly difficult. This can be judged of by the following comparisons: The tonnage of English vessels admitted to American ports was, in 1790, 218,914 tons; in 1791, 210,618; in 1794 it fell to 37,058, in 1795, to 27,097, and in 1796, to 19,669. After having risen a little during the first years of the nineteenth century, it commenced to decline again from the year 1805, and in 1811 and 1812 it was reduced to almost nothing. — Having reached this degree of intensity, the struggle could no longer be prolonged; it had to come either to open war, or to an amicable arrangement, which should put an end to the differences between the two countries. In 1812, in fact, war was declared; a war, determined perhaps by political motives, but the original cause of which was these commercial quarrels. Fortunately, this war did not last long, and it finally led, in 1815, to the conclusion of a treaty of commerce and navigation, founded upon reciprocity and equality of rights. — This treaty of 1815 may be considered as the point of departure of the new policy, successively adopted by the greater part of the states of Europe. Still this treaty did not end all quarrels. Besides the fact that it was not always faithfully carried out, it made scarcely any concessions except as regards the intercourse between the United States and the United Kingdom, leaving the colonial commerce, at which the American people had not ceased to cast longing glances, as it had formerly been. This second point, therefore, remained to be settled. It was the object of fresh debates, which were prolonged with more or less acrimony for many years, and to which the definite repeal of the navigation act alone could put an end. — The example given by the United States was not lost. Some years after 1815, Prussia exacted the advantages which had been accorded to the American Union, and showed herself disposed to use the same means to obtain them. England was tempted again to respond by a formal refusal, for the prestige of the navigation act was not yet, by any means, destroyed. But the government and parliament, much as they were devoted to the protective law, did not care to recommence a fatiguing and ruinous war similar to that which they had just gone through, nor to repeat the experience which had shown them its uselessness. It was to be feared, besides, that other nations would join Prussia, and that they would league together to resist the British monopoly. This consideration prevailed over all the others, and England understood soon enough that it was necessary to yield again. The treaty with Prussia was concluded in 1823; but already the question appeared under another aspect; England had taken a great step in advance. — On the proposition of the ministry, of which Mr. Huskisson was then a member, parliament passed, in 1822, not without dread nor without casting a desperate look backward, a bill which authorized the government, in a general manner, to conclude similar treaties with all foreign nations. This was to throw down with a single blow one of the supports of the system, which rested on the tariff of duties. By virtue of this bill a great number of treaties were successively concluded with all the independent states of Europe and America. — In the following years many new provisions were adopted, all modifying the original law, like that, for example, which extended to the nations of Europe the power, previously accorded to the American people, of trading, on certain conditions, with the English colonies. It was at this time also that for the first time the exportation to foreign countries of certain kinds of colonial merchandise, and particularly of sugar, was authorized. From this moment it may be said that the navigation act was battered in all its parts. — In 1725 it was entirely remodeled, to make a new act of it, in which an effort was made to take into account the principal modifications which it had undergone. After that time it was twice revised, in 1833 and in 1845. The last draft, that of 1845, recalls, in its essential provisions, the original act, to such a degree, that if we were to judge only from a comparison of the text of the two laws, we might think that from the one epoch to the other the system had undergone little change. But the last authorizes the government, in consequence of treaties concluded with foreign powers, to make so many and such notable exceptions, that these exceptions have almost destroyed the rule. Let us see what was the real state of the law before the definite repeal of the act. — *State of the Law before the Repeal of the Act.* We have just seen that even before the repeal of the law, differential duties, in direct international navigation, had ceased almost everywhere by virtue of the treaties of reciprocity. However, it seemed that the exclusion of third parties had been strictly maintained: this exclusion continued, indeed, in principle. But even in this respect there were already numerous exceptions, resulting principally from a sort of artificial extension of nationalities. After 1838 a large number of the states of Europe had been successively authorized to consider as ports belonging to them, so far as their maritime relations with Great Britain were concerned, the

ports situated at the mouths of rivers which flowed through any part of their territory. It was in this way that Austria, the first power to profit by this exception, could consider as hers the ports situated at the mouths of the Danube and the Vistula, and that her ships could sail from them to Great Britain with the same privileges as if they had set out from Austrian ports. It was in this way, also, that the ships of the zollverein could make use, under the same conditions, of the ports situated at the mouths of the streams or rivers which crossed any one of the associated states. Hanover, the two Mecklenburgs, the duchy of Oldenburg, Holland, Russia, and many other states, had successively obtained similar privileges, which became more and more extensive; so that all central and northern Germany, as well as a good part of the north of Europe, formed scarcely more, in the eyes of the English law, than one and the same country. There was now no nation which had not obtained the privilege of trading with the English colonies. Yet this privilege remained subject to many reservations. Granted to each power separately, by orders in council, it was more or less extended, according to the case in question, that is to say, according as the power which obtained it granted greater or less reciprocity. France and Spain were in this respect the least favored of Europe, because they had maintained more than the others their system of restriction. In any case, foreign ships were admitted only into certain ports of the English colonies called free ports. It is proper to add, that these free ports were very numerous, so much so that Jamaica alone had fourteen. Finally, in colonial commerce, the carriage of certain kinds of merchandise specially designated, and, besides, few in number, remained the exclusive privilege of English ships; and it was not permitted to foreigners to sail from one colony to another, that sort of navigation being likened to the coasting trade. Nothing had been changed in the provisions relative to the registration of ships and the conditions of their nationality. — *Repeal of the Act in 1849; what remains of it.* After the numerous and powerful attacks, which it had already been subjected to, the moment had come when the navigation act had finally to disappear. The time when it had been surrounded by a respect almost religious, and when it was considered as the palladium of British power, was past. It still had, it is true, a very great number of partisans, above all among those directly interested in the merchant marine. But each of the alterations it had undergone since 1815 had so little justified the fears and sinister predictions of the sectaries of the past, these alterations had been followed, on the contrary, by such favorable consequences, that the old faith in the efficacy of the act had been extinguished in some and strongly shaken in others. At the time when the first changes were introduced into it, changes necessitated by circumstances, the sacred ark was touched only with trembling, and in obedience to a fatal necessity. But later, after the unexpected success of the first trials, changes were made with a more cheerful spirit, and it was easy to foresee thenceforth that the moment would soon come when the navigation act would receive its death blow. The commercial reforms brought about in England, from 1842 to 1846, only hastened this moment by preparing the way. It is from 1815, or at least from 1822, that the first serious attacks made against the navigation act date, and since that time it may be said that the old edifice of restrictions, barriers and monopolies, which it established, only advanced from day to day toward an inevitable and fatal downfall. — To Mr. Huskisson belongs the honor of having commenced, from 1822 to 1825, the work of its destruction; to Sir Robert Peel, that of having prosecuted it, from 1842 to 1846, by ruining all that protected the edifice; and to Lord John Russell, the honor of having finished it, in 1849. In this latter year the navigation act was definitively repealed. — By virtue of the new law, which went into force Jan. 1, 1850, all the old restrictions are abolished. Since then, the ports of Great Britain have been open to all foreign vessels, from whatever country, and such vessels are received there, in whatever touches the laws of navigation, on the same footing as English vessels. Foreign vessels are also received upon the same conditions as English vessels in all the British colonies, and may import into and export from them such merchandise as they please. — Nevertheless the act of 1849, after having proclaimed the virtual abolition of the old restrictions, retains some of them, few in number, the maintenance of which appeared necessary, or which it was not thought should be entirely done away with. In the first place, it retains those restrictions in what concern the coasting trade, that is, the navigation from one port of Great Britain to another, as well as in regard to the navigation between Great Britain and the Channel islands: Guernsey, Jersey, etc. In the second place, it retains them also in regard to the navigation from one colony to another, and from one of the ports of a colony to another port of the same colony. Still, upon this point, the interdiction of foreign ships is not absolute. It is allowable for the colonies themselves to put an end to it, by addressing to the queen a request that they may be authorized to regulate their coast navigation themselves. Finally, no change has been effected by the new law in the provisions relative to the constitution of the crews of English vessels, and to the recognition of their nationality. These restrictions are the only ones which continue. They have not been maintained with a view of favoring the British marine, that system of protection having been condemned as harmful and vain, but only because their repeal would have given new facilities for smuggling, and therefore have reduced the public revenues. — *Did the Navigation Act accomplish,*

during its existence, the good which was expected of it? There is no doubt but that, in the early periods of its promulgation, the navigation act must have dealt a heavy blow at the Dutch merchant marine, which was then the general carrier between all the nations of Europe. Excluded, or almost so, from the ports of Great Britain, by reason of the severe prescriptions which forbade, in international navigation, all intervention of third parties, the Dutch ships lost at once one of their best customers. The damage was so much the more serious because the example given by England was not slow in being followed, at least in a certain measure, by some other states, (notably by France), which strove, as if in rivalry, to make their ports less accessible to foreigners. The Dutch merchant marine, therefore, saw the circle of its activity visibly narrowing from day to day. And as at this time, even more than to day,* the merchant marine was the real nursery of the naval army, the maritime power of Holland, which had been heretofore without a rival, was greatly influenced by it. The navigation act may therefore be considered as the first check given to the maritime greatness of Holland, although this artificial greatness must sooner or later have passed away, and although many other causes, both internal and external, contributed to its decay. — There can no longer be any doubt that the immediate effect of the navigation act was to give a certain impulse to the English marine. If commerce and industry had to suffer enormously from the severe restrictions imposed upon them all at once, and to experience a great injury from them, it is easy to understand that the merchant marine could and must increase, in a certain measure, at the expense of everything else. Did the advantage obtained on the one side furnish a sufficient compensation for the injury experienced on the other? Without doubt it did not, if we look at it from the point of view of the commercial interests of the country; for certainly the marine did not gain so much from this innovation as commerce and industry lost by it. But if, leaving the interests of industry and commerce out of the question, we consider the effect produced only from the point of view of maritime power, it appears to us certain that the navigation act fulfilled, at least up to a certain point, the intentions of those who were its authors. In a word, from the economical point of view, the measure was detestable in all respects, even at that time.— From the political point of view, and as a war measure, it can be justified or explained, and for a certain length of time it certainly produced the results which were expected of it. It is in this way that Adam Smith regarded it, when, despite his just horror for all restrictive measures, he made an exception in favor of the navigation act, which he considered a patriotic and wise act. He did not and could not ignore the injury this law had caused to the national wealth, but he thought it justified by considerations of another order. It was in his eyes a measure of public safety The damage which it must have caused to industry and commerce he considered as a sacrifice imposed upon the country in the interest of its security.—But if such were the first effects produced by the navigation act, it was not the case afterward. The first impulse once given to the British marine, it suffered itself, almost as much as foreign marines, from the restrictions established in its sole interest. These restrictions, in fact, traced a circle about it, and forbade it in a certain manner to overstep it. A proof of this truth is found in the fact that later, as the severe prescriptions of the act had to be relaxed, by the force of circumstances, the English marine prospered and increased much more than it had before. Thus, in 1815, a treaty of reciprocity was concluded with the United States, and, as a consequence of this treaty, so far from English ships being excluded from the ports of the United States, as had been feared at first and as shipowners had jealously predicted, it was found that the British tonnage in its ports increased from year to year, and finally rose far above what it had ever been. We have seen that, from 1792 to 1815, the tonnage did not exceed, in the best years, 210,000 tons; in 1844, before the great commercial reforms brought about by Sir Robert Peel, it had already gradually increased to more than 700,000 tons. All the other alterations which the navigation act successively underwent had like consequences; if the measure had had its useful side in the first moments of its existence, its day had gone by. Such is, moreover, the ordinary effect of restrictive measures established for the profit of any industry. They exalt it, they raise it up and increase it for a short time at the expense of all others; but later they become fetters even for that industry, by inclosing it, so to speak, in the narrow circle which they have made for it. — Freed henceforth from the inextricable network of its restrictive laws, England will become, without any doubt, the general rendezvous of the marine of the world. Its principal maritime cities, London and Liverpool, are destined to become the great entrepôts of Europe. Already colonial commodities flow there, to be distributed thence throughout the whole of northern Europe. Truly, other nations would have little ground to complain of this. They should not envy the English people these advantages, which are not acquired at their expense. CH. COQUELIN.

* We say, even more than to-day, because at that time the seas being generally infested with pirates, almost all merchant vessels were armed as for war, so that sailors commenced really an apprenticeship of maritime war on board merchant vesse'e.

NAVIGATION LAWS. From a very early period in the history of Europe, or from the time when the domestic and foreign trade of its different states attained to any considerable development, it was regarded as sound commercial policy, and indeed as an essential function of govern-

ment, to attempt to regulate by statute every species of production and exchange: *domestic*, with a view of preventing any class, guild, town, city or province from obtaining any industrial or commercial advantage over some other; and *foreign* or *international*, for the purpose of preventing any undue drain or export of money or the precious metals (which alone were regarded as wealth), as well as for securing to the people of every state a monopoly of the business or profits arising from its exports and imports, and for debarring from participation in the same, to the greatest extent possible, the people of all other nations. As the regulation of trade and commerce involved, furthermore and of necessity, the regulating of the machinery by which trade and commerce are conducted, all the states of Europe accordingly, whose trade and commerce were to any extent maritime, or across the sea and through their ports, from time to time enacted special codes or statutes known as "navigation laws," the object of which was to regulate, on the basis of the above assumptions, the use of ships, and of all business and commerce of which ships were an essential adjunct and instrumentality. — The first British navigation law of which a record has been preserved, was enacted in 1381, in the fifth year of Richard II., and provided "that none of the king's liege people should from henceforth ship any merchandise, in going out or coming within the realm of England, but only in ships of the king's liegance, on penalty of forfeiture of vessel and cargo." This law was modified the subsequent year, when it was found impossible of execution, by adding a clause that if British ships could not be had, foreign ships might be used. Subsequently another act was passed, providing that British ships should carry goods at reasonable rates, and in default thereof, foreign ships might be employed. This was followed by another act, about the time of Henry VII., fixing the rates which were to be charged by British ships. "In the reign of Elizabeth all restrictions on importing in foreign ships were abolished; and any goods could be imported or exported in any ship whatever, with a proviso that, if in alien ships, they should pay alien duties." The object of the change, as stated in the preamble of the act, was, that the laws in force were injurious to commerce, and provoked retaliation on the part of foreign states. — Following the discovery by Vasco de Gama of the new route to India by way of the cape of Good Hope, and of America by Columbus, and the subsequent establishment of colonies by the various maritime nations of Europe in the eastern and western hemispheres, the importance of navigation laws as a feature of state policy was greatly magnified, while at the same time the sphere of the influence of such laws was greatly extended. The various trans-oceanic colonies of the European states above referred to, were not in a single instance established or fostered by the mother country with the least reference to the pecuniary or political benefit of the colonists themselves; and, with such views, it was not to be expected that other nations would be allowed to participate in the benefits accruing from any trade or commerce with any colonies which were not of their own planting and under their own government. England, France, Spain, Portugal and Holland accordingly, through their navigation laws, prohibited all commercial intercourse on the part of other nations with their colonies, and enforced prohibition with great severity; Spain especially regarding, and sometimes treating, as pirates, even the crews of such vessels as through stress of weather or shipwreck were constrained to visit any of her colonial ports or territory. Foreign ships were first excluded from the English colonies in 1650; while other enactments in 1651 and 1660 (which constituted the foundation of the British navigation laws for the next 200 years), prohibited importation into England of the products of foreign countries, except in British ships, or in ships of the country of which the goods were the produce. — One of the agencies which powerfully contributed at this time to a change from the liberal commercial policy of England adopted under Elizabeth, was alarm at the continued maritime enterprise and ascendency of the Dutch; which nation, even as early as 1603, according to a pamphlet ascribed to Sir Walter Raleigh, "*everywhere surpassed us*"; and "*had as many ships and vessels as eleven kingdoms of christendom, let England be one.*" How great the hostility engendered in England by this competition is well illustrated by the fact, that the earl of Shaftesbury, as lord chancellor, officially announced, in 1672, that the time had come when England must go to war with the Dutch; for that it was "impossible both should stand upon a balance; and that if we do not master their trade, they will ours. They or we must truckle." One of the first governmental measures also after the restoration of Charles II. was to re-enact the laws of the commonwealth touching the colonial system, and the use of ships as commercial agencies, and combine them all in one act, which has since been known in British jurisprudence as the "first navigation act." The preamble of this act assigns, as a reason for its creation, "the encouragement of British shipping." In the navigation laws enacted under Cromwell there was no discrimination as to the *build* of ships; but in 1662, under Charles II., it was enacted, "that no foreign built ship shall enjoy the privilege of English or Irish built ships, even though the owners be Englishmen; prize ships only exempted." (See Ricardo's "Anatomy of the Navigation Laws," p. 27.) "This statute," says Sir Stafford Northcote, in his evidence given as legal adviser of the board of trade before a parliamentary committee in 1848, "did not wholly prohibit the employment of foreign built ships, but subjected them to alien's duties, on the same principle that aliens were always charged double duties." The same authority also states, that "in 1686 the British *coasting trade* was closed to for

eign built ships; the preamble of the act citing the continued decay of British shipbuilding as the cause, although ever since the time of Elizabeth it had been confined to ships owned by British subjects." And here one important and most instructive fact is to be noted, and that is, that although England closed the trade of her colonies and her coast line to foreign shipping, and framed her navigation laws with a special view of hindering or destroying the extensive ocean commerce of the Dutch, the shipping interests of the latter nation continued to so prosper and expand as to call forth from the British lord chancellor, as late as 1743, or more than eighty years after the navigation acts of the commonwealth, the following official declaration in the house of lords: "*If our wealth is diminished, it is time to ruin the commerce of that nation which has driven us from the markets of the continent, by sweeping the seas of their ships and by blockading their ports.*" — Recurring again to the influence of the transoceanic colonies of the European maritime states upon their navigation codes, it is to be observed, that as whatever did not enhance the trade and commerce of the mother country was deemed unfit to be a part of its colonial policy, the industry and trade of the colonies was in consequence subjected to the most stringent and unnatural regulations and restrictions. Thus, by a statute enacted by the parliament of Great Britain in 1663, it was ordered, that "none of the products of the English plantations or factories," "in Asia, Africa or America," "shall be carried anywhere (except to other plantations) till they be first landed in England, under the forfeiture of ships and cargoes." Scotland was not admitted to the trade of the British plantations until the union in 1706, and Ireland not until 1780. Other laws provided that the colonies should not be allowed to purchase, in any but British markets, any manufactured article which England had to sell. The effect of these skillfully devised instruments for the torture of industry and commerce was, that whatever of raw material the British colonies produced, and which the English manufacturer needed, could be sold to the latter alone and at his own price; on the other hand, whatever of wares the British manufacturer offered in the colonial market, the colonists were obliged to buy on the manufacturer's terms, or not purchase at all. And whether in the case of purchase or sale, the product could be transported only in British vessels, and at the carriers' own price: and to all this was added the further provision of a revenue tax of 5 per cent. upon all colonial exports and imports. By the act of 1699, in the tenth year of William and Mary, it was forbidden to ship colonial wool, or any woolen manufacture, from one colony to another; and British sailors were forbidden to purchase, for their own use, more than forty shillings' worth of woolen goods in any American port. By subsequent enactments, in the reign of George I., the transportation of hats, the product of colonial industry, was also forbidden; as well as the cutting, without a license, of any pine tree, two feet in diameter and not within any inclosure, between the Delaware and St. Lawrence rivers; the object of this latter statute being to maintain an ample supply of masts for the English navy. When Bishop Berkeley proposed to establish a great American university, he was answered by Walpole, that from the labor and luxury of the "plantations great advantages may ensue to the mother country; yet the advancement of literature and the improvement in arts and sciences in our American colonies can never be of any service to the British state." A colonial commissioner who was sent to ask of the royal (English) attorney general an increased allowance for the churches in Virginia, concluded his earnest appeal in these words: "Consider, sir, that the people of Virginia have souls to save." "*Damn* your souls! make tobacco," was the immediate reply. Sir William Berkeley, governor of Virginia, writing, in 1671, upon the feelings of the colonists in respect to these navigation laws, says: "Mighty and destructive have been the obstructions to our trade and navigation by that severe act of paliament which excludes us from having any commerce with any nation of Europe but in our own ships; we can not add to our plantations any commodity that grows out of it, as olive trees, or cotton, or vines. Besides this, we can not procure any skillful men for our hopeful commodity of silk, and it is not lawful for us to carry pipe-stems or a bushel of corn to any place in Europe out of the king's dominions. If this were for his majesty's service, or the good of the subject, we should not repine, whatever be our suffering; but, on my soul, it is contrary to both, and this is the cause why no small or great vessels are built here. For all are most obedient to the laws, while the New England men break through them, and trade to any place where their interests lead them to." — It is by means of these, and many other like historical citations which might be given (and which the reader desirous of further information can readily find in all standard histories of the sixteenth, seventeenth and eighteenth centuries), that it is alone possible to clearly comprehend the curious economic ideas which prompted the enactment of navigation laws in the first instance, and for more than six centuries have prompted rulers and statesmen to defend their policy and expediency and struggle for their continued maintenance. Absurd, tyrannical and even cruel, furthermore, as have been many of these provisions, it would be a mistake to regard them as the work of either heartless or corrupt men; on the contrary, they were rather the result of a false and vicious theory of wealth and trade—once universally and even still accepted in at least a degree in many countries—"which ignored the beneficent and immutable laws of value and exchange, and undertook, by capricious and arbitrary rules, not only to regulate the great social forces which bind men to each other and to nature, but, in defiance

of these, to torture industry in every conceivable way, in a vain attempt to force it into those artificial channels which they had marked out for it." They were also, it is to be remembered, but the part of a general economic system, which in all its features was consistent and harmonious. If England forbade her colonists to transport wool from one plantation to another, she also, at the same time, had a law upon her statute book which made it felony for any Englishman to export sheep. If the colonists were not permitted to carry any article of their produce upon the seas except in British ships, there was no different law for the Scotch, or Irish, or any other subjects of the crown; and the laws of trade, furthermore, which England adopted, were the same in all essential particulars which were adopted by all the other maritime nations of Europe during the periods under consideration. In evidence also that the laws regulating the early commerce and the carrying trade of the ocean were not exceptionally absurd, and in further illustration of the former continued interference of government with individual pursuits and personal freedom, it may be also mentioned, that the people of England at one period, subsequent to the reformation, were forbidden by statute from eating meat during Lent, in order "that the fisheries of the kingdom might be encouraged, and the number of seamen employed therein be increased": while in 1630, the crown issued a proclamation against erecting houses on new foundations in London, Westminster, or within three miles of any of the gates of London, or of the palace of Westminster; also against entertaining inmates in houses, which would multiply the inhabitants to such an excessive number that they could neither be governed nor fed. It is also desirable at this point to call attention to the circumstance that, apart from the immediate and direct influence of the early navigation laws upon industry and trade, their political and moral effect, or rather, of the spirit that led to their enactment, was also of the most momentous character. It was for the enforcement of these laws, or for the maintenance of the principles upon which they were founded, that more than half the battles of the eighteenth century were fought; and, as has already been shown, they were the prime cause of the revolt of the British-American colonies, and their separation from the mother country. (See AMERICAN MERCHANT MARINE.) The multitude of restrictions which these laws imposed on transactions which were in no way repugnant to the moral sense of good men, created a multitude of new crimes. Half the commerce of the world, at periods during the eighteenth century, was engaged in smuggling or in piracy; smuggling on the ocean leading, by easy transition, to piracy, while smuggling on the land frequently resulted in the brigandage which so long infested Europe. Mrs. Martineau, in her "History of England during the Thirty Years Peace," thus describes the state of affairs in England and France, even as late as the year 1824: "While this was going forward on the English coast, the smugglers on the opposite shore were engaged with much more labor, risk and expense, in introducing English woolens, by a vast system of fraud and lying, into the towns, past a series of custom houses. In both countries there was an utter dissoluteness of morals connected with these transactions. Cheating and lying were essential to the whole system; drunkenness accompanied it; contempt for all law grew up under it; honest industry perished beneath it, and it was crowned with murder." And Blanqui, in his "History of Political Economy," declares, that to such an extent was trade and commerce throughout Europe interfered with by legislation, that all trade would have perished had it not been for smuggling.—The fact that the restrictive laws passed by England in the seventeenth and eighteenth centuries to hinder the growth of the shipping and carrying trade of the Dutch failed to accomplish the result expected, has already been pointed out; but no better success attended the efforts in the same direction in respect to the British North American colonies. On the contrary, the shipping interests of the Americans continued to so prosper and increase, that in 1725 the shipwrights of the river Thames complained to the crown that their business declined, and that their workmen emigrated, because of the number of ships that the plantations built and furnished to England; and for the year 1775 the register of Lloyds returned, as the aggregate of new tonnage for the three years next preceding, 3,908 British vessels of 605,545 tons, and 2,311 of American build, with an aggregate tonnage of 373,618.—The principal features of the British navigation code, as it existed in 1849 (the time of its repeal), and which did not differ in any essential particulars from the provisions of the codes adopted by the other maritime states of Europe, were as follows: No foreigner could own, either wholly or in part, a British ship, and the captain and at least three-fourths of the crew of such vessels were compelled to be British subjects. Certain enumerated articles of European produce could only be imported into the United Kingdom for consumption, in British ships, or in ships of the country of which the goods were the produce. No produce of Asia, Africa or America could be imported for consumption into the United Kingdom, *from any European port*, in any ships whatever; and such produce could only be imported from any other places in British ships, or in ships of the country of which the goods were the produce. No goods could be carried coastwise from one part of the United Kingdom to another, except in British ships. No goods could be carried from any one British possession in Asia, Africa or America to another, in any but British ships. No foreign ships were allowed to trade with any of the British possessions, unless they had been specially authorized to do so by order in council. No goods could be exported from the United Kingdom to any of the British

possessions in Asia, Africa or America (with some exceptions with regard to India), in any but British ships. The following details of the experience of British trade and commerce under these laws will also to some extent illustrate their absurdity and injurious influence. For example: "An American vessel might carry American cotton to England direct; but if such cotton was landed at a continental port, no ship of any nationality could afterward land it for consumption in England. The grain of Russia, if once landed in Prussia, or in the ports of any other nation, was absolutely shut out from England, no matter if a deficiency of food in that country was threatening starvation to its people. In 1839 the price of coffee was especially high in the London market. Large quantities of Java and Dutch colonial coffee were in store in Amsterdam, but it could not be brought into England because it had been landed at a continental port. Under these circumstances it is said that a British ship was chartered, sent to Amsterdam, and despatched to the cape of Good Hope, where the cargo was landed, actually or constructively, and by some process recognized by the law so became the naturalized produce of that colony. It was then carried to England, and coming direct from a British colony in a British ship was admitted for home consumption. It is said that many thousand tons of merchandise were thus sent cruising half round the globe, involving an enormous waste of capital, in order that the letter of the law might be fulfilled, although its spirit was nullified." (Lindsay's "History of Merchant Shipping," Hamilton Hill, American Social Science Association, 1878.)—*Navigation Laws of the United States.* Up to the time of the American revolution, treaties of commerce between nations had been little other than agreements to secure special and exclusive privileges to the contracting parties, and to antagonize, as far as possible, the commercial interests of all other countries. But in the treaty of commerce entered into between France and the revolted colonies in 1778, the commissioners of the two nations—Franklin, Deane, Lee and Gerard—evidently determined to attempt to inaugurate a more generous policy, and to establish a precedent for freer and better commercial relations between different countries than had hitherto prevailed. It was accordingly agreed in the treaty in question to avoid "all those burdensome prejudices which are usually sources of debate, embarrassment and discontent," and to take as the "basis of their agreement the most perfect equality and reciprocity." And they further stated the principle which they had adopted as a guide in their negotiations to be that of "founding the advantages of commerce solely upon reciprocal utility and the just rules of free intercourse." The commissioners were, however, ahead of their times, as they even yet would be, if still alive and participating in the public policy of the United States. The traditions and habits of Europe were too strong to be at once broken down. No Adam Smith had then arisen to combat the then prevailing idea, that whatever of advantage one nation or country gained in trade and commerce necessarily entailed an equal and corresponding loss upon some other nation or country; and in the end the Americans succumbed, and within a comparatively few years their own country, falling into the rut of old prejudice, enacted (as will be hereafter shown) a commercial code as illiberal and narrow in most respects as any that had preceded it, and which still stands as the most striking and, in fact, the only relic of the unchristian and barbarous commercial legislation which everywhere characterized the eighteenth century. — When the convention that framed the federal constitution came together in 1789, there were two sectional questions of importance that came before it, and two only: the question of slavery, and the regulation of commerce. The extreme southern states wanted slavery and the slave trade legalized and protected. The south, as a whole, also favored free trade. New England, on the other hand, largely interested in shipping, a not insignificant proportion of which, either directly or indirectly, was engaged in the slave trade (her people, Massachusetts men especially, importing molasses from the West Indies, distilling it into rum, using the rum to buy slaves on the coast of Africa, and selling the slaves at the south,) desired, through a system of navigation laws, to hold a monopoly of the commerce of the new nation, while the middle states generally wanted neither slavery nor navigation laws. The sentiment of the country as a whole at this period was averse to slavery, and the cultivation of cotton not having then been introduced to any considerable extent into the southern states or made the source of profit that it subsequently became through the invention of the cotton gin, the anti-slavery feeling had developed itself much more strongly in some parts of the south than it had in New England.* So that if New England had been as

* "The sentiment was common to Virginia, at least among the intelligent and educated, that slavery was cruel and unjust. The delegates from Virginia and Maryland, hostile to navigation laws, were still more warmly opposed to the African slave trade. Delaware by her constitution, and Virginia and Maryland by special laws, had prohibited the importation of slaves. North Carolina had shown a disposition to conform to the policy of her northern sisters by an act which denounced the further introduction of slaves into the state as 'highly impolitic.'" (Hildreth, vol. iii., pp. 508-10.) Pennsylvania founded a society for the abolition of slavery in 1775, with Franklin for its first president and Rush its first secretary. New York had a similar society in 1785, with Jay as its first president and Hamilton as his successor. On the other hand, as some illustration of the then current New England sentiment, attention is asked to the following extract from an oration by Mr David Daggett (afterward United States senator and chief justice of Connecticut) at New Haven, July 4, 1787—a month before the federal convention, then in session, took up the subject of slavery and the navigation laws. The orator, after speaking of the gratitude and generous reward the country owed to the officers and soldiers of the late army, and its immediate inability to discharge such obligations, continued: "If, however, there is not a sufficiency of

true to the great principles of liberty as her people were always professing, it seems probable that, aided by the middle states, and in part by the south, she might have brought about an arrangement under the federal constitution, at the time of its formation, for the gradual but no very remote extinction of American slavery and an avoidance of the expenditure of blood and treasure which has since been entailed by its continuance. Selfishness and the love of the dollar, however, proved as omnipotent then as they ever have, and the result was a compromise of iniquity; the power to regulate commerce being inserted in the constitution, together with and as a consideration for the extension, by New England votes, of the slave trade until 1808 and the prohibition of export duties. — This curious chapter in our national history, although familiar to historical students, has been all but unknown to the mass of the American people. The evidence of its truth is, however, complete. The fourth section of the seventh article of the constitution of the United States, as originally reported by the committee of detail, provided that "no tax or duty shall be laid by the legislature on articles exported from any state, nor on the migration or importation of such persons as the several states shall think proper to admit; nor shall such migration or importation be prohibited." When the convention came to the consideration of this section they amended it by making the prohibition of the imposition of duties on exports general, or applicable to the federal government as well as to the states, although Mr. Madison tried to have the power to do so allowed to congress when two-thirds of each house should vote its expediency. The question next occurred on the residue of the section, which Mr. Luther Martin, of Maryland, moved to amend so as to authorize congress to lay a tax or prohibition at its discretion upon the importation of slaves. The provision as it stood in the report of the committee would, he said, give encouragement to the slave trade; and he held it "inconsistent with the principles of the revolution and dishonorable to American character to have such a feature in the constitution." Messrs. Rutledge and Pinckney, the South Carolina delegates, and Mr. Baldwin, of Georgia, warmly protested against Mr. Martin's proposition as an uncalled-for interference with the slave trade. Mr. Ellsworth and Mr. Sherman, of Connecticut, were both for leaving the clause as reported. "Let every state," they said, "import what they please." Elbridge Gerry, of Massachusetts, "acquiesced, with some reserve," in the complying policy of the delegates of Connecticut, while his colleague, Rufus King, "made a measured resistance" merely on the grounds of state expediency. George Mason, of Virginia, expressed himself with great energy in opposition to the views of the delegates from Connecticut. "This infernal traffic," he said, "originated in the avarice of British merchants"; and he "lamented that some of our eastern brethren had, from lust of gain, embarked in this nefarious traffic." In this state of things Gouverneur Morris arose, and, after adverting to the circumstance that the sixth section of the same article of the constitution under consideration contained a provision that no navigation laws should be enacted without the consent of two-thirds of each branch of congress, and that this provision particularly concerned the interests of the New England states, proposed that this section, together with the fourth section (relating to the slave trade) and the fifth section (relating to the assessment of a capitation tax on slaves) be referred to a special committee, remarking, at the same time, (see Rives' "Life and Times of Madison," vol. ii., pp. 444, 450), "that these things may form a bargain among the northern and southern states." — The hint thus given was not thrown away. All these matters were referred to a committee, and what this committee did is thus told by Luther Martin, one of its members, in a letter to the speaker of the Maryland house of delegates: "I found the eastern states, notwithstanding their aversion to slavery, were very willing to indulge the southern states at least with a temporary liberty to prosecute the slave trade, provided the southern states would in turn gratify them by laying no restriction on [the enactment of] navigation acts; and after a little time the committee agreed on a report, by which the general government was to be prohibited from preventing the importation of slaves for a limited time, and the restrictive clause relative to navigation acts was to be omitted." (Elliott's "Debates," 2d ed., vol. i., p. 373.) — The limit of time for the extension of the slave trade agreed to by the committee in making the bargain, was 1800; but when the report came before the convention, Mr. Pinckney, of South Carolina, moved to amend by substituting 1808 in lieu of 1800, as the term of the permitted traffic, and this motion was seconded by Mr. Gorham, of Massachusetts. Mr. Madison and others earnestly opposed this amendment, "but the coalition that had taken place rendered all remonstrance vain, and Gen. Pinckney's motion was carried in the affirmative; all of the three New England states, with South Carolina, Georgia, Maryland and North Carolina, voting for it, and Virginia, Pennsylvania, New Jersey and Delaware voting against it." Four days later the residue of the report, recommending that the sixth section, which imposed restrictions

property in the country, I would project a plan to acquire it. * * * Let us repeal all the laws against the African slave trade, and undertake the truly benevolent and humane merchandise of importing negroes to Christianize them. This has been practiced by individuals among us, and they have found it a lucrative branch of business. Let us then make a national matter of it. * * * We should have the sublime satisfaction of enriching ourselves, and at the same time rendering happy thousands of those blacks by instructing them in the ways of religion. * * * This would be no innovation. * * * This country permitted it for many years, among their other acts of justice, but their refusing to pay sacred and solemn obligations is not of so long standing."

against the passage by congress of a navigation act, was taken up and earnestly debated, and opposed by George Mason, Gov. Randolph and others, but as earnestly advocated by Pinckney and Butler, of South Carolina, "who earnestly invoked a spirit of conciliation toward the eastern states on account of the liberality they had shown to the wishes of the two southernmost states with regard to the importation of slaves," and, finally, "the bargain that had been entered into, in which the legalization of the slave trade for twenty years on the one side was the price of the abandonment of restrictions on the passage by congress of a navigation act" on the other, received its final ratification. (Rives' "Life and Times of Madison.") We quote also from Hildreth the following to the same effect: "Thus by an understanding, or, as Gouverneur Morris called it, 'a bargain,' between the commercial representatives of the northern states and the delegates of South Carolina and Georgia, and in spite of the opposition of Maryland and Virginia, the unrestricted power of congress to enact navigation laws was conceded to the northern merchants, and to the Carolina rice planters, as an equivalent, twenty years' continuance of the African slave trade." (Hildreth's "United States," vol. iii., p. 520.) "This transaction," continues Mr. Rives, "undoubtedly made a most disagreeable impression on the minds of many members of the convention, and seemed at once to convert the feeling of partial dissatisfaction that had already been excited in certain quarters, by one or two votes of the convention, into a sentiment of incurable alienation and disgust. Gov. Randolph, a few days after the first part of the bargain had been ratified, and while the latter part was pending, declared that 'there were features so odious in the constitution, as it now stands, that he doubted whether he should be able to agree to it.' Col. Mason, two days later, declared that 'he would sooner chop off his right hand than put it to the constitution as it now stands.'" And the names of neither of these delegates appear on the roll of delegates to the national convention who subsequently signed the constitution. — When the federal congress assembled for the first time under the constitution, New England was not dilatory in demanding the fulfillment of her part of this disreputable compact; and in 1789 and 1792 the foundation of our present navigation laws was laid, in acts levying tonnage dues and impost taxes which discriminated to such an extent against foreign shipping as to practically give to American ship owners a nearly complete monopoly of all American commerce. — By the act of 1789 a tonnage tax of six cents per ton was levied on all American vessels and fifty cents per ton on all vessels built and owned in foreign countries and entering American ports. Dec. 31, 1792, the registration act, in substance as it stands to-day, was enacted. In 1793 the coasting trade was wholly closed to foreign vessels. Discriminating duties on articles, the products of countries east of the cape of Good Hope, imported indirectly into the United States, were imposed, July, 1789. Subsequent to the war of 1812–14, the president was empowered to enter into more liberal arrangements with foreign nations in respect to shipping, but no disposition having been manifested by Great Britain and other nations to enact reciprocal legislation, nothing resulted; but on the contrary, in 1816, 1817 and 1820 congress enacted a system of navigation laws which were avowedly modeled on the very statutes of Great Britain which the Americans, as colonists, had found so oppressive that they constituted one prime cause of their rebellion against the mother country, the main features of difference between the two systems being that wherever it was possible to make the American laws more rigorous and arbitrary than the British model the opportunity was not neglected. — As an essential part of the history of this legislation, and as some extenuation of the illiberality of the first congress, it should be here stated that public sentiment in the United States in respect to the policy of the enactment of navigation laws, and of making them harshly discriminative against the shipping of foreign nations, experienced a marked change between the time when the power to regulate commerce was made in convention part of the federal constitution, and the time when the enactment of discriminating tonnage dues and tariff taxes came up for consideration in 1790 and 1792 in the federal congress. This was due entirely to the utter failure on the part of the American government (confederative and constitutional) to induce Great Britain to recede in any degree from the extremely illiberal commercial policy which she had adopted toward her former colonies since the attainment of their independence. Previously they could trade freely with other British colonies in America and the West Indies, exchanging lumber, corn, fish and other provisions, together with horses and cattle, for sugar, molasses, coffee and rum: but immediately after the conclusion of the war the people of the new nation were put on the same footing as those of other foreign countries; and, under the operation of the British navigation laws, were, in common with them, excluded from nearly all participation in an extensive and flourishing part of their former maritime trade. As illustrating the then temper of the times and the illiberal spirit that then pervaded the counsels of the nations, it may be mentioned that this policy was persevered in by Great Britain, even after it was proved in repeated instances to work most injuriously to her own home interests and to have inflicted great suffering upon her West Indian colonies. Thus, between 1780 and 1787, no less than 15,000 slaves were known to have perished from starvation in the British West Indies, by reason of inability, through the operation of the British navigation laws, to obtain the requisite supply of food from the North Americans, at a period when the home-grown portion of their subsistence had been destroyed by successive hurricanes. William Pitt, however, was a

man capable of rising above the ordinary level of his times, and his political surroundings, and foreseeing the serious difficulties of the situation, desired as chancellor of the exchequer, immediately after the close of the war, to deal liberally with the new nation; and accordingly, as early as 1783, introduced into parliament a bill, allowing comparatively free commerce between the United States and the British West Indies. But the measure, owing primarily to the resignation of the ministry, and the strong opposition of the British shipping interests, aided by the efforts of the loyalists of the remaining British North American colonies, was not only defeated, but in 1788 an act was passed absolutely forbidding the importation of any American produce into any British colony, except in British bottoms. These restrictions on the participation of the United States in British colonial trade very singularly remained unrepealed until 1830, in which year a British order in council was adopted authorizing vessels of the United States to import into the British possessions abroad any produce of the United States from these states, and to export goods from the British possessions abroad to any foreign countries whatever. — As some further evidence of the British jealousy of the commercial competition of the United States in the decade between 1783 and 1793 it may be also mentioned that Lord Sheffield, who headed the opposition to Mr. Pitt's bill (above noticed), published in 1783 a book, in which he advised the British government not to interfere too extensively with the Barbary pirates, on the ground that through lack of any sufficient naval force on the part of the United States to restrain and punish—but which force Great Britain was known to possess—the operations of the corsairs would be confined mainly to the destruction of American commerce and of the little states of Italy, whereby British commerce would be benefited. — Under such circumstances it was but natural that the representatives of the nation came together in Congress in 1791–2 with very different sentiments in respect to the policy of navigation laws from those entertained by the members of the federal convention in 1787. It was felt by the former and by the whole nation that the legislation of Great Britain—especially that part of it which broke up the then important trade of the United States with the British West Indies—was designedly hostile legislation, which could only be properly met and its continuance prevented by retaliatory legislation, and congress in 1790–92 accordingly did retaliate, and a quarter of a century later (1816–20), after another war, when Great Britain refused to accept the offer on the part of the United States of a more liberal reciprocal commercial policy, it enacted navigation laws even more stringent than any which had before found a place upon our statute books. To further complete this record it should be also here noted, that in connection with the restriction of commerce by the enactment of navigation laws in the first congress, the first selfish and sectional antagonism of the states in respect to the adjustment of duties on foreign imports also occurred. "The south" (we quote from Professor Sumner's "History of Protection in the United States") "wanted a protective duty on hemp, claiming that rice and indigo were unprofitable. Pennsylvania opposed any tax on hemp as a raw material of cordage, but wanted a tax on that. New England opposed the tax on cordage as a raw material of ships, but wanted protection on the latter." The most strenuous contention was, however, in respect to rum and molasses. "The south, except Georgia, wanted a high tariff on rum for revenue. The middle states wanted it in the interests of temperance; the eastern states for protection to their rum distilleries. Georgia opposed this tax because she used a great deal of rum and bought it in the West Indies with her lumber. The southern and middle states wanted a tax also on molasses, but this the eastern states vigorously opposed. Molasses was the raw material of rum." It was bought with salt fish, lumber and staves sent to the West Indies, distilled into rum in New England, sent as export to Africa to buy slaves, which in turn were sold to the south. After having bartered their souls by extending the horrors of the slave trade for twenty long years in consideration of a monopoly of shipping, was New England to permit the most profitable element of that monopoly to be at once taken away from her? Not if their representatives could prevent it! We are accustomed to look back upon the representatives that sat in the first congress, especially those sent from New England, as men infinitely removed from base and sordid motives, whose like it is never to be vouchsafed to us to see again in public office. But when one comes to look over the debates that took place in the first congress on the rum and molasses question, he can not help fancying that he is in the house of representatives at the present day and that a debate on the tariff is in progress.— The duty proposed to be assessed on molasses was six cents a gallon—a fourth of a cent less than molasses pays under the existing tariff of 1881; and the delegation from Massachusetts, it is recorded, "occupied the time of the house for several days with vehement remonstrances against it." One member, Mr. Thurber, went so far as to intimate that the people of his state "will hardly bear a tax which they can not but look upon as odious and oppressive." Mr. Fisher Ames, in a highly colored fancy speech on the woeful effects likely to follow the enactment of the proposed duty on molasses, used the following language: "Mothers will tell their children, when they solicit their daily and accustomed nutriment, that the new law forbids them the use of it, and they will grow up in detestation of the hand which proscribes their innocent food and the occupation of their fathers." And yet all the while none knew better than Fisher Ames that the "mothers" likely to be most distressed were the owners of distilleries, and that the occu

pation of the fathers that the children were to be debarred from following was sending this rum to Africa to be used to buy slaves. New England selfishness again triumphed. The proposed duty on molasses was reduced from six cents to two and a half cents a gallon, and rum was assessed at ten cents per proof gallon, while all other spirits were to pay but eight cents. — Such, then, is a brief history of the inception and growth of our present navigation laws. Conceived in sin and brought forth in iniquity, they seemed to have entailed a curse (not yet fully worked out, but in the process of completion) general for the whole country, but more especially on that section whose fathers sold their honor to accomplish the result, and who thereby merited execration, for having entailed for eighteen long years the horrors of the African slave trade. And when one journeys through New England and sees how thick are the graves of her sons slain in a war which slavery originated, the question might suggest itself: Would these graves exist had the ancestors of those who fill them not consented to strengthen and perpetuate domestic slavery as a consideration for the privilege of doing another wrong— namely, that of restricting their fellow-citizens from freely exchanging the products of their labor? — Having traced the inception and growth of the navigation laws of the United States, let us next inquire into their provisions. They may be in the main stated and illustrated as follows: 1. No American citizen is allowed to import a foreign-built vessel, in the sense of purchasing, acquiring a registry or title to, or of using her as his own property; the only other absolute prohibitions of imports being in respect to counterfeit money and obscene objects. (U. S. Rev. Stat., sec. 4132.) Furthermore, while we are the only people in the world who are forbidden to purchase foreign-built vessels, we freely permit all the world to enter our ports with vessels purchased in any market. Precluded, therefore, by the first provisions of our navigation laws, from engaging on equal terms in the carrying trade with foreigners, we wonder and complain that the carrying trade of even our own products has passed from our control. — 2. An American vessel ceases to be such if owned in the smallest degree by any person naturalized in the United States who may, after acquiring such ownership, reside "for more than one year in the country in which he originated, or more than two years in any foreign country, unless such person be a consul, or other public agent of the United States." (U. S Rev. Stat., sec. 4134.) — 3. If a native-born American citizen, for health, pleasure or any other purpose, except as a consul of the United States, or as a partner or agent in an exclusively American mercantile house, decides to reside ("usually") in some foreign country, any American vessel of which he may be in all or any part owner at once loses its register and ceases to be entitled to the protection of the flag of the United States, even though the vessel may have been of American construction and have regularly paid taxes in the United States, and the owner himself has no thought of finally relinquishing his American citizenship. (U. S. Rev. Stat., sec. 4133.) To illustrate this provision of our navigation laws, let us suppose Capt. John Smith, not a naturalized citizen, but a native American, is an owner, in all or part, of an American vessel. He becomes afflicted with a disease of the lungs, and, for his health, goes to live in the south of France, on account of the balmy atmosphere that prevails there. The moment that Capt. John thus, under the law, begins to "usually reside" in a foreign country, his vessel is liable to lose its register and the protection of the flag of his country. — 4. Every citizen of the United States obtaining a register for an American vessel must make oath "that there is no subject or citizen of any foreign power or state, directly or indirectly, by way of trust or confidence or otherwise, interested in such vessel or in the profits thereof." (U. S. Rev. Stat., sec. 4142.) We invite foreign capital to come to us and help build our railroads, work our mines, insure our property, and even buy and carry our government bonds as investments, but if a single dollar of such capital is used to build an American ship and thereby represents an ownership to any extent of the value received, we declare the ship to be thereby so tainted as to be unworthy of the benefit of American laws. — 5. A foreigner may superintend an American factory, run an American railroad, be president of an American college, or hold a commission in the American army, but he can not command or be an officer of a registered American vessel. (U. S. Rev. Stat., sec. 4131.) Notwithstanding this express provision of law, it is an indisputable fact that there is hardly an American vessel engaged in foreign trade that has not one or more foreigners employed as officers, and instances, it is said, are not rare of American vessels which have no citizens of the United States on board except the master. If Capt. John Smith, being a foreigner, took command of an American vessel, and falsely swore that he was an American citizen, he would "forfeit and pay the sum of one thousand dollars." If one of the owners should take such oath, Capt. Smith not being in the district, the vessel would be subject to forfeiture; but no such case of forfeiture has ever occurred. She would, however, not be subject to forfeiture if Capt. Smith "had been appointed the lowest officer on the vessel." To be sure, the law requires that "officers of vessels of the United States shall in all cases be citizens of the United States"; but there is no penalty whatever imposed on the vessel if they are not. Many American citizens, on the other hand, undoubtedly own vessels under foreign flags. Some of them transferred their vessels to English colors during the war to escape capture by confederate war vessels, but there are many who adopt this expedient to obtain cheap ships. They engage a trustworthy English clerk, for instance, and buy the vessel in his name, holding a mortgage for

