am therefore, sir, not authorized to enter into any discussions with you on the meaning of our constitution, or to prove to you that it has ascribed to him alone the admission or interdiction of foreign agents. I inform you of the fact by authority from the president. In your letter you personally question the authority of the president, making a point of this formality on your part; it becomes necessary to make a point of it on ours also; and I am therefore charged to return you these commissions and to inform you that the president will issue no *exequatur* to any consul or vice-consul whose commission is not directed to him in the usual form." To restrict Genet to legitimate diplomatic functions was to deprive him of most of his capacity for mischief; accordingly his career in the United States may be considered finally ended. A message from the president, Jan. 20, 1794, announced that the request for the recall of Genet had been agreed to by the French government; but the utter destruction which had already overtaken his party, the Girondins, at the hands of the Jacobins, was a plain warning to Genet not to return to France. He therefore remained in New York, where he married a daughter of Governor Clinton. He attracted no further public attention until his death in 1835. — The most ambiguous position in regard to the whole affair of Genet and his mission is that of Jefferson. *Prima facie*, the whole case is strongly in his favor: his state papers are all exceedingly creditable, being frank, explicit, and yet very temperate, even including the last crushing letter of Nov. 22. His private correspondence, however, and, still more, two dispatches of Genet to the French government, July 25 and Oct. 7, 1793, have thrown some doubts on Jefferson's earnestness: Genet says, in terms, that Jefferson had at first fraternized with him, had cautioned him against the influence which Hamilton and Gouverneur Morris were exerting on the president's mind in favor of Great Britain, and had aided him in organizing his expedition against New Orleans. In an official letter of Sept. 18 to Jefferson, Genet did not hesitate to charge him with having made himself the "generous instrument" of the request for Genet's recall, "after having made me believe that you were my friend, after having initiated me into mysteries which have inflamed my hatred against all those who aspire to an absolute power," and significantly remarked, that "it is not in my character to speak, as many people do, in one way and act in another, to have an official language and a language confidential." The last covert charge is utterly unwarranted: so far as all the evidence goes, Jefferson's language, both official and confidential, was at first cordially in Genet's favor, and as cordially against him when his plan of action had become evident. In the authorities cited below, the reader will find the case fairly given in von Holst, unfavorably to Jefferson in Hildreth, and favorably to him in Randall. — The case of Genet got little notice from congress, whose attention, in the winter of 1793–4, was entirely taken up by the first proposition to attack the commercial intercourse of Great Britain and the United States. (See EMBARGO, JAY'S TREATY.) Both the Genet episode, and that of Jay's treaty which immediately followed it, are instructive instances of the almost invariable influence which successive presidents have exerted in favor of peace abroad. Washington's example was closely followed by Adams in 1798, by Jefferson during his terms of office, and by Madison until he yielded to the force of the war feeling in 1812. ALEXANDER JOHNSTON.

GENEVA ARBITRATION. The commissioners who negotiated the treaty of Washington, recorded in a protocol so much of the history of the negotiations which preceded it as they desired to preserve. They say that in the conference of March 8, 1872, the Americans made the following statement of the demand then and since known as the "Alabama claims". "That the history of the Alabama and other cruisers which had been fitted out, or armed, or equipped, or which had received augmentation of force in Great Britain or in her colonies, and of the operations of those vessels, showed extensive and direct losses in the capture and destruction of a large number of vessels with their cargoes, and in the heavy national expenditures in the pursuit of the cruisers, and indirect injury in the transfer of a large part of the American commercial marine to the British flag, in the enhanced payments of insurance, in the prolongation of the war, and in the addition of a large sum to the cost of the war and the suppression of the rebellion," and added "that in the hope of an amicable settlement no estimate was made of the indirect losses, without prejudice, however, to the right to indemnification on their account in the event of no such settlement being made." The British commissioners replied, "that the British government could not admit that Great Britain had failed to discharge toward the United States the duties imposed on her by the rules of

international law, or that she was justly liable to make good to the United States the losses occasioned by the acts of the cruisers to which the American commissioners had referred." Then "the American commissioners expressed their regret at this decision of the British commissioners." The parties then negotiated for the submission of the claims to arbitration, and concluded the treaty of Washington in part for that purpose. The first article of the treaty, after reciting that claims against Great Britain "exist, growing out of the acts committed by the several vessels which have given rise to the claims generically known as the Alabama claims," provides that "all the said claims growing out of the acts committed by the aforesaid vessels" shall be referred to a tribunal of arbitration. This tribunal assembled Dec. 15, 1871, in Geneva, in Switzerland. It consisted of the following arbitrators: Count Federigo Sclopis, of Salerano, named by the king of Italy; Baron Itajuba, named by the emperor of Brazil; Mr Jaques Staempfli, named by the president of Switzerland; Charles Francis Adams, Esq., appointed by the president of the United States, and lord chief justice Sir Alexander Cockburn, appointed by the queen of Great Britain. J. C. Bancroft Davis, Esq., represented the United States as their agent; Lord Tenterden represented Her Britannic Majesty in the same capacity. On motion of Mr. Adams, seconded by Sir Alexander Cockburn, Count Sclopis was made president, and Mr. Alexander Favrot, of Switzerland, was elected to be the secretary of the tribunal. In accordance with the terms of the treaty the agent of each government then presented printed volumes containing the "case" of his government, with accompanying proofs. — The American agent laid claim for damages for injuries committed by thirteen vessels, viz.: the Sumter; the Florida, and her tenders, the Clarence, the Tacony and the Archer; the Alabama and her tender; the Tuscaloosa; the Retribution; the Georgia, the Tallahassee; the Chicamauga; and the Shenandoah. The British agent denied that the arbitration covered more than the acts of the Alabama, the Georgia, the Florida, and the Shenandoah. The tribunal took jurisdiction of all the vessels submitted by the American agent, and exculpated Great Britain from liability for the acts of any except the Florida and her tenders, the Alabama and her tenders, and the Shenandoah after leaving Melbourne. The American demands for damage were laid in the exact language of the protocol cited above, in which they were classified as "direct" and "indirect." On Feb. 3, 1872, Lord Granville informed the American minister in London, that "the British government held that it was not within the province of the tribunal of arbitration at Geneva to decide upon the claims for indirect losses and injuries put forward in the case of the United States." — Pending the diplomatic discussion which followed, the two agents met at Geneva, April 15, to put in the counter cases of their respective governments, and while there discussed the mode of settling the difficulty in case it could not be settled diplomatically. Soon after the reassembling of the tribunal in June (no diplomatic adjustment being reached) the plan discussed by the agents in April was practically carried out. The tribunal, of its own accord, declared that without expressing an opinion on the political question which had arisen, they were individually and collectively of opinion that the "indirect claims" did not "constitute, upon the principles of international law applicable to such cases, good foundation for an award of compensation or computation of damages." This decision was accepted by both governments as a satisfactory disposition of the disputed matter — With the scope of the arbitration thus settled, the tribunal made the following disposition of the matters before it. The treaty laid down three rules for the guidance of the arbitrators, viz.: "That a neutral government is bound, 1, to use due diligence to prevent the fitting out, arming or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use; 2, not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of the renewal or augmentation of military supplies or arms, or the recruitment of men, 3, to exercise due diligence in its own ports or waters, and, as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties." — The United States rested their demand on these propositions: that the British government, by the indiscreet haste with which the proclamation of neutrality (see ALABAMA CLAIMS) was issued, by the preconcerted action with France respecting the declarations of the congress of Paris, by refusing to amend the defective neutrality laws, by the delay in seizing a vessel which was evidently being fitted out at Liverpool and intended to carry on war with the United States, a country with which Great Britain was then at peace, and other unfriendly acts, and individual members of the government by open expressions of sympathy with the insurgents, had exhibited an unfriendly feeling which might affect their own course, and must have affected the action of their subordinates; that these facts proved an animus in the government and imbued with a character of culpable negligence many of the acts of its subordinates complained of for which a government might not otherwise be held responsible; and that Great Britain had always maintained a right to permit vessels like the Alabama to be constructed and equipped in her ports, so that in point of law she held that there was no

obligation to exercise due diligence to prevent their departure. — On these points the tribunal decided that "the due diligence referred to in the first and third of the said rules ought to be exercised by neutral governments in exact proportion to the risks to which either of the belligerents may be exposed from a failure to fulfill neutrality on their part." "The circumstances out of which the facts constituting the subject matter of the present controversy arose were of a nature to call for the exercise on the part of Her Britannic Majesty's government of all possible solicitude for the observance of the rights and duties involved in the proclamation of neutrality." — The American case also contended that the treaty required that when a vessel which had been especially adapted for war within a neutral port for the use of a belligerent in war comes again within the neutral's jurisdiction, the neutral should seize and detain it. The British papers contended that the obligations created by the treaty refer only to the duty of preventing the original departure of the vessel, and that the fact that it was, after the original departure from a neutral port, commissioned as a ship of war, protects it against detention. On this point the tribunal decided as follows: "The effects of a violation of neutrality, committed by means of the construction, equipment and armament of a vessel, are not done away with by any commission which the government of the belligerent power benefited by the violation of neutrality may afterward have granted to that vessel; and the ultimate step by which the offense is completed can not be admissible as a ground for the absolution of the offender, nor can the consummation of his fraud become the means of establishing his innocence. The privilege of exterritoriality, accorded to vessels of war, has been admitted into the law of nations, not as an absolute right, but solely as a proceeding founded on the principles of courtesy and mutual deference between different nations, and therefore can never be appealed to for the protection of acts done in violation of neutrality." — It was further contended in the American case that the insurgent cruisers had such advantages in British ports over the vessels of the United States in the storing and receiving of coal as made the ports bases of hostile operations against the United States. On this point the tribunal said: "In order to impart to any supplies of coal a character inconsistent with the second rule, prohibiting the use of neutral ports or waters as a base of naval operations for a belligerent, it is necessary that the said supplies should be connected with special circumstances of time, of persons, or of place, which may combine to give them such a character;" but Viscount d'Itajuba, while signing the award, recorded in the protocol his opinion that "every government is free to furnish to the belligerents more or less of that article." — The American case also contended that Great Britain could not escape liability by reason of alleged deficiencies in internal legislation enacted for the purpose of enabling the government to fulfill its international duties. The tribunal held that "the government of Her Britannic Majesty can not justify itself for a failure in due diligence on the insufficiency of the legal means of action which it possessed." — The American pleadings urged the importance of awarding a sum in gross, and thus closing the political question; and contended that interest should form a part of the sum so awarded, that the United States should be repaid for its outlays in pursuit of the cruisers, and that the sufferers should be compensated for the loss of prospective earnings. The tables of damages presented by the United States also presented claims for gross freights The tribunal decided that no compensation should be made for the pursuit of the cruisers; that none should be made for prospective earnings, "as they depend in their nature on future and uncertain contingencies", that net freights only should be allowed; and that "it is just and reasonable to allow interest at a reasonable rate"; and "by a majority of four voices to one awarded to the United a sum of $15,500,000 in gold as the indemnity to be paid by Great Britain to the United States as the satisfaction of all the claims referred to the consideration of the tribunal." This award was signed by Count Sclopis, Viscount d'Itajuba, Mr. Staempfli and Mr. Adams, Sept. 14, 1872. Sir Alexander Cockburn refused to sign it, and filed a long dissenting opinion. The president then declared the tribunal to be dissolved.

J. C. Bancroft Davis.

GEORGIA, one of the thirteen original United States. Its territory was originally included in the charter of 1662–3 to the lords proprietors of the Carolinas, but was set apart by a royal charter of June 9, 1732, to a company organized by James Oglethorpe to provide homes in America for indigent persons. The boundaries of the new colony were laid down in the charter as follows: "All those lands, countrys and territories situate, lying and being in that part of South Carolina, in America, which lies from the most northern part of a stream or river there, commonly called the Savannah, all along the sea coast, to the southward, unto the most southern stream of a certain other great water or river called the Alatamaha, and westerly from the heads of the said rivers respectively in direct lines to the south seas." This boundary was more precisely defined by the state constitution of 1798 as beginning at the mouth of the Savannah, running up that river and the Tugalo to the headwaters of the latter, thence straight west to the Mississippi, down that river to parallel 31° north latitude, thence east on that parallel to the Appalachicola or Chattahoochee, along that river to the Flint, thence straight to the head of the St. Mary's river, along that river to the Atlantic, and thence along the coast to the place of beginning. June 20, 1752, the charter was surrendered, and the colony became a royal province. — The first state constitu-

tion was adopted by a state convention, Feb. 5, 1777. It changed the name of parish to that of county, gave the choice of the governor to the legislature, fixed the governor's term at one year, and forbade the election of any person as governor for more than one year in three. A new constitution was formed by a state convention which met at Augusta, Nov. 4, 1788, and was ratified by another convention at the same place, May 6, 1789. Among other changes, it prolonged the governor's term to two years, and directed the senate to elect the governor from three names to be selected by the house. By an amendment adopted by a new state convention at Louisville, May 16, 1795, Louisville was made the permanent seat of government. Another constitution was adopted in state convention at Louisville, May 30, 1798. It abolished the African slave trade, but forbade the legislature to emancipate slaves without the consent of their owners, or to prevent immigrants from other states from bringing their slaves with them. Various amendments to this constitution were made up to and including the secession convention of 1861, the only one necessary to specify here being that of Nov. 17, 1824, which transferred the election of governor to the people. The changes produced by the rebellion will be given hereafter. — The territory originally claimed by Georgia, extending from the Atlantic coast to the Mississippi, was diminished in 1798 by the formation of Mississippi territory, from which the states of Mississippi and Alabama were afterward formed. (See those states.) All this territory was claimed by Georgia under her charter, the king's proclamation of 1763, and a cession by South Carolina, in April, 1787, of her claims under the original charter. The United States claimed it on the ground that it had been annexed to the British province of West Florida before the revolution, and had been ceded by Great Britain to the United States by the peace of 1783. The controversy was settled by the convention of April 24, 1802, between the United States and Georgia, by which the latter ceded her claims to the territory in dispute, in consideration of $1,250,000, and a stipulation that the United States would extinguish the Indian title to lands within the state of Georgia, for the use of Georgia, "as soon as the same can be peaceably obtained upon reasonable terms." (See CHEROKEE CASE.) — In presidential elections the electoral votes of Georgia have always been cast for democratic candidates, except in 1840 and 1848, when they were cast for Harrison and Taylor respectively, the whig candidates. In 1789 and 1792 the Georgia electors voted for Washington for the presidency and for various democrats for the vice-presidency. (See ELECTORAL VOTES.) In 1824 the Georgia electors voted for Crawford, and in 1836 for White (see those names), both of these being democrats. Until 1844 the congressional elections were by general ticket, a majority of the electors of the state choosing all the congressmen of the state. Under this system the congressmen were regularly democratic. The federal party made little opposition to the dominant party in the state, but soon after 1830 a strong whig vote appeared and endured until 1855, its best known members being John M. Berrien, Alexander H. Stephens, Thomas Butler King, and Robert Toombs. In 1838 the whigs, by a coalition with the "state rights" faction, elected all the nine congressmen, though four of them afterward declared for Van Buren; and in other years the legislature occasionally chose a whig United States senator. After the adoption of the district system in 1844, the eight districts of the state were at first evenly divided between the two parties. In 1848 the whigs permanently lost one of their districts and in 1850 another; but the seventh and eighth districts, composed of the central counties of the state eastward to the Savannah river, and represented by Stephens and Toombs, remained whig until the final overthrow of the party. The majorities in the democratic districts, though steady, were always very small. After the death of the whig party, an American party appeared in the state. (See WHIG PARTY, AMERICAN PARTY.) Until 1861 it held two of the congressional districts of the state, and maintained a strong vote in the others. To sum up, Georgia was, from 1830 until 1861, one of the most evenly divided of the southern states, and yet one of the steadiest in general vote and in proportional party strength. — The state elections until 1830 were undisputedly democratic, and all political struggles were entirely personal between different members of the same party. From 1796 until 1810 the claim of land companies to the Mississippi lands claimed by Georgia was the controlling issue in state politics, as was the case from 1825 until 1835 with the removal of the Creek and Cherokee Indians from the state. (See YAZOO FRAUDS, CHEROKEE CASE.) The "state rights party" of Gov. Troup retained its organization after its victory in the Cherokee case. It was still often known as the "Troup party" until about 1837; but in 1832 Thos. B. King and others of its leaders so committed it against Jackson that it gradually became the Georgia whig party. — After 1830 the state elections resulted almost as steadily in democratic success, but with much greater difficulty. Although but one governor, Crawford, was an avowed whig, the whig party in the state disputed every election vigorously, aided in electing at least one governor, Gilmer, in opposition to the national or regular democratic candidate, and frequently controlled the legislature, generally in years not affected by a presidential election. As a general rule the whig vote in the state may be reckoned at from 47 to 49 per cent. of the total, occasionally rising to a majority. — The formation of the so-called American party in the state reduced the opposition vote to about 40 per cent., and this proportion represents the opposition in 1860–61 both to the election of Breckinridge and to secession. The oppo-

sition to the latter measure, as elsewhere mentioned, was to the advisability, not to the principle, of secession, and ceased when the majority had pronounced the decision. Indeed, the leader of the so-called union party of the state, A. H. Stephens, was almost immediately elected vice-president of the new southern confederacy. (See ALLEGIANCE, SECESSION, CONFEDERATE STATES.) — In November, 1860, an act of the legislature provided for a special election for delegates to a state convention, which met at Milledgeville, Jan. 16, 1861. Jan. 19, by a vote of 208 to 89, an ordinance of secession was passed. It repealed the ordinance ratifying the constitution, and the acts ratifying the amendments to the constitution, dissolved the union between Georgia and the other states, and declared "that the state of Georgia is in the full possession and exercise of all those rights of sovereignty which belong and appertain to a free and independent state." The minority, however, signed the ordinance, as a pledge that they would sustain their state, with the exception of six; and these yielded so far as to place on the minutes a pledge of "their lives, fortunes and honor" to the defense of the state. Ten delegates were chosen by the convention to represent the state at the organization of the provisional government in Montgomery, and Georgia thus became one of the confederate states. The progress of the war developed a considerable opposition in Georgia to the confederate government. In the leaders it took the form of a sublimated state sovereignty, in opposition to the despotic acts of the executive; but in the mass of voters there seems to have been a strong undercurrent in favor of reconstruction in its first form, that is, re-entrance to the Union on terms. April 30, 1865, the Sherman-Johnston agreement ended the rebellion in Georgia. (See CONFEDERATE STATES, REBELLION, RECONSTRUCTION.) — June 17, 1865, James Johnson was appointed provisional governor of the state Under his directions a convention met at Milledgeville, Oct. 25, repealed the ordinance of secession, voided the war debt, and adopted a new state constitution, Nov. 7, which was ratified by popular vote. It recognized the abolition of slavery by the federal government as a war measure, but reserved the right of its citizens to appeal to "the justice and magnanimity of that government" for compensation for slaves; it made the governor ineligible for re-election; it confined the right of suffrage to free white male citizens; and it enjoined upon the legislature the duty of providing by law for "the government of free persons of color." State officers were elected Nov. 15, 1865, the legislature met in December, and the state remained under the new form of government until March, 1867. (See RECONSTRUCTION.) The state then became a part of the third military district, under Maj. Gen. John Pope. Under the direction of Maj. Gen. Meade, who succeeded him, a state convention met at Atlanta, Dec. 8, 1867, and formed a new constitution, which was ratified, April 20, 1868, by a popular vote of 89,007 to 71,309. It declared the paramount allegiance of the citizen to be due to the constitution and government of the United States, voided all state laws "in contravention or subversion thereof," declared all persons born or naturalized in the United States, and residents in the state, to be citizens of the state, forbade the legislature to abridge the privileges or immunities of citizens, abolished slavery and the limitation of suffrage to white males, prolonged the governor's term to four years, and voided all contracts for the encouragement of rebellion, made and not executed. Some changes, not affecting any of the above points, were made in congress, and the state was readmitted by act of June 25, 1868. — The election at which the constitution had been ratified had resulted in the choice of republican state officers, a republican senate, and a democratic house of representatives. In July the new state officers entered on their duties and the legislature ratified the congressional changes in the constitution, but during this and the next month the legislature proceeded to declare negroes ineligible to membership in it, and to admit to membership several persons who, it was alleged, were disqualified to hold office by the 14th amendment. During the year the state supreme court decided in favor of the eligibility of negroes to office, but the action of the legislature provoked an unfavorable feeling to Georgia in congress, and was construed as an effort to avoid the terms of reconstruction. In December, therefore, the Georgia senators were not admitted, and did not obtain their seats until January and February, 1871; the representatives had been admitted July 25 1868. The Georgia electors, in obedience to a state law passed under the confederacy and not repealed in 1880, voted Dec. 9, 1868, the second Wednesday of December, instead of the first, as required by the federal statute. On this nominal ground a vigorous effort was made in February, 1869, to reject the vote of Georgia, but it was counted "in the alternative." (See ELECTORS, VII.) — Nothing, however, could save Georgia from re-reconstruction. The act of Dec. 23, 1869, authorized the governor to reconvene the legislature, with only such members as the reconstruction acts allowed, prohibited the exclusion of qualified members, authorized the use of the army and navy to support the governor, and imposed upon the legislature the ratification of the proposed 15th amendment as a condition precedent to the admission of senators and representatives from Georgia. The seats of the representatives also were thus vacated until January and February, 1871. The organization of the legislature in January and February, 1870, was only effected with great difficulty by the governor, and his irregular course of action was condemned by the senate investigating committee; but the organization was finally accomplished, the conditions fulfilled by the legislature, and the

state admitted by act of July 15, 1870. The first election under the new régime took place Dec. 20–22, 1870, and resulted in the choice of democratic state officers, and of five democratic and two republican representatives in congress. At the next election for congressmen, 1872, the state having been re-districted, the republicans lost one congressman and gained one At the next election, 1874, the democrats elected all the nine congressmen; in two districts the republican vote entirely disappeared, and in all the others it was much reduced. Since that time the state has been democratic in all elections, state and national, and the political contest has been confined to factions of the dominant party. The peculiar state law, requiring electors to vote on the *second* Wednesday of December, excited some comment in 1881, but the undisputed republican majority in the presidential election of 1880 allowed the state's electoral votes to be admitted without objection.—A new constitution was formed by a convention which met at Atlanta, July 11, 1877, and was ratified by popular vote, Dec. 5. Its only noteworthy changes were its location of the state capital at Atlanta, and its limitation of the right of suffrage by prohibiting any one convicted of a penitentiary offense, and not pardoned, from registering, voting or holding office.—The most prominent citizens of the state in national politics have been William H. Crawford, Herschel V. Johnson, and Alexander H. Stephens. (See those names.) Reference should also be made (see also list of governors) to John M. Berrien, democratic United States senator 1825–9, attorney general under Jackson (see ADMINISTRATIONS), and whig United States senator, 1841–52; Joseph E. Brown, democratic United States senator 1879–85; Howell Cobb, democratic representative 1843–51 and 1855–7, speaker of the house 1849–51, and secretary of the treasury under Buchanan (see ADMINISTRATIONS); John Forsyth, democratic representative 1813–18, United States senator 1818–19 and 1829–34, minister to Spain 1819–23, and secretary of state under Jackson and Van Buren (see ADMINISTRATIONS); Joseph Habersham, postmaster general 1795–1801; Benj. H. Hill, democratic United States senator 1877–82; Thos. Butler King, whig representative 1839–43 and 1845–9; Wilson Lumpkin, democratic representative 1815–17 and 1827–31, and United States senator 1837–41; John Milledge, democratic representative 1792–3, 1795–9, and 1801–2, and United States senator 1806–9; and Robert Toombs, whig representative 1845–53, democratic United States senator 1853–61, and secretary of state of the confederate states. — The name of Georgia was given to the colony in 1732 in honor of King George II. The prosperity of the state and its vast possibilities of future growth have encouraged its citizens to give it the popular name of the empire state of the south. — GOVERNORS. George Walton (1789–90); Edward Telfair (1790–3); Geo. Matthews (1793–6); Jared Irwin (1796–8); James Jackson (1798–1801); Josiah Tatnall (1801–2); John Milledge (1802–6); Jared Irwin (1806–9); David B. Mitchell (1809–13); Peter Early (1813–15); David B. Mitchell (1815–17); William Rabun (1817–19); John Clark (1819–23); George M. Troup (1823–7); John Forsyth (1827–9); George R. Gilmer (1829–31); Wilson Lumpkin (1831–5); William Schley (1835–7); George R. Gilmer (1837–9); Charles J. McDonald (1839–43); George W. Crawford (1843–7); G. W. B. Towns (1847–51); Howell Cobb (1851–3); Herschel V. Johnson (1853–7); Joseph E. Brown (1857–65); James Johnson (provisional, 1865); Charles J. Jenkins (1865–7); John Pope and G. G. Meade (military governors, March, 1867 – June, 1868); Rufus B. Bullock (June, 1868 – October, 1871); Benjamin Conley (acting, October, 1871 – January, 1872); James M. Smith (chosen by special election, January, 1872 – January, 1877); Alfred H. Colquitt (1877–83).—See 1 Poore's *Federal and State Constitutions;* 3 Hildreth's *United States*, 532; 1 *Stat. at Large* (Bioren and Duane's edition), 448, 488; White's *Hist. ALEXANDER JOHNSTON.

GERMAN EMPIRE. I. *Area and Population.* The geographical position of Germany is almost in the centre of Europe, it being situated between the Slavonic lands of the East, and the Romanic countries of the West and South, and bordering in the north on Denmark, the home of a people who are the kinsfolk of the Germans. At one time the whole country from the Rhone to the eastern banks of the Vistula was tributary to the German king, when he, as emperor of Rome, extended his supremacy even over Italy. Of Poland, which was also tributary to him, the German rulers retained Silesia and Posen, and of Denmark they held Schleswig-Holstein; but all the land in the west, Lotharingia (Lorraine) and Arles, was in the course of time incorporated into France, which succeeded in securing even provinces whose population was chiefly of the Teutonic stock — Elsass (Alsace) and German Lotharingia (Lorraine), which, however, through the war of 1871, again came under German rule. Others, such as Switzerland and the Netherlands, were, through the peace of Westphalia, completely cut off from the empire. The only province which, until the wars of the French revolution, still formed part of the imperial dominion—Belgium—was, by the congress of Vienna, ceded to the Netherlands. For her losses in the west, Germany was partly compensated by an acquisition of territory in the east, where it made some inroads upon the Slavonic population. — The

present territory of the German empire, by the terms of the treaties between the North German confederation and the South German states (December, 1870), and through the acquisition of Elsass (Alsace) and German Lotharingia (Lorraine), embraces all the territory of the German league (Deutsche Bund), excepting Austria, Luxemburg and Liechtenstein, and includes the Prussian provinces—Prussia, Posen and Silesia—and the imperial province or territory of Elsass-Lothringen (Alsace-Lorraine). It is bounded on the north by the North sea, Denmark and the Baltic; on the east by Russia, Poland and Galicia; on the south by Austria from the Vistula to the lake of Constance, and Switzerland; on the west by France, Luxemburg, Belgium and the Netherlands. The present area and the population of the different states and principalities of the empire, including Elsass-Lothringen, according to the census of Dec. 1, 1880, are shown in the following table:

	STATES OF THE EMPIRE	Area, English square miles	Population Dec 1, 1875.	Population, Dec. 1, 1880.
1.	Prussia	137,066	25,742,404	27,278,911
2.	Bavaria	29,292	5,022,390	5 284,778
3	Würtemberg	7,675	1,881,505	1,971,118
4	Saxony	6,777	2,760,586	2,972,805
5.	Baden	5,851	1,507,179	1,570,196
6	Mecklenberg-Schwerin	4,834	553,785	577,055
7	Hesse	2,866	884,218	936,340
8.	Oldenburg	2,417	319,314	337,478
9.	Braunschweig	1,526	327,493	349,367
10.	Saxe-Weimar	1,421	292,933	309,577
11.	Mecklenburg-Strelitz	997	95,673	100.269
12.	Saxe-Meiningen	933	194,494	207,075
13.	Anhalt	869	213,565	232,592
14.	Saxe-Coburg	816	182,599	194,716
15.	Saxe-Altenburg	509	145,844	155,036
16.	Waldeck	466	54,743	56,548
17.	Lippe	445	112,452	120,246
18.	Schwarzburg-Rudolstadt	340	76,676	80 296
19.	Schwarzburg-Sondershausen	318	67,480	71,107
20.	Reuss-Schleiz	297	92,375	101,330
21	Schaumburg-Lippe	212	33,133	35,374
22.	Reuss-Greiz	148	46,965	50,782
23	Hamburg	148	338,618	453 869
24.	Lübeck	127	56,912	63,571
25.	Bremen	106	142,200	155,723
26	Elsass-Lothringen	5,580	1,531,804	1,566,670
	Total	212,036	42,727,360	45,238,829

As may be seen from the above table, the free towns, Hamburg, Bremen and Lübeck, take the lead as regards the increase of population during the census period, 1875–80; next comes Saxony, while Prussia comes last. As far as the decrease of the population is concerned, it was largest in the imperial province of Elsass-Lothringen. Of the total number of the population given, there were in the empire 22,185,433 males and 23,048,628 females; 275,856 were foreigners. The population of the principal cities having over 100,000 inhabitants, was, according to the census of 1875 and 1880, respectively, as follows:

CITIES.	Population, Dec 1, 1875.	Population, Dec 1. 1880.
Prussia—		
Berlin	966,872	1,122,360
Breslau	239,050	272,390
Köln (Cologne)	135,371	144,751
Königsberg	122,636	140,896
Magdeburg	122,789	137,109
Frankfort-on-Maine	103,136	137,600
Hanover	106,677	122,860
Danzig	97,931	108,549
Bavaria—		
München (Munich)	193,024	230,123
Würtemberg—		
Stuttgart		117,303
Saxony—		
Dresden		220,818
Leipzig		149,801
City of Hamburg, with suburbs	345,801	410,127
Elsass-Lothringen—		
Strasburg		104,501

—Emigration, which had been on the decline for a short time, mainly owing to the unsettled condition during the civil war, of the United States, which received the largest average number of emigrants, has again been on the increase, especially since 1879. The number of German emigrants during the period 1870–80 was 625,425. Out of every 10,000 emigrants 9,345 went to the United States, 22 to Canada, 4 to Central America and Mexico, 13 to the West Indies, 351 to Brazil, 73 to other states of South America, 21 to Africa, 5 to Asia, and 166 to Australia. Taking the census of 1875 as a basis, 13.9 out of every 1,000, emigrated from the German empire. Emigration was at its highest in 1854, when over a quarter of a million persons left Germany; after which it gradually declined till 1862, in which year the number was as low as 27,529; it rose again slowly, with fluctuations, till 1872, when there were 155,595 persons who left for the United States alone. In 1873 the total number was 130,937; in 1874 it was 75,502; in 1875 it declined to 56,289; in 1876, to 37,803; in 1877, to 21,964. In 1878 it again rose to 24,217; in 1879, to 33,327; and in 1880, to 106,190. Of the latter there were 63,778 men and 42,412 women, and about 103,115 emigrated to the United States of America, and 2,119 persons to Brazil. In 1881 emigration materially increased again. During the period 1846–80 the total number of emigrants to the United States was over 3,000,000. — II. *Trade and Industry.* As a branch of the industries whose province it is to develop the natural resources of a country, agriculture has attained a high state of perfection in Germany. Almost two-thirds of the entire population are engaged in it. The largest crops are returned by the low lands in the province of Prussia, the districts at the foot of the Alps in Bavaria, those at the foot of the mountain range from the upper Oder to the Maas river, the fertile marshes along the North sea, the strips along the Baltic, and those along the rivers and in the valleys.—On the basis of the statistics taken in 1878, showing the state of agriculture in the empire, the following figures are obtained:

	Hectare	Per cent. of the Total Area
Arable and garden land	26,059,108	48.3
Vineyards	131,846	0 2
Meadow land	5 917,739	11 0
Pasture	4,611,803	8.5
Forest and woodland	13,872,7.8	25 7
Lands neither used for agricultural purposes nor for forestry	3,400,543	6.3
Total area	53,995,767	100.0

An approximate estimate of the cultivable and uncultivable area is given by the official returns, of the same year, from the states and districts named in the following tables:

STATES AND DISTRICTS.	Cultivable.		Uncultivable	
	Square Miles.	Per ct. of Total	Square Miles	Per ct of Total
Prussia, including the minor states of North Germany.	134,400	97.7	12,130	8 8
Thüringia	4,450	93.7	300	6.3
Saxony	5,570	96 0	230	4.0
Bavaria	27,500	93 8	1,800	6.2
Würtemberg	7,200	95.6	330	4.4
Baden	5,200	89.4	630	10 6
Elsass-Lothringen	5,200	90.9	520	9.1
Hesse	2,850	96.0	120	4 0
Total	192,370	92 3	16,050	7 7

The following table shows the principal products during the year 1880:

PRODUCTS.	Area.	Quantity.	Percentage.
	Hectare.	Tons.	
Wheat	1,815,230	2,345,278	1.29
Spelt	386,417	489,340	1 26
One-grained wheat	6,919	6,223	0.89
Rye	5,920,6?8	4,962,525	0 83
Barley	1,623,999	2,145,617	1.32
Oats	3,793,252	4,228,128	1 13
Buckwheat	244,644	133,679	0 35
Maize	8,713	10,683	1.25
Pease	467,592	376,297	0.80
Lentils	33,882	29,093	0 86
Beans	151,591	209,459	1.31
Vetches	173,448	154,145	0 89
Lupines	410,125	174,056	0 42
Maslin	358,915	399,220	1.14
Potatoes	2,767,934	19,466,242	7 05
Beet-root	507,192	11,438,852	22.21
" (Seeds)	4,122	6,888	1 67
Rape	179,054	157,444	0.93
Flax	129,310	76,432	0.59
Hemp	17,944	10,800	0.60
Tobacco	20,415	34,955	1.71
Hops	39,049	23,450	0.60
Chicory	10,396	201,428	19.37
Clover	1,900,616	6,930,996	3.65
Lucern	227,559	1,083,536	4.76
Timothy	13,626	35,?98	2 65
		Hecto. wine.	
Vine products	115,640	523,560	4 50

Comparing the crops of 1880 with the products imported and exported, our table shows the following results regarding the quantities of the principal products:

PRODUCTS.	Harvest, 1880, 1881.	Imports, 1880-1.	Exports, 1880-1.	Total.	Seed	Left for Consumption.
	Tons.	Tons.	Tons	Tons.	Tons.	Tons.
Rye	5,562,435	758,002	18,239	5,712,288	832,827	4,879,463
Wheat	2,278,606	477,965	145,364	2,707,879	313,271	2,394,608
Barley	2,057,358	362,003	106,602	2,399,018	235,547	2,163,471
Oats	4,264,25?	202,698	3,877	4,392,055	595,538	3,796,517
Potatoes	18,904,596	25,971	282,477	19,209,736	5,523,568	13,687,262

—The development of the mines is a very ancient branch of German industry, which at present employs a large number of men, and gives a powerful impetus to kindred branches of industry. Though the precious metals, such as gold and silver, are not very abundant, the production of silver is probably the largest of any country in Europe. The quality of zinc obtained is only second to that of English zinc; lead is found in abundance; copper is also found in large quantities. Iron is found in quantities greatly exceeding those of any other mineral product; especially in Westphalia and the Rhenish provinces. The quantity of hard coal obtained is increasing from year to year, while the yield of salt is also very large. The production of metals and minerals in 1880 shows an increase over that of the year previous, as appears from the following table:

	Quantity Produced, in tons of 1,000 Kg.		Value of Production, in mark.	
	1880.	1879.	1880.	1879.
Hard coal	46,973,566	42,025,687	245,665	205,703
Lignite (Braun-Kohle)	12,144,469	11,445,029	36,710	35,227
Rock salt	272 270	238,160	1,805	1,591
Cainite and other salts	665,849	661 673	6,783	6,114
Iron ore	7 238,640	5,859,440	34,453	26,692
Zinc ore	632,896	589,546	11,930	8,050
Lead ore	159,726	149,055	19,122	17,843
Copper ore	480,854	398 828	11,996	10,073
Gold and silver ore	20,578	22,314	3,812	3,908
Salt	450,187	429 051	11,867	11,328
Pig iron	2,729,038	2,226,588	163,390	112,32.2
Zinc	99,646	96.757	33,871	27,825
Lead	85,928	82,362	35,415	22,877
Copper	13 839	9,859	18 447	11,960
Silver	186,010	117,506	28,608	26,560
	88 Kg.	8 Kg.		
Gold	462,96 Kg.	466,68 Kg.	1,292	1,302
Cast iron	514,847	448,016	94,716	81,232
Forged iron and steel	1,358,470	1,215,679	200,514	169,524
Smelted iron	660,591	500,901	136,413	112,811

The growth of the iron industry is shown by the following figures:

	1878.	1879.	1880.
Manufactured iron, in tons	2,125,320	2,190,356	2,570,783
Value, in mark	362,269,641	367,171,641	437,457,614
Laborers.....No.	92 026	96,956	106,968

The number of laborers employed in the manufacture of iron was, in 1878, 135,973; in 1879, 144,534; and in 1880, 163,899. —The census taken in 1875 regarding the different trades gives the following figures:

PERSONS ENGAGED.	German Empire.	Prussia	Bavaria.	Saxony.	Wurtemberg.	Baden	Elsass-Lothringen.	The other States.
1. Horticulture	25,464	11,911	4,610	2,954	855	833	778	3,523
2. Fisheries	19,626	15,285	1,245	139	161	554	359	1,893
3 Mines	433,206	361,406	10,209	32,008	2,407	742	14,308	12,126
4. Mason work and potteries	265,555	142,747	36,427	21,720	8,575	8,198	11,945	35,343

—The growth of German commerce was greatly aided by the customs union (*Zollverein*) organized in 1833, under the lead of Prussia, and which gradually took in all the states of Germany. Through it and the formation, under the constitution, in 1871, of the territory subject to the uniform operation of the customs and excise laws of the empire (*Zoll-u-Handelsgebiet*), Germany was at last enabled to secure the position it now holds among the commercial nations of the world; a position it could not have achieved without it, divided as it had been from a political and economical point of view. The present union embraces all the states of the empire, with the exception of the free towns of Hamburg and Bremen, and localities which, owing to their geographical position, can not properly be incorporated into it. The free towns are to remain outside the union until they themselves demand admittance. Under the constitution, the powers and the duties of the former Zollverein parliament were vested in the imperial diet, while those of the council were transferred to the Bundesrath, which has three standing committees, namely, on finance, on taxes and customs, and on trade and commerce. All the receipts of the union are paid into a common treasury, and distributed among the several states of the empire in proportion to their respective population. The chief sources of revenue are customs duties, principally on imports, and taxes on spirits, wine, sugar manufactured from beet root, and tobacco. The population of the territory included in the customs union is estimated at 42,337,974, according to the census of 1875.—The following statement gives the estimated value of the imports and exports in 1880 (figures are given in thousands):

	Imports	Exports.
Articles of Consumption.	Mark.	Mark.
1 Grain	330,704	194,228
2. Fermented liquors	39,914	54,804
3. Colonial wares	172,324	144.000
4. Tobacco and cigars	23,905	3,746
5. Seeds and fruit	110 670	52,063
6 Animals and fodder	317,599	196,373
Total	985.146	645.214
Raw Materials.		
7. Fuel	30,539	57,139
8. Vein material, ores and stone	62,916	63,811

—The railways of the empire as far as completed on July 1, 1881, and open for traffic, had a total length of 33,872 kilometres, or 21,000 English miles. The policy of the imperial government is to acquire, as soon as practicable, the right of property in all these lines, and place them under its exclusive control and management. — As regards the telegraph service, we find that the total number of dispatches in the year 1880 was 14,412,598, of which 9,448,128 were inland, and 4,964,470 foreign. The telegraph lines had, at the end of 1880, a length of 59,961 kilometres. — The imperial postoffice carried 575,309,050 letters, 140,981,960 postal cards, 8,463,070 patterns, 104,100,720 stamped wrappers, and 348,973,287 newspapers, in the year 1880. The total receipts of the postoffice (including telegraphic service) in 1880–81, amounted to 136,647,195 mark, and the total expenditure to 120,237,476 mark. The postoffices were 7,540 in number, with 5,659 telegraphic stations, at the end of 1880, and 63,413 persons were employed in the service. — III. *Religion and Education.* In regard to the constitution and organization of the leading churches in the empire, it must be noticed, that of these churches the Protestant, or Evangelical, are not all alike in the several states. Though Prussia has circuit and provincial synods, it still is in want of a general representative body of the entire church, in which ecclesiastical authority might be completely vested. The supreme executive and administrative authority of the church is represented by the ecclesiastical council. The synodic system may be found in a more perfect form in Bavaria, Saxony, Würtemberg, Baden, Hesse, Saxe-Weimar, Oldenburg, Brunswick and Waldeck. In all these states, and in Elsass-Lothringen and the Hanse Towns, the organization and constitution of the church is presbyterial; in most of the other states the consistorial system prevails. The higher clergy are the general superintendents, the superintendents (deacons). and in Elsass-Lothringen the ecclesiastical inspectors. The total number of ministers of the Protestant church in the empire is 16,000. The Catholic church has five archbishoprics: Köln and Gnesen-Posen in Prussia; München-Freising and Bamberg in Bavaria, Freiburg in Baden, Würtemberg, Hohenzollern, Hessen-Nassau—twenty bishoprics: Ermland, Kulm, Breslau, Hildesheim, Osnabrück, Münster, Paderborn, Fulda, Limburg and Trier, in Prussia; Augsburg, Passau, Regensburg, Eichstädt, Würzburg and Speyer, in Bavaria; Röttenburg in Würtemberg, Mainz in Hesse, Strasburg and Metz in Elsass-Lothringen, and three apostolic vicariates. In the several states of the empire there are, in all, about 20,000 priests and more than 800 monastic institutions. The Jesuits and a number of similar orders were, by the act of July 4, 1872, excluded from the territory of the empire. The Old Catholics have one bishop, who has his seat at Bonn. — According to the census of 1875, the different churches and denominations were, as regards the number of their adherents, as follows:

STATES.	Protestants.	Roman and Old Catholics	Christian Sects of various Denominations.	Israelites.	Members of other Denominations and such Persons as do not belong to any.
Prussia	16,712,700	8,625,840	59,400	339,790	4,674

—Popular education in Germany is of the highest order, and in regard to the number of people enjoying an average education, Germany is among the first. Since 1854, until the establishment of the empire, the secular authorities in the Protestant states even indulged in the opinion that the revolutionary and liberal spirit residing in the masses might be kept down by handing the schools over to the absolute control of the clergy. But those who fathered this surrender of the secular character of the people's schools, could not prevent the ultramontanes from taking advantage of the discontent that was aroused among the people, and securing for themselves whatever benefits there were in the reaction of the church against the spirit of liberalism aroused among the masses, as an incident to the revolutionary movement that swept over Germany in 1848. Since the establishment of the German empire under the headship of a state whose population is largely Protestant, the dangers which lay in handing over an institution—which, as the common schools, exercises such a powerful influence on the character of the people—to the exclusive control of the clergy, became even more apparent, and a movement is slowly setting in, which is in favor of placing the educational institutions of the people on a more liberal basis and making them more independent of the authority of the church. The census taken in Prussia in 1871 also paid some attention to education. There were, in Prussia, 16,008,417 persons over ten years of age who could read and write; of 296,084 persons over ten years, the educational condition was not stated; while 2,258,490 persons, or 12 per cent., over ten years, were reported as without any education. The proportion in the several provinces is somewhat different, as the following table shows:

STATES.	Educated Persons.	Persons who can Neither Read nor Write.	
Prussia	1,568,789	709,692, or 30	per cent
Brandenburg	2,067,223	123,188, 6	"
Pomerania	924,288	123,478, 11	"
Posen	696,741	420,090, 36	"
Silesia	2,369,045	398,406, 14	"
Saxony	1,514,780	58,260, 4	"
Schleswig-Holstein	723,495	30,790, 4	"
Hanover	1,387,689	89,237, 6	"
Westphalia	1,238,895	67,772, 5	"
Hessen-Nassau	1,003,977	40,263, 4	"
Rhenish Province	2,463,689	196,741, 7	"

In the other states the same fluctuations were noticeable, though in some the period of reaction was of shorter duration than in Prussia, in consequence of which the schools in states like Saxony, Baden, Brunswick and Würtemberg outstripped the rest. The number of the common or primary schools in the empire is estimated at about 60,000, in which about six millions of pupils are instructed. To every thousand inhabitants there are 150 pupils. The total number of teachers, male and female, is calculated at 75,000. As connecting schools between those of the lower grade and the higher, are the intermediate schools. Those of the higher grade are divided into so called *real schulen* and gymnasia. The *real schulen*, which are again divided into those of the first and of the second grade, and into the so-called higher citizens' schools—*bürger-schulen*—furnish the rudiments of the technical arts and sciences. In 1874 there were 106 *real schulen*, 42 of the second grade, and 107 *bürger-schulen*, with 82,000 pupils. The course of the gymnasia embraces the sciences and arts, and prepares the pupils for public service, and for admission to the universities. In 1874 they were 333 in number (183 Evangelical, 57 Catholic, and 93 mixed), besides 170 progymnasia and Latin schools, having, in all, 108,000 pupils. For the education of primary school teachers there are 156 seminaries, of which 110 are Evangelical and 41 Catholic. Then there are quite a number of theological seminaries, both Protestant and Catholic. The universities have principally four faculties: the theological, the law, the medical, and the philosophical. The oldest university in the German empire is the university of Heidelberg (1386); the youngest, that of Strasburg (1872). There are in all, including the academy of Münster, twenty-one universities, of which ten are in Prussia, three in Bavaria, one in Saxony, one in Würtemberg, two in Baden, one in Elsass-Lothringen, one in Hesse, one in Thüringia, and one in Mecklenburg. The number of students averages 20,000; the number of professors, 1,800. In addition to all these schools there are a number of polytechnic, commercial, military and agricultural schools, colleges of music, and naval academies. Education in the primary schools is made general and compulsory throughout the empire, which is certainly the most effective means of securing an average education to the largest number of people.—IV. *Army and Navy.* As one of the results of the war of 1866, the military organization of Prussia was introduced into the armies of all the North German states; after the establishment of the German empire in 1871, it was adopted by all the states in South Germany. The leading provisions were either incorporated in the constitution and in the act of May 2, 1874, concerning the organization of the military, or they were adopted as part of the laws of the empire. Added to these are the acts passed in 1874 concerning the control of the troops not on active duty and relating to the organization of the *landsturm;* also the act of May 6, 1880, increasing the imperial army on the peace footing. The military forces of the empire are composed of the army, the navy and the *landsturm;* the army is divided into regular troops and the militia, the navy into the fleet of war and the marines. In the regular army and the fleet, all those who are liable to military service are disciplined and prepared for active duty. These bodies are always ready for service, while the militia and the marines are only called out in case of actual war, and the *landsturm* is employed only on the de-

fensive, in case the safety of the country should require it. By article 57 of the constitution the obligation to serve in the army is made general; it provides that "every German shall be liable to service, and no substitution is allowed." Under article 59 of the constitution, every German capable of bearing arms has, as a rule, to be in the standing army for seven years, from his twentieth till the commencement of his twenty-eighth year. Of the seven years three must be spent in active service, and the remaining four in reserve duty; he is obliged to join the *landwehr* or militia for another five years. The service of the *landsturm* takes in all those capable of bearing arms, from seventeen to forty-two years of age, who are not otherwise on military duty. The German army, as at present organized, numbers about 1,800,000 men. The 63d article of the constitution provides that the whole of the land forces of the empire shall form a consolidated army, which in war and peace shall be under the command of the emperor. The sovereigns of the principal states have the right to select the lower grades of officers; and by the stipulation of Nov. 23, 1871, the king of Bavaria has reserved the privilege of superintending the general administration of that portion of the consolidated army raised within his dominions. Yet the emperor must approve of all appointments made, and nothing which may affect the superior direction of the troops of any state of the empire can be done without his consent. By article 64 all German troops are bound to obey unconditionally the orders of the emperor, and must take the oath of fidelity. Article 65 invests the emperor with power to order the erection of fortresses in any part of the empire, and by article 68 he has the power, in case the public order and safety are threatened, to declare any country or district in a state of siege. — The army of the German empire, as constituted in October, 1879, consists of 150 regiments of infantry, including the guards, 20 battalions of jäger, or riflemen; 93 regiments of cavalry; 49 regiments of artillery; 20 battalions of engineers, including a railway regiment, and 18 battalions of military train. The following shows the strength and organization of the imperial army on a peace footing:

BRANCHES OF SERVICE.	Officers.	Rank and File.	Horses.	Guns.
Infantry, 150 regiments	8,894	258,652	4,298	.....
Jäger, 20 battalions	482	11,247	140	.....
Cavalry, 93 regiments	2,902	66,512	68,515	.....
Field artillery, 36 regime te	1,800	30,637	17,100	1,200
Fortress artillery, 29 batt.	640	14 985	224	.....
Engineers, 20 battalions	400	10 150	250	.....
Train, 18 battalions	300	5,049	3,600	.....
Depots of Landwehr, 274 battalions	600	4,703	3	.....
Staff division	2,961	3,329	.....	.....
Total	18,079	400,935	97,389	1,200

The strength and organization of the imperial army on the war footing is as follows:

BRANCHES OF SERVICE.	Officers.	Rank and File.	Horses.	Guns
Infantry, including guards	19,426	885,388	20,988	.....
Jäger, or riflemen	780	41,184	1 008	.....
Cavalry	3,487	108,276	112,304	.....
Field artillery	2,213	88,319	78,066	2,124
Fortresses and coast artillery	1,370	56,800	8,200	576
Engineers	837	33,669	8,251	.....
Train and administration	724	44,010	44,255	.....
Railway and telegraph division	250	8,700	1,780	.....
Staff division	2,108	7,000	6,600	.....
Total	31,195	1,273,346	281,542	2,700

In the above statement are not included the troops of the field reserve, organized in 1876, numbering about 250,000 men, and those of the *landsturm*. The calculation is that, with the addition of the *landsturm*, Germany may place in the field at any time two and a half millions of armed men without drawing upon the last reserves. For military purposes, the empire is divided into seventeen districts, each represented by one army corps. The guards, taken from Prussia and Elsass Lothringen (Alsace-Lorraine) do not belong to any special division. — The fortress system of Germany has, since the Franco-German war, been remodeled; a number of old fortified places, which were considered useless, have been abolished; many new ones have been constructed, and others enlarged. The empire is divided into nine fortress districts, which are, together with the fortified places contained in them, as follows:

	Districts.	Fortresses.
1.	Königsberg	Königsberg, Marienburg, Dirschau, Memel, Pillau.
2.	Danzig	Danzig, Thorn, Kolberg, Stralsund, Swinemünde.
3.	Posen	Posen, Glogau, Neisse, Glatz.
4.	Berlin	Küstrin, Magdeburg, Spandau, Königstein, Torgau
5.	Mainz	Mainz, Rastatt, Strasburg, Ulm, Neu-Breisach.
6.	Metz	Metz, Diedenhofen, Saarlouis, Bitsch.
7.	Köln	Köln, Koblenz, Ehrenbreitstein, Düsseldorf, Wesel.
8.	Altona	Sonderburg, Döppel, Travemouth, Friedrichsort, Emsmouth, Kiel, Elbemouth, Wesermouth, Wilhelmshaven.
9.	München	Ingolstadt, Germersheim.