her full value as security. Some years ago the American consul general to China (Mr. Seward), in a report to the state department, stated, as within his personal experience from 1862 to 1875, "that the rigid enforcement of this law would often have forced the owners or agents of those vessels engaged in that part of the world to lay up their ships or transfer them to other flags."—6. No foreign-built vessel, or vessel in any part owned by a subject of a foreign power, can enter a port of the United States and then go to another domestic port with any new cargo or with any part of her original cargo that has been once unladen, without having previously voyaged to and touched at some other port of some foreign country, under penalty of confiscation. By the construction of this law all direct traffic by sea between the Atlantic and Pacific ports of the United States via Cape Horn or the cape of Good Hope, or across the isthmus of Panama, is held to be of the nature of a coasting trade or voyage in which foreign vessels can not participate. (U. S. Rev. Stat., sec. 4347.) In view of the fact that there has been no attempt in recent times, on the part of the English, French or Dutch governments, to interfere with the transport of merchandise by American ships by the common highway of the ocean, between the home ports of these countries and their colonial possessions, this construction of law, not contemplated at the period of its enactment, was regarded by Europe as a bit of very sharp and mean practice on the part of the United States, as it undoubtedly was.—7. An American vessel once sold or transferred to a foreigner can never be bought back again and become American property, not even if the transfer has been the result of capture and condemnation by a foreign power in time of war. (U. S. Rev. Stat., sec. 4165.)—8. A vessel under thirty tons can not be used to import anything at any seaboard port. (U. S. Rev. Stat., sec. 3095.)—9. Previous to a repealing act, in June, 1882, all goods, wares and merchandise, the produce of countries east of the cape of Good Hope, when imported from countries west of the cape of Good Hope, were made subject to a duty of 10 per cent. in addition to the duties imposed on such articles when imported directly. This law was interpreted so stringently that old second-hand gunny-bags, nearly worn out, did not lose their distinctiveness to an extent sufficient to exempt them from additional duties if they finally came to the United States, in the process of using, from a place west of the cape of Good Hope. In one instance a vessel from China, destined to Montreal, Canada, was sent, on arriving, to New York without breaking bulk. It was held that the voyage ceased in Canada, and that the new voyage to New York subjected the cargo to an additional 10 per cent. By the original navigation laws (act of 1790) it was provided that the tariff on all articles imported in American vessels shall be less than if imported in foreign vessels. On "hyson" tea the duty in American vessels was twenty cents per pound; in foreign vessels, forty-five cents. The discriminating duties (repealed in 1882) on products of countries east of the cape of Good Hope, imported indirectly, were a remnant and legacy of these old restrictions. (U. S. Rev. Stat., sec. 2501.)—10. If a vessel of the United States becomes damaged on a foreign voyage, and is repaired in a foreign port, her owner or master must make entry of such repairs at a custom house of the United States, as an import, and pay a duty on the same equal to one-half the cost of the foreign work or material, or 50 per cent. *ad valorem;* and this law extends so far as to include boats that may be obtained at sea from a passing foreign vessel in order to assure the safety of the crew or passengers of the American vessel. (U. S. Rev. Stat., sec. 3114.) To the credit of former days it should be said that this provision of law was not a part of the original navigation laws of the United States, but was incorporated into them by special statute passed July 18, 1866, entitled "An act to prevent smuggling, and for other purposes." Under the treasury regulations it is held that, although no part of the proper equipment of a vessel arriving in the United States from a foreign country is liable to duty, such equipment, if considered by the United States revenue officers as redundant, is liable to the payment of duty as a foreign import, although there may be no intent of landing, disposing of or using such extra equipment except in connection with the vessel. Thus, for example, when two sets of chains were found on board of a foreign vessel, and one set was held to be all that was necessary, the other set was made chargeable with duty. In another case, where anchors and chains were bonded on importation and at the same time entered for exportation and placed on board the vessel as a part of her equipment, it was held by the treasury that the legal duties should be collected on the same.—11. Foreign vessels losing a rudder or stern-post, or breaking a shaft, and arriving in the United States in distress, can not import others to replace these articles here without payment of the duty on the same. In one case of actual occurrence a foreign line of steamers left their mooring chains of foreign manufacture on an American wharf. Some over-vigilant revenue officer reported the occurrence to the treasury department, and it was decided that as the chains were landed, the legal duties should be collected from them as an importation. A foreign vessel can not even land copper sheathing for the sole purpose of being recoppered by American workmen without paying duties on the old copper stripped off and the new copper put on as separate and distinct imports. During the year 1871 the owner of a Dutch vessel entered at Boston, ignorant of the peculiar features of the tariff of the United States in respect to the ocean carrying trade, put on board at the foreign port of clearance a quantity of sheet copper sufficient to sheath the bottom of his vessel, it being intended to have the work done in the United States upon

her arrival, in order to save time and put the vessel in good order for her return voyage. The agent, advised of this arrangement, referred the matter to the officials of the Boston custom house for instructions, only to learn that the new sheathing metal could not be used in the United States as proposed without paying a duty of 45 per cent., while the copper taken off the ship's bottom must also pay a duty of four cents per pound as old copper. The agent signified his willingness to pay the latter and sell the old metal for what it would bring, but requested to be allowed to land the new copper in bond for re-exportation, as it would be carried out by the same vessel that brought it in. He was informed, however, that the bond for exportation required for its cancellation a certificate of the landing of the bonded goods in the foreign port for which its export was declared, which could not be obtained if it was entered at the port of destination *upon* and not *in* the ship carrying it. The consequence was, that when the ship discharged her cargo at Boston she sailed for Halifax, Nova Scotia, carrying her sheathing copper with her, and, after having been there coppered by the shipwrights of the British provinces, returned in ballast to Boston for her return cargo, all this costly proceeding being cheaper than the payment of 45 per cent. duty for the privilege of employing American workmen to take off the old sheathing and put on the new. — 12. If a citizen of the United States buys a vessel of foreign build which has been wrecked on our coast, takes her into port, repairs and renders her again serviceable and seaworthy, he can not make her American property, unless it is proved to the satisfaction of the treasury department that the repairs put upon such vessel are equal to three fourths of the cost of the vessel then so repaired. (U. S. Rev. Stat., sec. 4136.) The following is an illustration of the working of this provision of our navigation laws: In 1871 a citizen of Baltimore purchased a foreign-built vessel wrecked on the American coast and abandoned to the underwriters, and, by spending a large sum in reconstruction, rendered her again seaworthy. He then, being desirous of employing his capital embodied in this instrumentality of trade in the most profitable manner, and assuming that the reconstructed wreck was his lawful property, arranged for an outward cargo under the flag of the United States; but when the vessel was ready to sail, registry was refused by the customs officials on the ground that the vessel was of foreign construction, the sum of the repairs put on the wreck being a little less than three-fourths of the original cost of the vessel; or, in other words, the substance of this decision, which was correct in law, was, that while the citizen, under the laws of the United States, might lawfully buy and acquire title to a wreck and use it for any purpose other than navigation, he could not acquire title to it and make it American property lawful to use as a vessel, even after he had paid duties on its old materials as imports, unless he could show that he had expended upon the abandoned construction for the purpose of restoring it to its original quality for service, a sum nearly equivalent to the cost of building an entirely new vessel. The owner by law, most mercifully, in such cases is not, however, deprived of the privilege of selling the property to a foreigner. — 13. Every vessel belonging to the mercantile marine of the United States engaged in foreign trade (vessels employed in the fisheries excepted) must pay annually into the federal treasury a tonnage tax at the rate of thirty cents per ton. (U. S. Rev. Stat., sec. 4219.) At the commencement of the war in 1861 there were no tonnage taxes; but by the act of July, 1862, a tonnage tax of ten cents per ton was imposed, which was afterward increased to thirty cents, the present rate. Although there was nothing specific in the recent enactments to warrant it, and American shipping engaged in foreign trade was in such a condition as to demand the kindliest consideration from government, the treasury officials, interpreting the statute according to the invariable rule for the benefit of the government and to the disadvantage of the citizen, were in the habit, up to 1867, of collecting this tax at every entry of a vessel from a foreign port; but by the act of March, 1867, tonnage taxes can now be levied but once a year. On a ship of 1,000 tons the present tax, amounting to $300 per annum, represents the profits or interest (reckoned at 6 per cent) on an invested capital of $5,000, and, on a ship of 2,000 tons, of $10,000. Mr. F. A. Pike, of Maine, in a speech in the United States house of representatives, May, 1868, stated that this tax was equivalent in many instances to 3 per cent on the market valuation of an inferior class of American vessels, employed only in the summer months and largely owned by his constituents. In 1789, when the first tonnage tax was imposed, and the treasury of the new nation was sorely in need of revenue, the maximum rate for American vessels was six cents per ton. Vessels belonging to foreign states, between whom and the United States ordinary commercial relations are established, pay the same tonnage taxes as American vessels. But if any person not a citizen of the United States becomes an owner to the extent of the merest fraction in a ship of American build, then such ship is not entitled to the privileges accorded to ships owned wholly by foreigners, but must pay, on entering a port of the United States, a tonnage tax of sixty cents, or double rate, and such vessel at once ceases to be entitled to registry or enrollment as a vessel of the United States. Here, then, we have piled up, as it were, on the top of all other provisions, another direct, odious and stupid discrimination against the employment of foreign capital, provided it should so incline, for the developing of the American shipping interest and the employment of labor even in our own dock-yards and harbors. Suppos-

ing a similar law to be proposed, discriminating in like manner against the investment of foreign capital in American railroads, mines, factories, and mercantile enterprises generally, does any one doubt that the proponent would be at once hooted into contempt? And yet the hypothetical law is no more absurd than the law that actually exists upon the statute book. Practically the law is a dead letter. In the case of ordinary vessels rigid inquiry as to ownership is rarely or never instituted, and the oath required is regarded and taken as a mere form. In case of incorporated American ocean navigation companies (if there are any such), the president of the company has only to swear to the ownership of any vessel by the company, and the federal officials will not care if the ownership of one or a majority of the shares of the corporation vest in citizens of foreign nationalities; the provision of the statute, as with a view of making the law of no effect, being that in this swearing to ownership by a company it shall not be necessary to designate the names of the persons comprising such company. The result of this is, that any foreigner can purchase shares in any American navigation company, and not a vessel of their fleet will thereby lose American registration and American protection; but if a foreigner became the owner of the smallest fraction of a hundred-ton steamboat, plying between Key West and Havana, the registration of such vessel would be instantly vitiated. If a Sunday-school or a picnic party, out on an excursion, happen to come into an American port on a foreign (Canadian) vessel (as was recently the case on one of our upper lakes) for mere temporary and pleasure purposes, the vessel is liable to a tonnage tax, and a libel against such vessel, instituted by an over-zealous official for its payment, has been decided by the treasury department (August, 1876) to be a proceeding which the government must enforce. — 14. By the act of June 6, 1872, all materials necessary for the construction of vessels built in the United States for the purpose of foreign trade, may be imported and used free of duty. But all American vessels receiving the benefit of this act can not engage in the American coasting trade for more than two months in any one year without payment of the duties on which a rebate has been allowed. — 15. The several ports of the United States are classified by districts; and in each district one port is designated as a "port of entry," and others as "ports of delivery." All vessels on arriving from a foreign country in any district, must first report at the established port of entry, and then conform to the details of the custom house service; after which, if the vessel is American, it can proceed to any port of delivery in the district for the purpose of unloading. But if the vessel be foreign, it can only discharge at the port of entry, even though its cargo be imported exclusively for the use of American citizens at a port of delivery. A ship, therefore, may pass almost within hail of the point of destination of its cargo, and yet be compelled to unload many miles away, thus necessitating reshipping and repeated rehandling, at much additional expense. Thus the customs districts of Boston and Charlestown, Massachusetts, comprise only one port of entry, Boston; while Cambridge, Medford, Hingham, Cohasset, and other places, are all ports of delivery only If a foreign vessel arrives from abroad with a cargo of hemp for Hingham, instead of proceeding direct to the wharf in that port, she must first sail right by it, enter herself and cargo at Boston, and then unlade at a Boston wharf, and reship the goods, by coasting vessel or rail, to the owners at Hingham. — The following will also illustrate in some degree the manner in which the navigation laws of the United States have been executed: All vessels of the United States engaged in the coasting trade are required to be enrolled and licensed, and vessels engaging in trade and transportation without previously procuring such enrollment or license are liable to seizure and heavy penalties. On the east bank of the Hudson, in the city of Troy, state of New York, there are extensive iron works, the coal and ore supplies for which are largely transported over the Erie and Champlain canals. Boats coming down these canals loaded with such supplies are locked into the Hudson at West Troy, a point on the west bank nearly opposite to the furnaces; then after crossing the river, delivering their freight and recrossing, re-enter the canal and return on their route for another similar cargo. Some years ago the officials of the United States treasury department decided that under our navigation laws this temporary entry of boats from the canals into the Hudson for the purpose of delivering cargo, and their subsequent return into the canal, constituted a coasting voyage, for the engaging in which it was obligatory on the owners of the canal boats to have previously taken out a license. Of course the owners, not anticipating any such official interpretation of the law, had not provided themselves with licenses, but this nevertheless did not prevent a large number of boats from being seized and libeled for violation of the navigation laws, from which they were only released after expensive and annoying litigation and the payment of considerable sums in the way of costs or penalties. — Take another illustration of more recent date. It has of late years been customary for merchants and shippers on our northern lakes to buy and use for transporting grain large barges or hulks built in Canada, and as such constructions are not capable of moving or navigating except as they are towed, and are not provided with the usual appurtenances for navigation, they have not been regarded as subject to the provisions of our navigation laws relative to foreign vessels. During the summer of 1880, however, the collector of the port of Erie, Pa., on Lake Erie, called the attention of the treasury department to the circumstance that a certain barge, the William H. Vosburg, had been guilty of the heinous

offense of hoisting a sail on its apology for a mast—whether for the sake of avoiding a dangerous rock or a lee shore was not stated—and asked for instructions. The department promptly replied "that the only condition upon which that barge could continue to navigate those waters was to hoist her sails temporarily; any attempt to keep her canvas up beyond that would get her into trouble. Being Canadian built, she could not be enrolled, and, by consequence, the permanent use of sail upon her would entail forfeiture of cargoes and the payment of double tonnage tax at every port of arrival." "The official correspondence does not inform us what the result was, but it is safe to presume the little barge had to take down her little sail, as otherwise she would have been simply taxed out of existence, in accordance with the statutes in such cases made and provided."—In August, 1875, the Canadian yacht Oriole, of less than fifty tons burden, owned in Toronto, but belonging to the International yacht club and the yacht club of Detroit, arrived in Chicago from Toronto with a pleasure party of seven gentlemen for the purpose of participating, on invitation of the Chicago yacht club, in a regatta at the latter port, having previously made a tour of the lakes, stopping at various points of interest and taking on board, on several occasions, pleasure parties of ladies and gentlemen, who were entertained in part by transportation from port to port. On arrival at Chicago the Oriole was complained of to the treasury department as having violated the navigation laws of the United States, which forbid foreign vessels from participating in the coasting trade and from conveying passengers from one American port to another, and proceedings looking to seizure and confiscation were contemplated. This penalty the secretary of the treasury graciously remitted, inasmuch as there was evidently no intent on the part of the owner of the Oriole to violate the law; but owing to the absence of proper papers showing the nationality and occupation of the yacht, although these were well known, the privilege of exemption from tonnage taxes accorded by law to foreign pleasure yachts was not granted. The Chicago yacht club, therefore, paid on account of their guests, into the treasury of the United States, the sum of fifteen dollars, while the owners of the Oriole, not knowing what other legal difficulties they might encounter from a prolonged sojourn, slipped out of port in the early morning and returned home as soon as practicable. — We are accustomed, as we read of the sumptuary laws and arbitrary restrictions on commercial and personal freedom in years long past, to congratulate ourselves, as it were involuntarily, that we live on a higher and different plane, and that among nations calling themselves civilized and enlightened such things are no longer possible. It would be difficult, however, to find in any record of past experience more absurdities and iniquities than are embodied in the so-called navigation laws of the United States at present existing, and in the details of their administration during the last quarter of a century. And yet it was in respect to these same laws that a convention of one of the great political parties, held in Maine in August, 1877, unanimously resolved that "enacted in the infancy of the republic, they have proved their wisdom by long and varied experience. They embody the matured judgment of three generations of commercial men. Any radical change in these laws would be detrimental to the highest interests of American commerce and a damaging blow to the national independence of the country." In answer to the questions which must naturally here suggest themselves to every thoughtful mind, How is it that such laws can at this period of the nineteenth century be maintained and defended? and how happened it that a convention of presumably more than average intelligence could make public declaration of such nonsense and untruth as was embodied in the resolutions of the Maine convention above quoted? it may be said that upon no one public matter have the American people, until within a very recent period, been so little acquainted as in respect to our commercial laws and regulations. Scattered through statute enactments for over ninety years, and with court and treasury interpretations for the same period forming a part of the law and all of its administration, though not embodied in the statute, it has not been an easy matter for even those engaged in the business of law and lawmaking to know what the navigation laws actually were; and it is exceedingly doubtful whether in the convention referred to there was one single man that had any clear and definite knowledge of how these laws originated, what they embody, and what is the sphere of their influence. — *Repeal of British Navigation Laws.* It required a long time to induce even so much as a doubt in the minds of Englishmen, that such laws as her navigation code were not in every respect wise and expedient. Up to the year 1821, according to a report made to the British house of commons, "no fewer than two thousand laws" had been enacted at different periods for the protection, encouragement or regulation of British commerce, every one of which, according to the testimony of Buckle, "was an unmitigated evil." — Again, during the whole of the period of the existence of the British navigation laws, the predominant idea among British statesmen was, that commerce could not take care of itself, that it would decay under the influence of foreign competition, and that legislation—protective and interfering—was the essential thing to make it prosperous. Indeed, it was considered necessary that no parliament should go out of existence until it had enacted something pertaining to the regulation and encouragement of trade and commerce. "I pray you," said Charles II., in one of his speeches to parliament, "contrive any good short bills which may improve the industry of the nation; and so, God bless your councils." Mr. Ricardo, the celebrated economist and author, who wrote before the repeal of the navigation laws, in commenting

on this state of things, used the following language, which equally well applies to the existing situation in the United States: "All increase of shipping," he says, "they attributed to acts of parliament; none to increase of population and industry and wealth: according to them, all good is the result of restriction and protection, and only evil springs from enterprise and competition. Experience has taught them nothing; the word 'protection' has so mystified and deluded them that they are martyrs to it, and let it bind them down to inferiority and decay." "No one," says Mr. W. S. Lindsay, author of a recent work on merchant shipping, "can rise from a study of these laws without a feeling of amazement at the trouble our ancestors gave themselves to 'beggar their neighbors' under the erroneous impression which too long prevailed, that by their ruin our own prosperity would be most effectively achieved. It is therefore not surprising, that, under such legislative measures, maritime commerce was for centuries slow in growth, and that British merchants and ship owners frequently suffered quite as much through the instrumentality of laws meant for their protection as their foreign competitors against whom these regulations were leveled." — British legislators, in common with legislators of our own day and nation, were unwilling to learn, except by experience; but, after five centuries of experience in attempting to promote commerce and navigation by law, they began to realize that the general effect of such a policy was injurious, and not beneficial. This feeling first practically manifested itself in a motion in parliament, in 1847, by Mr. Ricardo, for the appointment of a committee to inquire into the operation and policy of the navigation laws; and, although strenuously opposed, the motion was adopted by a vote of 155 to 61. The committee thus created, owing to a termination of the session before they had concluded their labors, never reported; but the evidence taken by them, and placed on record, abundantly proved that these laws failed to secure superiority either in ships, officers or crews; that they failed to secure a supply of seamen for the navy; that they were prejudicial to both British foreign and colonial trade; that they caused the enactment by other countries of similar laws, framed, in part, for retaliation; and that they did not secure remunerative profits to the ship owner. One representative witness, deputed by an association of ship owners to appear before the committee, expressed the opinion that half the capital embarked in British shipping during the preceding twenty-five years had been entirely lost. — There was, moreover, a special stimulus acting on the British mind, at the time the reform movement commenced in 1849, in favor of a more liberal maritime policy. Ships were then built almost exclusively of wood. The United States could build cheaper and better ships than England, because the advantage in the material and skill for building was with them. And England, recognizing this fact, felt that the repeal of all restrictions in the way of the purchase by her citizens, of American ships, was one of the conditions essential to enable them to meet American competition on the ocean on anything like equal terms. By act of parliament, therefore, in 1849, all British navigation laws of a restrictive character, with the exception of such as pertained to the coasting trade, were repealed; and, in 1854, the British coasting trade also was thrown open, without restriction, to the participation of all nations. The reason why the British coasting trade was not also made free in 1849, the same as, and in connection with, British foreign trade, it is now well understood, was because of the unwillingness of the United States to make any reciprocal maritime concessions. — Although long discussed, and the end, to some extent, anticipated, this actual abrogation of the British navigation laws finally encountered great opposition throughout the kingdom; and predictions were freely indulged in by such men as Disraeli, Lord Brougham, Lord George Bentinck, and others, that henceforth "free trade in shipping would destroy the shipbuilding trade of Great Britain, ruin British ship owners, and drive British sailors into foreign vessels." In Liverpool, petitions to parliament against the repeal received 27,000 signatures, while a counter-petition received only 1 400 signatures. In London, the petitions against repeal received 23,000 signatures. Thomas Baring and other equally influential persons heading the list. Some leading British ship owners, seeing nothing but ruin before them, sold out their whole tonnage at the best price attainable in a depressed market, the moment that it became evident to them that all attempts to further perpetuate the navigation laws would be useless. In the house of commons, Mr. Disraeli concluded a long attack upon the first bill repealing the British navigation laws, in the following words, which would seem to have served as a model for nearly all the statesmen of the restrictive school in the United States from that time onward: "Will you, by the recollections of your past prosperity, by the memory of your still existing power, for the sake of the most magnificent colonial empire in the world, now drifting away amid the breakers, for the sake of the starving mechanics of Birmingham and Sheffield, by all the wrongs of a betrayed agriculture, by all the hopes of Ireland, will you not rather, by the vote we are now coming to, arrive at a decision which may to-morrow smooth the careworn countenance of British toil, give growth and energy to national labor, and at least afford hope to the tortured industry of a suffering people?" And he closed by sarcastically observing that "he would not sing 'Rule Britannia' for fear of distressing Mr. Cobden, but he did not think the house would encore 'Yankee Doodle.' He could not share the responsibility of endangering that empire which extended beyond the Americas and the farthest Ind, which was foreshadowed by the genius of Blake and consecrated by the blood of a Nelson—

the empire of the seas." Lord Stanley (afterward Earl Derby), in objecting to the proposal to admit a foreign-built ship to British registry, said, "It was essential to keep up the number and efficiency of our private building-yards, which would speedily decrease in number were such a proposal adopted." Admiral Martin testified before the select committee of the house of commons, "that if the abrogation of the navigation laws left the [British] ship owner at liberty to build his ships in foreign countries, and he availed himself of that license, it would inevitably diminish the shipwright class in this kingdom; yet on this class the safety of England greatly depended." Mr. Walpole, M. P., said that, "whatever gain might be reaped by individuals, the repeal of the navigation laws would imperil the safety of the country." Mr. Drummond, M. P., declared "the measure to be the last of a series invented by the Manchester school, the end and intention of which were to discharge all British laborers, and to employ foreign laborers in lieu of them—foreign sawyers instead of English sawyers, foreign shipwrights instead of English shipwrights, and so on through the whole category of employments." He added, "that if there was a satanic school of politics this was certainly it." The ship owners' society of London, in one of these appeals to parliament, after expressing the opinion that the maritime greatness of England depended upon the maintenance of the navigation laws, said, "that if these laws were abolished, 'Rule Britannia' would forever be expunged from our national songs, the glories of Duncan and Nelson would wither like the aspen leaf and fade like the Tyrian dye, and none but Yankees, Swedes, Danes and Norwegians could be found in our ports. Who would there be to fight our battles, and defend our sea-girt shores?" Lord Brougham also spoke of the laws that it was proposed to repeal, as having long been considered "not only as the foundation of our glory and the bulwark of our strength, but the protection of our very existence as a nation." But all of these appeals proved powerless to prevent the progress of reform, and common sense in the end triumphed by a majority of fifty-six in the commons and ten in the house of lords Sir Robert Peel, in closing the debate, met the predictions of disaster, so freely indulged in by the opponents of repeal, by showing that "the same outcry of ruin to the ship owner" had always been set up whenever any measure looking to the unshackling of ocean trade had previously been proposed; and adverted in particular to the circumstance that when in 1782, seventy years previous, it was proposed to admit Ireland to participation in the colonial trade, the ship owners of England prevented it on the ground that it threatened ruin to their interests, and that those of Liverpool, in a petition addressed to the house of commons, declared, "that if any such thing were permitted, Liverpool must be inevitably reduced to its original insignificance."—*Experience of British Shipping subsequent to the Repeal of the Navigation Laws.* Let us next inquire as to the results of the experience of this legislation, and how far the prophecies of doom indulged in by Disraeli, Brougham and Drummond were realized. From 1816 to 1840 the tonnage of the United Kingdom remained almost stationary, increasing during the period of twenty four years to the extent of only 80,118 tons. It began, however, to increase immediately and coincidently with the removal of British protective duties in 1842, and gained 444,436 tons between 1842 and 1849. After the repeal of the navigation laws it went up from 3,485,958 in 1849 to 3,662,344 in 1851; to 4,284,750 in 1854; to 4,806,826 in 1861; to 5,694,123 in 1871; and 6 574,513 in 1880.* But even this statement fails to convey a correct idea of the rapidity of growth which British commerce has experienced since the shackles for so many years imposed upon it by the navigation laws were removed; for, with the introduction of steam as a motive power for vessels, a very much larger amount of service is performed with a given amount of tonnage than formerly, thus continually diminishing the necessity for an absolutely large increase of tonnage. For a full understanding, therefore, of what has actually taken place, it is necessary to couple with the statement of the absolute increase of British tonnage a statement of the increase of tonnage entering or clearing the ports of the United Kingdom; which, comparing 1840 with 1880, has risen from 6,490 485 tons to 41,348,984 tons, an increase of over 500 per cent.—The statistics of the entries and clearances in the British foreign trade showed an increase in 1860 of 10,000,000 tons over 1850; 12,000,000 in 1870 over 1860; and 22,000,000 in 1880 over 1870. British steam tonnage increased two and a half times during the decade of 1850–60, more than trebled between 1860–70, and increased two and a half times again between 1870–80. "I am not acquainted with any national industry," says Mr John Glover, in a paper on "The Progress of Shipping," read before the statistical society of London, February, 1882, "of which such statements could be made on the authority of parliamentary returns." Wooden vessels, according to the same authority, are disappearing from the British register at the rate of about a thousand vessels each year. But, for every ton of effective carrying power thus lost, seven tons through replacement by steamers, it is estimated, are gained. Another curious fact showing the immense economy of steam, brought out by recent investigations, is, that the enormously increased work performed by the British commercial marine, in 1880, was performed by fewer hands than were employed in 1870. As has been already noted, the restrictions on the participation of foreign vessels in the coasting trade of Great Britain were not removed at the time of the repeal of the navigation laws in connection

* For the entire empire the aggregate of British tonnage is estimated at a much higher figure.

with foreign trade in 1849, but were continued until 1856. Much apprehension was even then felt at the possible effect of the removal of the last British barrier in the way of free ocean commerce; but experience soon showed that freedom was no less beneficial in the smaller sphere of its application than it had proved in the larger. The British coasting trade, as had been the case with the British foreign trade, immediately and largely increased under conditions of freedom; and while foreign vessels at once and for the first time came in and participated in it, the proportion of the total business transacted by British vessels eventually became greater than ever before, and the superiority once established has never been impaired.— Since Great Britain repealed her navigation laws in 1849, all maritime nations, except the United States, have either greatly modified the old time restrictions which they once imposed on the building and use of vessels, or abolished them altogether, Chinese and Japanese commercial exclusiveness having even yielded to the liberal spirit of the age. In the United States, however, the old laws, without material change, continue (1882) to hold their place upon the national statute book. International trade since their enactment has come to be carried on by entirely different methods. Ships are different, voyages are different, crews are different, men's habits of thought and methods of doing business are different, but the old, mean, arbitrary enactments which the last century devised to shackle commerce remain unchanged in the United States alone of all the nations, and, what is most singular of all, it is claimed to be the part of wisdom and the evidence of patriotism to uphold and defend them.— Those who oppose the repeal of the present navigation laws of the United States, on the ground (as they generally do) that it is necessary to maintain them in order to perfect American ship building, encourage commerce, promote national independence, and educate a large body of skillful seamen ready for any emergency, find themselves confronted with the disagreeable and undisputed facts, that under the influence of these very laws, our ship yards have become deserted, our ocean carrying trade has dwindled to insignificance, while an American sailor has come to be regarded almost in the light of a curiosity. In short, every end for which the navigation laws were originally instituted has been frustrated; and no result following their repeal could be any worse than what exists, or is certain to follow their continuance. Another result of the present state of things, which, if it has not already happened in a degree, is certainly to be apprehended, is the destruction, through the shutting out of free competition with foreign ship builders, of the inventive faculty of the nautical engineers and mechanics of the United States. American genius in days past has led the way in many great improvements in marine architecture; but with the decline of our ocean marine, the shutting up of our yards, and the continuance of antiquated, obstructive laws, we seem to offer no longer any incentive to either genius or enterprise in this direction. Bring back the ships, even by buying them abroad, and the repairs of a large merchant marine on this side of the Atlantic, which can not be avoided, will afford more employment to labor, and require the use of more capital, than ship building in the United States now does or ever can under the existing system. The United States must be a large ship-using, before it can be a large ship-building, nation.

DAVID A. WELLS.

NAVY. Although the word navy is applied indifferently so as to include not only vessels of war but also vessels of commerce, the merchant navy, in this article its meaning will be confined to the means of defense by sea, or vessels of war. A nation that possesses an extensive and flourishing commerce must possess a naval force that shall be adequate to protect it in case of war against the depredations of hostile nations. Again, colonies, as a rule, possess no extensive means of defense against the depredations of other nations, but depend for protection upon the mother country, and this entails the necessity of maintaining a navy upon the latter. And this necessity becomes stronger in proportion as the nation may be contiguous to other nations with which questions of state policy and the entanglements of diplomacy, of alliances and agreements, are liable to arise. Thus, England and France are, from their geographical positions, which bring them into close and opposing relations with one another, compelled to keep up naval forces, and forces that shall be as nearly as possible equal in strength and efficiency. Moreover, their commercial interests often clash, and they have from time to time entered into alliances with one another, which, depending upon the condition of the people of third countries over which they exercise a sort of joint protectorate, are liable to be broken, and to become a cause of war. Thus, the European nations, or at least such of them as have seacoasts, are, from their geographical positions, their political relations, and the identity of their commercial interests, forced to maintain a navy of sufficient strength to protect their rights and enforce an observance of them from other nations. The maintenance of the navy among these nations is one of the most important items of expenditure, and presents in this respect a curious contrast with the policy pursued in the United States. This country is in the neighborhood of no nation that could muster a sufficient naval force to do her great damage without being speedily crushed; and the expense attending the transfer of an extensive armament from European to American waters, together with the immense odds that would in a short time be brought against such a force if actually transferred, are securities against the making of such an attempt. That it has been done, is not to say that it will again be

done, for within the last twenty years naval warfare has undergone such a change as to make the methods used up to the rebellion as much out of date as the naval methods employed by the English against the Dutch in the seventeenth century. It is true that the many islands near our coast could be made centres of action, from which a predatory warfare could be carried on against the shipping of this country, and even descents could be made upon the coast. But this event is too remote to be seriously considered. Another advantage that this nation possesses, in addition to being the most powerful nation on the continent, is the fact that there are no alliances with European nations which could draw her into war should such a war be precipitated among European nations. The policy of not entering into alliances that could bring about such a result has become a recognized principle of our foreign policy, and experience has shown that a great part of the peace and general prosperity which has been enjoyed by this nation is due to a consistent adherence to this policy, and that while Europe may be convulsed by war, this country may, through her commerce even, gain by a policy of strict neutrality, only such measures being taken as are necessary to insure the safety of the merchant marine. Moreover, it has no colonies to protect, and, at present, not an extensive commerce with semi-barbarous people to maintain, and, if necessary, defend. It would appear as if this policy of non-interference with the affairs of other nations can not be longer maintained, but circumstances will compel the United States to enter into such political relations with weaker nations, in order to protect her own interests, as will prove fruitful sources of complication and even war. The rise of many nations of South America, with which in the near future an extensive and valuable commerce must be maintained, and such questions as are involved in the construction of a canal across the isthmus, affecting, as they do, the interests not of one but of many nations, must in time give rise to questions of public policy and of international commercial relations which this country can not afford to ignore. And when such conditions do come to pass, a navy will become as essential to the United States as it is to England, France or Italy. Nor is it pretended that a navy depends for its existence upon political reasons. If in the past the freedom from such complications has lulled the country into a sense of security, and but little attention has been paid to the formation and maintenance of a navy, that is no reason for a continuance of such a policy, or a defense of the former lack of such a weapon of defense, a deficiency that has been a source of much humiliation. At the time of writing [1882] this nation stands alone among great nations in having no naval force that could for one moment contend against the modern systems of constructing and arming war vessels.— But a navy is not the product of a day. It is a matter of slow growth, and in times of peace such a naval establishment must be maintained as will form a nucleus for a naval force in actual war. Nor need such a force remain idle. It carries and displays the nation's flag in foreign waters, and lends a moral, or, when necessary, an active, support to its ministers stationed at foreign courts, and its merchants in foreign countries; it may be usefully engaged in expeditions for scientific purposes, as the Japan expedition, the explorations in the Pacific ocean, and the Arctic expedition It maintains and keeps in active service a body of trained men who may form an efficient force when called into active service The navy has thus its uses in peace as well as in war, and the main question to be determined is, what force is sufficient for a peace establishment? The answer to this question must depend greatly upon the situation of the country, as has been noted above, and upon the condition of the people. A navy presupposes an advanced state of material prosperity, for it is a costly instrument. Moreover, a navy will be of greater vitality in proportion to the extent and value of a nation's commerce; and, other things being equal, those nations possessing the largest commerce will also have the most powerful fleets. But it does not follow that a navy should be proportioned in size to the merchant marine. Thus, at the outbreak of the rebellion the United States navy had in commission but forty-two vessels—a very inadequate force when the extent of its commerce is considered, and when its merchant vessels had engrossed a large share of the carrying trade of the world, which was much more liable to interference than at present. The value of an extensive merchant marine in furnishing the materials for a navy was clearly shown in the war of 1812 and the rebellion. The material strength of a navy consists in ships, engines and guns; but these would be useless without that which will give to them vitality, viz., a flourishing mercantile marine. But while a navy is a matter of government concern, a merchant marine depends upon the people, upon the general economic condition of the nation, and to place restrictions on the growth and extension of commerce, or to seek to foster it by bounties and subventions, does not assist in the formation of a navy, but is a costly and clumsy attempt to produce by artificial means what should be brought about by natural causes, and what would reach a high stage of development were there no interference with natural conditions. To favor large expenditures on the navy and yet prevent the development of a merchant marine, which must be depended on for the raw material of the navy, is to do exactly what should not be done, and any attempt to force into existence and maintain a navy under such conditions, would in the end prove a futile and costly experiment. Nor is it a sufficient reply to this, to urge that with the great changes in the methods of a navy, it has become less a matter of seamanship than of engineering, and that the merchant marine affords very little opportunity for acquiring such training as is re-

quired. However true this may be within certain limits, yet the most advanced navy can not afford to dispense with a certain class of vessels, fleet cruisers, for which a merchant marine can furnish not only men but vessels. — Moreover, the navy is in a state of transition, of perpetual change and advance, not only as respects the form of the vessel and material used in its construction, but also in the manner of protecting and arming it. It is difficult to fully realize how rapid have been the changes in this particular within a very short time. The old wooden ships of the line, which were propelled wholly by sail, and armed by guns of the most insignificant power and range when compared with the ordnance of to-day, have almost disappeared under the advances that have been made in engineering science. Yet these vessels were used up to 1861, the year of the rebellion, in this country, and they were employed to some extent in the operations of that war. The introduction of steam as a means of propulsion prepared the way for great changes in construction, although in itself it modified but slightly the form of the vessel. But however fitted for merchant vessels, it was at first seriously questioned whether steam could be used in war vessels, first, on account of the expense and the great amount of coal that must needs be carried for long voyages, and secondly, on account of the ease with which boiler and machinery could be injured by the shots of the enemy. Instead of decreasing the risk and danger of naval warfare, it was claimed that they were increased and the vessel was more vulnerable than before. But when put to the test all doubts were removed, and it was seen that a new and immense power was gained, which no longer compelled a vessel to depend upon such uncertain agents as wind and current, but by which it could be easily and successfully manœuvred under any conditions. So rapidly did steam make its way that in 1858 the sail vessel, for purposes of war, was regarded as obsolete, and the last sailing vessel built for the American navy was the Constitution, which was commenced in 1853 and completed in 1855. Moreover, this change in the means of propulsion was succeeded by a revolution in the manner of constructing war vessels, although a number of years elapsed before such a revolution became a settled fact. To protect the vitals of a ship it was coated with iron armor, and this idea of protection by iron or steel plates has been extended and developed, and vessels of that description, however different in the details of construction from the originals, now constitute a very important element in every navy that is worthy of the name. — It has justly been said that during the rebellion the United States reformed the whole system of naval warfare twice; first, in respect to the construction of ships, and secondly, in respect to the construction of ordnance. The greatest advance in naval construction was made in the monitor class of vessels, in which it was sought to expose as small a surface as possible to the guns of the enemy, to concentrate the armor on certain parts of the vessel where it is most exposed to injury, and to reduce the armament to a small number of guns, or even a single gun, whose great power and efficiency enables it to do more damage than could be accomplished by a broadside of the old vessels. These guns, instead of being placed on the sides of the vessel, which would be impracticable on account of the height of the vessel and weight of the metal, are placed so as to be parallel with the keel, and are therefore supported by the whole buoyant force of the vessel. The monitor class of vessels is an American invention, although it has reached its highest development among European nations; and although ridiculed and opposed when first proposed, yet its merits were quickly recognized when its powers were first tested in the contest between the Monitor and the Merrimac. — Every advance in armor has developed a corresponding advance in the form and force of attack, and the contest is still going on. The armor of the "Warrior" class of vessels, the most powerful vessel afloat in 1860, was composed of iron of four and one-half inches in thickness. To resist the most powerful guns of the present day armor of at least two feet in thickness is required, and some vessels in the present navy of Italy bear armor thirty inches in thickness, and they carry the heaviest guns yet manufactured. In order to reconcile the constantly increasing thickness of armor with the weight which the vessel is capable of bearing, it has become necessary to restrict the area of armor surface to ever narrowing limits. The object is to protect rather than to armor, and to expose such parts of the vessel as are not of vital importance, in order to gain in speed and protect certain parts, a process which involves the massing of the thickest armor in vital points. Thus, in the large iron vessels which the Italians are now building, the armor is withdrawn from every part except the battery, and even there the armor will be confined to a narrow belt of great thickness. Everything of importance that can be injured by projectiles will be kept below the water level, and the ships will be secured from sinking by means of an under-water deck and ample division into compartments. The active duties of a powerful ironclad are extremely limited, and the effective strength of a navy will doubtless hereafter lie in its fleet cruisers for offensive, and in its ironclads for defensive, purposes. Moreover, a most dangerous weapon for use against these ironclads lies in the torpedo, for it is from under the water that an ironclad can be attacked with greatest effect. Yet steps are being taken to render almost harmless such attacks. Thus, the vessel is divided into a large number of compartments, so that the injury may be localized; and a still further advantage is gained by filling such compartments with cork, which will add to the buoyancy of the vessel, or with coal, so that when the water rushes in it will find the space

already occupied by what already forms a part of the weight of the vessel. These changes have also tended to equalize the naval power of the more powerful nations. Sir William Armstrong, one of the best authorities on this subject, says: "So long as naval superiority depended upon seamanship and an unlimited supply of sailors, no nation or combination of nations could compete with us; but as soon as it became established that fighting ships could be manœuvred with more certainty and precision by the power of steam than by the power of wind, a revolution began which has gradually made naval warfare a matter of engineering rather than of seamanship. The introduction of rifled ordnance and percussion was the second step in this revolution, and had the effect of condemning as useless the whole fleet of wooden ships with which all our victories had been won, and which were the pride of the nation. Then commenced that contest between armor and guns which has gone on to this day, and has not yet been decided." — In vessels intended for long cruises on the ocean, the tendency is to strip off the heavy armor, and to go back to the old conditions, but with this important modification, that the vital parts of the fighting machine are well protected, so that they can not be disabled by a single shot or shell. The most vulnerable point to a great nation lies in its mercantile marine, and it is here that the greatest damage to its interests can be done in the shortest space of time. Moreover, the physical nature of the sea tends to render it easy to strike a blow by the capture or destruction of merchant vessels The wind and current charts explain what is now sufficiently well known, that the merchant ships follow very definite routes across the ocean, and that these routes converge on certain limited areas which have been called "crossings." "Thus every sailing vessel from Europe to the West Indies or to the United States, every ship from the United States or Canada bound to the eastward round the cape of Good Hope, or to the westward round Cape Horn, and every ship homeward bound from these distant stations either to Europe or to the states, necessarily passes through a position in the North Atlantic, approximately fixed by latitude 23° N., longitude 40° W. Or again every European or American ship, whether outward or homeward bound, that crosses the equator, does so in about longitude 26° W." It must stand to reason that in any future war these "crossings" will form most important strategic points. But in order to pursue with any success these merchant vessels, armed vessels of equal speed must be used, and a vessel loaded with armor can not accomplish this. So that a navy should contain a certain number of vessels of high speed, carrying as little unnecessary weight as is essential to its effective action. The same object may be attained by other means. Thus, in England certain advantages are offered to ship owners building their steamers subject to definite conditions in respect to strength and subdivision by which they may be better adapted for war. It was recently stated that the British admiralty has a list of upward of 200 ships, all of which had complied with the conditions of the department so far as construction is concerned. The value of this force, as auxiliary to the regular navy, can hardly be over-estimated. In 1861 this country occupied the same relative position, having an immense mercantile navy from which to obtain such vessels as were needed, and it was due to this fact alone that the blockade of the southern coast was so promptly begun, and so effectively maintained. — The policy of maintaining a navy is no longer a matter of doubt A powerful navy exerts a great moral power, and a nation without one is more open to attack from its neighbors, and particularly if advanced in material welfare, because it becomes an object worth plundering. It is ill-advised economy to stint appropriations for a navy, because in a very short space of time great loss could be inflicted upon commerce, which might have been averted had it been known that a naval force could be at once sent out to protect the national interests. Still, immense sums have been wasted in experiments in construction and armaments, which are no sooner proved of value than they are superseded by new and improved processes In existing circumstances it would be difficult to say what policy should be adopted with regard to a navy, for the changes are succeeding one another with great rapidity, and the end does not as yet appear. It may, however, be said that for some time ironclad fighting vessels or rams, and torpedoes, will be used for coast defense, and the latter particularly on coasts with shallow inlets, as on the eastern coast of the United States; and a number of fleet cruisers for offensive purposes. A navy, even of such a character, is a costly instrument; but, if efficient, will prove a profitable investment. Moreover, it is true economy to construct such a navy in time of peace when conditions are favorable. Such a policy also tends to keep in active employment skilled labor, which is becoming more and more essential as the character of the navy changes. To be ready for war is to be secure in peace, and the main object to be attained is to prepare a force that may be called into service without having to maintain a large and expensive establishment. — The history of the navy of the United States is at once curious and instructive. So long as the colonies remained loyal to the mother country no navy was formed or maintained, because they naturally looked to England for the protection of their commercial interests, and the prestige of the British navy was at that time such as to secure the colonies from the depredations of a hostile nation. So that at the outbreak of the revolution this country possessed no navy, and but little experience in the requirements of such a means of defense During the war no serious attempt was made to build a navy that could cope with English vessels, and resistance on the sea was con-

fined to spasmodic efforts called forth when the circumstances were pressing. Yet by the articles of confederation the power to build and equip a navy was vested in the United States in congress assembled, and the states were prohibited to keep war vessels in time of peace, except such number only as shall be deemed necessary, by the United States in congress assembled, for the defense of such states and their trade. This grant of power was not confined to a time of war, for, as Hamilton pointed out, were the means of defense to be given to the Union only in time of war, and to the states in time of peace, the Union "would be obliged to create, at the moment it would have occasion to employ, a fleet." But so powerless was the confederacy that little was done, as will be shown, under this liberal grant of power, and the contest against the British navy was chiefly carried on by private vessels, manned with patriot volunteers, and armed as circumstances would allow. In the fall of 1775 the attention of congress was called to this subject, but before any action was taken on its part, Washington had fitted out five or six armed vessels at Boston, and these were cruising on the New England coast as privateers. The states also took action, and in November of that year the government of Massachusetts established a board of admiralty, an example that was followed by other states. Congress had, however, already appointed a committee of three to direct naval affairs, consisting of Silas Deane, John Langdon and Christopher Gadsden, and resolved that "a swift-sailing vessel, to carry ten carriage guns, and a proportionate number of swivels, with eighty men," and another of fourteen guns and a proportionate number of swivels and men, should be fitted out and sent out to intercept British transports carrying munitions of war to Canada and Boston. On the 30th of October two more vessels were ordered, and the naval committee was increased to six members, a number that was still further increased to thirteen, and consisted of one member from each colony, to be appointed by ballot. The powers of this "marine committee" were not, however, such as to insure an efficient naval administration. It possessed little executive power, and, like a committee of congress, only examined naval subjects and reported thereon to congress. The committee appointed all officers below the rank of third lieutenant, and had the general control, under the immediate sanction of congress, of all naval operations. So little satisfaction did their work give, that congress, in November, 1786, selected three persons well skilled in maritime affairs to execute the business of the navy, under the direction of the "marine committee," to be known as the "continental navy board, or board of assistants to the marine committee." This remained in active operation until 1799, when a "board of admiralty," consisting of three commissioners not members of congress, and two members of congress, was established, the action of which was to be subject, in all cases, to the control of congress. Two years later a general "agent of marine" was appointed, with authority to "direct, fit out, equip and employ the ships and vessels of war of the United States, under such instructions as he should from time to time receive from congress," and Robert Morris was the first agent. During the war, congress authorized the purchase, construction or fitting out of between thirty and forty vessels; but the largest naval force at the command of congress was in 1776, and was composed of five frigates of thirty-two guns, twelve vessels of from twenty-four to twenty-eight guns, and eight mounting from ten to sixteen guns. Of the vessels authorized to be constructed, three were of seventy-four guns. This force, however, was not engaged in open warfare with the British fleet, but, in connection with privateers, was engaged in intercepting the supplies of the enemy, and great damage was thus done. It has been estimated that the number of captures made during the war, apart from those retaken or lost, was 650, the value of which was about $11,000,000. Almon's "Remembrancer" states that in 1776, 342 British vessels fell into the hands of the Americans; of which forty-four were recaptured and four were burned. In the following year the British lost 467 merchant vessels, although a force of seventy war vessels had been maintained on the American coast to protect the merchant marine of England. In 1777 congress directed that the building of ships of war should be suspended, in consequence of the high prices of all materials of construction, and from that time the navy rapidly decreased. The alliance with France in 1778 rendered less necessary a marine, and that country furnished a naval force which rendered material assistance to the land forces in the contest. In August, 1780, a committee of congress reported that only four vessels of war could be equipped that season, and in the following year, by the capture of the Trumbull, the American naval force was reduced to two frigates, the Alliance and the Deane; when the war was terminated, the United States had no navy, and the very few armed vessels they then had were ordered to be sold, and the same was done in the case of the Alliance. As showing how small must have been the naval force in 1784, there were appropriated in that year for the marine department but $30,000.— Peace, however, did not bring freedom from the fear of war. Florida was in hostile hands, and the navigation of the Mississippi had already become a matter of controversy. The provisions of the treaty with England remained unfulfilled and were likely to create new complications that might involve another war. The clear mind of Hamilton saw the necessity of making preparations for any emergency that might occur, and he recognized the fact that a navy must be formed in time of peace, but the strongest pressure came from the Barbary powers, which commenced hostilities against the United States by depredations on their commerce, and openly declared war. The commerce of this na-

tion in the Mediterranean was interrupted, and there was no naval force of sufficient strength to protect it from insult and depredations, a fact that only increased the daring of the Algerine pirates. But not until 1794, after the Portuguese government had concluded a truce with the regency of Algiers and withdrawn its fleets, thus removing the little protection it afforded, were measures taken by congress to create a navy, and then it was no policy for a permanent but for a temporary navy. In January, 1794, the house of representatives resolved "that a naval force, adequate to the protection of the commerce of the United States against the Algerine corsairs, ought to be provided," and six frigates were authorized to be built; but the act provided that in the event of peace no further proceedings should be taken by virtue of said act. In 1796 peace was made and the house authorized the completion of three of the frigates, and the sale of all materials not necessary to their completion. — In his speech to congress in 1796, referring to the depredations of the English and French on the merchant vessels of this country, President Washington gave the first distinct recommendation by the executive of a permanent naval policy. "To an active external commerce the protection of a naval force is indispensable. This is manifest of wars to which a state itself is a party. But besides this, it is in our own experience, that the most sincere neutrality is not a sufficient guard against the depredations of nations at war. To secure respect to a neutral flag, requires a naval force organized and ready to vindicate it from insult or aggression. This may even prevent the necessity of going to war, by discouraging belligerents from committing such violations of the rights of the neutral party as may, first or last, leave no other option. From the best information I have been able to obtain, it would seem as if our trade to the Mediterranean, without a protecting force, will always be insecure, and our citizens exposed to the calamities from which numbers of them have just been relieved. These considerations invite the United States to look to the means, and to set about the gradual creation of a navy. Will it not then be advisable to begin without delay to provide and lay up the materials for building and equipping of ships of war, and to proceed in the work by degrees, in proportion as our resources shall render it practicable without inconvenience, so that a future war of Europe may not find our commerce in the same unprotected state in which it was found by the present?" — President Adams, in his message of 1797, insisted upon the necessity of creating some naval force; and in the following year additions to the navy, by purchase, hire or construction, were authorized, and a further change was made in the organization of the marine department. An additional branch of the executive was formed, to be under the management of a secretary of the navy, who executed the orders of the president concerning the procurement of naval stores and materials, and the construction, armament and employment of vessels of war. This organization continued for seventeen years, when it was interrupted by the appointment of a board of commissioners composed of captains. This latter board was abolished in 1842, when the organization of the navy department into five bureaus was created, and on the outbreak of the rebellion its powers and duties were increased, and the number of bureaus increased to eight, as it remains to-day. — It would be unnecessary as well as tedious to trace step by step the number of measures adopted for creating a navy between the close of the revolution and the war of 1812 The threatening attitude of France gave a stimulus to naval construction, but with peace all materials and vessels were sold, with the exception of some of the larger ships of war. Docks for the repair of public vessels were built, and growing timber suitable for the navy was purchased in large quantities. Yet it was an accepted policy of the republican party not to prepare for war in time of peace, and the expenditures upon the navy were not of such amount as was justified by the relations then existing between this country and European nations, and the appropriations that were made were spent in building a large number of useless vessels called gunboats. The Barbary powers were forced to respect the American flag, but against the impressment of American sailors by British vessels of war only diplomatic representations were made. The active preparations for meeting the French came to naught, as only two actions worthy of note were fought. It was not until 1812 that the question of maintaining a permanent naval force was seriously considered, and from that year may be dated the beginning of a naval establishment in this country. Yet the measure met with great opposition. It was maintained that agriculture was the great interest of the country, and that the commerce of the Union was not of such importance as to justify large expenditures for its protection. The protection of commerce would, it was said, cost more than the object was worth, and therefore should not be granted. But Mr. Cheves, the chairman of the committee of naval affairs in the twelfth congress, carried through the necessary legislation, and the careful report of the committee marks an important point in the history of the navy At that time the navy had but three frigates of the first class, viz., the President, the United States, and the Constitution; and seven of the second class, two of which were in such condition as to be condemned, and the remaining five in need of extensive repairs. In March, 1812, three other frigates were put into actual service, and the sum of $200,000 annually was for three years appropriated toward the purchase of timber for ship-building and other naval purposes. In July, 1812, when war against Great Britain was declared, the United States had but one vessel on Lake Erie, and that one was not launched until the following month, nor was there a larger force on Lake Ontario. Active preparations were made to sup-

ply the deficiency of vessels both on the ocean and on the lakes, and the force that was so created was efficient as against the British navy, thus showing that this country possessed in a high degree the elements of a navy. In 1815 all construction was stopped, and all vessels on the lakes, save such as were necessary to enforce the revenue laws, were ordered to be dismantled and sold. A navy had now become a part of the settled policy of the country, and a measure to maintain it found an earnest support. In 1816 one million of dollars, annually for eight years, were appropriated for the gradual increase of the navy, a sum that proved to be more than sufficient for the intended objects, and was not entirely expended before 1827; and in 1817, in order to insure a sufficient supply of ship timber in future, the secretary of the navy was directed to cause the vacant lands to be explored, and to select and survey such tracts as should be found to produce live oak and red cedar, which were to be reserved from future sales, and appropriated for the sole purpose of supplying timber for the navy. Soon after, the vessels that were as yet uncompleted and on the stocks were boarded over to protect them from the elements, and the navy was reduced to a peace footing. No occasion for a naval force occurred between the war of 1812 and the rebellion. A small force was in the meantime maintained, and was used for protecting the persons and property of American citizens in foreign countries, in suppressing the slave trade, and in scientific expeditions. In the war with Mexico the navy was employed merely as a blockading force, and there was no naval force to contend with. — The rebellion found the navy in a very decrepit state. The whole number of vessels in commission was forty-two, of which only twenty-six employed steam as an auxiliary motive power; of the remaining sixteen all were sailing vessels and three were store ships. March 4, 1861, the home squadron, so called, consisted of twelve vessels, of which only four, carrying in all twenty-five guns and 280 men, were in northern ports. The difficulties that beset the government were such as to create grave doubts on its ability successfully to overcome them. Not only were the vessels at hand few in number and weak in armament, but the navy lost large numbers of its trained men and skilled officers when they were most needed. During the first four months of the rebellion upward of 250 officers resigned their commissions or were dismissed from the service, and a good number of these carried their knowledge and experience of naval matters to the opposing force. From an ill-advised economy on the part of the government, which had been especially marked since the financial panic of 1857, there was little material at the navy yards with which new vessels could be constructed and equipped; and the southern navy yards, together with whatever vessels and stores were in them, were seized by the insurgents. The loss of the Norfolk yard, which was the best equipped yard in the country, was a severe blow to the government. And turning from an examination of this poverty of resources to a consideration of what was expected of the navy, only serves to illustrate with greater clearness the great activity displayed in forming the navy with which the war was carried on. An effective blockade, that is, one that would prevent access to the blockaded country, was to be maintained from Alexandria in Virginia to the Rio Grande, a distance of 3,549 statute miles, with 189 harbor or river openings or indentations, much of the coast presenting a double shore to be guarded. In addition to this task an effective force of vessels must be maintained on the rivers, notably the Mississippi, cutting off supplies and co-operating with the army. Later on, there was great need of fleet cruisers to patrol the ocean in search of rebel ships which were preying on the commercial marine of the country. Measures were at once taken to meet the crisis, and the results prove how readily a mercantile marine could be used for naval purposes under the methods then in vogue. Before the close of November, 1861, 136 vessels had been added to the navy, of which seventy-nine were steamers; fifty-two vessels were ordered to be constructed, all to be propelled by steam; eighteen vessels of the old navy were repaired and put in commission; and twenty vessels returned from foreign stations. So that, while at the beginning of 1861 the government had at its command and within reach of its orders but four vessels of the navy, at the close of November, 1861, it counted in its possession upward of 226 vessels. Congress also authorized the appointment of a board of three skilled naval officers to investigate the plans and specifications that may be submitted for the construction of ironclad steamships or floating steam batteries. There had up to this time been no experience in the construction of such armored vessels, and there was little knowledge on the subject. The most efficient vessels of this class belonged at that time to the British navy and were protected by an armor four and one-half inches in thickness, backed up with wood, and this was assumed by the committee to be the heaviest armor that a sea-going vessel could safely carry. Among the plans submitted to the committee was one for a novel floating battery from J. Ericsson, of New York, which was destined to work a revolution in the construction of armored vessels. The committee recommended that one battery of the description be built, and early in March the Monitor left New York, and, sailing to Hampton Roads, soon proved that a new and powerful naval engine was created, for it defeated what was one of the most formidable vessels afloat, the Merrimac. The entire class of monitor or turreted vessels was brought into existence during the war, and in three years after the outbreak of the war the navy had become exclusively a steam navy. The change from wood to iron as the material of construction, and from sail to steam as a means of

propulsion, rendered almost useless the existing machinery in the government yards which were intended for the construction and repair of wooden sailing vessels, and there was neither the machinery nor the acquired skill and experience among the laborers that was essential to the construction of iron vessels. The government was compelled to rely mainly upon private ship-builders not only for the ships but for machinery. The secretary of the navy repeatedly urged upon congress the necessity of establishing a yard for constructing iron vessels and machinery, and this necessity became more pressing as the armor-plating became heavier and the machinery more generally employed in vessels by which repairs were essential to keeping them in perfect order. "Our country," wrote Mr. Welles in his report for 1864, "whose strength and power must ever be identified with and maintained by its navy, and which possesses in such abundance the means of creating and sustaining one, has not, in all the navy yards combined, the appliances possessed by single establishments in England and France. Were there outside of our navy yards establishments to perform promptly the requisite work in time of war, I should not at this time again press the subject of a navy yard for iron work for the construction of iron vessels upon the consideration of our authorities But although the department has generally been ably and zealously seconded in its efforts by private contractors, yet the fact that there is no customer but the government for much of this heavy class of iron work, forbids us to expect that individual enterprise will be prepared to execute it without full remuneration for all the outlay for shops, tools and machinery which may be required in preparation. The government has not even at this time an establishment where a shaft can be made for our steamers or a plate for our ironclads." — The rapidity with which a navy was formed, notwithstanding the many difficulties to be overcome, was beyond parallel in the history of any nation. Starting in the beginning of 1861, as has been shown, with but forty-two vessels in commission, at the close of the year the navy counted 226 vessels. In 1862 163 vessels were added, exclusive of all that were lost, making the full navy consist of 427 vessels, carring 3,268 guns, and having a total tonnage of 340,036. In 1863 the navy was still further increased by 161 vessels, over and above all that had been lost by capture, shipwreck or fire, making a total navy of 588 vessels, carrying 4,443 guns, and possessing a tonnage of 467,967. As showing the nature of the vessels in the navy, attention may be called to the following table:

Ironclad steamers, coast service	46
Ironclad steamers, inland service	29
Side-wheel steamers	203
Screw steamers	198
Sailing vessels	112
Total	588

In 1854, 109 vessels were added, and the navy consisted of 671 vessels in all, of a tonnage of 510,396, and carrying 4,610 guns. As the war was ended early in 1865, the further increase was not marked. Nor was the growth confined to vessels. "From 7,600 men in service at the commencement of the rebellion, the number was increased to 51,500 at its close. In addition to these, the aggregate of artisans and laborers employed in the navy yards was 16,880, instead of 3,844 previously in the pay of the government. This is exclusive of those employed in the private ship yards and establishments, under contracts, constituting an almost equal number." Between March 4, 1861, and the beginning of 1865, 418 vessels were purchased, of which 313 were steamers, at a cost of $18,366,681, and of these there were sold 340 vessels, for which the government received $5,621,800. These figures clearly show the wonderful success that was experienced in creating a navy in a very short space of time. — Another circumstance should be noted. As has been said, in 1816 certain tracts of timber were set apart for the purposes of the navy, and these lands were scattered through the states of Florida, Georgia, Mississippi and Louisiana. They were under the care of agents, who were to protect them from depredations. These agencies were continued at considerable expense, until the beginning of the rebellion, when they were discontinued, and were not revived on the advent of peace. "It is not known that any timber has ever been procured from these lands for the government, but so far as ascertained, every stick of live oak which has been used by the navy has been purchased, and there is little doubt that much of it was cut and taken from the timber reservations which had for years been protected by government agents, at great annual expense. Since the restoration of peace, ineffectual search has been made for the maps and papers relating to these lands, but they have not yet been found. Whether they have been misplaced or were abstracted by those who had access to and charge of them, but who fled south at the commencement of the rebellion, can not be stated. Some difficulty may be experienced in ascertaining the quantity and precise locality of these reservations; but, from what has taken place, it is evident that the policy of timber reservations with salaried agents to protect them is a costly failure, and should be abandoned. The government has experienced no inconvenience in procuring ship timber from private parties, nor is it apprehended that any embarrassment will occur from that source in the immediate future." — With the close of the war, measures were at once taken to reduce the navy; the squadrons were diminished in size, and the long line of block ading vessels were withdrawn, a large number being sold. So far as was practicable further work on vessels in process of construction was stopped, and every effort was made to contract the naval force within the limits of a peace establishment. In December, 1866, the total number

of vessels in the navy was 278, of which but 115 were in commission and on active duty on the foreign squadrons which were re-established. From this point the history of the navy presents but few points of interest. Large sums were annually spent on it, but it was so spent as to preserve what vessels already existed, and no attempt was made to keep up with the great improvements that have been made in the construction and armaments of vessels of war. Still the navy, such as it is, has been employed in cruising on foreign stations, affording aid and protection to American interests whenever required, in various expeditions of scientific inquiry, such as sounding and mapping the ocean, studying the currents, attending astronomical parties, etc., etc. — In 1881 it was recognized that if this country was to rank among the great maritime powers of the world, it would be necessary to increase the number and efficiency of the vessels of the navy, which had by that time become wholly inadequate either for offense or defense. Thus, on Jan. 1, 1882, the navy comprised 140 vessels, the nature of which may be judged of from the following table:

Steam vessels—		
First rates		13
Second rates		20
Third rates		27
Fourth rates, including two torpedo boats		8—68
Sailing vessels—		
Second rates	4	
Third rates, first class	6	
Third rates, second class	8	
Fourth rates	5	—23
Ironclads		24
Tugs		25
Total		140

But of this total of 140 vessels forty-two represented no naval power whatever, and could be employed for no purpose whatever, and fifteen were navy yard tugs, which are not serviceable for war purposes, and should be regarded as tools, part of the plant of the navy. This reduced the number of vessels capable of service to eighty-three. But further reductions must be made before the full force of the navy can be reached. Of these eighty-three vessels, fourteen are old sailing vessels, constructed on patterns long obsolete and armed on a system long since abandoned, and five are on the stocks in private yards, with the question of their fate still undecided; eleven steam vessels are of very doubtful use to the service, and could be of little value in the event of war, and fourteen are of the single turreted monitor class, which are not suited for cruising purposes but might be available for harbor defense, although they are defective as regards armament, all being armed with smooth-bore guns of large calibre, but of short range and small power. This reduces the number to thirty-nine vessels, from which, however, the ill-fated Rodgers must be deducted, leaving a grand total of but thirty-eight vessels. The secretary of the navy, in his report for 1881, sounded the note of alarm as follows: "The condition of the navy imperatively demands the prompt and earnest attention of congress. Unless some action be had in its behalf it must soon dwindle into insignificance." In July, 1881, an advisory board was constituted to report upon the best method of reconstructing the navy, upon the number and description of vessels that would be requisite to place the navy in a position to defend the commerce and ports of the country in case of war. The recommendations of the committee are worth giving in full, because they show the radical changes in the class of vessels needed, and in the great cost as compared with the cost of the vessels purchased during the rebellion: "Two first-rate steel, double-decked, unarmored cruisers, having a displacement of about 5,873 tons, an average sea speed of fifteen knots, and a battery of four eight-inch and twenty-one six-inch guns. Six first-rate steel, double-decked, unarmored cruisers, having a displacement of about 4,560 tons, an average sea speed of fourteen knots, and a battery of four eight-inch and fifteen six-inch guns. Ten second-rate steel, single-decked, unarmored cruisers, having a displacement of about 3,043 tons, an average sea speed of thirteen knots, and a battery of twelve six-inch guns. Twenty fourth-rate wooden cruisers, having a displacement of about 793 tons, an average sea speed of ten knots, and a battery of one six inch and two sixty-pounders. Five steel rams, of about 2,000 tons displacement, and an average sea speed of thirteen knots. Five torpedo gunboats, of about 450 tons displacement, a maximum sea speed of not less than thirteen knots, and one heavy-powered rifled gun. Ten cruising torpedo-boats, about 100 feet long, and having a maximum speed of not less than twenty-one knots per hour. Ten harbor torpedo-boats, about seventy feet long, and having a maximum speed of not less than seventeen knots." The total cost of these vessels is estimated to be $29,607,000. There is every reason for believing that these recommendations, or others of like nature, will be adopted, and that in time this nation will have a navy that will be sufficient for whatever demands are made upon it. — By the constitution the power of providing and maintaining a navy is vested exclusively in the federal government. The president is the commander-in-chief of the army and navy, and he commissions all officers of the United States. The direct management of naval affairs is under the control of a secretary of the navy, who is a cabinet minister, and acts under the directions of the president. The navy department comprises eight bureaus, to each of which are assigned certain definite duties, and over each is placed a chief who is responsible to the secretary for his acts. These eight bureaus, the duties of which are sufficiently indicated by the titles, are: 1, bureau of yards and docks; 2, of navigation; 3, of ordnance; 4, of provisions and clothing; 5, of medicine and surgery; 6, of construction and repair; 7, of equipment and recruiting; and 8, a bureau

presided over by an engineer-in-chief. Congress, alone, can make rules for the government and regulation of the naval forces. There is a naval pension fund. — The navy yards of the government are situate at the following places:

	Acres.		Acres.
Portsmouth, N. H.	164	Washington	42
Boston	83	Norfolk	109
New London	71	Pensacola	83
Brooklyn	193	Mare Island	900
League Island	923		

— A naval school under the management of the government is located at Annapolis, Md. In 1874, to encourage the establishment of public marine schools, the secretary of the navy was authorized to furnish on certain conditions, upon the application of the state, a suitable vessel, with all her apparel, charts, books and instruments of navigation, provided the same could be spared without detriment to the naval service, to be used for the benefit of any nautical school, or college having a nautical branch, established in certain designated cities. This provision, however, never came to anything, but two vessels being given under the necessary conditions. — *Authorities.* The *Reports* of the *Navy Department*, and of the *Congressional Committees;* the *Debates of Congress*, and *Naval Register*. There is no good history of the American navy. Sir Thomas Brassey on *The British Navy*, 1881–2; Sir N. H. Nicolas' *History of the Royal Navy.* WORTHINGTON C. FORD.

NAVY, Department of the. This constitutes one of the seven executive departments at Washington, and was created in the tenth year of the existence of the government of the United States. The brief act of congress, approved April 30, 1789, (1 Stat. at Large, 553), embodies the outline of this department, since largely extended and reorganized under subsequent legislation. — The head of the department of the navy, known as the secretary of the navy, is by law to execute such orders as he shall receive from the president relative to the procurement of naval materials, and the construction, armament, equipment and employment of vessels of war, and all other matters connected with the naval establishment. The secretary of the navy is by custom, not by law, a member of the cabinet, with a salary of $8,000. He is required to distribute the business of the department as he shall judge to be expedient and proper among the following bureaus: 1, a bureau of yards and docks; 2, a bureau of equipment and recruiting; 3, a bureau of navigation; 4, a bureau of ordnance; 5, a bureau of construction and repair; 6, a bureau of steam engineering; 7, a bureau of provisions and clothing; 8, a bureau of medicine and surgery. The chief of the bureau of yards and docks has charge of the navy yards and naval stations, their construction and repair; he purchases timber and other materials. The chief of the bureau of equipment and recruiting has charge of the equipment of all vessels of war, and the supply to their sails, rigging, anchors and fuel; also of the recruiting of sailors of the various grades. The chief of the bureau of navigation supplies vessels of war with maps, charts, chronometers, barometers, flags, signal lights, glasses and stationery; he has charge of the publication of charts, the Nautical Almanac, and surveys; and the naval observatory and hydrographic office are under the direction of this bureau. The chief of the bureau of ordnance has charge of the manufacture of naval ordnance and ammunition, the armament of vessels of war; the arsenals and magazines; the trials and tests of ordnance, small arms and ammunition; also of the torpedo service, and torpedo station at Newport, and experimental battery at Annapolis. The chief of the bureau of construction and repair has charge of dry docks and of all vessels undergoing repairs; the designing, building and fitting out of vessels, and the armor of ironclads. The chief of the bureau of steam engineering directs the designing, fitting out, running and repairing of the steam marine engines, boilers and appurtenances used on vessels of war, and the workshops in the navy yards where they are made and repaired. The chief of the bureau of provisions and clothing has charge of all contracts and purchases for the supply of provisions, water for cooking and drinking purposes, clothing and small stores for the use of the navy. The chief of the bureau of medicine and surgery superintends everything relating to medicines, medical stores, surgical instruments and hospital supplies required for the treatment of the sick and wounded of the navy and the marine corps. The judge advocate general receives, revises and records the proceedings of courts martial, courts of inquiry, boards for the examination of officers for retirement and promotion in the naval service; and furnishes reports and opinions on such questions of law and other matters as may be referred to him by the secretary of the navy. The chiefs of these bureaus are appointed by the president and senate from among the navy officers not below the grade of captain, and hold their offices for the term of four years. Their salaries are $5,000 per annum. While these chiefs of the important bureaus into which the business organization of the navy department is divided, are thus selected from among the experts in their profession, the secretary of the navy is commonly chosen on other grounds, and without naval experience. He is required to make an annual report to congress, embodying, 1, an account of receipts and expenditures for the year under each head of appropriation, 2, a statement of all naval contracts, 3, a statement of cost of all supplies and services furnished, and of stores and materials on hand in the navy yards, etc.; 4, a statement of all sales of vessels or materials. Besides the eight bureaus before named, the act of July 5, 1862, created a hydrographic office, attached to the bureau of navigation, with the function of providing nautical charts, sailing directions, etc., for the use of all vessels of the United States and of navigators generally. The

maps, charts and nautical books thus published are sold at cost to the public, and are of inestimable practical value (in connection with the charts of the coast survey) to navigators in American and other waters. — The official and clerical force of the navy department embraced, in 1882, 135 employés, with aggregate annual salaries amounting to $148,220; and the contingent and miscellaneous expenses of the department amounted to a further sum of about $234,000 in 1882. This is for the current official expenditure of the department and its bureaus, exclusive of the cost of supplies and expenditures for the naval service proper, and the eight navy yards of the United States established at Washington, Brooklyn, N. Y., Charlestown, Mass., Kittery, Me., League Island, Pa., Norfolk, Va., Pensacola, Fla., and Mare Island, Cal. — The naval observatory of the United States, located at Washington, is under the supervision of the secretary of the navy, with a superintendent usually having the rank of rear admiral (salary $5,000), and five professors of astronomy and mathematics, with salaries of from $2,400 to $3,500 each, according to length of service. The Nautical Almanac, issued annually for about three years in advance, is also distributed by the navy department. — The following is a list of the secretaries of the navy, with their various terms of office:

1.	Benjamin Stoddert	May 21, 1798
2.	Robert Smith	July 15, 1801
3.	J. Crowninshield	March 3, 1805
4.	Paul Hamilton	March 7, 1809
5.	William Jones	Jan. 12, 1813
6.	B. W. Crowninshield	Dec. 19, 1814
7.	Smith Thompson	Nov. 9, 1818
8.	Samuel L. Southard	Sept. 16, 1823
9.	John Branch	March 9, 1829
10.	Levi Woodbury	May 23, 1831
11.	Mahlon Dickerson	June 30, 1834
12.	James K. Paulding	June 25, 1838
13.	George E. Badger	March 5, 1841
14.	Abel P. Upshur	Sept. 13, 1841
15.	David Henshaw	July 24, 1843
16.	Thomas W. Gilmer	Feb. 15, 1844
17.	John Y. Mason	March 14, 1844
18.	George Bancroft	March 10, 1845
	John Y. Mason	Sept. 9, 1845
19.	William B. Preston	March 8, 1849
20.	William A. Graham	July 22, 1850
21.	John P. Kennedy	July 22, 1852
22.	James C. Dobbin	March 7, 1853
23.	Isaac Toucey	March 6, 1857
24.	Gideon Welles	March 5, 1861
25.	Adolph E. Borie	March 5, 1869
26.	George M. Robeson	June 25, 1869
27.	Richard W. Thompson	March 12, 1877
28.	Nathan Goff, Jr.	Jan. 6, 1881
29.	William H. Hunt	March 5, 1881
30.	William E. Chandler	April 1, 1882

A. R. SPOFFORD.

NEBRASKA, a state of the American Union, formed from territory ceded by France. (See ANNEXATIONS, I.) The territory of Nebraska was organized May 30, 1854 (see KANSAS-NEBRASKA BILL); it included territory now in the state of Colorado, and the territories of Montana, Dakota and Wyoming. An enabling act was passed April 19, 1864, and the state was admitted by act of Feb. 9, 1867, on the fundamental condition that the new state should never deny the elective franchise, or any other right, to any person, by reason of race or color, excepting Indians not taxed. The condition was accepted by the state legislature, Feb. 20, 1867, and the state was declared admitted by the president's proclamation of March 1, 1867. — BOUNDARIES. The boundaries of the state are as follows: Beginning at the intersection of north latitude 40° with the western boundary of Missouri; thence due west to longitude 25° west from Washington; thence due north to north latitude 41°; thence due west to longitude 27° west; thence due north to north latitude 43°; thence due east to the Reya Paha river, down that river to the Niobrara river, down that river to the Missouri river, and down the Missouri to the place of beginning. — CONSTITUTIONS. The first constitution was framed by the territorial legislature, Feb. 9, 1866, and was ratified, June 21, 1866, by a popular vote of 3,938 to 3,838. It forbade slavery, the contraction of a state debt of more than $50,000, and the creation of corporations by special laws; it fixed the terms of the governor, senators and representatives at two years; and it made Omaha the capital. It also confined the elective franchise to white citizens, but this was abrogated, as above stated, before the admission of the state. — A new constitution was framed by a convention at Lincoln, June 12, 1875, and ratified by popular vote Oct. 12. Its principal changes were restrictions upon special legislation and upon the power of corporations, and an apportionment of members of the legislature. — GOVERNORS David Butler, 1868–71; Wm. H. James, *ex officio*, 1871–3; Robert W. Furnas, 1873–5; Silas Garber, 1875–9; Albinus Nance, 1879–83. — POLITICAL HISTORY. Since its organization as a state, Nebraska has been republican in every election, national or state. All the governors, senators and representatives in congress have been republicans. The republican majority has been constantly increasing (with the exception hereafter noted); the republican vote for governor in 1870 was 2,851 to 278, and, in 1880, 52,337 to 28,167. In 1872, for governor, the democrats polled their largest proportional vote, 11,227 to 16,548. The legislature has always been very strongly republican; in 1882 but twelve of the 114 members were democrats. — Among the political leaders who have been made prominent by their state are the following: Lorenzo Crounse, representative 1783–7; Phineas W. Hitchcock, United States senator 1871–7; A. S. Paddock, United States senator 1875–81; Alvin Saunders, United States senator 1877–83; John Taffe, representative 1867–73; John M. Thayer, United States senator 1867–71; T. W. Tipton, United States senator 1867–75, and democratic candidate for governor in 1880; Edward K. Valentine, representative 1879–83; and Charles H. Van Wyck, United States senator 1881–7. — See 14 *Stat. at Large*, 391, *App.* iv., No. 9, for act of Feb. 9, 1867, and proclamation of March 1; 2 Poore's *Federal and State Constitutions;* Appleton's *Annual Cyclopædia*, 1867–80; Porter's *West in* 1880, 346.

ALEXANDER JOHNSTON.

NEGOTIATIONS. Diplomatic negotiations are generally conducted *viva voce*. It is only when all points are agreed upon, that any documents are exchanged. The negotiator, therefore, has room to exhibit talent of an order which it is somewhat difficult to define. In general, the ambassador or the ordinary minister plenipotentiary has charge of the negotiations; sometimes a special negotiator acts with him; in exceptional circumstances, an envoy extraordinary is intrusted with the mission of drawing up the treaty. — When, in the course of the negotiations, the tenor of a dispatch is of major importance, the foreign negotiator submits it to the minister of foreign affairs of the sovereign to whom he is accredited. This minister rectifies, if necessary, the wording of it, makes the expression of his opinion exact, and while he is considered to write nothing, renders relatively authentic the reproduction of its words. For the negotiator will never fail to make known to his own minister, that his dispatch has been examined. This examination does not prevent the negotiator from adding a special confidential letter. M. B.

NETHERLANDS, The. The Netherlands is bounded on the east by Germany, on the south by Belgium, and on the west and the north by the North sea. Its area is 8,123,378 acres, or 9,435,635 acres, if the more or less submerged territory of the Zuyder Zee and of Dollard be included. The tides have in all times exercised a great influence upon the configuration of the country. In the eleventh and twelfth centuries the Zuyder Zee, the old lake of Flevo and Dollard, and in the fifteenth century, the Bies-Bosch, came into existence. The loss of land sustained by the Netherlands during the last seven centuries is estimated at 1,574,027 acres, although there has been conquered from the sea a surface of 877,205 acres, and 113,270 acres of this since 1815. The provinces of Zealand and Holland have increased their areas 649,873 acres by means of dikes, of which 444,780 acres of very fertile clayey lands produce cereals and madder. — The population of the Netherlands according to each of the six decennial censuses, the first of which was taken Nov. 16, 1829, and the last Dec. 31, 1879, was 2,613,491, 2,860,450, 3,056,879, 3,293,577, 3,579,529 and 4,012,693, being an increase of 1,399,202, or over 53 per cent., in half a century. — The constitution of Oct. 25, 1848, gives the following personal guarantees: all persons within the territory of the kingdom, be they natives or foreigners, have an equal right to the protection of person and property. The law of Aug. 18, 1849, regulates the conditions of the admission and expulsion of foreigners, and of the extradition of criminals. The children born of Netherland parents, and persons born in the Netherlands, even those of alien parents, if they have their domicile in the kingdom, are Netherland citizens. (Civil Code of 1886.) A person may become a Netherlander by naturalization by virtue of the law of July 28, 1850. Natives only can be appointed to public office; they alone are electors and are eligible to the representative chambers and to the provincial and communal councils. Other fundamental principles of the constitution are the following: freedom of the press, with responsibility for criminal abuse of the same; inviolability of the secrecy of letters, which can not be opened except by judicial order and in cases provided by law; every citizen has the right of petition; petitions bearing a joint signature are not received, unless they come from a legally recognized corporation, and unless they have to do with matters within the province of such corporation; liberty of assembly and association, regulated and restricted by the law of April 22, 1855, "in the interest of public order." The acceptance of foreign naturalization, of military or civil offices, of titles of nobility, in a foreign country, without the permission of the king, and a residence of five consecutive years in a foreign land, without intention of returning, causes a forfeiture of political rights and the name of Netherlander. — The king exercises the legislative power jointly with two chambers of the states-general. The executive power is lodged solely in the king. The members of the first chamber, numbering thirty-nine, are elected by provincial councils from among the persons who pay the largest amount of direct taxes; they are taken from a list of names for each province, in which at most one inhabitant out of 3,000 can have a place. The members of the second chamber, one out of every 45,000 inhabitants, the actual number of whom is eighty-six, are elected in the forty-one electoral districts (law of May 6, 1869) by all domiciled Netherlanders who have attained their majority (twenty-three years), and who exercise all their civil and political rights, and pay, according to the locality, from twenty to sixty florins direct taxes (law of July 4, 1850). The number of electors in 1872 was 105,452, or one out of thirty-four inhabitants. Any Netherlander, who has attained the age of thirty years, and who is in the enjoyment of all his civil and political rights, may be elected a member of the second chamber. The term of office is nine years for members of the first and four years for those of the second chamber. One-third of the first go out of office every three years, and one-half of the second every two years. The sessions of the chambers are public. The king can dissolve the chambers jointly or separately. The second chamber has the right of appointing commissions of inquiry and of proposing amendments to bills. It can, besides, introduce bills, which, however, before being submitted to the king for his sanction, must be approved by the first chamber. The members of the chambers can not be called to account for the opinions expressed by them in the exercise of their functions. The fundamental law and the other laws have, unless it be decided to the contrary, the force of law only in the European limits of the kingdom. The king is in-

violable and irresponsible. Ministerial responsibility is fixed by the law of April 22, 1855. The budget is presented annually. No person can be tried outside of the jurisdiction in which he lives without his consent; no person can be arrested, except by virtue of a judicial warrant; no person can be deprived of his property, except by a decision of the tribunals in cases of public utility, compensation being made him therefor. The liberty and equality of religions is guaranteed; the liberty of correspondence with the heads of the church is limited by responsibility before the law for the publication of bulls and episcopal pastorals. The law of Sept. 10, 1853, upon the surveillance of the different religious creeds, repealed the law of the 18 Germinal, year 10 (April 8, 1802).— The eldest son of the king or his male descendants succeed to the throne by right of primogeniture. In default of descendants the right of succession passes to the brother of the king and his descendants. In default of male descendants of the house of Orange-Nassau, the succession passes to the daughter of the last king, and if there is no daughter, it passes through the oldest female member of the oldest male descending line of the king to the house to which she belongs. The male line is always preferred to the female line. With the exception of that of Luxemburg, the king can wear no foreign crown. The annual revenue of the king consists partly of domanial property (law of August, 1849), and partly of a sum fixed on his accession to the throne, and which is now 1,000,000 florins. For the support of the palaces, a sum of 50,000 florins is voted annually. The king and the prince heir are exempt from all personal taxes. The latter receives, upon reaching his majority, which is fixed at eighteen years of age, an annual sum of 100,000 florins, which sum is doubled at the time of his marriage. He bears the title of "Prince of Orange." The queen dowager receives an annual dotation of 150,000 florins. — The guardians of the king, in case of his minority, are certain members of the royal family and a few distinguished Netherlanders. In case of the incapacity of the king, the heir apparent, if he is of age, becomes regent by law. The regency is regulated by the law of July 28, 1850. The installation of the king or of the regent takes place at Amsterdam, the two chambers being assembled, by the taking of an oath to maintain the constitution, the independence of the country, the liberty and rights of the citizens, and to enforce obedience to the laws of the land.— The king has the superior direction of foreign affairs, the right to declare war, subject to an early notification of the two chambers of his intention. He concludes treaties of peace and of commerce with foreign nations. The sanction of the two chambers is necessary, when there is a question of the cession of the exchange of territory, even in the transatlantic colonies of the Netherlands, or of stipulations which concern rights established by law. The king is commander-in chief of the army and of the navy; he has the superior direction of the colonies and possessions in other parts of the world. The king presents annually to the states-general a detailed report of the administration and condition of the colonies, and the law regulates the administration of their finances. The king has the general administration of the finances in the mother country. He settles the salaries of public functionaries, with the exception of those of judges, which are fixed by the law relating to the judicial organization, promulgated Oct. 10, 1838. The laws of May 9, 1846, and May 3, 1851, regulate the pensions of officials. The king exercises the right of pardon. Amnesty can not be accorded except by law. The king can not grant exemptions except in the cases provided by law. He decides the administrative differences between two or more provinces. He presents bills and other propositions to the chambers, and sanctions or rejects those of the chambers. He presides over the council of state, and appoints and discharges the fifteen members of it. The law of Dec. 21, 1861, regulates the competency and composition of this council. The council of state is heard on all bills and all rules of general administration in the mother country and in the colonies. The prince heir apparent, when he reaches his majority, has a legal seat in the council, in which he has a consultative voice. All royal decisions and orders must be countersigned by a minister. — The titles of nobility are count, baron, chevalier and gentleman (*jonkheer*). Since 1814 a council, composed of four members and a secretary, has the administration of everything concerning the nobility. Previous to 1848 the nobility was one of the three estates represented in the second chamber; since the royal sanction of the new constitution, it has lost its political character. — The council of ministers is composed of the heads of the seven ministries. Bills and the general rules of administration are submitted to the deliberation of the council of ministers before and after their presentation to the council of state, as are also treaties with foreign powers, the most important instructions to be given to ministers plenipotentiary, and propositions made to the king for the appointment or dismissal of high officials. (Royal decree of March 31, 1842.) The seven ministries are as follows: 1, Foreign affairs; 2, Justice; 3, Interior; 4, Navy; 5, Finance; 6, War; 7, Colonies. The king can accord to high officials the title of minister of state, or of councilors in extraordinary service; there are, besides, honorary councilors. The latter can be associated by the king in the work of the council of state. The ministers have each a salary of 12,000 florins. — *Administration.* Each of the eleven provinces of the kingdom is governed by a commissioner of the king, with a salary of from 6,000 to 8,000 florins. The members of the provincial assemblies are elected for six years by electors, whose number in 1871 was 104,194. The provincial assemblies hold their sessions regularly at the beginning of July and of November, and

choose from their own body from four to six members to form a committee for the conduct of affairs and the execution of the laws and regulations. The secretary and the employés of this committee are appointed by itself. (Provincial law of July 6, 1850.) — The communal law dates from July 29, 1851. It destroyed the distinction between city and village. The number of districts in 1873 was 1,134, of which there were 834 with less than 3,000 and thirty-eight with more than 10,000 inhabitants. The number of communal councilors depends upon the population, according to the returns of each decennial census. There were in 1873 seven of them in communes with less than 3,000 and thirty-nine in communes with less than 10,000 inhabitants. The councilors are elected for six years. The electors are all persons who pay direct taxes; the amount of taxes qualifying them to vote is fixed at one-half the amount necessary to render one eligible to take part in the election of members of the second chamber. The burgomaster is appointed by the king for six years; he is assisted by one alder man in districts of less, and by three or four aldermen in districts of more, than 20,000 inhabitants. Each district has also its secretary and its receiver, elected by the council from a list of two persons, presented by the burgomaster and alderman. In the smaller districts these two offices are held by one person; in others the burgomaster discharges the duties of secretary as well as his own. — *Finance.* The improvement in the financial state of affairs, which had suffered greatly by the separation from Belgium and the extraordinary armaments of 1830 to 1839, dates from 1850 The nominal principal of the public debt at that time was estimated at a total of 1,239,592 646 florins, and the annual interest amounted to 36,194,879 florins. The principal of the public debt increased during eleven years, from Jan. 1, 1829, to Dec. 31, 1839, 376,622,406 florins, and the interest 19,342,187 florins. From 1850 to the month of July, 1872, a principal of 290,159,613 florins was liquidated, and the interest reduced 8,958,037 florins. The following table of the national debt in 1850 and 1873 shows the nature of each debt, and allows a calculation to be made of the power of liquidation:

DEBT IN 1850.

ITEMS.	Nominal Capital.	Interest.
	Florins.	Florins.
National debt, 3 per cent.	816,508,000	20,412,700
National debt, 2½ per cent.	120,856,861	3,625,726
Obligations of the syndicate of liquidation, 3½ per cent.	22,708,000	794,780
National debt, 4 per cent.	237,640,500	9,505,620
Colonial obligations, 4 per cent.	14,748,500	589,940
Treasury bonds, 4 and 4½ per ct.	17,799,950	571,998
Loan for the drainage of the Haarlem lake, 4 and 4½ per ct.	8,000,000	385,000
Loan for bridges and roads, 3 and 3½ per cent.	1,330,835	58,551
Interest and tontines	----------	139,100
Bail bonds of responsible employés	----------	20,000
Various items of interest	----------	91,484
Total	1,239,592,646	36,194,899

DEBT IN 1873.

ITEMS.	Nominal Capital.	Interest.
	Florins	Florins.
National debt, 3 per cent.	646,602,902	16,165,073
National debt, 2½ per cent	93,612,724	2,808,382
Obligations of the syndicate of liquidation, 3½ per cent.	12,301,000	437,535
National debt, 4 per cent	188,127,200	7,525,088
Colonial obligations 4 per cent	Liquidated.	----------
Treasury bonds, 4 and 4½ per ct.	----------	----------
Loan for the drainage of the Haarlem lake, 4 and 4½ per ct.	Liquidated.	----------
Loan for bridges and roads, 3 and 3½ per cent	3,976	119
Interest and tontines	----------	18,000
Bail bonds of responsible employés	----------	15 337
Various items of interest	----------	84,600
Total	940,847,802	27,054,133

At the commencement of the year 1879 the national funded debt was as follows:

ITEMS	Nominal Capital.	Annual Interest.
	Florins.	Florins.
2½ per cent. debt	632,099,402	15,802,485
3 per cent debt	91,322,950	2,739,688
3½ per cent. redeemable debt	11,250,000	391,125
Old 4 per cent debt	176,899,500	7,075,980
4 per cent. debt of 1878	43,000,000	2,426,642
Total	954,571,852	28,135,920

In the session of 1873 the states-general passed an act to increase the annual sum set aside as a sinking fund for the redemption of the debt, namely, 1,900,000 florins by 7,000,000 florins, and thus redeem a total amount of 8,900,000 florins. Another act of the session of 1875 increased the sum to 10,000,000 florins, to be set aside for the redemption of the national debt. — Below we give a table of the budget estimates of 1850, 1862 and 1873. Excise duties are paid upon the following articles: sugar, wine, native and foreign alcoholic liquors, salt, soap, beer, vinegar, beef and veal, the term indirect taxes applies to stamps, registration, and the taxes paid on mortgages and inheritances, the whole charged with thirty eight centimes additional.

SOURCES OF REVENUE.	1850	1862	1873.
	Florins	Florins.	Florins.
Direct taxes — Real estate	9,997,529	10,396,120	10,246,985

— The following is a list of the expenditures of 1862 and 1873:

ITEMS.	1862.	1873.
	Florins	Florins.
Civil list	900,000	750,000
Dotations	544,181	585,112
Ministry of foreign affairs	467,553	532,340
Administration of the Catholic and Jansenist religions.	660,714	----
Ministry of justice	2,958,892	3,165,102
Administration of the Protestant and Jewish religions.	1,731,656	----
Ministry of the interior	17,160,749	18,896,314
Ministry of the navy	9,224,587	9,345,280
Debt and liquidation	38,171,364	27,493,133
Ministry of finance	6,639,903	18,700,220
Ministry of war	12,619,690	17,100,520
Ministry of the colonies	1,574,447	1,371,306
Miscellaneous expenditures	49,240	50,000
Total	92,702,726	97,979,277

The expenditures in 1871 amounted to 94,573,752 florins. The revenue and expenditure in the years 1873–7 were as follows:

YEARS.	Revenue.	Expenditure.
	Florins.	Florins.
1873	109,507,189	108,033,523
1874	105,269,687	99,352,355
1875	119,837,573	118,911,247
1876	109,680,253	113,396,805
1877	106,392,823	117,927,685

The budget estimates of revenue and expenditure for the two years 1878 and 1879 were as follows:

REVENUE.

ITEMS.	1878.	1879.
	Florins.	Florins.
Direct taxes	23,712,023	24,306,057
Excise duties	37,931,000	38,595,000
Indirect taxes, including stamps	20,355,000	21,884,000
Customs duties on imports	4,611,040	4,611,040
Guarantee of gold and silver ware	366,200	366,200
State domains	1,740,000	1,695,000
Postoffice	3,400,000	3,600,000
Telegraph service	800,000	800,000
State lottery	430,000	430,000
Hunting and fishing licenses	140,000	143,000
Pilot dues	900,000	900,000
Dues on mines	3,565	2,265
State railways	1,622,000	1,626,000
Miscellaneous receipts	6,463,535	16,914,135
Total revenue	102,474,363	115,822,697

EXPENDITURE.

ITEMS.	1878.	1879.
	Florins.	Florins.
Civil list	950,000	750,000
Legislative body and council of state	615,772	615,389
Department for foreign affairs	639,290	635,990
Department of justice	4,410,473	4,488,578
Department of the interior	6,869,536	6,837,701
Department of marine	13,768,384	13,139 863
Public debt	27,178,018	28,435,920
Department of finance	17,336,922	17,880,659
Department of war	22,560,000	18,867,000
Department for the colonies	1,701,465	1,589.359
Public works and commerce	22,669,436	22,571,892
Total expenditure	118,199,296	115,811,801

In the budget estimates for the year 1880 the revenue was calculated at 108,000,000 florins and the expenditure at 114,000,000 florins. In the budget estimates for the year 1881 the revenue was calculated at 105,000,000 florins and the expenditure at 126,333,000 florins. —*Justice.* The superior court sits at the Hague. It has original jurisdiction in matters concerning the state and the royal family, and prizes, and in the case of the impeachment of ministers, as well as of misdemeanors committed in the exercise of their duties by high officials; and an appeal lies to it from the provincial courts and the courts in the colonies. (Articles 159 and 160 of the Constitution.) There are eleven provincial courts, thirty-four district courts, and 150 cantonal judges (justices of the peace). The fundamental principles of the administration of justice are: publicity of the arguments; a public prosecutor; no jury, but conviction by proofs and witnesses; defense by advocates and attorneys. Judges are irremovable except in case of misconduct. The judges of the cantons are appointed for five years by the king, but their appointment may be renewed. Notaries are appointed for life by the king, one for every 4,000 inhabitants (law of July 9, 1842). Military justice is exercised by seven military *hearings*. Besides this, the navy has three *hearings*. The high court of military justice is at Utrecht. The merchant marine has its council of discipline at Amsterdam, composed of four members and of a secretary (law of May 7, 1856). The judicial police is exercised by the minister of justice as chief director, and by the attorneys general of the eleven provincial courts as directors. The subordinates are the commissioners-in-chief, the commissioners of police, the officers in charge of the ports, the burgomasters, and the 618 sergeants of police.—The French penal code of 1810, modified by the two laws of June, 1854, is in force in the Netherlands. During the year 1869, 47,856 persons were prosecuted, of which number 644 were accused of crimes, 12,753 charged with misdemeanors, and 34,459 with offenses against police regulations. Crimes and misdemeanors against the state numbered respectively 112 and 4,394, against persons, fifty-nine and 4,809; against property, 473 and 3,550. Of those accused of crimes, 529 were males and 115 females; of those charged

with misdemeanors, 10,394 were males and 2,359 females; and of those charged with offenses against the regulations of the police, 29,469 were males and 4,990 females; in all, 40,392 males and 7,464 females. The average of the acquittals was 7 per cent. of those accused of crimes, and 14 per cent. of those charged with misdemeanors. Since Dec. 11, 1813, confinement in prison extending to twenty years has been substituted for forced labor. — *Religion and Education.* The Reformed church and the Evangelical Lutheran church in 1873 had each a synod; the Reformed had 1,357 parishes and 1,627 pastors; the Lutheran, fifty parishes and sixty-two pastors; the old Lutherans, presided over by a commission, eight parishes with eleven pastors; the Mennonites, 126 parishes with 126 pastors; the Remonstrants, represented by a commission, had twenty-one parishes with twenty-one ministers; the Moravian brothers, two parishes with two ministers; the German Evangelical church had one parish with one minister at the Hague. The Reformed Christians (who separated from the Reformed church) had 330 parishes with 230 pastors. The Jansenists have an archbishop at Utrecht, and two bishops, at Haarlem and Deventer, and are divided into twenty-five parishes and twenty-five curacies. The Roman Catholics, since 1853, have five dioceses, one archbishopric at Utrecht, and bishoprics at Haarlem, Hertogenbosch, Breda and Roermond, divided into 936 parishes, thirty-four rectorates and 896 curacies. The Catholic clergy numbered, in 1873, about 1,989 ecclesiastics, of whom 1,866 have charge of souls. The greater part of the convents are in North Brabant and Limburg. The Netherland or German Jews had, in 1873, a commission, 166 parishes and seventy-two auxiliary temples; the number of rabbis was fifteen, of whom one is at Curaçoa and one at Surinam. The Portuguese Jews had two parishes, at Amsterdam and the Hague, under the administration of a central commission. The population was divided in the following manner among the different religions, Dec. 31, 1859 and 1869:

	1859.	1869.
Reformed (Calvinists)	1,828,365	1,967,611
Reformed Christians	65,728	107,123
Evangelical Lutherans	54,606	57,545
Old Lutherans	9,931	10,522
Mennonites or Anabaptists	42,162	44,227
Remonstrants	5,326	5,486
Moravian Brothers	331	311
English Episcopalians	575	456
Jansenists	5,394	5,287
Roman Catholics	1,229,092	1,307,765
Greek Church	32	32
Jews	63,709	68,093
Religion unknown	3,794	5,161

— Elementary education (law of Aug 13, 1857) is very general in the Netherlands. According to the constitution education is free. The instructors in the elementary and intermediate schools are submitted to an examination, and are required to produce a certificate of good moral character. The supervision of the primary schools is confided to eleven inspectors, and that of the intermediate to three inspectors. The kingdom is divided into ninety four school districts, each with a supervisor. In each district of more than 3,000 souls, there is a school commission. Dec. 31, 1870, there were 3,727 primary schools, part public (2,608), and part private (1,119); there were 8,870 male teachers, and 2,042 female teachers. These schools contained, in January, 1870, 466,779 pupils, of which number 249,926 were boys and 216,853 girls. There were 832 infant schools attended by 29,662 boys and 34,659 girls; 212 private schools (adult classes) and schools open on Sunday only. The evening schools or classes were attended by 57,936 men and 23,675 women. The expenses for elementary instruction amounted to 4,984,534 florins. The normal schools for instructors are situated at Hertogenbosch, Groningen and Haarlem. The Latin schools (colleges) and the gymnasiums (lyceums) number (1870) fifty-five, with 212 professors and 1,128 pupils. Intermediate educational institutions (law of May 3, 1863) include the schools for artisans, and in general all practical schools for arts and trades, the polytechnic school, and the schools of agriculture, navigation, commerce and design. At the end of 1870 there were forty-four so-called higher middle class schools, with 519 professors, attended by 3,559 pupils; the polytechnic school at Delft, with nineteen professors, was attended, in 1870–71, by 164 students; the school of agriculture at Warffum had seven pupils, and the school of horticulture at Watergraafsmeer had twenty-nine; there were nine schools of navigation, with twenty professors and 208 pupils; besides many intermediate schools for young girls, the majority of which are private institutions. Higher instruction is given in the three state universities of Leyden, Utrecht and Groningen, and in the public athenæums of Amsterdam and Deventer, attended, in 1870, by 1,339 students. The theological students of the Reformed church follow the course of studies in the universities and athenæums, those of other religious creeds study in the seminaries: the Remonstrants, Mennonites, Lutherans and Jews at Amsterdam, the Reformed Christians at Kampen, the Jansenists at Amersfoort, the Roman Catholics at Driebergen, Warmond, Culemborg, Haaren, Hoeven and Roermond, with branches at Voorhout, Saint-Michielsgestel, Oudenbosch and Kerkrad. There are two preparatory institutions for future employés in the East Indies, one a state institution at Leyden, and one, district, at Delft, with nine professors and fourteen students. There are, besides, at Amsterdam a preparatory school for army and navy physicians, a polytechnic school, and a school for the instruction of midwives; there are military schools at Breda and Kampen, a naval school at Medemblik, a veterinary school at Utrecht, three institutions of deaf mutes, three for the blind, and one for idiot children, the last at the Hague. Besides there are many schools of swimming, gymnastics,

vocal and instrumental music, drawing, etc.— *Public Charity* is regulated by the law of June 28, 1854, which fixes the place of his relief at the place of birth of the person relieved. The institutions of charity are: 1st, those of the state, of the provinces and of the districts; 2d, of religious corporations; 3d, special; 4th, general. The first do not give aid except in case of the insufficiency of the others. These institutions, in 1869, numbered 5,194, of which 3.950 afforded home aid, 716 were almshouses for old people, children, etc., sixty-four hospitals, eleven asylums for the insane, and ninety workhouses. In 1869 aid was given to 148,951 housekeepers and 81,089 single persons; the cost of charity was 10,812,303 florins. The population of the state colonies for paupers at Ommerschans and Veenhuizen (in Overissel and Drenthe) on Dec. 1, 1869, was 5,508; the population of the colonies of the benevolent society, in Drenthe, Overissel and Frisia, was 2,276. The insane asylums, numbering twelve, are regulated by the law of May 29, 1841. The number of the insane in these establishments, Dec. 31, 1848, was 557 men and 609 women; Dec. 31, 1858, it was 961 men and 1,065 women, and Dec. 31, 1868, 1,557 men and 1,703 women. — *Army and Navy.* The composition of the army in 1872 was as follows: 1. Infantry—1,046 officers and 42,034 soldiers, one regiment of grenadiers and chasseurs, eight regiments of the line, one battalion of instruction of four companies, one dépôt of discipline of two companies, hospital corps forming two companies; 2. Cavalry—four regiments, 177 officers, 3,386 soldiers, and 2,679 horses; 3. Artillery—five regiments and a corps of pontonniers, in all, 387 officers, 10,014 soldiers, and 1,800 horses; 4. A corps of engineers, whose staff consisted of seventy officers and thirty-six inspectors of fortifications. This corps embraced besides a battalion of sappers and miners of five companies, with twenty-two officers and 922 men. The entire army was composed of 1,945 officers and 59,482 soldiers, and besides, in the provinces of North Brabant, Zealand and Limburg, of a gendamerie corps of ten officers, 362 men and 202 horses. The effective force of the army, July 1, 1872, was 1,872 officers and 57,992 soldiers, of which 29,189 were on leave. There were 4,707 horses. The army in the eastern and western colonies comprised, Jan. 1, 1871, 1,318 officers and 28,351 soldiers. Military service is obligatory, but substitution is allowed. — The law concerning the national militia dates from Aug. 19, 1861. Maximum of the annual contingent, 11,000 men (contingent for the year 1873, of which 600 were for naval service). Maximum of the number of militiamen is 55,000 men. Registration for recruitment takes place at the age of nineteen years, and the lot is drawn a year later. The contingent is regulated by the number of names inscribed the preceding year. Duration of service, five years. Service in the national guard is obligatory from twenty-five to thirty-five years (law of April 11, 1827). The proportion is two men out of every 100 inhabitants. Of these ten years, five years of active service are required; in the last five years the men form part of the reserve. — The navy is composed of: 1, ships for home service and a manœuvring corps, not embarked, (July 1, 1873, 53 officers and 1,741 men); 2, transport vessels for the colonies; 3 and 4, squadrons in the East and West Indies; 5, ships in other waters, including vessels in process of construction or of repair. The navy included, Aug. 1, 1872, 117 ships, of which seventy-four were steamers, with a power of 14,377 horses. These ships were able to carry 1,060 cannon. In active service there were forty-nine ships, thirty-eight of which were steamers, with a power of 6,269 horses, and armed with 378 cannon. The crews consisted of 5,598 men. The corps of officers of the fleet comprise one admiral, one lieutenant admiral, two vice-admirals, four rear admirals, twenty captains, 100 lieutenant captains, 120 first lieutenants, 220 second lieutenants, and seventy-six cadets of the first class; the administration comprises three inspectors, eighty-four administrative officers in three classes, and thirty-six midshipmen. — *Resources.* Although rural economy is very far advanced, the products of the soil are not sufficient for the support of the inhabitants. The most productive provinces are Zealand and Groningen. Wheat is cultivated chiefly in Zealand, South Holland and Limburg; rye in Groningen, Zealand, North Brabant, Guelderland and Limburg; potatoes in Zealand and the dunes; oats in Groningen, Frisia, Guelderland and Zealand; colza in Groningen and South Holland; tobacco in Guelderland and the province of Utrecht; flax and hemp in South Holland, and chiccory in Frisia The area of arable land is estimated at 2,128,766 acres. Value of the products varied, during the ten years 1861–70, from 156 to 198 millions of florins; the average is 173 millions. The area of the meadows and of the land devoted to the growth of fodder for animals is about 3,212,300 acres, or one-third of the surface of the country. The finest pastures are found in the two Hollands and in Frisia. Gardening and the cultivation of vegetables are brought to great perfection in the two Hollands and in the province of Utrecht. A large commerce is carried on with England in vegetables, fruit, butter and live stock. Toward the end of 1870 the live stock comprised 252,054 horses, 1,410,822 horned cattle, 900,187 sheep, 136,980 goats, 329,058 hogs, and 3,193 asses and mules. — The country is more commercial than industrial. The principal industrial centres are the great cities of the two Hollands, such as Amsterdam, Haarlem, Rotterdam, Leyden, Dordrecht, the Hague, the city of Utrecht, a part of North Brabant, especially Tilburg and its suburbs, the country of Drenthe, in Overissel, some parts of Guelderland, and the cities of Maestrecht and Roermond in Limburg. Toward the end of 1870, 708 manufactories used steam for a motive power, and made use of 794 engines and 1,043 boilers, with a force of 13,346 horses. Commerce and trans-

portation were effected at that time by means of 100 steamships, with 168 engines and 118 boilers, with a force of 12,118 horses. The patent law dates from May 21, 1819. The law of July 15, 1869, abolished patents for invention and introduction. The principal industries are connected with the building of ships, and with commerce with the colonies. There are 600 to 700 dock yards, of which 150 are devoted to the building of sea-going ships. The principal dock yards are found in the two Hollands, at Groningen and Frisia. Saw mills (113 in number) are found chiefly in the two Hollands in the region of Zaan, and about Dordrecht; manufactories of ropes in South Holland, and manufactories of sails at Crommenie, in North Holland. Then there are 500 to 600 brick yards, tile works and manufactories of pottery, chiefly in Guelderland, Overissel and South Holland; 400 millions of bricks are made annually; there are 400 to 500 gin distilleries, of which 221 are at Schiedam; the manufactories of tobacco and cigars number more than 300, principally at Amsterdam, Utrecht and Eindhoven; there are also manufactories of madder in Brabant and South Holland, and especially in Zealand; 300 to 400 oil mills, chiefly in North Holland; paper manufactories, chiefly in the region of Zaan, Guelderland, and at Maestricht and Rotterdam; sugar refineries at Amsterdam and Rotterdam, (producing 175 million to 220 million pounds, principally exported to Italy and Russia); rice mills at Amsterdam and Rotterdam; mills for polishing diamonds at Amsterdam, which have a European reputation; goldsmiths' establishments at Amsterdam, in South Holland and Frisia; linen and cotton manufactories, chiefly in Drenthe, Overissel, Guelderland and South Brabant; manufactories of woolen cloths at Leyden and Tilburg, and many other places. —The Netherland fisheries, above all the salting of herring, have always been renowned. The principal fisheries are those of the herring, large and small, which yielded, in 1871, two millions of florins, (322 ships); fishing with nets, (208 ships), half a million; cod, whiting fishing, etc., (87 ships). The exportation in 1871 was: cod, 4,030 tons; stockfish, 2,585,000 pounds. The products of the fishery of the Zuyder Zee, herrings, anchovies, shrimps, eels, etc., (650 ships), are exported principally to Belgium and Germany. —The following is a summary of the international commerce, in millions of florins. (The total amount of the special commerce can be found by subtracting the transit of the general commerce.)