— So far as the navy is concerned, rapid progress has been made for the last ten years. The fleet of war at the command of the empire consisted at the close of 1881, of twenty-two ironclads, including three not completed, fifty-nine other steamers, and four sailing vessels. The following gives a detailed list of them:

ARMOR-CLAD SHIPS.	Armor (Thickness at Water Line)	Guns		Indicated Horse Power.	Displacement or Tonnage.
		No.	Weight.		
Frigates—					
Kaiser	10	8 3	22 ton 18 ton	7,800	7,560

I	4	1	30 ton	600	1,000

— According to a plan proposed by the imperial government in 1873, and adopted by the diet, the German navy is to be largely increased. By March 31, 1883, the date set for the completion of the reforms in the navy, Germany will in all probability have a floating armament of eight ironclad frigates, six ironclad corvettes, one monitor, thirteen gunboats also ironclad, twenty wooden corvettes, six dispatch boats, nine other large and nine small gunboats, two artillery ships, three sailing brigs and twenty torpedo boats. At the close of 1880 the German navy was manned by 5,189 seamen and officered by one admiral, one vice-admiral, three rear admirals, fifteen captains and 401 lieutenants. There were, besides, 1,297 marines; artillery, numbering 458 men; in all 7,365 officers and men. The sailors of the fleet and marines are raised by conscription from the seafaring population, which on this account is exempt from other military service. The seafaring population of Germany is estimated at 80,000, of whom 48,000 are employed in the inland merchant navy, and about 6,000 in foreign navies. There are three ports of war, at Kiel and Danzig on the Baltic, and at Wilhelmshaven in the bay of Jade on the North sea. — V. *Constitution and Government.* The political unity of Germany being an accomplished fact, it is a matter of more than curious interest to know that it required not only the slow process of history, but all the consolidating influences of great events, the combined powers of a successful war and of a diplomacy of the first order, to unite a country which was divided into so many principalities, great and small, as the land over which the Carlovingians and their successors once exercised their mighty sway. At the beginning of and during the eighteenth century, when the political division of Germany was greatest, there were no less than 1,762 rulers, who, though by no means equal in influence, dignity and power, occupied each an independent dominion, and who were only loosely kept together in some sort of political union by the imperial power, whose dignity and influence, however, were fast declining. As a consequence of the revolutionary wars of France, the frail fabric of the Holy Roman empire of the German nation fell to pieces, and finally led, Aug. 6, 1806, to the abdication of Francis II. as the head of the empire, and the relinquishment by him of its office and dignity. The fall of Napoleon I. brought about, with some slight exceptions, the same territorial and political divisions which Germany enjoyed in 1792; when finally the proceedings at the congress of Vienna resulted in a confederation, *Deutsche Bund*, which was as little capable of uniting the nation politically, as the empire which had preceded it. It was not till after the successful wars of 1866 and of 1870–71 that Germany realized the sense of political unity and the powers which none but a close political compact could give. The first of these wars, which resulted in shutting out Austria, and leaving the South German states to themselves, had the effect of uniting the other states under the leadership of Prussia, in what became known as the North German confederation, (*Nord-Deutsche Bund.*) The successful issue of the Franco-German war finally led to the establishment of the German empire, which, under the headship of Prussia, includes besides the members of the North German confederation, the South German states and Elsass-Lothringen (Alsace-Lorraine). — The organic laws of the new empire consist of the constitution, which the German governments agreed on, and which is but a slight modification of the constitution of the North German confederation, the treaties concluded with the South German states for its ratification, and by which to some of these states certain reserved rights were guaranteed, and the military stipulations made with the several states comprising the new confederation. The imperial constitution is dated April 16, 1871. A few amendments were made in 1873. It is composed of seventeen chapters and seventy-eight articles. Chapter one defines the territorial extent or dominion of the new government. The government of the empire, in its broadest sense, is composed of the emperor, (as presiding or executive officer), the imperial chancellor, and the various subordinate executive and administrative officers, the Bundesrath (which see) and the imperial diet or Reichstag, as constituting the legislative and representative powers of the nation. There is no strict division or limitation of powers, as in the constitution of the United States, exercised by the different branches of the government, as will be seen by a reference to the organization and the functions of each of these branches. The Bundesrath is the chief exec-

utive and administrative body of the empire; yet, exceeding the ordinary functions of such a body, it has the power of originating, submitting and approving legislative measures, and thus acts as a sort of upper house to the imperial diet. (Constitution, chap. iv.) For a further enumeration of its powers and its organization, see article BUNDESRATH. The imperial diet or Reichstag is composed of representatives elected by universal suffrage and ballot. The Reichstag constitutes, together with the Bundesrath, the legislative branch of the government. Bills or legislative measures originating with the latter, require the approval of the former, in order to become a law. Before the laws thus passed can take effect, they must be assented to by the emperor, and countersigned by the chancellor of the empire. The Reichstag has the power to originate, and, with the advice and consent of the Bundesrath, to enact laws. Petitions sent into the Reichstag may be referred to the Bundesrath for further action. The members of the imperial diet, who receive no compensation for their services, are elected for three years in the ratio of one representative for every 10,000 inhabitants, according to the last census. A state having less than 100,000 inhabitants is entitled to one representative. Every German, being twenty-five years of age, has the right to vote in the state in which he may reside. Every German is eligible as a representative to the Reichstag, who is twenty-five years old, and has resided in one of the states of the empire at least one year previous to the election, except he be rendered ineligible for the same reasons that disqualify him as an elector, such as his being under guardianship or because of some legal disability, that he is in bankruptcy, a public pauper, or deprived of the rights of citizenship by the judgment of a court of competent jurisdiction. According to the last census the several states are entitled to the following number of representatives: Prussia, 236; Bavaria, 48; Würtemberg, 17; Saxony, 23; Baden, 14; Mecklenburg-Schwerin, 6; Hesse, 9; Oldenburg, Saxe-Weimar, Brunswick, and the free town of Hamburg, 3 each; Saxe-Meiningen, Anhalt, Saxe-Coburg-Gotha, 2 each; Mecklenburg-Strelitz, Saxe-Altenburg, the principalities of Waldeck, Lippe, Schwarzburg-Rudolstadt, Schwarzburg-Sondershausen, Reuss-Schleiz, Schaumburg-Lippe and Reuss-Greiz, and the free towns, Lübeck and Bremen, 1 each; Elsass-Lothringen, 15; making, in all, 397 representatives. A dissolution of the imperial diet short of the term of three years for which the members are elected, can only be effected by a resolution of the Bundesrath, and with the advice and consent of the emperor; in which case a new election must take place within sixty days, and the new diet must convene within ninety days, from the dissolution of the old diet. The diet can not, without the consent of its members, be prorogued for a longer period than thirty days, and not oftener than once during any one session. Government officials, who may be elected to the Reichstag, require no leave of absence in order to attend its sessions; yet if a member of the diet be appointed to a public office, or promoted, he must submit to a new election. The members of the Reichstag are, when in session, privileged from arrest, except when seized in the commission of some public offense; any previous proceeding pending against a member may, should the diet so demand it, be stayed during the sessions. Each member may exercise the right of free speech on the floor of the legislative assembly, and can not be held responsible outside the diet for his acts or speeches relating to the proceedings of, or touching any measure pending before that body. The proceedings of the Reichstag are public; each vote requires an absolute majority, a majority of the members duly elected being present. The diet elects its presiding officers and appoints its clerks and committees. (Constitution, chap. v.) Both the imperial diet and the Bundesrath are convoked once a year for the purpose of fixing the public budget. — The third branch of the government is represented by the executive or presiding officer, the emperor. Though forming the head of a federation composed of independent states or sovereigns, the imperial office and dignity is essentially the embodiment of monarchical traditions. Though, by law, made hereditary in the crown of Prussia, the imperial dignity is, in the opinion of him who exercises it, as much a gift of divine grace as any kingly crown since the days when Charles the Great styled himself *Carolus serenissimus Augustus, a Deo coronatus qui per misericordiam Dei rex.* And the exercise of the imperial office and its prerogatives is looked upon by the rulers of the empire as of divine right, as much as the royal prerogatives they individually enjoy as rulers of their several dominions. The emperor has the power of appointing and receiving ambassadors, of representing the German empire in its relations with foreign governments and in all international affairs, of declaring war, (though without the consent of the Bundesrath only in case of a foreign invasion), and of concluding treaties of peace, of forming alliances and of entering into diplomatic and other treaties with foreign governments —Under chapter two of the constitution, the legislative powers of the government are vested in the Reichstag and the Bundesrath. They have power to pass laws defining the right and regulating the change of domicile (excepting as to Bavaria), regulating the rights of citizenship, passports, the police surveillance of resident foreigners, and the trades, as also insurance, colonization and immigration; to raise revenue and regulate commerce, the coinage of money, the issue of currency; to fix the standard of weights and measures, and regulate the banking system; to prescribe the rules for issuing and for the protection of patents and copyrights; to pass laws for the encouragement and protection of German commerce and navigation and for the establishment of a proper consular system, for

the control of the railway system, and for the improvement of streams, and the construction of highways and canals in the interest of trade and commerce, and the regulation of internal navigation; to establish and prescribe rules for the postal and telegraph service (excepting as to Bavaria); to provide for the manner of enforcing in one state judgments and decrees rendered in another state, and for the authentication of public documents; to pass civil and criminal laws of uniform application throughout the empire, and to establish courts of competent jurisdiction for the enforcement and administration of these laws; to organize and prescribe rules governing the military and naval service; to pass sanitary rules and regulations; and to control and regulate the public press and the organization of private societies. Article three of the same chapter provides that the citizens or subjects of each state shall enjoy the rights and immunities of citizens in the several states composing the empire, and shall be in all respects equal before the law throughout the federal dominion. This is a provision somewhat similar to the one contained in the constitution of the United States. Chapter six relates to the tariff and commerce. Under it, the operation of the tariff laws and such as regulate public commerce extends throughout the dominion of the empire, which, to that end, forms a close union: excluded from this union are such districts as are not, on account of their geographical position, fit to be incorporated, while the free cities of Hamburg and Bremen are also excluded, until they move to be incorporated in the union. The revenues provided for by the imperial government are raised and administered by the governments of the individual states; the emperor, through proper officers, sees to it that the provisions of the law in the raising of the revenues are properly observed and carried out by the revenue officers of the different states. Chapter seven gives the control of the railways, except those of Bavaria and Würtemberg, to the imperial government. By virtue of chapter eight the postal and telegraph service is also placed under the control and management of the imperial government. Chapter nine relates to the navy and navigation, giving the chief command of the navy and the appointment of its officers to the king of Prussia. Chapter ten provides that the consular service shall be under the control of the emperor, who, with the advice of the committee of the Bundesrath on trade and commerce, shall appoint the several consuls. Under chapter eleven the military forces of the empire form one consolidated army, whose commander-in-chief shall be the emperor, and which is to be governed by the rules and regulations established for the organization and discipline of the army of Prussia. Chapter twelve relates to the finances of the empire, and provides that all receipts and expenses shall be fixed by law before the commencement of the next fiscal year. The chancellor is required to submit annually an account of the receipts and expenditures of the empire to the Bundesrath and the Reichstag. In case the revenues raised by the several states are not sufficient to meet the expenses of the government, and as long as the empire does not raise its own revenue, the chancellor has the power to call upon the several states for special contributions in proportion to their population, in order to meet the deficiency. In case of necessity the imperial government may also make loans, and pledge the public credit. Chapter thirteen relates to legal remedies and penalties; it confers on the court of appeals of Lübeck exclusive jurisdiction in cases of treason; all other offenses against the imperial government or any of its public officers are tried by the courts having competent jurisdiction under the laws of the state where the offense may be committed. Controversies between two or more of the states composing the empire, and whose organic laws do not provide for some mode of redress, are to be referred to the Bundesrath for adjudication; in case the Bundesrath is unable to reach a decision, the controversies are to be settled by the legislative powers of the empire. In case a suitor should be without a remedy under the laws of the state in whose courts he may apply for legal redress, he may invoke the aid of the Bundesrath, whose duty it is to compel the government of the particular state to furnish the proper remedy. Chapter fourteen provides that amendments to the constitution may be proposed by either of the legislative bodies; and are declared rejected, if fourteen votes of the Bundesrath are against their adoption. Chapter fifteen contains some general provisions declaring certain laws passed by the North German diet part of the laws of the new empire.—At the head of the administrative department of the empire is the chancellor's office, with the several departments, such as form the office of the postmaster-general, those presided over by the general director of the telegraph service, and those having charge of the affairs of Elsass-Lothringen (Alsace-Lorraine). Connected with the chancellor's office are also the statistical bureau, the bureau regulating the right of domicile, and the board of railway managers. The chancellorship and the ministry of foreign affairs are at present held by one and the same person, Prince Bismarck; the ambassadors and consuls of the empire are subject to his order and control. Added to the imperial administration are committees or boards on customs and excise duties, on emigration, on education, and a board of auditors; there was, also, until the establishment, in 1877, of the imperial court of last resort, a court of commerce, located at Leipzig, having original jurisdiction touching matters of trade and commerce.—The German empire has as yet no so-called federal judiciary, except the imperial court of last resort, established at Leipzig by an imperial act passed March 24, 1877. The civil and criminal jurisdiction of the country is vested in the several state courts. Yet a series of laws passed by the imperial diet in 1877 gave

these courts a uniform organization, and uniformity in both their civil and criminal procedure. The first is the law on the organization of the judiciary passed Jan. 27, the second is the code of civil procedure passed Jan. 30, and the third is the code of criminal procedure passed Feb. 1; added to these is the bankruptcy act passed Feb. 10, 1877. All these laws took effect on and from Oct. 1, 1879. A very important step toward consolidating the government and strengthening the feeling of nationality throughout the empire was the passage of the act, Dec. 20, 1873, whereby the whole range of civil and criminal law was placed within the sphere of the legislative powers of the empire. Aside from their procedure and organization, the state courts constitute the judiciary of the several states whose governments appoint the judges, though their qualifications are fixed by the law of the empire; the government of each state also establishes and defines the judicial districts within its territory, and fixes the rules of practice governing its courts. The imperial court has both original and final jurisdiction in all cases of high treason and treasonable offenses against the government or its head, the emperor, the same jurisdiction, which, by the original draft of the constitution, had been conferred on the supreme court of appeals in Lübeck. Its appellate jurisdiction extends to all cases of appeal properly so called, whereby a new trial and decision, touching both the facts and the law of such cases as are tried by the *schoeffengerichte*—courts of inferior criminal jurisdiction, composed of judges learned in the law and two or more laymen—may be obtained, and such cases may be remanded to the supreme court of the particular state where the case originally arose. As a court of last resort it also acts as a court of error; as such it has the power to review the proceedings of the courts in banc (*landsgerichte*) and of such courts as have trial by jury (*schwurgerichte*). Either the decisions rendered in such cases are reviewed, or the cases are remanded for further proceedings. Cases arising under the laws of an individual state are remanded to a court of review, composed of five judges of the supreme court of such state. If, however, the cases arise under the laws of the empire, the imperial court does not remand such cases on appeal, but exercises exclusive and final jurisdiction as a court of error. — The German empire is now composed of twenty-five states or principalities, including the free towns of Hamburg, Lübeck and Bremen, having governments of their own, and the imperial province of Elsass-Lothringen (Alsace-Lorraine), which, as such, is placed under the direct control of the government of the empire. Under its constitution, the empire forms a perpetual union of the states for the protection of the realm and the care of the welfare of the German people. — VI. *Finances.* As will be seen by a reference to what we have said in speaking of the constitution of the empire, the ordinary expenditure of the empire is defrayed from the revenues arising from customs, certain branches of excise, and the profits of the postal and telegraph service. In case the receipts from these various sources of income should not be sufficient to cover the expenditures, the individual states may be assessed to make up the deficit, each state being required to contribute in proportion to its population. The ordinary expenditure is, as a rule, to be voted only for one year, but, in special cases, may be voted for a longer term. The fiscal year, formerly coincident with the calendar year, was made to run from April 1 to March 31, in 1877. — In the public budget for the fiscal year 1881-2, the total amount of the revenue of the empire was fixed at 592,956,554 mark; the amount of expenditure was the same. By an act dated June 27, 1881, an additional appropriation was made, amounting to 395,846 mark, 365,000 mark of which were set down for extraordinary (*einmalige*) expenditure, which are to be either taken from surplus funds, or raised by special contributions on the part of each state. The revenues consist of:

	Mark
Customs and excise duties	335,490,150
Stamps on cards	11,100,000
Stamps on negotiable instruments	6,100,900
Statistical fees	300,000
Profits of posts and telegraphs	18,697,145
Profits of railways	11,039,400
Profits of government printing office	1,061,520
Imperial bank	1,505,430
Various receipts of the administration	5,815,501
From the invalid fund of the empire	31,071,344
Surplus of former years	6,529,730
Interests of imperial funds	3,842,605
Extraordinary supply	67,108,306
State contributions	103,288,523
Total	592,956,554

The customs and excise duties exceed those of the previous year by twenty-eight million mark. Contributions from such provinces as are not included in the tariff union, amount to 6,790,540 mark, exceeding those of the previous year by 389,940 mark. The receipts of the postal and telegraph service are estimated at 137,721,760 mark (four million more than those of the previous year), and the ordinary or continual expenses at 119,024,605 mark. The receipts of the railways are fixed at 37,635,000 mark (one and a fourth million more than those of the year before), and the expenses at 26,595,600 mark. — The extraordinary contributions, besides the special contributions of the states, serve to balance the accounts of the budget. As will be seen from the table on next page, the extraordinary or special expenditures are estimated at about 81½ million mark; of these, 14½ million are raised by state contributions, while the balance is to come partly from the imperial funds, partly from loans. — The state contributions as estimated exceed by 21½ million mark those of the previous year. They are levied upon the several states as follows:

	Mark
Prussia	52,501,405
Bavaria	20,149,588
Saxony	5,624,998
Würtemberg	7,281,433

	Mark.
Baden	5,185,472
Hesse	1,806,698
Mecklenburg-Schwerin	1,129,139
Saxe-Weimar	597,474
Mecklenburg-Strelitz	195,125
Oldenburg	651,238
Braunschweig	667,804
Saxe-Meiningen	396,669
Saxe-Altenburg	297,448
Saxe-Coburg-Gotha	372,449
Anhalt	435,562
Schwarzburg-Sonkershausen	187,625
Schwarzburg-Rudolstadt	136,379
Waldeck	111,648
Reuss-Greiz	95,823
Reuss-Schleiz	188,275
Schaumburg-Lippe	67,575
Lippe	229,343
Lübeck	116,070
Bremen	290,016
Hamburg	792,583
Elsass-Lothringen	3,810,854

These are, however, to be somewhat revised by the government in the course of the year on the basis of the census of 1880. — The expenditures are distributed as follows:

ITEMS	Ordinary or Continual.	Extraordinary or Special.
	Mark	Mark
Imperial diet	403 770	.....
Chancellor and chancellor's office	125,770	.....
Foreign department	6,564,890	131,400
Department of the interior	2,843,692	894,605
Imperial army	342,190,985	51,130,733
Imperial navy	27,518,326	11,573,558
Imperial judicature	1,700,852	200,000
Imperial treasury	69,461,336	3,680,766
Board of railway affairs	303,115	3,388,064
Board of auditors	46,458	8,000
Public debt	10 602,500	110,000
General pension fund	18,399 993	.....
Invalid fund	31,071,344	.....
Postal and telegraph service	.....	9,159,122
Imperial printing office	.....	30,000
Expenses in consequence of the war against France	.....	1,693,245
Total	511,652,026	81,304,493

Barring the surplus of previous years and the state contributions, the resources of the empire have been increased about twenty-eight million mark, owing to the increase in the amount of customs and excise duties. The draft of the public budget for 1882–3 estimates the receipts and expenditures at 607,234,771 mark. Of the expenditures, those that are extraordinary or special are fixed at 72,093,979, and 534,140,792 mark is the amount of those which are ordinary or continual. The fiscal year 1880–81 resulted in a deficiency of twelve million mark, which must be made up. In order to balance the receipts and expenditures, the state contributions are calculated at 115,712,740 mark, an increase, therefore, of more than twelve million mark. The fiscal year 1881–2 is expected to yield a surplus of fifteen million mark.— At the time of the establishment of the German empire, it had, as such, no public debt. The public debt has been created in recent years. On Feb. 1, 1881, the total funded debt amounted to 251,000,000 mark; added to which is a new debt of 102,540,088 mark, contracted in virtue of certain acts passed March 28 and May 24, 1881. The whole debt bears interest at 4 per cent. Besides the funded debt, there is an unfunded debt represented by *reichs-kassenscheine*, or imperial treasury notes, to the amount of 155,785,540 mark, outstanding on April 1, 1881. As offsetting this debt, there are a number of invested funds, amounting in all to 865,487,928 mark. Among these funds are the invalid fund of 546,418,885 mark, the fund for the erection of fortresses, amounting to 64,913,470 mark, and a war fund of 120,000,000 mark. — In regard to the monetary system of the empire, on Jan. 1, 1872, a law for the uniformity of coinage throughout the empire, passed by the imperial diet, was published, under which law, the standard of value is gold. The same law provided for the substitution of the mark, of 100 pfennig, as the general coin, to commence on Jan. 10, 1875. There are gold five-mark, ten-mark and twenty-mark pieces, the first called *halbe-krone* (half-crown), the second *krone*, and the third *doppel-krone* (double crown). — VII. *History.* On July 19, 1870, France followed up its threatening and daring attitude toward Prussia by a declaration of war. Contrary to the expectations of the French monarch and his advisers, not only the South German states took up the cause of Prussia, but the people throughout the land were willing to flock to the banner of the Prussian monarch, in order to resent the insult which in their opinion he had received; and to settle the old issue, which, since the days of Andernach, divided the French and the Germans, and which, later on, had been formulated in the literature of the two nations as the contest between the spirit of the Germanic races on the one hand, and that of the Latin races on the other.— In spite of a small body of opponents in southern Germany, who were either jealous of the supremacy of the Hohenzollern, or, for some other reason, opposed to the unity of the German states, the large body of the people was unanimous in encouraging the government to insist on the observance of the terms, which called for an alliance between the South German states and the North German confederation; and in hastening the general uprising of the nation against its traditional foe. The unity of the German people, on which, for generations, the aspirations of its patriots and poets had been centered, seemed to have become at once an accomplished fact. With the masses of the German people that unity soon became the leading idea of that short but memorable war, which taxed all the material and intellectual resources of the two nations.— With the fall of the French capital the war came to a close, resulting in the acceptance by the French of all the conditions imposed upon them, of which conditions the surrender of Elsass-Lothringen (Alsace-Lorraine) was hailed by the conquering nation as the only rational means of settling the traditional disputes flowing from the territorial division of the kingdom of Ludwig (Louis) the Pious.— The enthusiasm in which the German people indulged over their glorious achievements

in the field, soon deepened into the feeling that they were again a nation, not only bound together by the ties of blood, but also, a nation worthy of a common government, in which the traditions of the empire might be perpetuated, and the liberties of the people safely lodged. The call of the people for such a government, one which might realize their aspirations toward unity, became so imperative that the South German states could no longer resist it. It had become quite evident that their safety, no less than that of the rest of Germany, depended upon the consolidation of the different German branches, into which the nation was divided, and that, in the defeat of its traditional foe on the other side of the Rhine, a most powerful enemy to all attempts at uniting the Germans politically had been defeated. The principal difficulties lay in the way of deciding upon some form of government, which, while satisfying the desire of the people for unity, was calculated to infringe as little as possible upon the relative independence of the individual states, especially those of South Germany, and upon the sovereignty which they had hitherto enjoyed in the regulation of their internal affairs. Baden was the first state which raised the question, on Sept. 2, 1870, of consolidating the German states into a more perfect and permanent political union. Bavaria followed, by proposing a conference in which this question should be discussed. On Sept. 21, Delbrück, the chancellor of the North German confederation, went, at the request of Count Bismarck, from Ferrières, where the Prussians had their headquarters, to Munich, to receive the propositions of the South German states in regard to the matter. In these conferences, however, in which the head of the judicial department of Würtemberg, Minister Mittnacht, took part, the claims of Bavaria were of such a nature that no agreement was arrived at. Bismarck then invited the South German governments, except Bavaria, to send plenipotentiaries to Versailles, with a view to a conference to be held there, the attendance on which was left optional with Bavaria. In the several conferences held at that place during the month of October, and at which the South German states were represented by two plenipotentiaries each, and the North German confederation by ministers Delbrück, Roon and Friessen, the negotiations resulted, on Nov. 15, in an agreement with Hesse and Baden, by which they accepted the constitution of the North German confederation, after some slight changes had been made in it concerning the administration and control of the postal department and the railroads, and the regulation of the revenue. In regard to the military condition of Hesse a special stipulation was made; a conference held on Nov. 25 regulated those of Baden, whose military quota became part of the German, that is, Prussian, army. The treaty was finally ratified on Dec. 16 and 19 respectively by the two chambers of Baden and on Dec. 20 and 29 by those of Hesse. On Nov. 23 the treaty was signed by Bavaria, after it had secured some special privileges. Bavaria retained its right to be represented at foreign governments by its own ambassadors; the control and regulation of its military, its postal and telegraph service, and its railroads; and the right to pass certain revenue laws and laws defining and regulating the right of domicile. Bavaria secured, in addition, a permanent seat in the committee of the Bundesrath on the army and fortifications. The Bundesrath was to have a committee on foreign affairs, consisting of representatives of the kingdoms of Bavaria, Saxony and Würtemberg, the chairmanship of which was conceded to Bavaria. In this committee any amendment of the constitution might be defeated by a veto of the fourteen members of which the committee was to be composed. Though the national party was of the opinion that the terms of this compact recognized the independence of the several states to a greater extent than was just, it met, on grounds quite opposite to this, with a powerful opposition in the Bavarian chamber of deputies, and was not ratified until Jan. 21, 1871; whereas the federal council had ratified it on Dec. 30 of the year previous. — The treaty with Würtemberg was concluded on Nov. 25, 1870. Its provisions were in the main similar to those contained in the treaty with Baden, with the exception that Würtemberg retained the right to regulate its postal and telegraph service within its own territory and as far as it extended into the territory of adjoining states. At the same time a stipulation was entered into by Prusssia and Würtemberg, according to which the military forces of Würtemberg were to be united into one corps, and form, as such, an integral part of the consolidated army. The newly elected chamber of deputies finally ratified the treaty on Dec. 23, while the upper chamber sanctioned it on Dec. 29. Official notice of the ratification of the treaties with Baden, Hesse and Würtemberg was given in Berlin on Dec. 30, 1870, and that of the treaty with Bavaria on Jan. 29, 1871, after the diet of the North German confederation, which had convened in Berlin, Nov 24, had sanctioned it on Dec. 9, 1870. In the meantime the king of Bavaria suggested that the title of German emperor should be given to the head of the new confederation, and thus the splendor and dignity of the imperial office be revived. The federal diet issued an address to the king of Prussia, expressing a similar desire, which was presented to him at Versailles by President Simson, heading a delegation of thirty members of the North German diet, on Dec. 18, 1870. Whereupon, on Jan. 18, 1871, the king of Prussia, Wilhelm I., was, on motion of the princes and representatives of the free cities of Germany, assembled at Versailles, invested with the hereditary dignity and accepted the office of German emperor. Thus, after Germany's traditional foe, who was bent upon destroying the integrity of the German nation, had been defeated, and the people of Germany were once more united, it was natural that they should

connect in thought their present great achievement with the glories of the past, and indulge in the illusion that the imperial office of Charles the Great and the empire of Otto I. had been revived. Intense as the enthusiasm of the people was over the results of the war, they hailed with equal delight the assurance of a peaceful policy, which the first proclamation of the new emperor of the Germans gave to his people. After referring to the constitution of the North German confederation, in which provision had been made for a revival of the imperial dignity, the emperor said that he considered it his duty to accept that dignity; that, in doing so, he was mindful of the duty to protect with that fidelity which was a national characteristic of the German people, the prerogatives of the German empire and the countries composing it; to maintain the peace, and to defend, with the aid of the combined powers of the nation, the independence of Germany. In conclusion, the emperor trusted that he and those to whom the imperial crown would be handed down, might forever add to the power and dignity of its dominion, not by military conquests, but by increasing the blessings of peace, thus promoting the general welfare, freedom and civilization of the nation. — The proclamation was issued from the headquarters at Versailles on Jan. 17, 1871. The acceptance of the imperial office had the effect of changing the name by which the union of the German states was henceforth to be known; the designation *Deutsches Bund* was now changed into *Deutsches Reich*. Thus the German league, or, more strictly speaking, the North German confederation, ceased, and the German empire took its place. The great gain made by the Germans, through the successful conclusion of the war, was in a great measure due to the fact that they had carried on the war without foreign aid, and had persistently rejected all foreign intervention in securing the terms of peace finally agreed upon. There had been no want of a disposition on the part of some of the European powers to interfere. Among the European powers the czar of Russia was the only one who was decidedly in favor of the Germans. Italy and Austria sympathized with France. Denmark likewise hoped for the success of the French arms. England, at first, showed some indignation at the policy of the French government which aimed at a disturbance of the peace of Europe. Subsequently, however, the French were furnished with arms and ammunition from British soil, an active aid, which was not interfered with by the English government until Bismarck remonstrated against it. — On March 17, 1871, William I., now emperor of Germany, returned to Berlin. On March 21 the first imperial diet convened. The elections had returned a majority decidedly in favor of the new order of things, and in support of a national policy; yet among the 382 members of that body, there were 60 ultramontanes, who formed a persistent opposition to this policy. The address of the emperor pointed at the great achievements which had hitherto been the object of the people's aspirations: the unity of Germany, permanent protection against foreign invasion, a uniform system of laws, and an equal administration of justice throughout the land. Simson was elected president of the diet. The address to the crown, prepared by Lasker, was approved by a large majority, despite the objections of the clerical party. A proposition, submitted on April 1 by Reichensperger, in the interest of this party, which, among other things, advocated the freedom of the press, the right of establishing private associations, and the independence of the church, was rejected on April 4 by a vote of 223 against 54. The assembly also decided that its members should receive no compensation for their attendance and services. On April 14 the constitution of the German empire was adopted, only seven voting against it. — Of more than ordinary interest were the debates touching the state of Elsass-Lothringen. The government submitted a bill which provided for a permanent incorporation of this province with the German empire; but that the constitution of the empire was not to take effect in the province before Jan. 1, 1874; until then its affairs were to be administered by the emperor, with the advice of the Bundesrath. From different quarters the desire was expressed that the province should be united with Prussia; yet on June 3 the bill, with some amendments changing the date on which it was to take effect from Jan. 1, 1874, to Jan. 1, 1873, was passed by a large majority. On June 15 the session was closed, and on the day following the German troops entered and marched through the streets of Berlin in commemoration of the recent events which resulted in the establishment of national unity and a central government as a fit representative of the common bond which again united the German people. — The next session of the imperial diet commenced Oct. 16. The principal business of this session was the passage on Nov. 6 of a bill providing for the establishment of a war fund to the amount of 40,000,000 thalers; the adoption of a military budget, for which the gross sum of 90,373.275 thalers was voted; the granting of a subsidy to the St. Gothard railway, amounting to 10,000,000 francs; then the enactment of the law regulating the coinage of the empire, which established the *mark* as the general coin. Lasker's bill, which proposed to extend the legislative and political powers of the empire both in criminal and civil matters, was not finally acted upon by the diet, partly owing to the opposition it received from certain political factions and from the majority of the Bundesrath. The bitter struggle between church and state, to which the dogma concerning the infallibility of the pope gave rise, was foreshadowed in this session of the diet, when von Lutz, the Bavarian minister, submitted the bill, which had been approved by the Bundesrath, providing that any minister or other member of the clergy,

who while officiating in that capacity, either in a church or elsewhere, should discuss the affairs of state in a manner calculated to disturb the public peace, should be punished by imprisonment for two years. The leaders of the clerical party, Windthorst, Reichensperger, Mallinckrodt and others, rose with great indignation, and protested against a bill which they deemed so hostile to the best interests of the empire and the rights of the Catholic church. In spite of this protest the bill was passed on Nov. 28. The diet finally adjourned on Dec. 1, 1871. A further step toward political unity and a centralized government was taken by the total or partial abolition, on the part of the smaller states, of their embassies or foreign legations. In 1872 the clerical contest assumed a more threatening character. It was principally in Prussia that, in consequence of the indulgence shown by the government, the Catholic clergy became aggressive. The conduct of the clergy, which received a new impulse by the heated discussions concerning the dogma of infallibility, gave sore offense to the government, and aroused its latent energy to resist the aggressive policy of the church. On Dec. 14, 1871, a bill was submitted in the Prussian chamber of deputies, which provided that the control and superintendence of all public and private schools should be handed over to the government. This bill was passed by both chambers on Feb. 13, and March 8, 1872. But it was not only in Prussia that this doctrine, which insisted upon a revival of the idea that the religious behests issued from the see of Rome should be received by the Christian world as a finality, disturbed the public peace and divided the people; in Bavaria, too, the religious contest assumed a threatening aspect. There the advocates of this dogma were arrayed not only against the liberals, but also against those of their own church, who, like Doellinger and his followers, calling themselves Old Catholics, opposed the dogma of infallibility as an innovation, which was neither warranted by the faith of the primitive Christians nor supported by the ancient traditions of the church. As the contest seemed to spread all over Germany, it soon became evident that, if its baneful influence were checked by governmental interference, it could successfully be done only by some action taken by the imperial diet. The imperial government still tried to observe a conciliatory policy toward the pontiff at Rome; in March, 1872, Bismarck submitted the proposition to the pope, according to the terms of which the latter was to accredit Cardinal Hohenlohe, a zealous Catholic, though unfriendly to the Jesuits, as ambassador of the imperial government to the see of Rome. The decided manner in which this proposition was rejected by Pius IX. indicated that no agreement between the papacy and the empire could be arrived at. In the session which commenced on April 8, the attention of the imperial diet was first called to the question whether the budget should provide for the retention of the embassy at Rome; at the suggestion of Bismarck it was retained. The struggle, however, between the different parties, to which church issues had given prominence, began when the two bills against the Jesuits came up for discussion on May 15 and 16. One was introduced by Gneist, the other by Wagner-Marquardsen, both aiming at limiting the powers and checking the spread of this order. After an excited discussion, the bill introduced by Wagner-Marquardsen, which was more stringent in its provisions, was passed by a vote of 205 against 84. The action of the Bundesrath, whereby some of the most stringent provisions were modified, so as to make the supervision by the police not mandatory but directory, led to further discussions, which resulted in the bringing in of a new bill, providing that the order of Jesuits and similar orders as well as congregations should be excluded from the German empire, and their future settlement within it prohibited; that those existing were to disband within six months; that such members as were foreigners were to be banished the realm, while the natives might be confined to certain districts. This bill passed the diet by a vote of 181 against 93 on June 19, and was unanimously approved by the Bundesrath on June 25; it went into operation on July 4. In some of the German states—Bavaria, Saxony, Würtemberg and Baden—the Jesuits were not permitted to reside. In Prussia, however, their numbers had increased considerably during the last fifty years, especially in the Rhenish province, in Westphalia and in Posen, in Elsass-Lothringen, too, they formed no insignificant body. On the taking effect of the law in question, the monasteries were closed in the course of the summer, though not without causing disturbance, which required the interference of the military. Among the nobility, those of the Rhenish province and of Westphalia showed a good deal of sympathy for the Roman pontiff. In consequence of a resolution adopted by the Bundesrath on May 13, 1873, orders, such as that of the Redemptorists, the Lazarists, etc., came within the operation of the law. The Catholic bishops were greatly agitated by this action of the Bundesrath; they held a conference at Fulda, which lasted from Sept. 18 to Sept. 20, and resulted in the issuing by the assembled prelates of a memorial wherein they discussed the state of the Catholic church in the German empire, and declared open war against the imperial government. They announced a set of principles touching the freedom of the church and the independence of the clergy, which could hardly fail seriously to affect the sovereignty and independence of the government. The contest between the clergy and the government had now assumed alarming proportions. The gain of the Old Catholic party in the number of its adherents, while it added to the opposition against the aggressive policy of the Catholic church, intensified the struggle, and did much to give the contest the character of a war of principles, rather than that

of a struggle for power. The government now earnestly commenced to assert its authority, and the conflicts between the refractory bishops—Krementz in Frauenburg, Ledochowski in Posen, and others—and the public authority, showed that each of the contending parties was determined to carry the struggle to the bitter end. The pope expressed great indignation at the coercive measures employed by the imperial government against the bishops. The language employed by the pope when delivering his address on June 25, showed that the demands of the church and the interests of the state, as a system of public and private forces governed by law, were absolutely at war with each other. In his allocution of Dec. 23, the pope showed himself even more implacable, in consequence of which the Prussian legate at Rome took leave. Thus the *Culturkampf*, the struggle for civilization, as the foemen who were arrayed against Rome were pleased to term it, was inaugurated, and formed one of the most important factors in the development of the new empire. As against this formidable contest, which engrossed not only the attention of the government, but of the people at large, the other proceedings of the imperial diet, though important in themselves, gave no cause of serious disagreement. The more important measures discussed were the appropriations for the navy, the distribution of the French war contribution, the duties on salt and brewers' materials, the prolongation of the "dictatorship" in Elsass-Lothringen to Jan. 1, 1874, the exclusive control of the Luxemburg railroads by the imperial government, the revision of the military code, and Lasker's bill providing for the establishment by the imperial government of courts of original jurisdiction, which was again approved by the diet but still awaited the action of the Bundesrath. — The position of the South German states toward the empire still gave proof that they were not equally willing to assist the government in the promotion of its national policy. Baden had made the greatest concessions. In making civil marriage obligatory it had done even more than was expected. Hesse also had early changed its policy in favor of national unity. In Würtemberg, the proposition submitted by the democratic faction to the assembly, touching the "reserved rights"—that each particular change in the treaty of Nov. 25, 1870, should require the consent of the Landtag — was, in February, 1872, owing to the strenuous opposition of Minister Mittnacht, defeated by a vote of 60 against 29. A similar proposition introduced about the same time in the chamber of deputies in Bavaria met with the same fate. Some doubt, however, as to the policy of the Bavarian government was caused, when, in 1872, Count Hegnenberg-Dux, the prime minister, whose attitude toward the empire was of a friendly nature, having died, the king commissioned one of the most uncompromising opponents of the empire and a friend of the ultramontanes, *von Gasser*, to form a new cabinet. As the latter could not find the proper men willing to enter the new cabinet in support of his views, the uneasiness which had taken hold of those in favor of a national policy and who were friends of the empire, was removed, when von Pfritzschner, the minister of finance, was appointed president of the cabinet, and as such took charge of the foreign affairs of the government. This attempt on the part of the Bavarian government to yield to a policy unfriendly to the empire was all the more astonishing, as the meeting of the three emperors, William of Germany, Alexander II. of Russia and Francis Joseph of Austria, which took place about the same time at Berlin, although it did not result in a formal alliance, indicated that the three emperors meant to pursue a uniform policy, that Russia and Austria were willing to recognize the establishment of the German empire as a fact not in conflict with their own interests, and that they approved of the national policy of the German government; all of which did much to check the renewed warlike spirit on the part of France. — The fourth session of the imperial diet commenced March 12, 1873. The address of the crown suggested various measures touching the protection of the German empire, the extension of its powers, and the requirements of trade and commerce and other interstate relations; and with a tone of assurance referred to the friendly relations of the empire with neighboring governments as a circumstance which would certainly give Germany the support of these powers, should France ever avail herself of the first opportunity to gratify her desire for revenge. The comparative strength of the different parties represented in the imperial diet was as follows: the national liberal party had 115, the German imperial party 34, the liberal imperial party 30, the conservatives 50, the *progressists* 45, the centre 66 and the Poles 13 representatives; 23 members belonged to no party. Simson was chosen president. The bill introduced by Lasker, providing for the extension of the legislative and judicial powers of the empire so as to cover all civil and criminal matters, was adopted on April 3 by a decided majority, and its approval by the Bundesrath was promised by Minister Delbrück; the diet was also advised that the Bundesrath contemplated a civil code of uniform operation throughout the empire. The bill for the establishment of a general office superintending and regulating the railroad system of the empire was likewise passed. The same disposition was made of the bill granting the members of the imperial parliament compensation. The bill by which civil marriage was to be made obligatory on persons engaging in matrimony, as well as the different measures introduced for the surveillance of the public press, were not finally acted upon The postal treaty with Italy was approved May 28; an amendment to the postal treaty with Sweden, June 6; and the commercial treaty with Persia, June 21 An amendment to the revenue law was passed June 25, whereby the duty on

iron, steel, etc., was in some instances wholly abolished, in some reduced, Jan. 1, 1877, being fixed as the date of its total abolition. The coinage bill, passed June 24, definitely fixed the mark as the unit, and provided, among other things, for the withdrawal of all paper money heretofore issued by Jan. 1, 1876, and the issue of paper money by the imperial government, in regard to which a special bill, regulating the details of the matter, was to be submitted by the government to the diet at its next session. The special stipulations agreed upon with France, on June 29, 1872, and March 15, 1873, respectively, were also approved by the diet, which in doing so acknowledged the skill and wisdom displayed by Bismarck in obtaining from France the concessions embodied in these stipulations. The last stipulation provided that France should pay the entire war indemnity by Sept. 5, 1873, and that, in consequence, the German troops should commence on July 1 to evacuate the four departments, still held by them, and the fortress Belfort; that until the payment of the last installment Verdun should remain under the control of the German troops; the last installment being paid, Verdun was to be evacuated and the German troops withdrawn from French soil within fourteen days. The bill whereby the German constitution became operative in Elsass-Lothringen, and which was passed June 18, provided that the military rule to which it had been subjected should cease on Jan. 1, 1874; and, furthermore, that these imperial provinces were to be represented in the diet by fifteen delegates. Yet this bill, as well as the discussion of the report concerning the legislation and administration in Elsass-Lothringen, was not allowed to pass without giving the ultramontanes and democrats a chance to complain of the tendency they supposed in these proceedings to curtail the civil and religious freedom of the citizens in these provinces. The further discussions of this subject came to a close in the diet at last, when it adjourned June 25. — In Elsass Lothringen, whose administration was in charge of the chancellor of the empire, the sentiment of the inhabitants, which was not at all friendly to the new rule, was constantly kept alive by the encouragement it received from the ultramontanes and the French. Against all the influences which were brought to bear upon the inhabitants of these provinces to resist the German rule, and to set up the traditions of a few centuries, which had made them subjects of the government of France, against the fact that the stock and body of the people shared with their new rulers the same national origin, the government of the German empire, with singular firmness and energy, followed up its policy of drawing the political union between these estranged provinces and the rest of Germany closer, and of coercing the inhabitants of Elsass-Lothringen into a patriotic sentiment in favor of their German kinsfolk on the other side of the Rhine. Rapp, the vicar general of Strasburg, at the head of a committee whose object was to offer decided opposition to the new rule, was, on March 17, banished from the provinces; Lauth, the mayor of Strasburg, who had officially declared himself in favor of the restoration of French rule, was deposed April 7; and the board of councilmen, who had protested against this action of the German government, was suspended for two years; the superintendent of police was invested with the powers until then exercised by the mayor and the municipal council. In regard to the management of the schools, the government provided that it should be in the hands of its own officers; that the examination and appointment of teachers, the organization of the schools and the course of study should be determined by the government; that such schools as did not conform to the regulations laid down by the government were to be closed; and that from and after Oct. 1, in those districts whose population was German, no language but the German should be taught. At the election of members to the district and circuit councils, the clericals and all those governed by French sympathies, desired that either none but such as favored the opposition to and "protested" against German rule should be chosen, or that no election should take place. Yet the elections, especially in Lower Alsace, turned out more in favor of the government than was anticipated. Gradually a third party was organizing against those parties which were opposed to Germany, and adopted the name of the Alsacian party, whose spokesman was the Alsacian *Journal*. The members of this party, though recognizing the existing condition of things, were determined to remain Alsacians; they were not willing to cut loose from the traditions which had made them for centuries independent of their kinsfolk on the other side of the Rhine; their aim was to promote the political development and the industrial interests of their own country. — On Sept. 5 the last installment of the war indemnity was paid by France; on Sept. 8 the Germans commenced to evacuate Verdun, and on Sept. 16 the German troops crossed the borders of France. — The line of policy observed by the Prussian government in its struggle with the ultramontanes, which was in the main defined by the four laws introduced by the Prussian diet and passed in May, 1873, regulating the conduct of the church, was a very important factor and exercised the greatest influence upon the political and religious condition of the German empire. There arose a general opposition in all parts of the empire to the claims of the Roman pontiff, claims which were calculated not only to offend the dignity of the temporal government, but also to seriously disturb its relations with its subjects, who might set their fidelity to the church above their allegiance to their government. The orders of the Redemptorists, of the Lazarists, of the Priests of the Holy Ghost and of the Society of the Holy Heart of Jesus, associations similar to the order of the Jesuits, were, by virtue of a

resolution passed by the Bundesrath, dissolved by the imperial chancellor on May 20. Pius IX., in order to secure more favorable terms to the Catholic clergy, appealed, in a letter dated Aug. 7, to the emperor himself. The answer of the emperor, dated Sept. 3, charged the Catholic clergy with being the cause of all the difficulties and disturbances, and of refusing to yield, as the constitution and the laws required, obedience to the public authorities. The publication of these communications had the effect of making the emperor the recipient of a large number of addresses from all parts of Germany and from abroad, warmly approving the position he had taken, and encouraging the government to persist in the course it had adopted in opposition to the rebellious tendencies of the Catholic clergy. The meeting which took place about this time between the emperor and the czar of Russia at Ems, and the one between the former and the emperor of Austria, was followed by a visit, which Victor Emanuel, king of Italy, paid to the emperor at Berlin; the king had come in company with two of his ministers, and remained two days. All these events seemed to indicate that the temporal powers were agreed, if not openly to oppose, at least to discourage the overreaching policy of the clergy. The fact that Lasker's bill, which had been passed by the imperial diet, and which extended the authority and powers of the government of the empire so as to give it complete jurisdiction in civil and criminal matters, and enable it directly to control the conduct of its citizens throughout its territory—the fact that this bill was, on Dec. 12, approved by the Bundesrath by a vote of 54 against 4, did much to strengthen the position of the general government in the difficulties and disturbances the clergy had caused, and to lend the opposition to clerical pretensions the strong aid of the government throughout the empire. The movement inaugurated by the advocates of Old Catholicism gained in strength. In the convocation held by them at Köln on June 4, Reinkens was elected bishop. Having been ordained in his new dignity by Bishop Heykamp at Rotterdam, Aug. 11, Reinkens took the required oath before Minister Falk, and was at once confirmed in his office as Catholic bishop by the Prussian government. A few months later, on Nov. 9, Prince Bismarck was re-appointed prime minister, and again set about to shape the home policy of the Prussian government. At the election of delegates to the Prussian Landtag, which took place on Nov. 4, the conservative party lost fifty-nine members, whereas the clericals and the national liberals gained in strength. In this connection we may mention the fact, as one of more than ordinary significance, that within a few months a bill was submitted in the Prussian Landtag, by which civil marriage was made obligatory on persons engaging in matrimony; that the chamber of deputies in Bavaria and in Würtemberg approved Lasker's bill, which had passed both the imperial diet and the Bundesrath; and that in the lower house of deputies in Hesse certain bills were introduced, which placed the management of the schools and the organization of the church on a more liberal basis, and which were more particularly intended to free in a great measure the former from the control of the latter. The principle also, which seems to have been tacitly agreed to and acted upon by most of the German governments, that a change or amendment of the imperial constitution did not require the express approval of the diets or representative bodies of the several states comprising the German empire, but might take effect after having been passed by the imperial diet and having received the approval of the representatives of the several governments in the Bundesrath, was now insisted upon as a uniform rule, when, contrary to the established practice, the representatives of Saxony in the Bundesrath, pending the adoption of Lasker's bill, hesitated to cast their vote before being expressly authorized by the Landtag of that principality to do so.—The elections to the next imperial diet, which took place on Jan. 10, 1874, except in Elsass-Lothringen, where they were held Feb. 1, were held under great popular excitement, to which the issues pending between the different political factions had given rise. The clericals were very hopeful of success, and the result of the elections showed that they had gained in strength, especially as against the conservatives in Bavaria and some Prussian districts; the social democrats carried their candidates in nine electoral districts. Yet, as the diet was finally made up, the clericals, who numbered 101, were opposed by 155 members of the national liberal party, while the 135 members, who were opposed to the policy and government of the empire, had to make a stand against the imposing array of 240 representatives, including the *progressists*, who supported that policy; the conservative party, which had been reduced to twenty members, stood entirely outside of the working forces of the diet, and carried no appreciable influence. In Elsass-Lothringen, the election resulted in the return of ten clericals, including the bishops of Strasburg and of Metz, and of five members from the faction whose policy consisted in protesting against the administration of Elsass-Lothringen by the imperial government. The diet was now in session. At its opening on Feb. 5 the address of the crown mentioned several measures, which the government proposed to submit to that body, such as a bill concerning the press and a bill for the regulation of trade. On Feb. 16 the fifteen deputies from Elsass-Lothringen appeared in the halls of the assembly, and at once surprised the members of the diet by the propositions they submitted. One of these propositions was, that the population of Elsass-Lothringen should, at that late day, have the right of passing upon the question, whether they were willing to give their assent to the incorporation of that province into the German empire. This measure, however, was voted down by a decided

majority, without even being made the subject of discussion. The next proposition asked for the repeal of the law which invested the head of the administration of that province with certain dictatorial powers, including the right to call upon the military in case the public peace and safety required it. This proposition was taken up and discussed March 3, but was finally rejected by a vote of 196 against 138. On Feb. 14 the postal treaty between the government of the empire and Brazil was ratified, and on the 16th of the same month the extradition treaty with Switzerland. The bill by which vaccination was made compulsory was passed on March 16, but not without giving both the social democrats and the ultramontanes an opportunity to protest against and oppose it as a measure infringing upon the personal rights and liberties of the citizen. A bill providing for the establishment of a board of health was also passed on the same day. On April 24 a law was enacted, providing for the issuing of treasury notes to the amount of 120,000,000 mark, which were to take the place of the paper money issued by the several states, all of which was to be retired by Jan. 1, 1876. Several amendments to the law regulating the different trades, especially the one which made a breach of contract punishable as a criminal offense, were, Feb. 19, on the first hearing, most vigorously opposed by the members of the social democratic party; being referred to a committee, it did not reach a second reading during this session. The act regulating the press, which had been amended in many respects by the committee to which it had been referred on the first reading, was again taken up. After meeting with the united opposition of the social democrats and the clericals, which was principally directed against the right of seizure and the responsibility of the press, it was finally passed by a decided majority on April 19, although a motion to extend its operation also to Elsass-Lothringen was lost. Another source of discomfiture for the clericals was the bill making civil marriage obligatory, which was finally adopted on March 28. Yet this did not deter them from making a vigorous fight against the passage of the act prohibiting the unlawful or unauthorized exercise of clerical offices, and which provided that a violation of its provisions should be punishable by imprisoning the offender by loss of citizenship, and by banishment from the territory of the empire. This act, which was in the first place directed against those Prussian clergymen who still refused obedience to the existing laws, was finally passed on April 25 by a vote of 214 against 108. Yet the measure which met with the most general opposition from different factions of the diet, was the army bill. It fixed, in the first place, the numerical strength of the army in times of peace at 401,659 men. In the opposition to this provision, not only the factions whose policy was directed against the government of the empire as inconsistent with the ancient dignity and independence of the several German states, especially of the South German states, but all members with democratic proclivities of the *progressist* party and the left wing of the national liberals, headed by Lasker, were united. Among those who thus made a stand against the law were also the social democrats and the ultramontanes, who seemed, queerly enough, always ready to join hands in the effort to obstruct the policy of the imperial government. When the bill was at its first reading, Feb. 16, von Moltke insisted upon its passage, and defended its provisions as essential to the safety and peace of the empire. It was finally referred to a committee; it was two months before they were ready to refer it back. In spite of the great opposition the army bill had met with in this diet, public opinion seemed to agree with the views of von Moltke, that the safety and integrity of the empire required the adoption of some measure calculated to secure a ready and efficient military service in case of need, and in the end prevailed upon the committee to report in favor of the bill in a somewhat modified form. It passed to a second reading, April 13–17, despite the fight made on it by the social democrats, the ultramontanes and a certain faction of the *progressist* party, by a vote of 224 against 148, and it at last became a law, April 20, by a vote of 214 against 123. On April 26, 1874, the diet closed its first session of that year.—The spirit of opposition and hatred against the imperial government shown by the ultramontanes in and out of the legislative assemblies was certainly the occasion, if not the direct cause, which prompted, July 18, Kullmann, of Magdeburg, in the attempt to assassinate Prince Bismarck at Kissingen. The culprit was speedily seized, tried at Würzburg by a jury, and on Oct. 30 sentenced to imprisonment for a term of fourteen years, and to loss of citizenship for ten years, besides being put under police surveillance. A prosecution of more political importance than this, was that against Count von Arnim, who had been recalled from the embassy at Paris owing to some political differences between him and Prince Bismarck. The count was tried and convicted on the charge of having taken from the archives of the embassy certain political documents of great importance, which he refused to give up; he was, Dec. 19, sentenced to imprisonment for three months, from which sentence the accused took an appeal. The action of the chancellor in bringing the refractory diplomate to what he conceived to be speedy justice, and the reading in the course of the trial of certain documents which, among other things, bore witness to the skillful diplomacy displayed by the chancellor in his relations with the French government, could not fail to add to the distinction he had already won as Germany's foremost statesman. The last session of the diet of that year, which convened Oct. 29, 1874, was principally occupied in fixing the various items of the general budget for the year 1875, which, after being fully discussed and con-

sidered, was adopted in the shape submitted, Dec. 18. The postal treaties with Chili and Peru were approved Nov. 4, that with Berne, Nov. 30, and, on Dec. 9, a resolution was adopted, which declared in favor of popular representation in all the states composing the empire. A proposition for the establishment of a legislative assembly for Elsass-Lothringen, supported by the ultramontanes and opposed by Bismarck, was submitted by the deputies of that province, but no final action was taken. The diet again met in the following year, in a short session, which extended from Jan. 7, 1875, to Jan. 30. Parts of the principal business of this session were the extradition treaty with Belgium, which was approved on January 22; the act regulating the publishing and taking effect of the general laws of the empire, which was passed January 14; and the banking act, which made the imperial bank the leading institution in the banking system of the empire, which was passed January 30. The most important feature in the proceedings of this session, and which aroused the most general interest, was the final passage of the law making civil marriage obligatory throughout the territory of the empire; it also contained a provision whereby any member of the Catholic clergy or order might contract a lawful marriage. The law was passed, after meeting with the most stubborn opposition, from the ultramontanes, on January 25.—The event which most engaged public attention during the interval which marked the close of this session of the imperial diet and the opening of the next, was the publishing of the papal encyclica on Feb. 5, 1875, in which the laws passed by the Prussian diet against the Catholic clergy were declared invalid and of no binding force on the church. The excitement produced by this further evidence of papal defiance, again ran very high, and called out the full strength of the liberal element in support of the government in its contest against the uncompromising and defiant attitude of the church. The efforts of the ultramontanes were directed not only toward defeating the policy of the government in the legislative assemblies, but also toward enlisting the co-operation of the Catholic powers of Europe in the formation of a great and powerful alliance against Germany. But Bismarck was not weary, and the bold stand he took against the enemies of his government showed that he was ready to accept the issue of war, if war his opponents meant. This had the effect of quieting, for the time, the aggressive tendencies of the ultramontanes, and of causing England and Russia to raise a voice in the interest of European peace. —When the diet met again, on Oct. 27, 1875, the address of the crown invited the consideration of the assembly to the following measures: the new money standard of the empire, which was to be in force on and from Jan. 1, 1876; an increase of the tax on brewing material; an act providing for a stamp tax on negotiable instruments and other evidences of money transactions; an act for regulating the copyright of works of art; and, finally, the adoption of a new criminal code. The low condition of trade and commerce, noticeable throughout the country about this time, was pointed out, but not without being characterized as only temporary in its nature. The address finally called attention to the fact that the public peace was no longer threatened, but firmly established throughout the country. In the debates on the public budget the principal question was concerning the means of raising the eighteen millions required to meet the expenditures of the government. The government was in favor of meeting the deficit by an increase of the tax on malt, a stamp tax on negotiable instruments, etc.; while the majority of the diet were in favor of meeting the present want by curtailing the appropriations for the army and reducing them to a more economical basis. Though Bismarck advocated the imposition of an increased indirect tax on certain articles, such as beer, coffee, tobacco, brandy, sugar and petroleum, the bills taxing brewing material and imposing a stamp duty on negotiable instruments, etc., were rejected Dec. 16, and the budget was finally agreed upon, in a shape which met the views of the majority of the diet and in opposition to those held by the government, on Dec. 16, after which the diet adjourned without taking any action on the bill providing for the adoption of a criminal code. The principal features of this bill were the provisions of more than ordinary stringency directed against the unruly element of the population, whose actions were likely to be turned to political account; the provisions imposing certain penalties for the official misconduct of members of foreign legations, for encouraging offenses against foreign governments, for abusing the privileges of the pulpit by the clergy in their war against the secular authorities, for inciting the populace to actions in violation of the public laws, for public attacks on the institution of marriage, the family or property, and for resisting public officers in the discharge of their duties. The diet meeting again on Jan. 19, 1876, this bill, with the exception of the sections making criminal any act which tended to encourage the populace to commit a violation of the public laws, or which tended to encourage the different classes of society to commit acts of depredation or violence against one another, was finally passed in a somewhat modified form, whereupon the diet was closed Feb. 10, 1876.—Though unwilling to make public acknowledgment of the fact that there was a breach between him and the ruling majority of the diet, which threatened to become wider as the differences became more apparent between the policy of the imperial chancellor and that of the majority of the august assembly, who were, in theory at least, the representatives of the people at large, Bismarck was secretly chagrined at the defeat of his legislative measures, touching the raising of new taxes and the punishment of what he considered offenses endan-

gering the peace and safety of society and of the government. Added to this, were the difficulties he had to contend with in the Bundesrath. The majority of this body were opposed to the proposition submitted to them, whereby the railroad system of Germany was to be consolidated and placed under the control of the imperial government. Bismarck's native instinct saw in this opposition an indirect but firm protest against the policy of building up a strong central government, and of placing the consolidated interests of the country under the control of one power, wherein all the functions of government were firmly united. — The last session of the diet, which was the result of the elections of Jan. 16, 1874, was opened on Oct. 30, 1876. The address of the crown recommended the passage of a bill regulating the judiciary, a code of civil and criminal procedure, an act regulating proceedings in bankruptcy, and called the attention of the assembly to the struggles in the east, the differences between Russia and Turkey, and announced it as the intention of the government to maintain friendly relations with all foreign governments (especially those which were more closely united with it by historical traditions, such as Austria and Russia), and to use its effort in securing peace and good-will among those governments whose friendly relations with one another might be endangered or disturbed. Public opinion seemed to be somewhat divided as to the relative merits of the eastern question, the people, especially in South Germany, being mostly opposed to Russia, while the heads of the imperial government could not conceal their leaning toward the pretended champion of Christendom against the professors of Islam, and were willing to aid the former power, by a conference, to exact from the government of Turkey the adoption of some measures looking to the protection of the Christians within its territory. Beyond this, the government of Germany observed a strict neutrality. The principal business before the diet was the passing of the judiciary laws. The several bills concerning this matter had been referred to a committee chosen by the diet in 1875 for the purpose of revising and reporting them back. The committee concluded its labors on July 3, 1876, and submitted its report to the diet Nov. 3. Upon the reading of the report, the Bundesrath submitted no less than eighty-six objections, the principal of which were those against the trial by jury of all offenses in the nature of abuses of the privileges of the press, and the compulsory attendance of publishers and editors, of printers and compositors, as witnesses in such cases. In spite of these objections the bills passed the first and second readings, whereupon the Bundesrath withdrew all objections except eighteen, which that body firmly insisted on, giving notice to the members of the diet, that, if the bills in question were passed despite them, the Bundesrath would refuse its approval. Fearing that these important legislative measures might be defeated by an obstinate adherence to the position taken in regard to them by either side, a compromise was agreed upon, by which trial by jury in the cases referred to was not allowed except in those states in which, as in southern Germany, that form of procedure existed as a matter of right, and by which, furthermore, the compulsory attendance of such witnesses as we have mentioned could still be resorted to; the date when these laws were to take effect was fixed for Oct. 1, 1879. The bills were finally passed after their third reading, Dec. 21, whereupon the diet was closed on the following day. This compromise had the effect of producing great dissatisfaction in the ranks of the *progressist* party with the action of the majority of the diet, which in the main was composed of the members of the national liberal party, and was not without its influence on the forthcoming elections for the return of members to the next diet. The elections took place Jan. 10, 1877. The national liberal party lost twenty members, securing but 128, the *progressists* lost three, reducing their number to thirty-four, while the conservatives made considerable gains, and the centre managed to retain its previous strength. The social democrats gained five members, two of whom were from Berlin. Thus the national liberals failed to furnish the majority for the next diet; the only united majority vote lay with the factions, whose common policy, in support of the imperial government, had given them the name by which they became known as "friends of the empire"; they might command a vote of about 253, while their opponents could count upon 139 votes. Out of 2,500,000 votes cast, the vote of the socialist candidates reached 485,000, an alarming evidence of the strength of their party. Though the relative position and influence of the different parties appeared to be materially changed, when the new diet opened, Feb. 22, 1877, nothing occurred in its first session which was calculated to create serious disturbances in its business, or to pit the different parties against each other in a contest over the balance of power in the new assembly. On March 23 the diet passed the act giving to Elsass-Lothringen a legislative assembly of its own, with power to pass laws for the regulation of the internal affairs of the province, which, however, were to take effect only after obtaining the approval of the Bundesrath, and, in case of disagreement, of the imperial diet. On April 26 the various appropriations of the public budget were agreed on, which estimated the resources and expenditures at 540,536,415 mark respectively. The further legislative measures which passed, were the act fixing Leipzig as the seat of the imperial court of last resort, and an act regulating the granting and issuing of patents, and establishing a patent office. The comparative quiet of this session was somewhat broken by the startling announcement of the intended resignation of Bismarck, who at last, however, yielding to the solicitations of the emperor, refrained from pressing it any further, and simply took leave of

absence for an indefinite period. His resignation was tendered by the imperial chancellor on the alleged ground of failing health, but was in fact prompted by the opposition he met with in his attitude toward the eastern question, as well as to his home policy, which, especially as touching all questions of public economy, had become highly distasteful to his former allies in and out of the legislative assembly of the nation.—Passing the summer without any notable event, the fall of that year found Bismarck at Varzin, engaged in devising a system of revenue, calculated to make the empire really independent in all financial matters; he was also no stranger to the thought, in order to secure a working majority in the diet in aid of his plans, of making some advances toward his former allies, the national liberals, and, if possible, to win them over to some sort of concerted action with himself. The several conferences which took place at Varzin, in the winter of 1877, between the chancellor and Bennigsen, though they resulted in an understanding by which certain leaders of the national liberal party were to have a seat in the cabinet, came to a termination without any definite understanding or agreement, as the chancellor was unwilling to give the proper constitutional guarantees that the indirect taxes, which were to be levied by the imperial government, would be applied in such a manner as to reduce the heavy burden of the direct tax. The only reform in the revenue system, which the government proposed during the session of the diet, which commenced Feb. 6, 1878, was to confer upon the imperial government the power of levying a stamp tax in certain cases, and of raising the tax on tobacco. On this occasion, Bismarck made the statement in the assembly, that it was not so much a tax on tobacco as a monopoly of tobacco, which suited his policy—a statement which was not at all calculated to close the breach between him and the national liberals, who, in point of principle, were opposed to nothing so much as such a policy. The diet finally referred the chancellor's bill to a committee, with which it remained without any further action being taken on it during that session. After passing on the public budget, which estimated the resources and the expenditures at 536,476,800 mark, and passing an act authorizing the imperial chancellor to act by substitution, the diet was about to adjourn, when the uncertain state of public feeling touching the future relation of the government to that body, the imperial diet, which came nearest representing the wishes of the people, was still further increased by the attempt, fortunately unsuccessful, made by Max Hoedel upon the life of the emperor, on May 11. The government readily seized on this event as a reason for adopting stringent measures against the socialists, who were all along treated by the government as the most unruly element in the country; a bill was, on May 21, submitted to the diet, directed against the socialists, and providing for the passage of some special acts, the enforcement of which was to be entrusted to the Bundesrath and the diet. The majority of the diet, however, was of the opinion, that as long as the government had not exhausted all the powers already at its command for the repression of all public disturbances, it would not be advisable at that late day to hurry through a legislative measure of so great importance. The bill was therefore rejected, May 24, by a large majority.—The session of the diet from February to May, 1878, though of no special importance as far as the passage of legislative measures was concerned, indicated that the time was fast approaching, which called for a redistribution of the political power in that body. The national liberals, who had hitherto enjoyed the ascendency, and who had shown a ready disposition to act in concert with the imperial chancellor in carrying out his policy, were now, for the sake of the political principles they had expressed, compelled to change their attitude toward Bismarck, when Bismarck, with measures such as the tax on tobacco, (which, though they avowedly favored a monopoly, the chancellor warmly defended before the diet,) the proposed substitution of a system of indirect for direct taxation, and the law against the socialists, surprised the liberal majority of the diet by a line of policy, which, in more respects than one, was distasteful to that majority. The national liberals were in favor of a free trade policy, and in point of principle were arrayed against all monopolies; the traditions of their party history had made them the advocates not only of political freedom in its larger sense, but also of the personal liberties of the citizen, and they were now invited to further aid the one statesman, who hitherto had been in the full possession and control of all the political powers of the new empire, in the execution of a policy so much opposed to the very principles which helped to make them a political party. They hence declined to act on the measures submitted to them, and this session of the diet, though of more than ordinary length, came to an end without witnessing the adoption of a single measure affecting the great interests of the country.—Yet, following this came the second more successful attempt on the life of the aged emperor on June 2, by Carl Nobiling, a professed socialist. The emperor received serious though not fatal injuries, from which he slowly recovered. This new attempt to right real or supposed grievances of the masses by cutting off the head of the government, threw the government and the people alike into the wildest state of excitement, amidst which Bismarck succeeded in disbanding, on June 12, the imperial diet, and ordering a new election to take place on the 30th of the same month, by means of which the chancellor hoped to secure a conservative majority, in support of the government and its measures. Though the excitement preceding the election ran high and the contest carried on was most bitter, the result of the election was by no means of a very satisfactory nature,

and of no decided advantage to any one of the parties who had entered the contest. The conservatives had gained no decided majority, while the party who called themselves the "friends of the empire" had lost in strength The centre was the only faction which maintained its former quota, while the social democrats, who were in the thickest of the battle, lost but three representatives. As far as the working force of the new diet was concerned, it was represented by those parties of about equal strength, the national liberals, the conservatives and the centre. On Sept. 9 the diet met. The bill against the socialists was the only business before the assembly. It was referred to a committee on Sept. 17, and in its amended form reported back by the committee, passed on Oct. 19, by a vote of 221 against 149, the centre, the *progressists* and the socialists voting in the negative, while the national liberals voted in the affirmative, after an effective appeal to them by Bismarck, in which he not only denounced the dangers of socialism, but also assured his former allies that he harbored no thought of favoring or employing reactionary or any other measures which were against the true interests of the country. The act gave extensive powers to the public authorities in enforcing its provisions; it was, by its terms, directed against all societies, organizations, meetings and publications with socialistic tendencies, against any and all movements attempting to "upset" the present order of society, and endangering the public peace and safety of the country. Its enforcement was entrusted to a special committee of the Bundesrath, some of whose members, however, were taken from the judiciary; and the time during which it was to be in force was fixed at two years and a half, making it expire on March 31, 1881. The law having been passed, the war upon the socialists began. The further meetings and transactions of all the different socialistic organizations, 153 in number, were prohibited throughout the country, and the further publication of forty periodicals advocating the cause of socialism was forbidden; and on Nov. 28 the functions of the civil authorities for the preservation of the public peace were suspended in Berlin and the city declared in a "state of siege," while a large number of socialists were expelled. — Socialism in Germany, or, more strictly speaking, the party of the socialist democrats, had grown to its present proportions under the influence of the teachings of Karl Marx and Ferdinand Lasalle, and had developed into a political power throughout Germany even before the establishment of the empire under the active leadership of the latter. The movement inaugurated by Marx, resulting in the organization at London of the "International Workingmen's Association," September, 1864, was, in its theoretical tendencies, more comprehensive than the one which owed its origin to the efforts of Lasalle; Marx aimed at an organization in the interests of the working classes throughout the world, while the latter confined his efforts to Germany and thus became the leader of a distinctively national movement. It assumed a definite shape in the organization at Leipzig on May 23, 1863, of the "General Workingmen's Union." Lasalle, as the moving spirit, denounced the present means of production and the accumulation and distribution of wealth as being contrary to the sound principles of public economy and as aiding capitalists in robbing the workingmen of the avails of their labor, and in monopolizing the industries of the country for the benefit of the few. As against individual enterprise encouraged and regulated by competition and private capital, the advocates of this movement favored the consolidation of capital in the interests of labor, the formation of productive associations on the basis of a community of interests of those forming them, and, whenever required, the aid of the government in the shape of furnishing the appropriate guarantee for the raising of capital and funds for the encouragement and management of the numerous enterprises thus carried on, and insisted that the government was bound to protect the interests of the laboring classes by appropriate legislation. As a means of bringing the claims of the workingmen to the notice of the government and of enforcing them, Lasalle early advocated universal suffrage, and insisted upon it as the most effective means whereby the laboring classes might make themselves felt as a political power, and of promoting and defending their cause against the combined efforts of their opponents. Lasalle entered into the cause with all the ardor which youth and a brilliant imagination could give, and with a mind well equipped and disciplined for the work he undertook. He was then a man who, though young, had won distinction as a scholar and a brilliant advocate at the bar. Being elected president of the union, he began in all earnestness his work of securing to his followers the requisite political power by thorough organization and discipline. He was at the height of his influence, though greatly harassed by the personal attacks he met with on the part of the opponents of his cause, when his labors came to a sudden end on Aug 31, 1864; he fell in a duel he had provoked. It was not long after the death of their illustrious leader that dissensions broke out in the ranks of his followers. The more radical members of his party, favoring the wide-spread organization of the internationals and their more revolutionary tendencies, finally cut loose from their former organization, and in August, 1869, at Eisenach, formed a new association which they called "The Socialist Democratic Workingmen's Party." The platform adopted by them declared in favor of a democratic form of government, equality before the law and the abolition of privileges and class distinctions, the abolition of the wages system and the establishment of productive associations on the basis of a community of interests of all concerned, political liberty as forming the very basis of the economical liberation of the working

classes. The party further insisted on the direct exercise of universal suffrage, separation of church and state, compulsory education and the strictly secular management of the public schools, the abolition of all indirect taxes and the substitution of an income tax, and, finally, the aid of the government for the encouragement of productive associations and the pledge of the public credit in support of their various enterprises. Though the two factions by which the cause of socialism was represented in Germany, the followers of Lasalle and the internationals or social democrats, were as far as the details of their work were concerned and in many things opposed to each other, it soon became apparent that the cause of socialism could not gain in the end by a division of its forces, and this finally led to attempts at again uniting the two factions. It was in Gotha in May, 1875, that a reunion of the two factions was effected. The congress of Gotha, by which name the large gathering of representatives of socialism is known, resulted in the organization of what henceforth became known as "The Socialist Workingmen's Party of Germany." Its platform was in the main the same as the one adopted by the party at Eisenach, and its organization rapidly spread throughout Germany. This is the brief outline of the origin and growth of a party which, after the passage of a law aiding the government in its warfare upon its adherents, not only taxed all the energies of the public authorities in its suppression, but also gave rise to the sad spectacle of the government turning its entire machinery against a whole body of people, who, however mistaken in principle, formed the bone and sinew of the nation, and who were justified in their adherence to their cause by real grievances. — Turning from this by no means glorious incident, the government's war against the socialists, in the history of the German empire, we can make more honorable mention of the congress of Berlin, which met on June 13, 1878, to settle the eastern question, and over which Prince Bismarck presided. The fact that the chairmanship was accorded to the German chancellor showed the predominant position Germany had secured among the European powers, and that each was willing to submit to the discreet influence and the winning diplomacy which the imperial chancellor so well knew how to employ. The congress was in session until July 13, when the treaty was concluded, which, among other things, constituted Bulgaria an autonomic principality, though tributary to the porte, made Montenegro independent, engaged the porte to introduce legal reforms and to grant religious freedom, and which maintained the treaty of Paris (March 30, 1856) and of London (March 13, 1871) where not modified by the present treaty. The treaty of Berlin was ratified the following month, August 3, 1878 — On Dec. 5, 1878, the emperor returned to Berlin, and again assumed the duties of his office. On Dec. 15 Bismarck sent a communication to the Bundesrath, in which he defined the revenue policy, and advocated a general system of taxation and protection to native industry. Another important measure proposed was a bill which extended the disciplinary powers of the diet, whereby even speeches delivered in the diet could be made the subject of criminal prosecution. The new session of the diet was opened on Feb. 12, 1879, by the emperor in person. His address chiefly pointed out a thorough reform and change in the economical policy of the empire. The bill extending the disciplinary powers was rejected on March 7. The bill was to confer on the diet the power of punishing in a summary way those of its members whose speeches might be calculated to disturb the public peace and good order of society, or who were guilty of injuring the reputation, honesty and integrity of citizens, not members of the diet, etc., by excluding the members so offending from the diet, by revoking their commissions, or by turning them over to the ordinary tribunals for further prosecution. The government thus intending to carry the war against the socialists into the halls of the legislative assembly, and to stop all discussion of the merits of their cause carried on under the cover of its privileges, the majority of the diet, having passed the highly proscriptive act against the socialists throughout the country, was not willing to aid the government any further by adopting a measure which not only called in question the dignity of the supreme legislative and representative body of the people, but which was calculated seriously to affect the independence of its members, and the right of free discussion which they might justly claim on all questions agitating the public mind, or involving the interests and general welfare of the country. The most important question before the diet now, was that concerning the raising of a revenue to meet the public expenses, estimated by the budget submitted at 540 million mark. The government intended to meet the estimates of the budget by means of a tariff, which had the advantage of being supported by the plea that it helped to protect home industries, and thus impart a new energy to the various branches of trade and industry, which were then suffering from the reaction that had set in, in consequence of wild speculations, into which a great many had plunged soon after the close of the Franco-German war, and in which fortunes were wrecked as soon as they were built. After the diet had taken a short recess, in order to give its members an opportunity to examine in detail the bill to be submitted by the government and awaiting the action of the Bundesrath, the bill was finally presented to the diet on its meeting, April 28. The diet was composed of three parties: the conservatives (German conservatives or the imperial party), with 114 votes; the liberals (national liberals and *progressists*), with 125 votes; the centre (including the Poles and part of the representatives from Elsass Lothringen), with 125 votes. By uniting on any measure, two of the parties constituted a majority.

The *progressists* were as a unit opposed to the tariff bill as a means of protection, while the conservatives were without exception in favor of the bill, if for no other reason than that it was a measure fathered by the government, and distasteful to their political opponents, who were arrayed against them on all questions of public policy. The centre was also in favor of protection. A serious mistake was made by the national liberals in hesitating to make the tariff or the question of protection a party issue, and in not requiring from its members strict adherence to its traditional policy, and thus losing all concerted action in the struggle on hand. Strict discipline being neither required nor enforced in the ranks of this party, its difficulties were increased by the fact that it soon broke up into three factions: the positive and unqualified free traders, the protectionists, and those who were in favor of a tariff for revenue only. The national liberals therefore exercised no appreciable influence in deciding the question at issue, as the opposition coming from their ranks was neither feared, nor the divided support they could give much sought for. Bismarck, in thus effecting a coalition of all the conservative elements in the diet, and witnessing the utter helplessness and divided condition of those who had been his former allies, but who of late had become dissatisfied with his policy, and who were not united in either resisting or supporting the measures he proposed in order to alleviate the financial and economical condition of the empire, was not long in carrying his measure through the diet. The entire tariff bill, after all its features had been discussed, was finally passed on July 12, by a vote of 217 to 117, a large number of national liberals, the *progressists* and the social democrats voting in the negative. The act provided, aside from an outspoken protective tariff in favor of certain industries, for a duty on tobacco, iron, corn, lumber, petroleum, salt, coffee, tea and other grocers' commodities, a species of legislation which fell heavily on the large class of consumers who were to be indirectly benefited by the imposition of a protective tariff, which for the first time was put on trial in the new empire. The act further provided that the duties on commodities imported from such countries as by their tariff laws discriminated against commodities exported by Germany, and in favor of other states, might be increased double the fiscal rate; it also authorized an embargo in certain cases. Before the passage of this law, the attention of the diet was occupied by a bill providing for a local government of Elsass-Lothringen (Alsace-Lorraine) independent of the direct control and interference of the imperial government. The bill passed without much opposition on July 4. It provides for a governor (*stadthalter*), to be appointed by the emperor, and whose seat was to be at Strasburg; for a ministry, at the head of which was a secretary of state; for a council of state presided over by the governor; and a legislative assembly, composed of fifty-eight members. The bill as passed became a law and went into effect on and after Oct. 1, 1879. Its business being finished with the passage of the tariff act, the diet adjourned on July 12. — Bismarck, in effecting, for the purpose of securing a majority for his financial measures, a coalition between the conservatives, the party most loyal to the government, and the centre, the party which in the struggle between church and state had espoused the cause of the clergy in their war against the government, again showed his consummate skill in the management of opposing political factions. Yet aside from the fact that the liberals had now become thoroughly estranged from him, for the reason that by his adroit management he had pushed them to the wall and thus made their opposition harmless for the time, it was certainly no comfort to him to find among his supporters in and out of parliament those who were—the *Culturkampf* raging —his bitterest enemies; to see, on a moment's reflection, that his new allies could not and would not stand by him, unless he was willing to change or at least modify his position toward the papacy and the church. He had, for the time at least, lost the support of the liberal element; and subsequent events proved that he could not undo the fatal consequences flowing from this new alliance, and was bound to make concessions and sacrifice of principle, in order to retain his hold on the legislative majority represented by this coalition. — The excitement produced by the heated discussions over the new tariff law having subsided, the following year was one of comparative quiet in the public and political life of the nation. The close of the year 1879 was marked by the introduction of the new judiciary system, provided for by the imperial diet, throughout the several states, and the opening and first session of the imperial court of last resort at Leipzig, under the presidency of Edward Simson, whose name was already honorably connected with all the leading events of the empire. The foreign policy of the imperial government, of maintaining the independence and dignity of the empire, remained unchanged. The only efforts Bismarck made to aid in the settlement of the eastern difficulties, was to prevail upon the Turkish government to consent, in the interest of public peace, to the incorporation of Dulcigno with Montenegro. In all else the imperial chancellor observed a strict neutrality, his only care being to impress the European powers with the fact that while he was ready to meet any attempt to disturb the peace and safety of the empire, it was not the policy of the German government to interfere with the neighboring governments beyond the maintenance of public peace, or to add to the power and dignity of the empire by territorial annexations or foreign conquests. — On Feb. 12, 1880, the diet again convened. In the choice of its president, Count Arnim Boitzenburg, the coalition between the conservatives and the centre or ultramontanes made itself still felt. The relative strength

of the different factions remained unchanged: the conservatives had 58 members, the imperial party 48, the national liberals 85, the *progressists* 26, the centre 101, the socialists 10, and the rest made up a small faction, who occupied an independent position. A bill providing, among other things, for an increase in the numerical strength of the army in times of peace, which was submitted by the government ostensibly on the ground that the attitude of France toward Russia gave rise to a reasonable suspicion that an alliance was forming, was, after some discussion, passed on April 16, by a vote of 186 (of the conservatives and national liberals) against 128 (of the ultramontanes, *progressists*, Poles, liberals and Alsacians). An important feature in the proceedings of the diet was the bill providing for an extension of the time for and during which the law against the socialists must be in force, which formed the subject of debate on April 18 and 19, on which occasion the socialists, in concert with the *progressists*, denounced the evil features of the law, and opposed the present bill, while the national liberals submitted to it and the conservatives defended it, as a necessary measure for the preservation of the public peace. The bill was finally passed, extending the operation of the law to September, 1884. The alliance between the conservatives and ultramontanes, of which, beyond the election of the president of the diet, no further evidence was given during the present session, except in the passage of the law on usury and of the act regulating the different trades, seemed to be but temporary after all, and did not prevent the centre or ultramontanes from opposing two measures submitted by the government, one of which was for the protection and in the interest of the German trade and commerce with the South Sea islands, the other providing for the incorporation of Altona and St. Pauli, a suburb of the city of Hamburg, with the dominion subject to the operation of the German tariff law. The former measure was defeated, while the latter was, after some discussion, referred to the Bundesrath for further action which was to remove the objection to the measure, that Hamburg could not be deprived, for no other reason than to further the tariff system of the empire, of one of its most important districts without and against its express consent. Bismarck, considering these two measures as necessary and in the interest of the government, was greatly displeased with the opposition he met with from the centre; and in view of the fact that this faction still held the balance of power, he counseled the liberal elements to forget their differences, not only among themselves, but also with the government, in order to prevent any further alliance between the conservative and ultramontane elements, and in order to unite upon some policy in support of the unity and integrity of the empire as against its most bitter and persistent opponents. On May 11 the diet adjourned, these closing events giving some hope of future co-operation between the more moderate faction of the liberal party and the conservative elements of the government. — The events and incidents connected with the proceedings during the session of the diet which had just come to an end, had the effect of bringing about the final separation of the more uncompromising or left wing of the national liberal party from the more conservative element. The split between the two factions had been noticeable for some time, but the traditions of the party had, until now, been stronger than the individual differences of its leaders, and this had hitherto prevented an open breach. But the hopes, in which the leaders of the more radical faction indulged, of forming the nucleus of a new liberal party more powerful and more influential than the old, were not realized. The platform which they published on Aug. 28 declared their determined opposition to all reactionary measures, and also that the economical welfare of the people was closely connected with their political freedom, and depended upon the principle of free competition in the various departments of trade and industry. It was this last proposition which did not meet with favor from the conservative elements, and which finally gave rise to the disunion. — The *progressists*, on the other hand, were not willing to give up their independent position and simply fall into the ranks of the seceders; they rather claimed that those who cut loose from their former party organization should come over to them. The liberals not being willing to do this, there was no prospect of establishing some common ground on which the liberal elements in the different factions might meet, and, forgetting minor and past differences, carry out a policy which was in favor of both the economical and political liberation of the people — The third and last session of the present diet commenced on Feb. 15, 1881. The government announced as the main features of its financial policy the development of the resources of the empire in such a manner as to make it generally independent of the aid furnished by its constituent governments, and thus enable the latter to lighten the burden of their own taxation, which still fell heavily upon their respective peoples. — Among the bills submitted was the accident insurance bill, one providing for the re-establishment of the guilds, another against drunkenness, and finally the bill providing for an amendment of the constitution, whereby the public budget was to be fixed every two years, and on which, though introduced, no action was taken in the previous session. Since the relative strength and composition of the different parties, owing to the split in the liberal ranks, had materially changed, it was with some difficulty that the diet succeeded in choosing its presiding officers. The German imperialists and the national liberals resisted the re-election by acclamation of the former presiding officers, Count Arnim von Frankenstein and Ackermann, which the centre and *progressists*

had proposed. After Arnim had been elected by 147 votes, but declined, the choice finally fell upon von Gossler, one of the secretaries of the Prussian ministry, an ultra-conservative, though without political record; von Frankenstein and Ackermann were re-elected, and accepted. The diet being thus constituted, the public budget was the first thing taken up. It estimated the expenses at 588,077,972 mark, and was, after some slight modifications, passed on the third reading, March 24. The bill providing for biennial sessions and a quadrennial constitution of the imperial parliament came to its first reading on March 8. The government advocated its passage on the ground of relieving the overburdened legislature, while the liberals opposed it for the reason that it was aimed at the dignity, efficiency and privileges of the people's assembly The only support it received in the diet came from the conservative side; the centre was keeping back, awaiting the close of the *Culturkampf*, which was promised by certain advances that Bismarck, as the representative of the Prussian government, had made in favor of the clergy toward a final settlement of the struggle between church and state. The bill was referred to a committee, which, after a brief consultation, reported unanimously against its passage. It was finally rejected on its third reading, May 16, by an overwhelming majority. The same fate was shared by the bill submitted by the government in favor of an increase in the brewers' tax and in the stamp duties, and of a tax to be levied on such as were liable to military duty, but were not in actual service. Another defeat Bismarck suffered was the rejection of his measure, which proposed to promote the economical council, which aided and advised the Prussian government in its financial and economical measures, to the dignity of a council of the empire. The strong objection urged against it was, that, as heretofore constituted, this board was not entirely free from the influence of the government, and that it furnished no guarantee that its future constitution would be materially changed, and its usefulness much improved by simply being attached to the imperial government. An important measure before the diet was the accident insurance bill, which had passed the Bundesrath, and was submitted the latter part of March. It provided for the establishment of an imperial board of underwriters, who were bound to issue policies to all workmen, and who were to indemnify laborers who became disabled by accident, out of an insurance fund partly made up of premiums to be paid by those insured, and partly by government contributions. This was the first step taken by the government toward the fulfillment of the promise to alleviate the suffering working people, made at the time the bill against the socialists was submitted to the diet. The bill passed its first reading without much trouble. Its main feature, the insurance of workingmen against accidents, was approved by all, with the single exception of the *progressists*, while the clause providing for a government contribution was not allowed to pass without being criticized as a sort of monopoly It was referred to a committee which took about two weeks in considering the bill. In the committee the members representing the conservative party united with those representing the centre, thus securing a majority, against which the liberal members were powerless, and agreed on the following report: that all private insurance companies be prohibited from issuing the same kind of policies as provided for by the bill, and that, instead of one imperial board of underwriters, there was to be a board in each of the states composing the empire. The bill, as reported back, reached its second reading May 31. The *progressists* opposed the bill, while the socialists desired to have its provisions extended to the farm laborer. The national liberals were in favor of a board of underwriters for the whole empire, and of allowing private companies to issue similar policies. But the conservatives, in connection with the centre and the imperialists, defeated the proposition of the liberals. Bismarck insisted on the passage of the clause requiring the government to contribute toward the payment of the premiums. Though the bill seemed to have, in view of these different opinions, little chance of being adopted, it passed its final reading by a vote of 140 against 108, substantially in the shape it was reported by the committee. The bill coming back to the Bundesrath for its approval, it was, on June 25, rejected by this body on the ground that it was unjust to tax the disabled laborer without earnings by the compulsory payment of premiums, and that the establishment of insurance boards in the different states was, in its opinion, an impracticable measure. And thus the first attempt of the government failed toward enacting a law, which, in its opinion, was a most salutary measure of social reform. Having parted ways with the national liberals, and not being sure in all instances of the centre or ultramontanes, who were not willing to support the government without some assurance of the government's changing its position toward the Catholic clergy, Bismarck seemed to have lost his hold upon the factions which, united, might give him a legislative majority in the diet in support of his measures. Among the bills which were passed before the close of the present session, was the bill regulating the different trades after the pattern of the guilds, defining the relation of master and servant, and regulating the matter of apprenticeship, the law against drunkenness, that against the adulteration of wines, and the act recognizing the German as the official language in the legislative assemblies of Elsass-Lothringen. The present session suddenly closed on the evening of June 15, 1881, and with it the fourth legislative term of the imperial diet came to an end. No special reference was made in the diet to the foreign policy of the government, since all parties trusted to the chancellor's singular ability

and success in maintaining the public peace, and the undisturbed relations between the empire and the leading European powers. Yet the assassination of the Russian czar, Alexander II., on March 31, 1881, gave rise to expressions of sympathy on account of the sad fate of the aged monarch, and the diet passed, on April 4, a resolution, in which the German chancellor was requested to use his efforts in effecting an agreement with the leading governments of Europe, whereby the killing of any of the rulers entering into this compact, or the attempt to commit this offense, was to be made punishable, and the penalty inflicted, not only on such offenders as were citizens or subjects, but also on strangers who happened to be found within their respective dominions; and whereby, further, the offender, if found elsewhere, might, on proper request, be surrendered to the government against whose ruler the crime was committed. — Pending the discussion of the proposition submitted by the Prussian government to the Bundesrath, May 18, that the revenue office of Hamburg, with its different branches, should be abolished, and, as claimed by those opposing this measure, Hamburg thus be coerced into joining the tariff union, the whole agitation of this matter came to a sudden close by the publication, on May 27, of the treaty between the imperial government and that city, whereby Hamburg was to enter the union Jan. 1, 1889. — The principal event engrossing the attention of the nation, was the forthcoming election of representatives to the imperial diet entering upon its fifth legislative term. The imperial government exerted its influence to the utmost, in order to secure the election of representatives who might furnish the required majority for the passage of the various measures which Bismarck was anxious to put through the diet. The government press attacked the liberals most violently, and branded those who were not willing to vote in favor of Bismarck's candidates and to extend an unqualified support to the imperial government as enemies of the empire and the crown. Though the government employed all manner of means to carry the election, it failed to submit a distinct programme as to its future financial and economical policy; the tobacco monopoly was the only issue, which was used by the friends of the government in order to secure the vote of the people, on the plea that the revenue resulting from it would be sufficient to furnish the means of securing to the working classes a proper indemnity against accidents disabling them for work, and the means for the support of the aged paupers—the "patrimonium of the disinherited," as it was called. The installation of a bishop at Trier, who was exempted from taking the required government oath, the renewed negotiations with the see of Rome, concerning a peaceable settlement of the issues arising out of the *Culturkampf*, were the means employed to win over the ultramontane vote. The principal efforts of the government were directed toward securing the vote of the centre, though this party declared its unwillingness to support the measures and policy of the government while the obnoxious May laws, passed by the Prussian diet against the clergy, were still in force, and while the imperial chancellor threatened the diet with measures such as the tobacco monopoly and his socialist schemes, so distasteful to the party. The elections were to take place on Oct. 27. This gave the liberals time to recover from their apathy, and renewed courage to enter upon an active campaign. The socialist schemes of the chancellor, the news concerning a settlement of the clerical difficulties on the basis of concessions to the pope, which were at war with the interests of the state, the daring attitude of the orthodox Lutherans, and, finally, the agitation against and persecution of the Jews, gave rise to a reasonable apprehension among the middle classes, especially in Prussia, that a reactionary movement in politics not only, but also in matters concerning religion and the church, was fast setting in. All this had the effect of stirring up the body of the people, and setting the tide of the election against the friends of the government. Owing to the efforts made by all parties, the election on Oct. 27 left about a hundred contests undecided, and which as to all such cases made special elections necessary, which took place at different points during the month of November. The final result was as follows: the ultramontanes secured 98 members, the conservatives 57, the *progressists* 56, the national liberals 47, the radical wing of the liberals or the seceders 45, the imperialists 25, the independent liberals 6, the South German democrats or people's party 8, the social democrats 13, the Poles 16, the Alsacians 15, and the Danes 2. The greatest losses were suffered by the national liberals and the German imperialists, the latter losing all its leaders. The greatest gains were made by the *progressists* (twenty-eight members) and the radical wing of the liberals or the seceders (twenty-three members). At the first election the socialists had carried none of their candidates; those afterward elected owed their success to the fact that there was a large number among the ranks of the other parties, who, being in many ways disappointed at the result of the first election, either abstained from voting at the special elections, or, as was the case in Breslau with the conservatives, voted for the socialist candidates in order to counteract the strong run made by the *progressists*. The new diet, in consequence, was composed politically of three large divisions: the centre, together with the Guelfs, Poles and Alsacians, having 138 members; the conservatives and German imperialists with 82, and the liberals with 154 members. Among those who were most surprised and disappointed at the result of the elections was Prince Bismarck, who had reckoned on an increase in the list of conservative members, and now, in view of the present composition of the imperial diet, lost all faith in being able to secure a fair working majority in support of his

policy. — The diet convened on Nov. 17, 1881. In the absence of the emperor, who, on account of his health, was unable to attend in person, Bismarck read the imperial message. After referring to the growing resources of the realm, the favorable results coming from the economical policy of the government as far as sanctioned by the diet, the treaty with the city of Hamburg, and another bill extending the terms for fixing the public budget, and also extending the legislative terms of the national assembly, which the government was about to submit, the message dwelt at some length on the reforms proposed by the crown for the relief of the working classes, and the social evils from which they were suffering. The measures pointed out were the bill providing for accident insurance and the uniform establishment of sick relief funds. As the best means of lightening the burdens of taxation, and yet increasing the revenue of the government, the message advocated the tobacco monopoly. In conclusion, reference was made to the efforts of the government for the maintenance of the peace and dignity of the empire, and for perpetuating its blessings in the distant future. The election of the presiding officers on Nov. 19 furnished somewhat of a test of the relative strength and probable coalition of the different parties. The centre was willing to unite with the conservatives in the choice of a president to be named by the latter, if the first vice-presidency was conceded to them. All the conservative elements uniting, they elected, with the aid of the centre, their candidate, von Levetzow, president, by a vote of 193, against the candidate of the liberals, Stauffenberg, who received 146 votes. Thus the coalition between the conservative and ultramontane elements again promised to become a working power during the present session of the national assembly. On Nov. 24 the public budget was taken up on its first reading It estimated the expenses and the receipts at 607,234,771 mark, respectively. It was not until the second reading of the budget that the imperial chancellor, representing the government, had an opportunity of defining his position toward the leading parties in the diet, and the support he expected from them in aid of his policy. Richter, the spokesman of the *progressists*, had already, on the first reading of the budget, criticized the financial and economical policy of the crown, reminding those who represented the government that those who in a broad sense were termed the liberals, also had a definite and positive programme on all social and economical questions of the day, and that it was they who had fathered the legislative and other measures which proved to be of real benefit to the working classes, and that those representing the government were not alone in their sympathy for the laboring population, and their willingness to do something in order to alleviate their condition. Pending the debate on the treaty with the city of Hamburg, the incorporation of which into the tariff union taxed the imperial government with an outlay of forty million mark, the chancellor defended his policy which resulted in the treaty, and finally gave vent to his views on the status of the leading political parties. He deprecated the breaking up of the nation into numerous political factions, none of which, while threatening the integrity of the nation by their petty dissensions, could command the majority needful to carry out a policy in the interest of a united country and its government. He denied the charge of having been the first to bring about the breach between the liberal element and the government, claiming that it was the leaders of that party who had proposed that breach. On Nov. 29, the public budget being on its second reading, Bismarck charged the *progressists* with being a deadlock to all salutary legislation, and with harboring republican ideas and tendencies; he deplored the fact that the more moderate parties, the national liberals and the free conservatives, had lost in strength, and finally, on Nov 30, declared, that if the alternative were given him to choose between either uniting with the centre or the *progressists*, he would at all times prefer, on grounds of public policy and following the instincts of true statesmanship, an alliance with the centre. Yet, in spite of this high opinion expressed by the chancellor, the centre was not a party to be trusted. No sooner was this declaration made, than the centre united with the liberals in defeating, by a vote of 160 against 131, one of his pet measures, the appropriation of 85,000 mark required for the establishment of a German board of finance and public economy. Complaints, which were made on the liberal side of the house about the manner in which the last elections had been managed by the Prussian government, gave rise to a heated debate Dec. 15, during the course of which von Puttkammer, the Prussian minister, took occasion to remark, that the public officials who supported the government at the late elections were entitled not only to the thanks of the government, but also of their imperial lord and master. This put the liberals on their feet, and they strongly protested against abusing the powers of the government in order to influence the vote of the electors; and this protest could not fail to widen the breach between the liberals and those representing the imperial government. As if to prove this fact and give further cause of distrust, the emperor published his famous rescript, addressed to the Prussian ministry, in which he said: "On such of the public officers as are entrusted with the execution of the different acts of my government, and hence are liable to be discharged under the law regulating public discipline, devolves the duty under their official oath to represent the policy of my government even at the elections. I shall thankfully acknowledge the faithful discharge of this duty, and see to it that all public officers, in view of their oaths and their allegiance, will abstain at the elections as well from all opposition against my government."

The further proceedings of the diet were, after a short intermission during the holidays, again taken up on Jan. 9, 1882. The accident insurance bill again came up on Jan. 17 and 18, in the shape agreed upon by the liberal party; it was referred to a committee who were to report in the matter the next session. On Jan. 10, Windhorst, the leader of the centre or ultramontanes, moved the abolition of the act passed by the imperial diet May 4, 1874, which punished the refractory clergymen by interning or banishing them from the realm. After a debate which lasted two days, the motion was, on Jan. 4, carried by a large majority. Only about one-half of the conservatives and liberals voted against it; this was due to the fact that the conservatives thought that in view of their alliance with the centre they were in a certain sense obliged to yield to them in this instance, and that the liberals were tired of being charged with an undue zeal to prolong the ecclesiastical conflict, after the government had ceased to enforce the war against the clergy. The bill relating to the incorporation of Hamburg into the tariff union and providing for an appropriation of forty million mark was also passed on Jan. 21, by a vote of 171 against 102, the *progressists* and a part of the radical liberals or seceders voting against it. After the public budget had passed the third reading, the diet adjourned, Jan. 28, 1882. — In the special session called, and which convened on June 6, though the respective committees had been in session since June 1, the tobacco monopoly bill was, on June 14, one day before the adjournment of the session to Nov. 30, badly defeated by a vote of 276 to 43. The bills on accident insurance and on the establishment of sick relief funds, on which the committee was to report finally, were not acted upon, but laid over for the next session. In the course of the debate on the monopoly bill, Prince Bismarck declared, with much emphasis, that the imperial government would still adhere, even as against a growing majority in the national assembly opposing it, to a policy of protection, as the best means of both promoting native industry and developing the independent resources of the empire. — The German empire is now entering upon its second decade. Although a federation of sovereign states, although it recognizes the principle of popular representation in the law-making power of the government, it has proven, in the hands of a man like Bismarck, who has directed its affairs and shaped its policy, a monarchy in the strictest sense; not a monarchy bordering on absolutism, like the monarchies of the east of Europe, but a monarchy nevertheless in the sense that the government is practically centered in one person, who, under the forms of law, is constantly at work asserting his own will as the ruling power in the state, and whose influence is felt, not only in the imperial cabinet, but also in the halls of legislation, and in all the practical workings of the government. If we keep this fact in mind, we may understand to some extent why it is that we fail to see in the empire any traces of a real parliamentary government, such as we find in England; such as is deemed by some to be the only true government which, like the modern governments of Europe, is based upon both the traditions of history and the demand for greater popular freedom. If we keep this fact in mind, we may understand why it is that the legislative work of the nation, save those great measures which aimed at consolidating the people, had, especially after 1878, done so little to advance the interests of the people, to improve their economical condition, and to satisfy their rational desire for political and religious freedom by embodying its leading principles in some organic law, and thus putting it on a securer basis than mere tradition or royal self-restraint could give. Some think that this backwardness in the parliamentary life of the nation is principally due to the process of disintegration noticeable since 1879 in the leading political parties of the empire; that this disintegration hindered the building up of a real working majority in any one party which, while forgetting minor differences, would unite in carrying such public measures as were demanded, not only by the requirements of a consolidated government and the traditions of the crown, but also by the interests of the people, and of a great commonwealth. The old liberal-conservative majority, whose strength seems to have exhausted itself in supporting the national government against the opposition of all those factions which were opposed to the establishment of the empire under Prussian headship, was broken up in 1879, when the imperial government sought the aid of the clerical centre party for the support of those economic measures which were opposed to the principles of that majority. Yet the attempts at securing a majority formed by the ultramontane and conservative elements proved fruitless. In the meantime the breach in the ranks of the national liberal party widened. The *progressists*, before and since the establishment of the empire, until 1877, had repeatedly withdrawn their support and consequently weakened the liberal ranks, while the centre and the old conservatives could not but gain by this defection. Since 1879, owing to the peculiar policy that the imperial government had adopted, and dissatisfied with those of their political allies who were unwilling to protest by active means against this policy, a large number of such as until then had been faithful to their party, likewise withdrew from the liberal conservative ranks, and went over to the more independent and vigorous party of the *progressists*. This was done in the hope that the new coalition might permanently unite both wings of the old liberal party—the national liberals and the *progressists*—and thus form the basis of a new and powerful party in the interests of political liberalism and reform. But this great object, which, if carried out, would in all probability add greatly to the possibility of parliamentary government in

the empire, is a thing that has not been accomplished as yet, although many forces are at work to establish some common ground on which all the liberal elements of the nation might meet, and effect a strong political organization which would carry its influence directly into all the departments of government. Ever since 1879, when Bismarck began to turn against his old allies, and, forgetting that the men had not changed against whose interests he had waged a merciless war while fighting the Catholic clergy, attempted to secure the alliance of those very men—the German people have been, as a leading statesman, von Bennigsen, has well expressed it, in a state of political chaos; a state in which a man of such extraordinary power and influence as the imperial chancellor (who even to this day is, we may say, at the head of European politics, and still occupies a commanding position) has not succeeded in anything he has since undertaken, while politically he has suffered defeats such as only a statesman of his power and influence could hope to outlive. All these facts, and the fact that the German people have not, for centuries, been an active political nation, and thus are as yet devoid of that true political instinct which seizes upon every opportunity to transform the majority into a *political power* in the state, go far to explain why parliamentary government (which is the only government, in a monarchical state, that gives the people some share in the administration and conduct of the affairs which concern them as a nation; which makes them in fact citizens and not simply subjects of the crown,) has not as yet become established in the empire; and it explains, too, why the Germans, as has been said, are not, politically, a contented people. But a cause more potent than all the facts mentioned is certainly to be found in this, that the traditional theory, still prevalent in Europe, according to which it is the monarch who governs, and not the people, is maintained by a statesman to whom the Germans, as they themselves are willing to admit, owe much, and who, in the position he occupies, not only wields immense power, but has the personal influence and indomitable will necessary for the accomplishment of great ends. Added to his way of looking at the functions of the monarch is the doctrine announced by him, and which seems so much opposed to all constitutional government, that he, as chancellor of the empire and minister to the crown, is responsible to no one except to his lord paramount, the emperor. Doctrines and theories, such as these, are far from being mere abstractions in the mind of a man like Prince Bismarck; they are a real power in the state, and make themselves keenly felt in the settlement of all questions touching the relation of the people to the government. Principles such as these not unfrequently make the rulers forget, that whatever great achievements have been effected in the life of a nation, and whatever glories have been won by the governments of this world, such achievements were not effected and such glories were not won, except by the concerted action of a superior chief, and of a valiant people willing to follow him in the execution of great enterprises. Yet, that the empire is the best fabric that could be devised for the government of a people, like the Germans, whose individualism is so strong, and whose neighbors are their natural rivals, if not their natural enemies, will be denied only by those who forget what a powerful consolidating influence the idea of the old empire, up to the establishment of the new, exercised over the people; or by those who strongly dislike to hear that the Germans are once more, politically speaking, a united people.—BIBLIOGRAPHY. MAX. EBERHARDT, Chicago, Ill.