YEARS.	General Imports.	General Exports	Transit.
1846	256	210	92
Average of 1846-50	286	212	85
Average of 1851-5	329	282	109
Average of 1856-60	419	351	115
Average of 1861-5	466	405	105
Average of 1866-70	578	482	114
1871	785	649	189

The following is the movement of commerce, in millions of florins, between the Netherlands and the six following groups of countries. In the second group are included Germany, Sweden, Norway, and a part of Russia; in the third, Belgium, France, Spain and Portugal; in the fourth, Italy, Austria, part of Russia, Turkey, Greece, the Danubian Principalities, Egypt, and the Barbary States.

GENERAL IMPORTS.

FROM	1846 to 1850	1851 to 1855.	1856 to 1860.	1861 to 1865.	1866 to 1870.	1871.
Great Britain	67	89	106	123	167	247
Baltic and North seas and central Europe.	79	92	123	154	190	240

Asia, Africa, Australia	12	23	36	51	52	42

The following table shows the chief articles of import and export, for the years named:

ARTICLES	General Imports.		General Exports.	
	1846	1871	1846	1871.
Manufactures	41	73	17	62
Corn, flour, beans, etc	31	81	18	32
Thread	22	58	15	42
Sugar	33	56	31	63
Coffee	20	46	17	37
Cotton	6	42	7	34

Two-thirds of the foreign commerce of the Netherlands is carried on by sea. The merchant marine in 1846 numbered 1,936 ships, with 379,548 tonnage, and in 1871, 1,902 ships, with 521,098 tonnage. The following is a table of movement of navigation for the years 1831–71:

ENTRY.

YEARS.	National Ships.		Foreign Ships.	
	Ships.	1,000 Tons	Ships.	1,000 Tons.
1831	1,995	229	2,545	315
1831-40	2,321	274	3,058	427
1841-50	2,883	405	3,387	564
1851-60	3,429	565	4,095	775
1861-70	3,269	626	4,747	1,222
1871	3,051	715	6,516	2,012

DEPARTURE.

YEARS.	National Ships.		Foreign Ships.

1851–60	206	250	1,395	2,172
1861–70	207	313	1,365	2,357
1871*	204	276	1,342	3,843

* We here give some later statistics of the Netherlands. — The following table shows the actual revenue and expenditure for the years 1874–7, and the estimated revenue and expenditure for 1878–9, in florins:

YEARS.	Revenue.	Expenditure.
1874	105,269,687	99,352,355
1875	119,837,573	116,911,247
1876	109,680,253	113,396,805
1877	106,392,323	117,927,685
1878	102,474,363	118,119,296
1879	115,822,697	115,811,801

— The budget estimates for 1881 were as follows:

Sources of Revenue.	Florins.
Direct taxes	24,755,185
Excise duties	38,925,000
Indirect taxes, including stamps	23,460,000
Customs duties on imports	4,611,040
Guarantee of gold and silver ware	301,100
State domains	1,550,000
Postoffice	4,000,000
Telegraph service	935,800
State lottery	430,000
Hunting and fishing licenses	149,000
Pilot dues	924,000
Dues on mines	2,875
State railways	2,200,000
Miscellaneous receipts	2,866,605
Total revenue	105,110,605

Branches of Expenditure.	Florins.
Civil list	750 000
Legislative body and council of state	618,518
Department for foreign affairs	660,399
Department of justice	4,591,879
Department of the interior	10,180,735
Department of marine	12,124,440
Public debt	23,167,812
Department of finance	18,687 620
Department of war	20,167,812
Department for the colonies	1,871,736
Public works and commerce	20,271,296
Contingencies	50,000
Total expenditure	112,642,247

— The regular army of the Netherlands, Jan. 1, 1879, was composed as follows:

CLASS OF SERVICE.	Officers.	Rank and File.
General staff and military administration.	172	
Infantry—		
Staff	38	
One regiment of guards	108	4,232
Eight regiments of the line	848	38,504
One battalion of instruction	31	625
Dépôt of dicipline	12	44
Hospital corps	2	240
Cavalry —		
Staff	7	
Four regiments of hussars	94	4,318
Engineers —		
Staff	77	40
One battalion of sappers and miners	26	1,013
Artillery—		
Staff	63	54
One regiment of field artillery, with train	58	2,030
Three regiments of heavy (fortress) artillery	221	6,378
One regiment of light horse infantry	32	636
Two companies of pontonniers	12	317
Total	1,801	58,431

The colonial army of the Netherlands, Jan. 1, 1879, numbered 1,432 officers and 37,931 rank and file. — According to the law of April 1, 1881, reorganizing the army, on a war footing, it is to consist hereafter of a total of 61,400 men, the yearly contingent of militia to amount to 12,000 and that of the recruits to 11,000 men. 3,040,400 florins were appropriated in 1881, for the building of fortifications. 20,000,000 florins for the same purpose were called for in 1882. The system of fortifications is to be completed in 1883. — At the end of 1881 the navy of the kingdom was composed of 103 steamers, (including seventeen ironclads), and seventeen sailing vessels. The officers of the navy were: one admiral, one admiral lieutenant, three vice-admirals, three rear admirals, twenty captains, forty commanders, 300 first and second lieutenants, forty-three midshipmen, seventy-six administrative and fifty-one medical officers. The marine infantry consisted of forty-five officers and 2,140 non-commissioned officers and privates. — The estimates of the total imports and exports of the Netherlands for the years 1876 to 1878, in florins, are as follows: Imports, 1876, 713,440,549; 1877, 750,984,425; 1878, 713,440,549. Exports, 1876, 533,084,813; 1877, 541,887,066; 1878, 538,084,813.

M. M. DE BAUMHAUER.

NEUTRALITY may be considered in its principle, in its history, in the rights which it gives, or rather preserves, and in the duties which it imposes. — I. *History of Neutrality.* Neutrality flows from the mutual independence of nations. If the right to declare and wage war is one of the rights belonging to sovereign power, is not the right to remain at peace when other nations engage in war a still stronger proof of independence, and a far more precious prerogative of that condition in which a people belong to themselves and are absolute masters of their decisions and acts? From this point of view, the history of the progress of neutrality is also that of the progress of the independence of peoples. If neutrality was, among the nations of antiquity, scarcely anything more than an idle word, and in the middle ages but an object of disdain and hatred; if, even after the formation of modern Europe, it was for a long time weak and precarious, imperfectly defined and insecure, it was because it had not passed through all its social phases and arrived, by means of Christian civilization, at that equal balancing of power among the different states which secures to each a real and important independence. When Rome labored to inclose all the nations of the world in the meshes of her net, there were to be found but *tributaries* conquered by her arms; *dediticii*, who had submitted to her yoke; *allies*, who were in a state of dependence upon her, and were obliged to aid her in pursuing the course of her conquests; or, finally, *enemies*, who were bound to submit, sooner or later, to her victorious legions: but she recognized no *neutrals*. Nor could ancient Greece boast any superiority over Rome in this respect; for, within her limited boundaries, her numerous rival and jealous petty republics were leagued in turn one against another; and if neutrality was in a manner acknowledged, it was merely to protect, by means of the amphictyonic treaty, Delphi and its temple: a memorable example given by Paganism to Christianity, and one which serves to show how states can agree among themselves to mutually protect a holy city. But beyond this line of religious neutrality, what do we find in the world of antiquity? It was not as *neutral* states, but as the vassals of the powerful kingdoms of the east, that the maritime cities on the coast of Asia Minor and Syria, or those of the Mediterranean, obtained privileges and franchises for their commerce. Their ships of war composed the fleets of the king of Persia and served him as instruments wherewith to attempt the subjugation of Greece itself; as, later on, they formed the strength of the Roman fleets, when, after the fall of Carthage, Rome undertook the conquest of the world. — Nor were the centuries which saw the dissolution of the Roman empire centuries of neutrality, but rather of general and incessant strife. What nation would have pretended to remain neutral between the legions of Rome and the barbarians? There was then without doubt a principle in the spirit of Christianity which was destined to transform the world, and to produce modern civilization by mingling the ruins of ancient civilization with the new spirit of the gospel. But before it was able to enjoy peace, modern Europe had to found its independence by war. During the crusades all christendom was under arms. Abroad, the struggle against the infidels was not merely a war of state against state. The question was as to which should rule, Christian Europe or Mussulman Asia. To remain neutral in such a contest it would have been necessary to abandon one's faith. In Europe itself the feudal organization of the several states was no less exclusive of the principle of neutrality. With the requirements of military dependence, which obliged every vassal to sustain, with arms, the cause of his suzerain, the neutral would have been nothing but a felon. It was by means of maritime commerce that the principle of neutrality made its way into the law of nations. But the commercial cities of Italy were too much divided by malicious rivalries to appreciate the advantages of peace. Their very commerce lived by war and increased by the aid of monopoly and arms. The Hanseatic league, founded upon the union of interests, seemed better disposed to the practice of neutrality, but commercial ambition too often led it to deviate from this way. Not content with having obtained its own franchises, it would make a privilege of them, and this great confederation, which should have given peace and freedom to the north of Europe, was the cause of war throughout its whole extent. It was at the time of the decline of the great feudal system, when Europe began to be divided between three or four monarchies, which were about equally possessed of the different elements of wealth and strength, that neutrality became, like the leagues of states, a political means of counterpoise and balance. But at first this means could be used more by small states than by great empires. Commercial cities made use of it to protect their isolated condition; others employed it as a means of developing their power. The neutrality of Switzerland was established not only for the benefit of the Swiss people, but also for the reciprocal advantage of her powerful neighbors, and as an expedient to protect their respective frontiers against sudden invasions. The neutrality of the kingdom of Belgium has been established under similar conditions in our own day. But all neutrality imposed by treaties has

in it something of weakness. To be complete, the idea of neutrality implies the liberty to choose between peace and war; it supposes, in the neutral nation, strength sufficient to defend, in case of need, the position it has freely chosen. If the state which wishes to remain neutral, has not itself sufficient resisting force, it can ally itself with other nations who have the same interests. Hence, the armed leagues by which neutrality began to cause its rights to be recognized as against the unjust claims of belligerents. Leagues of this kind can be more easily formed in maritime wars than in wars on land, for on land neutral forces, unless belonging to states bordering on one another, could not combine without crossing the belligerent states, while, as the ocean ways always remain free, the naval forces of the neutral powers there find a vast field whereon to rally and to aid each other. Therefore the most important part of the history of neutrality is that which concerns maritime nations, and it was especially in the states bordering on the North sea that permanent interests were first found which made maritime neutrality the basis of their politics. Holland occupies the first rank among these nations. — In the new order of things created by the discovery of America, maritime commerce, which increased with the increase in extent of the known world, was divided into two parts. The transatlantic commerce remained for a long time in the hands of the Spaniards and Portuguese: but once they reached Europe, the products of America and India were loaded upon Dutch vessels to be distributed from port to port. Thus, as soon as the Dutch achieved their independence, they needed the freedom of the seas to preserve it. England, more ambitious, desired to establish her maritime domination everywhere by monopoly and privilege. She at the same time disputed with Spain the commerce with America, and with Holland the trade of the European seas. She did not then hesitate to proclaim distinctly, for her own benefit, the thesis of the subjugation of the seas. Her colonial system on the one hand, and the navigation act on the other, were the instruments she employed to draw to herself and to concentrate, if it were possible, in her own powerful hands the two branches of the maritime commerce of the world. To resist these pretensions of England the other northern nations felt the need of devising measures of defense and of uniting their forces. The old Hanseatic cities of Holland found for allies those Scandinavian kingdoms over which they had formerly wished to rule. Sweden and Denmark more particularly, as champions of the rights of neutrals, gave proof of an energy which powerfully aided this holy cause. But to insure its success, it was necessary that some of the great maritime powers should put themselves at the head of these leagues, formed not only for the defense of a people, but for the defense of a principle too. France, under Louis XVI., took this generous initiative by the declaration of 1778, and it alone of all the great states did not cease for one instant to lend the support of its influence or its arms to the cause of neutrality, in war as well as in peace, until it had achieved its complete triumph. Russia under Catharine and under Paul I. nobly concurred in this work of justice, by boldly urging the neutral powers of the north, in its manifestoes of 1780 and 1800, to league themselves together against England; this alliance, however, but interruptedly observed, indicated the end desired, without obtaining it. The great event, for which France prepared the way, which was to give the neutral powers a new attitude in the world, was the establishment beyond the seas of a great maritime state, which took neutrality as the basis of its political system, and as the grand starting point of the development of its power. It may be that the United States of America have not always defended with sufficient determination all the principles of the right of neutrality; but the very fact of the existence of this permanent neutrality of a great state during the entire period of the European wars of the French revolution and of the first empire, almost without deviating from its waiting and pacific policy, has very naturally given to the position of the neutral powers in the world a strength which they did not have before. In the face of the antiquated maxims of maritime tyranny which *Old England* persistently upheld in Europe, there arose the maxims of free navigation which the emancipated colonies of *New England* professed in America. These maxims France had constantly proclaimed: it was in their name that she had established the continental blockade, which, however, went so far as to violate and destroy all rights. But it was not by such unlawful use of force that the opposition of England was to be overcome. It was by the salutary influence of peace that France obtained, in 1856, of her old rival, now become her ally, the tardy recognition of the principles which formed the basis of the rights of neutrals. — II. *General Principles.* This brief historical résumé shows, better perhaps than any amount of philosophical reasoning could have done, how intimately the cause of neutrality is allied to the principle of national independence and maritime equilibrium It has been the subject of much discussion whether or not, from a scientific point of view, there is to be found a satisfactory and complete definition of *neutrality.* Viewed from the standpoint of reason, we find this simple truth, that neutrality is "peace established in the midst of war and respecting its rights." The difficulty which perpetually arises between belligerents and neutrals, therefore, is to know how to reconcile the rights of war with the rights of peace. It would become impossible to solve this difficulty, if the respective definitions of each of these opposite rights were pushed to the extreme: if it were true, on the one hand, that "anything that can serve to injure an enemy is permitted to belligerents"; and if, on the

other hand, it could be rightly maintained that "the neutral power, which wished to remain at peace can take no account whatever of the war, which should be for it as though it were not going on at all." In this absolute antagonism of contradictory principles, no reconciliation would be possible, and the neutral powers would only have to arm themselves to defend their rights by force, if need be. The systems based upon exclusive theories must inevitably lead to this conclusion Some, under pretense that necessity justifies all things in war, are led to recognize in neutrals no right which does not depend more or less on the caprice of the belligerents. Others, rightly seeing in the cause of neutrals that of commerce and of all the peaceful interests which constitute the life of human society and the wealth of states, would not accord to belligerents any rights except those from which neutrals would not have to suffer in any event. Truth is not to be found in either of these principles. Nor can we find it either in the odd system proposed by Lampredi, which consists in leaving the rights of belligerents and the rights of neutrals to be exercised *parallely* to the full length that they can extend, as if it were not folly to abandon to chance or force the care of finding the limit which reason should seek for and which should be determined by the law of nations. To make proper allowance for the rights of belligerents, and to establish likewise just limits to the rights of neutrals, is evidently the end which we must strive to accomplish. This was the way taken by the publicists who, in the very midst of maritime wars, began to build upon solid foundations the science of the rights of neutrality, by Bynkershoeck, Hübner, Galiani, Gérard de Rayneval, Azuni, and by Hautefeuille, Massé and Ortolan, who, at a more recent date, have resumed and developed these studies in time of peace. Each of these publicists has, according to his personal tendencies, enlarged or restricted the application of one principle or another; but all recognized the fact that war, as well as peace, has its just rights, and that they must limit each other without any one of them being suppressed, unless it be those which have nothing but the name of right, and which are manifest inventions of violence and arbitrary power. — Side by side with this labor of science there was another labor going on in morals, which was destined, without doubt, to prepare and facilitate the recognition of the rights of neutrals. It would be an interesting and profitable study to note how many injustices disappear of themselves according as individuals and nations gradually correct false theories founded upon ignorance and error. The moral result we here refer to was aided even by the material revolution operated in our day in the art of war, and, above all, in naval warfare. — In the conflict between the two principles represented by belligerents and by neutrals, the principle of peace and the principle of war, every inch of ground is disputed, and the right of peace naturally profits by every surrender made by the right of war, either spontaneously or by force, in the name of strict justice, or in the name of humanity. Thus, in 1856, the spontaneous resolution of the maritime powers to abolish the right of privateering effected the realization of a progress most favorable to the interests of neutrality, although neutrals had in principle no right to claim such a softening of the severities of war. This last consideration was absolutely indispensable in order to show the true character of the recent progress of the law of nations. We would have a very imperfect idea of this progress if we were to study each fact in it apart from the others. They are connected one with another, and can not be exactly appreciated except when considered as a whole. Neutrals did not obtain justice for their most sacred rights in time of war until commerce had obtained the recognition of the grand principle of the freedom of the seas in time of peace. — III. *Duties of Neutrals.* Neutrality being, as its very name indicates, nothing more than an abstention from war, the fundamental duty of neutral nations consists in abstaining from all participation in hostilities. *Neutrarum partium esse; neutri parti, belli causa, favere*, as Wolff expresses it. But beside this duty, which constitutes, so to speak, *passive* neutrality, there is another, the fulfillment of which requires neutrality to become *active*, that is, *impartiality* in the performance of the good offices which the neutral powers ought to render to each of the belligerents.—The first principle is self evident, and the second is the result of reasoning and theory. If a neutral power loses all claim to this title when it directly aids either party in the war, is it any more in keeping with its character to refuse to one of the belligerents the indirect assistance which its partial friendship lends to the other? But let us proceed. From this impartiality of neutral powers, which has been made a duty, it has been concluded that such powers should so act as not merely to offer the same friendly relations to both the belligerents, but also to prevent either one of them from assailing with impunity the rights and privileges of neutrality, by violating by hostile acts, for instance, the territory or territorial seas of a neutral state. — There are, above all, two very weighty matters connected with the duty of abstention imposed upon neutral powers, the *law of contraband* and the *law of blockade*. The two things are intimately connected with each other. In fact, when we say that neutral powers ought to "abstain from all participation in hostilities," we do not say enough; and this duty, by a natural consequence, requires that a neutral power should do nothing the direct result of which would be to prevent between two enemies the warlike operations allowed by the law of nations. Hence it follows, that neutral powers are obliged not only not to carry contraband of war to belligerents, but also to respect a blockade established under regular

conditions. In general, "anything for use in war" furnished the enemy by a neutral power, is called *contraband of war*. But if we take this word in its broadest acceptation, it is evident that all commerce between belligerents and neutral powers should be forbidden. In fact, war, and especially naval warfare, is waged, on the one hand, by means of arms of different kinds which must be manufactured and supplied with ammunition; on the other hand, by means of soldiers and sailors, who must be enrolled, paid, clothed, equipped and fed; finally, by means of ships, which must be built and, if necessary, clad in iron, armed with powerful machines, and provisioned. What then would remain, if we were to reckon as contraband everything that might serve, either proximately or remotely, the many and varied requirements of war? A distinction had, therefore, to be made between articles which might be freely traded in and articles of contraband: but to whom should belong the establishment of this distinction? To give it to belligerents would be to destroy the rights of neutrals. To give it to neutrals would be to compromise the rights of war. States finally agreed, by international treaties, what kinds of merchandise, what persons and what acts should be considered contraband. They acknowledged the fact that the manufacture or sale of all articles, even those to be used in war, can not in general be prohibited upon neutral territory; that in accordance with this principle, and saving all proper exceptions, the only kind of commerce which is absolutely forbidden to neutrals is the transportation of contraband goods to the enemy's country, whether these goods have been already sold upon neutral territory or whether the object of their transportation is, that they should be sold to one of the belligerents in its own ports. Among the rare exceptions to this rule there are two deserving of special notice: the one has reference to the enlistment of soldiers, and the other to the building or arming of ships of war in a neutral country for the service of belligerents.* It is perfectly clear that in these two cases it is not a question of things that merely may be used in war, but rather of things that constitute the body and substance of war itself, for no naval war can be carried on, or even imagined, without ships of war, nor can a war of any kind be waged without soldiers. Thus not only the transportation but even a sale made to a belligerent is, for a neutral, a hostile and forbidden act. As to other articles of commerce, the secondary law seems to have adopted as its rule that only those articles should be included in the contraband list which, in the state in which they are delivered to the enemy, can be of immediate service in carrying on the war, whether they consist of arms and implements of war or of materials that are of themselves directly fitted for use in war. To do away with all doubts, many of the great international treaties contain, together with the list of things prohibited in time of war, a counter-list of those that are not forbidden. Nevertheless, no matter what trouble may be taken to regulate these details of the secondary law, the changes which are constantly occurring in the art of navigation and in the form of engines of war, give rise to new questions in every epoch. To cite but one: the question has arisen in our own day, whether coal should not, by reason of its indispensable necessity in steam fleets, come under the prohibition which most of the great European treaties have placed upon sulphur and saltpetre; but public opinion would protest against this classification; for, of all the mineral substances which the earth conceals within its bowels, what one is there more inoffensive in its nature, and what one is there that owes less to the labor of man than coal, which passes, in its natural state, from our mines to the furnaces of our steamships? Within these limits the interdiction of the carrying of contraband of war to the enemy is surely the most reasonable and just of all the burdens imposed upon neutrals by the law of nations. It would even be difficult to understand how this prohibition could disappear without profoundly affecting the natural notions of peace and war. Is it not already a great deal for neutral nations to be allowed to take advantage of the immunity of their territory to manufacture and sell to belligerents munitions and arms, which are the instruments wherewith they fight? To transport these arms in their own vessels to the very theatre of the war would be, in the eyes of morality, to overstep the limit which separates peaceable commerce from active participation in hostilities. Does not the merchant, who, for a consideration, puts the gun into the hands of the soldier, perform an act of war as much as the soldier himself, who, by pulling the trigger, inflicts death directly?—It must, however, be admitted, that even a limited interdiction of contraband of war produces a lamentable consequence for neutrals—that neutral vessels are obliged to submit, even on the high seas, to be searched by belligerents. There is, perhaps, no arbitrary and violent measure which has, in practice, been the cause of more dissatisfaction and hatred than the abuse of *the right of search*. Nothing irritates a proud and generous people so much as the vexations to which their fellow-countrymen are daily exposed. But are the abuses of the right of search of such a char-

* The treaty of Washington, May 8, 1871, between the United States and Great Britain (Alabama claims) lays down the following principles: A neutral government is bound, 1, to use all diligence to prevent the arming of any vessel which it has reason to believe is intended for service as a privateer, or to take part in hostile operations against a power with which it is at peace, and also to use the same diligence to prevent even the departure from its jurisdiction of any vessel destined for privateering, or to take part in hostile operations, such vessel having been in whole or in part adapted for purposes of war within said jurisdiction; 2, not to allow any of the belligerent nations to make its ports or its waters a basis of operations, nor to make use of them to increase or replenish their military supplies or arms, or to recruit troops; 3, to exercise all necessary diligence in its own ports and waters, and over all persons under its jurisdiction, to prevent any violation of the obligations and duties above mentioned.

acter that they can not be corrected? Would it not be, not only possible, but easy, by reducing the thing to what the name expresses, by submitting the verification of the ship's papers to certain rules, without authorizing the annoying search of the interior of the vessel, to have the inspection accompanied with so much politeness and consideration that it would lose its character of a police measure and become little more than a mere formality? The only inconvenience it would then cause an unoffending vessel would be a slight delay. — There is not, on the contrary, in the entire law of nations a principle whose application produces graver, more irreparable and apparently more unreasonable consequences to the neutral than *the right of blockade*. In everything else it is upon belligerents, and justly so, that the evils of war press heaviest; for the belligerent, who suffers by the war, always has a means of putting an end to his sufferings by offering or accepting peace. But what means of putting an end to the war has the neutral who suffers from the blockade, if his offers of mediation are rejected? He may, therefore, see himself ruined by a state of things which he has done all in his power to prevent. — IV. *Rights of Neutrals*. Whatever may be the fatal necessity of war, whatever may be its justice, dignity and glory under certain circumstances, it is but an exceptional and abnormal state in the life of civilized nations. What are called *the rights of belligerents* are means of force and violence, which, in order to secure satisfaction for a just grievance, disturb all the ordinary relations of nations. With *the rights of neutrals* it is entirely different. Neutrality, as we have said already, represents commerce, civilization and peace. Its noble mission is to continue this peace in the very midst of the barbarities of war. Its rights are nothing else than the common rights of mankind, and we have no need of subtle definitions to explain them. According to Hübner's idea, whatever is not forbidden to neutrals by a formal restriction of the law of nations, is allowed them. First of all, they have a right, an absolute right, to respect for their persons and their goods. — *Respect of territory* is the first condition of the independence of neutral nations: it is also the easiest to observe, for here the line of demarcation between peace and war is traced with mathematical accuracy. The opinion was, however, held in former times that the belligerent had the right to convey his troops over neutral territory, provided it were done in an inoffensive manner. This is what Grotius and his school call *transitus innoxius*. Vattel even went so far as to pretend that a belligerent could, in case of extreme necessity, place a garrison for a time in a fortress situated in a neutral country. But all now agree that to take neutral territory by force in order to use it for warlike operations would be a flagrant violation of the rights of neutrality. — By neutral territory is meant not only the continental or insular possessions of a neutral state, but even those parts of the sea near the shore which the law of nations considers as part of the territory of a country. We will presently consider the question whether a neutral vessel should not also be considered as a detached portion of the territory. — The immunity of neutral territory naturally protects everything that is found in it, both the goods and persons of neutrals themselves and the goods and persons of belligerents. This is what constitutes *the right of asylum*. But, in order thus to share the privilege of neutrality, it is necessary that the belligerent who resides or takes refuge on neutral territory should continue, while he enjoys this asylum, in a situation analogous to that of neutrals themselves, that is to say, he should abstain from all acts of hostility — The lives of the enemy's troops, when closely pressed in a hard pursuit, are spared, if they succeed in reaching the frontier of the neutral state; but they must at once lay down their arms. Ships of war of belligerents may find a similar refuge in a neutral port, or in the waters of a neutral country near such a port. Once received into this port, the crew of a ship of war may revictual the ship there, and repair the injuries she has received from storms or in battle, but upon condition of there living at peace with any of the enemy's ships that chance, tempest or war may have driven, like herself, into this place of asylum. Further: if this armed vessel desire to put to sea again, the law of nations, in its foresight, will not allow her to leave a neutral port until one day after the departure of the enemy's ship which had preceded her has elapsed. The sacred rights of hospitality have imposed this salutary restriction upon the rights of war, which is known as the *twenty-four hour rule*. — If the law of nations protects even the persons and goods of the enemy upon neutral territory, it has still greater reason to protect the goods and person of a neutral upon the territory of belligerents. But, by a just reciprocity, the citizens of a neutral state, residing in the theatre of war, can avail themselves of this right of immunity only so long as they remain neutral in their acts as well as by their nationality. If they take a personal part in the war, they must submit to the laws of war. But so long as they abstain from all mingling in hostilities, their privilege as neutrals follows them everywhere: however isolated they may be in a strange land, their cause must not be confounded with that of the people with whom they are accidentally intermingled. How, then, shall we qualify, from the point of view of justice, the measures by which a belligerent, the moment a war is declared, lays hand on neutral ships moored in his ports, either arbitrarily to detain them under form of an *embargo*, or to press them into service for the transportation of troops or munitions of war in virtue of a pretended right of *angaria*? These measures are evidently contrary to the rights of neutrals, and can find no pretext for their practice but in the iniquitous theory, that everything *necessity* requires, even though it act as an injury to neu-

trals, is excusable or lawful. — We have reserved for the last the consideration of the gravest and most debated series of questions, those which concern commerce by sea between belligerents and neutrals. On land the separation of peace from war is naturally made by the distinction of natural territory. On the high seas this separation is altogether a moral one, and can only exist and be enforced according to the rules laid down in the law of nations. The vast expanse of the ocean is no one's domain; it belongs in common to all nations, and serves equally for the uses of peace and of war. It is the grandest commercial route for the peaceful intercourse of nations and the largest battle-field for the settlement of their quarrels. The law of nations established the separation between belligerents and neutrals at sea by the use of the flag, which is the conventional sign of the nationality of vessels. As to ships of war, as they represent the national force of the state whose flag they carry, and are armed for its defense, the right of a neutral flag to the absolute respect of belligerents has never been called in question. But in regard to inoffensive and unarmed merchantmen, it seems to us almost incredible how variable and confused the rules of maritime law were for a long time. The enjoyment of the rights of neutrality certainly could not be denied to a ship when the vessel and the cargo both were the property of neutrals. What was denied to neutrals was the right to transport upon their vessels even goods not contraband belonging to the enemy. There was a time when it was considered not only just but indulgent toward neutrals for a belligerent power to confine itself to confiscating an enemy's goods found on board of a neutral vessel, provided the vessel itself was allowed to continue its journey, and the captain was paid for the freight he would have earned on the intercepted merchandise. This was the provision of the *consulat de la mer*, and became almost the common law of the middle ages. In some maritime states the domestic laws concerning prizes went much farther: they condemned to confiscation not only an enemy's goods, but also the neutral ship which carried them. An ordinance issued in 1681 by Louis XIV., who was so wise upon other points, sanctioned the unjust maxim: "*robe ennemie confisque navire ami.*" — Some laws and treaties, carrying their violation of the rights of neutrals to the utmost limit, laid down the principle that "*navire ennemi confisque robe amie.*" Thus the nationality of the belligerent vessel seemed to communicate its character to neutral merchandise and cause its loss, while the nationality of a neutral vessel was effaced by contact with an enemy's goods. In order to understand such a deviation from the rules of justice, it must be borne in mind that privateering was then the chief means of carrying on a maritime war, and that "to encourage privateers" they believed themselves obliged, by reasons of state, to deliver over to them not only the enemy's goods, but those of neutrals also. Only the abolition of this kind of war could dry up the source of the evil. Progress had been at first slow and imperfect. Down to the middle of the eighteenth century it was believed that the suppression of the two most odious cases of confiscation, by declaring neutral vessels exempt from confiscation for carrying goods belonging to the enemy, and by declaring the goods of a neutral not liable to seizure when found on board an enemy's ship, would be sufficient justice. It was quite a different thing to declare that an enemy's goods carried by a neutral vessel should be everywhere respected. The principle of free transportation of an enemy's goods by neutral vessels was, it is true, admitted by a great number of European treaties; but the internal public law of England and even of France obstinately retained the contrary principle; and the same disagreement which existed in practice between the internal laws and the treaties existed, in science, between the different opinions of publicists. At the very time that it was to Holland's best political interest to cause the exemption of the neutral flag to be recognized, the celebrated Dutch publicist, Bynkershoeck, declared that, viewed from the standpoint of natural law, he saw no reason to exempt from seizure by belligerents an enemy's goods when carried upon neutral vessels. — There are two ways of looking at a neutral vessel freighted with an enemy's cargo. We may, on the one hand, look at such a vessel from a totally material point of view, and see in it "only a sea vehicle," which serves to transport goods, but without changing the laws which govern them. Or, on the other hand, we may ascend to a higher plane and consider a merchant vessel as a detached parcel of the neutral territory, which, upon an element essentially neutral, preserves the privilege of covering with territorial inviolability all that it carries with it. This beautiful and generous theory, which Hübner was the first to proclaim and Hautefeuille defended in an able and complete argument, could belong only to an age of civilization and progress. It impresses the mind by the noble simplicity of its formula (*the ship is territory*), and attracts it by the greatness of the interests which it protects; but does it possess, in an equal degree, that decisive authority which compels acceptance in virtue of a principle of natural and absolute justice? I should regret to enfeeble the reasons so confidently and so earnestly advanced in favor of a cause to which all the sympathies of my soul incline. Nevertheless, now that this great cause has won, we may explain to ourselves the resistance and delays its triumph met with by admitting that there was question here not so much of accomplishing an act of strict justice, as of taking another step upon the road of the progress of mankind; not so much of recognizing a right of neutrals, as of tempering and softening a right of war. What was the right which the belligerent denied the neutral flag? The right to take from its pursuit

commercial and private property of the enemy. The fixed territory of the neutral power protects such property only on condition that it remain motionless in the neutral state. The ship, which the law of nations made neutral territory, though floating and traveling territory, transports the enemy's goods to all points of the globe, puts them within the reach of all nations, and in fact restores, through the intermediation of neutrals, the possibility of maritime commerce by the enemy which the belligerents claimed to have the right to destroy.— This pretended right of suppressing all the commerce of an enemy was too long claimed by England. It was claimed by her when she wished to forbid neutrals the power to substitute during war their own vessels for those of belligerents between a mother country and a colony beyond the seas, and again when she denied to the commanders of ships of war of a neutral state, serving as escort to merchant vessels, the right to exempt the latter from search, by asserting their neutrality and declaring that they carried no contraband. The trouble and wars which this question of the search of convoyed vessels occasioned in the maritime world at the close of the last century, are well known. All these consequences of the old principle naturally fell with it, and the new principle "that the neutral flag absolutely covers the merchandise, even though belonging to an enemy, provided it is not contraband," thus became the keystone of modern maritime law.— V. *Conclusion.* To sum up in a few words the principles and facts in the foregoing, we may distinguish three periods or three degrees in the progress of international law in what concerns neutrals and especially maritime neutrals. — Down to the declaration of Louis XVI., in 1778, the rights of neutrality were in some measure left to the mercy of the domestic laws and particular treaties entered into between different states. Not but that we find written in the most important of these treaties respect for the neutral flag with a more or less exact definition of contraband of war, and certain provisions limiting the right of maritime blackade; but, as no general agreement had been concluded upon this subject, the true principles were sometimes admitted and sometimes disregarded, according to changing circumstances and the caprice of governments.— In the second period, which extends from 1778 to 1856, the neutral nations endeavored, in different ways, to concert together more exactly to define their rights and secure their recognition, either by diplomatic means, or even, if necessary, by force of arms. France, Russia, and the United States, in turn, took the lead in this progressive movement, which, begun in time of war, is followed up and extended in time of peace. The cause of neutrality became little by little the cause of all maritime nations, except England; for this last named nation, trusting in her strength and always regarding her commercial empire as indissolubly connected with the maintenance of her old maxims touching her rights on the sea, could not bring herself definitively to renounce any of them. — The cessation of England's opposition marks the third period. Yielding to the force of circumstances which led her toward a system of commercial liberty, she consented to recognize the fundamental principle that "the neutral flag covers an enemy's goods." Men now began to perceive at last that the recognition of the rights of neutrals was most intimately connected with the lessening of the hardships of war and the free development of international commerce. They therefore resolved upon the *abolition of privateering* as the principle from which was to flow the freedom of the seas, such as it is understood in the nineteenth century. — Under this two-fold aspect, the second article of the declaration of principles of April 16, 1856, is in our eyes the culmination of the progress ending; and its first article the point of departure of a new progress. *Text of the declaration:* "1. Privateering is now and forever abolished; 2. A neutral flag covers enemy's goods, excepting contraband of war; 3 Neutral goods, excepting contraband of war, shall not be seized under the enemy's flag; 4. A blockade, to be obligatory, must be effective, that is to say, it must be maintained by a force sufficient to prevent access to the enemy's coasts."

E. CAUCHY.

NEVADA, a state of the American Union, formed from territory acquired from Mexico. (See ANNEXATIONS, IV.) The territory of Nevada was organized out of the territory of Utah, by act of March 2, 1861. An enabling act was passed March 21, 1864, and the state was declared a member of the Union, in accordance with the enabling act, by President Lincoln's proclamation of Oct. 31, 1864. — BOUNDARIES. The boundaries of the state, as defined in the enabling act and accepted in the state constitution, were as follows: Beginning at the intersection of longitude 38° west from Washington with 37° north latitude; thence due west to the eastern boundary of California; thence northwest and north, along the eastern boundary line of California, to 42° north latitude; thence due east to longitude 38° west from Washington; and thence due south to the place of beginning. The act of May 5, 1866, took from the territory of Utah and added to the state of Nevada the territory between 37° and 38° west longitude and 37° and 42° north latitude, so that the eastern boundary of the state is now longitude 37° west from Washington. — CONSTITUTION. The first constitutional convention met at Carson City July 4–28, 1864, and formed a constitution, which was ratified by popular vote, Oct. 11. It prohibited slavery; gave the right of suffrage to white male citizens over twenty-one, on residence of six months in the state, providing they had not borne arms against the United States; fixed the term of the governor at four years, of senators at four years, and of representatives at two years; prohibited special legislation on a number of

specified subjects; and fixed the seat of government at Carson City. — GOVERNORS. James W. Nye, 1864–9; Henry G. Blaisdell, 1869–71; L. R. Bradley, 1871–9; John H. Kinkead, 1879–83. — POLITICAL HISTORY. From the admission of the state until 1870 it was steadily republican, the democratic representation in the legislature being only nominal. In 1870 the democrats carried the state and elected their candidate for governor, Bradley. The senate stood twelve republicans to eleven democrats, and the house twenty-six democrats to twenty republicans. The democratic proportion of the legislature immediately began to decrease again, and remained only nominal until 1880, though a democratic congressman was chosen in 1872 and the democratic governor was re-elected in 1874. In 1880 the democrats elected their candidates for congressman and (for the first time in the state's history) for presidential electors. The senate then stood fourteen republicans to ten democrats, and the house forty-three democrats to seven republicans. — Among the state's political leaders are Delos R. Ashley, republican representative 1865–9; Jas. T. Fair, democratic United States senator 1881–7; John P. Jones, republican United States senator 1873–85; Jas. W. Nye, governor of the territory 1861–4, and republican United States senator 1865–73; William Sharon, republican United States senator 1875–81; Wm M. Stewart, republican United States senator 1865–75. — See 12 *Stat. at Large*, 209, and 13:30, *app.* ii., No. 21, (for the acts of March 2, 1861, March 21, 1864, and the proclamation of Oct. 31, 1864, respectively); 15 *Stat. at Large*, 43, (for the act of May 5, 1866); 2 Poore's *Federal and State Constitutions;* Porter's *West in* 1880, 470.

ALEXANDER JOHNSTON.

NEW ENGLAND UNION (IN U. S. HISTORY). In 1643 the section now known as New England consisted of the following colonies: Connecticut and New Haven (now included under Connecticut); Massachusetts Bay and Plymouth (now included under Massachusetts); New Hampshire (claimed by Massachusetts and by Mason); and Maine (claimed by Massachusetts and the Gorges family). The church connection between the first four colonies was intimate, and at one of the annual synods, held at Boston in 1637, a civil alliance was proposed. Connecticut at first refused her consent, unless a veto power should be reserved to each colony; but an increasing pressure from the Dutch forced her to withdraw her opposition, and in 1643 the union was perfected, under the name of "The United Colonies of New England." — The union was confined to the first four colonies named above. Rhode Island applied for membership in 1648, but was refused, on the ground that her territory was properly a part of the patent of the Plymouth colony. The affairs of the union were administered by two commissioners from each colony, the votes of six of the eight commissioners being necessary for valid action. Its action was to be confined to such matters as were "proper concomitants or consequents of a confederation," such as peace, war, and Indian affairs; the control of local affairs was reserved to each colony; and expenses were to be assessed according to population. The commissioners, all of whom were to be church members, were to hold sessions annually at Boston, Hartford, New Haven and Plymouth, Boston being given a double share of sessions. Provision was made for the extradition of criminals and runaway servants. (See FUGITIVE SLAVE LAW, I.) — The union endured nominally for half a century, but its period of real life was about twenty years. At first its authority, or rather its advisory power, was actively exercised: it undertook the formation of a system of internal improvements, by laying out roads; exercised the treaty power with its Dutch and French neighbors; declared and waged a war against the Indians; and decided territorial disputes between the colonies. But the union had not been in existence ten years before signs of disintegration appeared, arising mainly from the unwillingness of the strongest colony, Massachusetts, to submit to the general authority. In 1650, the union having upheld the right of Connecticut, under an ancient grant, to levy tolls on commerce at the mouth of the Connecticut river for the support of a fort there, Massachusetts retaliated by levying tolls on Boston commerce belonging to other colonies, nominally for the support of the forts at Boston; and this proceeding almost broke up the union. In 1653 the union determined to declare war against the Dutch in New Netherland; but Massachusetts denied the right of the union to declare "offensive war" without unanimous consent. The general court, therefore, refused to levy its quota of men, and the war fell through. At the restoration of the Stuarts no formal condemnation of the union was made, but its functions were practically resumed by the crown. After 1663 the meetings of its commissioners became triennial, and soon ceased altogether. (See FLAG.) — See 1 Bancroft's *United States*, 420, and authorities there cited; 1 Hildreth's *United States*, 285, 326, 386, 463; 1 Spencer's *United States*, 94; 1 Pitkin's *United States*, 51; Chalmers' *Political Annals*, 178, 1 Chalmers' *Revolt of the American Colonies*, 86: 9 *Mass. ALEXANDER JOHNSTON.