GERRY, Elbridge, vice-president of the United States 1813–14, was born at Marblehead, Mass., July 17, 1744, and died in office at Washington City, Nov. 23, 1814. He was graduated at Harvard in 1762, was a member of the continental congress 1776–80 and 1783–5, was a delegate to the convention of 1787 (see list of members under CONSTITUTION), was in congress as a supporter of the constitution 1789–93, and was one of the X. Y. Z. mission to France in 1797–8. In 1812 he was elected vice-president. (See DEMOCRATIC-REPUBLICAN PARTY, I.–III; X. Y. Z. MISSION; MASSACHUSETTS; GERRYMANDER; CONGRESSIONAL CAUCUS)—See Austin's *Life of Gerry.*

A. J.

GERRYMANDER (IN U. S. HISTORY). In 1814 the democratic legislature of Massachusetts

proceeded to lay out the senatorial districts of the state with the single purpose of securing as many democratic senators as possible from the democratic vote. One result was, the extraordinary distortion of some of the districts, instead of the compact shape taken by a district fairly formed from contiguous territory. In one instance the district assumed a shape so distorted as of itself to suggest unfairness. The Boston *Centinel* published a colored map of the district, and the hand of Gilbert Stuart, the artist, completed the resemblance to some fabulous monster, to which was given the name of "the gerrymander," combining the names of the salamander and of Gerry, the democratic governor of the state. (See GERRY, ELBRIDGE.) The name, like the evil which gave rise to it, has survived to our own day. It is used either as a verb or as a noun; but it is more common to say that a party has "gerrymandered" a state than to say that it has been guilty of a "gerrymander" in a state.—The following hypothetical description of the process of gerrymandering, though written in 1815, is still perfectly accurate: "I suppose a case. Six counties, each containing 1,000 voters, are to be formed into three senatorial districts, each to elect four senators. These districts may be so contrived that the party predominant in the legislature at the time of arranging them, whether federal or democratic, with 2,320 voters, shall have eight senators, and the other, with 3,680 voters, shall have but four, and nevertheless every elector of the whole 6,000 shall exercise the right of suffrage I state the number of voters of each of the six counties to which I give names:

COUNTIES	Federalists	Democrats.
Jackson	120	880
Erie	280	720
Champlain	340	660
McDonough	680	320
Perry	150	850
Porter	750	250
Total	2,320	3,680

I might have styled the parties *big-endians* and *little-endians;* the name is of no importance. Now for a display of political legerdemain—in order to enable the minority to rule the majority:

	Federalists	Democrats.
I. Erie	280	720
Porter	750	250
Total	1030	970
II. Champlain	340	660
McDonough	680	320
Total	1020	980
III. Jackson	120	880
Perry	150	850
Total	270	1,730

Thus a minority of 2,320 have twice as many senators as the majority of 3,680—their candidates having been successful in the first two districts. This political arithmetic, like every other science, has its arcana. The grand and unerring rule is to make your own majorities as small and those of your adversaries as large as possible: in other words, to throw away as few votes on your own side, and as many on the other, as is in your power "—The process has since been varied in its application to legislative and congressional districts, but without forsaking the general rule above given. All parties, and in all states, have been guilty of the practice; and where a party has succeeded in carrying an election by demonstrating an outrageous gerrymander by its opponents, it has usually proceeded to offset it by an equally outrageous gerrymander of its own. The political history of the states of New Jersey, New York, Ohio and Indiana would give abundant but unnecessary illustration. A leading politician of the last named state is said to have remarked with satisfaction that he had so fixed his state that his opponents could not carry the legislature without at least 15,000 popular majority. The most flagrant instance of gerrymandering in congressional districts is probably the sixth district of Mississippi. This remarkable district consists of all the counties of the state which touch the Mississippi river. Its length is about 300 miles and its average breadth about 20; and its peculiar shape has given it its popular name of "the shoe-string district."—See APPORTIONMENT; 6 Hildreth's *United States*, 487; Parton's *Caricature and other Comic Art*. 316; Carey's *Olive Branch*, 409. ALEXANDER JOHNSTON.

GIBRALTAR. A piece of incredible negligence on the part of the Spanish government gave this post to England during the war of the succession. At Madrid, the war office was so convinced that the place was impregnable, owing to the fortifications of Daniel Speckel, that it was left almost without a garrison. In 1704 Sir George Rooke, the commander of the Mediterranean fleet, being informed that the garrison was composed of one hundred and fifty men at most, made a sudden attack on it with 1,800 men. It was soon obliged to surrender. The place has remained in England's hands since that time, in spite of the repeated efforts of Spain to take it. The last siege, which continued three years, seven months and twelve days, immortalized the name of Elliot.—The great sacrifices which England has submitted to to retain this fortress, have caused it to be said and written that the importance of the position is exaggerated, and that it is not worth the money which it costs. England has paid and pays no attention to this. In the course of an inquiry into the state of colonial fortifications in 1861, English statesmen, administrators, military men, Gladstone, Lord Herbert de Lea (Sidney Herbert), and Sir John Burgoyne, were all agreed on one point, that Malta and Gibraltar

were not colonies, but purely military posts, in which full garrisons should be kept up in times of peace as well as in war. The late Lord Herbert, then minister of war, did not hesitate to say that in case of war the colonies should expect to see their garrisons removed. "We shall retain possession of our colonies, if we remain masters of the sea. If we do, why leave garrisons in the colonies? and if we cease to be masters of the sea, what is the use of keeping isolated battalions there? Would not this be to expose them to be taken as in a trap?" In conformity with this policy England has always kept a strong garrison in Gibraltar. The number, which was 3,618 men in 1851, has been increased continually. In 1861 it was 6,001, of whom 4,396 were infantry. The state of the fortifications is found to be almost satisfactory. In the course of the inquiry to which we have just referred, Sir John Burgoyne presented an exhibit of the expenses to be made in putting the colonies in a state of reasonable defense; Gibraltar appeared in this for £25,000 only. In 1860 the expenses of this military post were increased for the single item of war to £420,685. — According to the census of 1868, the population of Gibraltar, excluding the garrison, was 15,782. The tables published on the movement of population show that the births exceed the deaths, in a considerable proportion. In 1859 the births were 636 and the deaths 441; in the same year there were 212 marriages. The number of children attending school was also very considerable for the population. In 1856 it was 2,413; of these, 1,527 belonged to Catholic schools; the remainder were divided among schools of the church of England, Wesleyans and Israelites. In the same year the revenue of the local government amounted to £32,500, which was increased to £36,397 in 1870, arising, in great part, from the duties on wines, spirits and other articles of consumption. The expenses reached £28,369, which were increased exceptionally to £41,921 in 1870. In 1869 the expenses were £29,724, and £36,788 in 1868. Gibraltar advances also in commercial importance. The imports and exports, which in 1857 were 1,756,384 tons, were more than 2,000,000 tons in 1862, and 3,084,000 in 1868. Three-fifths of this was on English ships; France only coming after Spain for imports and exports; and after the United States for exports. Foreign commerce shows also satisfactory results. Exports, which in 1857 amounted to £48,139, increased in 1860 to £150,658. During the same period the import of foreign products rose from £720,415 to £1,244,233. The greater part consisted, of course, in British products. Besides the political reasons for retaining this post, it is thought, rightly or not, that the immense profits which English merchants make in illicit trading have their share. — In the various political convulsions which have so often caused bloodshed in Spain, Gibraltar has often served as an asylum for the defeated of every party. — England is represented at Gibraltar by a governor, who bears the title of commander-in-chief and vice-admiral, though he belongs almost always to the army; a colonial secretary; a court of admiralty; and a police court, the first magistrate of which is an officer. The court of admiralty takes cognizance of commercial cases. For the remaining part of the civil and municipal government the ancient Spanish laws and customs are in force.

L. GOTTARD.

GOLD, a dense, ductile, malleable metal, of a brilliant yellow color, used in ornamentation and for money. Its especial adaptation for these purposes arises from its power to resist oxidation or corrosion upon exposure to air or moisture, and its insolubility in ordinary acids. In the form of coin it is readily distinguished from base metals by its characteristic lustre, its great specific gravity and its metallic ring. Alloyed with other metals its color changes: the yellow tint is successively lowered by increased additions of small quantities of silver, and, on the contrary, heightened by copper. In the ordinary state its hardness is about that of tin but not quite as soft as lead, varying, however, with the composition. — Pure gold is the most malleable of all metals, and has been beaten into leaves of $\frac{1}{282000}$ of an inch in thickness, and is then capable of transmitting light, the yellow hue being changed to green. — Gold is exceedingly ductile, and can be finely divided without heating. The specific gravity of gold varies with its previous treatment, being, when cast in bars, from $\frac{18}{100}$ and $\frac{29}{100}$ to $\frac{19}{100}$, and $\frac{37}{100}$, and raised by pressure or heating to $\frac{19}{100}$ and $\frac{40}{100}$. Its atomic weight has been given by modern chemists at from 196. to 196.67. — Pure gold can not be volatilized at any ordinary temperature when melted and kept in a state of fusion, but when alloyed with volatile metals and heated in contact with air, will rise in fumes. It is also dispersed by the electric battery, the concentrated heat of the sun's rays, or by the oxyhydrogen blow-pipe. — Gold is dissolved by bromine, chlorine and selenic acid, and, when heated, in a solution of strong sulphuric with a little nitric acid. — Gold is found diffused in many of the solid rocks, sometimes in a metallic state as native gold, and often in combination with silver, lead, tellurium and sulphides. Valuable and working deposits of gold are found in stratified rocks and in veins containing quartz traversing rocks of other geological periods; also in metallic sulphides and bitter spar, in which it is disseminated in grains, crystalline threads or masses, and in invisible particles. — Besides these places of original deposit, gold is excavated in so-called dry diggings at the bottoms of now buried rivers, or nearer the surface in alluvial deposits adjacent to dry water crevices, and in wet diggings in the beds of streams by whose currents it has been brought down from higher altitudes, separated from the lighter earthy matter and deposited in auriferous gravels and sands, in masses called lumps and nuggets, or in smaller particles in the form of grains, dust or thin scales. — Native gold

is never found absolutely pure, but always contains a small quantity of silver and frequently copper or iron, the proportion of gold in the alloy being 60.49 in Transylvania to 99.25 in Australia. Gold is also found alloyed with bismuth, palladium, rhodium, and associated with minerals and ores containing arsenic, antimony, tellurium and metallic sulphides of lead, iron, copper, zinc, etc. — The methods of obtaining and extracting gold vary with the character of the deposit in which it is found, but may be classified either as placer or vein mining. In the first, the gold is separated from an alluvial deposit by a purely mechanical process. After removing the overlying gravel or earthy material, the ground in contact with the bed rock is subjected to the action of water, where that is accessible, which, while removing the waste material, permits the gold to sink and be collected at the bottom. The separation of the gold in placer mining is effected in various ways: in some cases with a pan—a circular dish of sheet iron with sloping sides, a foot or more in diameter, held in a stream or hole filled with water. By skillful shaking and twisting the lighter materials are washed out, the heavier gold settling to the bottom For treating larger quantities sometimes an appliance called a cradle, from its resemblance to that household article, is used. It is a box from three to six feet in length resting upon rockers and having an opening at one end and pieces of wood about an inch square, called riffle bars, nailed across its bottom. The dirt, upon which water from time to time is poured, is shaken by the rocking motion through a perforated riddle-box, into which it is shoveled by an assistant, and drops upon an apron sloping toward the upper end of the cradle, from which it falls to the bottom, running out at the lower end. The gold, mixed with the heavier sand and gravel, is detained by the riffle bars. A modified form of the cradle, called a tom, with an extended inclined sluice, is sometimes constructed. Currents of water are also made to run through long sluices or shallow troughs, upon the bottom of which riffles made of strips of wood are placed. Whatever the mechanical contrivance employed, from the simple washing on the prospector's shovel to the largest hydraulic operations, the principle involved is the same, namely, the greater specific gravity of the gold carries it to the bottom of the pan, rocker or sluice, while the lighter and worthless portions are washed away. Where the gold is very finely divided, being in small grains or thin scales, it is liable to float away with the dirt, and is secured by using blankets of wool or copper plates covered with quicksilver to form an amalgam, which is removed by working and scraping the plates.—In California a large amount of gold is obtained by hydraulic mining, water being brought in many cases from great distances in ditches, flumes and iron pipes, from higher altitudes. Jets of water issuing under the pressure of a column, sometimes hundreds of feet in height, through nozzles skillfully arranged and directed, strike with tremendous force against the banks and beds of earth containing gold. Hills are undermined and washed away, their material being moved by the current into sluices where the gold is separated and collected. The earthy matter is carried to the lower levels and valleys or held in solution until it settles in the bays and more sluggish currents of the large rivers near the coast. The operations in mining gold-bearing quartz or other vein material are conducted in the manner usually employed in mining other metals or minerals. At a convenient point, either a tunnel, where practicable, is run horizontally from the surface to the vein, or a shaft is sunk perpendicularly to a sufficient depth, and from it a drift or level run until the vein is reached. Gold in quartz or free milling ores is usually disseminated in small particles, to obtain which, before undergoing the usual treatment, the gold-bearing rock must be finely pulverized. Various methods and devices are employed, among the simplest of which is the arrastra, which has a circular bed of stone of from eight to twenty feet in diameter with a post in the middle, through which extends a horizontal bar reaching to the circumference on either side. From each arm revolving around the post hangs a heavy stone weighing from three to five hundred pounds, the former end slightly raised above and the hinder resting upon the bed of rock to be crushed. Somewhat similar to this is the Chilian mill, with the same central upright and revolving arms, but having the grinding stones with a beveled face and roll, instead of being dragged upon the floor.—These earlier and ruder methods have been succeeded in large mining operations by rock crushers and stamp mills. By the former the rock is broken and crushed between powerful iron jaws, and by the latter pulverized by successive blows of heavy iron stamps or hammers upon the rock or ore resting upon a hardened iron bed. The pulverized rock is washed away, and the gold, set free, is collected by mercury, as in placer mining, but with greater care, as the particles of gold being smaller are more liable to be carried away by the current.—To separate the gold from the mercury, the amalgam, after first pressing out all the fluid mercury, is placed in an iron retort and heated to a low red heat, when the mercury volatilizes, passes over into a condenser connected with the retort, and is thus recovered for use in future operations. The gold is obtained nearly free from mercury (it being difficult to drive off the last portion of that metal) in a porous, sponge-like form, which can readily be melted and cast into bars.—Ores in which the matrix is an oxide of the metals are generally free milling. Those other than free milling are chiefly the sulphides of iron and copper, and to some extent lead, antimony and zinc, though in the latter silver is usually the more valuable constituent. — Ores in which gold is combined with the sulphides of the base metals are refractory in proportion to the extent of the base

metal, and the treatment is as varied as are the proportions in which the combinations exist. With some ores a simple roasting to eliminate the sulphur is found to be sufficient, and the most economical treatment which the value of the ore will permit, preparatory to crushing and amalgamating. Other ores of iron are better treated by the chlorinating process, while those in which copper or lead are valuable constituents are best treated by a smelting process which results in forming base bars of lead containing the precious metals or copper matte. The gold is removed from lead in a reverberating furnace, and copper matte is usually sold to 'copper works.—Gold as received at the mints, unless it is from a refinery, invariably contains silver. The methods of separating these two metals are known as the nitric acid process and the sulphuric acid process, in both of which the same principle is involved, that of dissolving the silver, decanting it from the gold, and subsequently recovering it by precipitation.—In the nitric acid process, to accomplish the solution of the silver, the gold is melted with twice its weight of silver, and while in a fused condition poured in a thin stream from a height of two or three feet into a tank of cold water for the purpose of subdividing it into granulations and giving a large surface for the action of the acid. The granulations are transferred to porcelain pots and treated with nitric acid; the pots are placed in a water bath to accelerate chemical action, the nitrous fumes of which are abundantly emitted, being carried away by a high flue. After the silver has been dissolved, the solution is drawn off into wooden vats containing a solution of sodium chloride, which precipitates the silver from a nitrate into a chloride. The gold is placed on a filter, washed, dried, pressed into cakes and melted. The precipitated chloride is removed to lead-lined vats, and zinc in a granulated condition is introduced, when a reaction attended by evolution of heat sets in, a soluble chloride of zinc is formed, and the silver liberated in a metallic state. It is subsequently washed, dried, pressed and melted into bars as in the case of the gold. — In the sulphuric acid process the same preliminary steps are observed in granulating the bullion. The granulations are treated in iron pots, with concentrated sulphuric acid, which in part breaks up, giving oxygen to the silver, while the undecomposed acid combines with the oxide of silver thus formed and forms sulphate of silver. The fumes from the operation are carried into a lead-lined chamber and reconverted into sulphuric acid by the aid of air and hyponitric acid. The gold is taken from the pots after the silver has been dissolved and drawn off, and treated as the residual gold from the nitric acid process. The sulphate of silver is decomposed in lead-lined vats by metallic copper, which in the process is converted into sulphate of copper, and the silver is precipitated in a metallic form. The solution of sulphate of copper, after being decanted, is concentrated by heat to the crystallizing point and recovered as commercial blue vitriol, and the silver is washed, dried, etc., and cast into bars. — The fineness of bullion and coin is estimated in thousandths, pure metal being considered 1000 fine. The process of ascertaining the fineness of gold, or assaying, may be briefly described as follows: One thousand parts of the alloy is accurately weighed; the weight used, for convenience' sake, is the French gramme divided into 1000 parts or millegrammes. Pure silver, to the amount of twice the weight of pure gold estimated to be contained in the alloy, is added, and the whole, enveloped in a piece of lead foil, is placed in a cupel in a muffle furnace heated to a high temperature. The cupel is made of compressed bone ash, and possesses the property of absorbing the oxides of base metals. The lead foil is oxidized, and as it is absorbed by the cupel carries with it the oxides of the base metals which may be contained in the alloy. This part of the process eliminates the base metal from the 1000 parts of alloy being operated upon. The button of gold and silver taken from the cupel is laminated by hammer and rolls into a thin slip and digested in nitric acid, which dissolves the silver and leaves the pure gold, which, after washing, drying and annealing, is returned to the balance and weighed. Its weight in millegrammes expresses in thousandths the fineness of the alloy. — Gold is one of the metals earliest mentioned in history, and has been found in all parts of the world. Almost every country contains workable mines or deposits of gold, but nearly all the fields in which supplies prior to the Christian era were obtained are at present abandoned. The most productive appear to have been situated east of Persia, probably in Tartary or southern Siberia, from which large stores were derived; also in India, Egypt, Nubia, Ethiopia and other regions on the east coast of Africa; and in Asia Minor, Thrace, Greece, and some of the neighboring islands, Italy, Spain and Gaul. — From the historical accounts of the large quantities of gold used in the ornamentation of ancient temples and public buildings, held in the treasuries and owned by monarchs and private citizens, in the form of plate, or money, and of the sums collected at various times for tribute, it is supposed that ancient mining was prosecuted with its greatest success during the first few centuries preceding the Christian era, but, either because mining for gold became less profitable or the mines were gradually exhausted, the production of gold after the reign of Augustus Cæsar rapidly diminished, and in the fifth century of our era had almost ceased. Many of the countries conquered by the Romans contained mines of gold which continued to furnish supplies during the continuance of the empire. But the Roman method of leasing and operating the mines soon ruined the mining industry. The operations were carried on by the labor of unwilling slaves, and being leased to favorites, whose only care was to secure the greatest profit during the term for

which they were to have possession, the richest deposits were worked out and no care taken to keep open the drifts and tunnels for the use of future occupants. — The principal deposits of gold worked during the present century are in the United States, in Australia, and in portions of Africa. Gold is mined to a limited extent in some of the mountainous regions of central and southwestern Europe in which the large rivers take their rise—notably the Rhine, the Danube and the Rhone. Small quantities have been annually produced in Italy. Hungary, Germany, Spain, and, in former years, in Turkey, Japan, China, in many other regions of Asia and Africa, and even in Great Britain. The largest gold production of the eastern hemisphere is found in Siberia on the eastern slope of the Ural mountains, and still further east on the headwaters of the Yenessei and Amoor rivers. These mines have been worked for many years with an increasing annual yield, amounting in 1880 to $28,000,000. A still larger quantity has been annually furnished to the world, since 1852, from Australia, embracing Victoria, New South Wales, Queensland and New Zealand, which together, in 1880, added $30,000,000 to the world's stock of the precious metals. A less productive but still important gold field is found in South America, principally in Colombia, Venezuela, Bolivia and Brazil, which promises to increase its present yield of $6,000,000 per annum. Gold is also found in North America on the Atlantic slope, in Nova Scotia, also near Quebec and on the eastern watershed of the Alleghany mountains, in the Carolinas and Georgia, and in the western mountain regions, in various localities, from Alaska to Central America. But the richest and most extensive deposits thus far discovered have been found in the states on the Pacific slope or in the basins or parallel ranges west of the Rocky mountains. — The gold mines of the United States, according to the mint reports, produced, in the fiscal year 1881, $36,500,000, and for thirty-four years, from 1848 to 1881 inclusive, $1,557,000,000. The yield of the several states and territories for 1880–81 was reported by the director of the mint as follows:

STATES AND TERRITORIES.	1880.	1881.
Alaska	$ 6,000	$ 7,000
Arizona	400,000	770,000
California	17,500,000	19,000,000
Colorado	3,200,000	3,400,000
Dakota	3,600,000	4,500,000
Georgia	120,000	150,000
Idaho	1,980,000	1,930,000
Montana	2,400,000	2,500,000
Nevada	4,800,000	2,700,000
New Mexico	130,000	120,000
North Carolina	95,000	75,000
Oregon	1,090 000	1,000,000
South Carolina	15,000	18,000
Tennessee		2,000
Utah	210,000	200,000
Virginia	10,000	11,000
Washington	410,000	100,000
Wyoming	20,000	7,000
Other	14,000	10,000
Total	$36,000,000	$36,500,000

— The production of the precious metals in the early centuries prior to and immediately succeeding the commencement of the Christian era, is somewhat conjectural. No reports are extant of the amount yearly obtained from the mines. As far as any authentic information has been received, the deposits of gold known to the ancients were little worked after the fall of the Roman empire, and from that date to the close of the fifteenth century, although in some regions gold was still obtained, the total amount was not large. If Mr. Jacob's conclusions are reliable, the total production of gold in Europe and western Asia from A. D. 800 to A. D. 1500 could not have exceeded $35,000,000, for he states that during that period the production of the precious metals was one-seventh or one-eighth of what it was from 1700 to 1800 in Europe and east of the Ural mountains, which for the last twenty years, the most productive period, he reports to have been $1,000,000 gold and $3,000,000 silver. According to his estimates, the mines of America sent to the old world, between A. D. 1492 and 1600, gold and silver of the value of $690 000,000, and from A. D. 1600 to 1700, $1,687 000,000; the mines of Europe and America furnished from A. D. 1700 to 1810, $4,000,000,000, and from A. D. 1810 to 1830, $500,000,000. The official statements published by him show that from the Russian mines, which commenced to produce in 1704, up to 1810, gold had been extracted to the value of 1,726 puds ($1,500,000) of which $500,000 was obtained within the last twenty years of the period. The average annual production of Asia and Africa he made $6,000,000. — Dr. Adolph Soetbeer's summary of the production in all the gold-producing countries of the world, from the discovery of America, to 1880, gives the following amounts and values:

	Years	Kilograms	Value.
1493 to 1850	358	4,697,000	$3,121,000,000
1851 to 1880	30	5,606,400	3,726,000,000
Total	388	10,303,400	$6,847,000,000

The countries from which supplies of gold were obtained and the yield of each in 1880 has been estimated by the director of the mint as follows.

COUNTRIES.	Amount and Value	
	Kilograms.	
United States	54,165	$ 36,000,000
Russia	42,960	28,551,028
Australia	45,251	80,073,815
Mexico	1,488	989,161
Germany	350	232,610
Austria	1,598	1,062,031
Sweden	3	1,994
Italy	109	72,375
Argentine Republic	118	78,546
Colombia	6,019	4,000,000
Bolivia, Chili, Brazil and Peru	569	378,157
Japan	702	466,548
Africa	3,000	1,993,800
Venezuela	3,423	2,274,692
Canada	1,226	815,089
Total	160,984	$106,989,846

— That the gold obtained from the mines for many centuries before the discovery of America was insignificant compared with their present production, is to some extent evidenced by contrasting the yearly coinages of the periods. The mint records of Great Britain show that gold coinage from the eighteenth year of Edward III. to the death of Henry VII., was only £464,908, from the accession of James I. to George I., £18,244,868; from that date to 1829, £132,056,241; and from 1830 to 1880, £201,897,275. The average annual gold coinage was —

1345 to 1509,	165 years	$ 13,640
1603 to 1710,	108 years	844,870
1711 to 1829,	119 years	5,548,581
1830 to 1880,	51 years	19,793,000

— The gold coinage of the United States has in like manner increased. From A. D. 1793 up to and including the year 1848, when gold began to arrive at the mint from California, a period of fifty-six years, $76,341,440 of gold was coined — an annual average of $1,363,400. But in the succeeding thirty-three years, 1849–81, the gold coinage increased to $1,135,495,746, and averaged yearly $34,408,962, and for the last eight years nearly $50,000,000. The same fact is seen in looking at the total gold coinage, etc., of a number of countries for the preceding five years, as stated in the reports of the director of the mint as follows:

1875	20 countries	$ 195,987,428
1876	16 countries	213,119,278
1877	18 countries	201,616,466
1878	17 countries	188,386,611
1879	13 countries	90,714,493

The total yearly coinage at the mints of the various countries of the world, however, always far exceeds the production, as those institutions are employed in manufacturing into coins of their own country, the coins imported from foreign countries as well as the bullion received from the mines. — Upon a careful review of the metallic circulation in all the commercial countries of the world, both Dr. Soetbeer and the director of the United States mint find that the total amount of the gold coin in those countries is less than half the amount of gold received from the mines since the discovery of America, and not even half of their yield during the twenty-nine years from 1851 to 1879. It is evident, therefore, that the greater portion of the annual production is appropriated for other purposes than coinage into money. — Efforts have been made by several statisticians, notably by Jacob and by Soetbeer, to ascertain the amount of gold and silver lost by abrasion and used in ornamentation and the arts. In the years 1879, 1880 and 1881 the director of the mint caused circular inquiries to be issued, the replies to which reported as used in manufactures and the arts in the United States in 1881, of coin and bullion other than old jewelry, plate, etc., over ten millions of gold and over three millions of silver, and the director estimated in 1881, that over eleven millions of gold was thus used in the United States and at least seventy five millions in the world. The character of the gold was reported to him as follows:

United States coins	$ 3,315,882
Fine bars used	6,171,317
Foreign coin, jewelry, plate, etc.	599,524
Total	$10,086,723

— Mr. William Jacob, in 1831, made a very exhaustive inquiry as to the amount of money in the world at various periods up to that date. He placed the accumulated stock of gold and silver, in the year A. D. 14, at 1,790 millions of dollars, which he estimated, however, to have been reduced by the year 482 to 435 millions of dollars, and in A. D. 806 to 168 millions, and that it remained at about 170 millions up to the discovery of America in 1492. By the year 1600, accessions from the mines of America had increased the amount of gold and silver to 1,650 millions of dollars, by 1700 to 1,130 millions, by 1809 to 1,900 millions, and twenty years later, 1829, to 1,566 millions. — Some authorities have questioned the allowance made by Jacob for abrasion and appropriation in the arts, and place the stock in the world upon the discovery of America at a higher rate. Seyd's estimate makes it 900 millions of dollars. He estimates the amount of money in the world in 1848 to be, of gold, 2,000 millions; in 1872, 3,650 millions; and in 1878, 4,150 millions. — Soetbeer, assuming that the amount of gold available for coinage in civilized countries in 1830 was 800,000 kilograms ($531,216,000), estimated that, after deducting for consumption in the arts and export to the Orient, there remained 4,690,000 kilograms ($3,116,974,000). This nearly coincides with the estimate of the director of the mint for 1880, who makes the gold circulation of the world $3,221,223,971. — During the three centuries preceding our own, general prices seem to have advanced in Europe, as the same nominal sum of money would buy much less in the eighteenth than in the fifteenth century. This is accounted for in some measure by the debasement of the coins then frequently practiced in every country, but it is more generally attributed to the effect of the large amount of gold and silver received during that period from the western world. It might therefore have been expected, and has been asserted, that the increased production of gold in the world after 1848, and the large addition to the stock of money in commercial countries, would depress its purchasing power, or, what is the same thing, inflate prices. A comparison, however, of the market prices of staple articles in several commercial countries, does not show any large advance in the average prices of the years 1878 to 1881, over the prices of 1850. In some instances they appear to be lower. According to statistical tables in the "London Economist," the prices, in 1878, of a large number of selected articles, being the principal commodities entering into consumption in England, were 101 per cent. of the mean of their prices for

the years 1845–50, and their mean prices for the years 1878–81 were 114 per cent., and in 1881 were about 116 per cent. A comparative table of the prices of French imports and exports at different periods shows that in 1878 the prices of French imports were 96 per cent. and of French exports 74 per cent — a mean of 85 per cent. of their prices in 1850. A like comparison of the prices of leading commodities in the New York market for the same years shows in 1878 no advance, although prices were somewhat higher in 1880. It may therefore be said that the enormous addition to the metallic circulation witnessed in the last thirty years appears to have been required by the increased wealth, greater commercial enterprise and enlarged production of the present period, and to have been received and absorbed without thus far materially affecting general prices. HORATIO C. BURCHARD.

GOVERNMENT. This word is used to designate the aggregate of the powers to which the exercise of effective sovereignty belongs in each state. The union under one central authority of all the component elements of nations is what alone constitutes and makes them political bodies, that is to say, bodies capable of life, of volition and collective action; and there is not a single nation which would not fall into dissolution if the government called to direct it should disappear or cease to obtain the submission which it requires in order to be obeyed. — Though all governments have in reality the same tasks to perform, they are far from existing under the same form. There are as many political institutions, as many communities in which the sovereign authority lives and acts under conditions markedly diverse, as there are states. Hence governments are divided into different species or kinds; but, as a modern writer (Dufau, *la République et la Monarchie;* introduction, p. 18) justly remarks, "we have still to find a correct classification of the forms of government and discuss the name proper to each." — We are indebted to the Greeks for the most ancient classification of governments. According to their publicists there were three forms of the state and of government: monarchy, or the reign of a single man; aristocracy, or the reign of the great and wealthy; democracy, or the reign of the aggregate of free men: forms, the corruption of which produced, respectively, tyranny, oligarchy, and demagogy or ochlocracy (mob rule). Since each of these forms, whenever it prevails alone, is not slow in bringing on abuses and evils of an increasing gravity, some writers have advised a combination of them, but without being able to indicate definitely the means of effecting this combination nor the means of preserving it from all destructive change. — The ancients were led to adopt the classification which they did, by the idea which they formed of sovereignty. Slavery, which weighed upon a part of the population by preventing them from rising to an understanding of the rights which flow from the nature of man, concealed from them the origin and the essence of this sovereignty. In their eyes sovereignty had its origin in force alone. It belonged altogether to the state, that is to say, to those who being masters in the state alone had the government of it. Outside their ranks were none but subordinates, subjects, held to obey laws framed without their co-operation. Under the empire of such ideas it was natural that distinctions between forms of government should all rest upon a single fact, the numerical proportion existing between governments and the governed. — In modern times, owing to more exact ideas of law and sovereignty, the truth has been more nearly approached, and the definition given by Montesquieu of the nature of the three kinds of government, if it does not embrace the whole truth, embraces a great part of it. "There are," says Montesquieu, "three kinds of government: the republican, the monarchic and the despotic. The republican is that in which the people in a body, or only a part of the people, exercise sovereign power; the monarchic is that in which a single man governs, but according to fixed and established laws; while in the despotic one man, without law or rule, controls everything by his will and caprice." Since the time of Montesquieu many other classifications have been made and new names used, but the work has advanced but little, and doubt and confusion exist in men's minds, which can not but react harmfully upon the correctness of political ideas. — The forms of government are so numerous and variable that it is very difficult indeed to consider all the differences which exist between them; in this matter, we must content ourselves with discovering the real source of the forms of government and ascertaining what is fundamental in them. The observation of facts gives the following result In principle, sovereignty resides and can reside only in the aggregate of the individuals united into one same political body; but as it is impossible for the population to exercise this sovereignty by themselves and continually, they are forced to establish governments to which all that part of sovereignty is given which they can not reserve to themselves. On the other hand, under whatever title and to whatever extent governments are invested with sovereign power they never possess it completely. Among every people, in the absence of recognized political rights, feelings and will are met with, whose supremacy is maintained, and which impose on the action of the government impassable limits. Thus, there exists between peoples and governments at all places and times a division of the exercise of sovereignty, which, however unequal it may be, and whatever the provisions of the law concerning it, can not result in leaving either peoples or governments without some part of this exercise. — There are many states in which the division of the exercise of sovereignty between the people and the government is a constitutional and legal reality. Such states are those in which there exist only the

public powers which are subject to election, or powers whose decisions in order to become executory must have the formal consent of the governed or some portion of the governed. In other states the division of sovereignty is less perceptible, but such division, however, exists, and there never was a government which had not to take into consideration the will of the people, and never a government which could not assert its own. — Take the most completely autocratic states: there are some in which the monarch has apparently all power over men and things. Religious beliefs, written laws, traditions of the past, nothing which subjects the intelligence, has been omitted in order to consecrate his person, sanctify his authority and free it from all restraint. What is the result? In such states the omnipotence of the master is in reality but a deceptive fiction. Before and around him are living forces which impose more or less narrow limits to his will. Neither the powerful nobles, nor the ministers of religion, nor the soldiery, nor the people, are disposed to endure everything from him. There are beliefs, interests, rules, customs, which they do not allow him to offend, and when he forgets this, insurrections, which frequently dethrone or put him to death, teach such rulers that their sovereignty has limits, and that above it there is another sovereignty which occasionally awakes, refusing to be annihilated. And so there is the case of republics, in which the magistrates, simple executors of the will of those who chose them, seem devoid of all personal initiative. The government here preserves by the force of things the real exercise of a certain part of effective sovereignty. There are matters on which citizens as a body could not deliberate without compromising secrecy; there are others which come unexpectedly and require immediate decision, and it is necessary that the government should act, even if its action should involve the future. The time, of course, will come when account must be given of the motives which impelled it, but the fact will nevertheless remain that a sovereign act was performed which in a good number of cases will infallibly react on the destiny of the state. Such is the case in all political communities. There are no states in which the exercise of sovereign power is not divided in different proportions between the people and their government, and from the inequality of these proportions arise the differences which separate the forms of government most profoundly.—The first and most considerable distinction arising from the difference of the proportions of sovereign actions which the government holds, is that which makes the governments republican or monarchic. Wherever nations retain sovereign action in the largest measure, they remain representative, they choose the depositories of public authority themselves, and there is not a single person who does not hold the mission which he performs from the will itself of the whole or a part of the people. On the contrary, where nations do not retain so much sovereign action they are not representative, and their government exists of itself. In such a government there is a personal power elevated above all, and not emanating from the suffrages of those whom it governs. Birth invests successive titularies with this power according to an order established by the laws and declared immutable — Such are the two great constitutive forms under the one or other of which are ranged all possible governments. In fact, there is no government which is not a republic or a monarchy, that is to say, which does not emanate altogether from an election or which does not admit of hereditary royalty.—After the fundamental distinction which divides governments into two clearly distinct categories, come all the distinctions which arise from the difference of the sums of effective power the exercise of which they possess. These distinctions are numerous and not less marked in republics than in monarchies. In fact, the different kinds of republican governments have nothing in common except the principle upon which they are based. But in everything relating to the change of persons composing the government, and the degree of independence which these persons enjoy in the administration of the state, no two have ever been exactly alike. There have been some formed of simple councils, changed several times in a year and obliged to consult their constituents before rendering the least new decision. On the other hand, we have seen cases where a chief elected for life disposed freely of employments and was able to impress on public affairs a character depending in a great degree on his personal will. And between these two extreme forms there is a large number of intermediate ones. — In like manner, notwithstanding the hereditary character of the king, the monarchic form lends itself to numberless modifications. While there are states in which the prince possesses absolute power, there are others in which, subject to the law, he decides nothing of himself, and in which he performs no act of authority without the direct concurrence and control of the nation, represented by legislative assemblies whose members it has chosen. — One point to be remarked is the absence of terms for classifying the different republican governments. On the contrary, numerous terms make it possible to classify different monarchic governments, and, though they have not all the desirable precision, these terms have the merit of being in harmony with the reality of facts. Thus, when it is said of these governments that they are autocratic, absolute, despotic, limited, constitutional, representative, parliamentary, words are used to which a real sense is attached, words which denote differences of form between these governments, due to the unequal apportionment of the parts of sovereignty, the exercise of which belongs to hereditary chiefs of the state. — Certain writers, following in this the example of antiquity, divide governments into aristocratic and democratic. The greatness or smallness of the number of per-

sons in possession of the right to share in managing the affairs of the state is never an insignificant fact. Nothing has a more active influence than this on the decisions of the ruling powers, and especially on the distribution of offices and on the advantages attached to public life. But if it is well to note the fact, it should not be forgotten that governments, so far as they are aristocratic or democratic, merely reflect the nations to which they belong; and this in reality does not affect their form in their really characteristic part, the degree of independence and the discretion reserved to the powers of which they are the assemblage. — Besides governments which direct the different states, there are others whose authority extends over a number of states, distinct, but connected by pacts of alliance or federal union. These have no other prerogatives than those which the governments of the several states have yielded in their favor, and there may be very considerable differences between the amounts of directing authority which they wield — Whence comes the diversity of forms of government? To answer this question has been and is the object of the labors of science. The study of facts justifies the following statement: The differentiating cause of the forms of government is the difference in the situations of the states themselves. Extent, configuration, geographical position of states, the number, origin, traditions, industrial and commercial interests of the populations which they include, all vary—there is nothing similar among them, and if there are some that contain but few germs of decomposition, there are others, on the contrary, which conceal many of energetic and persistent vitality. This does not permit the governments to accomplish their tasks under the same conditions of existence and action. The less homogeneous the elements collected in the same social body, the more the powers called to maintain union demand independence and stability, and the greater the share of these they obtain. — It would be impossible for a state to exist unless the populations which it includes retained less influence on its destiny in proportion as they themselves are incapable of agreement. In every state there is a measure of participation, either in creating the public powers or administering collective affairs which for these populations limit the power of the elements of discord to whose influence they are subject; and when this measure is exceeded, conflicts more and more productive of violence and irritation break out and lead to intestine strife. Such has been the course of affairs at all times and in all places. The degree of political sociability of populations ranged under the same central authority has decided the amount of sovereignty of which the populations have retained the regular and continuous exercise. Great where the populations owing to natural affinities form a very compact whole, this amount has always been small or nothing where the populations did not accommodate themselves to the same laws or the same administration; and to governments have fallen all that portion which they could not manage without damage to the maintenance of internal peace. This is a necessity imposed on every state under pain of anarchy and destruction. — As to the circumstances which react on the form of governments by rendering populations more or less social, they are all those which have the sad privilege of sowing dissension and hatred in the bosom of states. Differences of origin, of language, and nationality, quarrels between established religions, rivalries between social classes, jealousies and struggles between local interests: these circumstances and many others less important, mingle and combine, strengthen or weaken each other; and their total action, by determining to what point the wishes of the governed are or are not reconcilable, determines in the last resort the mode of existence and the amount of sovereignty which each government requires to preserve the state it governs from dissolution and ruin. — Among the circumstances which contribute to vary governmental constitutions there is one which has always attracted more attention than others: territorial extension. This circumstance Montesquieu declares to be altogether of decisive importance. "The natural peculiarity of small states is to be governed as republics, that of medium size to be subjected to a monarch, that of great empires to be governed by a despot." What is true in this regard is, that the power of the causes of discord and ruin which they contain is almost always in proportion to the size of the states. Ordinarily the greatest enclose not only states which are foreign to each other, but nations between which exist enmities, the deeper because there are among them some which arms alone have been able to force into an association which deprived them of their former independence. Generally also it is in the largest states that the antagonism of different religious beliefs, and the differences of climate and geographical situations maintain in the bosom of populations hatreds and rivalries of the most intense character; and such is frequently the unsociability of the elements entering into their composition that they would separate if the power intrusted with maintaining political unity were not fixed in the hands of an absolute sovereign. There are nations which do not possess so much sovereign action as they might exercise without peril to public peace; there are none which could retain it beyond the measure fixed by the energy of the motives of dissension, to whose influence they are subject, because in such a case the anarchy which originates on account of inefficient central authority extends its ravages gradually, and ends by bringing the state to ruin. — Anarchy is death to all political associations. By destroying in the bosom of a state the power destined to unite all its forces under a single management, it dissolves and deprives it of the means of resisting the attacks of its neighbors. Hence the necessity of escaping the destructive effects of anarchy has at

all epochs decided in every state in the world the organization of the government. Wherever a change in the personnel of the government by election lets loose storms of passion destructive in their violence, the political community has been able to preserve itself only on condition that it seek repose under the monarchic form; on the contrary, where the same change in the personnel of the government merely caused agitation without disorganization, the community retaining a more complete exercise of sovereignty, continued to live under a republican form. — The need of union and internal security has influenced not only the division of states into monarchies and republics, but also the modifications which more or less affect political constitutions of the same sort and bearing the same name. In republics as well as in monarchies, the number and real force of the elements of trouble and division, whose force must be restrained, have influenced the partition of sovereign action between the governing and the governed; and in fact there have never been two states in which this partition was regulated in precisely similar proportions. It follows from this that political liberty can not flourish everywhere in the same degree, and that, as Montesquieu thought, there are states condemned to exist only on condition of accepting the evils produced by an entire absence of liberty. This is certainly a real misfortune for these states; but, it is proper to remark that this misfortune is, for those who suffer it, but one fruit of the iniquities in which one party among them has shared. Brute force created and maintains the empires weighed down by the despotism of the prince. One of these empires extended its conquests over territories belonging to neighboring nations; it has subdued and retains under its rule people who regret their former autonomy, and instead of fellow-citizens it finds in the vanquished enemies, almost always disposed to rend the ties of an association which they detest. This is what chiefly makes states—whose greatness rests only on a union, under the same government, of races distinct by origin, language and historical antecedents—the seat of absolutism. War exists within them, and nothing less than a continual state of siege is requisite to prevent it from breaking out. Their unity is too artificial not to succumb, if the authority which forms its only bond is not free from all control and restraint. This authority has struggles and combats to endure, and, like military command, it can admit neither limit nor division. In this way nations are punished which abuse their power; they oppress and are oppressed; the servitude which they impose on others turns against them, and they can not escape it without a decrease of the territorial greatness which they acquired unjustly. — We have seen on what foundations governments rest, in what the differences consist which appear in their structure, and from what sources these differences really come. It remains now to show what the natural attributes of governments are, and within what limits the task devolved on them should be restricted. — The true rule is, that governments should do only what members of the community, either singly or collectively, are unable to do of themselves, or unable to do sufficiently well, without the co-operation of public authority. But where shall we find the line of demarcation between things pertaining directly and specifically to governments and things which pertain to them only partially or not at all? After a close examination the question will not be found so simple as it might appear, and in practice it has received a variety of solutions. It is easy, nevertheless, to designate the functions which in all states belong of strict necessity to governments. They are those functions whose fulfillment is essential at all times to the maintenance of independence and national unity. Execution of the laws, negotiations or treaties with foreign countries, the levy and employment of military forces, collection and application of the product of taxes intended to provide for expenses of public utility, all these acts belong to the special domain of the governmental power; and when members of the community unite in regulating them, it is in proportion as they participate in the exercise of effective sovereignty, and form an integral and working part of the government. — There are other parts of sovereign action, which, without being concentrated in the hands of government, demand its continual co-operation. Such is the administration of justice. There are states in which the people themselves designate the judges who administer justice for them, and, by means of juries selected from their own ranks, take part directly in the exercise of the judicial power. In this respect, combinations may be very different, and the best are always those which free the judges most from external dependence; but whatever be their spirit or character, there still remains a task which the central authority alone is fitted to accomplish with the requisite success, that of assuring the execution of the laws in accordance with the will of the legislator. If the accomplishment of this task is imperfect, laws abandoned to various interpretations would at length cease to be understood alike at all points of the national territory, and society would suffer from the uncertainty of the rules on the strict observance of which the security of person and property depend. — Of social wants there are some the satisfaction of which demand, imperatively, the co-operation and action of the state. These are provided for by services and labors of public utility, and consequently at the common expense of all portions of the territory. There are many ways of executing these labors, and many ways also of meeting the expenses which they necessitate, and of obtaining repayment; but the care of declaring the utility of these works and of seeing that they accomplish their purpose, is incumbent on the state. Thus, in the organization of postal communication, the digging of canals, making of

long roads, its intervention is necessary, and the government intervenes because it is the organ of what is most general in the interests to be conciliated and satisfied. There is no state of any extent without communities endowed with life peculiar to themselves and having special wants and interests. Communes, parishes, districts, departments, counties, provinces, under whatever denomination they may be known, these fractions of the political association have to bear the local expenses, and manage the property which belongs to them, perform all the acts required by an existence distinct from the general existence, and all have mandatories and administrations, which deliberate and act in their name; everything differs, nevertheless, according to the country in the measure of the liberty which they enjoy, in all things concerning the conduct of their affairs. While certain governments make it a point to keep them in leading strings, and allow them to move only with the permission and under the control of government functionaries whom they themselves have chosen, others do not interfere at all in their decisions, and let them act in all questions at their own risk and peril. — If we examine the question on one side only, it seems that in their relations either with communes, or territorial fractions, having an existence of their own, governments should confine themselves to enforcing obedience to the laws of the state, and to preserving from all injurious attacks the interests placed under their care, but, on a closer inspection, we discover that affairs are not everywhere and always arranged in the same fashion. Populations are not equally advanced in all countries, or equally fitted to administer the affairs within their jurisdiction. The reason is, that the past has not been the same for all. Even in Europe there are still some nations whose escape from serfdom is too recent, and who, bent under the weight of ignorance, unless government acted, would make none of the sacrifices which the improvement of their intellectual and economic position most imperatively demands. Still, even with these populations, compulsion should be reduced to minimum proportions. The power of producing the qualities required in civil life is found only in the practice of that life. In order to know what are the collective interests, and what intimate ties exist between them and private interests, it is necessary to be occupied with them. Men who take no part in the decisions made with reference to the public good, never discover to what point this good is connected with their own, and remain indifferent to everything which passes outside of the sphere in which their domestic activity is concentrated. If you take away local liberty, political liberty will have but ill-secured foundations, and, not finding among the masses feelings and ideas to render it dear to them, will be exposed to the hazards of revolutionary crises — After having indicated what governments have to do, either alone and unaided, or in concert with one or another subdivision of the political community, it remains to show within what limits their action should be confined, and what the domain is which they can not enter without becoming more injurious than useful. — There are liberties in every society which it is important to leave in all their natural extent. It is an indefeasible right of individuals to use their faculties and powers as they see fit, to improve their condition, to amass wealth and rise to the possession of all the advantages attached to the social state. This right has for each one no other limit than the respect due to the same right of other men, and in everything which concerns this right, the task of public power consists solely in preserving its exercise from any offensive or restrictive attack. — Unfortunately governments have not judged in this way. Instead of contenting themselves with securing to each person the highest possible degree of safety in the employment of his means of well-being and in the enjoyment of the goods which have come to his share, they have considered it as their office to direct the activity of individuals according to their own pleasure, and to interfere in the distribution of wealth. Ranks and conditions, ownership and distribution of lands, application of capital and labor, production and exchange of products, labor, manufactures and commercial transactions — there is not one of these which has not been subjected to distinct repressive rules, and their acts have only succeeded in creating obstacles to the beneficent energy of arts and civilization. — It is impossible to invade the common right without spreading in the midst of societies injustice and serfdom, the weight of which will inevitably arrest or retard their progress. Such has been and such always will be the effect of laws intended to create a civil and economic order different from that which should be produced by the free development of individual forces and faculties. These laws operate only on condition of taking from some to give to others, and their results are continually in opposition to the general welfare. If they tie up the land in whole or in part for the benefit of one portion of the community, they reduce among the remainder the possibility of obtaining the advantages of ownership in real property, narrow the field of their action, and weaken the mainspring of their efforts. Nothing acts so efficaciously on the energy of men as the desire to acquire land; above all, nothing inclines them so much to be careful, industrious, to accumulate savings, the use of which is required on land; but where this desire, for want of meeting all the facilities for satisfying itself, to which it has the right, remains feeble and languishing, populations lack the qualities most essential to their prosperity. Among the causes which prevent the nations of Europe from advancing with firmer and quicker step toward civilization, one of the first places must be assigned to the institutions which give to privileged classes the exclusive possession of vast portions of the soil;

and if the Slavonic nations have remained behind others, it is principally because among them landed property was reserved entirely to those families of which the nobility was composed. — In industrial affairs the interference of authority is no less injurious. At every epoch the kinds of production which are stimulated by the circumstances of the moment obtain the most ample remuneration, and on this account attract more labor and capital than others. This is the natural course of things which governments oppose, whenever, by distinguishing between the different branches of commerce and industry, they provoke the special development of some. In this case, by calling productive forces into less fruitful fields than those which they leave or would choose, they diminish their general fruitfulness, and nations do not gain from their labor all the results which they desire. To this drawback are added others of no less gravity. First, it is only by imposing on the community more or less onerous burdens, that industries are sustained which are wanting in some of the conditions of success, which they would need in order to dispense with assistance, and such combinations are changed into obstacles to the increase of wealth. In the second place, the action of power enfeebles among producers the qualities most necessary to the proper employment of their resources. Instead of counting only on profits due to the energy and dexterity of their own efforts, they leave to the state the care of securing for their work sufficient recompense, and generally they care little for profiting by innovations which demand advances of money and sacrifice. — Let an examination be made of the results produced in practice by legislative arrangements, intended either to modify the distribution of property and wealth or to assign artificial and forced directions to the application of labor, and we shall find not one which is not an attack on liberty, whose productive activity needs to be developed in all its power, and which does not deprive members of the social body of some of the means and elements of prosperity, the use of which they have the right to retain. At present, owing to the advance of enlightenment, governments, better informed than in former periods, have commenced to see that there is a large number of facts of the economic and civil order which must be left to themselves. In the most advanced states of Europe laws which formerly reserved to particular classes the possession of the soil, or treated unequally the different methods of labor and production, have already given way to less restrictive enactments; and it is very clear that the time is approaching when the laws of justice will at last receive the respect due them. — It is to be desired, nevertheless, that governments should no longer extend their action beyond the circle in which the interests of society require them to be confined. In everything relating to the distribution of wealth, to the application of industrial forces, and the conquests of individual activity, their task consists solely in superintending the execution of engagements, to secure for persons as well as property of every kind of which they are in legitimate possession the highest measure of safety possible. This task accomplished, they have only to follow the course taken by events. To regulate this course there are natural laws which require no assistance from man; laws, whose work is always the better and completer the more it is accomplished in freedom. To endeavor to substitute a different order for the order which is the object of these laws, is nothing less than to try to substitute for the results of supreme wisdom the results of human wisdom, which are necessarily imperfect; and such fool-hardiness meets inevitable punishment in the sufferings which it inflicts, or in those whose abolition it prevents.

HIPPOLYTE PASSY.

GOVERNMENT, Provisional. Every political society needs a head; this need must be deeply engraved in human nature, for, since the creation, political societies have never been able to dispense with a head. Thus, the first act of a revolution is to replace the head swept away by the political tempest. And it is this great and indispensable need of having a government that renders people indulgent as to the methods employed at the time of choosing leaders, to whom they give power, or whom they allow to take it; this causes them to close their eyes to the usurpations which these representatives permit themselves to make, while proclaiming aloud the sovereignty of the people which they trample upon, while making laws by their own authority which their limited and provisional mandate would not permit them to make, sometimes while performing definitely acts beyond their mission and competence. But the people abhor anarchy beyond all things. — Still, "it is an eternal experience," says Montesquieu, "that every man who has power is inclined to abuse it." Now the majority of revolutions have had, as cause and excuse or pretext, the necessity of restraining the abuses of power. Nevertheless powers constituted with a precarious title and following revolutions fall into the same errors. Thus, the provisional government in France of 1814 hastened to create a king, and Talleyrand, while showing his salon of the rue St. Florentin, said, "There is where the restoration was made." The provisional government of 1830 in France acted in the same manner, and the government of July was established in the Hotel de Laffitte. The provisional government of 1848 in France repeated these mistakes, and after deliberating a few hours gave birth to a republic. The dictator of 1851 used and abused his usurped power; and as to the government of "national defense," of Sept. 4, 1870, it kept long enough within just limits with the exception of the delegation of Tours. "But," we repeat, "every man in possession of power is inclined to abuse it." We see, besides, by these examples, that it is the tendency of chiefs of states to usurp rights;

this tendency is not peculiar to monarchies; all powers, whether oligarchies, monarchies or republics, tend by their nature to absorb the people as contradistinguished from the governing party, no matter by what name he is called, in the same way as they would if he reigned.—Where, then, is the remedy for this aggression? It is not found in the continuation of the quotation of Montesquieu: "To prevent the abuse of power it is necessary to dispose things so that one power should check another, otherwise every power advances till it finds limits." Montesquieu's remark applies in fact only to normal conditions, and the existence of a provisional government characterizes a political situation which is pre-eminently abnormal; power in this instance is held by men who are self-elected, that is to say, by men without election, but for this very reason provisional governments should abstain from disposing of the future. Their powers do not reach beyond the term of their office; they are legitimate only for the maintenance of order, and not to issue laws, which the regular authorities will have time to do. They should absolutely take but urgent measures and no other, and they should always hasten to ask a bill of indemnity from the first parliament for each particular measure, and not for all taken together. — There is a detail upon which we must dwell in closing. In France, as in most other states, a distinction is made between an act which is passed by the legislative power, *a law*, and that which emanates from the executive power, *an order, ordinance, a decree*. Now the provisional government being dictatorial in its character it combines the two powers. On this account it is frequently difficult to distinguish the act which is a law from the act which is a decree, and certain persons are disposed to consider all the acts as laws, an interpretation which may have serious inconveniences. It is important, then, to bear well in mind that the nature of the act is not changed by the effect of the signature of a revolutionary dictator, that is to say, a decree remains a decree — It is needless to add, that if the government which was overthrown, or rather, whose overthrow was sought, remains in power, it will respect absolutely nothing of what was done by the *insurgent* government (the word provisional applies only to successful insurrections). The French government recognized nothing done under the commune, not even the record of births, deaths and marriages, and the government at Washington did not recognize for a moment the acts of the secession government, although it lasted three years.

MAURICE BLOCK.

GOVERNMENT INTERVENTION, Political Economy of. Upon this question political economists, and others who take an interest in social subjects, are divided into two great parties. On the one side, there are those who wish that the state should do very much more for the people; on the other side, there are those who think that the influence now exerted by the government should be greatly curtailed. There are, consequently, two distinct phases of thought, each most ably and powerfully represented. The first party may generally be said to be composed of some of the most enterprising, intelligent and politically active of the working classes. It also embraces most of those who have strong philanthropic tendencies, but who have not directed systematic thought to the consideration of the true causes that produce the suffering which excites in them such generous sympathy. Among those who desire to see government intervention greatly curtailed, there are to be found a comparatively small number of exceptionably thoughtful working men. The most consistent and thoroughgoing upholders of these doctrines, however, belong to a certain philosophic school, the distinguished leader of which is Mr. Herbert Spencer. His writings contain probably by far the most powerful and exhaustive statement of the arguments against over-legislation, and against the growing tendency to rely upon state assistance. These opinions generally receive the designation of *laissez faire*. In a very circuitous way it has, as it were, accidentally happened that *laissez faire* is popularly supposed to derive authority and sanction from the principles of political economy. The advocates of free trade in England had to attack one kind of government interference; and, in abolishing protection, they undoubtedly released commerce from numberless fetters which had been imposed by the state in that country. The sympathy which the free traders were thus naturally led to feel for *laissez faire* soon became increased by another circumstance. The English factory acts, when first proposed, were vehemently resisted by the manufacturers as an unwarrantable interference with industrial freedom. The majority of these manufacturers were leading free traders, and were also prominent members of what is known as the Manchester school. As, however, the abolition of protection and opposition to the factory acts were both defended on the ground of hostility to state interference, there soon arose a connection between the Manchester school and *laissez faire*. During the anti-corn-law agitation, the advocates of free trade so repeatedly appealed to the principles of political economy that there was assumed to be a peculiar connection between this science and the Manchester school. As, however, this school had identified itself with the doctrine of *laissez faire*, it was soon popularly supposed that *laissez faire* and political economy were intimately associated with each other. It has been thought advisable to explain the origin of this association of ideas, because when its accidental character is clearly perceived it is more easy to understand that political economy gives no sanction whatever to the doctrine of *laissez faire*. In fact, there is nothing whatever in the principles of economic science to lead to the establishment of any general conclusion with regard to the advan-

tages or disadvantages of state interference. — Error and confusion are sure to result if we seek to lay down some rule as applicable to every proposed case of government intervention. Although the main object I have in view is to point out the evils resulting from an undue reliance upon the state, yet it seems to me that those who exhibit this tendency scarcely adopt a more erroneous course than those who are such extreme advocates of *laissez faire*, that under all circumstances they condemn government interference without inquiring into the nature of the particular instance to which it is to be applied. As an example of this it may be mentioned that those who are most thoroughly indoctrinated with *laissez faire* apparently consider that they are bound to oppose compulsory education because it involves state interference. Such opposition affords an instructive warning against the danger of offering too implicit obedience to any general principle A moment's consideration will suffice to show that interference on behalf of children and interference on behalf of grown-up persons rest on entirely different grounds. The latter kind of interference may be objected to because it impedes the freedom or men's actions, is antagonistic to individual liberty, and, in the words of Wilhelm von Humboldt, "prevents the harmonious development of the human character." The child, however, independently of all government interference, must be under the control of a parent or a guardian. It is therefore idle to talk of his individual liberty and of his freedom of action; these must be more or less completely surrendered to his parent or guardian. It is therefore evident that the question of state intervention must be regarded from an entirely different point of view when it is applied on behalf of children. It most generally happens that they require the aid of the state when those who are constituted their natural protectors neglect their duty or abuse their power. The extent to which there is such an abuse of power or such a neglect of duty must be the chief element in determining the limits to which it is desirable that the state should extend its protection to children. A child having no power to provide itself with food and clothing, it will be generally admitted that the state ought to take some action if a parent either can not or will not supply his children with the necessaries of life. Although this is a case in which the necessity of some interference will at once be acknowledged, yet the conditions under which such interference should take place suggest considerations of the utmost importance. The history of the English poor law abundantly shows that if the state renders aid to neglected children with too great liberality, and if at the same time parents, who are responsible for these neglected children, are treated with undue leniency, a most disastrous encouragement is given to improvidence and immorality. Then again, it would probably be admitted by the most enthusiastic friends of compulsory education that, in order to justify it, it ought, in the first instance, to be proved that every one who is born in a civilized country is entitled to claim from his parents a certain amount of mental training, and that, if this claim is ignored by the parents, it is the duty of the state to enforce it. No one would be prepared to say that interference between the parent and the child, in reference to education, is good in itself; it would not be needed if the social condition of the country were more satisfactory; and those who are among the foremost to recognize the importance of compulsory education confidently hope that it will gradually be rendered unnecessary as nations advance in social improvement. Here then is a case in which the right or wrong of government interference can not be determined by *a priori* considerations; a trustworthy decision can only be arrived at on the point by ascertaining to what extent parents neglect the duty which they owe to their children of providing them with a certain amount of mental instruction. — Another illustration of the importance of deciding each proposed case of government interference upon its merits, is afforded by considering the circumstances under which it is desirable that the state should attempt to regulate the hours of labor. Such interference is ordinarily condemned on some such ground as the following: It is said to be contrary to individual freedom; it is urged that if it is legitimate that the state should say how many hours a man should work with his hands, it would be equally legitimate to decree the amount of mental labor that should be permitted. A government official would consequently have to visit every study; a man would have to be watched in his daily avocations; the time when he retired to rest and when he rose from slumber might have to be noted. Life with all this worry and watching would scarcely be worth having. Then again, it is said that a legal limitation of the hours of labor might so cripple productive industry as to render successful competition with foreign countries impossible. The trade of a country might thus be lost, and the people be deprived of the chief source of their maintenance. Fully admitting the force of these and other considerations, I view with as much disfavor as any one can, the cry which is raised in favor of a law fixing a legal limit of so many hours for the day's work. But those who are strongly opposed to such legislation should be careful to avoid the not unfrequent error of hastily concluding that the state can never be justified under any circumstances in regulating the hours of labor. It certainly appears to me that it is quite as desirable to pass a law limiting the number of hours which a child is permitted to work, as it would be undesirable to impose similar restrictions upon men and women. If grown-up persons over-work themselves they do it of their own free will. They can not be compelled to labor more hours than they please unless they are either held in subjection as slaves, or unless they are in some other way deprived of

personal liberty. A child, however, is not permitted to exercise freedom of judgment; he does not himself decide at what age he shall begin work, and the number of hours he shall each day labor. All this is determined for him by others. If, therefore, it can be shown, as it has undoubtedly been shown in England, that, through the cupidity and mistaken economy of employers, and through the selfishness, avarice and poverty of parents, large numbers of children are worked too young and are also greatly over-worked, then it seems to me that one of the clearest cases that can be imagined is made out in favor of state intervention Under the circumstances just described it is only by state intervention that the child can be protected against what may prove to be an incalculable and irreparable injury. The only argument of weight which has been suggested against such interference has been urged by those who say that to deprive a parent of a portion of his children's earnings, is certainly unjust upon those parents who are extremely poor. We here simply say that, after making due allowance for the difficulties associated with the poverty of parents, we believe it can be proved that the balance of argument strongly preponderates in favor of the state interfering on behalf of over-worked children. — It is not necessary to quote other instances to show that state interference on behalf of children is usually to be defended on grounds entirely different from those which would be brought forward to justify similar interference on behalf of grown-up persons. I will, therefore, proceed to state some of the considerations which have to be taken into account when government intervention is applied to adults. It will be useful, in the first instance, to mention certain principles, to the truth of which scarcely any will refuse assent. It will, for instance, be generally admitted that government intervention is not a good thing in itself; the more it can be avoided the better. Probably the best measure which can be obtained of the welfare of a community is to ascertain to what extent each member of it can, with advantage to all the rest, be permitted to have freedom of action. It is obvious that this freedom will be curtailed in proportion to the extent to which the authority of the state has to be introduced into private life. The following considerations will probably suffice to show that the well-being of a community may be estimated in the manner just suggested. Nothing, for example, brings such manifold evils upon a nation as wide-spread ignorance among its people. No one would think of advocating compulsory education if children generally received an adequate amount of instruction. Consequently the extent to which the necessity exists of the state interfering with education may be regarded as a measure of popular ignorance; and the amount of this ignorance indicates the difference between the present condition of a country and the welfare it might enjoy. If another example is required to corroborate what has been stated, we may revert to the instance of the state interfering in reference to the employment of children. As previously stated, children are sent to work too soon, or are worked too many hours a day, chiefly in consequence of the cupidity and mistaken economy of employers, or in consequence of the selfishness, avarice or poverty of parents. With the decline in the force of these agencies there would be a corresponding diminution in the necessity for this particular kind of government interference. But could there be more conclusive evidence of a marked improvement in the general condition of a country than would be supplied by the fact that the agencies to which allusion has just been made were exerting less influence? A moral and intellectual advance would be indicated by the circumstance that cupidity and mistaken economy were much more rare among employers. Again, still more striking evidence would be afforded of general advancement, if parents were so little avaricious or selfish, and if so little poverty existed among them, that they were rarely or never tempted to permit their children to be over-worked. — It is, however, not necessary to say more with a view of showing that government interference is not good in itself, but that it must be regarded rather as a disagreeable remedy which has to be applied in order to cure or counteract various defects in the social condition of a country. The remedy is not only a disagreeable one, but it may be compared to some of those strong medicines which not unfrequently leave behind after consequences of a serious kind; these medicines can not be given to a patient without some risk; they should always be used with the utmost caution and discrimination. Statesmen, therefore, when they are pressed to extend the area of government intervention, should consider that they occupy a position not unlike that of a physician who has to decide whether he will give to a patient some extremely dangerous drug. The physician, if he is at all worthy of his profession, will endeavor to ascertain the exact state of his patient, and will carefully note all his symptoms. If he does not do this, but if, on the contrary, he adopts whatever course he believes will give most immediate satisfaction to the patient and his friends, mischief is almost sure to ensue, and he forfeits all claim to confidence and respect. In a similar way, statesmen, when they are asked to use state intervention, should not forget that it is a perilous experiment, and should do all in their power to ascertain the exact circumstances under which it is applied, in order to estimate, with as much correctness as possible, what will be its future consequences. If statesmen do not do this, but if, on the contrary, they adopt that course which they believe will most promote the interests of party, and give them the most immediate popularity, then the gravest misfortunes may be brought upon their country. — It is impossible to dwell with too great earnestness upon the demoralization and mischief which would ensue if some of the demands which are

now so constantly urged for state assistance should be conceded. Of all these demands none are so insidious, none so dangerous, as those which would call in the aid of a central authority to enable one section of the community to levy contributions for its own advantage from the rest of the nation. This has already been done to a most alarming extent, and a powerful influence would be exerted in the same direction by many of the social movements which now receive popular favor. As a proof of what has just been stated, it will be sufficient to remark, without discussing the subject with further detail here, that about £9,000,000 are annually levied in England and Wales for the relief of the poor. This great sum represents a heavy tax imposed on industry, and no small portion of the amount is taken from the industrious and provident to be distributed among those who have brought poverty upon themselves by indolence and improvidence. As if the harm already done by thus encouraging recklessness and discouraging thrift had not been sufficiently great, an appeal has often been influentially put forward to administer the poor law with greater liberality. This simply means that the industrious should be still more heavily fined, in order that a more liberal reward might be given to improvidence. Some of the best-intentioned people are thus unconsciously advocating schemes which would bring a similar baneful influence into operation. Proposed chimerical measures of relief have numerous and powerful advocates. Like the English poor law, however, they may all be regarded as developments of the principle that it is not simply by the sweat of the brow or by the labor of the brain that men must support themselves, but that they have a right not only to look to others to provide them with maintenance, but, as far as possible, to protect them against the consequences of their own voluntary acts. But although the principle, just referred to, can not, in my opinion, be too strongly condemned, yet it must not be supposed that we should be justified in at once rushing hastily to the conclusion that there should be no poor laws whatever, that under no circumstances should free education be given, that the state should never assist emigration, and that neglected children should not be cared for. The important question which has to be considered is this: If any of these things ought to be done, under what circumstances, and in what particular manner should they be done? In attempting to come to a decision on this point, it is above all things essential to keep in view that the utmost discouragement should be given to improvidence. For instance, it has been proved that out door relief is often simply regarded as a gift, the acceptance of which entails no disagreeable consequences. Residence in a workhouse in England is, on the contrary, generally looked upon as a somewhat serious punishment. It is, therefore, obvious that in-door relief discourages voluntary pauperism, whereas it is greatly stimulated by out-door relief. Consequently England, without abolishing her poor law, may in the future avoid much of the harm which it has done in the past if the granting of out-door relief were to be either altogether forbidden, or only permitted in very exceptional cases. Again, with regard to emigration, although reasons will afterward be stated which lead to the conclusion that it would be most unwise for England to undertake to pay the passage-money of all who might wish to settle in foreign countries, yet in the case of some great emergency it might be advisable for her, as an exceptional measure, to resort to state emigration. In a similar way, although I believe that a general system of free education ought to be resisted because it would weaken the sense of parental obligation, yet, in my opinion, no child ought to be permitted to grow up in ignorance because his school fees are not forthcoming. It would be scarcely less unjust for a parent to make others pay for the education of his children than it would be to make others pay for their food and clothing. The state very properly orders local authorities to undertake the maintenance of children if they are unprovided with the necessaries of life; but if a parent willfully refuses to feed and clothe his children, then he is criminally punished. If, however, it is not a voluntary act, then he is treated as a pauper. In a similar way, I think, a parent ought to be punished if he makes other people pay for the education of his children, in order that he may have something more to spend in his own enjoyment. If, however, he is too poor to pay the school fees, then there is just as much reason why he should be treated as a pauper as if he were unable to feed and clothe his children.—Enough has now probably been said to show with what extreme caution any scheme should be viewed which proposes to benefit a class by the expenditure of money obtained by taxation. As previously remarked, the objections to be urged against such proposals assume greatly increased force when, as is not unfrequently the case, the class among whom the money is chiefly to be distributed are not to contribute toward the extra taxation which the additional expenditure will necessitate. Thus, the carrying out of the social and economic changes advocated by the international society would involve a heavy outlay of public money. At the same time it is to be observed that it is one of the cardinal principles of this association to raise all taxation by a graduated property tax.—There are, however, other instances of government intervention which do not directly involve expenditure of public money. If an attempt is made to ascertain the effects of such interference, it will be found that considerations of a very complicated character are often involved. At the outset of such an investigation, certain principles can be laid down which will greatly assist us in arriving at a right decision in any particular case, although they will not furnish any general conclusions of universal applicability. Sanitary legislation af-

fords an instance in which the interference of the state will most generally be admitted to be both just and desirable. A man who neglects drainage and other matters upon which the preservation of health depends, not only injures himself and those who are dependent upon him, but may become the centre and source of wide-spread disease. Because it is thus comparatively easy to decide in favor of a compulsory system of drainage of houses and compulsory purification of rivers from sewage, it is not unfrequently supposed that, for similar reasons, the state ought to interpose in such a matter as restricting, if not prohibiting, the sale of intoxicating liquors. Thus, it is said that intemperance is not less injurious to health than defective sanitary arrangements, and it is argued that if it is within the appropriate functions of the state to secure good drainage, it must be quite as much within its legitimate functions to impede or forbid the sale of intoxicating liquors. But in order to justify such a conclusion it would be necessary to prove that as imperfect drainage is bad in itself, so all consumption of alcohol must be deleterious; the extent to which it is deleterious merely varying with the amount of consumption. The analogy, however, at once breaks down if it is admitted, as it generally will be, that beer, wine and other alcoholic beverages, if taken in due moderation, need not be pernicious, but, on the contrary, may be beneficial. It is, however, argued by the advocates of a prohibitory liquor law, that the mischief resulting from drunkenness is not confined to the drunkard himself; he often so much injures his family as to reduce them and himself to pauperism; sometimes he is led into crime; in this way, consequently, intemperance greatly increases pauperism and crime. It thus inflicts a serious loss upon the community, and adds much to the taxation of the country. Such considerations as these induce many people to think that as the whole community is injured by drunkenness, the state should give the majority the right to restrict or prohibit the sale of intoxicating liquors. The demand for the exercise of such a power obviously suggests considerations different from those which are associated with enforcing a certain sanitary scheme, such, for instance, as the carrying out of a uniform system of drainage. No one can be benefited by having a place imperfectly drained, whereas all who, for example, drink beer and wine in judicious moderation may be subjected to great inconvenience, and may even be injured if the sale of these articles is forbidden or greatly impeded. Thus, if it were enacted, as has been so often proposed in England, that there should be only one public house for each 1,000 or 2,000 people, many men, if they wanted to purchase a glass of beer, would have perhaps to walk a couple of miles. They would have to submit to this trouble and inconvenience not through any fault of their own, but solely because certain people do not practice self-restraint. Then again, if the number of public houses were artificially limited in the manner proposed, a great industry would manifestly have to be carried on as a monopoly. It is difficult to imagine any trade conducted as a strict monopoly without causing abuse and unfairness. It would be almost impossible to find any authority who might with safety be entrusted to select the persons who should enjoy the privilege of exercising this monopoly. Competition in the trade would also be to a great extent destroyed, and competition is the best security for fair prices and a good article. It has, however, been suggested that the monopoly should be put up to auction; but if this were done, the large brewers would be able to outbid less wealthy competitors, and the trade would be thrown more completely than it is now into the hands of a limited class Again, it is obvious that those who pay a large price for the privilege of exercising monopoly would recoup themselves with handsome interest for their outlay; they would do this by charging an additional price for all the articles sold. It thus appears that one of the results of carrying out such a policy of restriction would be to subject temperate people to great inconvenience. They might have to walk a considerable distance for every glass of beer they wished to purchase, and they would be obliged to pay an additional price for it. There certainly seems to be good reason for condemning government intervention when it subjects all who can exercise self-restraint to loss and inconvenience, in order that the force of temptation may be somewhat reduced to the self-indulgent. — It will, perhaps, however, be urged that if these suggested legislative restrictions should cause annoyance to temperate people, they would be abundantly compensated both for their additional trouble and for the additional price they might have to pay for beer, by the stimulus which would be given to the prosperity of the country, and by the reduction which might be effected in its taxation if drunkenness were diminished. But before the individual liberty of a whole community is interfered with, because some abuse freedom of action, justice and policy alike demand that everything should be done to see whether such abuse could not be checked by punishing those who do not exercise self-restraint. Thus, before any legislation is sanctioned which would impose upon temperate people many vexatious restrictions, a far more decided effort should be made than has ever yet been attempted to punish intemperance, and make the drunkard more directly bear the consequence of his acts. At the present time an exactly opposite course is adopted. It seems to be a recognized principle of the law of England that crimes committed by persons while they are drunk should be treated with exceptional leniency. It is hardly possible to take up a paper without seeing cases in which magistrates either altogether excuse the perpetrator of some dastardly assault, or greatly mitigate the usual punishment, on the ground that the accused was drunk at the time the offense was

committed. — The subject of the liquor traffic has been alluded to here, chiefly for the purpose of showing that the problem of government interference involves so many complicated and difficult considerations that each demand for it should be separately investigated, in order that the special circumstances involved in each particular case should be carefully weighed. It would have been foreign to the immediate purpose of this article to attempt anything like a complete discussion of the questions involved in greatly restricting or prohibiting the sale of intoxicating liquors. If it had been my intention to enter upon such a discussion, it would have been necessary, among other things, to have referred to the experience which is afforded by America of the working of a prohibitory liquor law in that country. The evidence of those must have been examined who assert that the demoralization which ensues from the gross and systematic evasion of this law, far more than counterbalances any good which may result from the slight effect produced in somewhat diminishing intemperance. — I have, however, already entered into what may probably appear to be a too detailed consideration of the general subject of state intervention. I have been chiefly induced to do so because one of the most characteristic features of modern socialism is the growing tendency which it displays to demand state assistance, especially in the form of grants of public money to carry out social and economic reforms. These general remarks on government intervention will moreover render a not unimportant assistance in discussing various social questions. HENRY FAWCETT.

GRACE OF GOD. The majority of the kings of modern Europe, in public acts and on their medals or coins, have given themselves the title of kings *by the grace of God*, *Dei gratia rex*. This is the exact and complete formula of legitimacy and divine right. Formerly coins bore this device, *Sit nomen Domini benedictum*. In these four words the *Dei gratia rex* already existed in germ. Indeed, what other motive could Charlemagne or Philip Augustus have for blessing the Lord except for having made them kings? The Roman emperors, before Christianity, although their power was absolute, did not pretend to hold it by the grace of God. The principle on which it rested was not divine right, it was delegation by the people to which they appealed. In the twelfth century the legists of Bologna did not yet profess a theory different from that of the Institutes: "By the law *Regia* according to which the empire was constituted, the people yielded all their power to the prince." From this the jurist Theophilus concluded that "the prince is not only master of our property but even of our lives," which proves that even the most senseless despotism has always found defenders. — With Christianity appeared new ideas on the origin of power and the source of sovereignty. When Pepin was consecrated king by St. Boniface in 752, the character of royalty was changed. The king became the anointed of the Lord; an indelible sanction which came from heaven was given to his power. The person of the king was thenceforth as inviolable and sacred as that of the priest, and the prince had soon to accustom himself to place the origin of his right in the will of God. Beginning with Theodosius the Younger, the emperors of the east were anointed, their example was followed by the Visigoth and Frankish kings. But the theory of divine right which was to flow from this was formulated much later. — Under the reign of Charles II. in England Filmer became its interpreter. The following are the principal features of the system he invented, and which was reproduced afterward with more or less modifications by writers of the theocratic party. Hereditary monarchy in the order of primogeniture is alone conformable to the will of God; it is of divine institution; no opposing right can be invoked against the prince who possesses it *by the grace of God;* no human power can be arrayed against it. From this it follows that the monarch who holds his rights from Heaven alone, is absolute, and can not be bound to his subjects by any engagement, and that the promise which he gives simply expresses his present intention without binding him by any obligation. These absolutist doctrines were placed under the authority of the Holy Scriptures, which, however, appear to be rather opposed to them. Thus, in the Scripture God punishes the chosen people for having desired a king; and in the history of the Hebrews the order of primogeniture is far from being rigorously observed; we find that the youngest brothers are by preference the object of divine protection. Isaac was not the eldest son of Abraham, nor Jacob of Isaac, nor Judah of Jacob, nor David of Jesse, nor Solomon of David. In polygamous countries little account is generally taken of the rights of primogeniture. As to the New Testament, Filmer could have found there no example favorable to his thesis. Neither Tiberius to whom Christ enjoined men to pay tribute, nor Nero whom St. Paul commanded men to obey, were monarchs by divine right. (See Macaulay's "History of England.") — Filmer's theory was not an isolated fact. Bossuet in France lent it the support of his eloquence and genius. This theory is found entire in these eloquent words. "To God alone belong glory, majesty, independence; he alone establishes thrones and destroys them; he gives his power to princes or withdraws it" The king, according to Bossuet, reigning by the grace of God, could not recognize an authority superior to his own, except the divine power itself, whose representative he is upon earth. — These words, *by the grace of God*, taken in themselves, would seem to express merely an idea of submission and respect, a pious invocation of the divine power. In truth, everything takes place by the will of God, but it is not in this sense and with this humility that the device appears in history; it has a more ambitious and haughty

meaning. It is the negation of the sovereignty of the people, it is the formula of a power "from which the people should endure everything, which can not itself be forfeited, no matter how senseless and incapable it may be, of a right which pretends to be superior to all rights, indefeasible, and which would be inviolable if all other rights were violated." (Guizot.) ÉMILE CHÉDIEU.

GRAHAM, William Alexander, was born in Lincoln county, N. C., Sept. 5, 1804, and died at Saratoga Springs, N. Y., Aug. 11, 1875. He was graduated at the university of North Carolina, in 1824, studied law, was a whig United States senator 1840–3, governor 1845–9, secretary of the navy under Fillmore 1850–53, and was the whig candidate for vice-president in 1852. (See WHIG PARTY.) He was in the confederate states senate 1864–5. A. J.

GRANGER, Francis, was born at Suffield, Conn., Dec. 1, 1792, and died at Canandaigua, N. Y., Aug. 28, 1868. He was graduated at Yale in 1811, removed to New York, and entered state politics there as one of the anti-masonic leaders. He was the anti-masonic candidate for governor in 1830 and 1832, and was the whig candidate for vice-president in 1836. (See ANTI-MASONRY, I.; WHIG PARTY.) He was a whig representative from New York 1835–7 and 1839–43, and postmaster general under Harrison. A. J.

GRANGERS (IN U. S. HISTORY), the popular name for "The Patrons of Husbandry," a secret association devoted to the promotion of the interests of agriculture. Its formation dates from Dec. 4, 1867, but for several years its organization spread very slowly from Washington, its birthplace. Its general development fairly began in 1872, and before the end of the year 1875 it numbered about 1,500,000 members in every section of the Union. — The secret machinery of the order corresponds very closely to that of the freemasons. The lodges are called "granges," *i. e.*, farms, whence the popular name of the order; but both men and women are admitted to membership. There is a state grange for each state, and a national grange for the whole Union. There are four degrees in subordinate granges, one in the state grange, and two in the national grange, the last three being named, respectively, Pomona, Flora and Ceres. — "No grange, if true to its obligation, can discuss political or religious questions, or call political conventions, or nominate candidates, or even discuss their merits in its meetings." Though the order is thus fundamentally non-political, it has been extremely difficult to keep it free from political influences. Its extent is a standing temptation to designing politicians, and its aim to cheapen transportation has a constant tendency to carry it into a *quasi* political warfare against railroad corporations. Its leaders have, indeed, been very successful in keeping its organization out of politics, but its success in other respects has taught the farmers of many of the northwestern states the virtues of organization and has caused the temporary formation of "farmers' parties," particularly during the stagnant period of national politics, 1872–5. — See Appleton's *Annual Cyclopædia*, 1873, 622; Kelley's *Origin and Progress of the Patrons of Husbandry* (1875); Martin's *History of the Grange Movement* (1875); Smedley's *Manual of Jurisprudence of the Patrons of Husbandry* (1875); Carr's *Patrons of Husbandry on the Pacific Coast* (1875).

ALEXANDER JOHNSTON.

GRANT, Ulysses S., president of the United States 1869–77, was born in Point Pleasant, Clermont county, Ohio, April 27, 1822, was graduated at West Point in 1843, served with credit in the Mexican war, and in the war of the rebellion rose to the chief command of the armies of the United States. Aug. 12, 1867, he was appointed secretary of war *ad interim* by President Johnson, and Jan. 14 following he gave the position up to Stanton, when the senate disapproved the latter's removal. (See IMPEACHMENTS, VI.) In the following June he was nominated for the presidency, was elected in November, and was re-elected in 1872. (See REBELLION; REPUBLICAN PARTY; ELECTORAL VOTES; RECONSTRUCTION; INSURRECTION, II.) He was a candidate for renomination in the republican convention of 1880, but was not nominated. (See GARFIELD, J. A.) — When Grant was first nominated and elected he had no known political opinions and no experience in civil administration. Neither of the lacking qualifications, however, was demanded in 1868; the country only desired a president who could hold taut the length of rope that had been gained, keep the peace between the lately warring sections until politics should settle back to their ordinary level, and take care that in this process the results of the war, the abolition of slavery in every form, negro suffrage, and the equality of races before the law, should not be lost. For these purposes Grant represented very exactly both the needs and the desires of a majority of the qualified voters of the country. On the one hand, his kindly and considerate treatment of Lee and his surrendered soldiers, and his report to the president in 1865 on the condition of the insurrectionary states, showed that he had no vindictive feelings toward the conquered; and on the other hand, his calm and unswerving obstinacy, as it had often been tested in the field, marked him as a man who would not be likely to vacillate before any show of opposition to the laws. On the whole, the result justified the wisdom of the popular selection; indeed, a wiser president would probably not have succeeded so well. — Since 1874–5 the case has been very different. The very characteristics which in 1868–70 made Grant a very useful president, have since then made him an anachronism in politics. Nevertheless, a strong faction of the republican party has always been desirous to raise him again to the presidency, in

spite of the blunders and scandals of his second term of office. For these latter and notorious evils, however, his civil inexperience, not his personal character, is to be blamed, and his last annual message, Dec. 5, 1876, very fairly states the case, thus: "Mistakes have been made, as all can see and I admit, but it seems to me oftener in the selections made of the assistants appointed to aid in carrying out the various duties of administering the government — in nearly every case selected without a personal acquaintance with the appointee, but upon recommendations of the representatives chosen directly by the people."— See Badeau's *Military History of Grant;* Coppee's *Life of Grant;* Dana and Wilson's *Life of Grant;* Chesney's *Essays in Military Biography;* Young's *Around the World with Grant;* and authorities under articles referred to.

ALEXANDER JOHNSTON.

GREAT BRITAIN. The official designation is "The United Kingdom of Great Britain and Ireland." The greater island was known in Cæsar's time as Britain, a name of prehistoric (probably Iberian) origin and uncertain meaning. The inhabitants were called Britons by their Roman conquerors, but called themselves Kymrý; their English conquerors afterward called them Welsh, or "strangers." Another ancient name of Britain is Albion, a word of Celtic origin, meaning "hilly," and kindred with the names of the Alps, Albania on the eastern shore of the Adriatic, and Albany, an ancient epithet of Scotland. The island is supposed to have taken its name Albion from the cliffs of Dover visible from the opposite Gaulish coast. The northern part of the island was known to the Romans as Caledonia, a Celtic name of disputed meaning; but it acquired its name of Scotland from the Scots, an Irish tribe which early in the Christian era obtained possession of the western highlands. Ireland itself, Ierne, or Hibernia, is simply "the western land." From the fourth century to the tenth, Britain was overrun and occupied by successive swarms of invaders from the northern coast of Germany, from Denmark, and from Norway. The German tribes were known chiefly as Angles, Saxons, Jutes, and Frisians. The Angles, coming from a little district called Angeln, on the Baltic coast of Sleswick, were much the most numerous, and at last gave their name to the new home, Angleland, or England, although it was first under a Saxon king that the various parts of the country were united into a great kingdom. Of these tribes the Jutes and Frisians settled mainly in Kent and the Isle of Wight; the Saxons settled in the south and centre of the English territory, and the Angles in the east and north, as far as the site of Edinburgh. The Danes and Norwegians, coming later, effected settlements on the east coasts of England and of Ireland, and on the northern coasts of Scotland. In the course of these centuries of invasion, the ancient British population of Britain was largely forced into the western districts—into Cumberland and Lancashire, Wales and Cornwall, and into Brittany, the northwestern peninsula of Gaul. The various tribes of North German invaders, under leaders bearing now the title of kings, now simply that of *ealdormen* or earls, founded many petty kingdoms in Britain, some of which corresponded nearly in outline to modern shires or counties. But the title "king" in those days did not mean the ruler of a specified territory; it meant the principal chief of a particular tribe of men. At various times there were kingdoms of the Northumbrians, or "people north of the Humber"; of the Mercians, or people on the *March* or western border against the Welshmen; of the East Angles, of the East, Middle, South and West Saxons, and of the Kentish men or Jutes Modern authors used to speak of a *heptarchy*, or system of seven Teutonic kingdoms in Britain; but the expression is inaccurate, as there were never at any one time seven regularly organized states, and at some times the number of fluctuating divisions amounted to ten or eleven. The relations of these states were those of chronic warfare. Sometimes one king gained a temporary supremacy over all his rivals, and then called himself Bretwalda, or "wielder of Britain," but this did not mean that he was king over the whole country, in the modern sense; it only meant that the other kings owed him, for the time being, an indefinite homage. In the first half of the seventh century Northumbria took the lead among these little kingdoms; in the following half century the lead passed to Mercia; at the beginning of the ninth century the first place was decisively taken by Egbert, king of the West Saxons, but England can hardly be regarded as constituting a single kingdom until the reign of Edgar, 959–75. Since the time of Edgar, England has always been under a single government—an instance of political stability to which the history of the rest of the world has hitherto afforded no parallel—but its boundaries have in one instance been enlarged, namely, by the conquest of Wales under the great king Edward I., in 1283. Scotland was also conquered by Edward I. in 1296–8, but regained its independence in the following reign, the work being completed by Robert Bruce at Bannockburn in 1314. At the death of Elizabeth in 1603, the crown of England passed to the king of Scotland as next of kin, and for another century the two kingdoms remained distinct and independent, with one king, but with two parliaments, one at Westminister and one at Edinburgh. In 1706–7 Scotland was united to England, and began to be represented in the parliament at Westminster in such manner as will be shown below. At this time, therefore, the "United Kingdom of Great Britain" began its formal existence. The conquest of Ireland was attempted as early as 1170, in the reign of Henry II., by Richard, earl of Pembroke, surnamed "Strongbow"; and Ireland indeed continued thereafter nominally subject to the king of England. Yet the conquest of Ireland

can hardly be said to have been accomplished earlier than the reign of Elizabeth, and it was first really carried to completion by Oliver Cromwell. Though subject to the English crown, Ireland retained its independent legislature until 1801, when it was formally united with Great Britain, and began to be represented in the parliament at Westminster. So the formal existence of the "United Kingdom of Great Britain and Ireland," strictly speaking, begins with the beginning of the nineteenth century. — The total geographical area of the United Kingdom is about 122,161 square miles, divided as follows: England, with Wales, 58,311; Scotland, 31,326; Ireland, 32,524; total, 122,161. In other words, the area of England with Wales is almost exactly equal to that of the New England States, omitting Vermont; or to that of the state of New York with Vermont added; or to that of the state of Georgia. The area of either Scotland or Ireland alone is a little less than that of the state of Indiana. The area of Great Britain without Ireland is equal to that of the six New England states with half of New York added. The area of the United Kingdom is equal to that of the four states of Vermont, New York, Pennsylvania and New Jersey. The greatest length of Great Britain, from its southwest corner at Land's End to Duncansby Head, where John o' Groat in the reign of James IV. built his celebrated ferry-house on the beach of the Pentland Firth, is about 600 miles. Its greatest width, along the south coast, is 320 miles; its least width —say from Kincardine on the Forth to Dumbarton on the Clyde—is less than 30 miles. The greatest length of Ireland is 300 miles, and crosswise from Carnsore Point to Erris Head it measures about 200 miles. The higher mountains of Great Britain rise in the west of the island, so that most of the rivers belong to the North sea drainage. The largest of these, the Thames, draining an area about equal to that of the state of Connecticut, and possessing a tidal upflow for 60 miles from its mouth, makes London practically a seaport. The climate of Great Britain displays to a remarkable extent the effects of maritime situation. While the parallel of London runs through Labrador, the summers are not only much cooler, but the winters are much less severe, than in any part of the northern United States. In January the thermometer in London seldom goes below 32° Fahrenheit, while in July it seldom goes above 80°. — The population of the United Kingdom during the following decennial periods is shown in the table below:

YEARS.	England and Wales	Scotland.	Ireland.	Total
1820	12,172,664	2,091,521	6,801,827	21 066,012
1830	14,051,986	2 364,386	7,767,401	24,183,773
1840	16,035,198	2,620,184	8,175,124	26,830,506
1850	18,054,170	2,888,742	6,552,385	27,495,297
1860	20,223,746	3,061,251	5,764,543	29,049,540
1870	22,704,108	3,360,018	5,402,759	31,466,885
1880*	25,480,000	3.661,000	5,361,000	34,505.000
1881*	25,789.922	3.695,456	5,294,436	34,779,814

* Approximate.

It will be seen that the population of England has nearly trebled since the beginning of the present century, and that the population of Scotland has more than doubled; while, on the other hand, the population of Ireland remains the same as at the beginning of the century, the natural increase having been drawn off by emigration. The rate of increase in Great Britain, though very small compared to that of the United States, has been greater than that of any other European country. England is more densely populated than any other country in the world excepting Belgium. The population of England is 437 to the square mile, whereas that of Massachusetts, the most densely peopled state in the American Union, is 225 to the square mile, and that of China proper is about 300 to the square mile. At the beginning of the reign of Edward III., in 1327, the population of England is estimated to have reached 4,000,000; but in 1348 and the following years the terrible plague known as the Black Death, destroyed half the population, reducing it to about 2,000,000. Toward the end of Elizabeth's reign the population had reached about 5,000,000. In 1700 it was 6,045,008; in 1750 it was 6,517,035. — England is divided into 40 counties or shires, and Wales into 12; Scotland into 32 counties and 1 stewartry (Kirkcudbright, formerly administered by a royal steward with powers more extensive than those of a sheriff); Ireland into 32 counties, forming 4 provinces. Some of the English counties—as Kent, Surrey, Essex, etc.—correspond to old kingdoms; others being regarded as parts of old kingdoms, were known as *shires* or divisions; some, such as Durham, were ancient bishoprics. As these counties have all grown up historically, and not as the result of any arbitrary subdivision of the kingdom, they are extremely irregular in extent and in population. Yorkshire, the largest of the English counties, is forty times the size of Rutland, the smallest. In Ireland the four provinces—Ulster, Leinster, Munster, and Connaught—retain the names of ancient Celtic kingdoms, but the division into counties was made for administrative purposes after the English conquest. Three of the English counties—Durham, Lancaster and Chester—are called counties palatine, and in mediæval times their earls possessed peculiar prerogatives. — I. CONSTITUTION. In order to speak intelligently of the government of Great Britain, it is necessary to distinguish carefully between its two aspects, formal and practical. In form, the English government is a monarchy, in practice, it is a republic. That is to say, while the supreme governing power nominally resides in the hereditary sovereign, subject to specific constitutional limitations, in reality it does nothing of the sort; in reality the supreme governing power resides in the house of commons. It has been customary to speak of "king, lords and commons" as three estates of the realm, among which the powers or functions of government are subdivided; but this is a mistake. The powers

and functions of government in England are not subdivided between three estates of the realm, but they are concentrated in the house of commons. The house of lords may protest against a given decision of the commons, but has no power to reverse it; and the sovereign has in reality no veto power whatever, not even such power of protest as is possessed by the lords. As Mr. Bagehot forcibly observes, the queen "must sign her own death-warrant if the two houses unanimously send it up to her." Yet in the view of the law, and in common parlance, the sovereign is the source of all government in England. Though not possessed of legislative power, the sovereign is often spoken of as the executive; yet it is only by a palpable legal fiction that the sovereign of Great Britain can be regarded as the executive. The executive power really resides in a body unknown to English law, in a committee of parliament generally called the cabinet; and principally in the chairman of that committee, generally known as the prime minister or premier, though his official designation is usually "First Lord of the Treasury." — Viewed in this way, stripped of the legal fictions which result from its peculiar historic development, nothing can be simpler than the actual working of the English government. A house of commons is chosen by the people. The recognized leader of the party which wins the election is appointed (nominally by the crown, but this is a mere form) to conduct the government and to form a cabinet. So long as this government is supported by the votes of a majority of the house, it continues in office. When it ceases to be supported by the votes of a majority of the house, two courses are open to it. On the one hand, the prime minister and his cabinet may resign, and thus make room for a cabinet of the opposite party; or, on the other hand, the prime minister may dissolve the house of commons and order a new election, in which case, if his party returns a majority of members he continues in office, but if it fails to do so, he resigns at once. In this way, anything like a deadlock between the legislative and executive powers is rendered impossible. In this way the final authority in every disputed question rests with the house of commons. For though the prime minister may refuse to recognize as final the decision of a particular parliament, he can only do so through dissolving that parliament and ordering the election of a new one, and to the verdict of this election he must submit. But, although there must be a new election of parliament at least once in seven years, so long as the party of a given prime minister continues to return a majority of members so long may he continue in office, be it for half a century. In its practical working, therefore, the English constitution has this peculiar excellence, that the supreme executive power is entrusted to a minister who may be kept in office as long as he is satisfactory to the people, but can instantly be removed, without disturbance of any sort, the moment any feature of his policy is seriously disapproved by the people. And if there be room for any doubt as to whether the conduct and policy of the chief executive magistrate are satisfactory or not, the question can be settled at any time by a direct appeal to the people. — It is common in the United States to speak of the secretary of state as our "prime minister" or "premier," but nothing could well be more absurd. The American secretary of state answers to the British secretary of state for foreign affairs; there is nothing in his position or in his functions which is in any way analogous to the position or the functions of the British premier. But in many respects the American president answers to the prime minister. He is unlike the prime minister in that he acts in his own name, in that he is not a member of the legislative body, and in that his term of office is arbitrarily limited by the constitution. But he is like the prime minister as being the chief executive magistrate for the time being. — It was said above that the house of lords has no power to reverse a decision of the house of commons. There is no possibility of a real deadlock between the two houses. In point of fact, a bill which has passed the commons may be defeated in the lords, but whether the commons accepts such a veto or not depends entirely upon the strength of its determination and of its interest in the bill. When the commons has finally made up its mind, the lords must sooner or later submit. In case the lords were to persist in opposing the will of the commons, the lord chancellor would be authorized to commission a sufficient number of new peers to "swamp" the upper house. This prerogative is something to be used only with reluctance and as a last resort, and it has not actually been used since the reign of Anne, but the knowledge that it can be used constitutes a sufficient check upon the house of lords. In 1832 the government was prepared, if necessary, to secure the adoption of the reform bill by the creation of eighty liberal peers; and the knowledge of this fact at last caused the lords to withdraw their opposition to the bill. In the reign of George I. an attempt was made to take away this prerogative of creating new peers (technically supposed to be a prerogative of the sovereign), but it was evidently fortunate for the peers as a legislative body that the attempt was unsuccessful. The continuance of the independent existence of the house of lords is favored by its manifest inability to obstruct seriously the course of legislation, while as a revising and criticising body it has often been found of great service. In like manner the continuance of the English monarchy is favored by the fact that the sovereign has come to be merely an ornamental part of the governing organization, without the power of doing serious mischief. In many instances, indeed, the sovereign is useful as the theoretical source of "prerogatives" that derive their practical value only from being exercised by a responsible ministry with the approval of the majority of the house of commons. — This unquestioned supremacy of the

commons in the English government is of modern growth. We can hardly refer it to a period back of the revolution of 1688, at which time, as we shall see, cabinet government, in the strict sense of the term, had its beginnings. Yet back of that time, and far back in the middle ages, it is not so much true that the ultimate governing power did not reside in the commons as that it was more or less uncertain where it resided. In Plantagenet times it was to some extent true—as it is not at all true to-day—that the sovereignty was shared between "king, lords and commons." To determine precisely where the ultimate authority resided, and in what ways it might constitutionally exert itself, required several generations of discussion and more or less of hard fighting. England has never at any time, save for five years under Cromwell, been governed despotically; at no time has the sovereign been able to override the laws, save now and then through the subserviency of the judiciary, which was one great curse of the Tudor and still more of the Stuart times. The gradual dissolution of the feudal system, which resulted in the temporary establishment of despotic government all over the continent of Europe, resulted in the firm establishment of a free popular government in England. Many circumstances conspired to bring about such a result, but one of the most important was the conquest of the kingdom by the Normans. The accession of William the Conqueror was marked by a tendency toward centralization such as at that time characterized no other kingdom in Europe, but this centralization was achieved at the expense of the nobles, not at the expense of the common people. The old English nobility, through manifold acts of confiscation, was pushed down into a subordinate position in the social and political scale; while the new Norman nobility, through the very circumstances of its creation, was unable to assert such an independence of the crown as was asserted until nearly the end of the middle ages by the nobility of France and other continental countries. The king's authority, through his sheriffs and lord lieutenants, penetrated, with more or less efficiency, into every county. Instead of tyrannizing over the common people, and making war on the king, each in his own interest, the nobles were obliged to court the aid of the yeomanry and burghers, and, when they opposed the crown, to do so in an organized body and for the acquirement of certain permanent legal rights which under the circumstances they must needs share with the yeomanry and burghers who were their allies. Such was, in rough outline, the general character of the relations between "king, lords and commons" during the great formative period of English constitutional history between the Norman conquest and the accession of Edward I. Its most important feature was the alliance between the nobles and the common people, which resulted from the weakness of the nobles relatively to the crown, and which was consummated during the thirteenth century in the rebellion organized against Henry III. by the barons under Simon de Montfort. It was in the course of this struggle that the house of commons, as an independent legislative body, originated. The oldest English sovereigns—the kinglets over such little realms as Kent or Essex—used to hold consultations with their "elders" or nobles, after the fashion of Homeric kings, while the crowd of "churls" or common people stood about and listened, and signified approval or disapproval by cheers or groans, or by clashing their weapons. But after there had come to be one king over all England, the common people could not all come to hear his consultations with the nobles, and rattle their spears or quarter-staves; and so the *parliaments* or meetings for "talking" public business came gradually to consist only of the king and such great nobles as he thought it worth while or felt obliged to invite to come and discuss public affairs with him. In the days of the united monarchy before the Norman conquest, such meetings of king and nobles were called "*witenagemote*" or "meetings of wise men." But though the common people—the yeomen and burghers—had given up the practice of attending such royal meetings, they never quite gave up the practice of attending county meetings. When it had become manifestly impracticable for all the freemen in a county to attend in a body, they hit upon the device of sending representatives. Each township sent to the county assembly its "reeve" or principal magistrate, accompanied by "four discreet men." This had become a time-honored custom long before the thirteenth century, and so when Simon de Montfort wished to increase the strength of the popular party espoused by the barons, he had a precedent for a representative assembly all ready to hand. In 1265 Earl Simon called together a parliament in which the peers sat in person as heretofore, while each town sent two elected citizens and each county sent two elected "knights of the shire." And these elected citizens or burghers, and knights of the shire, sitting and voting separately from the body of peers, formed the first real house of commons. —The tendency to an alliance of interest between the nobles and the commons, which early brought forth such sound practical results, was further increased by a circumstance of which the importance in English history can hardly be overrated. In the countries on the continent of Europe the children of nobles were always regarded as themselves noble; nobility came to them as a birthright, and in the absence of any common legislative dealings between the nobles and the common people, this circumstance went far toward bringing about an entire separation of feelings and interests between the two classes. It tended toward the creation of a *caste* of nobility, destitute of sympathy with the common people. Such a caste, in France for example, could go so far as to compel the non-noble caste to pay all its taxes for it. But in England there has never been a noble *class*, as such. After the Norman conquest only those persons

came to be regarded as peers whom the king summoned to attend his great council or witenagemot. Other people might possess great wealth or importance, but until summoned to the witenagemot they were not politically distinguishable from the mass of commoners, they were not regarded as peers. By degrees the right to be summoned to the great council came to be regarded as hereditary in certain families through long usage; but as the thing which was inherited was simply the right to occupy a legislative office, it could not belong to more than one member of a family at a time, at least as a matter of mere inheritance. Hence the children of a peer have always been commoners, and only one child at a time has been able to reach the peerage merely through inheritance. This state of things has from the outset thrown an active and influential set of people into the house of commons, giving to that body a weight and importance which in mediæval times at least it could not possibly have acquired in any other way. And through the legislative co-operation thus ensured between plain country gentlemen and city merchants on the one hand, and the heirs of noble families on the other hand, it has prevented anything like a determined hostility between the two houses of parliament, and greatly increased their ability to limit and define the prerogatives of the crown. One of the most conspicuous facts in English history is the harmonious way in which the two houses have worked together; and it is a fact to which elsewhere in European history we find no parallel. At first, as might have been expected, it was the commons that generally followed the lead of the lords; but it was inevitable that in course of time this relationship should be reversed. As the so-called lower house represented not only the inhabitants of the chartered towns, but also the great majority of landed gentry and yeomanry—the whole nation, in short, with the exception of the personal holders of hereditary or official seats in the upper house—it was inevitable that such an assembly should gradually draw into itself all the real governing power of the state. — In the thirteenth and fourteenth centuries the power of parliament was perhaps almost as great as at the present day when fairly brought to a final test, but it was far more liable to encounter resistance on the part of the crown As Mr. Freeman observes, "the ancient parliaments demanded the dismissal of the king's ministers; they regulated his personal household; they put his authority into commission; if need be, they put forth their last and greatest power and deposed him from his kingly office. In those days a change of government, a change of policy, the getting rid of a bad minister and the putting a better in his place, were things which could never be done without an open struggle between king and parliament, often they could not be done without the bondage, the imprisonment, or the death, perhaps only of the minister, perhaps even of the king himself. The same ends can now be gained by a vote of censure in the house of commons; in many cases they can be gained even without a vote of censure, by the simple throwing out of a measure by which a ministry has given out that it will stand or fall." — The political events of the fifteenth century tended to increase the power of the crown at the expense of parliament; but in such a way that the influence of the lords suffered much more diminution relatively than that of the commons. From the earliest times it has been one of the most fundamental principles of the English constitution that the king can levy no tax save with the consent and by the authority of parliament. And this principle has at all times prevented the crown from becoming independent of parliament. At all times, indeed, the crown has possessed certain sources of revenue, established by immemorial custom, and not liable to be interfered with by parliament. In Blackstone's Commentaries, book i., chap. viii., these sources of revenue are fully described under the head of the king's "ordinary revenue" Among these sources were divers fines and aids connected with the bestowal of ecclesiastical preferments, escheats and confiscations of property, and such minor matters as deodand, treasure trove, flotsam and jetsam, etc. But in ordinary times all these sources of revenue were insufficient to maintain the crown in independence, or to enable it to carry on the work of administration without calling upon parliament for aids and subsidies. And the granting such aids and subsidies, which had to be raised by taxation, naturally fell into the hands of the commons as representatives of the nation at large. During the great wars of Edward III. and Henry V. the crown would have been powerless for want of pecuniary resources but for the aid of the commons. If a public policy proposed by the crown were disapproved by the nation at large, it could be frustrated by a refusal on the part of the commons to grant supplies; and it is no doubt ultimately through this control of the public purse that the house of commons has come to be the supreme power in the government. — But during the fifteenth century the power of parliament in both its houses received a shock through that terrible series of struggles known as the wars of the roses. These wars during a period of thirty years (1455–85) were carried on with an obstinacy and barbarity unequaled elsewhere in English history. The battles were distinguished for their enormous slaughter, that of Towton, March 29, 1461, having been probably the bloodiest battle ever fought on English soil. After each victory of either party followed a series of wholesale executions; such of the nobles as escaped death on the field were usually beheaded without mercy. So great was this slaughter that the first parliament of Henry VII. contained only twenty-nine lay peers. The old nobility, in short, was almost annihilated, both in person and in property; for along with the slaughter there went wholesale confiscations, and these confiscations added greatly to the disposable wealth of the crown. These events contributed