NEW GRANADA. This was the name of the country now known as Colombia, or the United States of Colombia. Colombia is a federative republic in the northwestern part of South America. The United States of Colombia consists of nine states: Antioquia, Bolivia, Boyáca, Cáuca, Cundinamarca, Magdalena, Panamá, Santander and Tolima; besides which there are two territories. The area of the states and territories is 830,000 square kilometres, but a great part of this area is uninhabited. In 1877 the states had a

population of 2,999,000 and the territories of 53,466, to which numbers must be added about 100,000 of yet uncivilized Indians. The federal capital is Bogota, with 40,883 inhabitants. The states of Colombia were, previous to 1810, under Spanish rule. After they had declared their independence they entered into political connection with other states. Thus, in 1819, together with Venezuela and Quito, they formed the republic of Colombia. Venezuela and Quito, however, dropped out of this union in 1830, and the remaining group of states assumed the name of the republic of New Granada, which gave place in 1861 to the present federative republic of the United States of Colombia. The constitution of Colombia dates from May 8, 1863. According to that constitution the government of the country has three branches: the executive, the legislative and the judicial powers. The executive power is lodged in a president, who is elected for two years. He is assisted by four secretaries. These are the secretary of home and foreign affairs, the secretary of finance and public works, the secretary of the treasury and of credit, and the secretary of war and of the navy. The legislative power is exercised by a congress, consisting of a house of representatives and of a senate. The senate consists of twenty-seven members, three from each state. The number of representatives is at present sixty-one. There is a supreme federal court at Bogota. The constitutions of the several states are similar to that of the Colombian union of states. At the head of each state there is a president or governor, assisted by a secretary general. The term of office of the governors is, in Antioquia four years, in the other states two. The federal army, in times of peace, consists of 3,000 men. In case of war, each of the states is required to furnish 1 per cent. of its population as a military contingent. The finances, according to the budget of 1878–9, show receipts amounting to $6,059,115. The expenditures amounted, in 1877–8, to $7,271,933. The national debt amounted, Feb. 1, 1875, to $15,999,304. The preponderant portion of the population are whites and mestizoes. A part are *zambos*, or the children of negroes and Indians. There are also some *ladenos*, or the descendants of whites and Indians, but with a greater proportion of Indian than of white blood. The religion of the country is the Roman Catholic, but other religions are tolerated. — BIBLIOGRAPHY. NEW HAMPSHIRE, one of the original states of the American Union. Its territory, with the boundaries described below, was granted by Charles I. to John Mason, by charter dated Nov. 7, 1629, modified and confirmed by another charter of April 22, 1635. During the commonwealth period in England the New Hampshire settlers, like those of Maine, came under the jurisdiction of Massachusetts, and so remained for nearly forty years, 1641–79. In 1675 one of Mason's grandsons applied to the king for restitution of the territory, and, after a hearing, a royal decree was issued Sept. 18, 1679, reciting that Massachusetts had usurped authority over the territory, and that the territory "hath not yet been granted unto any person or persons whatsoever," and ordered that it should become a royal province. It remained a royal province until the revolution, but had no charter, its existence as a separate colony depending on the king's will. The relation of the colony to Massachusetts bore some resemblance to the connection between Delaware and Pennsylvania (see DELAWARE): the same governor was often sent out for the two colonies together, but the assemblies were separate. — BOUNDARIES. The grant of 1629 was of "all that part of New England between 40° and 48° north latitude," between Maryland and the St Lawrence. The grant of 1635 was more circumspect in its assignment of boundaries, as follows: from the middle part of "Naumkeck river," eastward along the seacoast to Cape Ann, and "round about the same to Pischataway harbour"; thence to the head of "the river of Newgewanacke" [Salmon Falls]; thence "northwestwards till sixty miles be finished"; and from the Naumkeck "up into the land west sixty miles, from which period to cross over land to the sixty miles end aforesaid." These words seem to designate a territory whose northern boundary was a line northwest from the Salmon Falls to the Connecticut river, while the southern boundary was considerably south of that which is now the southern boundary of New Hampshire. In the final settlement (see MAINE) New Hampshire gained the whole northern part of her present area, but took as a southern boundary a line three miles north of the Merrimac river to its most southwestern bend, and thence directly west. — CONSTITUTIONS. In the opening of the revolution New Hampshire applied to congress for directions as to civil government, and congress, by resolution of Nov. 3, 1775, recommended the formation of a temporary state government. In accordance with this recommendation, a convention at Exeter, Dec. 21, 1775–Jan. 5, 1776, adopted the state's first constitution, without submitting it to popular vote. It was very brief, and practically left both the legislative and execu-

tive powers of government in the hands of a house of representatives or assembly, chosen by towns, and a council chosen by counties. A convention at Concord, June 10, 1778 – June 5, 1779, framed a new constitution, which was rejected by the towns. A new convention at Exeter, June 12, 1781 – Oct. 31, 1783, framed a new constitution which, having been variously amended in the town meetings during the two years of the convention's existence, was ratified by popular vote, and went into force June 2, 1784. It declared New Hampshire a "free, sovereign and independent state"; gave "towns, parishes, bodies corporate, and religious societies" the power to provide for the support of Protestant ministers, but without establishing any state church; gave the legislative power to a "general court" (see BURGESSES), composed of a senate of twelve, chosen annually by districts, and a house of representatives, chosen annually by the towns according to population; imposed a property qualification of £200 on senators and £100 on representatives; provided that state officers should be "of the Protestant religion"; gave the right of suffrage to "male inhabitants over twenty-one, paying a poll tax"; gave the executive power to a "president," chosen annually by popular vote, or by the legislature in default of a popular majority, with the title of "his excellency," and having a property qualification of £500, together with an advisory council of five, chosen by the legislature. A new constitution was framed by a convention at Concord, Sept. 7, 1791 – Sept. 5, 1792, and during the continuance of the convention was ratified by the town meetings. Its principal changes were the alteration of the title of the executive to "governor," and a provision for the periodical submission of the constitution to the people for decision on the necessity of revision. It has been thus submitted a great number of times, but only twice amended. In 1852 all property qualifications for state officers were abolished. In 1877 the term of the governor and legislature was extended to two years; state elections were changed from March to November; the religious qualification was abolished; and the senate was enlarged to twenty-four members. — GOVERNORS. John Langdon, 1784–6; John Sullivan, 1786–8; John Langdon, 1788–90; Josiah Bartlett, 1790–94; John T. Gilman, 1794–1805; John Langdon, 1805–9; Jeremiah Smith, 1809–10; John Langdon, 1810–12; William Plumer, 1812–13; John T. Gilman, 1813–16; William Plumer, 1816–19; Samuel Bell, 1819–23; Levi Woodbury, 1823–4; David L. Morrill, 1824–7; Benjamin Pierce, 1827–9; John Bell, 1829–30; Matthew Harvey, 1830–31; Joseph M Harper, 1831; Samuel Dinsmoor, 1831–4; William Badger, 1834–6; Isaac Hill, 1836–9; John Page, 1839–42; Henry Hubbard, 1842–4; John H. Steele, 1844–6; Anthony Colby, 1846–7; Jared W. Williams, 1847–9; Samuel Dinsmoor, 1849–52; Noah Martin, 1852–4; Nathaniel B. Baker, 1854–5; Ralph Metcalf, 1855–7; William Haile, 1857–9; Ichabod Goodwin, 1859–61; Nathaniel S. Berry, 1861–3; Joseph A. Gilmore, 1863–5; Frederic Smyth, 1865–7; Walter Harriman, 1867–9; Onslow Stearns, 1869–71; James A. Weston, 1871–2; Ezekiel Straw, 1872–4; James A. Weston, 1874–5; Person C. Cheney, 1875–7; Benjamin F. Prescott, 1877–9; Nathaniel Head, 1879–81; Charles H. Bell, 1881–3. — POLITICAL HISTORY. The ratification of the constitution in New Hamphire was accomplished with difficulty (see CONSTITUTION), but when the ratification was accomplished, the state became reliably federalist. The leader of the democratic party of the state was John Langdon; but, though his personal popularity made him United States senator until 1801, he never succeeded until 1805 in making his state democratic. John T. Gilman, the federalist leader, was regularly re-elected governor for eleven years, and the legislatures were of the same political complexion. The strongest indications of a change were visible in 1804. In the elections of that year the democrats secured the electoral vote of the state, the legislature, and through it the United States senator; and Gilman had a majority of but forty votes for governor. In the following year Langdon was elected governor, and the state remained democratic until 1813, with the exception of the years 1809 and 1810. In 1812 the federalists again elected Gilman governor, and a majority of the legislature. Following a precedent which the democrats had recently set in Massachusetts (see that state), they proceeded to reconstruct all the courts of the state, substituting a series of courts with new names and federalist judges. Both sets of judges held their appointed sessions; the court officers in some places supported one set, and in others their opponents; and law and justice were suspended until the new court triumphed. In 1816 the democrats in turn carried the state, secured its electoral vote and the legislature, removed the federalist judges, and appointed democrats in their places. They went further and attacked the charter of Dartmouth college, whose trustees were federalists and had the power to fill vacancies in their number. An act was passed changing the name of the college to Dartmouth university, modifying the charter, and enlarging the number of trustees. Two college organizations appeared. The new one, backed by the legislature, secured the buildings and records; but the old one, after prolonged litigation, carried the case to the United States supreme court, and there secured a verdict, on the general ground that the charter, though granted originally by the king, was a contract which the federal constitution forbade the state to violate. — Thereafter the state remained democratic until 1856; though the single electoral vote cast against Monroe in 1820 came from New Hampshire, it was cast rather on personal than on party grounds. In 1824 and 1828 the state's electoral vote was cast for John Quincy Adams, while he was still one of the republican (democratic) candidates; but when parties were fairly

reformed, the state, under the leadership of Isaac Hill and Levi Woodbury, was as strongly democratic as ever. The whig vote in the state was seldom over 40 per cent. of the whole, and was more usually about 30 per cent.; even in the general whig success of 1840, the democratic majority in the state was 6,386 out of a total vote of 58,954 for electors, and for state officers the majority was about 2,000 larger. It was not until 1847 that any break was made in the democratic supremacy in the state; in that year one of the four congressmen was a whig, and another a free-soiler. In these two congressional districts, comprising the four southern counties of the state, the democrats were beaten, until the redistricting, after the census of 1850, made all the districts again democratic; but the democratic majority in the rest of the state was always large enough to control all the general state elections, and the governors and legislatures were still steadily democratic.— In 1855 the democrats lost control of the state. At the previous election their opponents, under the common name of Americans, or "know-nothings" (see AMERICAN PARTY), had carried the lower house of the legislature; and in the spring of 1855 they elected the governor, Metcalfe, all the three congressmen, and a heavy majority of the legislature. In March, 1856, the democrats succeeded in electing Wells governor by a majority of eighty-eight votes out of 66,510, but they were still in a minority in the legislature. During the summer the republican party was organized in the state, and carried it in November. From that time until after 1870 New Hampshire was republican in all elections, state, congressional and presidential, with the exception of a single democratic congressman in 1863. The popular majorities were never large, but they were sufficiently persistent to result regularly in the election of a republican governor, and the maintenance of a republican majority in the legislature.— In 1871 the democrats succeeded in making a tie in the state senate, and in securing one majority (165 to 164) in the lower house; and, as the scattering vote prevented their candidate for governor from having a clear majority on the popular vote, he was elected by the legislature. The same thing happened in 1874, the democrats having a larger majority in both houses of the legislature. During the same period (1871–82) the congressional representation was republican, except 1871–3, when all three congressmen were democrats; 1873–7, when two were democrats; and 1877–9, when one was a democrat. With these exceptions the state has been republican by very small but very steady majorities. In 1880 the vote for governor was as follows: Bell (republican), 44,434; Frank Jones (democrat), 40,815; W. S. Brown (greenback), 503. The legislature in 1881–2 stands as follows: senate, sixteen republicans, eight democrats; house, 179 republicans, 114 democrats.— Among the political leaders in the state's history have been John P. Hale, Franklin Pierce, Daniel Webster (see their names), and the following: Chas. G. Atherton, democratic congressman 1837–43, and United States senator 1843–9 and 1853 (see PETITION); Henry W. Blair, republican congressman 1875–9, and United States senator 1879–85; Wm. E. Chandler, secretary of the navy under Arthur; John Taylor Gilman, governor (federalist) 1794–1805 and 1813–16; Nicholas Gilman (brother of the preceding), democratic congressman 1789–97, and United States senator 1805–14; Isaac Hill, democratic United States senator 1831–6, and governor 1836–9 (see BANK CONTROVERSIES, III.); John Langdon, democratic United States senator 1789–1801, and governor 1805–9 and 1810–11; Samuel Livermore, federalist congressman 1789–93, and United States senator 1793–1801; James W. Patterson, republican congressman 1863–7, and United States senator 1867–73; William Plumer, federalist United States senator 1802–7, and democratic governor 1812–13 and 1816–19; George Sullivan, democratic congressman 1811–13, and state attorney general 1816–35; and Levi Woodbury, governor 1823–4, democratic United States senator 1825–31, secretary of the navy and treasury under Jackson and Van Buren (see ADMINISTRATIONS XI.–XIII.), United States senator 1841–5, and justice of the supreme court 1846–51. ALEXANDER JOHNSTON.

NEW JERSEY, a state of the American Union. The conflicting claims to its territory are elsewhere noticed. (See NEW YORK.) June 23, 1664, the duke of York transferred it for ten shillings to Sir George Carteret and Lord John Berkeley, under the name of Nova Cæsarea, or New Jersey, the name being given in compliment to Carteret, who, as governor of the channel island of Jersey, had been the last to surrender to the commonwealth's forces in the civil war. March 18, 1674, Berkeley sold his share to two Quaker proprietors for £1,000, and in 1676 the province was divided by a line from Little Egg Harbor to the northwest corner of its territory, Carteret taking East Jersey, and the Quakers West Jersey. In 1682 Carteret's heirs sold East Jersey to a company of proprietors, and in 1702 all the proprietors ceded their rights of jurisdiction to the crown, reserving their rights of property. Their successors still maintain a formal organization, though their property rights have long since passed away.— BOUNDARIES. The boundaries assigned by the duke of York's grant were as follows: "Bounded

on the east part by the main sea, and part by Hudson's river, and hath upon the west Delaware Bay or river, and extendeth southward to the main ocean as far as cape May at the mouth of Delaware Bay, and to the northward as far as the northermost branch of said Bay or River of Delaware, which is forty-one degrees and forty minutes of latitude, and worketh over thence in a straight line to Hudson's river." None of the boundaries gave any difficulty except the northern, the location of which was long disputed between New York and New Jersey. It was finally settled by a board of joint commissioners, whose decision was confirmed by the two legislatures in February, 1834, and by act of congress of June 28 of the same year. — CONSTITUTIONS. A grant of political privileges, known as "the concessions," was made by Berkeley and Carteret in 1664–5. It became the organic law of the province, and under it the people had a popular assembly until the revolution. The first provincial congress of New Jersey met at New Brunswick, July 21, 1774, and during the next two years it gradually assumed nearly all the powers of the assembly. July 2, 1776, the provincial congress declared all civil authority under the king to be at an end, and adopted a state constitution, which went into effect without ratification by popular vote. The instrument was to be null and void in case of reconciliation between the colonies and Great Britain. It provided for a governor, legislative council and general assembly, one councilor and three assemblymen to be chosen yearly by each county. Members of council were to be worth £1,000, members of assembly £500, and voters £50. The two former provisions soon ceased to be regarded, and the last was evaded by an act passed in 1820, providing that county tax payers should be "taken and deemed to be worth £50." The governor was to be chosen annually by the legislature, and was also to be president of the council and chancellor of the state. He was thus the chief executive, legislative and judicial officer, but in practice his judicial functions entirely outweighed the others in importance, and the governor was really an elective chancellor. The only title claimed by the new state was that of "The Colony of New Jersey," but the provincial congress, July 18, having formally approved the declaration of independence, assumed "the style and title of the Convention of the State of New Jersey." No further changes were made in the organic law, except that, by act of Nov. 25, 1790, the permanent capital was fixed at Trenton, and that many of the clumsier features of the constitution became gradually obsolete. — Early in 1844 the popular demand for a revision of the constitution forced the legislature to call a state convention, which met at Trenton, May 14–June 29, 1844, and framed a constitution, which was ratified by popular vote. It abolished imprisonment for debt, except for fraud; made a residence of one year in the state and five months in the county the only restrictions upon white manhood suffrage; continued the court of chancery, with a chancellor of its own; and vested the government in a senate composed of one senator from each county chosen for three years, in a general assembly chosen annually by the counties in proportion to their population, and in a governor chosen by popular vote for three years. In 1875 a number of amendments were ratified, the principal ones providing, 1, that the word "white" be struck out of the suffrage clause; 2, that the soldiers of the state in federal service in time of war should not therefore lose their votes; 3, that the legislature should not pass special laws on a number of specified subjects; and 4, that the governor should be allowed to veto parts of laws passed by the legislature. A constitutional commission has (1882) proposed further amendments, which have not yet been acted upon by the people. — GOVERNORS. William Livingston, 1776–90; William Paterson, 1790–93; Richard Howell, 1793–1801; Joseph Bloomfield, 1801–12; Aaron Ogden, 1812–13; William S. Pennington, 1813–15; Mahlon Dickerson, 1815–17; Isaac H. Williamson, 1817–29; Peter D. Vroom, 1829–32; Saml. L. Southard, 1832–3; Elias P. Seely, 1833; Peter D. Vroom, 1833–6; Philemon Dickerson, 1836–7; William Pennington, 1837–43; Daniel Haines, 1843–5; Charles C. Stratton, 1845–8; Daniel Haines, 1848–51; George F. Fort, 1851–4; Rodman M. Price, 1854–7; Wm A. Newell, 1857–60; Charles S. Olden, 1860–63; Joel Parker, 1863–6, Marcus L. Ward, 1866–9; Theo. F. Randolph, 1869–72; Joel Parker, 1872–5; Jos. D. Bedle, 1875–8: George B. McClellan, 1878–81; Geo. C. Ludlow, 1881–4. — POLITICAL HISTORY. New Jersey, until 1801, was a federalist state, and her governors, senators and congressmen were federalists, though one democratic congressman, Kitchell, was almost continually re-elected during this period. In 1800 the federalists, having control of the legislature, and desiring to secure all the congressmen of the state, passed a bill for the election of all the state's representatives by general ticket instead of by districts. The election took place early in 1801, and was carried by the democrats. In the following autumn the democrats also elected a majority of the legislature and the governor, and from that time until 1812 the state remained democratic in all general elections. During the war of 1812 the federalists recovered the state, and in 1812 the electoral vote of New Jersey was cast for DeWitt Clinton. From that time until 1832 the state was continuously democratic; but the division between the two parties was not as virulent as in other states, and some of the nominal democrats of New Jersey were really moderate federalists. The refusal of ex-Gov. Aaron Ogden, in 1814, to accept a major general's commission in the federal army, on the ground that he had already been commander-in-chief of the army and navy of New Jersey, is an instance of the strong state feeling which then was characteristic of New Jersey politics and politicians, and which gradually led to the jocular assertion

that New Jersey was not one of the United States. The electoral vote of the state was cast for Jackson in 1824, and for Adams in 1828, but after that year the two parties in the state were so nearly equal, and the margin between them was so often governed by personal or local questions, that a complete record would take altogether too much space. In 1832, for example, the electoral vote of the state was cast for Jackson by a majority of 463 in a total popular vote of 47,249; but the legislature and governor chosen were whig. In 1836, 1840, 1844 and 1848 the electoral vote of the state was given to whig candidates. During all this period the legislatures were generally whig, though by a very small majority, but the governors, with the exceptions of Pennington and Stratton, were democrats. In so constantly close a vote the election of congressmen by general ticket was certain to lead to a disputed election, and in 1838 the state was thrown into a ferment by an attempt of the whig governor and council to "count out" the successful democratic candidates. (See BROAD SEAL WAR.) — One of the characteristics of the state's voting population is its persistence; the majority in each county changes very little each year, except from the increase of population, greater or less excitement at elections, immigration, or the creation of new counties. Thus, the strong republican counties in 1880, Essex, Camden, Passaic, Cumberland, Gloucester, Morris, Mercer and Burlington, were the counties in which the whigs were accustomed to "roll up" about the same proportional majorities; the strong democratic counties, Monmouth, Hunterdon, Warren, Sussex and Cape May, were proportionally as democratic then as now; and Salem and Somerset were about as doubtful The exceptions are Hudson, Bergen and Middlesex, all of which were formerly whig or doubtful, but are now democratic. — For this reason the vote of the state reconciled itself with great difficulty to the revolution in politics which the slavery question introduced after 1850. The whig voters were very unwilling to accept the republican organization, with a new issue, to which they were entirely unaccustomed, and many of them preferred to join their former opponents. On the other hand, political opposition to foreigners, a feeling which is not uncommon in agricultural communities, had been familiar for many years in the state, though never as yet successful (see AMERICAN PARTY), and was attractive to many democrats, as well as whigs. It was therefore easier for the Americans, or "know-nothings," than for the republicans, to find footing in the state. In New Jersey the vote for Fremont and Fillmore in 1856 was nearly equal, and Fremont's vote was a great decrease from Scott's vote in 1852, while in all other northern states (except Pennsylvania) the reverse was the case. In 1856 and 1859 the republicans and Americans united their forces and elected the governor by a narrow popular majority; but the legislature remained democratic. In 1860 all the parties opposed to the republicans united on a fusion electoral ticket; but the Douglas voters also ran a complete ticket of their own, including their three electors on the fusion ticket. The result was, that the three Douglas electors received a majority of 4,000 on the total vote, while four of the Lincoln electors, having a plurality over the rest of the separate Douglas and fusion tickets, were elected. At the same election the republicans elected two of the five congressmen, and a majority of the senate, but the assembly was still democratic. — Throughout the war of the rebellion the state was democratic by a heavy majority. Gov. Parker's majority in 1862 was 14,597 in a total vote of 108,017; and there was a democratic majority of thirty-five out of eighty-one members of the legislature. The majority decreased gradually, however, until in 1865 the republicans elected the governor and a majority of both houses of the legislature; three of the five congressmen were republican also. Since that time (with the exception of the election of 1872 referred to below) the democrats have elected all the governors and have carried the state at presidential elections, while the republicans have kept control of the legislature, except in 1867–9 and 1876–7, when they were democratic. At the election of 1872 the proportion of democrats who refused to vote was so large that the republicans were almost universally successful: the electoral vote was republican by the unusual popular majority of 15,200 in a total vote of 168,467; and both houses of the legislature and six of the seven congressmen were republican also The state had five congressmen from 1862 until 1872, and seven from 1872 until 1882. In the former period three of the five were democrats, except in the elections of 1866 and 1870, when the republicans obtained a majority. In the latter period four of the seven have been republican, except in 1872, when their share rose to six out of seven, and 1874 and 1876, when the democrats had five out of seven. — As a general rule it may be said that the popular vote of the state is republican in the southern part of the state, and becomes more and more strongly democratic as one goes to the north: the exceptions are the extreme northeastern part of the state, where a suburban New York population has made the vote very doubtful, and in the great manufacturing cities, Newark and Paterson, which have been made republican through a desire for protection. (See REPUBLICAN PARTY.) The democratic strongholds are Jersey City and the agricultural counties of the centre and north; the republican strongholds are Newark, Paterson, and the glass-making counties of the south. — The most prominent New Jersey names in national politics have been those of Wm. L. Dayton, Theodore Frelinghuysen, Geo. B. McClellan, Joel Parker and Winfield Scott. (See those names.) Among the more strictly state politicians are the following names: Joseph Bloomfield, the first democratic governor, representative in congress 1817–21; Lewis Condict (whig), representative 1811–17 and 1821–33; Jonathan Dayton,

one of the signers to the constitution, federalist representative 1791–9, speaker of the house 1795–9, and United States senator 1799–1805; Mahlon Dickerson, governor (democratic) 1815–17, representative 1817–33, secretary of the navy under Jackson and Van Buren; Philemon Dickerson (brother of the former), representative (democratic) 1833–6 and 1840–41, and governor in 1836; L. Q. C. Elmer, representative (democratic) 1843–5, and justice of the state supreme court 1850–52; Frederick Frelinghuysen, federalist United States senator 1793–6; Frederick T. Frelinghuysen (nephew of Theodore Frelinghuysen), republican United States senator 1866–9 and 1871–7, and secretary of state under Arthur; John Hill, republican representative 1867–73 and 1881–3; Littleton Kirkpatrick, democratic representative 1843–5; William Livingston, the state's first governor, and one of the signers to the constitution; Wm. A. Newell, whig representative 1847–51, governor 1857–60, republican representative 1865–7, candidate for governor in 1877, and governor of Washington territory 1880–84; William Pennington, whig governor 1837–43, and republican representative and speaker of the house 1859–61; Theo. F. Randolph, governor (democratic) 1869–72, and United States senator 1875–81; Geo. M. Robeson, secretary of the navy under Grant, and republican representative 1879–83; Saml. L. Southard, democratic United States senator 1821–3, secretary of the navy 1823–9, and whig United States senator 1833–42; John P. Stockton (brother of Robt. F. Stockton), minister to Rome 1858–61, democratic United States senator 1865–6 and 1869–75; Richard Stockton, federalist United States senator 1796–9, and representative 1813–15; Robert F. Stockton (son of the preceding), commodore in the navy (see ANNEXATIONS, IV.), and democratic United States senator 1851–3; Peter D. Vroom, governor (democratic) 1829–31 and 1833–6, one of the democratic representatives in the "broad seal war" in 1839–40; Garret D. Wall, United States senator (democratic) 1835–41, and judge of the court of errors 1848–50 — See 2 Poore's *Federal and State Constitutions;* Mulford's *History of New Jersey;* Whitehead's *East Jersey* (to 1703); R. ALEXANDER JOHNSTON.

NEW MEXICO, a territory of the United States, composed of territory acquired from Mexico (see ANNEXATIONS, III.–V.), organized by act of Sept. 9, 1850. (See COMPROMISES, V.) As originally organized it embraced all the territory of the United States south of latitude 37° north, east of California and west of Texas, and also that territory north of latitude 37° and south of the Arkansas river. To this was also added the "Gadsden purchase" (see ANNEXATIONS, VI.), the territorial organization thus covering 261,432 square miles. From this, in 1861, the northwest corner was made a part of the territory of Nevada, and the northeast corner, from parallel 37° to the Arkansas river, was added to the territory of Colorado; and in 1863 the remainder was diminished by the organization of the western half as the territory of Arizona. (See those names.) The capital is Santa Fé, and the governor in 1882 Lionel A. Sheldon. — The population of New Mexico in 1880 was 119,565, nearly double that of the state of Nevada. A state constitution was formed by the people of New Mexico in 1850 (see COMPROMISES, V.), and the territory would in all probability have been admitted as a state long ago, but for the fear that its Mexican population would practically establish a state church therein. Jan. 18, 1878, the territorial legislature passed, over the governor's veto, a bill to incorporate the Jesuit fathers, with the privilege of holding real estate to any amount without taxation, and congress annulled the act, Feb. 3, 1879. — The act of Sept. 9, 1850, is in 9 *Stat. at Large,* 446 (for New Mexico); the act of Feb. 3, 1879, is in 20 *Stat. at Large,* 280

ALEXANDER JOHNSTON.

NEW YORK, a state of the American Union. Its territory at first belonged to the Dutch, by right of its discovery in 1609 by Henry Hudson, an Englishman in the Dutch service; but it was part of the vast stretch of territory claimed by the English by right of its discovery by the Cabots in 1497–8, and in 1664 an English expedition took possession of it. With the exception of a reoccupation by the Dutch in 1673–4, it remained an English colony until the revolution. — BOUNDARIES. 1. Under the Dutch the territory, then called "New Netherlands," had no well defined boundaries. The Dutch claims included the present states of New Jersey and Delaware, in which they were enforced, Pennsylvania, in which they were only asserted, and eastward to the Connecticut river; the latter claim was maintained for a time, but was gradually abandoned. 2. Under the English the name of New Netherlands was changed to New York, it having been granted to the duke of York by Charles II. in 1664. The grant included a large part of the present state of Maine (see MAINE), some of the islands south of it, and all of the territory between the Delaware and Connecticut rivers. Even before the duke took possession of his grant, he had bargained away the present state of New Jersey to other proprietors (see NEW JERSEY), but the boundary between New York and New Jersey was

not finally settled until 1834. The boundary between Connecticut and New York was marked out by commissioners in November, 1664, but was not finally agreed upon until 1728. The New York authorities from the beginning enforced jurisdiction over the whole of Long Island, though its towns eastward of a prolongation of the Connecticut boundary line had until 1664 sent delegates to the Connecticut legislature and considered themselves a part of that state. The boundary between New York and Massachusetts was long and warmly disputed, was pretty accurately marked out in 1773, but was not finally agreed upon until 1787, after a territorial suit between the two states had been begun before the congress of the confederation. (See CONFEDERATION, ARTICLES OF, Art. IX.) Delaware was made over by the duke of York to Penn in 1682; and the boundary between Pennsylvania and New York was agreed upon and marked out by Rittenhouse in 1786. (See DELAWARE, PENNSYLVANIA.) The duke of York's grant, as made in 1664 and renewed in 1674, was imperfect in that it assigned no western boundary to the territory granted, being really only a grant of a specified part of "the mainland," but the New York authorities claimed all the territory north to the St. Lawrence and west to the great lakes by virtue of Dutch and English occupation and asserted conquest from the Indians. On the other hand, the charter of Massachusetts made "the South Sea" its western boundary, so that it claimed the right to extend its jurisdiction west to the great lakes, excepting, perhaps, the territory along the Hudson river, which New York had long ago reduced to possession. This controversy was settled in 1787, Massachusetts yielding the jurisdiction of the territory in dispute in return for the pre-emption right to a large part of it. Before 1789 the boundaries of New York had been settled as at present (but see VERMONT). — CIVIL GOVERNMENT. Under the Dutch, New York was governed successively by Peter Minuit, Walter van Twiller, William Kieft, and Peter Stuyvesant, all sent from Holland by the Dutch West India company. When the duke of York became king as James II., New York became a royal province, and so remained until the revolution, with governors appointed by the crown and a popular assembly. The last of these assemblies adjourned April 3, 1775, and a provincial congress (see REVOLUTION) took its place April 20. This body was compelled to meet at Kingston, as New York city was the headquarters of the British throughout the revolution. July 10, 1776, a popular convention met at White Plains, and finally adjourned, April 20, 1777, at Kingston, having formed the first constitution of the state of New York, which went into force without being submitted to the people. It vested the government in a governor, to be elected by popular vote for three years, a senate and an assembly (see ASSEMBLY), with a limited veto power in a council composed of the governor, the chancellor, and the judges of the supreme court; it gave the right of suffrage to freeholders, and provided "that a fair experiment be made" of voting by ballot; and it vested the right of appointment to, and removal from, state offices in a council composed of the governor and four senators, to be chosen by the assembly. A second constitution was framed by a convention at Albany, Aug. 28–Nov 10, 1821, and was ratified by popular vote. It reduced the governor's term to two years, abolished the councils of revision and appointment, and made suffrage practically universal, but it disfranchised free negroes, unless seized of a freehold of the value of $250. Instead of four senate districts, one choosing nine, two six, and one three senators, as the constitution of 1777 had provided, there were now to be eight senate districts, each choosing four senators. In 1826 manhood suffrage was formally adopted by amendment, and in 1845 property qualifications for public officers were abolished. A third constitution was adopted by a convention at Albany, June 1–Oct. 9, 1846, and ratified by popular vote. Its principal changes were the abolition of "all feudal tenures of every description" (see ANTI-RENTERS), the division of the state into thirty-two senate districts, each to choose one senator, the election of judges by popular vote, and a prohibition of special charters for banking corporations. (See Loco-Foco.) In 1869 the constitution of the state judiciary was considerably modified, the rest of a new constitution formed in 1867 being rejected. In 1874 a number of amendments were ratified by popular vote, intended mainly, 1, to prevent bribery and corruption at elections; 2, to prevent the legislature from passing special laws in a number of specified cases; and 3, to prevent the giving of money or loaning of credit by municipal corporations for anything except for their legitimate expenses; the governor's term was also lengthened to three years. — GOVERNORS (since 1776) George Clinton, 1777–95, John Jay, 1795–1801, George Clinton, 1801–4; Morgan Lewis, 1804–7; Daniel D. Tompkins, 1807–17; De Witt Clinton, 1817–23; Joseph C. Yates, 1823–5; De Witt Clinton, 1825–9; Martin Van Buren, 1829–31; Enos T. Throop, 1831–3; Wm. L. Marcy, 1833–9; Wm. H. Seward, 1839–43, Wm. C. Bouck, 1843–5, Silas Wright, 1845–7; John Young, 1847–9; Hamilton Fish, 1849–51; Washington Hunt, 1851–3; Horatio Seymour, 1853–5; Myron H. Clark, 1855–7; John A. King, 1857–9; Edwin D. Morgan, 1859–63; Horatio Seymour, 1863–5; Reuben E. Fenton, 1865–9; John T. Hoffman, 1869–73; John A. Dix, 1873–5; Samuel J. Tilden, 1875–7; Lucius Robinson, 1877–80; Alonzo B. Cornell, 1880–83; Grover Cleveland, 1883–6. — POLITICAL HISTORY. It is very difficult to abridge the political history of New York, owing mainly to the extent of the state and the diversity of the interests and feelings of its various parts. New York has always been a political world in itself. Within it every American political party of any importance has first come to notice, with the possible excep-

tions of the federal and democratic parties, and even of these the former owed its conception to Alexander Hamilton, of New York, and the latter first attained national position by its success in New York in 1800. The anti-masons, the whig, liberty, free-soil, American (know-nothing) and republican parties, all first found their local habitation or name in New York. (See the parties named.) And yet the state has shown no great constancy to any of them; its majority has been very shifting and uncertain, and has been considered the decisive, or "pivotal," factor in every presidential election, since 1793, which has been in anywise doubtful. — In a state of less comparative magnitude this uncertainty would have led to the political elevation of very many of its citizens, through the desire of the parties to conciliate the state; but every New York leader, of any party, has had to contend against factions in his own state, as well as against the compact influence of other states or combinations of states. New York has therefore furnished but one president by election to the United States, though two of its citizens have succeeded to the presidency by the death of the elected president; but each new president, on entering office, has had to deal with a New York leader of his own party, too weak to secure the presidency and yet powerful enough to maintain a quasi-independence. Three presidents, Jackson, Pierce and Lincoln, were able to solve the difficulty by placing the New York leader (Van Buren, Marcy and Seward respectively) at the head of the cabinet; in other cases, as those of Adams and Hamilton, Jefferson and Burr, Madison and George Clinton, Monroe and De Witt Clinton, Polk and Silas Wright, Fillmore and Seward, Grant and Fenton, Hayes and Conkling, and Garfield and Conkling, the efforts of the administration to create or support a faction of its own in New York have endangered or completely destroyed its party's supremacy in the state. The giving of due weight to this one difficulty, common to nearly all administrations, will go far to explain the successive political revolutions in the state. — I. : 1777–1807. The limitation of the right of suffrage to freeholders, during New York's early years of existence as a state, and the hereditary transmission of vast estates, on which many of the freeholders were tenants, gave early rise to three great clans, or families, the Livingstons, the Schuylers and the Clintons, whose struggles for supremacy make up most of the political history of the state until about 1801. The Livingstons were the ablest representatives of the mass of New York landed families, the Van Rensselaers, Van Cortlands, Morrises, Coldens, and others; the Schuylers, of the same class, though not generally so able as the Livingstons, had risen to prominence by virtue of the revolutionary services of their head, Gen. Philip Schuyler, and, above all, of the commanding genius of his son-in-law, Alexander Hamilton; and the Clintons, few in number and far poorer than their rivals, were strong in the confidence of the independent freeholders, who were not attached by interest or marriage to any of the great families. The Clintons seem to have been the most unselfish; but, with all three, political contests were intensely personal, and all interests were more or less subsidiary to those of the family. The most prominent of those who were Livingstons by birth or marriage were Chancellor Robert R. Livingston, the head of the family, Brockholst Livingston, Edward Livingston, Maturin Livingston, Smith Thompson, Morgan Lewis, and Gen. John Armstrong; the Schuylers had only Philip Schuyler and Hamilton; and the Clintons were really but three in number, George, the governor, James, his brother, and De Witt, his nephew, though Chief Justice Robert Yates and John Lansing were their firm supporters. — From the first the Clintons were anti-federalist, and opposed the adoption of the constitution (see ANTI-FEDERAL PARTY; CONSTITUTION, II.); the Livingstons and Schuylers were as warmly federalist. Hammond asserts that the federal patronage was used against Gov. George Clinton in his own state as soon as the federal government was fairly organized; nevertheless Clinton held his own until 1795, when he retired temporarily from politics, and Yates was defeated by Jay, a federalist, for the governorship. Jay had really defeated Clinton three years before, and was counted out by the improper rejection of the vote of three counties by the canvassers; but he urged his friends not to "suspend or interrupt that natural good humor which harmonizes society," and the result in 1795 justified the political wisdom of his refusal to contest by forcible means the decision of the canvassers. His election and the retirement of Gov. Clinton, whose nephew De Witt was not yet old enough to take his place, demoralized the New York republicans (see DEMOCRATIC PARTY), and gave the control of the state to the federalists for the next six years. In 1797, therefore, the electors, chosen by the legislature, were federalists, and voted for Adams and Pinckney. There must have been some untoward result, however, in the election of 1793, for, immediately after it, the whole Livingston interest abandoned the federalists, and joined the republicans; Edward Livingston became a republican congressman from New York city in 1795, and the chancellor was the republican candidate for governor in 1798. But, in the meantime, a new republican interest had been forming, apart from, and opposed to, all the landed families. Burr had begun political life as a moderate federalist, had then held aloof from both parties, but was now an ardent republican. He had considerable support throughout the state, from the class which had formerly supported the Clintons; but his stronghold was in New York city, where he first introduced "the machine" into politics. (See BURR, AARON.) Before the end of the year 1799 he had compelled his recognition as one of the republican leaders, and in 1800 his shrewd management in the composition of the republican

electoral ticket aided largely in influencing the election. He induced the Clintons to accept a part of the places on his ticket on the apparently impossible condition that the Livingstons would do the same; he repeated this process with the Livingstons; and the whole ticket, when completed by the addition of neutral names, was strong enough to carry the state in the election of April, 1800, for the legislature which was to choose the electors. Burr's apparent control of his state gained for him the nomination, as a fellow candidate with Jefferson, by the republican congressional caucus, and he was elected vice-president in 1801. (See CAUCUS, CONGRESSIONAL; DISPUTED ELECTIONS, I.) — Burr's leadership was only apparent. The year 1801 had been marked also by the re-election of George Clinton as governor, and the entrance of his nephew, De Witt Clinton, upon a share of the management of the party. The latter, in conjunction with his brother-in-law, Ambrose Spencer, at once reinvigorated the Clinton interest. Charges of treachery were freely brought against the "Burrites"; the administration, in its inevitable conflict with Burr, bestowed its patronage exclusively upon the Clintons and Livingstons; and the Burrites, after a final and desperate effort to elect their leader governor in 1804 by aid of the federalists, went down. This result came mainly through the unscrupulous and even savage introduction in 1801, by the Clintons and Livingstons, of the idea that "the spoils belong to the victors," which thereafter corrupted New York politics, and since 1829 has corrupted national politics also. (See CIVIL SERVICE REFORM; DEMOCRATIC PARTY, IV.) Hammond cites two instances under Jay's administration, Dec. 28, 1798, and March 9, 1799, as the first two instances of removal without cause by the New York council of appointment. But these two cases, even if incapable of explanation, are glaring exceptions to the otherwise invariable rule of New York politics until 1801, under both republican and federalist administrations; while, after 1801, it would be almost equally difficult to find an instance of removal for any cause except party necessity or advantage. In this manner federalists and Burrites were politically outlawed, and the Clintons and Livingstons secured control of the state. It seems difficult, upon all the evidence, to resist the conviction that the origin of the "spoils system" in American politics was really due to the rising ambition of De Witt Clinton, tempted by the opportunity afforded by an irresponsible council of appointment, to which the New York constitution had given absolute power of removal. Under Jay, a republican council, Clinton being one, had claimed a concurrent power to appoint and remove, not being content with a simple power to decide upon the governor's nominations; and a state convention, Oct. 13–27, 1801, declared this view of the council's powers to be correct. From this time the power of removal by the council of appointment, extending to almost all the local offices of the state, even to that of the mayor of New York, became for twenty years the controlling element of New York politics. — The savage character which this new departure at once gave to political contests was marked by an epidemic of dueling, in which, it was alleged, the Burrites concertedly endeavored to kill their most formidable opponents or drive them out of politics by force of bodily fear. The most vindictive of these duels was that between DeWitt Clinton and John Swartwout, a close friend of Burr, in which Swartwout insisted vainly upon having a sixth shot after being twice severely wounded; the most calamitous was that between Hamilton and Burr, in which the former was killed. — Dissension soon arose between the Clintons and the Livingstons. The latter, in spite of their extensive influence, were no match for the united abilities of De Witt Clinton and Spencer; George Clinton became vice-president in 1805 in Burr's place; and, though Morgan Lewis, a connection of the Livingstons, was chosen governor in 1804, the Livingston interest began to decline. In 1805–6 the Clintons, having gained control of the council of appointment, began an attack upon the Livingstons, or "Lewisites," which was finally successful in 1807 by the election of Governor Tompkins, a Clintonian. De Witt Clinton thus became the arbiter of New York politics for the time; the last of the great landed families had gone down in the race for power; and the first stage of New York's political history may be considered at an end. Though the dominant faction was headed by two members of the Clinton family, there was no longer any general connection by blood or marriage in its composition; it was united by common interests, and may properly be considered the republican party of the state. The federalists had been completely null since 1800, and most of their voters and leaders had seized the various opportunities of joining one or other of the contending republican factions. — II.: 1807–23. The defeated Lewisites and Burrites at once declared in favor of Madison, and against George Clinton, for the presidency in 1808, and they seem to have been recognized as the "administration wing" in the distribution of federal patronage. The coalition was usually known as "Martling men," from the name of their meeting place in New York city ("Martling's Long Room"). The Clintonians were generally unfriendly to the administration's "restrictive system." (see EMBARGO), and out of this one point of agreement was developed a tacit alliance with the federalists, which culminated in their joint support of De Witt Clinton for the presidency in 1812. During the first confusion, in 1809, the federalists, by a sudden effort, succeeded in securing the legislature and the council of appointment, and used the power of removal without pity. But their triumph was brief: the next year Tompkins was again elected governor, with a republican legislature and council. Before the presidential election of 1812 the "Martling men" had taken possession of the hall and appurtenances of the almost defunct Tammany so-

ciety, of New York city, and were commonly known as "bucktails." (See TAMMANY SOCIETY, BUCKTAILS.) They claimed to be the only veritable supporters of the administration, and the opponents of Clintonism, personal government, and disguised or open federalism. The Clintonians, however, were strong enough to elect Clinton presidential electors on joint ballot in 1812. (See FEDERAL PARTY, II.)—The election for governor in 1813 revealed a long suspected breach in the dominant party. De Witt Clinton found his influence in his party overbalanced by that of Gov. Tompkins, Ambrose Spencer, Martin Van Buren and John W. Taylor; he therefore became an opponent of Tompkins' re-election, and entirely lost control of his party. His own faction, with the aid of the federalists, held control of the offices until 1815, when an anti-Clinton council made a clean sweep of all the federalist and Clintonian officeholders. This defeat put an end to the federal party in New York, and seemed to be equally fatal to Clinton. Tompkins, Van Buren and Spencer were now the leaders of the party, but the two former were so much more influential than Spencer that he, about the year 1816, sought a reconciliation with his former ally, but late political enemy, De Witt Clinton, and brought him back into politics to restore the balance. The new coalition was immediately successful; to succeed Tompkins as governor, Clinton was nominated and elected in 1817, against Peter B. Porter, the candidate of the Tammany men, or "bucktails"; and with his entrance to office he initiated the "canal policy" of the state.—The connection between the seaboard and the interior had been one of the earliest problems in American politics. (See ANNEXATIONS, I.) Its great difficulty lay in the mountain barrier which extends from northern Alabama to Maine, parallel with the coast; and the most practicable breach in this was that which was made in the state of New York by the Hudson river. From its upper regions a level territory, excellently adapted for a canal, stretched westward to Lake Erie. The idea of such a canal seems to have been suggested by Gouverneur Morris, of New York, first in 1777 and at intervals afterward. April 8, 1811, the New York legislature passed an act appointing Morris, Clinton, R. R. Livingston, Robert Fulton, and others, "commissioners of inland navigation," but the project slept through the war, which soon after followed, until 1815, when Clinton, during his enforced retirement from politics, renewed his advocacy of it with redoubled vigor. Immediately upon his inauguration, supported by a thorough-going canal legislature and council, his public life became entirely devoted to the construction of the Erie canal, or "Clinton's ditch," as his opponents contemptuously called it.—The anti-Clinton republicans throughout the state now generally accepted the name of bucktails. Though in a popular minority for some years, they were always superior to their opponents in point of ability, for Clinton would not willingly endure a rival near the throne, and dangerously able men among his own supporters rapidly gravitated toward the bucktails. Their leaders were Van Buren, Erastus Root, Samuel Young, Roger Skinner, Peter R. Livingston, Joseph C. Yates, and Ogden Edwards, all noted names in New York politics; Tompkins was already hopelessly lost under a load of debt which he had accumulated in defense of the state during his governorship, and which was really the cause of his death in 1825. The leadership of the Clintonians was strictly confined to Clinton himself and Spencer, who had no aspirations for office. The remnant of the federalists was led by Wm. A. Duer, Peter A. Jay, W. W. Van Ness, and Abraham Van Vechten. Most of them supported Clinton; but a small division, often derisively called "high-minded federalists," from their frequent use of the phrase "high-minded men" in their addresses, supported the bucktails and opposed the Clintonians as a personal party. In 1820 the bucktails at last gained complete control of the legislature, but it is noteworthy that at the same election Clinton was re-elected governor over Tompkins. For this success he was indebted mainly to his canal policy; but his term of office was embittered by the rigorous manner in which the bucktail council exercised the power of removal. This body was abolished by the constitution of the next year, and its last year was acknowledged on all hands to have been the most extraordinarily evil year of its existence. The extent of its power for evil may be estimated from the statement that, in 1820, 8,287 military and 6,663 civil officers throughout the state were absolutely at its mercy. Clinton also complained most bitterly, in his messages to the legislature, of the manner in which the administration at Washington had placed the federal patronage at Van Buren's disposal, and of interferences in state elections by federal officeholders "as an organized and disciplined corps."—In the election of 1822 the former bucktails at last became the republican party of the state, and the Clintonians were completely overthrown. Clinton himself had discreetly declined to be a candidate for the governorship, and his opponents elected their candidate for governor without opposition, the entire senate, and almost all the assembly. The result was partly due to the Clintonian opposition to the revision of the constitution in 1820–21, but far more to the advance of the democratic idea in the state. The day of personal politics was very nearly over. The growth of the state's population, and the enlargement of the right of suffrage, had made the body of voters so large that it was no longer possible for any one man to exercise direct personal control over a controlling mass of voters. The increase may be shown by comparing the vote at intervals of nearly ten years: (1792) George Clinton 8,440, John Jay 8,332; (1801) George Clinton 24,808, Stephen Van Rensselaer 20,843; (1813) D. D. Tompkins 43,324, Stephen

Van Rensselaer 39,718; (1824) De Witt Clinton 103,452, Samuel Young 87,093. The party was now headed by a number of leaders, who were at one in their feelings, interests and methods, and who aimed rather to ascertain than to control the feelings of the people. (See ALBANY REGENCY.) — III. : 1828–50. The regency began its long and successful career with a mistake. Its members were strongly in favor of Crawford for president in 1824 (see DISPUTED ELECTIONS, II.), as were a great majority of the legislature, which then had the power to choose electors. The party at large seems to have preferred Adams, and many members of the legislature were elected under a pledge to vote for an electoral law to give the choice of electors to the people. The Clintonians, who were also for Adams, were naturally in favor of such a law, and the regency members, after postponing the bill to a date beyond the presidential election, passed a resolution to remove De Witt Clinton from the unsalaried position of canal commissioner, to which he had retired in 1822. The resolution was introduced in order to compel the recalcitrant Adams members either to become identified with the Clintonians or to break with them altogether; the result was to excite a lively indignation throughout the state. Clinton was brought back into politics again, and elected governor in 1824, and again in 1826. In the choice of electors in 1824 the legislature was much divided. The Adams and Clay members at last united on a ticket composed of twenty-six Adams and ten Clay electors. The Adams electors, on the next ballot, were all chosen, but by some legerdemain only four Clay electors were chosen, five of the remaining six being for Crawford and one for Jackson. The change of these five votes from Clay to Crawford excluded the former from the list of three candidates to which the house of representatives was confined in voting for president. — One of the most singular political manœuvres ever contrived was successfully carried out in the election for United States senator in February, 1825. By law the senate and assembly were to ballot separately for a senator, and, if they chose different persons, the decision was to be made by joint ballot. The Clintonians had a majority in the assembly and on joint ballot; the regency had a majority in the senate. The assembly nominated Ambrose Spencer; the ten Clintonians in the senate voted for him also; but the twenty-two regency senators, by voting each for a different candidate, prevented a choice by the senate and a joint ballot, so that the senatorial election went over to the next year, when a regency senator was chosen. — The failing health of Crawford during Adams' presidency compelled the regency to look elsewhere for a candidate. As between Adams and Jackson, the former seems to have been the natural preference of the regency, as the latter was of Clinton personally. Until Sept. 26, 1827, the regency preserved a profound and almost ostentatious neutrality between the two most prominent candidates remaining; on that day the first Jackson address was issued from Tammany Hall, and thereafter all the political prospects of the regency were hazarded upon the chances of Jackson's election. Before Clinton had any opportunity to define his position, his sudden death, Feb 11, 1828, left the opposition to the regency almost without a head. Nevertheless the Adams opposition was strong enough to secure sixteen of the state's electors, who were then chosen in congressional districts, though the eighteen Jackson electors, being a majority of the college, chose the two electors at large and made the state's electoral vote twenty to sixteen in favor of Jackson. Van Buren was at the same time chosen governor. Immediately afterward he passed into Jackson's cabinet, and carried with him the methods which had long been familiar in New York politics. Thereafter national democratic politics were to be marked by the use of popular conventions as nominating bodies, by absolute submission to the majority, no matter how small a portion of the party might make the decision, unsparing punishment of individual action in opposition to the majority, and the use of the civil service as an instrument of reward or punishment. The whole programme may be summed up as the *unitizing* of political action. Majorities were to be absolute in every democratic organization, national, state, county or city; minorities were simply to be ignored, and individuals were morally and politically bound to follow the majority of their organizations, even in opposition to their own party organization of higher rank. (See DEMOCRATIC-REPUBLICAN PARTY, IV ; ALBANY REGENCY ; NATIONAL CONVENTIONS ; TAMMANY SOCIETY.) But, though regency methods thus became national, the regency itself remained cautiously, judiciously and strictly a state organization; it refrained carefully from interfering in national politics, except to secure the federal patronage within the state, and, in dangerous or difficult elections, to call back some one of its former members from the federal service to serve as its candidate. — The Adams, or national republican, party in New York was seriously embarrassed not only by its lack of leaders, but by the sudden rise of an anti-masonic party, pledged to proscribe every freemason of any party. (See ANTI-MASONRY, I.) From motives of expediency the Adams conventions usually endeavored to conciliate the anti-masonic candidates in their nominations; but at the same time the Adams men, who were freemasons, preferred a regency candidate to an anti-masonic candidate, and frequently gave their votes and influence to the former. The result was that, though the two parties, voting separately, generally polled as large a vote as the Jackson men, any attempt at coalition was followed by a defeat. For eight years, therefore, New York was democratic (the "Jackson men" having taken the name of democrats); the governors were regency men; and the legislature was strongly democratic

in both branches. In 1837 the democrats were for the first time beaten in a legislative election, the whigs carrying six of the eight senatorial districts, and 101 of the 128 assembly districts; and in the following year Wm. H. Seward, who had been beaten in 1836 by Marcy, was elected governor over Marcy. In all this long struggle the western part of the state, commonly called by the democrats "the infected district," was the staying power of the opposition. It never wavered. Its opposition to the regency had begun under Clinton, was continued (since most of the regency were freemasons) in the form of anti-masonry, but when the anti-masonic fever had died out so far that the anti-masons accepted Clay, a freemason, as one of its leaders, the "infected district" was as cohesive as ever in its opposition; and the territorial location of party strongholds in the state is closely and curiously similar in 1883 to that which existed while Clinton and Spencer were fighting the bucktails in 1818–22. — Under the reign of the regency every governor and legislature were democratic until 1846, with the exception of this period, 1837–41, when the state became whig through democratic divisions. The charter of a national bank was the question which divided political parties from 1833 until 1843 (see BANK CONTROVERSIES, III., IV.; WHIG PARTY); and in New York this was further complicated with others relating to state banks (see LOCO-FOCO), so that there were there three parties: the whig party, which supported banking interests in general, the regency democratic party, which opposed a national bank but supported the state banks, and the "loco-foco" democratic party, which opposed the grant of special banking privileges to any corporation whatever. Further, the canal question had divided the democrats into hunkers, or conservatives, and barnburners, or radicals; the former desiring the extension of the canal system, and the latter its limitation to immediately profitable canals. The loco-foco division of the party ceased after 1839; the hunker and barnburner division continued even after the adoption of the constitution of 1846, which removed the original cause of division, and the barnburners then became practically the regency party, though Croswell and Marcy, of the regency, inclined toward the hunker faction. These democratic divisions gave the whigs some temporary successes. In 1839 they gained a majority in the senate, which had been steadily democratic for twenty-one years, and in 1840 they secured the electoral vote of the state for Harrison. The democratic division as to banks was then healed, and the legislature in 1841, and the governor in 1842, again became democratic. — In 1844 the regency labored with more than usual energy to carry the state, its ablest member, Silas Wright, leaving the United States senate to run for the governorship. Polk, soon after his inauguration, began to cultivate a New York faction of his own, in opposition to the regency, and the result was a wider disruption of the democratic party, and the return of the whigs to power. The regency were able to secure the nomination of Wright in their party convention, but were unable to elect him. In 1848 the struggle between the regency and the administration widened into national proportions. (See BARNBURNERS, FREE-SOIL PARTY.) The result of this election was, not so much to overthrow the remnant of the regency as to show that it was already overthrown. Out of sympathy with the national party, stigmatized with the reproach of having introduced abolitionism as a weapon by which to defeat Cass, the regency went down, and its adherents either abandoned it or retired from politics. In 1850 it formed a coalition ticket with its opponents, and in the state convention of 1852 it had but twenty delegates, under John Van Buren, who refused to "walk arm-in-arm to the funeral" by approving all the measures of the democratic national convention of 1848. The reign of the regency was over. Its sceptre had passed to a larger circle of its own party, and a similar knot of leaders in the whig party had learned its method and followed it with success. — The accession of Fillmore to the presidency in 1850 brought to light a division in the New York whig party also. The Seward whigs leaned toward abolitionism; the Fillmore, or "silver gray," whigs wished to ignore slavery in politics. This division aided the democrats in carrying the state in 1852. But the schism in the victorious party immediately broke out afresh, the former hunker party now taking the name of "hards" or "hard shells," and their younger rivals that of "softs"; the names, however, had principal reference to the slavery question, and many individuals in both factions had changed sides in the confusion. The general election of 1854 was therefore extremely complicated, four tickets being run, a fusion ticket of whigs, a hard, a soft, and a know-nothing ticket. The fusion ticket was successful, and in the following year its supporters had developed into the new republican party. The former Fillmore whigs went either into the republican party, under Seward's leadership, or into the American party, or know-nothings. The democratic party of the state, without leadership, and distracted by divisions which had their origin only in the disappointed ambitions of local leaders, remained in the minority until 1862. In 1855 the know-nothings elected the state officers inferior in rank to the governor, and there was no party majority in the legislature; in other years the state was steadily republican. — In 1862, during the depression caused by federal disasters, the democrats elected the governor and state officers, but the senate was republican and the assembly a tie. Since that time the vote of the state has been very uncertain and irregular. The legislature has usually been republican, but the state has nevertheless often been carried by the democrats on the total vote. In 1868 the democrats elected the governor and state officers, and secured the electoral vote of the state, but the legislature remained republican in both