in various ways to enhance the royal power at the expense of parliament. In the first place, the peers newly created by the Tudor kings were for a time inclined to be subservient to the crown; and this tendency was aided under Henry VIII. by the dissolution of the monasteries, which at once withdrew thirty-six abbots and priors from the house of lords, and thus eliminated another source of opposition to the royal authority. In the second place, the available wealth of the crown was so far increased by escheats and confiscations that it became for a time to some extent independent of the house of commons; it became unnecessary to summon parliaments quite so frequently as before. In the third place, the effect of thirty years of anarchy was to arouse in the people a feeling of intense loyalty to the Tudor sovereigns as the guarantors of order and peace. And this feeling was strengthened by the curious uncertainty as to the succession which prevailed through the Tudor period. Throughout the sixteenth century the terrible memories of the civil war of the fifteenth made people unusually sensitive to the evils of a disputed succession. It was this feeling which caused some of the most atrocious acts of Henry VIII. and his daughter Mary to be condoned. This feeling went far toward making the Tudor parliaments more subservient to the crown than any others which have ever assembled in England. "Very different indeed," says Mr. Freeman, "from the parliaments which overthrew Richard II. and Charles I. were the the parliaments which, almost without a question, passed bills of attainder against any man against whom Henry's caprice had turned, the parliaments which, in the great age of religious controversy, were ever ready to enforce by every penalty that particular shade of doctrine which for the moment commended itself to the defender of the faith, to his son or to his daughters."—Nevertheless, even during the reign of Henry VIII., when the English government made perhaps its nearest approach to despotism, the importance of the house of commons was acknowledged by the persistence of the efforts made to corrupt it. The Tudor tyranny was scrupulously legal in form, and it has been truly said that "every deed of wrong done by Henry with the assent of parliament was in truth a witness to the abiding importance of parliament." One feature of the Tudor period was the continual and energetic interference of the government in parliamentary elections, and this alone shows that the assent of the commons was even in these times held indispensable. Still stronger illustration of this is shown by the creation of rotten boroughs, more especially in Cornwall, which we must be careful not to confound with such other rotten boroughs as Old Sarum. Many of the boroughs disfranchised by the great reform bill of 1832 had become "rotten" in a natural way, simply by being outstripped in rate of growth by adjacent towns. But besides these, many rotten boroughs were called into existence in the Tudor period by the government sending writs of election to petty places likely to return members who would be found subservient to the court. That the crown could not get along without the house of commons is shown by nothing more forcibly than by the very pains which it thus took to pack that legislative body. Nevertheless all such proceedings tended to impair the quality of the legislature and to weaken its authority; and it was clear that if English freedom was to be maintained, a constitutional struggle must arise, in which the independence of parliament must be asserted and the arbitrary tendencies of the crown checked. Such a struggle would no doubt have come before the end of the sixteenth century but for reasons which it is easy to point out During the first half of Elizabeth's reign the dread of a disputed succession, which had been so effective ever since the accession of her grandfather, was greatly enhanced by the fact that in case of her death without issue her probable successor would be the Catholic queen of Scotland, whose cause was supported by Philip II. of Spain, the most formidable enemy to popular liberty in all Europe. Until the overthrow of the Invincible Armada in 1588 the king of Spain was an enemy whose power of mischief it would not do to underrate. This state of things so thoroughly identified the interests of the people with the interests of the great queen, both before and after her magnificent triumph over Spain, that anything like a serious constitutional struggle between herself and her parliament was quite out of the question. Besides all this, Elizabeth was a woman of too much good sense and tact to get herself drawn into a quarrel about questions of authority and prerogative. After her death all was changed. It was clear that no future sovereign could afford to take such liberties with the constitution as the Tudors had done, unless endowed either with unusual shrewdness or with unbounded personal popularity, or both. But Elizabeth's successors had little shrewdness and little personal popularity. In foreign relations, while the cause of Elizabeth had been identical with that of England, on the other hand the Stuarts always contrived to favor just that line of foreign policy most calculated to alarm and disgust the English people. While the memory of the Armada was still fresh in the land, James I. ostentatiously cherished a perverse friendship for Spain; and in the latter part of the century, when Spain had ceased to be dangerous, and France under Louis XIV. had become the chief enemy to freedom in Europe, then James' grandsons showed even greater perversity in their criminal subservience to the French court. Thus, as the causes which kept the nation loyal to the Tudors no longer existed, it was natural that the great struggle which was to teach the sovereign hereafter to "know his place" should begin with the accession of the House of Stuart. By this time, too, the spirit of the old nobility had

grown up again in the new, and the united strength of lords and commons was as great, in relation to that of the crown, as it had been in the days of Richard II. The occasion for conflict, moreover, was precipitated by the impecuniosity of the Stuart kings. James I. and Charles I., without anything like the pecuniary resources of Henry VII., were much more anxious than Henry VII. to get along independently of parliament, and the larger part of the history of their reigns is the history of their attempts to raise money in unconstitutional ways. "Tonnage and poundage," "ship money," and other similar illegal exactions, combined with the persecution of the Puritans to bring about the rebellion which for a few years resulted in overturning the throne. The so-called commonwealth, which ensued, far from vindicating for the popular legislature its title to the supreme authority in the government, proceeded to overturn the legislature as well as the throne. The brief period of the commonwealth was in reality a season of anarchy, save during the briefer included period of Cromwell's supreme authority. The attempts of Cromwell to rule in connection with a house of commons were totally unsuccessful, because the constitution supplied no precedents adequate for determining the character of the relations between the two. In case of a conflict of policy the ultimate authority must rest with the party strongest for the time being, which in this instance was the lord protector as head of an invincible army. The brief rule of Cromwell, though deservedly glorious in English history, was a pure despotism with nothing constitutional about it. It was a despotism which did not deserve to last, which endured some five years only by reason of the transcendent ability and weighty character of Cromwell himself, but to which even Cromwell's greatness could hardly have sufficed to insure a much longer duration. The restoration of the monarchy, with all the constitutional precedents grouped about it, was really the only condition upon which the good work begun by the long parliament could be successfully carried on. The essential triumph of the Puritan rebellion was illustrated in the reformatory measures of the first parliament of Charles II., and it would have been even more complete but for the temporary reaction of feeling which the anarchical character of the commonwealth had brought about. For a moment the crown was once more associated in men's minds with peace and quietness, a feeling of which Charles and his brother proceeded to take advantage to defy public opinion. — The second revolution, in 1688, finally settled the question as to where the ultimate authority in the English government resided. It settled it in much the same way that it had been settled in 1399 by the deposition of Richard II., but this time the questions at issue had been much more definitely propounded, and the solution was much more unmistakable. The turning out of Richard had been a plain assertion of the right of parliament to make and unmake kings; but the turning out of James, coming as it did within forty years from the overthrow and execution of his father, showed that henceforth the king of England could keep his place on the throne only on condition of "governing by act of parliament." — This final and unmistakable assertion of the supremacy of parliament has been further illustrated by the growth of modern cabinet government, which took its rise in the revolution of 1688. Before William III., the kings of England had had ministers, but up to his time each minister had been regarded as the personal servant of the crown so far as concerned the discharge of the duties of his own office. Each minister was separately responsible before the law, but that kind of collective responsibility whereby the whole group of ministers assume or resign office together had not yet been established. It was not even necessary that the various ministers should belong to the same political party, or should hold similar views on great questions of public policy. Under William III. began the practice of insuring practical co-operation between the crown and parliament by means of total changes in the ministry; and from this beginning it has gradually come to pass that the change of ministry is determined entirely in accordance with the will of parliament, and not at all with reference to the will of the sovereign; and thus it has further come to pass that the real executive power in England no longer resides in the crown but in the cabinet. A conflict between crown and parliament, such as occurred in the seventeenth century, could not occur at the present time, since all the active power of the crown has passed into its representative, the cabinet — a representative agent which changes in personality as often as the parliamentary majority changes. The crown, as such, is in England a mere "survival"; and such reasonable prospect of permanence as it has is mainly due to the very fact that it has become a mere survival. Yet from a practical point of view it can hardly be doubted that the abolition of the monarchy to-day need not modify in any essential respect the already well-established operation of cabinet government in England. — This complete absorption of the executive power by the cabinet, with the concomitant complete dependence of each cabinet upon its parliamentary majority, has been brought about only by degrees. The change has been, so to speak, stealthy in its progress. It would be hard to say precisely when it was consummated. George III. — the last English sovereign whose will has really counted for anything in politics — had considerable influence in deciding who should be his ministers. His antipathy to the elder Pitt was effective in keeping Pitt out of the cabinet. George III. also took part in cabinet affairs himself. He was opposed to his own prime minister, Lord North, as to the desirableness of prolonging the war against the American colonies; and his obstinacy

was to some extent successful in prolonging the war. Nothing of the sort would be possible today. The opinions and wishes of the queen can not make the slightest difference as to the selection of Mr. Gladstone for prime minister or as to the passage of the Irish land bill. — But although we can not say precisely when this change was consummated, we may say that the most important date in English constitutional history since 1688 is unquestionably 1832, the year of the great reform bill. In that year was inaugurated a change whereby the house of commons has come to represent, much more truly than before, the whole English people. While the old "rotten boroughs" and "pocket boroughs" existed, although the vote of the commons determined what was to be the supreme law of the land, it was nevertheless possible and customary for the crown and the peerage, through corrupt influence upon the elections, to determine to some extent the composition of the house of commons. The year 1832 may be assigned as the epoch at which the supremacy of the commons became finally complete throughout all departments of the government. — For the composition of the so called lower house, and the changes wrought in it by the reform bills of 1832 and 1867, see HOUSE OF COMMONS. — II. FINANCES. For a certain number of public purposes, taxes are raised exclusively by local authorities without any action on the part of the general government. Among the more important of these objects of local taxation may be mentioned the maintenance of paupers, the repair of roads and bridges, the erection and care of prisons, insane asylums, and other public buildings, including parish churches, and the support of the police. All such expenses as these are provided in Great Britain, precisely as in the United States, by the various local governments. The amount of these expenses will be stated below under the head of local administration. — The finances of India and of the colonies are kept entirely separate from those of the United Kingdom. Not a penny from the revenues of these countries finds its way into the coffers of the imperial exchequer, nor is the British treasury in any way responsible for any of their expenses, except in certain special cases, as for example, where the imperial government guarantees a loan contracted by one of the colonial governments with the approval of parliament. The British treasury pays the salaries of the governors and other important officers in a few of the colonies; but in all the principal colonies these expenses are provided for by colonial taxation. From the beginning it has been a fundamental principle of British colonization that it should be self-supporting; and to this circumstance, no doubt, a considerable part of the extraordinary success of British colonization is due. At the same time, where military defense is concerned, the imperial government charges itself to a certain extent with the protection of the colonies, as well as with the maintenance of its dominion in India. — The first principle of taxation in Great Britain is that the government can neither raise any tax, nor expend a penny of the public revenues, except through a vote of parliament. This principle, which has always lain at the bottom of the English constitution as the ultimate practical guaranty of English liberties, was distinctly and formally acknowledged by the crown in the reign of Edward I.; and although English sovereigns—notably the first two Stuarts—have since then sought to evade it, their attempts have been unsuccessful. On the other hand, the initiative in levying taxes or in disposing of public moneys is never taken by parliament, but always by the cabinet, or nominally and in former times really by the crown. So strictly is this rule adhered to that the house of commons refuses to receive petitions soliciting any particular disposition of the public funds for any purpose whatever. If lobbying of this sort is to go on at all, it must go on with the ministry, not with the legislature. — The treasury department of the British government was in former times administered by the lord high treasurer an officer who ranked immediately after the two archbishops and the lord chancellor, as the fourth personage in the kingdom outside of the royal family. But this office became obsolete in the reign of Anne, and the treasury is now administered by a bureau or committee of five. The chairman of this committee, known as the "first lord of the treasury," is usually the prime minister, who has the general business of the government to superintend; so that, in point of fact, the especial charge of the business of the treasury is lodged with the second officer of the committee, who is known as the "chancellor of the exchequer." The other three members of the committee are of no especial account. Now and then it has happened that the same person has occupied the offices of first lord of the treasury and chancellor of the exchequer at the same time. This was the case with Sir Robert Peel in 1834 and with Mr. Gladstone in 1874; and both offices are held by Mr. Gladstone at the present time (1881); but in the nature of things such a union of two such onerous offices must be exceptional. All the five members of the treasury committee, as well as their two secretaries, must be members of parliament, and all go into or out of office together when there is a change of administration. It is the business of the chancellor of the exchequer to present each year to the house of commons his financial statement for the year just expired, and also his "budget" or estimate of receipts and expenses for the current year. The financial year in Great Britain ends on the last day of March, and the budget is usually presented to the house a few weeks later. In presenting the budget, the chancellor indicates what modifications, if any, the government proposes to make in the system of taxation for the ensuing year; and he usually makes out his estimate in such a way as to allow a margin of from two to three million dollars for incidental or unforeseen addi-

tions to the reckoned expenses. — 1. *Revenue.* The total revenue of the United Kingdom for the year ending March 31, 1880, amounted to £70,747,079, equal to $339,585,979. The chief sources of this revenue were. 1st, Custom house duties, £19,326,000; 2d, Excise tax, £25,300,000; 3d, Income and property tax, £9,230,000; 4th, Stamp duty, £10,316,103; 5th, Land and assessed tax, £2,670,000; 6th, Postoffice receipts, £3,330,000; 7th, Crown lands, £390,000; 8th, Miscellaneous, £184,976. These sources of revenue may be considered in detail. — 1st. Custom House Duties. Since 1845 customs duties have been levied only on imported goods, and the number of articles subject to duty has been greatly reduced. In 1841 the tariff list contained something like 1,200 articles; in 1881 it contained only eight, of which only five are of any importance, to wit: tea, yielding £4,016,319; coffee, yielding £216,925; wines, yielding £1,378,508; spirits, yielding £4,941,871; tobacco, yielding £8,596,757. The only other dutiable articles are chicory, cocoa and dried fruits. Customs duties are levied indiscriminately upon goods produced in British colonies and goods produced in foreign countries, and no distinctions are made with reference to the nationality of the ships from which goods are landed. The articles made dutiable are in the main articles which can not be produced in the United Kingdom. Where a dutiable article is produced in Great Britain, as in the case of spirituous liquors, it is subjected to an excise tax as nearly as possible equivalent to the duty. It will be seen, therefore, that the British tariff is devised simply for the purpose of raising revenue, and not at all for the purpose of what is called "encouraging native industry" by taxing consumers for the benefit of producers. The most important changes made in the tariff during the present century have been made by Sir Robert Peel in 1842 and 1845, and by Mr. Gladstone in 1853 and 1860. The results of these changes, as affecting the revenue derived from the tariff, may be seen in the following brief statement: In 1842 the total revenue from 1,200 articles was £22,523,000; in 1880 the total revenue from eight articles was £19,326,000. The custom house department is administered by a board of six commissioners holding office for life or during good behavior; this board is under the general direction of the treasury, and, more specifically, of the chancellor of the exchequer. Customs duties have in all ages been part of the revenues of the British government. In former times they were known by the epithet "tonnage and poundage," the tonnage duties being applicable to wines or spirits, and the poundage duties being analogous to what are now commonly known as *ad valorem* duties. — 2d. Excise. The principal articles subject to excise at the present day are spirituous liquors, beer, hops, chicory, and the sugar used in breweries. Besides this, the excise department receives a very considerable revenue from licenses, hackney carriages and cabs, and race horses. License taxes are levied on innkeepers, brewers, wine merchants and venders of beer and spirits, tobacconists, and grocers selling tea, coffee or pepper. A revenue is also derived from licenses for killing or selling game. During the past forty years a great many excise duties have been abolished, such as the excise upon salt, leather, candles, beer, vinegar, glass, soap and paper; yet the revenue derived from the excise has been increased, instead of being diminished, by these exemptions. — 3d. Income Tax. The income tax is levied upon incomes of £100 per annum and upward. The net yield of this tax is estimated as averaging £1,100,000 per penny; so that a tax of nine pence on the pound will yield a revenue of £9,900,000. The income tax is levied upon incomes derived from rent of land or houses or other real estate, from commerce or professional services, or from salaries. The income tax was first established by the younger Pitt in 1798. At the end of the Napoleonic wars, in 1815, when its annual yield was about £14,000,000, it was abolished; and was not again imposed until 1842, when a deficit of £10,000,000 having rolled up in the course of five years, Sir Robert Peel laid a tax of seven pence in the pound on incomes of £150 and upward, for three years. Incomes in Ireland were exempted from this tax. In 1845, in order to assist Sir Robert Peel in his projects of commercial reform, the tax was continued; and since then it has from time to time been continued by special legislation, for various specific purposes. In 1853 Mr. Gladstone extended the tax to incomes of £100 and upward, besides extending its operation to Ireland. This arrangement was intended to last only until 1860; but the Crimean war intervening in 1854, it was found necessary not only to prolong the period of the tax, but to increase its rate even to sixteen pence in the pound. Since 1860, although the rate has been reduced to four pence, and although a tax of this kind is always and deservedly unpopular, the proper occasion for abolishing it altogether does not seem to have arrived. — 4th. Stamp Duty. Stamps are required upon all wills, bills of exchange, receipts, title deeds and policies of marine insurance. — 5th. Land Tax. This is a tax of four shillings in the pound, or 20 per cent. on the annual income of all landed property. These figures seem enormous, but are really moderate enough, since the valuation upon which the tax is assessed is the valuation of the year 1692, which is a merely nominal figure when compared with the present value of estates. Besides this, in the same group of taxes, come the taxes upon dwelling houses, upon domestic servants, private carriages and horses, and various articles of luxury. None of these taxes are levied in Ireland. — 6th. Postoffice Receipts. The postal service, in connection with the public revenue, was established by Cromwell in 1657, but its revenue-yielding function has always been regarded as entirely secondary to its function as a public convenience. In

1868 the telegraph lines throughout Great Britain were purchased by the government, and have since that time been operated by the postoffice department, greatly to the benefit of the public. Throughout Great Britain and Ireland every postoffice has a telegraph office connected with it, and messages are sent to any distance at a uniform rate of one shilling for twenty words. The revenue derived from this source amounts to about one-tenth of that derived from the carriage of letters; but this ratio constantly tends to increase, from which it may perhaps be inferred that the tariff will ultimately be diminished. — 7th. Crown Lands. These are landed estates forming, so to speak, the residuum of the ancient hereditary domain of the crown. They are now ceded to the state by every sovereign, at the moment of his accession, in consideration of an annual allowance granted him for life by parliament, and known as the "civil list.' The crown lands are administered by a special department, the commissioners of woods and forests. But these lands do not include the duchy of Cornwall, which is separately administered, and the revenue from which is assigned to the Prince of Wales, nor the duchy of Lancaster, whose revenues are paid to the queen. — 8th. The revenues from the sale of antiquated or worthless accoutrements of the army and navy, unclaimed arrearages of the national debt, contributions from the viceroyalty of India in partial reimbursement of expenses incurred by the imperial government on account of the military armament of India, dues or arrears paid in by foreign governments, *conscience money* (*i. e.*, anonymous remittances of uncollected taxes), and various other occasional, unimportant or unclassifiable receipts. — 2. *Expenses.* The national expenses of the United Kingdom may be considered under three heads: 1st, the consolidated funds; 2d, the public expenses of administration; and 3d, the national debt. The annual expenses of administration are provided for from year to year by special votes of the house of commons. Expenses relating to the consolidated fund, or to the liquidation of the national debt, are regulated by acts of parliament extending over an indefinite period, and remaining in force so long as they are not formally abrogated. — 1st. The Consolidated Funds. The yearly revenue, after having been paid in to the exchequer, is placed to the credit of the consolidated funds. Against this credit there are charged certain debits as follows. first, the regular interest of the national debt; then, the civil list, or annual endowment assigned to the sovereign; then, the expenses of the courts of justice, along with the salaries of certain permanent officers, such as the comptroller of the exchequer, and other matters which are not regarded as worth while to be rearranged at every parliament. All these charges are summed up as the regular annual charges against the consolidated fund. The surplus is applied to the public expenses of administration. — 2d. Public Expenses of Administration. Some time before the annual meeting of parliament, the heads of the different departments, after consultation with the lords of the treasury, prepare estimates of the probable expenses of the administration of their departments for the ensuing year. Four especial budgets are handed in: one for the navy, one for the army, one for the revenue department, and one for the civil service. The civil service is subdivided into departments, such as that of public works, law and justice, education, colonial and consular service, and charitable institutions; and besides all this, there is a section devoted to various temporary purposes. Down to the year 1863, moreover, a small sum was put at the disposal of the ministers for unforeseen expenses. But since 1863 this item has been provided for by a regular and permanent assignment of £120,000. The estimates are subdivided into articles, each article having reference to a special branch of expense. The amount assigned by parliament for the civil service of the preceding year is set down in a column by itself; and by the side of it are set down the corresponding estimates for the ensuing year; and these estimates are accompanied by very elaborate explanations concerning every detail of expense, however minute. Printed copies of these estimates are distributed to each member of the house of commons. After a while they are submitted to the committee of supply for examination, and the articles are then discussed and put to vote, one after another. After a certain number of articles have been adopted, an act is passed authorizing the lords of the treasury to apply a certain proportion of the public revenue to the purposes assigned by vote of the house of commons. This act is called the "ways and means act." The gross amount specified in this act can never exceed the amount of the sums already appropriated by the committee of supply. Several acts of ways and means are ordinarily passed in the course of each session, in accordance with an old constitutional tradition whereby enough money is to be granted during the sitting of parliament to prevent any delay in public business, without putting into the hands of the crown enough funds to enable it to dispense with parliament. Thus are the financial proceedings of the house of commons still affected by reminiscences of that family of Stuart kings whom it was not safe to trust with money! At the close of the session a general act of ways and means is passed, recapitulating all these minor acts, and authorizing the lords of the treasury to appropriate the revenue in general as therein assigned. This general act is called the act of appropriation. In times of war, when it is impossible to foresee exactly the characters and amounts of all the expenses that may be found necessary, it is customary to pass a "vote of confidence," allowing the government several millions sterling in order to provide for extraordinary war expenses. Funds granted in this way can not be appropriated for any purpose that is not immediately connected with the war going on at the time. If the government

turn out to have need of any further funds, parliament must be summoned and demand made for a further credit. — A few words concerning the practical operations of the exchequer will here be in place. All the revenues collected are paid into the exchequer, from which no funds can be withdrawn except by order of the comptroller of the exchequer, an officer of high rank and independent position, who can be removed from his post only after an address presented to the crown (that is, to the prime minister) by both houses of parliament. Whenever an order for money is presented to the exchequer, it is the business of the comptroller to see that the object for which the money is drawn is one of the objects which have been authorized by parliament, and that the amount demanded falls within the limits of the credit allowed by the house of commons for this specific purpose. The comptroller can not himself draw any money whatever from the exchequer; he can only order the bank to charge moneys to the credit of a third party whom he designates. Most of the demands on the public funds of the interior are made by the paymaster general, who advises the treasury daily of the sums which he is intending to draw on the following day, and of the several accounts to which they are to be charged. The treasury then authorizes the comptroller of the exchequer to give the paymaster the necessary credit, and the paymaster can then transfer this credit to his drawing account and proceed to make payment. His payments are made in various ways; small sums are paid in ready money at the paymaster's window, and larger sums by checks on the bank. Payments abroad are usually effected by means of orders on the treasury drawn by government officers resident abroad, and accepted on presentation by the paymaster general. Officers entitled to draw such orders are usually officers of the commissary department, and the orders are drawn on account of what is known as the treasury chest fund. This fund consists of about £13,000,000 coming from the accumulation of disposable balances of various sorts, and it furnishes a very convenient means for making disbursements in different parts of the world. The final check relating to the expenditure of the public revenues is furnished by the audit office. The bureau of audit consists of four commissioners who are removable only in the same way as the comptroller of the exchequer. Most of the public accounts are sent in to the audit office for examination, but the detailed accounts of the army and navy are revised by especial military comptrollers. The audit office does not approve an account unless it can be shown that the credits have been appropriated in strict accordance with the acts of ways and means. There are two different kinds of audit, one called the "detailed audit," the other known as the "appropriation check." So far as the first is concerned, the duties of the audit office consist in ascertaining whether each responsible person has expended legitimately the funds entrusted to him. Before each responsible person is set a statement of all the advances which have been made to him, and he is required to render an account of the manner in which he has expended these sums. This account is carefully examined item by item, and the commissioners require a full explanation of every obscure or doubtful point. If the explanations are unsatisfactory, the commissioners "disallow" the items to which they relate, and at last, after concluding their examination, they make their report to the treasury; and the treasury decides for itself in the case of disallowances whether it will accept or cancel them. The "detailed audit," however, only certifies that the accounts to which it refers are duly balanced, that there are vouchers for each payment, and that every payment has been duly authorized. The "appropriation check" goes farther than this, and by means of it the commissioners of audit indicate to parliament the exact sums that have been expended in every particular for which appropriations have been made, showing, moreover, whether the sums appropriated have been entirely expended. This second kind of audit is applied only to a few very important departments, such as the army and navy, and the public works. — The following tables show the total amounts of revenue and expenditure for the sixteen financial years 1866–81:

YEARS ending March 31.	Revenue			Proportion of Receipts Per Head of Population.
	Estimated in the Budgets.	Actual Receipts at the Exchequer	More (+) or Less (−) than Budget.	
	£	£	£	£ s d.
1866	66,392,000	67,812,292	+ 1,420,292	2 5 1
1867	67,013,000	69,434,568	+ 2,421,568	2 5 8
1868	69,970,000	69,600,218	− 369,782	2 5 6
1869	73,150,000	72,591,991	− 558,009	2 6 8
1870	73,515,000	75,434,252	+ 1,919,252	2 8 4
1871	67,634,000	69,945,220	+ 2,311,220	2 4 5
1872	72,315,000	74,708,314	+ 2,393,314	2 7 8
1873	71,846,000	76,608,770	+ 4,762,770	2 8 2
1874	73,762,000	77,335,657	+ 3,573,657	2 8 2
1875	74,425,000	74,921,873	+ 496,873	2 6 3
1876	76,625,000	77,131,693	+ 506,693	2 7 1
1877	78,412,000	78,565,036	+ 154,036	2 7 6
1878	79,146,000	79,763,299	+ 617,299	2 7 8
1879	83,230,000	83,115 972	− 114 028	2 9 2
1880	83,055,000	81,265,000	− 1,790,000	2 7 7
1881	82,696,000	84,041,288	+ 1,345,288	2 8 9

YEARS ending March 31	Expenditure			Proportion of Expenditure Per Head of Population.
	Estimated in the Budgets.	Actual Payments out of the Exchequer.	More (+) or Less (−) than Budget.	
	£	£	£	£ s. d.
1866	67,249,000	65 914,357	− 1,334,643	2 4 2

1868	71,287,000	71,236,242	− 50,758	2 6 6
1869	77,8.8,000	74,971,816	− 2,886,184	2 8 6
1870	68,498,000	68,864,752	+ 366,752	2 4 0
1871	69,486,000	69,548,539	− 62,539	2 4 3
1872	72,433,000	71,490,020	− 942,980	2 5 0
1873	71,663,000	70,714,448	− 948,552	2 4 5
1874	75,511,815	76,466,510	+ 954,695	2 7 7
1875	74,527,000	74,328,040	− 198,960	2 5 10
1876	76,741,000	76,621,773	− 119,227	2 6 10
1877	78,901,000	78,125,227	− 775,773	2 7 2
1878	85,669,000	82,403,495	− 3,265,505	2 9 3
1879	86,241,110	85,407,789	− 833,321	2 10 6
1880	85,999,871	84,105,754	− 1,894,117	2 9 3
1881	83,840,025	83,107,924	− 732,101	2 8 3

The expenditure for the financial years 1868 and 1869 included supplemental appropriations for the Abyssinian expedition, amounting to £5,600,000, and the expenditure for 1874 included the sum of £3,200,000 paid for the Alabama claims under the treaty of Washington. — During the whole period of sixteen years there has been an almost uninterrupted reduction of taxation, as may be seen from the following statement. In 1864 the taxes were *reduced* by £4,615,508; in 1865 by £3,235,384; in 1866 by £5,343,405; and in 1867 by £601,462. In 1868 they were *increased* by £1,285,000; and in 1869 by £1,450,000. In 1870 they were *reduced* by £2,735,670; and in 1871 by £4,497,343. In 1872 they were *increased* by £3,050,066. In 1873 they were *reduced* by £3,895,105; in 1874 by £3,327,380; in 1875 by £4,554,903; and in 1876 by £66,000. In 1877 they were *increased* by £1,549,050. In 1878 they were *reduced* by £6,000. In 1879 they were *increased* by £4,340,000. The increase in 1868 and 1869 was connected with the expenses of the Abyssinian expedition; that of 1877 was connected with extraordinary disbursements on account of the war between Russia and Turkey; and that of 1879 was connected with the war in South Africa. — The annual revenue derived from the income tax, the most important of the direct taxes, during each of the financial years 1870–81, was as follows.

YEARS ending March 31	Tax in £.	Annual Receipt.	Limitations.
	d.	£	
1870	5	10,044,000	On incomes of and above £100, with an abatement of £60 on incomes under £200.
1871	4	6,350,000	
1872	6	9,064,000	
1873	4	7,500,000	On incomes of and above £100, with an abatement of £80 on incomes under £300.
1874	3	5,691,000	
1875	2	4,306,000	
1876	2	4,109,000	
1877	3	5,280,000	On incomes of and above £150, with an abatement of £120 on incomes under £400.
1878	3	5,820,000	
1879	5	8,710,000	
1880	5	9,230,000	
1881	6	10,650,000	

—3d. National Debt. The largest branch of national expenditure is that for the interest and management of the national debt. The origin of the national debt goes back to 1694, when the bank of England loaned the government £1,200,000 at 8 per cent. interest, in consideration of certain chartered privileges which were secured to it at about that time. During the past hundred years the expenditure on account of the debt has increased more than fivefold. The debt is partly funded, partly unfunded. The holders of the funded debt can not demand the payment of the principal, but only the annual interest, while the holders of the unfunded debt can call for payment of principal as well as interest. The funded debt has been funded partly in perpetuity, partly in terminable annuities. The perpetual annuities are redeemable on payment of the principal which they represent; but in the case of most of them the government can not exercise its right of redemption without giving at least a year's notice. The unredeemed principal of the perpetual funded debt amounted in 1871 to about £731,000,000. Of the terminable annuities, some are the outstanding balances of annuities of which the term was originally fixed, while others are brief annuities created by the government in exchange for loans of money applied to the redemption of the perpetual funded debt; so that the creation of a terminable annuity in this way is a step toward the payment of the debt. — An attempt was made by Mr. Gladstone in 1853 to reduce the interest of a considerable portion of the debt to 2½ per cent.; but the attempt was unsuccessful. The principal feature of this plan was the issue of exchequer bonds bearing 2½ per cent. interest until 1864, and 2½ per cent. until 1894, after which the bonds should be redeemable at the pleasure of the government. These bonds were offered in exchange for bills of exchequer or for shares in the consolidated fund, but they were only taken up to the amount of about £400,000, and this was almost solely in exchange for bills of the exchequer. The arrears of the national debt are paid through the agency of the bank of England, which receives a commission upon the payments that it makes. Formerly so much importance was attached to the maintenance of a sinking fund for redeeming a certain amount of the debt each year, that loans were often made for the purpose of keeping it up. But the obvious futility of borrowing in order to pay the debt caused this sinking fund to be abolished. But by the provisions of an act of parliament of 1875, the national debt is now to be gradually reduced by means of a new permanent sinking fund, maintained by annual votes of the legislature. The charge of the sinking fund for the financial year ending March 31, 1876, was fixed at £27,400,000; for the following year at £27,700,000; and for every subsequent year at £28,000,000. It was also provided that the charges under this head should be entered under the consolidated fund.—The unfunded or floating debt comprises bills of the exchequer and bonds of the exchequer. There are various kinds of exchequer bills, distinguished as "supply bills," "deficiency bills," and "ways and means bills." Between the two latter kinds of bills there is a close analogy. The bills of ways and means serve as a guaranty for loans made at the bank in order to cover some deficit in the quarterly revenues designed for supplying the public service; and in just the same way the deficiency bills provide against slight deficits in the consolidated funds. These two classes of bills may be issued without special recourse to parliament, in virtue of the general authority given to the government for financial management. The supply bills of the exchequer are issued in virtue of a direct authorization by parliament. They are a kind of promissory notes, bearing an interest fixed from time to time by the treasury, and pay-

able at assigned dates. These notes are usually issued in March and June of each year, and they usually run for one year from the date of issue. They have most of the characters of bank bills, and are receivable in payment of the revenues for the year in anticipation of which they are issued. But formerly the sum of these bills in circulation would occasionally become too large to be redeemed under these conditions; and in such cases it was customary to authorize a new issue each year for the purpose of paying off the bills of the preceding year arrived at maturity. The inconvenience of this is obvious, and in 1861 a new system was introduced. Bills of the exchequer are now charged to the account of the consolidated fund. They are thus payable at the close of one year from the date of issue, but are only paid in case payment is demanded by the holders. If they are not presented for payment at the end of the year, they are payable at the end of the following year, and so on. The treasury is authorized to issue new bills in amount sufficient to replace those which have been paid on presentation. The holders of bills of the exchequer which have not more than six months to run may offer them in payment of taxes. The treasury has the right to fix the rate of interest on these bills, which can not, however, exceed 5½ per cent. per annum. The sum total of exchequer bills in circulation does not exceed £6,000,000, though formerly it attained a much higher figure.—Exchequer bonds are notes bearing interest and payable at specified dates. They are issued for periods of five or six years. The sum total of bonds in circulation twenty years ago was nearly £4,000,000, but has dwindled until it is now less than £1,000,000.—The following table exhibits the condition of the national debt from its origin down to the year 1881, at various periods:

PERIODS.	Principal of Debt.	Interest, and cost of Management.
	£	£
Debt at its beginning in 1694	664,263	89,855
Excess of debt contracted during reign of William III. over debt paid off	15,730,439	1,271,087
Debt at accession of Anne, 1702	16 394,702	1,310,942
Debt contracted during Anne's reign	87,750,661	2,040,416
Debt at accession of George I., 1714	54,145,363	3,351,358
Debt paid off during George I.'s reign over debt contracted	2,053,125	1,133,807
Debt at accession of George II., 1727	52,092,238	2,217,551
Debt contracted from 1727 till peace of Paris, 1763	86,773,192	2,634,500
Debt in 1763	138,865,430	4,852,051
Paid during peace, 1763–75	10,281,795	380,480
Debt at beginning of American war, 1775	128,583,635	4,471,571
Debt contracted during American war	121,267,993	4,980,201
Debt at close of American war	249,851,628	9,451,772
Paid during peace, 1784–93	10,501,380	243 277
Debt at beginning of French war, 1793	239,350,148	9,208,495
Debt contracted during French war until overthrow of Napoleon	601,500,343	22 829,696
Total funded and unfunded debt on Feb. 1, 1817, when English and Irish exchequers were consolidated	840,850,491	32,038,191
Debt paid from Feb. 1, 1817, to Jan. 5, 1836	53,211,675	2,894,674
Debt on Jan. 5, 1836	787,638.816	29,143.517
Debt on March 31, 1880	774,044.235	27.488.187
Debt, including terminable annuities and charge thereon on March 31, 1881	768,703,692	2 ,448,598

— During the fifteen years 1867–81, the capital of the national debt varied as follows:

YEARS ending March 31	DEBT.			
	Funded.	Terminable Annuities.	Unfunded	Total.
	£	£	£	£
1867	770,188.625	25.607 076	7 956,800	803,752 501
1868	741,844.981	53.258 874	7,911.100	803,014.955
1869	741,112,640	51,913,623	9,896,100	802.922,363
1870	741,514,681	49.667,479	6,761,500	797.943.660
1871	732,043,270	54,413 310	6,091,000	792,547.580
1872	731,756,962	52,286,775	5,155.100	789.198,837
1873	727.374,082	50 201.768	4.829,100	782,404,950
1874	723.514,005	48,021,178	4.479.600	776,017,783
1875	714,797,715	52,311.487	5 239,000	772.348 202
1876	713,657,517	49,078 792	11,401,800	774.138,109
1877	712.621,355	46,549,819	13.943,800	773,114 974
1878	710.843,007	43,644,057	20,603,000	775 090 064
1879	709,430.593	40.345.454	25.870.100	775,646 147
1880	710,476,359	36,222.976	27 344,900	774,044,235
1881	709,078.526	37,547,666	22,077.500	768,703,692

— The balances in the exchequer for the sixteen years 1866–81, are shown in the following table:

YEARS ending March 31	Balance in Exchequer.	YEARS ending March 31.	Balance in Exchequer
	£		£
1866	5,851,314	1874	17,442.854
1867	7,294,151	1875	6,265,322
1868	4,781,846	1876	5.119.587
1869	4,707,259	1877	5,988.650
1870	8,606 647	1878	6,243 389
1871	7,023.435	1879	6,915,756
1872	9,342,652	1880	3,273,428
1873	1,992,705	1881	5,923,662

— Parliament has at various times placed at the disposal of the government large sums to be loaned to private individuals or companies upon personal security, in order to facilitate the progress of works of national importance. Advances of this sort are known as "exchequer loans." They are made upon proper security, at a reasonable rate of interest, and are payable at specified periods. — III. Local Administration. The principal administrative division of the kingdom is the *county*, of which, as above stated, there are 52 in England and Wales, 33 in Scotland (including the "stewartry" of Kirkcudbright), and 32 in Ireland. The county of York is divided into three parts or districts known as *ridings*, a word which is probably a corruption of *trithing* or

"third." The principal county magistrates are the lord lieutenant, the sheriff, the justices of the peace, and the coroners. — *Lord Lieutenant.* This officer is appointed by the crown (*i. e.*, by the prime minister), and is chosen from among the principal noblemen residing in the county. He is assisted by one or more deputies whom he appoints himself, and who compose with him the lieutenancy of the county. He is the keeper of the rolls, and in this capacity takes part in the sittings of the justices of the peace. Down to 1871 he was commander of the militia, and appointed its officers, as well as those of the yeomanry and the volunteers; but in 1871 these prerogatives were transferred to the crown. — *Sheriff.* In ancient times the sheriff was elected by the freeholders of the county; but since the reign of Edward I. he is appointed annually by the crown. It is not permissible to refuse the position of sheriff, although no salary is attached to it and the office brings with it considerable expense; but the social consideration connected with the office is such that the principal landholders of the county are usually very desirous of obtaining it. The penalty, in case of refusal, is a fine of £600. An interval of three years must elapse between any two successive incumbencies of the same sheriff. The sheriff is charged with the maintenance of the public peace and the execution of the laws. He presides over elections, he is superintendent of jails, he arrests persons accused of crime or misdemeanor, he summons juries, and sees that judgment is executed. To assist him in the discharge of his duties he appoints a deputy sheriff, as well as bailiffs and jailors. The sheriff is not a justice of the peace, and can not take part in the sittings of these magistrates. The sheriff of the county of Middlesex is not appointed by the crown, but is elected by the citizens of London. — *Justices of the Peace.* The administrative functions of the ancient county courts have been passed down to the justices of the peace. These magistrates are nominated by the lord lieutenant in his capacity of keeper of the rolls, and are appointed by the lord chancellor. They must necessarily be residents in the county. Their numerous duties are performed in assemblies known as quarter sessions, petty sessions, and special sessions. The business transacted in quarter sessions is both judicial and administrative. As civil judges they decide appeals from decisions of the petty county courts; they decide upon questions relating to local taxation, licenses, and the practical administration of the poor laws. As criminal judges they have cognizance of petty crimes and misdemeanors, and may arrest persons or bind them over to keep the peace. Their principal administrative duties relate to the supervision of bridges and highways, prisons and asylums, and local police. They appoint the chief of the police, subject to the approval of the home secretary, and the chief appoints his subordinate officers, subject to the approval of the justices of the peace. An officer known as "clerk of the peace" who is appointed by the lord lieutenant, attends the sessions as secretary, and is charged with the execution of their decisions. The justices of the peace appoint a treasurer In order to facilitate the transaction of business, each county is divided into districts, and the justices resident in each district hold petty sessions, from which an appeal lies to the quarter sessions. The justices of the peace in quarter sessions also assess the county taxes in accordance with a uniform valuation of the taxable property in the county. The county expenses are chiefly incurred in the building and repair of bridges and highways, and of county court houses. These are all provided out of the general tax levied at the quarter sessions. A special tax is devoted to the maintenance of prisons and lunatic asylums. The local police is also supported in the main by the county, though a certain proportion, not exceeding one-fourth of the expense, is usually contributed by the national treasury. The various committees charged with the separate items of county affairs, such as the committee on prisons, the committee on buildings, etc., prepare an account of the expenses incurred in their several departments; and these accounts, together with the report of the treasurer, are submitted to the approval of a committee of finance appointed by the justices of the peace. — *Coroners.* The duties of the coroner are the same in Great Britain as in the United States. Though, as his title imports, he is *par excellence* the "crown officer" or representative of the crown, he is usually elected by the freeholders of the county. In some instances, however, he is appointed by the crown, or by the chief magistrates of certain cities. Each county has from three to six coroners. — *Cities and Boroughs.* These names are applied particularly to municipal corporations independent of the county, which retain, by virtue of a charter or of a special act of parliament, the power of self-government intact. Legislation regarding these corporations was summed up and epitomized in an act of 1835. A municipal corporation consists of a mayor, a board of aldermen, a common council, and citizens or burgesses. The citizens are all individuals having attained their legal majority who have occupied during three consecutive years a house, shop or office within the city, or who have their true residence within the city or within a radius of seven miles of it, and who have besides been enrolled as liable to the poor tax. The citizen list, or roll of burgesses, is publicly revised every year. The citizens elect the councilors, auditors and assessors. Councilors are chosen subject to a property qualification of not less than £500. No ecclesiastic can be elected councilor, nor can any one who is in receipt of a salary from the city. Councilors are elected for a term of three years. Aldermen are appointed by the common council, and hold office for a term of six years, and no one is eligible as alderman who is not eligible as councilor. The alder-

men preside at city elections, and one of them takes the place of the mayor in the case of his absence or death. The mayor is elected annually by the common council, and is taken indifferently from among the aldermen or from among the councilors. The mayor is *ex officio* justice of the peace during his year of office and the following year. In the municipal council his sole privilege is to preside at the meetings. The municipal council holds its meetings quarterly, and besides this, extraordinary meetings can be summoned by the mayor or by any five councilors. Two-thirds of the members of the council are required for a quorum. The council may make regulations for the city and ensure their observance by affixing fines not exceeding £5. Such regulations become effective only after having been posted for forty days at the entrance to the city hall, and after having been communicated to the home secretary. The council administers the municipal estates and revenues, and it has supervision over the local administration of justice, over prisons and houses of correction, and other local matters. Besides the council there are in every city certain officers which are either appointed by the council or elected by the citizens. The assessors and auditors are elected by the citizens, while the other officers are appointed by the council and hold office for life or during good behavior. Among these are the town clerk (who has charge of the charters and archives of the city, and prepares the electoral lists), the town treasurer, etc., etc. In most cities and boroughs there are county courts for the trial of civil actions, the extent of their circuit being prescribed by the lord chancellor. These courts have cognizance of all civil actions not exceeding £50 in value. At the request of any city, its magistrates may undertake the administration of criminal justice in petty cases, the expense being defrayed by the city. The principal expenses of cities and boroughs are expenses for lighting, water, repair of streets, and police. — *Parishes.* At the base of local administrative organization in Great Britain is found the parish. The ancient division of the county was into hundreds and townships, but these divisions at the present day have had their principal functions merged in or obscured by those of the county and the parish. At the head of each hundred there is an officer called the high constable, who was formerly elected by the freeholders of the hundred, but who is now appointed by the justices of the peace in quarter sessions. The duties of this officer have lost their ancient importance, and are now limited to the collection of taxes and the serving of writs. The word "town" has to a considerable extent departed from its ancient meaning. Towns which are not especially chartered as cities or boroughs have no distinct government as such, but for all administrative purposes make a part of the county in which they are situated. Nevertheless, neither the old townships nor the old free assembly of the township have disappeared, though both are disguised by a peculiar nomenclature. The change from the old *township* to the modern *parish* is in most instances merely a change of name; and the old *town meeting* survives in the *vestry meeting* of the parish. The vestry elects officers for the administration of parochial affairs, such as church wardens, commissioners of cemeteries, constables, overseers of the poor, and highway surveyors. The church wardens, of whom there are two in each parish, have charge of the repair of the parish church and of whatever secular business belongs directly to the church. They are paid from the revenues of the church; and before 1868, when their wages from this source were inadequate, a special tax was levied, known as the church rate, which could not exceed 5 per cent. of the annual revenue from the properties on which it could be laid. Since 1868 the payment of church rates has been made optional. Wherever there is a parochial cemetery, its administration is entrusted to a special committee, which provides for its expenses by a tax on burials. Whenever it is necessary to establish a new cemetery, or enlarge an old one, the committee may negotiate a loan, with the consent of the vestry. All country roads except turnpikes are kept up by the parishes, by means of a highway rate which is assessed in precisely the same manner as the poor rate. Petitions for the abatement of these classes of taxes may be heard by the justices of the peace in special or quarter sessions. Besides these obligatory charges, the vestry can undertake, at its own option, the service of the police and that of lighting the streets, the taxes for these purposes being assessed after the manner of the poor rates, except that properties consisting in buildings pay three times as much as lands. Besides these local services, there are others—such as public carriages, water supply, fire department, repair of town clocks, public baths, markets, etc.—which are sometimes discharged by the vestry, but perhaps more generally by local committees whose sphere of activity may extend over several parishes. The extent of the circuit of such local committees is determined by the home secretary, but the committees are responsible not to the national government, but to the parishes with which their work is concerned. — *City of London* The huge metropolis, with its population (in 1879) of 4,714,000, is technically known as the "Metropolitan District," and its current name is London. Properly speaking, however, the city of London contains hardly 100,000 of this vast population. The city contains 108 parishes, and is divided into 26 quarters or wards. The municipal government is vested in the council, consisting of the lord mayor, 26 aldermen, and 206 councilors. The lord mayor is elected annually by the council of aldermen and the assembly of guild masters, among the aldermen who have held the office of sheriff. Within the city the lord mayor takes precedence over the members of the royal family with the exception of the sovereign. He has the

prerogatives of a lord lieutenant, and besides his administrative functions he is the first justice of the peace for the city, and sits in several local courts. The aldermen are elected by the freeholders occupying houses of more than £10 rental. The common council can not contain more than eight members following the same trade. To be eligible as councilor it is necessary to possess, in one's own ward, a house of at least £10 rental. The common council is at once a legislative and an executive body. It regulates and alters the constitution of the city, without appeal to any other authority in the kingdom. It disposes of all the funds of the municipal corporation; and it appoints all the municipal officers whose appointment has not been reserved to the aldermen. Among the municipal officers the most important is that of the *recorder*, who is elected for life by the board of aldermen. He is the consulting lawyer of the corporation, and represents the lord mayor in his judicial functions. In all cases where the lord mayor and the aldermen sit as judges, the recorder sums up the arguments and pronounces the decisions. He also attends the central criminal court as representative of the lord mayor, and at the close of each session of this court he makes report to the crown concerning capital sentences. He presides over the quarter sessions at the Guildhall and at Southwark; and he is also the advocate of the city, charged with the defense of its interests, if necessary, before parliament. The *common sergeant*, elected by the common council, is the assistant of the recorder. He attends the meetings of the aldermen and common council, as well as those of the different municipal committees, to give legal advice when required. The *town clerk*, chosen also by the common council, has charge of the archives and is keeper of the municipal seal. The *remembrancer* is an officer who attends the houses of parliament in order to watch the interests of the city there, and to make a report of whatever is said or done that may affect its privileges. The *chamberlain*, besides filling the office of city treasurer, receives the oath from persons who have established their right to the freedom of the city, and decides disputes between masters and apprentices. After these officers come the comptroller, the auditors, the secretary of municipal works, the coroner, and the two sheriffs. — *Metropolitan District.* The various departments of public service entrusted to local committees, of which mention was made above, constitute in London a special administrative department, which deals principally with public works. The metropolitan circuit, for this purpose, comprises the city of London and county of Middlesex, with certain parts of the counties of Essex, Surrey and Kent, the whole making up the enormous aggregate known to modern geography as London. This metropolitan circuit is divided into thirty-eight districts, each of which has its board of commissioners. The city by itself forms one district, and the same is the case with some of the more important metropolitan parishes. The administration of the entire metropolis is under the supreme direction of a metropolitan commission composed of forty-three members, appointed by the district commissions and by those vestries which perform the same work as the district commissions. The members hold office for three years, one-third of the number being replaced each year. The metropolitan commission elects its own president and other officers. This metropolitan commission has charge of the sewers, decides upon the opening of new streets or the widening or altering of old ones, and also controls the naming of the streets and the numbering of houses. The purification of the Thames is one of the most important works which the commission has in hand; and to defray the cost of it parliament has authorized a tax of three pence in the pound on the rental of all the real estate in the metropolis for forty years. The general expenses of the commission are met by a tax graded equitably with reference to the wealth of the various districts and the advantage which they relatively receive from a given set of improvements. The members of the district commissions are chosen in each parish from among those people who pay poor rates assessed on an annual income of not less than £40; and they are chosen by a vestry consisting of not less than 18 nor more than 120 members. Parishes containing more than 2,000 electors are divided into sections. In districts formed of a single parish the vestry itself acts as a district commission. These local commissions and vestries superintend the local lighting, sewerage, paving, and street cleaning. They also employ physicians to inspect the sanitary condition of their districts. Each vestry or district commission defrays its expenses by means of two taxes: the general rate and the sewer rate. Separate accounts are kept for each of these taxes, as well as for street lighting when that is provided for by a general tax. The vestry or district commission is authorized to abate taxes, in whole or in part, in the case of localities which derive little or no advantage from them. These taxes are collected by the inspectors of the poor rate, unless the vestries or district commissions appoint special collectors. The accounts of all these local boards are approved by auditors elected at the same time as the vestrymen. A special auditor, appointed by the government, approves the accounts of the metropolitan commission.— The total amount annually raised by local taxation was as follows, in the three divisions of the United Kingdom, in the year ending March 31, 1874, this being the latest official return:

DIVISIONS.	Receipts from Taxes.	Raised by Loans.	Tot'l Local Revenue from all Sources.
	£	£	£
England and Wales	23,897,029	8,201,499	37,731,193
Scotland (partly estimat'd)	2,372,557	149,494	3,202,714
Ireland	2,996,009	129,493	4,599,908
Total for United Kingdom	29,265,595	8,480,486	45,533,815

—The following table exhibits the amounts of the various branches of local expenditure in the year ending March 31, 1874:

ENGLAND AND WALES.

In the Metropolis:	
Poor relief, including workhouse loans repaid	£ 1,636,541
All other parochial expenditure payable out of poor rates	136,507
	£ 1,773,048
Local management by vestries (exclusive of metropolitan board of works) maintenance of roads, watering, lighting, sewerage, etc.	1,516,964
Metropolitan board of works: local public works, sewerage, etc.	1,385,015
Corporation and com'rs of sewers of London: local public works, sewerage, etc.	1,136,371
Metropolitan police	1,041,601
School boards	743,448
Burial boards, etc.	56,710
Total local expenditure in metropolis	£ 7,653,157
County Districts:	
Poor relief, includ'g workhouse loans repaid.	£ 6,053,998
All other parochial expenditure payable out of poor rates	583,154
	£ 6,637,152
County purposes: police, prisons, asylums, etc.	2,780,165
Municipal boroughs, for public works, police, etc.	3,573,433
Urban sanitary authorities	7,958,208
Rural sanitary authorities	159,419
For maintenance of public roads, by highway boards	1,575,608
Turnpike trusts	671,099
School boards	1,214,617
Burial boards for public cemeteries	341,971
Other purposes	422,465
Total local expenditure in country districts	£25,334,137
Coast Districts:	
For erection and maintenance of commercial harbors	£ 3,082,571
Lighthouses, pilotage, and saving life at sea	680,689
Total local expenditure in coast districts	£ 3,763,260
Summary: Metropolis	£ 7,653,157
Country	25,334,137
Coasts	3,763,260
Total England and Wales	£36,750,554

SCOTLAND.

Parochial boards for relief of the poor	£ 851,365
Town authorities	1,176,000
County assessments: police, prisons, roads, etc.	258,000
Turnpike trusts	180,158
School boards	327,847
Other purposes	364,172

—IV. CHURCH. The established church of England is the Protestant Episcopal, the fundamental doctrines of which are regarded as embodied in the thirty-nine articles, agreed upon in convocation in 1562, and finally settled in 1571. The separation of the English church from Rome, which was declared by Henry VIII., was consummated at the beginning of the reign of Elizabeth. The crown was declared by parliament to be the supreme head of the realm in matters spiritual as well as in matters temporal The thirty-nine articles, together with the book of common prayer, were adopted as containing an authoritative statement of the cardinal tenets of the church. The dogma of transubstantiation was rejected, and with it were rejected works of supererogation, purgatory, indulgences, the worship of images and relics, the worship of the virgin and the saints, auricular confession, and the celibacy of the clergy; and communion in both kinds was allowed to the laity as well as to the clergy. An oath was required of all the clergy, as well as of all members of parliament and all public officials, recognizing the sovereign as the head of the church. At first there was no recognition of liberty of conscience; both Catholics on the one hand, and Calvinistic Puritans on the other, were subject to persecution. But the spirit of persecution is not congenial with the spirit of civil liberty which has always been so powerful in England; and by the eighteenth century complete toleration had begun to prevail. At the present day all sects are fully tolerated in England, and civil disabilities do not attach to any class of citizens for religious reasons. — The sovereign, as temporal head of the church, possesses the right to nominate to all vacant archbishoprics and bishoprics; but this, like most of the rights of the crown, is practically exercised by the prime minister. The premier appoints to deaneries and such prebendaries and canonries as are in the gift of the crown. There are 2 provinces and 31 dioceses in England. The provinces are those of Canterbury and York, each under its archbishop. The former contains 23 dioceses, the latter contains 8. The archbishop of Canterbury is the primate; as spiritual head of the church he presides at the coronation of the sovereign and administers the oath. The archbishops are the chiefs of the clergy in their provinces, and they confirm and consecrate all the bishops. They have also each his own diocese, wherein they exercise episcopal, as throughout their provinces they exercise archiepiscopal jurisdiction. Thus there is the diocese of Canterbury, as well as the province of Canterbury, comprising the dioceses of Canterbury, Winchester, Salisbury, Exeter, London, etc. For the management of ecclesiastical affairs, the provinces have each a council, called the convocation, consisting of the bishops, archdeacons and deans, in person, while the inferior clergy are represented by proctors. These councils are summoned by the archbishops in the queen's name. In the province of Canterbury the convocation is divided into two houses, like parliament, the archbishop and bishops sitting in the upper house, while the deans and the representatives of the inferior clergy sit in the lower house. In the province of York all sit together in one house. The archbishop of Canter-

bury takes precedence of all other subjects, after the members of the royal family. The archbishops and bishops sit, by virtue of their office, in the house of lords; and this circumstance in English history has, very fortunately, prevented the development of the convocation into a separate estate of the realm, co-ordinate with the peers and the commons. The houses of convocation have their sessions during the same season as the sessions of parliament, but their powers have become with time very much restricted, and at the present day none of their decrees are in any way binding on the laity unless confirmed by act of parliament. It has become one of those happy devices, of which English history is so full, of allowing certain classes of people to play at sovereignty, and even to exercise here and there a little harmless jurisdiction, while the real sovereignty remains all the time with the chosen representatives of the people in the house of commons. The ecclesiastical courts take cognizance of questions of heresy and schism, of public worship, and of the revenues of the clergy. In each diocese the archdeacon's court is the court of primary jurisdiction. Above this comes the consistorial court of the bishop. Appeals lie from this to the provincial court of Canterbury, known as the court of arches, and from this there is a final appeal to the judicial committee of the privy council.—There are about 12,000 parishes in England, besides something like 200 places ranked as extra-parochial. Every parish has a parish church, presided over by the rector, who is called the "parson." He holds during life the freehold of the parsonage, with its manse and glebe-lands, and receives the tithes and other dues. But in some cases the benefice is annexed in perpetuity to some spiritual corporation, which thus appropriates the dues and becomes the patron of the living. A *vicar* is a person appointed by such a corporation, to hold the living as its lieutenant; in other respects the vicar does not differ from a rector The patronage, or right of nomination to a benefice, is called the *advowson*, and is legally classified under the head of real property. Of the 11,728 benefices now existing in England and Wales, 1,144 are in the gift of the crown, 1,853 are presented by bishops, 938 by chapters, 931 by officers of metropolitan churches, 770 by the universities of Oxford and Cambridge, the colleges of Eton, Winchester and others, and 6,092 by lords, gentlemen and ladies in the enjoyment of private patronage. Rectors receive the whole revenue of their benefices; but vicars, as simple agents or delegates of the holders of the benefices, receive only a portion. By an act of 1871, when a parson who has held a living for seven years or more is incapacitated by physical infirmity from discharging his duties, he may be retired on a pension not exceeding one-third the revenue of the living.—The church revenues are derived very largely from real estate, and also from tithes (which in 1836 were commuted for a fixed charge in money), as well as from surplice fees for baptisms, marriages and burials. The sum total has been estimated at £4,480,000. The archbishop of Canterbury receives about £15,000; the archbishop of York, £10,000; the bishop of London, £10,000; the bishop of Durham, £8,000; the bishop of Winchester, £7,000; and the other bishops from £3,000 to £5,000. The deans receive £1,000 and upward.—Of the entire population of England and Wales, about 14,000,000 belong to the established church, leaving about 11,500,000 to all other sects. Among the Protestant dissenters, the most numerous and influential are the Independents or Congregationists, the Wesleyans, and the Baptists. The Wesleyans have more than 9,000 places of worship, the Congregationalists about 3,500, and the Baptists about 2,000. Other dissenting sects of more or less social importance, are the Unitarians, Quakers and Moravians. There are about 1,000,000 Roman Catholics in England; and the Roman church has 14 dioceses there, all united in the so-called "province of Westminster," and presided over by one archbishop and thirteen bishops. In Scotland the Roman church has three vicars. In 1877 there were 1,039 Catholic chapels in England, and 233 in Scotland.—The established church in Scotland is Presbyterian in government and Calvinistic in doctrine. There is in each parish a parochial tribunal, called a "kirk session," consisting of the minister as president, together with several other persons prominent in the neighborhood, of whom two are selected as "elders." A certain number of parishes constituting a district send each its minister and one of its elders to an assembly called a "presbytery," which has the power of ordaining ministers, of authorizing candidates to preach before ordination of investigating complaints against members of the church, of admitting new members, and of pronouncing sentences of excommunication. Minor matters of church discipline are dealt with in the kirk session, from which, however, an appeal always lies to the presbytery, and ultimately to the general assembly, the highest body in the Scotch church. The general assembly is composed partly of ministers and partly of lay members, elected annually by the different presbyteries, boroughs and universities. It consists of 386 members, and meets in May every year. The nomination of ministers belongs either to the crown or to private individuals. In 1830 some of the Scotch people protested against this use of patronage, and in 1843 the result was the division of the church. Alongside of the national church of Scotland there grew up the free church of Scotland. The latter church, supported entirely by voluntary contributions, has built 900 churches and 600 school houses, besides establishing several foreign missions. Including the free church, considerably more than half the population of Scotland may be ranked as dissenters from the established church of Scotland. There are numerous bodies of Con-

gregationalists, Wesleyans, Baptists and Unitarians. The national church of Scotland has three presbyteries in England. — In 1876 it was estimated that there were 51,250 Jews in Great Britain, of whom 39,883 resided in London. — In 1871 the census of Ireland showed the following distribution of sects: Roman Catholics, 4,141,933; Episcopalians, 683,295; Presbyterians, 558,238; Wesleyans, 41,815; Baptists, 4,643; Congregationalists, 4,485; Quakers; 3,834; Jews, 258; Miscellaneous, 19,035. — The Roman Catholic church in Ireland has 4 archbishoprics (Armagh, Cashel, Dublin and Tuam) and 23 bishoprics. The church is supported by fees on the celebration of births, marriages and masses; by Christmas and Easter dues; and by voluntary subscriptions and free-will offerings. The Catholic college of Maynooth was disendowed Jan. 1, 1871. The Protestant Episcopal church was established by law in Ireland, from the time of Elizabeth until 1869, when Mr Gladstone's government disestablished it. It is henceforth on the same footing practically as any other free or dissenting sect. — V. Poor Law. Down to the time of Henry VIII. the only institutions for public charity were the monasteries, which by distributing alms alleviated distress in a fitful and irregular manner. Upon the dissolution of the monasteries it was soon found desirable to establish some civil machinery for the relief of the poor, and various more or less ineffectual measures were passed during the sixteenth century, with this object in view, until at last in 1601 the famous statute 43 Eliz., c. 2, became the foundation of the modern English poor law. This statute provided that every parish should have a board of overseers of the poor, consisting of the churchwardens, together with from two to four householders to be appointed annually by the justices of the peace nearest at hand. It was the duty of these overseers to levy a "poor rate" upon the landed property in the parish, and to apply the proceeds of this tax, first, in setting to work indigent children and able-bodied persons without means of subsistence; and secondly, in relieving the aged or infirm or other poor people who were unable to work, and who had no parents, grandparents or children able to support them. Should any parish prove unable to furnish sufficient money for these purposes, the justices might make good the deficiency out of any other parish within the hundred; and if the resources of the hundred also were found inadequate to bear the burden, the deficiency might be made good out of some other part of the county. An appeal against the rates might be carried to the justices in quarter sessions. The overseers were further authorized to apprentice pauper children, and, with the consent of the lord of the manor, to build poor houses on the waste land of the parish. In cities and boroughs the mayor might exercise the powers herein granted to the justices of the peace. One evil result of this arrangement was that the well-regulated parishes had to carry a heavier burden than the poor and ill-managed parishes, as paupers were inclined to migrate from the latter to the former. This evil gave rise to what was known as the doctrine of settlement, in accordance with which it was provided in 1662 that, on complaint of the churchwardens or overseers, an indigent person coming into a parish might be compelled to return to the parish where he was born, or at least where he was last settled. Such abuses prevailed in the administration of this system of poor relief that in 1834 a new act was passed, placing the administration of the poor law under the control of a board of commissioners to be appointed by the crown. The powers lodged in this board passed through various vicissitudes into the hands of the local government board in 1871. By the act of 1834, and later acts, the board was authorized to insist upon the erection of workhouses in which able-bodied paupers should be compelled to reside; and, wherever necessary, to consolidate several adjacent parishes into a union, with a workhouse in common. Masters of workhouses and other wage-receiving officers of unions or parishes were made removable by the board, which was also empowered to provide for a thorough inspection of workhouses, and for a proper audit of the accounts of overseers. Each parish was to remain separately chargeable for the maintenance of its own poor. The effects of this act of 1834 were such that within three years from its passage the total annual expenditure for the relief of the poor was reduced from £6,317,253 to £4,044,741. The expenditure at the present time is over £8,000,000 annually for England and Wales; but in view of the enormous increase in wealth and population, this burden is much lighter than in 1834. — VI. Public Instruction. Public education has made great progress in Great Britain during the past half century, but has nowhere attained so high a level as has been reached in the northern United States. The difference in respect of illiteracy, moreover, between different counties of Great Britain is quite as marked as the difference between Massachusetts and Mississippi. The test usually applied is only an approximate one, consisting in ascertaining the proportion of men or women who are able to sign the marriage register. Judged by this test, the percentage of illiterate men in England in 1841 was 33, and the percentage of illiterate women was 49; but in 1876 the percentage of men was reduced to 16 and that of women to 22; and in 1877 the percentage of men was 15 and of women 20. In Scotland the percentage of illiteracy is much smaller, being 9 in the case of men and 18 in the case of women. In Ireland it is much greater, being 31 in the case of men and 37 in the case of women. Among the different parts of England the smallest percentage of illiteracy is found in Westmoreland, and next in Middlesex, while next in honorable mention come Surrey and Rutland. The highest percentage of illiteracy is found in Wales. As compared with the rest of Great Britain in respect to

public education, Scotland has ever since the reformation been far in advance. The Presbyterian reformers ordered every parish to establish a primary school under the supervision of the minister, and these schools have been of immense benefit to the country. In 1871, out of 629,235 children in Scotland between the ages of five and thirteen years, 494,860 were enrolled as attending the public schools. An important measure toward the advancement of primary education in England was carried through parliament by Mr. Gladstone's government in 1870. In this act it is ordered that "there shall be provided for every school district a sufficient amount of accommodation in public elementary schools available for all the children resident in such district, for whose elementary education efficient and suitable provision is not otherwise made." These schools are in each district placed under school boards invested with great powers, among others that of enforcing attendance at school upon all children between the ages of five and thirteen. The expenses of these schools are charged upon the local rates. Under the operation of this act we find that whereas in 1871 there were 9,521 schools, attended by 1,345,802 children, in 1879 there were 17,166 schools, attended by 2,594,995 children. The members of the school boards are elected for three years by the burgesses in boroughs or by the rate payers in parishes. The number of members varies from five to fifteen. They serve gratuitously, but are allowed indemnity for expenses or damages resulting from their service on the board. The board appoints the instructors and any other necessary officials, it fixes their salaries, and can dismiss them when requisite. Instruction is not absolutely gratuitous, as in the United States, but there is a small charge for tuition, the rate being fixed by the board. If the parents of a child are too poor to pay the tuition fee, the board pays it for them; if it appears, on due inspection, that a district is too poor to bear the expense of tuition fees, the department of education authorizes the board to establish a school there which shall be entirely gratuitous. In 1879 the average amount of school fees paid by each scholar was 10s. 5½d., equivalent to $2.50½. Scholars who distinguish themselves may continue their education in normal schools, where £23 are allowed for expenses in the case of a boy and £17 in the case of a girl. — In secondary as well as primary education Scotland takes the lead. Instruction is given in the "borough schools," and in special industrial schools or mercantile colleges. The Andersonian university, founded in 1708 at Glasgow for scientific studies, is now an evening school where some 800 pupils receive instruction in penmanship, modern languages, book keeping, and elementary mathematics and physics. At Edinburgh the Watt institution, founded in 1821, teaches chemistry, physics, mathematics, modern languages, drawing and modeling; more than half the pupils are laboring men. There are something like twenty mechanics' institutes in Scotland; and schools of design have been established in many cities, of which that in Edinburgh is attended by 1,800 pupils. In England there are a great many higher schools established by private liberality and more or less richly endowed. In the first rank come the great schools of Eton with 800 pupils, Harrow with 520, and Rugby with 500, which were founded in the sixteenth century and are situated in the country; others, somewhat less celebrated, are situated at Winchester, London and Shrewsbury. The expense of living at these schools often reaches £200 per year, but there are systems of pecuniary aid analogous to those adopted in American colleges. More modern in character are the college of the city of London, founded in 1841, giving instruction in ancient and modern languages, mathematics and vocal music; the Owens college at Manchester, giving scientific and literary instruction; and the collegiate institution at Liverpool, which is at once a scientific school and a preparatory school for the universities. Among the institutions especially devoted to industrial training, a most conspicuous place is held by the public institution established in 1859 at South Kensington under the name of the "Science and Art Department." This establishment comprises a normal school of design, a central school of design, and an industrial museum. Pupils in the normal school of design, after having passed six semi-annual examinations, are placed in charge of art schools established in different towns and cities of the United Kingdom. In 1871 there were 212,500 pupils studying in these art schools. In scientific instruction the department has made use of various "mechanics' institutes" and other popular courses of instruction which were already in existence. Deserving pupils obtain prizes and endowments for the purpose of pursuing their studies in the royal school of mines, the royal college of chemistry, the London laboratory of metallurgy, or the royal scientific college at Dublin. The courses of study comprise all the sciences, as well as architecture and the designing of machinery. — As regards the higher instruction, the two great universities at Oxford and Cambridge are subjects far too extensive and complicated to be treated, even in a cursory way, in a brief, sketchy article like the present. The university of London, founded in 1837, differs from these in giving no direct instruction; it simply examines candidates for a degree, and its examinations are very severe. Women are admitted as candidates. To this university, however, are attached two colleges, both situated in London The one, known as University college, prepares pupils for the examinations, and is entirely unsectarian in its management; the other, called King's college, is Episcopalian in complexion. In Scotland there are four excellent universities, at Edinburgh, Glasgow, Aberdeen and St. Andrews.— VII. ADMINISTRATION OF JUSTICE. The simplest form of the administration of justice in England has already been described under the

head of "Local Administration." In every county there are magistrates called justices of the peace, selected from among the most respected landholders of the county. They serve without pay, and when once appointed usually hold their offices for life. Their general administrative duties have already been described. At assizes the justices usually sit as a grand jury, though the members of a grand jury do not need to be justices. As judges in quarter sessions, or even sitting singly, the justices of the peace may try petty cases, either civil or criminal; but an appeal always lies from the decision of a single justice to the quarter sessions. There are about 18,300 justices of the peace in England, but in some cases the title does not necessarily imply an active discharge of the duties of the office. There are sinecures in this, as in all other institutions. — Besides the justices of the peace, there are the sixty *county courts* in England and Wales, which deal with petty matters. These courts are held by a single salaried judge, appointed for life, and they can try cases involving not more than £50. They have also the powers of a court of chancery in cases involving not more than £500. By an act of 1863, in towns with a population of 25,000 or more, there may be appointed, at the request of the local authorities, a salaried magistrate who, either by himself or with the aid of the justices of the peace, may do the work of these county courts. In London and some other cities there are special police courts, held also by a single salaried judge, which take cognizance of petty crimes and misdemeanors. In the city of London the lord mayor also holds a police court at the Mansion House, and one is held by an alderman at the Guildhall. — The higher courts of common law (modified by acts of 1873 and 1875) are: the court of king's bench, the court of exchequer, and the court of common pleas. They are held at Westminster, where the court of chancery also sits. Each of these common law courts is held by a president and four assistants. The presiding judge, in the queen's bench and in the common pleas, is called lord chief justice; in the exchequer he is called lord chief baron. Formerly the provinces of these three courts differed considerably, but with the progress of business they have come to overlap each other in many directions; but the court of exchequer, as its name implies, is purely a fiscal court; the common pleas is simply a civil court; while the queen's bench has cognizance of both civil and criminal cases, and appeals lie to it from all the inferior courts. — For judiciary purposes, England is divided into eight circuits, and the judges of these three supreme courts are obliged twice a year to hold *assizes* in these circuits. The judges allot these circuits among themselves, and go about, holding their assizes in person. Each individual judge, in holding a court on his circuit, sits as a delegate of the supreme court to which he belongs. By means of these circuits, the jurisdiction of the common law courts at Westminster is extended all over England, taking direct cognizance of all cases, whether civil or criminal, which lie beyond the jurisdiction of the county courts or of the justices of the peace. — The supreme court of chancery at Westminster is held by the lord chancellor, but as the relations of equity to common law are very much the same in England as in the United States, the peculiar functions of this court require no special explanation here. A final appeal, in many cases, lies to the house of lords; but there is nothing in England which answers to the supreme court of the United States, as the circumstances pertaining to a federal government are non-existent in Great Britain. Within the limits of the crude outline sketch here given, however, the administration of justice in England does not materially differ from the administration of justice in the United States. But the English understand the value of a good judge better than the Americans; for the inferior judges receive salaries equivalent to $6,000, while the judges of the highest courts are paid at the rate of from $30,000 to $40,000 per year. — VIII. ARMY. The maintenance of a standing army in time of peace, without the consent of parliament, was prohibited in 1690 by the bill of rights. It requires an annual vote of the house of commons to keep the army in existence from year to year. A cabinet meeting is held shortly before the sitting of parliament, which receives communications from the commander-in-chief respecting the number of officers and men, in each branch of the service, which are needed for the ensuing year. On the basis thus furnished, the cabinet authorizes the secretary of state for war to draw up his "army estimates" to be submitted to the approval of the house of commons. A further efficient means of controlling the army is furnished by the mutiny act. In the absence of the mutiny act, the soldier on English soil is subject only to the common law, and could be punished, even for desertion, only by a civil action of contract. That martial law, without which an army can not maintain its orderly existence, exists itself only through the mutiny act which is limited in duration to a single year, and consequently has to be renewed at the beginning of every session of parliament. To such precautions were the English people led by the attempts of the Stuarts to set up a tyranny; and they were obviously so thorough as to make henceforth the merest beginning of a military despotism well nigh impossible. — The force of the regular army at decennial periods since the beginning of the present century, and cost of maintaining it, have been as follows:

1800,	240,505 men	£17,350,000
1810,	352,982 "	23,240,000
1820,	120,765 "	10,580,000
1830,	110,481 "	8,840,000
1840,	131,112 "	8,840,000
1850,	143,850 "	8,960,000
1860,	227,733 "	14,840,000
1870,	107,836 "	14,093,500
1880,	107,100 "	15,541,300

The regular army of the United Kingdom in 1882, exclusive of India, consisted of 7,222 commis-

sioned officers, 17,555 non-commissioned officers, trumpeters and drummers, and 108,217 rank and file; a total of 132,994 men of all ranks. The following table shows the composition of this force:

BRANCHES OF THE SERVICE.	Officers	Non com. Officers	Rank and File.
Officers on the General and Departmental Staff:			
General staff	256	146	.....
Army accountants	254	.....	.....
Chaplain's department	87	.....	.....
Medical and veterinary department	676	.....	.....
Commissariat department, etc.	337	.....	.....
Total Staff	1,610	146	.....
Regiments:			
Royal horse artillery, including riding establishment	115	218	2,445
Cavalry, including life and horse guards	581	1,381	10,420
Royal artillery	665	1,540	16,637
Royal engineers	382	797	4,001
Army service corps	2	525	2,503
Infantry, including foot guards	3,223	7,018	68,400
Army hospital corps	52	310	1,590
West India regiments	100	156	1,580
Colonial corps, including gun lascars	20	57	482
Total Regiments	5,140	12,032	108,058
Staff of Militia:			
Artillery and engineers	52	856	.....
Infantry	253	4,078	.....
Total Militia Staff	305	4,934	.....
Miscellaneous Establishments:			
Instruction in gunnery and engineering	22	63	71
Royal military academy, Woolwich	23	20	8
Royal military college, Sandhurst	35	21	18
Staff college	6	2	2
Regimental schools	16	174	.....
Manufacturing establishments	19	39	.....
Various ditto	46	124	50
Total Miscellaneous	167	443	149
Summary:			
Total general and departmental staff	1,610	146	.....
Total regiments	5,140	12 032	108,068
Total militia staff	305	4,934	.....
Total miscellaneous establishments	167	443	149
Total Regular Army	7,222	17,555	108,217

—The following table shows the cost of maintaining the army for the year ending March 31, 1882:

EFFECTIVE SERVICES.

1. *Regular Forces.*

General staff and regimental pay, allowances, etc.	£4,436,000
Divine service	52,400
Administration of martial law	39,800
Medical establishment and services	300,500

2. *Auxiliary and Reserve Forces.*

Militia pay and allowances	476,800
Yeomanry cavalry	73,900
Volunteer corps	540,500
Enrolled pensioners, and army reserve force	218,800

3. *Commissary Department.*

Commissariat establishments and wages	404,800
Provisions, transport, and other services	3,411,000
Clothing establishments and supplies	780,000
Manufacture and repair of war stores	1,170,000

4. *Works and Buildings.*

Superintending establishment and expenditure for works, buildings and repairs, at home and abroad	758,900

5. *Various Services.*

Military education	£ 164,100
Miscellaneous services	40,100
Administration of the army	222,200
Total effective services	£13,089,800

NON-EFFECTIVE SERVICES.

Rewards for military service	84,000
Pay of general officers	129,700
Pay of reduced and retired officers	1,054,700
Widows' pensions and compassionate allowances	124,300
Pensions for wounds	17,600
In-pensions	33,900
Out-pensions	1,386,500
Superannuation allowances	202,200
Militia and volunteer corps	87,400
Total non-effective services	£3,019,600
Summary: Effective services	£13,089,800
Summary: Non-effective services	3,019,600
Total	£16,109,400

One or two items of the foregoing table require a word of explanation. Beside the regular forces, the army estimates include appropriations for four classes of auxiliary and reserve forces, the titles of which appear in the table under that heading. In the year 1880–81 the total number of militia was 139,111; that of yeomanry, 14,511; that of volunteers, 245,648; and that of enrolled pensioners, etc., 47,000; making the total auxiliary force, 446,270. This, added to the regular army, 1880–81, makes a total of 553,370 men available for the military defense of Great Britain. — The total force of the British army in India usually stands at about 60,000; since 1877 it has been kept at the figure of 62,653. — About 40 per cent. of the British regular army is stationed in England and Wales, 2 per cent. in Scotland, 12 per cent in Ireland, and 46 per cent. abroad. — There is no conscription, or enforced military service, in Great Britain; the force of the army is maintained entirely by voluntary recruiting. The greatest abuse which had characterized the army administration, namely, the purchase of commissions, was abolished by Mr. Gladstone in 1871.— IX. NAVY Down to the time of Henry VII., whenever it was necessary to have an armed fleet for the defense of the British or the assault of the French coasts, it was customary to press merchant vessels into the service, very much as the United States government in 1861 appropriated New York ferry-boats to be used as gunboats. It was under Henry VIII. that the English navy first assumed a distinct existence, although nearly two centuries before, under Edward III., the English had won at Sluys a naval victory of the first magnitude, destroying the antagonist French fleet almost as thoroughly as at the Nile or at Trafalgar. The superiority of the English navy became pronounced in the reign of Elizabeth, and by the end of the seventeenth century was generally acknowledged, though the French and Dutch still held their position as formidable rivals. Since the middle of the eighteenth century the supremacy of the English navy over the waters of the earth has been undisputed. Until the reign of Anne the government of the navy was

vested in the lord high admiral; but since then it has been administered by the board of admiralty, or "Lords Commissioners for executing the office of Lord High Admiral." The board consists of five members who are always changed with every change of the government. The financial secretary of the board is also changed. The fixed administration, independent of the state of political parties, consists of two permanent secretaries, the controller of the navy, the accountant general, the directors of engineering and architectural works, of transports, of contracts, of naval construction, of naval ordnance, and of the medical department, and the superintendents of victualing and stores. The first lord of the admiralty, corresponding to our secretary of the navy, is always a member of the cabinet; he has supreme authority over the navy, and all questions of importance are left to his decision. The other members of the board are the senior naval lord, who is responsible for the discipline of the fleet, and directs its general movements; the third lord, who superintends the management of the dock yards and the building of ships; the junior naval lord, who superintends the transport and commissariat; and the civil lord, who is responsible for the accounts. Unlike the army, the existence of which has to be renewed every year by act of parliament, the British navy is a permanent establishment, and the statutes in accordance with which its discipline is maintained run in perpetuity, or until revoked or amended by the house of commons.—The following table gives the navy estimates for the year ending March 31, 1882:

EFFECTIVE SERVICES.

Wages to seamen and marines	£2,704,226
Victuals and clothing	1,014,481
Admiralty office	180,583
Coastguard service, naval coast volunteers, and royal naval reserve	194,481
Scientific branch	120,382
Dock yards and naval yards at home and abroad	1,446,346
Victualing yards and transport establishments	71,917
Medical establishments	65,969
Marine divisions	22,188
Naval stores	1,172,700
Ships, etc., built by contract	683,239
New works, building, machinery, and repairs	550,141
Medicines and medical stores	70,460
Martial law and charges	10,069
Miscellaneous services	127,421
Total effective services	£8,494,553

NON-EFFECTIVE SERVICES.

Half-pay, reserved half-pay, and retired pay to officers of the navy and royal marines	£ 877,890
Military pensions and allowances	847,085
Civil pensions and allowances	337,991
Total non-effective services	£2,062,916

SERVICES FOR OTHER DEPARTMENTS.

Army department for conveyance of troops	£ 228,450

Summary:	Effective services	£ 8,494,553
	Non-effective	2,062,916
	Other departments	228,450
Total		£10,725,919

These estimates not being found quite sufficient, a supplementary grant for the navy, of £83,000, was made toward the close of the session of 1880.—The number of seamen and marines at present serving in the navy is as follows:

Seamen	35,700	
Boys, including 2,200 for training	4,900	
		40,600
Marines, afloat	6,200	
" ashore	6,800	
		13,000
Coast guard, officers and men		4 000
Indian service		1,200
Total		58,800

—The number of ships in the British navy has undergone great variations, not simply with the growth of the navy in actual strength, but also with the progress of the art of naval warfare. In 1588 the fleet which defeated the Spanish Armada consisted of 176 ships and 14,992 men; but of this great force only 34 ships and 6,225 men belonged to the royal navy; the rest were volunteers serving in merchantmen pressed into the service. In 1679 there were 76 ships-of-the-line in commission. In 1750, shortly before the beginning of the war which made England the mistress of the seas, the navy consisted of 135 ships-of-the-line, 112 frigates, and 130 sloops and smaller vessels. During the great war between England and France at the beginning of this century, the British navy was increased to enormous dimensions. In 1800 it comprised 850 ships of all classes. In 1810 it comprised 1,239 vessels actually ready for service, of which nearly 300 were ships-of-the-line, about 600 were frigates, and the remainder were sloops and corvettes. In 1820 the navy comprised 745 vessels, of which 140 were ships-of-the-line. In 1822 the introduction of steam brought about an entire revolution in naval warfare. The grand old line-of-battle ships soon began to become obsolete. Down to 1835, however, the 625 vessels of which the British navy consisted comprised 110 ships-of-the-line, 150 frigates, and 350 smaller craft, with only 15 steam ships. In 1842 the invention of the screw propeller by Ericsson, and its substitution for the paddle wheel, introduced fresh changes of great importance into the art of naval construction; six years after, the British navy contained 49 screw steamers, of which 1 was classed as a ship-of-the line and 10 as frigates. At the close of the Crimean war in 1856, the navy comprised 964 vessels, among which were 45 screw steamers classed as ships-of-the-line, 30 classed as frigates, and 300 of inferior power; besides all this, there were 14 paddle wheel frigates, and 100 paddle wheel corvettes; of sailing vessels, there were 50 ships-of-the-line, 125 frigates, and 300 sloops and brigs. In 1860 the introduction of plated armor, followed in 1862 by Ericsson's invention of the turret ship, taken in connection with the simultaneous progress in the art of gunnery, entirely revolutionized the art of naval construction. The appearance of the "Monitor" in Hampton Roads, March 9, 1862, marks perhaps the greatest single step that has ever been taken in the history of naval warfare. Its immediate effect was to render antiquated all the most recently built ships then existing in all the navies of the world. Important innovations have been made since the invention of the "Monitor"; but

the present British navy dates from the year 1862; and for the purposes of naval warfare at the present day the great navy of the Crimean war would be of no more use than a squadron of 964 pleasure boats. — The most important portion of the present British navy at the beginning of 1881, consisted of 68 ironclad ships, afloat and building, of which number 48 were described as efficient, while 17 had become antiquated or otherwise inefficient, and 3 had been built solely for colonial use and were not reckoned as strictly British. The following table gives a general idea of the character of the 48 effective ironclads:

NAMES OF IRONCLADS	Thickness of Armor.	Guns.		Horse Power.	Displacement or Tonnage
		No	W'ght		
First Class —	Inches.		Tons.		
Inflexible	16 to 24	4	81	8,000	11,406

Resistance	4½	18	6½	2,537	6,070

In this table the ships marked with an asterisk were not yet launched at the beginning of 1881, but were expected to be finished in the course of the year. The Inflexible, built at Portsmouth and launched in 1878, is the most formidable war vessel that has ever existed. She is 320 feet in length and 75 feet in extreme breadth. In her central part a citadel 12 feet high, one-half above and one-half below the water, contains the engines and boilers, the hydraulic loading gear, the magazines, and the base of the rotating turrets. The walls of this citadel, 41 inches thick, consist of armor plates varying from 16 to 24 inches in thickness, with a strong teak backing. Within this armored citadel are the two turrets, 12 feet high and 28 feet in diameter. The turrets do not stand in line fore-and-aft, but are placed *en échelon*, so as to command a fore-and-aft fire from all the guns. Each turret holds two 81-ton guns, capable of firing a ball weighing 1,650 lbs., with a charge of 300 lbs. of powder. The vessels of the second class are designed for ocean warfare, but are inferior in power to those of the first class. The Polyphemus, now building at Chatham, deserves especial mention as representing an entirely new style of war ship. She may be described as simply a steel tube, deeply immersed, her convex deck rising but 4½ feet above the water line. She carries no heavy guns, her whole power being concentrated in a tremendous ram 12 feet in length. Besides the ram, the Polyphemus has three torpedo ports. The third class comprises a group of very swift and powerful cruisers. The ships of the fourth class are at present regarded as fit only for coast defense. Those of the fifth class were built for the most part between 1861 and 1863, and are now antiquated, except for the protection or destruction of mercantile fleets. Not a single vessel built prior to 1861 now remains in use in the British navy. — X. RESOURCES: AGRICULTURAL, INDUSTRIAL AND COMMERCIAL. *Agriculture.* According to the official reports, of the 77,000,000 acres constituting the superficial area of the United Kingdom, about 47,000,000 are devoted to agriculture, including both grazing and the growth of cereals, etc. Of this, 11,833,000 acres are devoted to cereals; 5,271,000 to kitchen vegetables; 565,000 are left fallow; 6,236,000 are laid out in gardens, orchards, etc.; and 22,525,000 are utilized as pasture lands. The area devoted to cereals is subdivided as follows: wheat, 3,831,000 acres; barley, 2,617,000 acres; oats, 4,362,000 acres; rye, 81,222 acres; beans, 550,613 acres; and pease, 391,250 acres. The average yield of wheat in the United Kingdom is estimated at 27 bushels per acre, of barley from 35 to 40 bushels, and of oats about 45 bushels; thus giving a total average yield of wheat, 103,437,000 bushels; of barley, 98,137,500 bushels; and of oats, 196,290,000 bushels. The principal fruit raised in Great Britain is the apple, the yield of which is estimated at four tons to the acre. — The average number of domestic animals in the annual census taken on the 25th of June

is about three million horses, ten million oxen and cows, thirty-three million sheep, and five million hogs. — The census of 1871 showed in Great Britain 549,784 farms of all sizes. Of this number 51.3 per cent. were farms of 20 acres and less, and 48.7 per cent. were larger farms. It is difficult to make a very precise estimate of the wages paid for agricultural labor, since the usages, the rates and the mode of payment differ considerably in different parts of the country. In some districts wages are paid in kind; in some places a certain amount of labor is given in exchange for rent. Wages paid in money range ordinarily from 12 to 15 shillings (*i. e.*, from $2.88 to $3.60) per week. — *Mineral Products.* British agriculture, though conducted with great care and skill, is too limited in extent either to obtain a controlling position in the markets of the world, or to furnish a sphere for the activity and satisfaction for the material wants of the dense and rapidly increasing population of the United Kingdom. The industrial and commercial development of Great Britain has been primarily due (next to the free constitution of the government) to the immense mineral resources of the country. The most important mineral and metal products are coal and pig iron, the annual yield of which, in the years 1868–79, is shown in the following table:

YEARS.	Coal.		Pig Iron.	
	Quantities	Value	Quantities.	Value.
	Tons.	£	Tons.	£
1868	103,141,157	25,785,289	4,970,206	12,381,280
1869	107,427,557	26,856,882	5,445,757	13,614,397
1870	110,431,192	27,607,798	5,963,515	14,908,787
1871	117,439,251	35.121,347	6,627,179	16,667,947
1872	123,497,316	46,311,216	6,741,929	18,540,304
1873	127,016 747	47,631,380	6,566,451	18,057,739
1874	125,043,257	46,849,194	4,985,084	14,844,936
1875	131.867,105	46,163,486	6,365,420	15,645,774
1876	133,344.766	46,670,668	6,555,997	16,062,192
1877	134.610,768	47,113,767	6,608,664	16.191.236
1878	132,654,887	46,429,210	6,381,051	16,154,992
1879	132,606,012	46,332,012	5,995,337	14,788,342

The total amount of iron ore produced in 1879 was 16,692,802 tons, valued at £6,746,668. As to other mineral products, the yield for 1879 is shown in the following table:

PRODUCTS.	Quantities.	Value.
Lead ..... tons	80,850	£1,123,952
Tin ..... "	14,142	572,763
Copper ..... "	73,141	282,271
Salt ..... "	2,735,001	1,504,250
Silver ..... ounces	833,462	70,860
Gold ..... "	447	1,790

— The production of coal in 1879 was distributed as follows.

	Tons.
Durham and Northumberland	31,210,000
Wales and Monmouthshire	19,464,000
Scotland	15,320 000
Lancashire	17,621,000
Yorkshire	15,900,000
Staffordshire and Worcestershire	13,990,000
Derbyshire	6,975,000
All other districts	9,268,012
Total	132,808,012

The production of pig iron in 1879 was distributed as follows:

		Tons
England —		
Yorkshire	1,425,000	
Elsewhere	2,851,000	4,276,000
Scotland		982,300
Wales and Monmouthshire		737,037
Total		5,995,337

The exports of coal to foreign countries have increased more than fivefold since 1850. In 1879 the quantity of coal exported was 15,740,082 tons, valued at £6,793,932, of which 3,317,370 tons went to France, 2,055,080 tons to Germany, and the remainder, distributed in quantities not exceeding 100,000 tons, to some forty different countries. — *Textile Industries.* Important as are the working of metals, and the mining of coal, as elements in the national wealth of Great Britain, these industries still derive their chief importance from the facilities which they have afforded for the development of the enormous textile industries for which Great Britain is so famous. The various inventions designed to replace by machinery the slow processes of manual labor have been promptly put into operation in England, thanks to the abundance of all the raw materials needed for the construction of machinery, as well as of cheap coal, placing at the disposition of manufacturers all the mechanical power required for their various purposes. The introduction of machines for spinning and weaving has had such an influence upon manual labor as to reduce very considerably the number of hands requisite for producing a given quantity of thread or of cloth. But, far from lessening the general demand for labor in textile industries, it has enlarged the field of labor to such an extent that the population for which these branches of production now furnish the means of subsistence, in the United Kingdom alone, may be counted by millions. It is to the work of Arkwright, Watt, and their fellows, more than to all other causes combined, that the enormous increase of Great Britain in wealth and population during the present century is due. — The recent condition of the textile industries of Great Britain may best be represented in a series of tables. In 1815 the total imports of cotton were 99,000,000 lbs.; in 1820, 152,000,000 lbs.; in 1830, 264,000,000 lbs., in 1840, 592,000,000 lbs.; in 1850, 663,576,861 lbs.; in 1860, 1,390,938,752 lbs.; and in 1863, 669,583,264 lbs. The falling off between 1860 and 1863, due to the blockade of the southern states in the rebellion, is very noticeable; and it is worthy of remark that a supply of cotton more than adequate for the industries of England in 1850, had become, through the mere expansion of industry, so inadequate, only thirteen years later, as to produce a period of distress almost compar-

able to a famine. Subsequent fluctuations are exhibited in the following table:

YEARS.	Total Imports of Cotton.	Total Exports of Cotton.	Retained for Home Consumption.
	lbs.	lbs.	lbs.
1867	1,282,536,912	350,626,416	911,910,496
1868	1,328,084,016	322,600,480	1,005,483,536
1869	1,220,809,856	272,928,544	947,881,312
1870	1,388,305,584	286,630,576	1,101,675,008
1871	1,778,139,776	362,284,160	1,415,905,616
1872	1,408,837,472	273,005,040	1,135 832,432
1873	1,527,396,224	220,000,256	1,307,595,968
1874	1,568,864,432	258 967 632	1,307,896,800
1875	1,492,351,168	262 8.3,868	1,229,497,360
1876	1,487,856,848	203,305,872	1,284,552,976
1877	1,355,281,200	169,396,304	1,185 884,896
1878	1,340,380 048	147,257 936	1,193,122,112
1879	1,469,358,464	188,201 888	1,281,156,576
1880	1,628,664,576	224,577,360	1,404 087,216

The first shipment of cotton from the United States to Great Britain was in 1791, and consisted of 182,000 lbs. During the past fifty years other countries have begun to rival the United States as cotton growers. The imports of raw cotton, from various parts of the world, in 1837 and in 1879, have been as follows:

COUNTRIES.	1837.	1879.
	lbs.	lbs.
From the United States	300,000,000	850,000,000
From India	50,000,000	350 000,000
From Brazil	25,000,000	100,000,000
From Egypt	10,000,000	200,000,000
Total	385,000,000	1.500.000,000

— Until the nineteenth century the manufacture of woolen cloths was the principal industry of Great Britain. In 1801 the total manufactures of the country were valued at £60,000,000, of which woolens represented more than one-fourth. Since then the production has quadrupled. England and Scotland now consume in their mills one-fourth of the total wool clip of the world; the mills count more than 5,000,000 spindles and 279.000 operatives. The fluctuations in the wool trade from 1867 to 1880, inclusive, were as follows:

YEARS	Total Imports of Wool	Total Exports of Wool	Retained for Home Consumption
	lbs	lbs	lbs.
1867	233,703,184	90,832,584	142,870,600
1868	252,744,155	105,070 311	147,673,844
1869	258,461,699	116,608,305	141,856,384
1870	268,250,499	92,542,384	170,706,115
18.1	323,036,299	135,089,794	187,946,505
1872	306,379,664	137,511,247	168,868,417
1878	318,036,779	123.246,172	194,790,607
1874	344,470,897	144,294,663	200,176,234
1875	365,065,578	172,075,439	192,990,139
1876	390,055,759	173,020,372	217 035 387

— The following table shows the numbe of textile factories, and of operatives employed in them, in the three divisions of the United Kingdom, on Oct. 31, 1874:

	Number of Factories.	Persons Employed.		
		Males	Females	Total
Cotton Factories:				
England and Wales	2,542	180,607	259,729	440,3 6
Scotland	105	5,880	80 274	86,104
Ireland	8	1,188	1,892	3,075
Total	2,655	187,620	291,895	479,515
Woolen Factories:				
England and Wales	1,483	54,119	51,252	105,371
Scotland	257	11,816	15,912	27,728
Ireland	60	782	724	1,506
Total	1,800	66,717	67,888	134,605
Shoddy Factories:				
England and Wales	123	1,568	1,856	3,424
Scotland	2	3	4	7
Ireland	.....	.....	.....	.....
Total	125	1,571	1,860	3,431
Worsted Factories:				
England and Wales	648	53,995	77,835	131,830
Scotland	43	3,052	7,203	10,255
Ireland	1	3	9	12
Total	692	57,050	85,047	142,097
Flax Factories:				
England and Wales	141	6,856	15,471	22.327
Scotland	159	12,752	33,064	45,816
Ireland	149	18,323	41,993	60,316
Total	449	37,931	90,528	128,459
Hemp Factories:				
England and Wales	45	1,465	1,574	3,039
Scotland	12	581	1,250	1,831
Ireland	4	221	120	341
Total	61	2,267	2,944	5,211
Jute Factories:				
England and Wales	15	1,510	3,423	4,933
Scotland	84	9,543	21, 50	30,893
Ireland	11	479	1,615	2,094
Total	110	11,532	26,388	37,920
Hair Factories:				
England and Wales	21	464	322	786
Scotland	6	48	377	425
Ireland	.....	.....	.....	.....
Total	27	512	699	1.211
Silk Factories:				
England and Wales	812	12,772	31 647	44,419
Scotland	4	109	631	740
Ireland	2	290	110	400
Total	818	13,171	32,388	45,559
Hosiery & other Factor's				
England and Wales	548	15,158	11,419	26,577
Scotland	8	585	585	1,120
Ireland	.....	.....	.....	.....
Total	556	15,698	12,004	27.697
Summary:				
England and Wales	6,379	328,491	454,528	783.022
Scotland	680	44,269	110,650	154 919
Ireland	235	21,281	46,463	67.744
Total	7,294	394,044	611,641	1,005,685

Of this total number of persons employed (1,005,685) there were 61,209 boys and 64,677 girls under thirteen years of age. The average wages of the cotton operatives in Lancashire were estimated in 1860 at 18s. 6d. per week for men, 10s. 2d. for women, 7s. for boys, 5s. for girls. In the linen factories at Belfast wages vary from 5s. 6d. to £2 per week, according to the skill of the workman. The average wages paid in England and Scotland for work in the woolen factories were at the same time from 6s. to 7s. per week for spinning, and 9s. for weaving; these operations being mainly carried on with the assistance of women and young girls; the wages of men in the same factories averaged from 16s. to 26s. per week. — *Hardware.* The manufacture of hardware, cutlery and machinery employs 530,000 workmen. The raw material is valued at £20,000,000, and the manufactured goods amount in value to over £100,000,000 annually, of which about two-thirds are used in Great Britain and one-third exported. Until quite recently the hardware industry of Great Britain surpassed in magnitude that of all the rest of the world put together; and, though no longer without competitors, it is still advancing as rapidly as ever. Through the increase of the maufacture of cutlery, pins, and other hardware, such towns as Sheffield and Birmingham have quadrupled their population within seventy years.

	1811.	1881.
Sheffield	58 000	284,000
Birmingham	86,000	380,000

The annual product of the *total manufactures* of the kingdom is about £665,000,000, and the number of workmen employed is 2,930,000. — *Commerce.* In the first decade of the nineteenth century, when the grandfathers of the present generation of Englishmen were spending £624,000,000 to overthrow Bonaparte, the commerce of the British empire did not exceed £60,000,000. At the present day it reaches about £931,000,000, of which about £320,000,000 represents the trade of the colonies. This is about one-third of the entire trade of the world. The following table gives the declared value of the imports and exports during the eighth decade of the century:

YEARS	Total Imports	Exports of British Produce.	Exports of Foreign and Colonial Produce.	Total Imports and Exports
	£	£	£	£
1871	331,015,380	223,066,162	60 508,538	614,590.080
1872	354,693 624	256,257,347	58 331,487	669,282,458
1873	371,287,372	255,164,608	55,840,162	682,292,187
1874	370,082,701	239,558,121	58,092.343	667,733,165
1875	373,939,577	223.465 963	58 146,360	655.551.900
1876	375.154,703	200,639,204	56,137,398	631,931,305
1877	394,419.682	198,898.065	53 452,955	646,765,702

Total	411,229,565	223,060,446	634,290,011

These tables show that while the commerce of the United Kingdom extends all over the world, its principal dealings are with few countries. More than one-half of all its commercial dealings are with six countries: the United States, France, India, Germany, Australasia, and the Netherlands. Our own country ranks first in the list; and the trade between Great Britain and the United States is more than twice as great as that between Great Britain and France, the second country on the list in the table of 1879. In other words, the commercial ties between Great Britain and the United States are more than twice as strong as the ties between any other two countries in the world; and their strength is rapidly growing year by year.—The six chief articles of import into Great Britain for the year 1880 are as follows:

1.	Wheat and flour	£62,857,269
2.	Cotton, raw	42,772,088
3.	Wool	26,375.407
4.	Sugar	22,894,885
5.	Wood and timber	16,736,809
6.	Tea	11,613,398

The six chief articles of export for 1880 are exhibited in the following table:

1.	Cotton manufactures:	
	Piece goods, white or plain	£34,755,147
	" " printed or dyed	22,377,370
	" " of other kinds	6,529,916
	Cotton yarn	11,901,623
	Total	£ 75,564,056
2.	Woolen manufactures:	
	Cloths, coatings, etc.	6,736,721
	Flannels, blankets and baizes	897,088
	Worsted stuffs	7,241.156
	Carpets and druggets	1,133,545
	All other sorts	1,256,667
	Woolen and worsted yarn	3,344,740
	Total	£ 20,609,917
3.	Iron and steel:	
	Iron, pig and puddled	5.218,660
	" bar, angle, bolt and rod	2,376,379
	" railroad	5,072.353
	" wire	827,915
	" tinned plates	4,457,887
	" hoops and plates	3,383,120
	" wrought, of all sorts	3,792,128
	" old, for re-manufacture	1,165,089
	Steel, wrought and unwrought	2,096,805
	Total	£ 28,390,316
4.	Coal, cinders and fuel	8,372,933
5.	Machinery	9,263,516
6.	Linen manufactures:	
	White or plain	4,818,841
	Printed, checked or dyed	150,182
	Other sorts	886,996
	Linen yarn	1,201,542
	Total	£ 7,057,561

—*Shipping.* The number of vessels carrying the British flag was at the beginning of the present century greater than that of any other nation of ancient or modern times, and during the present century it has quadrupled. The following table exhibits the total shipping of the United Kingdom, both sailing and steam, and for both home and foreign trade, for years 1867–80:

YEARS.	Number of Vessels.	Tons.	Men
1867	21,777	5,493,708	196,340
1868	22,250	5,516,434	197,502
1869	21,881	5,557 308	195,490
1870	22,180	5,559,110	195,962
1871	22,207	5,633,561	199,732
1872	22,554	5,761,606	203,720
1873	21,581	5,748,097	202,230
1874	20,872	5,864,588	203,606
1875	20,191	5.891,692	199,667
1876	20,349	5,996,152	198,638
1877	20,319	6,115,638	196,562
1878	20,094	6,236,124	195,585
1879	20,029	6,249,633	193,548
1880	19,972	6,344,577	192,972

— The following table shows the distribution of the total amount of shipping into sail and steam, and also into home and foreign trade, for the years 1866 and 1879, omitting the intervening years:

	YEARS.	Sailing Vessels.			Steam Vessels.		
		Number.	Tons.	Men.	Number.	Tons.	Men.
Home Trade...	1866	11,212	813,909	37,440	612	147,194	9,005
	1879	10,709	706,082	36,782	1,344	240,070	14,279
Partly Home and Partly Foreign	1866	1,546	278,167	10,055	110	47,194	2,050
	1879	909	126,027	4,743	209	84,496	3,153
Foreign Trade.	1866	7,454	3,612,973	109,073	784	553,425	28,748
	1879	4,831	3,082,567	73,652	2,027	2,006,591	60,939

It will be seen from this that the proportion of steamers is growing so rapidly that before very long the sailing vessels will be in the minority. The tendency of the merchant vessels is to increase in size and tonnage. The average tonnage has more than doubled since 1840, and in this way the nation has effected a saving of 123,000 seamen, as compared with the former number of hands to tonnage, as we may see from the following table:

YEARS.	Total Tonnage.	Sailors	Tons Per Man.
1849	3,096,000	153,000	20
1861	4,360,000	172,000	25
1877	6,116,000	197,000	32

According to the scale of 1849 it is obvious that 320,000 seamen, instead of 197,000, would be required to man the British merchant fleet at the present day. The saving thus effected in gross amounts to 38 per cent., thus allowing a great reduction of freight charges, and enabling food and raw materials to be imported, and manufactures to be exported, with less expense and greater profit. — The proportion of trade done all over the world in British vessels is as follows: United Kingdom, 55.120,000 tons, or 88 per cent.; United States, 7,434,000 tons, or 59 per cent.; Canada, 5,673,000 tons, or 80 per cent.; France, 5,254,000 tons, or 36 per cent.; Australasia, 4,492.000 tons, or 93 per cent.; Netherlands, 3,790,000 tons, or 51 per cent.; Germany, 2,298,000 tons, or 36 per cent.; Italy, 1,887,000 tons, or 23 per cent.; South America, 1,200,000 tons, or 50 per cent.; West Indies, 1,180,000 tons, or 60 per cent.; Russia, 1,006,000 tons, or 34 per cent.; South Africa, 1,004,000 tons, or 86 per cent. The total carrying trade of Great Britain is therefore about 90,000,000 tons, which, at an average of 10s. ($2.40) per ton, yields an income of £45,000,000 per annum. The sum paid by British underwriters averages £1,500,000 yearly, being about £6 per ton on vessels and £8 per ton on cargoes. The total amount of marine insurance usually exceeds £450,000 —

Railways. From the opening of the first railway, in 1825, down to the end of 1850, the number of miles of railway constructed in the United Kingdom was 6,621; this was at the rate of 265 miles annually. In 1860 the length of lines was 10,433, the average rate of construction being 381 miles annually. At the end of 1879 the length of lines was 17,696, the annual average on the total length having increased to 402 miles. The principal recent railway statistics of Great Britain are comprised in the following table:

YEARS.	Length of Lines open at the end of each Year.	Total Capital Paid Up (shares and loans) at the end of each Year.	Number of Passengers Conveyed (exclusive of season ticket holders).		Traffic Receipts	
			Total.	Per Mile.		Per Mile.
	Miles.	£	No.	No.	£	£
1871	15,756	*552,680,107	375,220,754	23,814	48,892,780	3,063
1872	15,814	569,047,346	422,874,822	26,740	51,304,114	3,244
1873	16,082	588,320,306	455,320,288	28,312	55,675,421	3,462
1874	16,449	609,895,919	478,316,701	29,078	56,901 281	3,459
1875	16,658	630,226,942	507,532,187	30,468	58,982,753	3,541
1876	16,872	658,214,776	538,681,722	31,928	59,917,868	3,551
1877	17,077	674,059 048	551 593,654	32,301	62,973 328	3,687
1878	17,335	698,545,154	565,024.455	32,594	60,486,122	3,485
1879	17,696	717,003,469	562,732,890	31 800	59,395,282	3,356
1880	17,945	728,621,657	603,884,752	33,652	61,954,754	3,453

At the end of 1878 the total length in miles of railways in the British empire was as follows:

United Kingdom			17,335
India		8,215	
Ceylon		92	
Dominion of Canada		5,574	
Jamaica		25	
British Guiana		21	
Australasia	New South Wales	650	
	Victoria	931	
	South Australia	292	
	Queensland	298	
	Tasmania	175	
	New Zealand	718	
		3,064	
Cape Colony and Natal		154	
Mauritius		66	
			17,211
Total			34,546

At the end of 1879 between 5,000 and 6,000 miles of new lines were in process of construction in the different parts of the empire. The railways in the United Kingdom employ a force of 276,000 men. No less than 176 members of parliament are railway directors. From 1847 to 1873 the number of passengers killed per million steadily decreased; since 1873 it has risen, as is shown in the following table:

In	1847-9	the	ratio	of deaths was	1 in 4,782,000
	1856-9	"	"	"	8,708,000
	1866 9	"	"	"	12,941,000
	1871-3	"	"	"	20,083,000
	1874-8	"	"	"	11,688,000
	1879	"	"	"	5,350,000

JOHN FISKE.