branches. That there was fraud in the vote seems to be undeniable, for in all previous elections, even in such exciting contests as 1840, 1844, 1860, and 1864, the proportion of voters never exceeded 90 to 92 per cent. of the legal voting population, while in 1868 it reached the incredible proportion of 97.07 per cent. The enormous democratic majority in New York city (112,522 dem., 43,372 rep.), and the control of the count by the Tweed ring, seem to localize the fraud beyond question. In 1870 the democrats again carried the state, electing the governor, state officers, and a majority in both branches of the legislature. In 1872 the state was carried by the republicans, Governor Dix's majority over his opponent being over 50,000.— By this time the political condition of the state had been very considerably changed. From 1854 until about 1873–4 the democratic party was practically a minority in the state outside of New York city, and the only question was, whether the republican majority in the rest of the state would be large enough to overcome the democratic majority which it was to encounter at the Harlem river. The organization of the republican party throughout the state had long been very complete, under the leadership at first of R. E. Fenton, and, after 1868, of Roscoe Conkling, whose sympathy with the then administration was more pronounced than his predecessor's. The democratic organization, outside of New York city, had long been imperfect; its local managers were discouraged; and there was no recognized state leadership, except in the counsels of Gov. Seymour. About 1873 the leadership was suddenly assumed by Samuel J. Tilden, only known hitherto as a lawyer, the chairman of the democratic state committee, and one of the agents in the overthrow of the Tweed ring. (See TAMMANY SOCIETY.) Abandoning the absolute dependence of former years upon New York city, he pushed the reorganization of the party throughout the state, secured entire control of its machinery, and in 1874 was elected governor by over 50,000 majority over Dix. His term was distinguished by his success in breaking up a canal ring in the western part of the state, and in 1876 he was nominated for the presidency by the democratic national convention. (See TILDEN, S. J.) His retirement from state politics left the organization which he had revived under the control of a circle of his most trusted supporters. The most prominent of these was Lucius Robinson, who was nominated for the governorship in 1879. The organization of both the great parties in the state was now strikingly similar. It may best be described in the words of the "Evening Journal," a republican newspaper of Albany, which, though used with reference to the republican "machine," are just as applicable to its rival. "The choice of delegates [to the state convention] was a 'put-up job.' The plan of operations was carefully and minutely mapped out at head-quarters. Trusty and well-instructed lieutenants were assigned to each district. These had their sergeants in every county, and these their corporals in every town. Success was made the test of fidelity, and rewards were to follow in proportion to the success achieved. No man could be a tide-waiter who did not carry his ward; no man could be a harbor-master who did not carry his county; and no man could be so much as thought of for canal superintendent, or auditor, or state assessor, or bank superintendent, who did not take his district with him to the Utica convention. It was a race for the spoils on the part of the subordinates, and a race for the presidency on the part of the chiefs." The democrats of the state, outside of the city of New York, seem to have been very well satisfied with the workings and results of their "machine"; but in New York city a new Tammany, under a local leader named John Kelly, had arisen from the ashes of the old one. The Kelly organization seems to have become disaffected partly by a general dislike to the predominance of the country democracy, partly by a disinclination to submit to any authority whatever, but most of all by the apprehension that the Tilden "machine" intended to substitute some more popular nominating body or bodies in the city instead of the Tammany oligarchy. It therefore declared war upon the Tilden machine, and, when it was excluded from the state convention, a rival body of delegates admitted, and Robinson nominated, it nominated its leader, Kelly, for the governorship. The republican machine had given great dissatisfaction to its party, and a number of its voters, commonly called "scratchers," or independents, decided to erase from their ballots the names of its candidates for governor and state engineer. In the election the two parties were almost a tie on most of the candidates. Kelly polled 43,047 votes in New York city, 34,519 in the rest of the state, from various elements ill-affected to the Tilden machine, and 77,566 in all; the republican candidate for governor fell 16,737 below the lowest of the unscratched candidates; and the Kelly revolt was thus successful in defeating Robinson, and in giving the republicans a majority of seventy-three out of the 161 members of the legislature. In 1880 the electoral vote of the state was republican. The popular vote shows the character of the party strength and its locality very clearly. What may be called the urban counties, the seats of the great cities of Albany, New York and Brooklyn, or in their immediate neighborhood, all gave heavy democratic majorities; outside of these, only five of the sixty counties gave democratic majorities, and these were all exceedingly small.—When the new administration of President Garfield was inaugurated in 1881, it was almost immediately called upon to solve the problem which had embarrassed almost every administration since that of Washington—the settlement of a *modus vivendi* with the chief of the party in New York. The solution could only be found in choosing between an open conflict and a grant of the fed

eral patronage within the state to the state leader. (See CONFIRMATION BY THE SENATE.) The president sought to find a middle course by dividing the patronage between the two factions of New York republicans. Thereupon the two New York senators, one of whom was the recognized leader of the republican "machine" in the state, resigned their positions, apparently under the delusion that, if they should be re-elected by the state legislature, the administration would be utterly unhinged by such a rebuke, and would succumb at once. The contest in the legislature was long, and roused a curiously intense excitement. (See GARFIELD, J. A.) The senators were defeated for re-election. But their close political associate, Vice-President Arthur, became president at Garfield's death; and the division of feeling was thus extended into the state election of 1882, which resulted in the choice of a democratic legislature and governor, the majority of the latter (192,854) being the largest yet recorded in a state election. — The political situation in New York in 1883 is very singular. There are two great parties in the state. Both are distracted by quarrels in which the mass of voters take little or no interest; neither has now any recognized leader, nor would either submit generally to the guidance of a leader, if one could be found; neither has a trace of principle or policy in state interests, such as divided parties in the state until 1850; and both organizations maintain a precarious existence as offshoots of the national parties, the adherents of the dominant party struggling for federal offices *in præsenti*, as their opponents do *in prospectu*. The only strictly state organization is the much-berated Tammany society of New York city, whose efforts are directed solely to local offices, with such few federal offices as it can secure by barter. The whole political history of the state is the clearest possible record of the inevitable results of the spoils system in politics: its first employment by a few strong-willed men, with some idea of great principles in its application; its extension to a clique of smaller and less passionate leaders, who use it more as a business means; its immediate and brilliant success in winning elections, and in compelling all parties to adopt it; its further debasement as a mere tool in the hands of men who use it without knowledge of, or care for, any other weapon in politics; its certainty to drive men of a higher understanding of politics out of the competition, as bad money drives out good; and its ultimate disintegration of all parties who employ it, as soon as local leaders, through it, learn to regard political contests as without principle, and to employ the spoils system against their own party as well as against their opponents. To the Italian astronomer Jupiter's moons seemed to be hung in the sky as a convincing proof of the truth of the Copernican system; to the political student the last eighty years of New York's history are fully as instructive. — The names of men who have become prominent in New York politics are of course very numerous. Among them are those of C. A. Arthur, Aaron Burr, De Witt Clinton, George Clinton, Roscoe Conkling, Millard Fillmore, Francis Granger, Horace Greeley, Alexander Hamilton, John Jay, Rufus King, Wm. L. Marcy, Wm. H. Seward, Horatio Seymour, S. J. Tilden, D. D. Tompkins, Martin Van Buren, Wm. A. Wheeler, Silas Wright (see those names), and the following: John Armstrong, democratic United States senator 1801–4, minister to France 1804–10, and secretary of war 1813–14; Daniel D. Barnard, whig representative in congress 1827–9 and 1839–45, minister to Prussia 1850–53, and the ablest contributor to the "Whig Review" (see WHIG PARTY); Benjamin F. Butler, Van Buren's law partner, and attorney general and secretary of war under Jackson and Van Buren (see ADMINISTRATIONS, XIII.); Churchill C. Cambreleng, democratic representative in congress 1821–39, and minister to Russia 1840–41; Sanford E. Church, democratic justice of the state supreme court; Daniel S. Dickinson, democratic United States senator 1844–51, and republican candidate for governor in 1862; John A. Dix, democratic United States senator 1845–9, secretary of the treasury in 1861, major general of volunteers 1861–5, minister to France 1866–9, and republican governor of the state 1873–5; Wm. M. Evarts, United States secretary of state 1877–81; Reuben E. Fenton, democratic representative in congress 1853–5, republican representative in congress 1857–65, governor 1865–9, and United States senator 1869–75; Hamilton Fish, whig representative 1843–5, governor 1848–50, and secretary of state (republican) 1869–77; John A. Griswold, representative in congress (democratic) 1863–5, (republican) 1865–9, and republican candidate for governor in 1868; Thos. P. Grosvenor, federalist representative 1813–17, and distinguished for eloquence; Washington Hunt, whig representative 1843–9, governor 1850–52, and candidate for governor in 1852; James Kent, chancellor of the state 1814–23; Francis Kernan, democratic representative 1863–5, candidate for governor in 1872, and United States senator 1875–81; Preston King, democratic representative 1843–7, free-soil representative 1849–53, republican United States senator 1857–63, and collector of the port of New York 1865; Edward Livingston, democratic representative 1795–1801 (see also LOUISIANA), secretary of state under Jackson, and minister to France 1833–5; Robert R. Livingston, chancellor of the state 1777–1801, and minister to France 1801–4 (see ANNEXATIONS, I.); Edwin D. Morgan, governor of the state 1859–62, and United States senator in 1863–9; Amasa J. Parker, democratic representative 1837–9, and justice of the state supreme court 1847–55; Peter B. Porter, democratic representative 1809–13 and 1815–16, and secretary of war under J. Q. Adams; Clarkson N. Potter, democratic representative 1869–75 and 1877–9; J. V. L. Pruyn, democratic representative 1863–5 and 1867–9; Lucius Robinson, republican comptroller

of the state 1863–5, and democratic candidate for governor in 1879; Erastus Root, democratic representative 1803–5, 1809–11, 1815–17, 1830–33, and in the intervals of these terms of service prominent in state politics as a democrat and (after 1833) a whig; Gerrit Smith, abolitionist representative 1853–4; Ambrose Spencer, chief justice of the state supreme court 1810–23, democratic representative 1829–31, and afterward a whig; John C. Spencer, democratic representative 1817–19, afterward an anti-masonic and whig leader (see ADMINISTRATIONS, XIV.); Nathaniel P. Tallmadge, United States senator (democratic) 1833–44; John W. Taylor, democratic representative 1813–33, and speaker of the house 1820–21; Enos T Throop, democratic representative 1815–16, governor 1829–32, and minister to Naples 1838–42; Wm. M. Tweed, democratic representative 1853–5 (see TAMMANY SOCIETY); Fernando Wood, mayor of New York city 1855–7 and 1861–2, and democratic representative 1841–3, 1863–5, and 1867–81; Stewart L Woodford, republican lieutenant governor 1867–9, republican representative from Ohio, 1873–4, and thereafter United States district attorney for the southern district of New York. — The popular name for the state is *The Empire State*, from its size and wealth, or *The Excelsior State*, from the motto on its coat of arms. — See 2 Poore's *Federal and State Constitutions;* O'Callaghan's *Documentary History of New York* (1600–1800) and *History of the New Netherland;* Brodhead's *History of New York* (1609–91); Moulton's *History of New York;* G. ALEXANDER JOHNSTON.

NEW ZEALAND. (See OCEANICA.)

NICARAGUA. The state of Nicaragua, bounded on the west by the Pacific ocean, is on all other parts surrounded by the states of Honduras, San Salvador and Costa Rica. It touches the Atlantic ocean only by a triangular prolongation, at the point of which is situated the port of San Juan; its area is 122,000 square kilometres. According to Squier, the best authority in such matters, its population is 300,000, of which number not more than 30,000 are whites. The remainder is composed of Indians, mestizoes and negroes, the latter numbering from 18,000 to 20,000. — By its geographical position, Nicaragua was, more than any of the other states of Central America, interested in the maintenance of the confederation of Guatemala, which united for the time the five republics of Central America after the recognition of their independence by Spain. It nevertheless had a large share in the events which, in 1842, brought about a definitive dissolution of that confederation. The condition of weakness and isolation, which was the result of this, weighed more heavily on Nicaragua than it did on its former confederates. Its territory, which is admirably situated for the construction of a canal opening a passage from the Atlantic to the Pacific ocean, was for many years coveted both by England and the United States In 1848, under pretext of obtaining satisfaction for injury done her subjects, England took possession of San Juan, the name of which she changed to Greytown. In 1852 the Clayton-Webster treaty stipulated for the restitution of this port to Nicaragua, but on the condition that there should be no imports or tonnage duties except such as were strictly necessary for the preservation of the port and the maintenance of its lighthouses. By this treaty England and the United States settled, of their own accord, certain questions of boundaries, upon which the states of Costa Rica and Nicaragua were divided. In the same year England, for the purpose of guarding her commercial interests involved in the question of interoceanic communication, declared the islands in the bay British colonies, although they were given up to the state of Honduras in 1860. These acts of foreign interference again started the idea of a confederation with the states of Honduras and Costa Rica. But they could not come to an agreement, and the negotiations, entered upon to establish a federation, ended, March 4, 1854, in a new act of separation. The conservative party was then in power; the democratic party did not allow it to rest, and called Walker to its aid. After two and a half years of strife, Nicaragua, which had escaped not without difficulty from the domination of the hardy filibuster—the soul and arm of a policy whose object it was to constitute in Central America, by colonization on a large scale, a confederation destined to draw into the United States, willingly or by force, the states of Central America—fell into the hands of American diplomates, and was very near entirely losing its independence (which it had preserved with great difficulty upon the field of battle,) in the negotiations which ended in the treaty of commerce, concluded Nov. 16, between Isarrari and the cabinet at Washington. This treaty conceded to the United States the right of transit between the two oceans, by every way of communication

existing or which might exist. Two free ports were to be established at each of the extremities of communication, and no customs or tonnage duties were to be levied upon the merchandise and ships of the United States. The federal government extended its protection over its routes of communication, and had the right to transport troops over them, and protect itself there, in case of need, by a military force. These provisions are only an exact repetition of those inserted in the treaty with Mexico, relative to the isthmus of Tehuantepec. They caused none the less a profound sensation. The legislature of Nicaragua hastened to disavow them and to place the interoceanic communication under the protection of the powers, who had guaranteed the integrity of the Ottoman empire. Another resolution of the legislature, in March, 1859, asked the government to admit all nations, without privilege or exclusion, to the advantages of this communication; to establish free ports at the ends of the line; to impose moderate tolls and customs duties, and to forbid the passage of troops. Upon these bases the treaty concluded with England, June 29, 1860, rests. The right of armed intervention, to protect British interests, had nevertheless to be conceded in principle. — The republic of Nicaragua is governed by the constitution of Aug. 19, 1858. The executive power is exercised by a president elected for four years; the legislative power by a senate of ten members, and by an assembly of eleven deputies. Justice is administered by tribunals whose decisions may be reviewed by the supreme court of Nicaragua. The army numbered, in 1873, about 13,000 men. — In 1866 the receipts amounted to $841,253; and the expenditures the same year were $829,471. In 1868 the receipts were $632,471, and the expenditures $517,709. The public debt, in 1873, was $4,090,000. The exports, in 1866, were of the value of $771,966, and the imports amounted to $792,085. In 1870, the exports amounted to $924,031, and the imports to $914,648. The revenue of Nicaragua, in the year 1879–80, was $2,436,090, and the expenditures $2,570,135. The total amount of the public debt was $9,500,000, at the end of 1877. — The products are the same as those of the other states of Central America. Nicaragua is also devoted to the raising of large and small live stock, a market for which is found in neighboring states. — BIBLIOGRAPHY. LOUIS GOTTARD.

NIHILISM, about which we have heard so much for some years past, is not entirely new. It has existed for a long time even under this strange name; it has been the fashion in the schools and universities of Russia for the past twenty years among the male students and short-haired female students, whether native or foreign. Although it may have seemed antiquated and almost forgotten before it received its recent popularity and vigor, nihilism was always held in high favor by the youth of Russia, and attracted the attention of the police and the government long before the attempts of 1878 and 1879 excited the curiosity of Europe. — Nihilism is not a system in the same sense as the positivism of Auguste Comte, or the pessimism of Schopenhauer; it is not a new form of the old doctrines of skepticism or naturalism. In philosophy it is scarcely anything more than the grossest and wildest materialism. In politics it is a socialistic radicalism, less anxious to improve the condition of the masses, than to destroy all existing social and political order. It is not a party, for it has no aim but destruction; under its standard we find revolutionists of all kinds, *authoritarians*, federalists, mutualists and communists, who agree only in postponing till after their triumph shall be secured, all discussion of a future organization of the world.* The name of *nihilism*, a name that suitably expresses its scientific nullity and its destructive aspirations, is merely a sobriquet rejected by most of its professors.† — In its principle and instincts, as in its aims and methods, nihilism has but little that is original. With all its exaggerations it is hardly more than a pupil of the revolutionary schools of the west, a pupil that prides itself on excelling its master, and exceeds at pleasure their rashest teachings in order to show what it has drawn from them. Although it has thousands of zealous and sincere followers, it can not be called a science or a school, so long as study, science or scientific

* Under the influence of Bakunin and of the international, most of the Russian revolutionists, in and out of the empire, seem to have had for their formula the confederation of independent and productive communes. In 1874, after the establishment of the journal "Vpered" by Lavrof, discussions having arisen in the beginning as to the manner of preparing and directing the revolution, a refugee named Tkatchef, in a pamphlet entitled "On Revolutionary Propagandism in Russia," declared that "*the party of action*," instead of preoccupying themselves with the question of future organization, should have nothing in view but their work of destruction. This counsel has been adopted by an immense majority of the Russian revolutionists.

† The term *nihilism* is taken, we believe, from a novel of Ivan Turgeneff, "Fathers and Children," in which the celebrated novelist describes the first generation of nihilists. J. de Maistre had already used the word *rienisme* (nothingarianism) in a more or less analogous sense somewhere in his letters on Russia, if we are not mistaken. The nihilists ordinarily style themselves revolutionists, democrat-socialists, or simply propagandists.

methods, which it so loves to parade, have in reality no place in it. Nearly everything it possesses in this regard is derived from theories or treatises outside itself. — Nihilism, or rather Russian radicalism, can, it is true, boast a national theorist, a utopian legislator or prophet of the future, who, in his brief career as an apostle, from 1855 to 1868, acquired an influence over the youth of the country which his misfortunes served but to increase. This Russian Proudhon, or Lasalle, has been exiled for nearly twenty years in the depths of Siberia, where he passed seven years at hard labor in the mines in punishment of his revolutionary propagandism, and where he has grown old in isolation and inaction far from all communication with Russia and the outer world. This man is Tchernychevski, an able writer and an indefatigable worker, armed with a powerful logic and a biting irony, a vigorous and subtle intellect, an enthusiastic and energetic character, and a mind thoroughly Russian alike in its defects and in its good qualities. Philosopher, economist, critic, novelist, a missionary of the dread doctrines of which he has been one of the first martyrs, Tchernychevski has given the theory or *summa* of Russian radicalism in his scientific treatises, and in an eccentric and rambling romance, written in a prison dungeon, he has published its poem and its gospel.* — It is perhaps no injustice to Tchernychevski to attribute more of his ascendency over his disciples and over the young heads of Russia to his long and fastidious romance than to his didactic treatises. This man, whose influence had dethroned that of Herzen and about whom Siberia and long suffering have thrown the halo of martyrdom, was regarded by many of his fellow-countrymen as one of the giants of modern thought, one of the great pioneers of the future, a Fourier, or rather a Russian Karl Marx. Notwithstanding all the admiration of which he has been the object, and the real originality of his mind, the ideas of Tchernychevski present nothing very original, either in political economy or philosophy. The form and details may be new and individual; the basis of the theories is German, English and French. What gives to the work of Tchernychevski, at least to his romance, the greatest savor of the soil, is perhaps the sort of mystic and visionary realism which is found among many nihilists. Great, however, as has been the ascendency of Tchernychevski and some other writers of the same school over the youth of Russia, the nihilism of to-day is far from following blindly the lessons of the masters whom it glorifies; it draws more from their romantic visions than from their scientific deductions. — From a pyscological point of view, nihilism may be said to result from the union of two opposite tastes in the Russian character, a taste for the absolute and a taste for realism. From this unnatural union has resulted this revolting monster, one of the most direful children of the modern mind. We find in it also an example of that impatience of all restraint and of that rashness in speculation which are frequent among the Russians, but which make less pretense to science or method among them than they do among the Germans. From a moral and political point of view, nihilism is first of all a pessimism with which nature and climate have somewhat to do. Seeing nothing but evil everywhere, it aims at overthrowing everything—government, religion, society, the family—in order to replace all by a better world. Nihilism has in it nothing of the critical skepticism which compares and examines, and which reserves its judgment. It is a negation which asserts itself boldly and admits of no investigation; which becomes a sort of retrograde dogmatism as narrow, as blind and not less imperious and intolerant than the traditional beliefs whose yoke it rejects. — In the intemperance and rudeness of the negation which they hurl at all that mankind honor and respect, many of the nihilists display the foolish boyishness of youthful incredulity, something of the disorderly waywardness of minds recently emancipated. For many of those who profess them the theories of nihilism are but a sort of protest against the ancient superstitions which still rule the masses, against political servility, intellectual hypocrisy or the social conventionalities that too often rule the higher classes. — If you should ask a nihilist in what his doctrine consisted, he would reply: "Take earth and heaven, the state and the church, kings and God, and hurl them down and spit upon them; this is our doctrine." This definition would be a subject of raillery for an adversary, as it could hardly be less exact. The expression, however, is not shocking to the ears of a Russian as it is to ours; *spitting* enters quite extensively into Muscovite superstitions. They spit to avert an evil, they spit as a sign of astonishment, they spit as a sign of contempt. The nihilist delights in spitting upon everything, he loves to set at defiance the spirit of veneration and humility which is active in the Russian of the lower ranks, who doubles himself in two before his superiors as before the images of the saints. This shows what a profound discordance of ideas and sentiments afflicts the nation. The two extremes are here met with in the moral as well as the physical order, in man as well as in nature. the most artless political and religious veneration is confronted by the most brazen intellectual and moral

* Tchernychevski began his career in 1855 by a treatise on natural æsthetics, or the relations of art and reality (*Esteticheskiia otnocheniia iskoustva i dessitelnosti.*) A little later, in an essay entitled "The Anthropologic Principle in Philosophy" (*Antropologitcheskii v filosifi*), he explained a system of *transformist* materialism, defended the unity of principle in nature and in man, and reduced all morality to pleasure or utility. In 1860 he published, in the *Sovremennik* review, a translation, with an appended criticism on the "Political Economy of John Stuart Mill." In this book the Russian writer employs, for the benefit of socialism, all the arms he can secure from certain theories of the English school of economists, Malthus and Ricardo in particular. Finally, in 1868, the *Sovremennik*, which was soon after suppressed, published anonymously the romance "What can be done?" (*Chto delat*), written in the prisons of St. Petersburg.

cynicism.—This coarse negative materialism is not the whole of nihilism; this monster born of opposite inclinations has another face, very different but equally Russian, namely, mysticism. These men, so disdainful of all faith, of all metaphysical dreams and of everything ideal, have also their speculations or their dreams. At the root of this naturalistic realism there is a sort of idealism anxious to make for itself a course in the unexplored field of the possible. From the midst of the pessimism that curses the existing social order springs an unbridled optimism, which ingenuously discounts the wonders of a utopian future. In Russia, most of the young men, the greatest injury you could offer to whom would be to call them idealists, and who would consider it as the greatest possible humiliation to be regarded as such, do not hesitate to abandon themselves to the wildest dreams and reveries in matters which seem to offer least opportunity for them. It is in the domain of economy and social science, in the domain of positive realities, that the Russian, whether nihilist or not, abandons himself with the greatest freedom to utopian vagaries and the search for the absolute. It is while following the path of realism and utilitarianism, that he abandons himself to theories and chimeras; he travels, as it were, in a circle, and abandons the speculative spirit only to return to it, like a traveler who, after passing the antipodes, would reach by another route the country he has left behind. The sphere which requires the greatest sobriety of mind is that in which the Russian (and in this he is not alone) gives the freest scope to his imagination. With a great difference of science and method, have we not seen something of this preposterous speculation among the most pronounced adversaries of metaphysics, among certain positivists, for instance, who have sometimes reached, in economic and political questions, conclusions so little in keeping with their method and in fact so little positive? This contradiction, which is so frequent among most socialists or radicals, this sort of change of front which is explained, in the most negative schools, by an imperative want of the ideal and of faith in a better world, is nowhere of more frequent occurrence or more striking than it is among the Russians. Here their national spirit manifests itself with all its contrasts, with its defiance and disdain of received beliefs, with its ingenuous confidence in doubtful theories and its taste for paradoxes.—De Tocqueville has remarked that in our day the revolutionary spirit acts after the manner of the religious spirit. This can be more truly said of Russia than of any other part of the world. Revolution has become a religion among the nihilists, whose dogmas are as little discussed as a revelation, and whose obligations are nearly as imperative as the commandments promulgated in the name of the Divinity. Negation has assumed among them the aspect and character of faith; it possesses its enthusiastic fervor and a zeal that nothing can check. Nihilism has its devotees and its illuminati, its confessors and its martyrs, just as it has its gods and its idols. From this point of view, the common opinion which formerly took nihilism for a sect, was not so far wrong as it seemed at first sight. With its absolute spirit, impatient of all criticism, its sturdy faith and the impassioned devotion with which it inspires so many scattered followers, it is really a sort of religion, whose deaf and insensible god is the people adored in their degradation, a sort of church whose bond of union is love for this suffering god, and whose law is hatred of its persecutors. By the blind ardor of their faith, their rejection of all that is foreign to their doctrine, their exclusivism and fanaticism, many of these proud nihilists bear a most striking resemblance to the coarse popular sects, their contempt for which they can never sufficiently express.—These detractors of all faith and all supernatural hope, these contemners of all spiritualism, are themselves idealists and mystics after their own fashion. We may frequently perceive this in their language, and even in their writings. Although most of them profess to disdain, as childishness or useless superfluities, poetry, pictures and allegories, they can not withstand their seductions. These enemies of all superstition and of all veneration, who pretend to recognize in the noblest acts of devotion merely an instinctive impulse or a refined egoism, constantly praise the heroes and heroines of their cause, more like saints martyred for their faith than like modern conspirators.* Any one who will read the celebrated romance of Tcherny chevski, "What can be done?" will be surprised at its singular union of mysticism and realism, of practical and prosaic observations, and vague and dreamy aspirations, all jumbled together in that strange work of radical doctrinarianism. In this long and sluggish history, which pretends to portray for us the reformers of society and the sages of the future, her own destinies and the destinies of woman and of humanity are revealed to the heroine in symbols and dreams These readily transparent allegories may, it is true, have been suggested to the already imprisoned author by the necessity of not too fully arousing annoying censure. In the prisoner's romance there is, by the side of this humanitarian mysticism, a sort of natural asceticism, which to us seems queerer still. The revolutionary ideal, the finished type of the man of the future, a certain Rakhmetof, not only possesses all the perfections of the fraternity combined, but, like a Christian anchorite or an Indian ecstatic, Rakhmetof chooses to renounce all the joys of life and the pleasures of sense; he denies himself and

* We here give, as an example, the translation of some verses addressed to Lydia Figner, one of the young heroines of the recent political trials (Detoonbüstvo, Geneva, 1877). "Strong, oh young girl, is the impression made by thy enchanting beauty; but still greater than the charm of thy face is the charm of thy purity of soul. * * * Full of sadness is the image of the Saviour, full of sadness are his divine features; but in the fathomless depths of thy eyes there is more love than suffering."

mortifies himself in order to be like his suffering god, the oppressed people.* When fruits were served him, Rakhmetof eat only apples, because apples were the only fruit the people could eat. If he did not clothe himself in sackcloth, this upholder of the rights of the flesh, instead of sleeping upon a bed, chose to lie upon a piece of felt filled with nails an inch long. — There are undoubtedly few Rakhmetofs outside of novels: among the admirers of Tchernychevski, too many abandon themselves to the barefaced licentiousness authorized by their dismal doctrines; this stoicism, this contempt of material enjoyments imperiously demanded for others, is, however, sometimes found in real life. Among the innovators of both sexes who profess and often practice free love, are found some who, by a strange contradiction, hold themselves in honor bound not to use the rights which they lay claim to. As a matter of course, this is more common among women, who are ever predisposed to contradictions, and more desirous than men of ennobling every whim. It is among certain of these devotees of nihilism, among these young girls who are its most ardent proselytes and most courageous missionaries, that we find the best illustrations of all the generous sentiments and unconscious idealism that can lie concealed under this repugnant materialism. Among these women who preach the suppression of the family and the free intercourse of the sexes, among these young women with short hair, who delight in imitating the gait and the language of young men, it is no uncommon thing to meet some whose conduct, far from being in accord with their cynical principles, is pure and irreproachable, despite all the outward appearances of an adventurous and loose life, and the promiscuous immorality in which the wisest among them seem to delight. — Nihilism has its virgins, and many a female conspirator of twenty, arrested and transported of late years, has carried with her to Siberia a virtue all the more meritorious as their doctrines set no value on it. A still more remarkable fact is, that nihilism has its mystical or platonic unions, its couples who, married ostensibly in the eyes of the world, choose to act as though they were not married. This is what is called, in the sect, a fictitious marriage. Since the trial of Netchaief, there has scarcely been a political case that has not brought to light some of these singular unions. It is difficult to understand what impels the enemies of society to this simulacrum of marriage. For many, especially for young girls, it is a means of emancipation which facilitates political propagandism. It gives the young woman who is enrolled in the holy cause a husband in order to give her the freedom of a married woman; sometimes he is the man who has instructed and converted her, more frequently he is a friend, sometimes a stranger procured for the purpose. Solovief, the author of the first attempt upon the life of Alexander II. in 1879, had contracted a marriage of this kind. In reality the affianced marries only the sect, and the parties often separate the very day of their nuptials, to go each his own way, and extend the propagation of their sect. Solovief had done thus, and when his wife and himself left their province for St Petersburg they dwelt apart. For some, the fictitious marriage is an association, a sort of co-operation of two companions; for many, this may be a means of proving in the least manner possible that they have been united by a union blessed by the church and sanctioned by the state, a means of placing themselves beyond the reach of the law and the prejudices of society by appearing to submit to them. The husband does not enjoy the rights which religion and the law give him, the wife retains her liberty in the legal engagement, and after the regular marriage ceremony has been performed and she refuses herself to her husband, she can, with the consent of the latter, if she choose, indulge in free love. Finally, for some others, the fictitious marriage is a sort of novitiate or term which, after some months or years of trial, gives place to a more natural union. Thus it is, if I am not mistaken, that in the romance of Tchernychevski, Vera and Lapoukhof live at first as brother and sister, having two apartments under the same roof, separated by a neutral ground, until the day when one single chamber shall unite the two, while awaiting which the husband discovers the reciprocal affection of one of his friends and his wife, and discreetly disappears in order not to cause them any embarassment or scruple, only to return under another name at the expiration of several years, to share as a neighbor and a companion the happiness of the new couple. — Nihilism is no longer purely negative; it has become ardently revolutionary and socialistic. The faith, enthusiasm and religious devotion of its followers are shown most plainly in its processes of propagandism—in the rashness of their attempts, and in their constancy in braving transportation and death. This sad courage before judges and executioners has been often exhibited by other sectaries and other revolutionists of different countries; there never yet was a perverse folly but had its believers and martyrs. The peculiarity of contemporary Russian nihilism is its manner of addressing itself to the people, of *going into the people* (*itti v narod*), to use their own chosen expression. In order to make itself better understood by the people, the plan of its propagators is to mingle with them, to assimilate themselves to them, to live their life of privation and manual labor, forgetting their habits and prejudices of education. In this, the missionaries of nihilism seem to have wished to imitate the first apostles of Christianity. In what other country can we in our day find young men of good family, university students, throwing off the garb and

* The following is one of the maxims of Rakhmetof: "Since we demand for men the complete enjoyment of life, we should prove by our example that we demand it, not in order to satisfy our personal passions, but for man in general."

customs of their class, to work as common workmen in the forges or manufactories, in order to be better able to understand the people and to initiate them in their doctrines? In what other country do we see well-bred young women, after returning from travel abroad, congratulating themselves on finding a place as cook in the house of a foreman of a manufacturing establishment, in order to be able to approach the people and study personally the labor question? In Russia, where manners, ideas and even dress more widely separate the different classes, this social abolition of classes, even for a time, must surely be more difficult than anywhere else. In this manner of propagating their doctrine, by putting themselves directly in contact with the mass of the people, do we not discover, in the midst of all their aberrations, the positive instinct, the realistic sense of Russia, which, instead of remaining hovering in the misty regions of theory, descends to the side of the workman and the peasant in the factory, or the forge, or the school? The practical spirit of the Russian is curiously intermingled with his theoretical eccentricities, just as a sort of idealism ingrafts itself upon his most decided naturalism. — No sadder sight, perhaps, can meet the eye of the observer than this alliance, in the young people of both sexes, of opposite and nearly equal extreme qualities and defects, than this prostituting the noblest and most generous instincts of the human heart to the service of the most revolting doctrines. Be this as it may, it can not be denied that nihilism, so repugnant in its principles, so insignificant in its methods, so ridiculous in its pretensions, and so odious in its attempts, reveals certain qualities of the Russian mind and character, and precisely those which are most frequently denied it. If it shows in their full deformity some of the unpleasant features of the national temperament, which is too often inclined to extremes, it enlightens with a sinister glimmer one of its noblest and least apparent traits. This people, so often accused of passivity and intellectual torpor, nihilism shows us is capable of energy and initiative; capable of sincere and active enthusiasm; capable, in fine, of devotion to ideas. From this point of view, I would venture to say that this sad phenomenon does honor to the nation which suffers from it. It is not misery, ignorance, cupidity and ambition that are the active fomenters of the revolutionary spirit in Russia, as they are in other countries, but it is frequently passions that are originally high and noble. The men who claim to be the apostles of human fraternity and unity, know how to share, when occasion requires, the labor of the humble and the suffering of the poor, and they fully realize the fact that, in their country, revolution is not a career nor a game in which ambition has everything to gain and the agitators have but little cause to fear for their safety. Most of the nihilists, at least most of those who figure in the trials, are very young men and very young women. It is among the young men, or, to be more exact, among the youth, of the country, that the revolutionary faith finds most of its adherents. Age seems soon to lead most of them, if not to skepticism, at least to lukewarmness, discouragement and prudence. Is it not a remarkable fact that in the innumerable political trials of the last ten years scarcely any but young men have been implicated? Of all the conspirators condemned or arrested, there are very few thirty years of age, few have passed the age of twenty-five, and most of them, as Mirsky, the author of the attempt upon Gen. Dreuteln, were minors. In a country in which radical ideas have already been handed down in the schools for more than a generation, this phenomenon leads to the belief that age has considerable to do with this effervescence of negation and revolution. Russia is not the only country where young men inclined to every chimera become at the end of ten or fifteen years practical, positive, commonplace men, adapting their principles and their ideas to the advancement of their interests. There is nothing more common everywhere than these recantations which reassure the politician while saddening the moralist; but this contrast between the different seasons of life, between youth and maturity, have often seemed to me more regular and more marked in Russia than elsewhere. The Russian is, perhaps, thanks to his practical good sense, more quickly disabused of his revolutionary reveries, and impressed with the lack of proportion between the means and the end of these agitations. Thus to attack with such poor weapons a power so strong, men must be either inspired or childish. There is also in this perhaps an additional trait of the national character, which is inclined to go from one extreme to another. Thus it always happens that there are few countries in which parents and children find it so difficult to understand one another. In this respect the picture by Ivan Turgeneff in "Fathers and Children" is still true. By contact with real life, practical and positive instincts, egotistical instincts ordinarily regain the ascendency over revolutionary, romancing and utilitarian idealism, to such an extent as completely to choke their aspirations or relegate them to the tranquil sphere of dreams. Hence it is that there are so many young nihilists swearing to destroy everything, and so many men willing to endure everything and to preserve everything. Hence it is, in a word, that there are so many Russians whose ideas never conflict with their interests; among whom the profession of the sturdiest theoretical radicalism is united without difficulty to the care of their fortune and the common occupations of their calling. — Must we attribute to this kind of conversion brought about by age the singular transformation of entire generations, such as that of 1860, for example? No generation of any age ever had more faith in the good, greater confidence in improvised institutions or greater taste for liberal innovations. Now, the noble anxiety for the advancement of moral interests and the regeneration of the country of most of these men who but just

now were passionately applauding reforms and demanding new ones every day, has, in a few years, given place to skepticism, indifference, and a too exclusive preoccupation for material and personal advantages. Such a subsidence, such a moral decadence, after an over-excitement of some years, is indeed nothing more than natural; the same thing has happened in France after each revolution. The phenomenon is none the less remarkable in Russia, on this account. In the Russian mind, discouragement seems always to follow close on enthusiasm, dejection close upon exaltation. Is the fault attributable to their political system, or to the temperament of the people? Perhaps to both causes at once. — Nihilism or Russian radicalism is most frequently an affair of age; we may say it is a disease of youth, and this not merely of individual cases, but even of the nation generally. It is her intellectual and political youth and her historical inexperience that make Russia so forward in speculative boldness, so disdainful of the experience of others on so many questions, and so confident in the facility of a social transformation. Added to this is a secret self-love. Even when he accepts the ideas of the west, the Russian loves to strain them, to surpass them in revolution as in everything else; he is a pupil who endeavors to excel his masters, a new comer who readily considers his elders timid and backward. The Russian frequently feels toward the west something of the sentiments of a young man toward a middle-aged or old man; even while he appreciates our ideas or our lessons, he is inclined to believe that we are resting by the way, and he undertakes to pursue to their end the ways and ideas which others have opened to him. "Between you and me, what are your nations of Europe?" one of the first Russians I ever knew inquired of me a long time ago. "They are graybeards who have given all that they are capable of giving, and of whom nothing more can reasonably be expected; we shall not find it hard to surpass them when our turn shall come." But when will this turn come? Many are tired waiting for it. Unfortunately, this natural presumption is far from always implying labor or real effort. Too many Russians await the grand future of their country as something which is bound to come some day, just as the fruit ripens upon a tree; too many others, disdaining what is possible and railing at the liberty of which the west furnishes them the example, profess themselves disgusted skeptics; while the most impatient among them, imagining that they can metamorphose their country with a single stroke of the revolutionary wand, have recourse without scruple to the most foolish and odious machinations. — Bloody anarchy and the dissolution of the empire would be the inevitable results of a revolution in Russia. Fortunately for civilization there are few countries in which even the transitory triumph of the revolutionists is less probable. The extent of the empire, the dispersion of the population, and the small number of the cities, are so many obstacles to those surprises which elsewhere overturn a government in a few days. It has no Paris to declare a revolution, and even in the capital there are no people to establish one. The only possible revolutions in Russia will be revolutions of the palace, and the country has lost the tradition even of these since the time of Paul I. — We must decline to consider Russia as a volcano ready to burst forth. Certain prophets have been declaring there existed there all the precursory signs of a revolutionary explosion for the past fifty years. We often hear it said that Russia is on the eve of its 1789, and that the end of the nineteenth century in that country will recall the close of the eighteenth century in France. Such comparisons are based upon remote and vague analogies. The autocratic empire may some day, soon perhaps, have its 1789; I should be greatly surprised if it were to have, at least in this century, its 1793. There is in this Russian movement nothing of the spirit which agitated all classes in the nation at once under Louis XV.; besides, there is in Russia nothing of the universal weariness, the profound hatred and the incurable defiance that rendered the suppression of the ancient régime impossible without violence and excess. In France, under Louis XVI., the ground was covered with combustible matter that had been amassed during centuries, and needed but a spark to start the greatest conflagration the world has ever seen. In Russia, under Alexander II and III., the atmosphere is filled with sparks carried by the winds from the west; flashes and sinister glimmerings meet the eye, but the inflammable matter is wanting or is too scattered to feed a grand conflagration. It may still be said to-day, as in 1825 and 1848, that the material for a revolution is lacking in Russia. — Who are the men who pretend to seize upon an empire of more than eighty million souls? Some thousands of young men without experience, without practical ideas, without influence, incapable alike of producing or directing a revolution; unknown, misunderstood and regarded with suspicion by the people; presumptuous children, ignorant of life and believing everything possible to their weakness. What are their arms, their resources, their means of action? Pamphlets, and circulars either written or printed, among a people the greater part of whom can not read. And what else? The arm of some hired assassin, cut-throat or incendiary. They approve of every means and dare everything in the dismal field of criminal warfare which alone is open to them; but the stiletto, the rifle and the mine are not enough to produce a revolution. If there is a country in which the government is upheld by the slender thread of a human life, that country is no longer Russia. — The energy and tenacity, audacity and self-abnegation, the sombre and fanatical heroism of the enemies of the state, but serve to make manifest to all their utter impotency. Organization is not perhaps what they lack. To contrive their plot they would have but

to copy the models afforded them by the revolutionists of other countries, to appropriate to themselves the old machinery of secret societies and hidden governments, now brought to such perfection, with their affiliated branches and their hierarchy of supervising committees, their mysterious and anonymous chiefs, blindly obeyed by followers to whom they remain unknown. For their organization and propagandism, they have, in the blind enthusiasm of their youth, the indifference or disaffection of society and the unpopularity of the police or administrative corruption, aids and facilities which they could not have in any other country in Europe. They have been wonderfully aided by the contradictions and blunders of the government or its agents; their boldest attempts have long enjoyed the benefit of impunity. What profit have they derived from these advantages? Not enjoying like the carbonari or Mazzini of Italy, or the Polish revolutionists of 1863, the alliance of the national spirit, all the efforts of their committees, whether at home or abroad, have been without fruit. They have succeeded in murdering some functionaries, and even Alexander II. on March 13, 1881, in burning houses, quarters, and almost entire towns; but they have not been able to raise the smallest insurrection. In vain have they assailed at once the people of the cities and the country, the bureaucracy, and even the army. It has not helped them any to have accomplices among their official adversaries, and to gain auxiliaries in the ranks of the army, such as Lieut. Dubrovine, the *terrorist officer* hung at St Petersburg in 1879. They have succeeded only in rendering themselves odious to the people, furnishing arms to the enemies of progress. If they have forced the government to resort to extraordinary precaution and severity, it is the country that has suffered by it, the country whose progress they have retarded and which retains a just grudge against them for it. — The nihilist agitation of 1878 and 1879 manifested the absolute powerlessness and real weakness of the revolutionists. Do we mean by this that all this nihilist movement, this effervescence of spirits among certain classes of young men, is not fraught with damage to the state or danger to the government? Decidedly not. The evil, the actual peril, is not a revolution, which is to-day senseless, chimerical and impossible; it is a weakening and sterile agitation constantly renewed; it is a sort of periodical fever, with violent attacks succeeding regularly to periods of apparent calm and depression. The imminent danger is not political but intellectual and moral anarchy, which exhausts the nation in fruitless efforts; which leaves the country disturbed, enervated, without any clear guidance or definite policy, without any distinct horizon; which leaves the state exhausted and enfeebled in all its resources. In addition to this, such a state of things can not continue indefinitely; it will not take a great many years, not a generation perhaps, to render any catastrophe possible. — Because radicalism has not extended beneath the surface of the nation, it does not follow that it is not a serious malady, over which the Russian character is sufficiently strong and healthy to triumph by itself. The revolutionary spirit is one of those evils which nature alone can not cure. Nihilism is an ulcer which, if it be not attended to, threatens to become incurable, to eat through the whole social body, and, little by little, to extend to the vital organs. — The remedy, the efficacious treatment, is to be found neither in repressive nor preventive measures. It is vain to dream of striking at the roots of the evil in the universities and colleges. It would be in vain, according to the advice of some distinguished minds, following the plan renewed by the emperor Nicholas, to lay the blame on modern studies and culture, to modify the course of instruction, to substitute classical studies for the physical sciences, or *vice versa;* it would be in vain to limit the number of students, or restrict the sphere of studies, to exclude the women and young girls who aspire to superior education and equality with the other sex; it would be in vain to forbid those numerous foundations of scholarships which charity or vanity, either public or private, establish in colleges or universities, that serve but to recruit the class of educated proletarians; there would always remain support enough and proselytes enough for nihilism. It would be in vain, as has often been contemplated, to submit the universities and their students to military discipline, to oblige students to wear a uniform, to shut them up in boarding schools or barracks; these would only be palliatives, better adapted to conceal the progress of the evil than to heal it. To effect a cure, in our opinion, another regimen must be adopted. There are diseases that were formerly treated by dieting and blood-letting, which we cure to-day with stimulants, tonics, fresh air and exercise. Russia's case is of this number; she should be placed under a more strengthening regimen. — Modern science possesses no sure preservative or certain specific against the revolutionary epidemic. None but an ignorant man or a charlatan would promise either. The revolutionary spirit is one of the evils which nations must, in our day, accustom themselves to live with; the question is, in Russia, as it is everywhere else, to be strong enough to endure it. Of all the means and all the remedies proposed for this end, the surest seems to be political liberty. This is an old receipt, and out of fashion with many, and for some even worse than the evil which it pretends to combat; it is, in our opinion, the only efficacious one All the governments that have honestly and patiently tested it have been benefited by it. Russia's greatest misery is an absolute want of political liberty. A lawful avenue must be opened to the vague aspirations that are springing up among the youth of the country and in society, or there will be an explosion.

ANATOLE LEROY BEAULIEU.

NOBILITY. By this, or by some equivalent term, has been designated in all times the body of men who have attributed to themselves in an exclusive manner the higher functions of society. Most frequently this body established its rule by conquest. Thus the nobility of most of the states of Europe owes its origin to the barbarous hordes which invaded the Roman empire, and divided its ruins among them At first these troops of emigrants, whom the insufficiency of the means of subsistence and the allurement of plunder urged from the regions of the north to those of the south, overran and laid waste the civilized world; but soon, either because the personal property which served them as booty began to be used up, or because the more intelligent understood that a regular exploitation would be more profitable to them than simple pillage, they established a fixed residence for themselves upon the ruins of the world they had laid waste and conquered. — This establishment of the barbarians in the old domain of civilization, and the institution of a feudal nobility which was the result of it, had a utility which it would be unjust to ignore. It must not be forgotten that the Roman empire, internally undermined and corrupted by the cancer of slavery, had ended by falling in ruins, and that the wealth accumulated by Græco-Roman civilization was at the mercy of the barbarians. In so critical a situation, the establishment of the Goths, the Vandals, the Lombards and other emigrants from the north upon the territory which they had ravaged, was a blessing. Having become proprietors of the greatest part of the capital which the conquered nations had accumulated upon the land, these barbarians were henceforth interested in defending it against the hordes which came after them It was thus that the old enemies of civilization became its defenders, and that the wealth accumulated by antiquity, in passing from the weak hands of its old owners to those of the conquerors of the north, more numerous, more courageous and stronger, was preserved from total annihilation. The destructive wave of invasion stopped before this new rampart, raised up in the place of the dismantled rampart of Roman domination. The Huns, for example, who had come from the depths of Tartary to share the spoils of the old world, were destroyed or repulsed by the coalition of the Goths and Franks, established in Italy and in Gaul; and later the Saracens, no less redoubtable than the Huns, met the same fate. — If the Goths and the Franks had not appropriated to themselves the fixed capital of the nations they had subjugated, would they have risked their lives and their booty to repulse the savage soldiers of Attila? And what would have remained of the old civilization, if this barbarian chief of a nomad race had continued to overrun and ravage Europe? Would not Greece, Italy, Gaul and Spain, despoiled of their personal wealth, and deprived of the greatest part of their population, have ended by presenting the same spectacle of desolation and ruin as the empire of the Assyrians and the kingdom of Palmyra? When, therefore, we take into account the circumstances which accompanied the establishment of the barbarians in the bosom of European civilization, we perceive that this violent substitution of a new race of proprietors for the old race presents rather the characteristics of the exercise of the right of eminent domain than those of spoliation properly so called. Hence, this extremely important consequence, that the property of the nobility which had its origin in conquest does not deserve the anathema which certain socialists have launched against it; for the original titles of the nobility to their estates was founded on general utility, that is to say, upon justice. — The conditions of the establishment of the barbarians in the bosom of the civilized world were extremely varied. Historians have nevertheless demonstrated that they generally took to themselves two-thirds of the land; such was, for example, the proportion in Gaul, when it was conquered by the Franks. This proportion, however, was not arbitrary; it was determined by the necessities of the situation. In each subjugated nation was found an aristocracy of proprietors, dating most frequently from an anterior conquest, whom the conquerors were interested in treating with a certain consideration, in order not to push them to the dangerous extremity of despair. According as this aristocracy had preserved more or less strength and influence, the conquerors left it a more or less considerable portion of its domains, limiting themselves to subjecting it to simple feudal fines. Hence there were two kinds of domains, and the title of *francs alleux* (freeholds) was given to lands occupied by the conquerors, as the count de Boulainvilliers explains with much clearness. "The Gallic proprietor," says this learned historian of the French nobility, "was required to pay certain tributes of the fruits and revenues of his lands, according to the demands of the victors. The Frank, who possessed his lands entirely free and unburdened, had a more absolute and more perfect ownership of them; hence this distinction was marked by the term *salic lands*, meaning lands or *alleux* of the Franks, called also Salians; in a word, *francs-alleux*, that is to say, absolutely and thoroughly their own, hereditary, and free even from all tribute of the fruits *Terra salica, quæ salio militi; aut regi assignata erat, dicta ad differentiam allodialis, quæ est subditorum.* (Basnage, word Alleux.) This method of dividing the conquered lands was imitated by the Goths, who called the lands which they had retained *sortes gothicas*, and those which they had left to the Romans, *sortes romanas*. The Normans did the same thing in regard to the old possessors of Neustria when they conquered it, and this was the origin of the greater part of freeholds; for the complete freedom of these lands from taxation caused them to be called freeholds." (*De la noblesse française*, by the count de Boulainvilliers) There were, therefore, two nobilities after the conquest, the one composed of members of

the conquering army, and the other composed of the old proprietors not completely dispossessed. The former, whose lands were free, were at first in the ascendency; but after long struggles, of which the beautiful romance, Ivanhoe, for example, gives a picturesque sketch, these two nobilities, drawn together by common interests, were generally confounded in one. — It sometimes occurred to the conquerors to make an inventory of the wealth which they had appropriated to themselves; this was especially the case in England after the Norman conquest. The results of this curious inquiry were embodied in the Domesday Book.* — The division of the booty and of the lands was effected in an unequal manner between the chiefs and the soldiers of the conquering army. This inequality was based upon the unequal share which each had taken, according to his rank in the army, in the work of conquest. The distinction of rank was determined by the necessities of the enterprise. When the barbarians invaded a country, they chose the chiefs from among the most courageous and capable of their number, and they obeyed them in the common interest. The chiefs chose aids (*comites*) to cause their orders to be executed; and a military hierarchy, based upon the necessities of the enterprise which was to be carried out, was thus organized of itself. The conquest accomplished, it was natural that the share in the booty should be proportionate to the rank which each man, having any claim to it, held in the army of invasion. The supreme chief had, therefore, the greatest share, both in personal effects and in lands; the lesser chiefs and the common soldiers of the conquest obtained shares proportionate to their rank, or to the services which they had rendered. These divisions were frequently the occasion of bloody quarrels, to which the necessities of common defense alone could put an end. — When the plunder to be divided comprised, besides personal effects, immovable property, lands or houses, the army of invasion dispersed, and each

* The Domesday Book is nothing but a great inventory of the Norman conquest. We quote from the history of M. Augustin Thierry some interesting details concerning the origin of this curious inquiry, and upon the way in which it was drawn up. "King William," says M. Augustin Thierry, "caused a great territorial inquiry to be made, and a universal register of all the changes of property made in England by the conquest to be drawn up. He wished to know into what hands, throughout all the extent of the country, the domains of the Saxons had passed, and how many of them still kept their inheritances by reason of treaties concluded with himself or with his barons; how many acres of land there were in each rural domain; what number of acres would be sufficient for the support of a soldier; and what was the number of the latter in each province or county of England; what was the gross sum of the products of the cities, villages, towns and hamlets; what was the exact property of each count, baron, knight, sergeant-at-arms; how much land each one had, how many people with fiefs of his lands, how many Saxons, cattle and plows — This work, in which modern historians have thought they discerned the mark of administrative genius, was the simple result of the special position of the Norman king as chief of a conquering army, and of the necessity of establishing some order in the chaos of the conquest This is so true, that, in other conquests whose details have been transmitted to us, for example, in the conquest of Greece by the Latin crusaders in the thirteenth century, we find the same kind of inquiry, conducted on an exactly similar plan by the chiefs of the invasion — By virtue of the orders of King William, Henri de Ferrières, Gaultier Giffard, Adam, brother of Eudes the seneschal, and Remi, bishop of Lincoln, as well as other persons selected from the jurists and the guardians of the royal treasury, set out to journey through all the counties of England, establishing in each place their council of inquiry. They caused to appear before them the viscount of each province or of each Saxon shire, a personage to whom the Saxons gave in their old language the title of shire-reve or sheriff. They called together, or had the viscount call together all the Norman barons of the province, who indicated the precise boundaries of their possessions and of their territorial jurisdictions: then some of the men connected with the inquiry, or commissioners delegated by them, went to each great domain and into each district or century, as the Saxons called them. There they made the French soldiers of each lord and the English inhabitants of the century declare, under oath, how many free owners and how many farmers there were upon the domain; what portion each occupied as full proprietor or on precarious tenure; the names of the actual holders, the names of those who had been owners before the conquest, and the different changes of property which had taken place since that time; so that, say the chronicles of the times, three declarations were exacted concerning each estate: what it had been in the time of King Edward, what it had been when King William had granted it, and what it was at the present moment. Beneath each particular statement was inscribed this formula: 'This is what all the French and all the English of the shire have sworn to.' — In each town an inquiry was made as to the amount of taxes the inhabitants had paid to former kings, and how much the town produced for the officers of the conqueror; an investigation was made as to how many houses the war of the conquest or the construction of fortresses had caused to disappear; how many houses the conquerors had taken, and how many Saxon families, reduced to extreme poverty, were unable to pay anything. In the cities the oath was taken of the great Norman authorities, who assembled the Saxon burgers in their old council chamber, now become the property of the king or of some foreign baron. Finally, in the places of lesser importance the oath was taken of the collector or provost royal, of the priest and of six Saxons or of six *villains* of each city, as the Normans called them. This investigation lasted six years, during which time the commissioners of King William traveled over all England, with the exception of the hilly countries in the north, and to the west of York, that is to say, the modern counties of Durham, Northumberland, Cumberland, Westmoreland, and Lancaster. The investigation was concluded in 1086. — The editing of the inventory of taxable property or the *terrier* of the Norman conquest for each province that it mentioned, was modeled on a uniform plan. The name of the king was placed at the top, with the list of his lands and of his revenues in each province: then followed the names of the chiefs and of the smaller proprietors, in the order of their military rank and of their wealth in land The Saxons, spared by special grace in the great spoliation, figured only in the lowest ranks; for the small number of this race who remained free and unburdened proprietors, or tenants-in-chief of the king, as the conquerors expressed themselves, were so only as regards inconsiderable domains. The other Anglo-Saxon names scattered here and there through the list, belonged to farmers of certain fractions, more or less great, of the domain of Norman counts, barons, knights, sergeants-at-arms or cross-bowmen. — This valuable book, in which the entire conquest was registered, so that the memory of it could not be effaced, was called by the Normans the *grande rôle*, the *rôle royale* or the *rôle de Winchester*, because it was preserved in the treasury of the cathedral of Winchester. The Saxons called it by a more solemn name, the book of judgment-day, Domesday Book, because it contained their sentence of irrevocable expropriation." (Augustin Thierry, *Histoire de la conquête d'Angleterre par les Normands*, book ii., pp. 237-244.)

one of its members occupied the lot which had fallen to him in the division. But in dispersing in a conquered country, and therefore hostile and exposed to new invasions, the conquerors took care to preserve their military organization; they lived organized in such a way that, at the first appearance of danger, they might immediately flock to the banner of the chief, and take their place in the ranks. It is thus that the feudal system was established. The characteristic trait of this system was the rigorous maintenance of the hierarchical organization of the conquering army, and the obligations which flowed from it. At the first call of the supreme chief, emperor, king, or duke, the lesser chiefs assembled the crowd of those who had worked the conquest. Each was bound, under pain of forfeiture, to report at the call of his hierarchical superior; the army was soon on foot again, in good order, to defend its domains, either against a revolt from within or an aggression from without. — The chiefs thus preserved their rank after the dispersal of the conquering army. Each rank had its particular name, sometimes of barbarian origin, sometimes borrowed from the Roman hierarchy. This name passed from the man to the domain; hence kingdoms, duchies, marquisates, counties, baronies, etc. Those of the conquering army who possessed no rank, but who had obtained a lot of land, simply took the name of freeholders, and their lands that of freeholds, and they formed the lesser grade of the nobility.* Being obliged to set out on the march at the command of the chiefs, they enjoyed as compensation, like the latter, the privilege of exemption from taxes, and that of sending representatives to the assemblies or parliaments of the nobility, in which the interests of their orders were discussed. — Nevertheless, it was important to assure the duration of this organization which care for the common defense required. The right of primogeniture and of entail were introduced to assure this duration. Each having obtained a portion of the land, on condition of fulfilling certain obligations, it was essential, in the first place, that this lot should not be divided up; in the second place, that it should not pass into the hands of a foreign or hostile family. The division of the land would have destroyed the pledge which assured the exact fulfillment of the military services, upon which depended the common security; it would have introduced anarchy into the conquering army, by necessitating a continual transformation of the hierarchy. The introduction, into the ranks of the army, of men belonging to the conquered race, which could have taken place after the alienation or sale of the lands occupied by the conquerors, would have been no less dangerous. The law of primogeniture and entail served to preserve the conquerors from this two-fold peril. The law of primogeniture maintained intact the domain, which was the pledge of the fulfillment of the duty of each toward all, by transmitting it from generation to generation to the eldest son of the family. Entail prevented foreigners or enemies from slipping into the ranks of the army, by not allowing the noble proprietors to alienate their domains. The primitive organization of the conquering army could therefore be perpetuated after the conquest had been accomplished, and the nobility formed itself into a veritable guild at the head of society. — This organization had its manifest utility, in that it prevented the country, in which the conquering army had established itself, from becoming incessantly the prey of new hordes of barbarians. It had its inevitable drawbacks, in that it delivered the industrious population over to the mercy of a greedy and brutal horde, who most frequently used without any moderation its right of conquest. At first the condition of the subject populations was most hard. The conquerors were subject to laws and obligations based upon their common interest; these laws and these obligations, which extended to all, to the chiefs as well as to the soldiers, protected in a certain measure the weak against the strong. But nothing similar existed in favor of the vanquished; the latter were a booty which the conquerors disposed of at their pleasure. Perhaps it was well that it was so, at least in the very beginning; for if the conquerors had not had a maximum of interest in defending property, at that time the object of continual aggression, they would, according to all appearances, have remained simple nomad plunderers, and the capital accumulated by civilization would have been entirely destroyed. But this absolute power of the conquerors over the conquered, whether it was necessary or not, could not fail to engender the most monstrous oppression. The serf or subject of a lord was taxable, and liable to forced labor at pleasure, which signified that the lord could dispose, according to his will, of the property of the unhappy serf, and sell him, and his family, after having confiscated his goods. Every individual, merchant or other, who crossed the domain of a lord, was exposed also to be pillaged, reduced to slavery, or massacred. Fortunately, this violent state of affairs could not last; order and justice have such a character of utility, that they re-establish themselves in some way, after the most terrible social upheavals. The lords were not slow to see that it was for their interest to accord their serfs, agriculturists or artisans, certain guarantees of security, and not to despoil them in a violent and arbitrary manner, in order to procure the more from them. Hence, customs. These customs, whose utility for the master as

* This natural and general nobility of all the conquerors, says M. Augustin Thierry, increased in proportion to the authority or personal importance of each of them. After the nobility of the king, came that of the governor of the province, who took the title of count; after the nobility of the count, came that of his lieutenant, called vice-count or viscount; and then that of the warriors, according to their rank, barons, knights, esquires or sergeants, nobles in an unequal degree, but all nobles by right of their common victory and of their foreign birth. (*Histoire de la conquête d'Angleterre par les Normands*, book ii., p. 84.)

well as for the subject was proved by experience, ended by becoming a solid barrier against the arbitrariness of the lords. The condition of the serf, protected by the custom, became more bearable, and the revenue of the lord was increased in consequence; the agriculturists, being less exposed to spoliation, agriculture commenced to flourish again, and famines, after having been the rule, became each year less frequent. Agglomerated in the cities, and by this very fact in a better state than the agriculturists mutually to sustain themselves, artisans obtained more promptly still guarantees against arbitrary power; they were allowed, on condition of certain fixed feudal fines, and sometimes even on condition of an indemnity once paid, to exercise their occupation in peace, and the by-laws of corporations were at first nothing but records of the customs, agreements or transactions, which protected them from the rapacity of the lords. The same customs were established and the same transactions effected for the benefit of commerce. At first the merchants, who had ventured to traffic from city to city, as they had done in the time of Roman domination, had been despoiled, reduced to slavery or massacred by the barbarian lords, whose domains they traversed. But soon, all commerce having ceased, the lords themselves realized the inconveniences of this state of things. What did they do? For their capricious and arbitrary depredations, they substituted fixed and regular feudal fines; they guaranteed to the merchants free and safe passage through their domains, on condition of their paying toll. This was still onerous, without doubt; for each country being divided into a multitude of little seigniorial estates, a merchant, who had to travel through a somewhat small extent of country, was obliged to pay a multitude of tolls. But it was less onerous than pillage and assassination; and commerce, thus protected by the better understood interest of the lords, again assumed some activity.— The improvement did not stop here. Events and progress of different kinds weakened successively the feudal nobility, either by diminishing the importance of the part it played, or by increasing the power of the classes, which were subordinate to it. As soon as feudalism was firmly established and constituted, the danger of invasions became less; not, however, as the historian Robertson has declared, because the source whence they flowed had dried up. There were still, in the north of Europe and in the centre of Asia, multitudes greedy for booty, and disposed to precipitate themselves upon the countries in which the arts of civilization had accumulated wealth; but, between these hungry multitudes and the prey which they coveted, the rampart of feudalism had been raised. After having vainly attempted to make a breach in this rampart, which replaced that of the Roman legions, the barbarian hordes drew back one after the other into the heart of Asia, and descended upon India and China. Then the conquerors, established upon the ruins of the Roman empire, could enjoy a little repose. But repose was foreign to their nature. They wore themselves out with intestine struggles. The weaker lords were subjugated or despoiled by the stronger. The supreme chief, who at first had had no authority over his old companions, except when there was question of providing for the common defense, profited by their dissensions to increase his power at their expense. He accorded his alliance and his protection to the weak, on condition that they made themselves dependent on him and paid tribute to him. It was in this way that most of the freeholds were changed into *fiefs*.* This modification of the feudal system had very important consequences. The number of intestine strifes diminished, because the more powerful lords no longer dared to attack the weak, when the latter had become vassals of the king. On the other hand, the king, who collected tribute from the lands of his protegés, saw that they brought more to him in proportion as the taxes collected to the profit of the lords were less numerous and less burdensome. He endeavored, therefore, to diminish the number of particular tolls, and to moderate the exactions the lords made from their serfs. His salutary intervention was felt also in the money system. In the beginning, each lord had taken to himself the right to coin money, imposing upon the inhabitants of his domains the obligation of using only the coinage stamped with his effigy. Money soon became as bad as it could possibly be, while the subjects of the lords had no means of protecting themselves from the damage caused them by false coinage. It was quite otherwise, when, the freeholds having been transformed into fiefs, the king levied taxes upon the domains of his vassals. To prevent the loss which the adulterations of the moneys caused in the payment of the taxes, he appointed certain officials charged with the sur-

* Montesquieu has given with much clearness the nature of this transformation of the feudal system, as well as the causes which determined it. "The manner of changing a freehold into a fief," he says, "is found in a formula of Marculfe. A man gave his land to the king; and the king gave it back to the donor as a usufruct or benefice, and the latter designated his heirs to the king. Those who held fiefs had very great advantages. The indemnity for injuries done them was much greater than that of free men. It appears, from the formulas of Marculfe, that it was a privilege of the vassal of the king that whoever killed him should pay 600 sous of indemnity. This privilege was established by the salic law and by the Ripuarian law, and while these two laws imposed a penalty of 600 sous for the death of a vassal of the king, they imposed only 200 for the death of a free man, Frank, barbarian, or a man living under the salic law, and only 100 for that of a Roman." After having enumerated various other privileges which the vassals of the king enjoyed, the author of the *Esprit des lois* adds: "It is easy, therefore, to think that the Franks who were not vassals of the king, and still more the Romans, endeavored to become so; and that in order that they should not be deprived of the domains, the custom was devised of giving one's freehold to the king, and of receiving it from him as a fief, and of designating to him who should inherit it. This custom continued always, and was practiced especially in the disturbances of the second race, when every one needed a protector." (*De l'esprit des lois*, book xxxi., chap. 8.)

veillance of the coinage of the lords, and with preventing them from melting down and adulterating his own money. In proportion as the power of this protector of the weak became more extensive, he confiscated or bought the right of coinage of the lesser lords and appropriated it to himself. The industrious classes did not fail to profit by these changes. Their condition was improved again when the most bellicose and turbulent portion of the nobility went to the crusades. The lords, convinced that the conquest of the east would procure for them fortune in this world and would assure their salvation in the next, granted their liberty at a low price to multitudes of serfs. And as very few of them returned from that religious California of the middle ages, the serfs, who had bought their liberty, were able to preserve it. Finally, the middle class of the cities, having become rich and powerful by industry, undertook to make themselves completely independent of their lords. The communal movement commenced, and this movement, seconded by the kings, who sold their protection to the middle class of the communes, as they had before sold it to the lesser lords, contributed also to enfeeble the power of the nobility.—The feudal system thus fell little by little into ruins. The subject classes advanced each day with a more rapid step toward their enfranchisement, inscribing upon their banners the word *liberty*. The substitution of fire arms for the old instruments of war gave the finishing stroke to feudalism, by permitting thenceforth the industrious classes to protect themselves against the invasions of the hardy races of the north. Artillery replaced with advantage the iron armed colossi of chivalry, and the order of nobility ceased to be the necessary rampart of civilization. The services which it rendered losing their value, the supremacy and the privileges which it continued to claim for itself were borne with less patience. Above all was this the case in France, where, the royal power having ended by reducing the nobility to the condition of servants of the court, it presented the spectacle of the saddest moral and material decay. Its eldest sons, provided with magnificent sinecures, expended their incomes in idleness, and ran into debt to avoid being eclipsed by an industrious bourgeoisie, whose wealth kept increasing. Its younger sons, too numerous for the employments which the monarch had at his disposal, and too proud to devote themselves to commerce and industry,* filled the gaming houses and places of evil resort. The nobility, thus degraded, lost its old ascendency over the masses, and in 1789 the industrious classes rose up against the domination of a caste, which no longer could make arrogance and privileges forgotten through the magnitude of its services. The French nobility disappeared, swallowed up in the whirlpool of the revolution.—The following, according to the learned author of *La France avant la révolution*, is an account of the rights and feudal privileges which the nobility still enjoyed when the great catastrophe occurred: "In almost

* Nobility prejudice interdicted to poor nobles the employments of industry and commerce, formerly degraded by slavery. It was not till the eighteenth century that there commenced to be a reaction against this prejudice. A writer, who then enjoyed some notoriety, the abbé Coyer, wrote a work entitled the *Noblesse commerçante*, in which he urged the nobles to have recourse to the useful and remunerative occupations of industry and commerce to restore their patrimonies, which the abuse of luxury had considerably reduced. The work of the abbé Coyer was well received by the young nobility, who were commencing to be impregnated with philosophic ideas; but it excited in the highest degree the indignation of the partisans of the old ideas. An aristocratic writer, the chevalier d'Arcq, undertook to refute the unseemly and incongruous propositions which were advanced therein. The arguments of this defender of nobility prejudice were not lacking in a certain originality. The chevalier d'Arcq stated, in the first place, with a sorrowful horror, that the nobility was only too disposed to follow the degrading counsels of the abbé Coyer, and he conjured them, in the name of their honor and of the safety of all, to pause on the brink of so fatal an abyss. "It would be necessary, on the contrary," he exclaimed with indignation, "to place new barriers between the nobility and the path it is proposed to open. Without such barriers, instead of seeing only one gentleman in a family follow this path, it is to be feared that all, or at least almost all, the members of the family will rush into it, and that we shall see a crowd of nobles upon our merchant vessels, with no other arms than the pen, instead of seeing them upon our war vessels, the sword in their hands to defend the timid trader. It is asked, what do you wish a gentleman to do, who only possesses ancient titles, one reason the more to make him blush for his misery? Is it in France that they dare to put this question? Is it in France that a gentleman remains idle upon his estate, while victory is waiting to crown the nobility on the battle-fields? Is it in France that a gentleman is advised to give himself over to baseness, to infamy, in fine, to dishonor the name of his ancestors, virtuous, without doubt, since they were judged worthy of nobility, with no other pretext than to save him from indigence, while there is a gracious monarch to serve, a country to defend, and arms always ready for whoever wishes to walk in the road of honor?" (*La noblesse militaire opposée à la noblesse commerçante, ou le Patriote français*, pp. 73, 87.) The chevalier d'Arcq then reprimanded the nobility for its excessive luxury; he begged them to practice economy, and ended by putting this curious dilemma: "Commerce on a large scale, the only commerce which can be suitable for the nobility, if indeed commerce can be suitable for it, is not carried on without the funds necessary to purchase the first commodities, and without which, desire, zeal, activity and intelligence become useless instruments. Either the nobility, which it is wished to make commercial, possesses these funds, or it does not possess them. If it possesses them, it has no need of commerce; these funds should be sufficient for its subsistence, while awaiting the reward which its merit and its services should naturally procure for it. * * If the nobility has not the funds necessary for the purchase of the commodities, in what way can it take the first steps in commerce? A gentleman acknowledges no other masters but God, honor, his country and his king. Is it then to the service of a plebeian that it is wished to subject him under the title of an apprentice? Is it by laying aside the trappings of war to don the harness of servitude that it is pretended to lead him to fortune? What a resource! What shame! Is not indigence a thousand times preferable to him?" (*La noblesse militaire, etc.*, p. 98.) The abbé Coyer retorted with two volumes, entitled, *Développement et défense du système de la noblesse commerçante;* and Grimm, giving an account of the quarrel in his correspondence (1757), wrote a plea in favor of the military nobility. The question remained undecided, and in our days there are still many nobles imbued with the prejudice which the abbé Coyer combated. Yet the most obstinate are willingly resigned to "derogate," by investing their funds in industry, provided that the investment is remunerative.

all the rural districts there existed numerous vestiges of the feudal system. Each village had its lord, who, in general, possessed the best lands, and had certain rights over those which did not belong to him. Thus, there was the exclusive right of the chase upon all the territory of the fief; there was the tithe, the extent of which was more or less great; there was, at each transfer of property, the tax on the lot of land and on its sale. The lord could retain, for the price of sale, the land sold in his territory, could force the inhabitants to grind in his mill, to bake in his oven, to make their wine in his press, etc. On the vassal were incumbent also certain personal services, such as the obligation to work a certain number of days without compensation, which were called *corvées*, to render certain services under certain determined circumstances, etc. In some provinces, like Franche-Comté and Burgundy, mortmain existed still in many of the villages; the peasant could not quit the land or marry without permission of his lord, under pain of losing his property, and if he left no children, the lord was his heir. — But Louis XVI. had abolished mortmain in all the domains of the crown, and many lords followed his example. Justice was administered in the first resort, and sometimes in the last, by judges appointed by the lord. Finally, the clergy took the tithes, the government the villain tax and the tax on salt, and the peasant was subject, besides, to the *corvée* and the militia duty, while all the nobles and almost all the bourgeois functionaries were exempt from it." (*La France avant la révolution*, by Raudot, p. 103.) Finally, the nobility monopolized most of the great offices of the state, and had at its disposal numerous sinecures. — There are no precise data as to the number of the members of the French nobility, at the time when the revolution deprived them of their privileges. According to Sieyès, their number did not exceed 110,000. This is the way in which Sieyès made his calculation: "I know," said he, "but one way to estimate the number of individuals of this order: it is to take the province where this number is the best known and compare it with the rest of France. That province is Brittany, and I remark in advance that it has more nobles than the others, either because they do not "derogate" there, or because of the privileges which the families retain, etc., etc. There are in Brittany 1,900 noble families; I will say 2,000. Estimating each family as having five persons, there are in Brittany 10,000 nobles of all ages and of both sexes. The total population is 2,300,000 individuals. This number is to the entire population of France as one to eleven. We must then multiply 10,000 by eleven, and we have 110,000 nobles at the most for the whole of the kingdom." The author of *La France avant la révolution* thinks that the opinion of Sieyès is very near the truth. — Like the French nobility, but with more success, the British nobility has endeavored to maintain its old supremacy. No aristocracy has been able to derive more advantage from its position. By the establishment of the corn laws, it has endeavored to raise the value of the lands belonging to its eldest sons. By the extension of the colonial empire of England, it has gradually increased the arena open to its younger sons.* Nevertheless the industrious classes have come to understand that the costs of this policy of monopoly fall chiefly upon them, while the aristocracy receives the most evident benefit from it. These classes have fought against the political and economical monopolies of the aristocracy, and thanks to the great agitation of the league, and to the reforms of Sir Robert Peel, continued by Lord John Russell, this work of enfranchisement is very far advanced. It is proper to add, however, that if the British aristocracy has shown itself grasping in the matter of monopolies, it has displayed great and solid qualities in the exercise of the functions it has monopolized. It has done better still. Whenever it has discovered a man of eminent ability in the lower strata of society, it has had the intelligent cleverness to make a place for him in its own ranks. It is thus that it has known how to render its monopoly bearable, and to preserve a great and legitimate ascendency over the country. — When the noble classes shall have finally ceased to be privileged in a direct or indirect manner, it is probable that the titles which serve to distinguish them will lose their value. For this value depends much less upon a prejudice of opinion than upon the positive advantages which they can confer. These advantages amount to nothing in the liberal professions: let a merchant, for example, be noble or plebeian, the credit which he enjoys in the market remains the same. But it is quite otherwise in the functions which are connected with the government. It is rare that the nobility is not favored in an exceptional manner in the distribution of offices and of honors.†

* See, on the subject of this policy of monopoly and of war of the British aristocracy, the introduction to *Cobden et la Ligue, ou l'Agitation anglaise pour la liberté du commerce*, by Fred. Bastiat.

† According to Bentham, no system of rewards is more costly than that which consists in according titles of nobility as a payment for services rendered the state. The following are the reasons given by the illustrious utilitarian philosopher for his opinion: "It is commonly said that rewards in honors cost the state nothing. This is an error; for not only do honors render services dearer, but moreover there are burdens which can not be estimated in money. All honor supposes some pre-eminence. Among individuals placed on a level of equality, some can not be favored by a degree of elevation, except by making others suffer by a relative abasement. This is true, above all, of permanent honors, of those which confer rank and privileges. There are two classes of persons at whose expense these honors are conferred: the class from which the new dignitary is taken, and the class into which he is introduced. The more, for example, the number of the nobles is increased, the more their importance is diminished and the more the value of their order is detracted from — Profusion of honors has the two-fold disadvantage of debasing them and of causing also pecuniary expenses. If a peerage is given, a pension must frequently be added to it, if only to maintain the dignity of it. — It is thus that the hereditary nobility has raised the rate of all rewards. If a simple citizen has rendered brilliant services, it is neces-

— These old qualifications of the nobility constitute besides a singular anachronism in the organization of modern society. As has been seen above, the titles of duke, marquis, count and baron served to designate the grades of the military hierarchy of feudalism; they about corresponded to the modern denominations of general, colonel, major and captain. Would not bankers, manufacturers, savants or artists, invested with these titles borrowed from feudal hierarchy, present a somewhat ridiculous spectacle? Would they not have quite as much reason for adorning themselves with the titles of mandarin, grand-serpent or sagamore? How would this last nomenclature be more absurd than the other? Have our bankers, our manufacturers, our savants and our artists any more resemblance to the fierce warriors of the middle ages than they have to Indian chiefs or Chinese mandarins? — The privileges, and probably also the titles, of nobility will end by disappearing with so many other remnants of the old system of servitude. But does this mean that our society is destined some day to undergo the process of leveling? By no means. There will always be, in the work of production, superior and inferior functions, functions requiring in a high degree the concurrence of the moral and intellectual faculties of man, and functions for which lesser aptitudes will be sufficient. The former will always be better remunerated and more honored than the latter. The aristocracy of society will be formed by the former, and this natural nobility —so much the more respectable because it will be better founded upon the superiority of merit and upon the greatness of its services—will have no need to make a show of haughty pretensions and superannuated titles in order to obtain public consideration. G. DE MOLINARI.

NOMINATING CONVENTIONS (IN U. S. HISTORY) are entirely a modern and democratic innovation, originating about the year 1825. Their development has come through the successive steps of a private caucus, a legislative caucus, and a congressional caucus, down to the perfected machinery of a modern political party's township, county, state and national nominating conventions.—I. ORIGIN. Before, during and immediately after the revolution, the inception of political action in America was mainly controlled by a series of unofficial coteries of leading and kindred spirits in every colony (see CAUCUS), by whom resolutions were prepared, intelligence was disseminated, and occasionally revolutionary action was directly begun. In New England they controlled or led the town meetings; in the south they commonly acted through the district militia organizations; but elsewhere they hardly preserved any semblance of connection with the legitimate political units. Their existence, and the popular acquiescence in their action, was due partly to the manner in which suffrage was then limited by property qualifications, so that the caucuses, or juntoes, were really fair and trusted representatives of the legal voters; and partly to the still surviving respect for the influential classes. Their survival may be seen in the democratic clubs of 1793, in the federalist "Essex junto" and the democratic "Albany junto" of the immediately subsequent years, in the Tammany society, in the "Albany regency" of 1820–45, and, in a modified form, in the various "rings" of later years. (See DEMOCRATIC CLUBS, ESSEX JUNTO, ALBANY REGENCY, TAMMANY SOCIETY.)—Upon the organization of the federalist and republican parties after 1790, their workings were at first limited by the traditions of the past. In a party of that time the national and state leaders filled the place of a national convention, settling the party policy by a voluminous correspondence, or by personal interviews. The position of these leaders was wholly due to their success in gaining the confidence and support of the still powerful local caucuses; so that these latter were still the skeleton of each party organization. The manner of their workings in the federalist state of Connecticut may serve as an example. Goodrich, a federalist in sympathy, thus describes a town meeting of 1796–1810: "Apart in a pew sat half a dozen men, the magnates of the town. In other pews near by, sat still others, all stanch respectabilities. These were the leading federalists, persons of high character, wealth and influence. They spoke a few words to each other, and then relapsed into a sort of dignified silence. They did not mingle with the mass; they might be suspected of electioneering. Nevertheless the federalists had privately determined, a few days before, for whom they would cast their votes, and being a majority they carried the day." John Wood, a democratic writer of the time, gives an exaggerated estimate of the influence of the congregational clergy, and describes the politics of the state as controlled by Timothy Dwight, president of Yale college, and "pope of the state," his twelve "cardinals of the corporation," and the multitude of inferior clergy, whose annual consultation was held at the commencement in

sary to begin by taking from the common class and raising him to the rank of nobility. But nobility without an independent settlement is only a burden. Therefore it is necessary to add to it gratuities and pensions. The reward becomes so great, so onerous, that it can not be paid all at once. It is necessary to make of it a burden, with which posterity is loaded. It is true that posterity must pay in part for the services, the fruits of which it shares; but if there were no noble by birth, personal nobility would be sufficient. Among the Greeks a pine branch or a handful of parsley, among the Romans a few laurel leaves, rewarded a hero. — Fortunate Americans, fortunate for so many reasons, if, to have happiness, it is sufficient to possess all that constitutes happiness! This advantage is still yours. Respect the simplicity of your manners and customs; take care never to admit an hereditary nobility. The patrimony of merit would soon become that of birth. Give pensions, raise statues, confer titles; but let these distinctions be personal. Preserve all the force, all the purity of honor; do not alienate that precious fund of the state in favor of a haughty class, which will not be slow in using it against you." (*Théorie des récompenses et des peines*, book ii., chap. 6.)

September; but clerical influence was only a part of the wider class influence which Wood could not understand. The two pictures are complementary; and the reader can see their application to national affairs in the collected correspondence of Hamilton, Jefferson, Pickering, or any other political leader of the time.—As the dividing line between the parties became more strongly marked, the necessity of some organized guide to party action became more apparent; and the perception of the necessity was quickened by the growth of the democratic spirit in both parties. There was an increasing number of local leaders who demanded participation in the councils of the party, and these found their natural means of expression in the legislative bodies. As a part of the annual business of congress and the state legislatures, there grew up a system of legislative and congressional caucuses of the members of each party, the former to make state nominations, the latter to make presidential nominations. (See CAUCUS, CONGRESSIONAL.) Both these political means may fairly be considered as dating from 1796. It is true that nominations had been made in a few states by legislative caucuses before that year; but these were such cases as the nomination of Gov. Jay in New York, in 1795, when members of the legislature merely voiced a unanimous feeling of their party in the state. It was not until after 1796 that the legislative caucus undertook to decide, among rivals for a nomination, which should be entitled to the support of the party. After 1797 this was regularly the case everywhere. Very often, however, citizens from various parts of the state took part in the legislative caucus, and their signatures, in a separate list, were added to the address with which the caucus always announced its nominations to its party. Of course their presence was only allowed as a make-weight, and not as a controlling influence in the caucus, but it prepared the way for the system of nominating conventions which was to follow. — This final system, like most other innovations in the American practice of politics, had its origin in New York. It was first suggested in January, 1813, by the ultra democratic "bucktail" faction, or Tammany society, of New York city, then fighting De Witt Clinton, and apprehensive of his influence over the democratic members of the legislature out of New York city. (See NEW YORK.) They therefore proposed formally that a state convention should be called for the purpose of nominating a governor. Their proposal was not ratified by the party, and nothing more was heard of it until 1817, when it was revived in a modified form, this time by the Clintonians. In a purely legislative caucus of either party, the districts which had chosen members from the opposite party would not be represented; and in 1817 a number of Clintonian counties, whose members of the legislature were federalists, chose delegates to represent the democratic voters in the caucus. These were admitted, and aided in nominating Clinton. The effect was at once perceptible. Conventions for the nomination of members of the legislature became the regular mode of procedure; the practice spread to other states; and the time was evidently not distant when conventions of delegates would take control of the party machinery in the state, and finally in the nation.—The congressional caucus received its death blow in 1824, and the legislative caucus, as a state nominating body, perished about the same time. In both cases the reason was the same: the old politicians, who had for years controlled the action of the dominant party, had too strong a hold upon the party machinery to be resisted in the regular caucuses; and the new politicians, whom the rising democratic spirit and the extension of the suffrage were together bringing to the front, preferred to try the issue with the old party leaders in some new forum. Instead of the congressional caucus, the legislatures of various states assumed the functions of nominating bodies for the election of 1828. Legislative caucuses for purely state nominations were almost as rapidly abandoned. In 1824 they were still held, mainly for the nomination of electors; but in Rhode Island the legislators were careful to call themselves "citizens from various parts of the state"; and in Pennsylvania the members of the legislature led the way by calling a democratic state convention to nominate electors. In New York the opponents of the "Albany regency," hopeless of success in a legislative caucus, planned a delegate state convention to nominate John Young for governor, but the regency's legislative caucus threw them into confusion by nominating Young, and the convention was not held until the following year. This (of 1824) was the last legislative caucus for state nominations ever held in New York; there, and in all other doubtful states, state conventions at once became the nominating bodies. Thereafter it was only in such unilateral states as South Carolina that legislative caucuses retained anything of their old unofficial powers. — During Jackson's first term of the presidency (1829–33) the state convention system, the middle term of the great modern party "machine," was well built up. Awkward attempts were made in 1830–32 (see below) to erect the superstructure, the national convention. The nominal basis of parties, the local township or county conventions, were hardly yet in existence, except in the great cities; in the country, nominations and ratifications were still made by mass meetings. Before 1835, under the skillful management of Van Buren and his associates, the democratic "machine" was fairly complete in all its parts, local, state and national conventions; and the model has since been only more finely polished, not improved upon or developed. The whigs were later in adopting it. Their organization was very incomplete in 1836; in 1839–40 it was better, but was thrown into confusion by the mob-system of fighting to which the party leaders then resorted; but before 1844 both parties were organized alike. Since that time every great na-

tional party has carried on its political warfare by means of a regular army of politicians, to whom politics is a trade, like war, the nominating conventions are the weapons, the voters are the magazine, and the offices, appointive rather than elective, are the *causa belli*, the spoils of the campaign, and the bond of party cohesion. Of the three essentials to the existence of the politician class, it is not desirable to abolish the voters; the effort to remove the appointive offices from politics has not yet been successful; and no plausible plan to deprive them of their most effective weapons, the nominating conventions, has yet been suggested. — II. The laws which govern local and state conventions are the ordinary parliamentary rules of proceeding. In the national conventions there are certain special characteristics which have hardened into laws. 1. *Democratic Conventions.* In democratic national conventions the state has always been the normal voting unit. The casting of the vote of the state as a unit, by the will of a majority of the delegation, has always been recognized as legitimate and regular; and when the vote of a state has been divided, and the minority of the delegation allowed a voice, it has been by the will of the delegation, not of the convention. In this there is the great difficulty that an unavailable candidate might be nominated by the concurrent vote of a number of states, none of which could possibly be carried by any democratic candidate. To counteract this difficulty the celebrated "two-thirds rule" has always been the law of democratic national conventions: it requires that two-thirds of the delegates shall vote for a candidate to secure him a nomination. It has never been formally settled whether the two-thirds is of all the delegates present, or of all the delegates admitted; but Douglas' and Breckinridge's nominations in 1860 both followed the former rule. No votes are given to delegates from territories, since their constituents can not vote at the elections. In each state two delegates are admitted for each electoral vote. — 2. *Republican Conventions.* A republican national convention consists also of two delegates for each electoral vote in the states; but two delegates from each territory are admitted, with power to vote. This last feature is intended to build up a party strength in the territories before they become states. The voting unit has always been the congressional district, or the individual delegate. Among party managers there has always been a lurking desire to introduce the democratic unit system of state voting and the "two-thirds rule," but only one serious attempt has been made to enforce it. In 1880 the state conventions of Pennsylvania, New York and Illinois instructed their delegations to vote as a unit for Grant, though a strong minority had been elected under instructions from their local conventions to vote for other candidates. The national convention sustained the minority in their claim of a right to cast their votes without regard to the state convention's instructions. Practically, therefore, it may be laid down as the republican theory that the local conventions in the congressional districts are to select delegates, instructing them, but not irrevocably; and that the state conventions are only to select the four delegates corresponding to the state's senatorial share of the electoral votes, with two additional delegates, if the state elects a congressman at large. Any usurpation of powers by the state convention will be summarily set aside by the national convention. — 3. *Other Conventions.* The conventions of third parties, or attempts to form third parties, are much more likely to follow the republican than the democratic model, for they lack the organized constituency, or "machine," which gives the latter its form and is constantly striving to imitate it in the former. For the same reason the delegates are, to a very great degree, practically self-appointed, or appointed by little cliques of voters. The evolution of a new national party is now attended with almost insuperable difficulties. It must be the result either of the patient labor of years in a clear field, as in the case of the democratic party; or of a great popular movement, sustained long enough to produce a regular army out of a mob, as in the case of the republican party. Until some successful substitute for the convention system is discovered, we may consider the sporadic third party national conventions as foredoomed failures. — III. State and local conventions have been so numerous since 1825 that it is impossible to notice them particularly. The proceedings and results of the national conventions are given under the names of the various parties; it is only designed here to collect the places and dates of the party conventions preparatory to each presidential election, and the names of their several nominees. — 1832. *Anti-Masonic* (see ANTI-MASONRY, I.): Baltimore, Sept. 26–28, 1831: Wirt and Ellmaker. *National Republican* (see WHIG PARTY, I.): Baltimore, Dec. 12–14, 1831; Clay and Sergeant. *Democratic:* Baltimore, May 22, 1832; Van Buren for vice-president. (See DEMOCRATIC PARTY, IV.) — 1836. *Democratic:* Baltimore, May 20, 1835; Van Buren and Johnson. There was no whig national convention for this election. (See WHIG PARTY, II.)—1840. *Whig:* Harrisburgh, Pa., Dec. 4–7, 1839; Harrison and Tyler. *Democratic:* Baltimore, May 5, 1840; Van Buren for president. (See DEMOCRATIC PARTY, IV.) The "Liberty party" nominations (see ABOLITION, II.) were made by a local convention in New York. — 1844. *Liberty:* Buffalo, Aug. 30, 1843; Birney and Morris. *Whig:* Baltimore, May 1, 1844; Clay and Frelinghuysen. *Democratic:* Baltimore, May 27–29, 1844; Polk and Dallas. — 1848. *Democratic:* Baltimore, May 22–26, 1848; Cass and Butler. *Whig:* Philadelphia, June 7–8, 1848; Taylor and Fillmore. *Free-Soil:* Buffalo, Aug 9–10, 1848; Van Buren and Adams. — 1852. *Democratic:* Baltimore, June 1–4, 1852; Pierce and King. *Whig:* Baltimore, June 16–19, 1852; Scott and Graham. *Free-Soil:* Pittsburgh, Aug. 11, 1852; Hale and

Julian. — 1856. *American* ("know-nothing"): Philadelphia, Feb. 22–25, 1856; Fillmore and Donelson. *Democratic:* Cincinnati, June 2–6, 1856; Buchanan and Breckinridge. *Republican:* Pittsburgh, Feb. 22, 1856 (for party organization only); Philadelphia, June 17, 1856; Fremont and Dayton. *Whig:* Baltimore, Sept. 17–18, 1856; ratified the "American" nominations. — 1860. *Democratic* (Douglas): Charleston, S. C., April 23 – May 3, Baltimore, June 18–23, 1860; Douglas and Johnson; (Breckinridge) Charleston, May 1–4, Richmond and Baltimore, June 11–28; Breckinridge and Lane. *Constitutional Union:* Baltimore, May 9–10, 1860; Bell and Everett. *Republican:* Chicago, May 16–18, 1860; Lincoln and Hamlin. — 1864. *Republican* (Radical): Cleveland, May 31, 1864; Fremont and Cochrane; (Regular) Baltimore, June 7, 1864; Lincoln and Johnson. *Democratic:* Chicago, Aug. 29, 1864; McClellan and Pendleton. — 1868. *Republican:* Chicago, May 20–21, 1868; Grant and Colfax. *Democratic:* New York, July 4–11, 1868; Seymour and Blair. — 1872. *Liberal Republican:* Cincinnati, May 1, 1872; Greeley and Brown. *Republican:* Philadelphia, June 5–6, 1872; Grant and Wilson. *Democratic:* Baltimore, July 9, 1872; ratified the "liberal republican" nominations. — 1876. *Greenback:* Indianapolis, May 17, 1876; Cooper and Cary. *Republican:* Cincinnati, June 14–15, 1876; Hayes and Wheeler. *Democratic:* St. Louis, June 27–29, 1876; Tilden and Hendricks. — 1880. *Republican:* Chicago, June 2–8, 1880; Garfield and Arthur. *Greenback:* Chicago, June 9–11, 1880; Weaver and Chambers. *Democratic:* Cincinnati, June 22–24, 1880; Hancock and English. — Whenever the above conventions have been in session more than one day, the nominations must be assigned to the last day. — See authorities under the names of the parties.

ALEXANDER JOHNSTON.

NON-INTERCOURSE. (See EMBARGO.)

NORTH CAROLINA, one of the original thirteen states of the American Union. The jurisdiction over its soil was claimed by Great Britain on the general ground of the Cabot voyages. A grant was made to Sir Walter Raleigh by Queen Elizabeth, March 25, 1584, of all such "lands, territories, countries, cities, castles, towns, villages and places" as he should "discover and possess"; but after five voyages he failed to make any permanent settlement. March 24, 1663, Charles II. granted to Edward, earl of Clarendon, and seven associates, the province of "Carolina," lying between 31° and 36° north latitude, extending west to the south sea. June 30, 1665, a charter was granted to Clarendon and the other "lords and proprietors," in which the grant was extended by making the southern boundary latitude 29° north, and the northern boundary a straight line west from the head of Currituck inlet, as at present, half a degree to the north of latitude 36°: the "province of Carolina" thus covered about the same coast line as the modern states of North Carolina, South Carolina and Georgia, and extended theoretically to the Pacific ocean. — March 1, 1669, a code of "fundamental constitutions" for the province was drawn up by the proprietors; its authorship is attributed to John Locke, the philosopher, but it was long supposed to be one of the vagaries of Anthony Ashley-Cooper, afterward earl of Shaftesbury, to whom Locke was secretary. One-fifth of the lands was to go to the proprietors, the eldest of whom was to take the first rank, with the title of palatine; one-fifth to the hereditary nobility; and three-fifths to the people. The nobility was to consist of three classes: landgraves, caziques, and lords of manors; each was to have a stipulated number of acres of land, which was not to be alienated after the year 1700, and the right to hold court leet for his territory; the rest of the population were to be "leetmen," they and their children's children to all generations, attached to the soil—that is to say, serfs. The parliament was graded into four chambers: proprietors, landgraves, caziques, and commons, or lords of manors; the latter name was long retained in the North Carolina legislature. (See ASSEMBLY.) This absurd attempt to establish feudalism among the pioneers of Carolina was an utter failure; it was disregarded from the first, and in 1693 was formally abandoned by the proprietors. — The division between the northern part of the province, at first called Albemarle county, and the southern, was established two or three years before 1700. The northern portion, afterward North Carolina, had thereafter its own assembly, sometimes a separate governor, and sometimes a governor in common with South Carolina. In 1719 the proprietary government fell to pieces, and in 1729 the crown bought out the proprietors, and both North and South Carolina were thereafter royal provinces. The boundary line between the two was settled in 1735; the northern boundary line had been run eight years before. (For the western boundary, see TENNESSEE.)—CONSTITUTIONS. A provincial congress (see REVOLUTION) met in the colony Aug. 25, 1774 and under its direction a convention at Halifax, Nov. 12–Dec. 18, 1776, framed the first constitution of the state, which was not submitted to popular vote. It provided for a general assembly, consisting of a senate and a house of commons, chosen annually, one senator and two representatives from each county, and one representative from each of six towns; for a governor, to be elected annually by the legislature, to hold office not more than three years in six; and imposed property qualifications on the holding of office, and on the right to vote for senators: otherwise suffrage was limited by the qualifications of age and one year's residence. In 1835 the constitution was largely amended: the senate was now composed of fifty members, chosen by districts, and the house of 120 members, chosen by counties, according to population; free negroes were for the first time excluded from the right of suffrage; the

election of governor, to serve two years, was given to the people; and the sessions of the legislature were made biennial. In 1854 property qualifications in voters for senators were abolished. The secession convention of 1861 did not modify the constitution itself. The convention of 1865, which repealed the ordinance of secession, adopted an ordinance abolishing slavery, which was ratified by a popular vote of 19,039 to 3,970. In May, 1866, the same convention revised the state constitution; but their work was rejected by a small popular majority. The reconstruction convention Jan. 14 – March 16, 1868, framed a new constitution, which was ratified, April 21–23, by a popular vote of 93,118 to 74,009. The political changes from the old constitution were mainly the change of the name of the house of commons to that of the house of representatives, the lengthening of the governor's term to four years, the grant of the right of suffrage to negroes, the provision for registration laws, and the following features of the declaration of rights: any right to secede was forever repudiated; the paramount allegiance of the citizen was declared due to the United States; the debt incurred for the rebellion was declared null and void; and slavery was forever prohibited within the state. In 1875–6 this was amended, the most important change being in the judiciary. — GOVERNORS. Richard Caswell, 1777–9; Abner Nast, 1779–81; Alexander Martin, 1781–4; Richard Caswell, 1784–7; Samuel Johnston, 1787–9; Alexander Martin, 1789–92; Richard D. Spaight, 1792–5; Samuel Ashe, 1795–8; William R. Davie, 1798–9; Benjamin Williams, 1799–1802; James Turner, 1802–5; Nathaniel Alexander, 1805–7; Benjamin Williams, 1807–8; David Stone, 1808–10; Benjamin Smith, 1810–11; William Hawkins, 1811–14; William Miller, 1814–17; John Branch, 1817–20; Jesse Franklin, 1820–21; Gabriel Holmes, 1821–4; Hutchings G. Burton, 1824–7; Jas. Iredell, 1827–8; John Owen, 1828–30; Montfort Stokes, 1830–32; David L. Swain, 1832–5; Richard D. Spaight, 1835–7; Edward B. Dudley, 1837–41; John M. Morehead, 1841–5; William A Graham, 1845–9, Charles Manly, 1849–51; David S. Reid, 1851–5; Thomas Bragg, 1855–9; John W. Ellis, 1859–61; H. T. Clark, 1861–2; Zebulon B. Vance, 1862–5; William W. Holden, provisional, 1865; Jonathan Worth, 1865–8; William W. Holden, 1868–71; Tod R. Caldwell, 1871–4; Curtis H. Brogden, 1874–7; Zebulon B Vance, 1877–81; Thomas J. Jarvis, 1881–5. — POLITICAL HISTORY. In the beginning of her history as a state, North Carolina occupied a peculiarly isolated position. She had few ties of sympathy or interest with even the nearest states, Virginia and South Carolina; she had laid the foundation of a navy; she had issued her own paper money extensively; and had developed many of the characteristics of a separate nationality. Her first convention, therefore, refused to ratify the constitution, unless twenty-six specified amendments should be added to it, the most essential one being a prohibition against interference by congress or the federal judiciary with state paper money already in circulation. It was not until the following year that a second convention ratified the constitution, recommending eight amendments, including the one above mentioned. (See CONSTITUTION, I.–II.; STATE SOVEREIGNTY; BANK CONTROVERSIES, II.) Notwithstanding the ratification, the state legislature in the following year refused to take the oath of allegiance to the United States. — From her first admission North Carolina was a democratic state. By the district system of choosing electors, one of her electoral votes was given to Adams in 1796, four to Adams in 1800, and three to Pinckney in 1808; all her other electoral votes (twelve until 1801, fourteen until 1811, and fifteen until 1841) were given to the regular democratic presidential candidates until the election of 1840. Her delegates in congress were as regularly democratic, though the seacoast districts occasionally returned a federalist. During this period Nathaniel Macon was the most prominent democratic leader. In the legislature the federalists were much more strongly represented, and throughout the war of 1812 were very nearly on equal terms with their opponents. —In the state elections of 1836 the state showed a whig majority, electing a governor and eight of the thirteen congressmen from that party. In 1840 the electoral vote of the state became whig by a popular vote of 46,376 to 34,218, and continued whig until 1852 by about the same proportional vote. Rayner, Clingman, Badger, Mangum and Graham were the best known whig leaders of this period.—In 1848 the last whig governor of the state, Manly, was elected. In 1850 the democrats, for the first time since 1836, elected the governor, and a majority of both houses of the legislature; but the whigs still secured six of the nine congressmen. In 1852 the electoral vote of the state was democratic; and its majority remained steadily democratic until the outbreak of the rebellion. Many of the leading whigs, notably Thomas L Clingman, became democrats; but others, such as Rayner, maintained an opposition under the "American party" organization. Even in 1859 the remnant of the old whig party, without an organization, and with hardly the semblance of a party name, was able to elect four of the eight congressmen, and to poll a popular vote of 39,965 to 56,222 for governor. In 1860 the Breckinridge electoral ticket carried the state by a narrow majority. — In 1860–61 the sentiment of the state was strongly against the expediency, not the right, of secession. (See SECESSION.) The legislature voted strongly against all attempts to secede, and on appointing commissioners to represent the state at Montgomery, instructed them, by a vote of sixty-nine to thirty-eight, to "act *only* as mediators"; a projected state convention was rejected by popular vote; and the seizure of federal forts was checked and disavowed. President Lincoln's call for troops in April changed the current. The legislature was convened in special session, May 1; the federal forts were seized; a

convention was called for May 20, the supposed anniversary of the Mecklenburgh declaration; and on that day the state convention passed an ordinance of secession and ratified the constitution of the confederate states. — From the beginning of the war the people of the state were completely dissatisfied with the confederate government, because of the manner in which it had neglected the defense of the state and allowed the Roanoke expedition to seize the eastern portion of it. In 1862 they elected as governor Z. B. Vance, a former "American," and an open opponent of President Davis; in 1863 the "American" element elected nearly all the state's representatives in congress, as a peace delegation; and in 1864 the candidates for governor were both peace men, one (Vance) wishing for peace through negotiations by the confederate government, the other (Holden) for separate state negotiations. Vance was elected by a vote of 54,323 to 20,448. It has been said that there was some desire to secure the secession of the state from the confederate states, but this hopeless scheme was never practically undertaken. — May 29, 1865, William W. Holden was proclaimed provisional governor of the state by President Johnson; and under his auspices a convention met at Raleigh, Oct. 2, declared the ordinance of secession null and void Oct. 4, and prohibited slavery Oct. 6. Both acts were ratified by popular vote, almost unanimously. A new legislature ratified the 13th amendment, and a new governor was elected and inaugurated Dec. 15, 1865. May 24, 1866, the convention of 1865 reassembled, and made an entire revision of the state constitution; but their work was rejected by a popular vote of 21,552 to 19,570. — In March, 1867, the state government was superseded by the appointment of Maj. Gen. Sickles to the command of the military district composed of North and South Carolina. (See RECONSTRUCTION.) Aug. 26 he was displaced by Maj. Gen. E. R. S. Canby. Under his directions a convention met at Raleigh, Feb. 14, 1868, and formed a new constitution, which was ratified by popular vote. It made no disfranchisement either on account of race or on account of participation in the rebellion. Under it a new governor and legislature were elected, the 14th amendment was ratified, and by the terms of the act of June 25, 1868, the president declared by proclamation, July 11, that North Carolina was restored to full participation in the national government. The electoral vote of the state was given to Grant and Colfax, by a popular vote of 92,241 to 73,600; and all the state officers were republicans. — The republican majority in the reconstructed legislature was decided: the 15th amendment was ratified March 4, 1869, by votes of forty to eight in the senate and eighty-seven to twenty in the house. Immediately after its organization disorders began in the state (see KU-KLUX KLAN), and under acts of the legislature the governor proclaimed Alamance county in insurrection, March 7, 1870, and Caswell county, July 8; made arrests there by military force; and obtained federal assistance. (See INSURRECTION, II.) The result was a great popular excitement, and in August the democrats elected five out of seven congressmen, thirty-two out of fifty senators, and seventy-five out of 120 in the lower house. The new legislature in November chose ex-Gov. Vance United States senator, though his disabilities were not yet removed; and the house impeached Gov. Holden for his proclamations, and for refusing to obey the writs of *habeas corpus* issued by the state courts. March 22, 1871, he was convicted and removed, and T. R. Caldwell became governor in his stead. A legislative effort to call a constitutional convention was defeated by a popular vote of 95,252 to 86,007. — The state election of August, 1872, was close and exciting. The republicans obtained a majority of the popular vote, 98,630 to 96,731 (for governor), and thus elected their candidates for governor and state officers; but the democrats secured a majority of both houses of the legislature. In November the democratic vote fell off 24,000, and the electoral vote of the state was given to Grant and Wilson by a heavy majority. The legislature adopted a number of amendments to the constitution, which were ratified by popular vote; and passed a ku-klux amnesty act for all offenses under the grade of murder, arson and burglary, an act to allow local prohibition of liquor selling, and an act to submit the question of a constitutional convention to the people. The convention project was ratified by popular vote; that body met at Raleigh, Sept. 6 – Oct. 11, 1875, the political parties being a tie in its membership, and framed an amended constitution, mainly altering the form of the state judiciary. Their ratification was one of the questions in the election of Nov. 7, 1876, in which each party exerted itself to the utmost. The opposing candidates for governor, Vance and Thomas Settle, canvassed the state together, and a large vote was called out on both sides. The result was the success of the democrats in electing the governor, over two-thirds of both houses of the legislature, and all but one of the congressmen. The popular majority was by no means so emphatic; for governor it was 123,265 to 110,256. Since that time the state has remained democratic, the principal subject of political discussion being the repudiation of a portion of the state debt; but in no other southern state has the republican vote remained so constant, or been treated with so much apparent fairness. In the presidential election of 1880 the popular vote was 124,204 for the democratic ticket, 115,878 for the republican, and 1,136 scattering. The legislature stood as follows: senate, thirty-eight democrats, twelve republicans; house, seventy-four democrats, forty-four republicans. — In the local politics of the state nothing has been more remarkable than the singular political mistake of the dominant party in 1881. With the approval of the democratic leaders, the democratic legislature passed a stringently prohibitory liquor

law, and submitted it to the people; but at the election, August 7, the democratic majority disappeared, and a majority of over 110,000 appeared against the law. — Among the prominent names in the state's political history are the following: Geo. E. Badger, secretary of the navy under Harrison, and whig United States senator 1846–55, Thomas Bragg, democratic governor 1855–9, United States senator 1859–61, and attorney general of the confederate states (see CONFEDERATE STATES); John Branch, democratic governor 1817–20, United States senator 1823–9, secretary of the navy under Jackson, representative in congress 1831–3, and candidate for governor in 1838; Thos. L. Clingman, representative in congress (whig) 1843–5 and 1847–51, (democrat) 1851–8, United States senator 1858–61, and brigadier general in the confederate army; James C. Dobbin, democratic congressman 1845–7, and secretary of the navy under Pierce; Alfred Dockery, whig congressman 1845–7 and 1851–3, and candidate for governor in 1854: Wm. A. Graham (see his name); Nathaniel Macon, democratic congressman 1791–1815, United States senator 1815–28, and speaker of the house 1801–6, a most sincere, consistent and incorruptible politician; W. P. Mangum (see his name); John Pool, whig candidate for governor in 1860, and republican United States senator 1868–75; Matt. W. Ransom, major general in the confederate army, and democratic United States senator 1872–89; Kenneth Rayner, whig congressman 1839–45, one of the "American" leaders 1855–8, and solicitor of the treasury under Hayes and Garfield; Thomas Ruffin, democratic congressman 1853–61, killed in the confederate army; Thomas Settle, president of the republican national convention in 1872, and republican candidate for governor in 1876; Zebulon B. Vance, whig (or opposition) congressman 1858–61, colonel in the confederate army, governor 1863–5 and 1877–9, and democratic United States senator 1870–72 (not admitted) and 1879–85; and Hugh Williamson, federalist congressman 1790–93. ALEXANDER JOHNSTON.

NORTHWEST BOUNDARY (IN U. S. HISTORY). I. CLAIMS. The territory bounded north by latitude 50° 40′, east by the Rocky mountains, south by latitude 42° (the northern boundary of California), and west by the Pacific ocean, has been claimed at various times, and to varying extents, by Russia, Spain, Great Britain, and the United States. As the claims overlapped and interfered with one another, they may be first stated. (For the northeast boundary, see MAINE.) — 1. The claim of Russia rested mainly on occupation by fur traders, and its southern boundary was at first undefined. April 5–17, 1824, a treaty was arranged between the United States and Russia, which was ratified by the former Jan. 11, 1825 By its third article no settlements were to be made under the authority of the United States north of latitude 54° 40′, nor any Russian settlements south of that line. Feb 28, 1825, by a treaty between Russia and Great Britain, the same parallel was made a part of the boundary between their respective settlements. By these two treaties Russia at once secured her southern boundary, and withdrew from the imbroglio.— 2. The claim of Spain, in some respects the best of all, rested in discovery, backed by occupation. The discovery rested in the voyages of Cabrillo and Ferrelo in 1543, to latitude 43°; of Juan de Fuca in 1592 to parallel 49°, and the strait which bears his name; of Vizcaino in 1603, to latitude 43°; of Perez in 1774, to latitude 54°; of Heceta in 1775, to latitude 48°, discovering, but not entering, the river St. Roque (now the Columbia); and of a few minor voyages as far north as latitude 59°. Occupation had been begun as early as 1535, by a land expedition under Fernando Cortez, and Jesuit settlements were gradually pushed further north, though they never passed latitude 42°. Nevertheless, Spain asserted exclusive control of the coast beyond latitude 42°. In May and June, 1789, Spanish armed vessels seized several British vessels in Nootka sound, and war was only averted by the Nootka sound convention, or treaty of the Escurial, Oct. 28, 1790, by which British trading buildings in Nootka sound were to be restored, the right of trade was to be secured to both parties, but neither was to land on coasts already occupied by the other. In 1803, by the treaty ceding Louisiana (see ANNEXATIONS, I.), the claim of France, which was really the claim of Spain, to an indefinite territory on the Pacific, was transferred to the United States; and by the Florida treaty of 1819–22 (see ANNEXATIONS, II.), Spain fixed latitude 42° as the Pacific portion of the boundary line between her American territory and the United States. Spain thus retired from the field, leaving but two contestants for the disputed territory, Great Britain and the United States. — 3. Great Britain had little or no claim by discovery. Drake had seen the coast in 1580; Cook had examined it slightly in 1778; and Vancouver much more thoroughly in 1793: but all these were rather rediscoverers than discoverers. Occupation was actually begun in 1788 by Meares, an English lieutenant; but he was under the Portuguese flag at the time, with letter of marque against British vessels who should molest

him, so that his occupation could hardly weigh heavily for Great Britain. In 1793, 1806 and 1811 enterprising fur traders, in private employ, pushed into the Oregon country, and established trading posts there; but there was no attempt at permanent settlement south of latitude 49°. — 4. The claim of the United States deduced from Spain is at least doubtful. The claim by discovery rests on two grounds, the voyage of Gray, and the expedition of Lewis and Clarke. In 1792 Capt. Gray, of Boston, entered the river St. Roque, at which Heceta had only guessed, and changed its name to the Columbia river, after the name of his vessel. In 1805–6 Lewis and Clarke, under orders from President Jefferson, crossed the Rocky mountains, struck the southern head waters of the Columbia, floated down that river to its mouth, and explored very much of the Oregon country. On the strength of Gray's discovery the United States claimed all of the country drained by the Columbia; but so extensive a claim is hardly tenable in international law. Lewis and Clarke's expedition was more important: it was made under government authority, and it covered most of the territory south of latitude 49°; while the British fur traders were not in public employ, and their explorations were north of latitude 49°. On the whole, if discovery alone were in question, latitude 49°, as finally fixed, would seem to be equitable: south of it the United States had officially explored the territory; and north of it Great Britain had done so, though not officially. In 1811 John Jacob Astor, of New York, established a trading post at the mouth of the Columbia, and named it Astoria; but during the war of 1812 it was captured by the British, and named Fort George. In 1818 it was restored to the United States government, but its private owner abandoned it. Attempts in 1822 and 1827 to organize American fur companies for operating in the Oregon country were unsuccessful, owing to the powerful rivalry of well-established British companies; but they led the way to a more legitimate occupation, by immigration, in which Great Britain could not compete. This began in 1832, and after 1838 no autumn passed without an increasing supply of permanent settlers across the Rocky mountains. In 1845 the American population was nearly 3,000, and there was no probability of any decrease in the increase for the future. Here, after all, lay the true ground of the American claim—in legitimate and permanent settlements; and, as these filled the space covered by Lewis and Clarke's explorations, the two together make a valid claim up to latitude 49°. — II. SETTLEMENT. The definitive treaty of peace of Sept. 3, 1783, after defining the northeastern boundary to the St. Lawrence river (see MAINE), continued the northern boundary between the United States and British America up through the middle of the St. Lawrence river and the great lakes to Long lake, on the northern coast of Lake Superior; thence northwesterly by the water communications through Rainy lake to the lake of the Woods; and thence to the river Mississippi, which was then the boundary between the United States and Spanish America. The cession of Louisiana to the United States in 1803 made necessary a definition of the northern boundary between the new cession and British America; and this was settled by the second article of the convention of Oct. 20, 1818, which fixed latitude 49° as the boundary from its intersection with the lake of the Woods to the Stony [Rocky] mountains. West of the Rocky mountains the whole territory was to be open, for ten years, to the vessels, citizens and subjects of both powers, without prejudice to the claims of either. By the convention of Aug. 6, 1827 (ratified by the United States, April 2, 1828), the joint occupation of the Oregon country by Great Britain and the United States was continued indefinitely, with the provision that either party might annul and abrogate it, on giving twelve months' notice to the other. In both these negotiations the American negotiators laid formal claim to the whole territory drained by the Columbia, included generally between parallels 42° and 52° of latitude; but they showed a willingness to compromise on latitude 49° to the Pacific. The British negotiators, on the other hand, seem to have been willing to accept latitude 49° to its intersection with the Columbia; but thence to the Pacific they insisted on the Columbia itself as a boundary, thus adding to British America nearly the whole of the present territory of Washington. In such a conflict of claims, the only possible line of action was to continue the joint occupation until one party should be able to assert an exclusive right to some part of it.— As American immigration increased, the certain perils of a joint occupation increased with it The magistrates of neither country could have or exercise jurisdiction over the citizens of the other; and difficulties between parties of different nationalities could therefore have no forum for settlement. In 1838 propositions to organize some system of justice in the Oregon country began to be offered in congress. At first these were only to imitate the British system of erecting forts and providing magistrates for the trial of offenses, without any design to terminate the joint occupation; but the settlement of the northeastern boundary question in 1842 had an unfortunate effect on the discussion of the true northwestern boundary. There was considerable dissatisfaction in both countries over the result of the treaty of 1842, and a determination to insist on their respective claims in Oregon. In the United States this feeling took two distinct forms. 1. The treaty by which Russia had agreed to settle no farther south than latitude 54° 40′ seems to have produced a belief that this line was the proper boundary Forgetting that the treaty could bind only the parties to it, and that Great Britain could appeal to a precisely similar contemporary treaty with Russia, there were many in the United States who

were willing to insist on the Russian boundary even at the price of a war with Great Britain. This feeling was popularly summed up as "fifty-four-forty-or-fight." 2. The "Monroe doctrine" was strongly appealed to, in order to sustain the view that to yield any part of the Pacific coast to Great Britain would be to consent to the formation of a European colony on this continent, and that too, as our nearest neighbor. Of this feeling Douglas was the ablest exponent. — In this state of public feeling, the democratic national convention of 1844 declared for the "re-occupation of Oregon," on the ground that our title to the whole of it was clear and unquestionable. It was, to be sure, coupled with a demand for the "reannexation of Texas" (see ANNEXATIONS, III.); but it met a popular feeling in the north and west which it was difficult to resist. Democratic success in 1844, and the decided tone of President Polk's inaugural in 1845, made the Oregon question prominent from the beginning of his administration. Under the preceding (Tyler's) administration, the secretary of state, Calhoun, had been conducting a negotiation on the Oregon question with the British minister, Pakenham, from July, 1844, until January, 1845. Calhoun had offered to take latitude 49° as the boundary; Pakenham had offered, in return, the Columbia river from latitude 49° to the Pacific, and when this was declined had proposed an arbitration, which Calhoun refused. This refusal, and the declaration of the inaugural that our title to "the whole of Oregon" was indisputable, and that our settlers there must be protected, raised the war feeling high in Great Britain. This seems to have had an influence on the president. In July, 1845, his secretary of state, Buchanan, again proposed latitude 49° as a boundary, which was again refused; but the rumor of the offer evoked such a storm that the secretary withdrew the offer. — The meeting of congress in December, 1845, was the signal for a renewal of the question. Resolutions were introduced in both houses that the "whole of Oregon" belonged to the United States, and that there was no power in the president and senate to alienate by treaty any part of the soil of the United States. Senators Allen, of Ohio, and Hannegan, of Indiana, were the most persistent champions of these measures. On the contrary, the opposition, Calhoun being its ablest speaker, held that, since immigration to Oregon could only come from the United States, it was wiser to maintain the joint occupation until the natural process of crowding out should compel Great Britain to withdraw. The former then began to press a resolution directing the president to give Great Britain the twelve months' notice to terminate the joint occupation. The latter united in holding, 1, that as the notice was part of a treaty, the treaty power alone could give it; 2, that the notice was in the direct line of war with Great Britain, for which the country was not ready; and 3, that in any event the resolution should only authorize the president to give the notice when in his judgment the proper time had come; that is, when the United States should be ready for war. This the other side answered by pressing bills for the increase of the navy. — To strengthen the hands of the anti war democrats and whigs, the president sent to congress, Feb. 7, 1846, the correspondence between the two governments since December. From this it appeared that Great Britain was arming; that the United States had asked for the reasons of her preparations; and that she had frankly acknowledged that she was incidentally preparing for an American war. — In March, after the house had passed the directory resolution for notice, a friend of the president in the senate advised a compromise on latitude 49° as the boundary. He declined to calm the resulting excitement by acknowledging the president as his authority. April 16 the senate passed a discretionary resolution for notice; and two days later the house amended it by "authorizing and requesting" the president to give notice. April 23 both houses agreed to a new resolution, which, while varying the form of the senate resolution, retained its essence, that the president be "authorized" to give the twelve months' notice, and that negotiations should continue. — June 6, 1846, the British ambassador offered to accept latitude 49° as the boundary to the channel between Vancouver's island and the mainland, thence down the middle of the channel and the strait of Fuca to the Pacific, with free navigation, to both parties, of the channel and the Columbia. Even this did not wholly relieve the president, for he had no mind to array himself against the "fifty-four-forty" idea. He therefore endeavored to throw the responsibility upon the whig senate by requesting its advice on the acceptance of the convention — a process unused since Washington's time. It must be recorded to the credit of the whigs, who were not ignorant of his purpose, that they advised the ratification of the convention, June 12. Ratifications were exchanged at London, July 17, 1846, and the Oregon question, in its main features, was settled finally. — There was still, however, one minor point, which was not settled until 1872. The commissioners appointed to run the boundary could not agree on the true water channel through the middle of which it was to run. The British insisted on the Rosario straits; the Americans on the canal de Haro. By the thirty-fourth article of the treaty of Washington, in 1871, it was agreed to submit the question finally to the emperor of Germany as arbitrator. In the following year the arbitrator decided in favor of the canal de Haro. — See 8 *Stat at Large*, 80, 248, 360, 9 *ib.*, 869, and 17 *ib.*, 863 (for treaties of Sept. 3, 1783, Oct. 20, 1818, Aug. 6, 1827, June 15, 1846, and May 8, 1871, respectively); authorities under OREGON, 3 von Holst's *United States*, 161, 216, 273; 15, 16 Benton's *Debates of Congress* (see index); *Statesman's Manual* (Polk's Messages); Greenhow's *Northwest Coast*, 1840, and *History of Oregon and California*, 1845 (the authorities cited

ALEXANDER JOHNSTON.

NORWAY. One of the two states forming the Scandinavian peninsula, and united under the sceptre of the same king, with Sweden. The area of Norway, a small part of which is cultivated, is about 317,000 square kilometres, and its population, according to the census of 1875, the last taken, was 1,806,900. Former censuses give the population as follows: 1769, 723,141 inhabitants; 1801, 883,038; 1815, 885,431; 1825, 1,051,318; 1835, 1,194,827; 1845, 1,328,471; 1855, 1,490,047; 1865, 1,701,756 inhabitants. At the end of 1879 the population was estimated at 1,916,000.— Norway has nothing in common with Sweden except its Scandinavian origin, its religion (Lutheran), the king and foreign representation. Its constitution dates from 1814, the time of its union with Sweden, and presents many remarkable peculiarities. The Norwegian parliament is called the *storthing*, and is divided for legislative affairs properly so called, into two chambers, the *odelsthing* and the *lagthing*. The members of the *storthing* are composed of representatives from the cities and representatives from the country, both elected for three years. To be eligible a person must enjoy a good reputation, be an elector, be thirty years of age, inhabit the district in which he is elected, and have lived at least ten years in Norway. The members of the council of state, the employés of the administration, and the officials of the court, are not eligible. To be an elector a man must be twenty-five years old, have lived at least five years in Norway, have taken the oath of fidelity to the constitution, enjoy a good reputation, and must have one of the following qualifications: 1, he must be or have been an official; 2, possess lands either as proprietor, or as farmer with a lease of more than five years; 3, be a *burger* in a *commercial* city so called, or possess in a seaport town real property worth at least $165; 4, have been registered as a tax payer for five years in the districts of the north of the kingdom, called the Finnish steppes, inhabited principally by Laplanders. There are two degrees in the elections. In the country 100 primary electors choose one secondary elector; the secondary electors assemble in the chief towns of the district, and choose from their own number one member out of every ten, but not more than four, as deputies. In the cities there is one secondary elector for every fifty primary electors, and in the assembly of the former one member is elected out of four, but not more than four in all. The deputies, whose number was fixed at 111 by the law of Nov. 26, 1859 (seventy-four for the rural districts and thirty-seven for the commercial cities so called), receive a certain allowance per day while sojourning at the seat of parliament, and traveling expenses; they formerly assembled every three years at Christiania, but by a modification of the constitution adopted in April, 1869, it was resolved to hold annual meetings. It can not remain in session more than three months without the authorization of the king. The king may also call the *storthing* together in extraordinary session, but he can not dissolve it and have new deputies chosen. Among those elected there are always many communal functionaries (fifty to sixty), and notably pastors, teachers and choir leaders. The prerogatives of the *storthing* are, to make and repeal laws, to vote the budget, to watch over the public finances, to examine the acts of the government, and to try crimes against the state. The king and the viceroy (prince royal) are not subject to this political jurisdiction. The deputies share with the government the initiative in legislation. When the *storthing* comes together in assembly, it elects a fourth of its members to form the *lagthing* (upper chamber); the rest constitute the *odelsthing*, and each chamber meets separately. Bills are presented to the *odelsthing;* those which are passed by it are sent to the *lagthing*, which accepts or rejects them. In the latter case, the bill comes back with the exceptions to it, which are examined by the *odelsthing*. If each chamber persists twice in its opinion, they come together, and the *storthing* votes as a single assembly. In the *lagthing* the members of the high court of justice are chosen. — The laws passed are subject to the sanction of the king. This sanction can be refused twice. When passed the third time by the *storthing*, the law has no further need of sanction. The king has then only a *suspensive veto*. This was the way, in 1821, that the institution of nobility was abolished in Norway. The king has nevertheless rather extensive power, and the ministers are responsible only if they have not noted their protest on the record. With this exception they are free to affix their countersign; or, to speak more exactly, the ministers are responsible only for their propositions. The king can appoint a viceroy or a lieutenant; the prince royal only can be viceroy, and he is then obliged to reside in Norway nine months out of the twelve. — The "Norwegian government" is composed of two ministers and at least seven councilors of state, appointed by the king from among Norwegians. One of the ministers and two councilors of state are always with the king in Sweden, and the five others, presided over by the viceroy or the

lieutenant of the king, (there has been none since 1880), are occupied with affairs of the interior. The king can decide nothing without having taken the advice of the council of state, or of the part of the Norwegian government which has its seat at Christiania. He is general-in-chief of all the land and naval forces, but he can not employ the army or the navy for a war of aggression without the consent of parliament; not even in favor of Sweden, which is considered as a foreign country by Norway. Still, the king "can make treaties, declare war, levy troops," but we believe that these royal rights exist more upon paper than in fact. The king, however, enjoys the plenitude of executive power. — There are seven ministerial departments, each one directed by a councilor of state. The departments are as follows: 1, of worship and education; 2, of justice and police; 3, of the interior; 4, of finance and customs; 5, of the army; 6, of the navy and the postoffice; 7, of the revision of accounts. — The finances of Norway are remarkable for this, that direct taxes have been abolished there. The budget is always voted for three years, and the financial period commences April 1. The estimate of the expenditures and receipts for the period 1869–72, and the accounts of 1870, in ducats, worth five francs sixty-three centimes each, are as follows:

RECEIPTS.

ITEMS.	1869-72	1870.
Customs	3,050,000	3,053,800
Tax on brandy	570,000	520,000
Tax on barley	225,000	263,000
Postoffice (gross proceeds)	365,500	323,100
Stamped paper	77,000	73,600
Telegraphs (gross proceeds)	124,000	135,000
Silver mines	178,000	192,600
Miscellaneous receipts	502,500	673,800
Total	5,092,000	5,234,900

EXPENDITURES.

ITEMS	1869 72.	1870.
Civil list	147,000	139,400
Storthing	47,017	96,000
Council of state, etc.	189,970	191 600
Foreign affairs	126,565	125,800
War	1,115,500	1,118,200
Navy and postoffice	1,172,815	1,030,900
Justice	306,474	304,900
Worship and instruction	181,101	164,400
Interior	480,775	453,900
Finance	1,222,949	1,217,500
Unforeseen and surplus expenses	101,834	65,900
Total	5,092,000	4,908,500

The debt in 1871 was about 7,500,000 ducats, of which more than five millions were incurred by loans for railways (in 1848 at 4 per cent., and in 1858 at 5½ per cent.), and almost a million by a loan contracted in 1851 to establish a state bank. — The standing army in 1873 numbered about 2,000 men (volunteers), but all the inhabitants are obliged to serve five years in the line—two in the reserve, and three in the landwehr; they are then enrolled in the landsturm, or *leveé en masse*. Young men who have completed their nineteenth year are liable to be recruited. The navy was composed at the same date of sixteen steamers (156 guns), of which two are frigates, and 103 sailing vessels (507 guns). The naval force embraced, in 1866, 14,754 men. — Norway can not be called a rich country. The climate is not favorable to agriculture, although it is not so cold as its high latitude would seem to imply, but the raising of live stock is important. There were in Norway, in 1855, 154,447 horses, 949,935 horned cattle, 1,596,199 wool-bearing animals, 113,320 hogs, 357,102 goats, and 116,891 reindeer. The useful land is divided into 128,537 estates, but there are also immense forests and other lands, which may be considered as public domains. These forests are a great source of wealth for the country, which carries on a large commerce in lumber, but their wealth must not be considered as inexhaustible. Its fisheries are the principal industry of Norway, the exploitation of its forests ranking only second. The third important branch of industry is mining, but it is far from having the importance it has in Sweden. A large number of Norwegian marines are employed in the transportation of merchandise between two other countries, where the commerce is relatively active. The imports, which were estimated in 1856–60 at about 15,500,000 ducats a year, rose in 1870 to 26,200,000; and the exports, which attained, 1856–60, only 11,500,000, in 1870 slightly exceeded 20,000,000. The movement of navigation, which in 1861 was 583,000 *lasts* (two tons) entry, and 529,000 departure, in 1870 was 762,600 entry and 775,991 departure. The merchant marine in 1861 consisted of 5,493 ships (drawing 276,077 *lasts*) and in 1870 of 6,993 ships (drawing 486,912 *lasts*); 118 of these ships were steamers. In December, 1872, there were 496 kilometres of railways and 5,800 kilometres of telegraphs, and the post carried 5,429,198 letters. — Happy under its democratic government, created without the spirit of imitation, Norway is evidently progressing. Public instruction is very wide spread, and besides permanent schools, there are traveling instructors, who bear elementary knowledge even into remote localities. There is a university at Christiania and secondary schools in different cities. Special instruction is not neglected. Taking everything into consideration it can be said that Norway is making great efforts to remain on the level of civilized countries, and that she is succeeding. —

MAURICE BLOCK.

* The budget of Norway for the period commencing July 1, 1880, and ending June 30, 1881, is distributed as follows:

Sources of Revenue.	Kroner.
Customs	18,600,000
Excise on spirits	3,600,000
Excise on malt	2,400,000
Tax on succession	280,000
Stamps	490,000
Mines	874,100
Postoffice	1,600,000
Telegraphs	850,000
Judicial fees	875,000
Income on state property	2,032,300
Income on state railways	3,654,400
Loan for construction of railways	7,019,400
Private subscriptions for the same purpose	1,273,300
Miscellaneous receipts	293,400
Total revenue	43,791,900

Branches of Expenditure.	Kroner.
Civil list	434,100
Storthing	397,100
The ministries	1,144,700
Church and education	2,893,500
Justice	3,228,500
Interior	4,861,300
Finance and customs	3,621,300
Army	6,370,800
Navy	1,883,400
Post, telegraphs, ports, lighthouses, etc.	4,352,300
Foreign affairs	461,500
Amortization of debt	1,309,500
Interest and expenses of debt	4,611,700
Construction of railways	8,292,100
Miscellaneous	169,700
Balance	269,800
Total expenditure	43,791,900

(The krone is worth about twenty-eight cents.) The public debt amounted, at the end of June, 1879, to 99,632,000 kroner. — The troops of the kingdom are raised mainly by conscription, and to a small extent by enlistment. All young men past the twenty-first year are liable to conscription, with the exception of the inhabitants of the three northern amts of the kingdom, who are free from military service. The nominal term of service is ten years, divided between seven years in the line and three years in the landvaern or militia. The landvaern is only liable to service within the frontiers of the kingdom. On Jan. 1, 1880, the troops of the line, with its reserves, numbered 40,000 men, with 700 officers. The number of troops, actually under arms can never exceed, even in war, 18,000 men, without the consent of the *storthing*. The king has permission to keep a guard of Norwegian volunteers at Stockholm, and to transfer, for the purpose of common military exercises, 3,000 men annually from Norway to Sweden, and from Sweden to Norway.—The naval force of Norway comprised, at the end of October, 1880, thirty-four steamers and ninety sailing vessels, the latter, with the exception of five, forming a flotilla of row-boats for coast defense. — The average value of the total imports into Norway, in the five years, 1876–80, was 161,300,000 kroner, and of the exports 102,300,000 kroner. The shipping belonging to Norway numbered 8,125 vessels, of a total burthen of 1,509,477 tons, at the end of 1879. Norway has, in proportion to population, the largest commercial navy in the world. — At the end of October, 1880, there were in Norway 759 miles of railway open for traffic, and 212 miles under construction. There were at the end of 1879, telegraph lines of the length of 5,815 English miles (4,634 miles belonging to the state, and 681 miles to the railways), and wires of the length of 9,726 miles (8,414 miles belonging to the state, and 1,312 miles to the railways). The number of postoffices at the same time was 904. Number of letters forwarded through the post in 1879, 13,311,909.

NOTE, Diplomatic. In diplomatic language the written communication which takes place between accredited agents of different powers is called *note*. The different kinds of notes are distinguished as follows: The *official* note, ordinarily signed by an ambassador, a minister plenipotentiary, a *chargé d'affaires;* in a word, by the diplomatic agent. The *verbal* note, not signed, either because the diplomatic agent does not wish to assume responsibility in a definitive way, or because there is need simply to recall the essential points of a political conversation upon questions which have been treated *viva voce*. The *secret* note, which has been introduced into diplomatic usage to furnish a more complete understanding of the state of affairs and the probabilities of their solution, outside of the official correspondence.

EUGÈNE PAIGNON.

NULLIFICATION (IN U. S. HISTORY), the formal suspension by a state government of the operation of a law of the United States within the territory under the jurisdiction of the state. Such a suspension was attempted successfully by Georgia, 1825–30 (see CHEROKEE CASE), and unsuccessfully by South Carolina in 1832–3; but the two cases must be distinguished. In the former case, the refusal to obey the federal law forbidding intrusion upon the Indian territory was hardly founded on any claim of right; it was rather a case of law-breaking than of nullification. In the latter case, the state power to nullify was claimed as an integral feature in American constitutional law. The success of the former attempt left the federal government still in a position to assert its functions in the future and to maintain them better as it gained more strength; the success of the latter would have radically altered the nature of the Union. — After the passage of the Kentucky and Virginia resolutions in 1798–9 (see KENTUCKY RESOLUTIONS), the state governmental organizations were utilized as political weapons in several well-known instances of resistance to the federal government or its enactments. In 1809, in the Olmstead case, the state government of Pennsylvania had gone so far as to order out the state militia to oppose the mandate of a federal court, in 1809–10 the judges, governors and legislatures of all the New England states had strained every point of law which ingenuity could suggest to thwart or hinder the restrictive system (see EMBARGO); in 1820 Ohio had similarly opposed the operations of the branch of the United States bank within its limits (see BANK CONTROVERSIES, III.); but, in all these cases, the struggle between the state and federal governments had been governed by the tacit understanding of both parties that in the end the state government must give way, unless relieved by some party change in the control of the federal government, or by the *laches* of the federal government in maintaining its position. In the language of John Taylor, of Caroline, the most intense of Jeffersonian nullifiers, "the appeal is to public opinion; if that is

against us we must yield." (See also PERSONAL LIBERTY LAWS.) — The passage of the tariff of 1824 (see TARIFFS) showed a disposition among northern representatives of all parties to so arrange the duties on imports as to protect American manufactures, and this was followed by the still more protective tariff of 1828. Under a system of slave labor, in which workmen would have no incentives to skill, thoroughness or economy, manufactures in the south were an impossibility; and southern leaders naturally looked upon protection as a contrivance to benefit a northern interest at the expense of the whole people. — The constitutional objections to the levying of protective duties by congress were that, though the constitution gives congress power to lay and collect duties and imposts, the power is granted only for the purpose of raising revenue to "pay the debts and provide for the general welfare" of the country; that this was in its nature very different from the asserted power to impose protective or prohibitory duties, for the prohibitory system must end in destroying revenue from imports; that it was equally incompatible with the general welfare clause, being exercised for the benefit only of a particular interest; and that the passage of a protective system by a majority in congress did not make it the less a violation of the constitution. — The first to cast about for a remedy for the "tyranny of a majority" was John C. Calhoun, of South Carolina. It is strange that his failure to find the remedy in the constitution did not lead him to suspect that the southern labor system was at fault in the matter; on the contrary, he proceeded to coin the extraordinary and extra constitutional remedy to which he gave the name of "nullification," borrowed from the Kentucky resolutions of 1799, where it seems to be used in an entirely different sense. Jeffersonian nullification contemplated a concerted action of states which should, if three-fourths of the states could be induced to agree in reprobating a federal law, "nullify" it in national convention by constitutional amendment; Calhoun nullification contemplated a suspension of the law by any aggrieved state, until three-fourths of the states, in national convention, should overrule the nullification. Both ideas encouraged frequent national conventions; but it is obvious that under the latter, if one-fourth of the states should support the recalcitrant state, the minority, having the initiative, would be enabled to veto any policy which should be disagreeable to it. — The substance of Calhoun's arguments for the propriety and expediency of nullification was as follows: 1. The basis of the whole was the dogma of state sovereignty. "It is a gross error," said Calhoun, in February, 1833, "to confound the *exercise* of sovereign power with *sovereignty* itself, or the *delegation* of such powers with a *surrender* of them. A sovereign may delegate his powers to be exercised by as many agents as he may think proper, under such conditions and with such limitations as he may impose; but to surrender any portion of his sovereignty to another is to annihilate the whole." From this, thought Calhoun, it would fairly follow that, whenever a sovereign state became satisfied that her agent, the federal government, was misusing the powers delegated to it, it was the right of the state to suspend the exercise of the power delegated until it should be properly used. A. H. Stephens thinks this use of state sovereignty, as a basis for nullification, "too subtle" for common comprehension, but the difficulty seems to have lain, for once, in a defect of Calhoun's logic. If his premise, the idea that the Union was a compact between sovereign states, were true, it might justify a state in regarding the compact as entirely at an end, if it believed the compact to have been violated or subverted by other states; but it could not justify a state in remaining in the Union, receiving all its benefits, and nullifying its laws at pleasure. Many southerners, in 1832–3, would have shown great respect for a direct secession by South Carolina, but regarded nullification with contempt and dislike. (See STATE SOVEREIGNTY, SECESSION.) Another point in which both schemes of nullification failed to connect with that of state sovereignty was their usually tacit admission that the nullifying state should submit if its nullification failed to be supported by the national convention. In that event what was to become of the nullifying state's sovereignty? 2. Underlying all the doctrines of nullification, state sovereignty and secession, was the notion that the government of the United States was "one of love, not of force"; that obedience to its laws was rather voluntary than compulsory; and that general discontent with any law in any considerable section of the Union was proof positive that the law was wrong or unwise and must be altered or repealed Of course such a system of government for human beings is an impossibility; but the idea was not confined to nullificationists, was fostered by loose expressions and by the almost imperceptible working of the national governmental machinery, and was quite general until it vanished in the fire of the rebellion. (See NATION.) 3. The propriety of leaving the final decision of disputed questions as to the powers of congress to the supreme court was denied because the court was itself a part of the federal government, whose powers were in question; because very many cases were not capable of being put into form of a suit to be brought before the court; and because the court itself had taken distinct and aggressive ground against the states. (See JUDICIARY, II.) 4. The two-fold *comitia* of the Roman republic, each independent of the other and yet both uniting, by mutual forbearance and concession, in a concurrent authority, were instanced to demonstrate the innocuousness and even expediency of nullification. The instance might have been a fair one if there had been in question but a pair of states, instead of a Union; but with twenty-four states in 1830, and thirty-eight in 1883, it is not easy to calculate the geometrical progression of the difficulties which would have

attended an attempt to govern through twenty five or thirty-nine co-ordinate *comitia*.— The first open assertion of nullification as a constitutional right of each individual state, that is, of Calhoun nullification, was in the adoption of the so-called "South Carolina Exposition" by the legislature of that state. This was a report of a committee of that body, originally prepared by Calhoun during the summer of 1828. In the following winter, 1829–30, Calhoun being president of the United States senate, occurred the "great debate in the senate" (see FOOT'S RESOLUTION), in the course of which Hayne, of South Carolina, first avowed and defended in congress the right of a state to nullify a federal law. His position was thus stated by Webster: "I understand the honorable gentleman from South Carolina to maintain that it is a right of the state legislature to interfere, whenever, in their judgment, this government transcends its constitutional limits, and to arrest the operation of its laws. I understand him to maintain this right as a right existing under the constitution; not as a right to overthrow it, on the ground of extreme necessity, such as would justify violent revolution. I understand him to maintain an authority, on the part of the states, thus to interfere for the purpose of correcting the exercise of power by the general government, of checking it, and of compelling it to conform to their opinion of the extent of its powers. I understand him to maintain that the ultimate power of judging of the constitutional extent of its own authority is not lodged exclusively in the general government; but that, on the contrary, the states may lawfully decide for themselves, and each state for itself, whether in a given case the act of the general government transcends its power. I understand him to insist that if the exigency of the case, in the opinion of any state government, require it, such state government may, by its own sovereign authority, annul an act of the general government which it deems plainly and palpably unconstitutional."— Webster's definition of nullification has been taken, rather than anything in Calhoun's or Hayne's speeches, because, though formulated by an enemy to nullification, it more exactly states it. It was not the object of the advocates of nullification to define it *exactly;* in the endeavor to establish a new feature in the American constitutional system, it would have been impolitic to lay down a limit beyond which they would not go, and to less than which they would not submit. In this instance Hayne neither accepted nor rejected Webster's definition, but referred him to the third of the Virginia resolutions, which claims the right for the states to "interpose." Hayne seems to have held that the legislature of a state might nullify; Calhoun held the slightly more tenable ground that nullification must be carried out by a state convention, as the highest exponent of the sovereignty of the state, and that the legislature had only to enforce the acts of the convention. It will be seen that South Carolina's nullification followed the theory of Calhoun, not that of Hayne.—That portion of the debate which related peculiarly to nullification, and which was confined to Webster and Hayne (Calhoun being the presiding officer, and not privileged to debate), took place Jan. 20–26, 1830. Had the modern system of national conventions been in existence, the attempt would immediately have been made to secure control of a democratic convention, and commit the party to the new doctrine, as was successfully done in the case of Texas annexation in 1844. (See DEMOCRATIC PARTY, IV.) The best substitute known at the time was adopted; a dinner was given April 13, 1830, to commemorate Jefferson's birthday; all the leading democrats in or near Washington were invited; and the twenty-four regular toasts were carefully drawn to suggest nullification as the inevitable result of Jefferson's political teachings. Among the invited guests was President Jackson, who, at the end of the regular toasts, being invited to offer one, gave the since famous toast, "Our federal Union; it must be preserved." Calhoun retorted with another: "The Union—next to our liberty the most dear: may we all remember that it can only be preserved by respecting the rights of the states, and distributing equally the benefit and burden of the Union." Evidently, in Jackson, nullification had found a lion in the way. Hitherto he had admired and liked Calhoun, had regarded him as his zealous defender on several critical occasions, had given three of the six cabinet positions to friends of Calhoun, and apparently would have had little objection to seeing Calhoun succeed him in the presidency. From this time he began to develop an antipathy to Calhoun, as the contriver of nullification, which other aspirants for the succession were interested in increasing. Proof was brought to the president that Calhoun had condemned, instead of defending, his course in the Seminole war (see ANNEXATIONS, II.); Calhoun, having been brought to account by the president, began the preparation of a pamphlet defending his own course in that affair, which was published in March, 1831; in the following month the president broke up his cabinet, thus getting rid of the three Calhoun members of it; and from that time Calhoun, the opponent of Jackson, was regarded by the president's party very much as Burr, the opponent of Jefferson, had been in 1807. (See KITCHEN CABINET.)— July 26, 1831, Calhoun published a treatise on nullification in a South Carolina newspaper, which was widely copied. It argued, as before, in favor of the constitutionality and expediency of nullification, and took the further ground that unless congress, at the approaching session, should eliminate the protective features from the tariff, it would be advisable that South Carolina should force an issue by nullifying the law and forbidding the collection of the duties within the state. The national debt was being steadily decreased (in 1835 it amounted to only $37,513); the total ordinary expenses of the government

were from twelve to thirteen millions of dollars (in 1831, $13,864,067); the revenue from customs alone was about twenty-five millions (in 1831, $24,224,441); what then, asked Calhoun, was the honest and proper course for the federal government to pursue upon the approaching extinguishment of the debt? To continue to tax the non-manufacturing south, by high duties on imports, for the benefit of northern manufacturers, and to expend the surplus of receipts over expenditures in a system of internal improvements which would demoralize and corrupt both congress and its constituents? or to prevent the accumulation of the surplus by a timely and judicious reduction of the duties, and thereby to leave the money in the pockets of those who made it, from whom it can not be honestly or constitutionally taken, unless required by the fair and legitimate wants of the government? If the former course was persisted in, it would become an intolerable grievance, and South Carolina ought to cease to look to the general government for relief, exercise her reserved right of nullification, and relieve herself by forbidding the collection of the obnoxious duties in her ports, and allow her citizens to supply themselves with foreign goods untaxed. No attempt was ever made by any nullificationist to reconcile this programme with the plain direction of the constitution that "all duties, imposts and excises shall be uniform throughout the United States," and "that no preference shall be given by any regulation of commerce or revenue to the ports of one state over those of another"; no human ingenuity could reconcile them. — Nearly all of the seven months of the following session was taken up by the consideration of Clay's tariff bill, which finally became law, July 14, 1832, the vote standing 132 to sixty-five in the house and thirty-two to sixteen in the senate. The act was to go into effect March 3, 1833. It reduced the duties on many of the articles on its list to 25 per cent., instead of 30 per cent., as before; but it recognized fully the principle of protection; the heavier duties were still designed for the protection of manufactures; every southern senator and representative opposed to protection voted against the bill; and McDuffie, of South Carolina, declared in debate that it increased the amount of protection to manufactures and also the burdens of the south. — In South Carolina, where this result of the winter's session of congress had already been discounted in speculation, the next step was nullification. The legislature was convened, Oct. 22, by the governor, and passed an act calling a state convention, which met at Columbia, Nov. 19, 1832, and passed an ordinance of nullification, Nov. 24 This ordinance, 1, declared the tariff acts of 1828 and 1832 to be null, void, and no law, nor binding upon the state, its officers or citizens; 2, prohibited the payment of duties under either act within the state after Feb. 1, 1833; 3, made any appeal to the supreme court of the United States, as to the validity of the ordinance, a contempt of the state court from which the appeal was taken, punishable at the discretion of the latter; 4, ordered every office holder and juror to be sworn to support the ordinance; and 5, gave warning that, if the federal government should attempt to enforce the tariff by the use of the army or navy, or by closing the ports of the state, or should in any way harass or obstruct the state's foreign commerce, South Carolina would no longer consider herself a member of the Union, but would forthwith proceed to organize a separate government. — The two points about the ordinance which are especially to be noted, in considering the success or failure of nullification, are, 1, that the ordinance, which was now a part of the organic law of the state, irreversible except by another convention, had declared positively that the existing duties should not be collected after Feb. 1 following; and 2, that force in any form would be followed by secession. A union party, admitting the right of secession, but not that of nullification, existed in the state, but the action of the convention was generally supported in and out of the legislature. Simms, as cited among the authorities, gives the respective voting strength of the two parties at 30,000 and 15,000. The new legislature, which met in December, 1832, and was almost entirely made up of nullifiers, elected Hayne governor, put the state in a position for war, and passed various acts reassuming powers which had been expressly prohibited to the states by the constitution. Gov. Hayne's message defended the doctrine of nullification, and declared the primary allegiance of every citizen to be due to the state. (See ALLEGIANCE, III.) In January, 1833, the legislature, having passed all the acts necessary to empower state officers to resist the levy of duties, to recover property seized for non-payment of duties, and to resist the mandates of federal courts with the whole *posse comitatus*, adjourned and left the field clear for the struggle. — It is as well to group here the successive steps by which the federal government disregarded the convention's threats in case of the application of force, or of the harassing in any way of the state's foreign commerce. Nov. 6, 1832, the president had instructed the collector at Charleston to provide as many boats and inspectors as might be necessary, to seize every vessel entering the port and keep it in custody until the duties should be paid, "to retain and defend the custody of the said vessel against any forcible attempt," and to refuse to obey the legal process of state courts intended to remove the vessel from his custody. Gen. Scott was ordered to Charleston to support the collector, and a naval force was sent to the harbors of the state. Dec. 11, the president issued his so-called "nullification proclamation." It declared the doctrine of nullification to be "incompatible with the existence of the Union, contradicted expressly by the letter of the constitution, unauthorized by its spirit, inconsistent with every principle on which it was founded, and destructive of the great object for which it was formed";

but stronger than all its arguments was its warning to the people of the state: "The dictates of a high duty oblige me solemnly to announce that you can not succeed. The laws of the United States must be executed. I have no discretionary power on the subject — my duty is emphatically pronounced in the constitution. Those who told you that you might peaceably prevent their execution deceived you—they could not have been deceived themselves. Their object is disunion, and disunion by armed force is treason. Are you ready to incur its guilt? If you are, on your unhappy state will fall all the evils of the conflict you force upon the government of your country." Strong as was this language, the known character of its author added still more force to it; no man was so dull as not to understand that Andrew Jackson's "execution of the laws in the face of organized opposition" meant the utter destruction either of the president or of the opposition. In the north the proclamation was received with almost unanimous enthusiasm; in the border states it was received more coolly, even Clay finding "many things in it too ultra" for his taste; in the other southern states there was a certain feeling of neutrality, discontent with South Carolina, but determination that she should not be "coerced." Dec. 31, Gov. Hayne issued a counter-proclamation, warning the citizens of the state not to be seduced from their primary allegiance to the state by the "dangerous, pernicious, specious and false" doctrines of the president's proclamation. Jan. 16, 1833, the president, in a special message, asked congress to empower him to alter or abolish revenue districts, to remove custom houses, and to use the land and naval forces for the protection of the revenue officers against attempts to recover property by force. A bill to enforce the tariff was therefore at once introduced, was instantly nicknamed the "bloody bill"—sometimes the "force bill"; and the debate upon it not only overlapped the dreaded date, Feb. 1, 1833, but lasted until the end of the month. It became law March 2, 1833. — On both of the issues which South Carolina had forced, the state had evidently been beaten. In spite of the solemn promulgation of the unrepealed ordinance of nullification, the duties had been collected as usual after Feb. 1; force had been applied, and yet the state had not seceded. A private "meeting of leading nullifiers" in Charleston had indeed decided, late in January, that the enforcement of the ordinance should be suspended until after the adjournment of congress; but certainly it will not be pretended that a meeting of private citizens, even of "leading nullifiers," could have any authority to "suspend" a part of the organic law of the state. That would have been nullification in naked deformity—nullification even of state law by individual citizens. It is beyond a doubt that the ordinance would have been relentlessly enforced on the appointed day but for one consideration—the attitude of the executive.— On the other hand, the tendency in congress, from its first meeting in December, 1832, had been toward a modification of the tariff. Many distinct influences were at work in this direction. The rapid reduction of the debt and the probability of a surplus weighed heavily with some; many democratic representatives were by nature opposed to the principle of protection, had only taken it up because of their constituents' desire for it, and were now very willing to make "the crisis" an excuse for overthrowing it; the president's own influence had been thrown heavily in favor of a revision of the tariff; and many even of those who were honest protectionists, were disposed to lessen the magnitude of the crisis by sacrificing protection. In the house the committee of ways and means reported, Dec. 27, 1832, the administration measure, usually called the Verplanck bill, which cut the duties down to the scale of 1816, giving up all the protective duties of 1824, 1828 and 1832. Feb. 12, 1833, Clay asked permission in the senate to introduce a compromise tariff bill. Its main features were that, after Dec. 1, 1833, all *ad valorem* duties of more than 20 per cent. should be reduced one-tenth every two years until June 1, 1842, at which date the rate of 20 per cent. should be the maximum. Calhoun, who was now in the senate, agreed to the bill, assigning as a reason his desire not to injure manufactures by too sudden a reduction. The bill, assured of the support of both protectionists and nullifiers, seemed certain of success, when Clay, Feb. 21, sprung upon the nullifiers an amendment by which duties were to be paid on the value of the goods in the American port, not in the foreign port of exportation. Up to this time the house was still debating the Verplanck bill; but, Feb. 26, by a vote of 119 to eighty-one, the house passed the bill which Clay had introduced in the senate.— Everything now rested with the senate. The nullifiers there found Clay's amendment extremely distasteful, since the levying of duties on the higher American valuations was in itself protection, and on the last day but one of the session announced their final resolution to refuse to vote for it. The protectionists declared the nullification vote to be a *sine qua non*, and their leader, Clayton, of Delaware, moved to table the bill, acknowledging that it was his intention to kill it, and leave South Carolina and the president to decide the enforcement of the existing tariff. Clayton was induced to withhold his motion until the next day; in the meantime he was importuned to release Calhoun at least from the necessity of voting for the Clay amendment; but he insisted upon either the whole nullification vote for the Clay amendment, or the failure of the entire bill. The next day Calhoun unwillingly voted for the whole bill, covering his retreat by an unmeaning declaration that his vote was only given on condition that some suitable method of appraisement should be adopted. The whole bill passed the senate by a vote of twenty-nine to sixteen, and was signed by the president March 2. The South Carolina convention, March 16, met and repealed the ordinance of nullification. — It

can not be doubted that the country lived for the next nine years under a progressively less protectionist tariff, nor that the reduction of the tariff was in great measure due to the attitude of South Carolina. There is far more doubt as to whether it can be fairly said, as it has sometimes been said, that "nullification triumphed." On the contrary, it might be more fairly said that the explosion, while it stunned protection for the time, killed nullification forever. Calhoun's new constitutional scheme had aborted in every point: it had not been put in force at the appointed time; it had received no respectful recognition from the federal government; the president's "harassing of the state's commerce" had been followed, not by secession, but by an illegitimate and unofficial "suspension" of the ordinance; no convention of the states had been called to decide between the state and the government; but congress and the president, interpreting their own powers, had revised the tariff at their own discretion. Nullification was evidently still-born, though the good nature of congress gave an opportunity to perform the last rites of sepulture over it by formally repealing it. It was so dead that its own parent never again ventured to hint a hope of its revivification; and when the protective tariff of 1842 was passed, neither Calhoun nor any one else suggested a nullification, but South Carolina, like other anti-protective states, quietly submitted until a change of parties brought the revenue tariff of 1846. — It is not at all certain that the final settlement of the question, however its immediate wisdom may be questioned, was not for the greatest ultimate good of the country. On the one hand, if congress had forced the issue with the state, the question of state sovereignty and primary state allegiance would have been settled by Jackson in 1833 with the expenditure of far less blood and treasure than was expended in 1861–5. On this ground mainly, that it was not proper to yield great principles to faction, and that "the time had come to test the strength of the constitution and the government," Webster had refused to have any share in the remedy of a compromise tariff. On the other hand, it is equally certain that a conflict on such grounds would never have rid the south of the incubus of slavery. It was well that the conflict was postponed until state sovereignty and slavery, inextricably involved in a common purpose, should perish by a common disaster.