GREECE, a kingdom in the southeast of Europe, consisting of old Middle Greece (Hellas), the Peloponnesus (Morea) and the islands Eubœa, the Cyclades, the Northern Sporades, and, since Nov. 14, 1863, of the Ionian islands, which up to that time had been an independent state under the protection of England. The kingdom of Greece has an area of 19,941 English square miles, and a population (1879) of 1,679,775, of which number 37,598 are Albanians, 1,217 Wallachians, a total of 29,126 foreigners, *i. e.*, Germans, French, English, Italians, and comers from the Ionian islands. The rest of the population are modern Greeks; that is, descendants of the ancient Hellenes, with a mixture of Slave blood. They speak the Greek language. The majority of the population belongs to the orthodox Greek Catholic Church. In 1870 there were 12,585 Roman Catholics and 2,582 Jews in the kingdom. The capital is Athens, with a population of 68,677. Greece won her independence, after a long struggle, from Turkish rule, and was declared a sovereign kingdom by the London protocol of Feb. 3, 1830. A treaty between England, France, Russia and Bavaria procured for Prince Otto the Grecian kingly crown; and he continued to reign until Oct. 22, 1862, when a provisional government constituted at Athens declared him deposed. On Dec. 22, 1862, the constitutive national convention assembled at Athens, on the motion of the protecting powers, chose Prince William (George), second son of the present king, Christian IX. of Denmark, (Schleswig-Holstein-Sonderburg-Glücksburg,) king of the Hellenes, under the title of Georgios I. But the constitutive national assembly established, in 1864, a new constitution of the monarchy, a constitution which King George swore to support, Nov. 26, 1864. According to the provisions of this constitution, the crown shall be hereditary in the male line of the king's posterity; it passes eventually to the younger brother of the latter; but in no case can the crowns of Greece and Denmark belong to the same monarch. The executive power is in the king, and in the legislature. The national assembly consists of a single chamber of 187 deputies. This chamber has taken the place of the former estates assembly, with two chambers. The members of the national assembly are elected at general elections, and by direct election. Elections for members of the assembly take place every four years. The supreme executive board consists of the council with the ministers of foreign affairs, of justice, of the finances, of worship, public instruction, war, the navy, and of the interior. For the purposes of administration the country is divided into thirteen *nomarchies* (government districts), at the head of which stands a *nomarch* (president): Attica and Beotia; Eubœa; Phthiotis and Phocis; Acarnia and Ætolia; Achaia and Elis; Arcadia; Laconia; Messenia; Argolis and Corinth; Cyclades; Corfu; Cephalonia; Zante. The subdivisions of the *nomarchies* are the *eparchies*, governed by an *eparch*. There are fifty-nine *eparchies*. The capital is under a special prefect of police. In the administration of justice the areopagus is the highest court. There are, besides a court of cassation at Athens, courts of appeal at Athens, Nauplia, Patras and Corfu. Subordinate to these are the sixteen courts, and courts of assize, besides which there are 175 "justices of the peace" for lesser civil cases and lesser criminal offenses. The metropolitan of the Greek Catholic church resides at Athens. There are fourteen archbishops and sixteen bishops. Roman Catholic archbishops are located at Romas and Corfu. There are four bishops under their jurisdiction. — By a statute of Jan. 15, 1867, a law of military duty, applicable to all, was introduced into Greece. The time of service, according to this law, begins with a person's twentieth year. He must remain six years in the reserve *corps* and ten in the *landwehr*. — According to the budget of 1880, the receipts of the Grecian state were estimated at 46,716,857 drachmas. The state debt amounted, in 1880, to 315,209,011 drachmas. — BIBLIOGRAPHY. K. BAUMBACH.

GREELEY, Horace, was born at Amherst, N. H., Feb. 3, 1811, and died near New York city, Nov. 29, 1872. He became a printer and a whig editor, founded the "New York Tribune" April 10, 1841, was a whig representative in Congress 1848–9, and was defeated in 1872 as liberal republican and democratic candidate for the presidency. The excitement of the campaign, the alienation of his personal and party friends because of his acceptance of the democratic nomination, and the sudden death of his wife, to whom he was tenderly attached, overwhelmed him, and he died of softening of the brain soon after the election. — Until 1872 Greeley's personality was usually merged in his newspaper. He made it the most prominent of abolition newspapers, but by no means confined it to abolition. In it he especially advocated a high protective tariff and the expenditure of surplus revenue upon public improvements; but he opened it also to the discussion of Fourierism, dress reforms, the marriage relation, vegetarianism, and every other theory which seemed to him to offer a possibility of good. These discussions and his personal eccentricities of dress and manner, impeded any general popular recognition of his real solidity of sense; and his nomination, solely on the score of availability, by his life-long political opponents, the democrats, was a sheer absurdity. Nevertheless it opened the way for *post-bellum* politics, and in this way Greeley's death was a sacrifice which was not made in vain. (See DEMOCRATIC PARTY, VI.; REPUBLICAN PARTY, III.) — See Greeley's *Struggle for Slavery Extension, American Conflict, Recollections of a Busy Life*, and *Essays on Political Economy;* Parton's *Life of Greeley* (1868); Reavis' *Life of Greeley;* Whitelaw Reid's *Memorial of Greeley;* Hudson's *Journalism in the United States; Galaxy*, March, 1873; Stowe's *Men of our Times.*

ALEXANDER JOHNSTON.

GREENBACK-LABOR, or NATIONAL PARTY, The (IN U. S. HISTORY). I. Before the war of the rebellion agriculture was under many disadvantages in the western states and territories. Grain, after the payment of transportation to a market, seldom paid any great profit, and the use of corn for fuel was quite common. During the war the government became a heavy customer of easy access, the mortgages on farms, originally due in gold, were paid in paper at from 50 to 60 per cent. discount, and in 1865 agriculture was at its flood tide of prosperity. All was commonly attributed, however, to the inflation of the currency by the introduction of "greenbacks," and since 1865 there has been a constant disposition among many men of all parties in the agricultural states to recur to the inflation of the currency as a remedy for evils of all sorts, for the loss of the government as a customer, for loss upon crops, or for general financial distress. — Another influence, closely kindred to the foregoing, is the feeling of many farmers that the bankers, particularly in the eastern states, whom they suppose to hold most of the bonds of the United States, made a hard bargain with the government in the time of its greatest need, and have been trying to make their bargain harder ever since; that, having paid for their bonds in greenbacks worth from 38 to 75 cents on the dollar, they would have been well paid in greenbacks at or near par; that they had influenced congress to give them, in the act of March 18, 1869, more than their due by making all bonds payable "in coin," even when the face of the bond did not specify the medium of payment, and that, when silver began to decrease in value as compared with gold, they had again influenced congress in 1873 to demonetize silver and thus make their bonds payable in gold alone. These two influences, aided by discontent at the exemption of United States bonds from taxation, have been the foundation of the greenback party proper; subsidiary influences only began to affect it after 1876. — So early as 1868 the proposition to pay in greenbacks that part of the national debt not specifically payable in coin, particularly the 5-20 bonds, had become known as the "Ohio idea." It controlled the democratic convention of that year see (DEMOCRATIC PARTY, VI.), and its leading advocate, Pendleton, was strongly pressed for the democratic nomination for the presidency. For some years afterward democratic state conventions throughout the western states reiterated the Ohio idea in their platforms, but this had generally ceased except in Ohio, before 1871, and disappeared in the coalition of the democratic and liberal republican parties in the following year. — II. GREENBACK PARTY. The passage of the resumption act of Jan. 14, 1875, committing the government and people to the payment of the debt in specie in 1879, revived the greenback feeling. The proposal of the measure had brought about a greenback convention at Indianapolis, Nov. 25, 1874, which adjourned after indorsing by resolution the three propositions which have been the foundation of all greenback platforms since that time: 1, that the currency of all national and state banks and corporations should be

withdrawn; 2, that the only currency should be a paper one, issued by the government, "based on the faith and resources of the nation," exchangeable on demand for bonds bearing interest at 3.65 per cent.; and 3, that coin should only be paid for interest on the present national debt, and for that portion of the principal for which coin had been specifically promised. The development of the new party was checked for a time by the continued adoption by democratic state conventions of the three propositions just mentioned; but it was revived again toward 1876 by the growing likelihood that the democratic nomination for the presidency would fall to Gov. Tilden, of New York, who was not an advocate of the Ohio idea. A national convention of the "independent" party, the formal name of the party at this time, was held at Indianapolis, May 17, 1876, and nominated Peter Cooper, of New York, for president, and Newton Booth, of California, for vice-president. The latter declined, and Samuel F. Cary, of Ohio, was substituted. The platform indorsed the three propositions above mentioned, and demanded the repeal of the resumption act. In the presidential election the greenback candidates received 81,737 popular votes, over half of them in the five states of Illinois, Indiana, Iowa, Kansas and Michigan.— In the state elections of 1877 the vote of the party rose to 187,095. Greenback state tickets were nominated in most of the northern states, though they had little popular strength outside of the western states — III. GREENBACK-LABOR PARTY, or NATIONAL PARTY. Workingmen's parties have always been occasional features in state and local politics. About 1877 they began to be more general, and the grievances which led to the railroad riots of that year gave them a national importance. In some state elections, as in Massachusetts and Pennsylvania, the "labor reform" and "greenback" parties united, and the union was made national by the convention of Feb. 22, 1878, at Toledo, Ohio. This convention recognized the name "national" for the party, which seems to have been first used in Ohio in 1877, but the usual name for the party continued to be "the greenback-labor party." The platform added to the former greenback platform some resolutions in favor of legislative reduction of workingmen's hours of labor and against the contract system of employing inmates of prisons. — In the state and congressional elections of 1878 the greenback-labor vote suddenly rose to over 1,000,000, and fourteen congressmen were elected by it. The increase, however, was almost entirely due to the fact that the party had become a union of all the discontented elements. Its greatest development was in states like Iowa, Maine and Massachusetts in the north, or West Virginia, Georgia and Missouri in the south, where the dominant party's majority was fixed and large, and where the minority in despair adopted the greenback-labor organization as the only possible means of success. In the north the fusions were of democrats and nationals; in the south they were of republicans and nationals; while in the closely contested and doubtful states the national vote amounted to nothing except as a means of drawing off a small per centage of votes from the democratic or republican party. (See MAINE, DELAWARE, MASSACHUSETTS.) Thus, of the fourteen congressmen above mentioned, five were "republican-nationals," seven "democratic-nationals," and but two "nationals" pure and simple.— The party's national convention was held at Chicago, June 9, 10, 1880, and nominated Jas. B. Weaver, of Iowa, and B. J. Chambers, of Texas, as its presidential candidates. The latter is said to have declined the nomination, but no substitute was appointed. The platform renewed the former greenback platform, and added various resolutions in favor of the eight-hour law and the sanitary regulation of manufactories, and against Chinese immigration, land grants to railroads, and grants of special privileges to corporations and bondholders. The party's popular vote in the presidential election was 306,867, being about 3 per cent. of the total vote. The number of greenback-labor congressmen was reduced to eight, four from Missouri, two from Maine and one each from New York and Texas. — The leaders of the party have been Gilbert De La Matyr, of Indiana; Weaver, and Edward H. Gillette, of Iowa; Hendrick B. Wight, of Pennsylvania; and Solon Chase, Geo. W. Ladd, and Thompson H. Murch, of Maine. Of these, Chase has never been in congress; and all the others, except Ladd and Murch, failed to be re-elected in 1880. William D. Kelley, of Pennsylvania, a republican, was usually considered a greenback-labor member until 1880. — The political principles of the party are peculiar in many respects. Its proposition to pay the debt in that which is not money, but a promise to pay money, was a novelty in American politics before 1868, but will probably be renewed at intervals until the final extinction of the debt. Its opposition to banks is in the general line of the strict construction or democratic party's history (see LOCO-FOCO; DEMOCRATIC PARTY, IV.), and has given it most of its democratic allies. Its proposition that congress should assume the power to reduce workingmen's hours of labor, to regulate their sanitary condition, to reduce railroad freights in regulating interstate commerce, and to impose a graduated income tax, is entirely loose-construction in its nature. It is impossible therefore to specify any distinctive constitutional basis for the party's future. (See CONSTRUCTION, III.) ALEXANDER JOHNSTON.

GREENBACKS. (See U. S. NOTES.)

GUARANTEE, International. The necessity of securing to one's self the right of property in one's part of a common conquest or inheritance, and more recently the necessity of protecting small states against the ambition of large ones, has given birth to international guarantees.

The European balance of power can continue only by means of these guarantees: for how could Belgium and Switzerland on one side, and the Roumanian principalities and Servia on the other, maintain their independence without efficient protection, the one against France or Germany, the other against Russia or the Ottoman porte? The system of alliances between the weak and the strong would often attain the same object, but in the system of alliances small nations contract compromising obligations, and may at a given moment find themselves dragged into a European war, and they would be subject to its chances; while with the system of guarantees, whether the guaranteed states remain neutral, or even independent, their safety may be absolutely assured, they may escape the alternatives of the rivalry of great European states and pass the most dangerous crises as simple spectators. In this respect international guarantees present a considerable advantage to weak states. Hence, international guarantees are an improvement and a progress in the formation of the European equilibrium, which is such a difficult and laborious work. For several centuries all politicians capable of extending their views beyond the egotistical interests of their own country to the general good of mankind, have endeavored to establish a system of states, constituted with sufficient strength and durability to prevent Europe from becoming the prey of one of those large nations which are struggling for primacy—an event with which it has been several times threatened. Can international guarantees obtain this object partially? We think so. We shall cite several examples of these guarantees in order to show what they are. It is known that the powers assembled at the congress of Vienna joined in a final act dated June 9, 1815, and that all signed the various stipulations, relative to the territorial redistribution of Europe, which had become the object of several separate treaties. This act sets forth in its articles 84 and 94 that the neutrality of Switzerland is *recognized and guaranteed.* In a subsequent special act, exchanged at Paris, Nov. 20, 1815, under the name of "Declaration between Austria, England, France, Prussia and Russia," the contracting powers declare, that they *recognize formally and authentically the perpetual neutrality of Switzerland, and guarantee the integrity and inviolability of its territory.* After the events which brought about the independence of Belgium, Holland made peace with the new state by the treaty of April 19, 1839, of which article seven declares that Belgium *forms an independent and perpetually neutral state, and that it will be held to observe this same neutrality with reference to all other states.* Now, the same day several acts were exchanged, one between the five great powers and Belgium, another between the five great powers and Holland, the third between the five great powers and Belgium, Holland and the Germanic confederation; and in these treaties the convention concluded separately between Belgium and Holland, and in which their neutrality is stipulated, is placed under the guarantee of the five great powers. In 1867, after Switzerland and Belgium, a third neutral state was constituted in Europe, the grand duchy of Luxemburg. The treaty concluded at London, May 11, 1867, between Holland, England, Belgium, Austria, France, Italy, Prussia and Russia, declares that the grand duchy *is a neutral state in perpetuity, and that this neutrality is placed under the collective guarantee of all the contracting powers, except Belgium, which is itself a neutral state.*— The stipulations of the final act of Vienna which we have cited above, show clearly what difference there is between an international convention and an international guarantee. The convention does not oblige the contracting party, against which the treaty is violated, to take up arms in defense of the treaty; this is a right, but not a duty. Thus the possession of Lombardy by Austria was stipulated in the final act of Vienna by the eight signatory powers; and nevertheless Austria was deprived of Lombardy by the arms of France in 1859, and Austria did not think of claiming the aid of any of the signatory powers. It is altogether different with the guarantee: the guaranteeing power has, to begin with, the right of intervening, if the treaty is violated, just as if a simple convention were in question; but in addition it is obliged to take up arms in defense of the thing guaranteed; it is obliged to do this on the demand of the guaranteed state or the co-guaranteeing states, whether the treaty has been violated by one of these or some other power. Such is the essence of the guarantee, without which it would not differ from the convention. It obliges the guarantor to take up arms at the moment required. A recent example shows that the guarantee should be understood in this sense. In 1870, when the war broke out between Prussia and France, it was feared that the neutrality of Belgium would be violated by one of the belligerents. England, according to the treaty of 1839, was one of the five great powers guaranteeing this neutrality; without appealing to the accompanying guarantee of Austria and Russia, she stipulated by two separate treaties of August 11, 1870, on one side with France, and on the other with Prussia, for the execution of the guarantee of 1839, and, in case this guarantee should be violated by one of the belligerent powers, she engaged to co-operate with arms in favor of this neutrality with that one of the two adversaries who should wish to defend it against the one violating it. England interpreted her duties soundly in thus declaring her readiness to take up arms even against one of the co-guaranteeing powers. — In the three examples of contemporary guarantees which we have just cited, the states guaranteed are neutral. This neutrality was constituted in the interest of peace and the equilibrium of Europe, in order to hinder the great neighboring states from disputing over the possession of these small territories. The effect

of the guarantee was to cause the neutral state to be respected, which without this would have been powerless for self-defense; and, on the other hand, the guarantee is subordinated to the observance of neutrality by the neutral state itself. If this state violated its neutrality, it would lose the benefit of the guarantee; every duty on the part of the guaranteeing states would disappear with reference to it; but the duty of making the neutrality respected would remain to the guarantors with respect to each other. For example, if Belgium had allied herself to France in 1870, we believe that Prussia would have had the right to require England, Austria and Russia to cause the treaty of 1839 to be respected by France and Belgium. But there is little probability that a neutral state would abandon a position so advantageous to itself, and put the guaranteeing powers in movement by its own ambition. These run the danger of having to protect it either from the attacks of one of themselves, or those of another nation. The case is different when the guarantee applies to a state not tied by international law, and which preserves the fulness of its liberty. Turkey since 1856 is the subject of a guarantee of this nature. By article seven of the treaty of Paris of March 30, 1856, which put an end to the Crimean war, Austria, England, France, Prussia, Russia, and Sardinia which subsequently became Italy, *engaged each on its own behalf to respect the independence and territorial integrity of the Ottoman empire; they guaranteed collectively the strict observance of this engagement, and declared that they would consequently consider every act hostile to this as a question of general interest.* A separate treaty, concluded April 15, 1856, between England, Austria and France, confirmed with reference to these three states the obligations resulting from the preceding treaty. This treaty declared that *the three signatory states guaranteed collectively the independence and integrity of the Ottoman empire consecrated by the treaty of March 30, and that every infraction of this treaty would be considered by these signatory states of the treaty of April 15 as a casus belli.* The guarantee thus given to Turkey differs from those touching Switzerland, Belgium and the grand duchy of Luxemburg in this, that the situation which it undertakes to maintain may be imperiled, not only by an act of the co-guaranteeing powers or other states which might attack Turkey, but also by an act of Turkey itself, which, not being held to neutrality, may, by making war on another nation, lose its integrity and independence. What in the last case would be the duties of the guaranteeing powers? We believe that the guarantee could not be invoked by Turkey, which would have compromised its position by its own fault, but we believe that one of the guaranteeing powers, in whose interest the integrity of Turkey was stipulated, might either interfere individually or appeal to the co-guarantors to interfere collectively. Thus in our opinion the obligations of the guarantee are different when applied to neutral states, from what they are when applied to independent states. — The same treaty of March 30, 1856, constituted a guarantee of a third kind in favor of the two Roumanian principalities and the principality of Servia with respect to Turkey. Article 22 states that *the principalities of Wallachia and Moldavia shall continue to enjoy, under the suzerainty of the porte and the guarantee of the contracting powers, the privileges and immunities which they possess. No exclusive protection shall be exercised over them by one of the guaranteeing powers. There shall be no particular right of interference in their internal affairs.* Article 28 states that *the principality of Servia shall continue to depend on the porte in conformity with the imperial hatti which fixes and determines i's rights and immunities, placed henceforth under the collective guarantee of the contracting powers.* Thus they became two vassal states guaranteed against their suzerain in the possession of their rights; this is a special and definite guarantee; it is limited to the case in which the suzerain should attempt to abuse his superior power. It is given to the vassal against the suzerain; it does not extend to the case in which a stranger state should attack the vassal. — It will be observed that in all the conventions which establish international guarantees, no term of duration is assigned to the guarantee. The obligation contracted is therefore perpetual, unless the contract is canceled according to the forms admitted by all other international contracts. We have a quite recent example of the modification of a treaty by the common consent of the contracting parties. The treaty of March 30, 1856, was revised by the treaty of London, March 13, 1871, in its provisions relative to the neutralization of the Black sea. In the same way the guarantees may come to an end by the consent of the co-guarantors; but is it right that in default of this common agreement a nation should remain bound forever by agreement full of danger to itself? We think not. Contracts of an international guarantee, like contracts of a similar nature concluded by private persons, should have only a limited duration. It is not right that either nations or individuals should find themselves so situated that they can not free themselves from an engagement which has become impossible, except they do so through a dishonest act, or by making an heroic sacrifice. The utility of international guarantees for the peace and repose of Europe is very great. They should not, therefore, be too risksome for the co-guarantors. The responsibilities which they impose may be very onerous as was shown by the double convention which England was obliged to conclude in 1870 to preserve the neutrality of Belgium. The danger revealed by this event aroused in England a general uneasiness with regard to various international guarantees in which it was involved, an uneasiness which had manifested itself as early as 1867 after the treaty relative to the grand duchy of Luxemburg. Lord

Stanley, in the house of commons in 1867, calmed this feeling by the argument that each one of the guaranteeing powers, in a treaty which stipulates a collective guarantee, is not held individually, but only collectively with all the co-guaranteeing powers. At the same time the earl of Derby enunciated the same doctrine in the house of lords, and cited the treaty of March 30, 1856, as an example of the collective guarantee which obliges all together, and none separately, and the treaty of April 15, 1856, as an example of the individual guarantee which obliges each guarantor whatever the conduct of the co-guarantors. The question was again discussed in the house of lords, March 6, 1871, between Lord Malmesbury and Lord Granville, and April 12, 1872, in the house of commons, where Mr. Gladstone, in language very carefully worded, made an explanation from which it results that the engagements of international guarantees are not binding in an absolute manner on the contracting powers, and that their execution may be subordinated to circumstances. This doctrine is not admissible; it is as contrary to the text of the treaties as to morals, and there is no need of refuting it. But we find the distinction established by Lord Stanley and the earl of Derby partially correct, according to which England was not bound by the guarantees regarding the grand duchy of Luxemburg and Turkey except in so far as the co-guarantors decided to fulfill their obligations. This interpretation is too absolute, for if the co-operation of all the co-guarantors is necessary to render the obligation binding, the bad faith of one of the parties may annul the whole guarantee. What may be admitted is this, that if the majority of the guaranteeing powers refuse to co-operate, the minority are freed from their obligations and retain merely the right of interfering if they think proper. The difference noted by the earl of Derby between the treaties of March 30, 1856, and April 15, 1856, is a real one; the first mentions a collective guarantee and the second a guarantee of all and each. The latter, according to the principles of private law, binds each power individually even if the others should not act. The interests of European peace require that international guarantees should be serious, and in order that they should be so we think their duration should be limited to a definite period, and treaties should explain more precisely the obligations they impose. F. A. HÉLIE.

We wish to insist, above all, on the necessity of limiting the guarantee to a certain number of years. It is impossible to foresee events long in advance; it is imprudent, therefore, to bind one's self for an indefinite period. It is doubtless impossible to foresee circumstances even for a relatively short period, ten or twelve years, for example. But as in political and social life it is impossible to go so far as to refuse every engagement concerning the future, the risk is lessened by limiting the engagement to a fixed period. We can generally calculate with sufficient accuracy the probable chances for ten or twenty years; these are very short periods for a non-revolutionary nation. — On the other hand, a serious and efficacious guarantee of ten or twenty years duration, (and not one in name, which is no guarantee at all), would generally suffice either to consolidate a new state (established and maintained by its own population), or to allow the danger to pass which comes of the claims or the selfishness of a man, or from passion of any kind. If, on the contrary, the object of the guarantee is to assure permanence to any state of things, what is there to hinder a periodical renewal of the treaty of guarantee? Consequently our advice is to guarantee rarely, to guarantee only for a definite period and in specific cases, and to guarantee only with serious intent.

MAURICE BLOCK.

GUATEMALA. *Historical.* During the Spanish rule the kingdom of Guatemala included the five provinces of Guatemala, Honduras, San Salvador, Nicaragua and Costa Rica. After their declaration of independence in 1821 they joined Mexico for a short period, but, two years later, formed themselves into a federal republic, under the presidency of Morazan. This state of things was not long-lived. In 1832 the confederacy had merely a nominal existence. In fact, the five states had already separate governments. Morazan's two defeats, in 1839 and 1842, and his death in the latter year, destroyed the last traces of federalism and left the field free to the champion of separatism, a creole, Don Rafael Carréra. Gen. Carréra's rule was not established without difficulty. He gave himself out as the armed representative of democracy. He had to meet, therefore, the opposition of the wealthy classes. But when his power was once well established he made very large concessions to the social interests of these classes, and the constitution of October, 1851, voted by an assembly whose members owed their election to him, was far from being demagogic. According to the terms of this constitution, which was revised in 1859 without any very important modifications, it is necessary to have a profession, property, or some trade furnishing the means of living independently, in order to be a citizen of Guatemala. Public functions can only be exercised by persons enjoying the rights of citizenship. The appointment of a foreigner to the performance of these functions confers on him the quality of citizen. — The government consists of the president, council of state and the house of representatives. The president is elected for four years, by an assembly composed of the house of representatives, the metropolitan, archbishop, members of the court of justice, and the council of state. He is re-eligible indefinitely. The president directs foreign affairs, makes treaties of alliance and commerce, is the custodian of public order, and, in conjunction with the council of state, has the pardoning power; proposes

and sanctions laws, and in case of urgency issues decrees which have the force of law; presents to ecclesiastical dignities; and may, in an urgent case, contract a loan when the legislature is not in session, provided he calls an extraordinary session immediately after. The choice of ministers plenipotentiary and the principal financial officers must be confirmed by the council of state. The council is composed of the secretary of state, eight councilors appointed by the house of representatives, and as many members as it pleases the president to appoint from among the former chiefs of the executive power, the former presidents of the representative bodies, the former ministers of state, and the presidents and regents of the court of justice. The council is elected for four years. The house of representatives, whose term of office is the same, consists of fifty-two deputies. It votes the budget, examines and corrects accounts, and has the right to impeach the president, the ministers, councilors of state and ministers plenipotentiary; its ordinary session commences Nov. 25 and ends Jan. 31. It has the power to revise the constitution, with the concurrence and sanction of the government — In 1855 President Carréra, in accordance with wishes which were more or less spontaneously and sincerely expressed in several large cities, was constrained to accept the presidency for life and the power of appointing his successor. Till 1862 the government met no serious obstacles at home. But at that epoch Carréra had to defend his authority and his life against insurrections and conspiracy, with which the army was not unacquainted. Carréra died in 1865. — *Area and Population.* The area of the state is estimated at 41,830 square miles. According to a census taken in 1880 the population is 1,215,310, of whom a third are of European descent and two-thirds "aborigines." Diversity of race is one of the great causes of the troubles which agitate the Central American countries. — The capital of Guatemala, Santiago de Guatemala, has 57,728 inhabitants, one-tenth of whom are of European origin. — *Finances.* In the year 1879 the sources of revenue and branches of expenditure of the state of Guatemala were as follows:

REVENUE.	
Import duties	$1,144,158
Export duties	267,668
Spirit licenses	900,988
Tax on sugar-cane plantations	41,305
Extraordinary and miscellaneous receipts	2,159,021
Surplus of 1878	21,617
Total revenue	$4,534,757

EXPENDITURE.	
Interest of public debt	$1,000,382
Army	1,278,994
Pensions	24,671
Ministry of foreign affairs	102,311
Ministry of interior and finance	734,852
Ministry of public works	31,092
Public instruction	245,695
Miscellaneous expenses	835,760
Total expenditure	$4,534,757

On Jan. 1, 1880, the debt of Guatemala amounted to $7,334,358. — *Army.* Guatemala has a standing army of 2,180 men, and a militia of 33,229 men. — *Public Instruction.* The higher and middle schools are in the hands of the Jesuits. By the provisions of the concordat the supervision of all departments of education belongs to the clergy. — *Church and State.* Ecclesiastical affairs are regulated by the concordat of April 17, 1852, which contains very nearly the same provisions as the concordats concluded between the holy see and the other states of Spanish America. Nevertheless, in civil and criminal matters, ecclesiastical jurisdiction is maintained in all questions which arise exclusively between the clergy. — *Administration of Justice.* The administration of civil and criminal law is nearly the same as it was under Spanish dominion. Above the lower tribunals is a supreme court whose members can be removed only in cases specially provided for by the constitution. — *Resources.* Guatemala abounds in dye and cabinet woods, gum and balsam trees, and sugar cane; palm trees grow there in abundance. The principal exports are coffee, cochineal, skins, indigo and cotton. The total exports in 1880 were estimated at $4,425,000, and the total imports at $3,647,000. The foreign trade is almost entirely with the United States and Great Britain — The position occupied by Central America between the two oceans, with its numerous watercourses, some of which flow into the Atlantic and others into the Pacific, is of a nature to greatly facilitate communication between the two oceans. In 1861 the five states of Central America accepted the proposition made by the state of Costa Rica to establish in the city of Leon (Nicaragua) a general council to be entrusted with the management of foreign affairs, the command of the army, and the collection of customs which were to be levied thenceforth according to a common tariff. The same committee was to establish a uniform system of weights, measures and coinage. This was in reality a return to federalism, the system for which Morazan struggled during twenty years. — BIBLIOGRAPHY. GUILDS. Several causes have of late years awakened interest in the mediæval guilds. The rise and growing importance of trades-unions and the differences between labor and capital, have led economists, especially in Germany, to investigate the points of analogy between these

ancient and modern associations. The enormous wealth of some of the surviving London trade companies has led to inquiries into their origin and history. Dr. Luigi Brentano's works have contributed much to attract attention to the whole subject. This eminent writer, however, has allowed certain views respecting the modern trades-union to bias and color his account of the mediæval guild, the importance of which he has exaggerated; while he has also been led to misconceive in some degree its constitution and its position as a factor in mediæval economy, by overlooking two other factors of greater power and yet higher antiquity, the town or civic commune and the state. Without a clear apprehension of the parts filled by these two factors and of the relation in which they stood to the guild, it is impossible to understand the true place and functions of the last institution, or the real course of its development and history. — The guild, according to Dr. Brentano, was the germ of the constitution of the mediæval town. The organization and polity of the town had in fact a more archaic source. Could a full history of the early English towns be recovered, it would exhibit many varieties of development under diverse conditions of origin, situation, physical geography, tenure and local surroundings. But however different their career and fortunes, their growth and structure had in ordinary and typical cases some broad features in common. Their rise and growth were not in accordance with what seemed to the economic philosophy of the last century the natural order of things. The original germ was not a concourse of individuals attracted together by the pursuit of gain, but an organized community bound together by ties of kinship. Broad as the contrast is to modern thought between the city and the rural village, the fact which throws most light on the essential features of mediæval urban economy, is the evolution of the city in normal cases from the old village community, *vicus* or township, or an aggregation of such communities; the members of which were kinsmen or fellow-clansmen, with exclusive rights over the village territory and all advantages to be derived from it, equal lots in the arable land and common enjoyment of the pasture and forest. No stranger could settle within the mark without the permission of the community, or share in their rights without formal adoption. Every member of the little body must farm as the village assembly thought fit, or according to common usage. If any special crafts or trades had grown up, or had been admitted from without, they were subject to control and regulation, and the craftsmen were bound to accept customary remuneration, or such as seemed reasonable to the community and its governing body. Every one within its borders was either a kinsman by blood or adoption and a copartner, and therefore bound by fellowship and unity to conform to its customs and rules, or a servant or stranger on sufferance, and, as such, bound to obedience. In all cases there was a subordination of the individual to the community. The village assembly controlled the rotation of fallow and crop, the use of the forest or waste, the processes of trade, the payment for labor, and the prices of such commodities as were sold within the township. It was not a mere agricultural community. The townsmen had co-ownership of their territory not only for the purpose of husbandry, but in relation to every means of subsistence and profit to be derived from it, whether by means of hunting, fishing, pasture or the practice of handicrafts or trade. Where local conditions favored the growth of commerce, a mediæval guild might spring up for its protection and regulation, but the powers which such a body exercised, unless conferred in later times by the crown, must be regarded as originally derived from, if not expressly granted by, the town community or its governing body. In like manner when industrial progress and the extension of the market led to the formation of special craft guilds or trade fraternities, these must be considered as owing their powers, jurisdiction and exclusive rights to the town, and as exercising them subject to its control. The state or national government, or the king as its head, might override local authority and confer special privileges on a particular trade fraternity or body of craftsmen, but otherwise the guild drew its rights and privileges from the civic body, and was regarded as possessing them not for its own subsistence or profit only, but for the good of the whole town and its burghers. Hence, too, the civic authorities, following the usage of the primitive township, regulated wages and prices.— But, as already said, to understand the economy of the mediæval town and the position of the guild, we must take account of another factor in the constitution of early Teutonic society, the state or central government, acting as the representative of the whole nation. Beyond assigning to the clan or body of kinsmen settling down in a *vicus* or township their mark or common territory, the central government originally did not intervene in the affairs of the local community, unless to compel its members to perform military or public duties, but the right to control them in all matters, if not involved in the fundamental relation between the two bodies from the first, was at least subsequently evolved from it. And in proportion as the state grew stronger and better organized on the one hand and industrial development advanced on the other, the intervention of the state began to extend to trade internal and foreign. This function of the state or the king was not regarded as essentially different from that of the administration of justice. As to enforce just weights, measures and money was not considered fundamentally distinct from the maintenance of just dealing between man and man in relation to property and the observance of contracts, so to secure good and genuine commodities at reasonable, moderate and equitable prices, as opposed to exorbitant and extortionate charges,

partook of the nature of the maintenance of justice; though in later times the growth of the maxim *caveat emptor* removed this branch of jurisdiction from the tribunals. The king's court not only intervened, on complaint before it, to compel the strict observance of royal charters to guilds, but enforced on the trades generally both special ordinances of the king and principles of the common law relating to the quantity, quality and price of wares. The guild system never reached so great a development in England as in Germany or even in France; the earlier centralization of government and establishment of royal authority diminishing the power of both town-governing bodies and guilds in England, as the inferiority of its civic architecture still indicates. No such splendid town halls and guild halls rose in the English cities as were to be seen on the continent of Europe. As the governing body of the mediæval town represented the civic community evolved from the township or aggregation of townships, so the state represented the larger community of the nation evolved from the tribe or aggregation of tribes. And ancient ideas of the relationship of the members of the tribe and the duties they owed to one another, underlay in altered forms the whole industrial and commercial structure of mediæval society. The trader was regarded as trading for the advantage of the public, not for his own gain, in respect of which he was held entitled only to a fair livelihood and to such profit as secured it. — No records of the beginnings of the earliest trade guilds exist, but when they first come before us in history, they bear all the marks of having been modeled and organized on the type of the archaic joint family. The principle *natura non facit saltum* is as applicable to the social as to the physical world. In Dr. Johnson's time, as we know from Boswell's accounts of his tour in the Hebrides, various crafts were still hereditary in the highlands of Scotland, as they are still in the east, and as there is reason to believe they once were in English townships and manors. And when the village community grew into a town in which the demand was sufficient to employ a number of persons, several branches of the same family might follow the same craft, dwelling side by side, and organized like a joint family. There is no foundation for Dr. Brentano's supposition that England was "the birthplace of guilds." Trade guilds, doubtless of higher antiquity than any purely English institution, existed in India in the middle ages; and the Indian caste is in one of its aspects simply a wider development than the guild of a joint family following hereditarily a particular occupation. A few of the mediæval trade corporations in France may have descended from the Roman *Collegia*. Some certainly are traceable to the organization, by the Frank conquerors, of their serfs into industrial bodies. The laws of the barbarians show that the German lords maintained great establishments of serfs skilled in various industrial arts; and it is well established that in many towns on the continent of Europe during the middle ages, there were organizations of bondsmen in crafts. But the original and typical trade guild, there is strong reason to believe, grew out of a joint family of freemen pursuing an hereditary employment. We find, then, three great original factors in mediæval urban economy, the town commune, the state and the guild; and without reference to all three it is impossible to understand the position and founding of the third. The constitutions and regulations of the guild did not flow simply from its character as a brotherhood or joint family. It stood within and subordinate to the town-governing body on the one hand, and the state on the other hand. The industrial and commercial organization of the towns in relation to prices, profits and wages, the processes of manufacture, the quality of commodities, the regulation of commerce internal and foreign, resulted from the action of the three factors—the legislature or the king, acting ostensibly on behalf of the public at large or the nation; the town authorities, representing the civic community; and the guild, looking to the interests of the particular trade and the fraternity which practiced it. Dr. Ochenkowski has justly criticised Dr. Brentano's description of the organization, discipline and regulations of the guilds, as overlooking their subordination to the state, the king, the law and the tribunals; and as ascribing to the parental character of the guild in respect of its own members on the one hand, and its regard for the public good on the other, much that was the result simply of compulsory obedience to the supreme government and the law of the land. The fundamental principles of the ordinances of the guilds, Dr. von Ochenkowski urges, rested on the common laws of the realm; where a guild organization was granted it was with the proviso, implied if not expressed, that the rules must be in accordance with law; and the rights and duties of the guild members attached to them as citizens and subjects, so much so that in many cases where the craftsmen of a particular place had no organization, they were required to prepare the proper regulations. Dr. von Ochenkowski himself, however, overlooks the relation in which the town commune stood to all trades practiced and all bodies practicing them within its jurisdiction. All rights of trade within the town territory had originally belonged to the communal body. Just as the township had originally regulated the modes of husbandry, the rotation of crops, the times of sowing, plowing and reaping, the size of each man's lot in the arable land, the rights of common over the waste, and the number of animals that could be put on the common pasture, so it had original jurisdiction over all crafts and commerce within its boundaries. The ordinances of the London guilds were by consequence made under supervision and subject to the approval of the town council or the court of mayor and aldermen. The articles of the bowyers and fletchers ap-

proved in the 45th year of Edward III., afford an illustration. As Mr Riley, in his "Memorials of London and London Life," cites them from the records of the city, a petition to the court of mayor and aldermen of "the good folks of the trades of bowyers and fletchers," showed that it was "finally ordained and agreed between the said persons of the one trade and of the other, four men only excepted, for the profit and advantage of all the community, that no man of the one trade should meddle with the other. And counsel having been held between the mayor and aldermen upon the matter, it was agreed and granted by them that the articles in the said petition should in future be observed for the common profit of all the people. Afterward, at a hustings of common pleas of law, the aforesaid four persons came before the mayor and aldermen and said that they had divers things of each of those trades which they were working upon and not completed, and that some of them had apprentices in both trades and many bows and arrows finished for sale; and they wished for some respite, and for leave to complete the things aforesaid that were not completed, and that they might expose the same for sale, etc., so that they might be able in the meantime to decide which of the said trades they should elect to adopt and follow from henceforth. And the same was granted unto them." — Rules limiting the number of apprentices a craftsman might keep, or the hours which he might work, might be secretly designed by the members of a craft guild to limit competition and production and to keep up prices, but they were submitted to the town authorities and sanctioned by them as tending to secure efficient work and good articles; and as, for that end, prohibiting craftsmen from taking more apprentices than they could efficiently teach, or from working at night by insufficient light and at the risk of fires in the city. The theory of the organization, discipline and regulations of the guilds was that the good of the community, not the gain of the members of the craft, was the paramount object, and that the craftsmen owed obedience to the town authorities who had granted to them their privileges and powers. There is no trace in the history of the English towns of any general struggle, such as Dr. Brentano has assumed, between patrician members of a great mediæval guild and plebeian members of craft guilds. But the governing body of the town, as exercising the ancient rights of jurisdiction of the civic community, regarded with natural jealousy attempts on the part of a particular craft to set aside its control and to exercise unauthorized jurisdiction over its own members and those of cognate trades, as the London weavers attempted to do. The contest between the weavers and the city in London (where it is uncertain if there was any primitive merchant guild) was not one between patricians and plebeians, but between the legitimate government of the citizens and a trade fraternity which aimed at complete independence on the ground of a special royal charter, the powers conferred by which it was ultimately convicted before the king's judges of exceeding. — The three great factors in mediæval urban economy, the town government, the state and the guild, were sometimes in unison, sometimes at variance. But all three were essentially adverse to the idea that the gain of the individual trader was to be his paramount object. The welfare of its citizens was the object of the town; the state aimed professedly at the general good of the public, though often really consulting chiefly the interest of the governing classes; and the guild, while ostensibly seeking the benefit of the community at large of consumers, made the advantage and credit of the trade and the fraternity practicing it its dominant object. The notion that every man had a right to settle where he liked, to carry on any occupation he thought fit and in whatever manner he chose, to demand the highest price he could get, or, on the contrary, to offer lower terms than any one else, to make the largest profit possible and to compete with other traders without restraint, was absolutely contrary to the whole structure and spirit of mediæval economy. — Much misconception exists with respect to the policy and effect of the enactments of Edward III.'s 37th parliament, which ordained that every craftsman should choose his occupation, and abide by it thenceforth without following any other, and that merchants should deal in only one kind of merchandise. Some have regarded these statutes as creating a division of labor. The first of the two in fact only recognized a separation of occupations which had naturally taken place, as in the case of the bowyers and fletchers already referred to. Though the legislature could not have sought to initiate the separation of trade, of making bows from that of making arrows, and would never have conceived the idea of such a separation had it not spontaneously arisen. Nor could it have entered into the minds of legislators to subdivide the business of making knives into three distinct trades of bladesmiths, sheathers and cutters. The division of labor was no discovery of Adam Smith's, neither was it a discovery of Edward III. and his parliament, who simply acted on a well-understood principle that it tended to secure good and cheap articles for consumers; while at the same time it prevented quarrels between trades people about what they might sell, such as often occurred. The act of the 37th of Edward III. c. 6, did indeed attempt to introduce a novel division of labor by compelling every merchant to deal in only one kind of merchandise. It was speedily found that the enactment tended to defeat its real object, which was by no means what Dr. Brentano has supposed. This eminent writer speaks of the act as "a legal recognition of the principle of the trade policy of the craft guilds, namely, that provision should be made to enable every one with a small capital and his labor to earn his daily bread in his trade freely and independently, in opposition to the principle of

the rich, freedom of trade." The real policy of the measure was to keep down prices in the interest of the governing classes. The idea of the legislature at the moment was, as the petition on which the act was grounded expresses it, "that great mischiefs had newly arisen, as well to the king as to the great men and commons, from the merchants called grossers, who engrossed all manner of merchandise vendible, and who suddenly raised the prices of such merchandise within the realm." It was immediately found that so absurd an interference with commerce would not tend to the advantage of rich consumers, and the enactment was repealed in the next parliament. But its policy was the same as that of the statutes of labor of the same period: the regulation of prices ostensibly for the good of the public, but really of the governing orders. — The middle ages were profoundly hypocritical, and the state, the town and the guild alike frequently professed to study the welfare of the public, when the real object was the advantage or gain of a particular class, or local community, or body of traders. There was a principle of exclusiveness, monopoly and self-seeking at the root of every early association, whether the tribe, the village community, or the family. All these—and mediæval economy was based on these original principles of organization—were exclusive bodies and occupied a position of antagonism toward strangers and the world without. They combined, it is true, with the principle of exclusion that also of adoption; putting the one or the other into practice according as their own interests at the moment suggested. The mediæval guilds became ultimately such grasping and extortionate bodies as well to merit Bacon's condemnation of them as "fraternities of evil." Yet their later career was not simply degeneracy as Dr. Brentano describes it; it was a development of the principle of exclusiveness inherent in the spirit and constitution of every early form of human association.

GUNBOAT SYSTEM, The (IN U. S. HISTORY). President Jefferson succeeded an administration which had begun the formation of a navy, and for the first year of his first term he made no open effort at a change in this particular. In his message of Dec. 15, 1802, he proposed the addition to the navy yard of a dry dock in which the vessels of the navy could be laid up under cover. This proposition was much ridiculed as a fresh instance of Jefferson's ruling passion for public economy. About the year 1803 the president's attention seems to have been attracted to the figure made in naval action by the armed galleys of the Barbary and other Mediterranean powers, and it seems to have struck him that here was a species of vessel which, in American hands, would prove a very effective and, above all, economical naval force. Feb. 28, 1803, an act was passed appropriating $50,000 to build gunboats, mainly for use on the Mississippi; but the acquisition of Louisiana gave further time for experiment. The message of Nov. 8, 1804, announced the expenditure of the appropriation, and expatiated with considerable enthusiasm on the utility and economy of a gunboat system instead of a navy. This part of the message was referred to a house committee of which Nicholson was chairman, and to this gentleman the president, in a letter of Jan. 29, 1805, fully elaborated his pet scheme. He argued that coast and harbor defenses would cost at least $50,000,000, and could never prevent the entrance of a hostile vessel. A more advisable measure was to provide for the defense of the fifteen principal harbors by 240 gunboats, to cost from $2,000 to $4,000 each. The seamen and militia of the various towns were to be trained to man them, and the vessels were ordinarily to be drawn up under sheds, in which situation they would cost nothing but an inclosure or a sentinel to see that no mischief was done them. A few were to be kept constantly afloat as revenue cutters, and in case of war the emergency would determine the number necessary to be equipped. The gunboats were to be built in ten years, at the rate of twenty-five annually. Their effective force was to be increased by another feature of the plan. This consisted in loaning to the seaports heavy cannon, to be mounted on traveling carriages and dragged along the beach by the militia to points from which a hostile vessel or fleet might be annoyed or dislodged. — All this now seems a very extraordinary plan to be the sole reliance of a neutral nation against the unbridled license of the great European belligerents; but congress appropriated $60,000 to try the system, and at the following session, in 1806, fully adopted it, refused further appropriations for a navy, authorized the president to sell such frigates as required repairs, ordered the other vessels to be laid up in ordinary, and appropriated $250,000 for gunboats. The fact that New England federalists favored, and President Jefferson opposed, the creation of a strong navy was sufficient for the southern and western members of congress, and adherence to the gunboat system became, for nearly six years, a test of orthodox republicanism. Thus was inaugurated a system, founded in a confessed, and even avowed, ignorance of nautical affairs, which temporarily demoralized the navy, cramped its energies, proved utterly and hopelessly useless either for offense or defense, and never realized even Jefferson's leading ideal of economy, since the gunboats were found to cost about $10,000 each (instead of $2,000). Nevertheless the system was continued, in spite of the incessant ridicule of the federalists, and 103 gunboats were built in Jefferson's last year of office. — Much of the harbor defense during the war of 1812 was left of necessity to the gunboats, as the only important naval provision which had been made for war; but the gunboat system was no longer a test of party faith. Rodgers, of the navy, receiving early news of the declaration of war, and escap-

ing from New York harbor before orders to remain in port could reach him, vindicated the fair fame of his branch of the service by the capture of the Guerrière. Subsequent successful sea fights increased the popular enthusiasm for the navy, in which the democratic president and congress joined as heartily as if naval equipment had always been the main article in the party creed. The appropriations for the support of the navy rose from $1,870,274 in 1811 to $7,989,910 in 1814. The last appropriation for gunboats was made in 1813; after that time no attempt was made to build any other than sea-going vessels. But the initial successes of the little American navy had already drawn a strong detachment of the heaviest British vessels to the American coast, and toward the close of the war the capture or blockade of most of the national vessels compelled an unwilling dependence upon the gunboats on the seaboard. On the great lakes, the naval operations during the war advanced from the original employment of gunboats by both sides to the building of ships of over 100 guns.— See Cooper's *Naval History of the United States; American Register*, 1806–10; 5 Hildreth's *United States*, 538, 579, and 6: 29; 1 *Statesman's Manual* (Jefferson's *messages*); 4 Jefferson's *Works* (ed. 1829), 28; 2 Tucker's *Life of Jefferson*, 175; 1 Garland's *Life of Randolph*, 271; Carey's *Olive Branch*, 51; 3 Benton's *Debates of Congress*, 516 (see also index); 2 *Stat. at Large*, 206, 616, and 3: 105–144. ALEXANDER JOHNSTON.

H

HABEAS CORPUS is a writ ordered by a court of law or equity, to produce before it the body of a prisoner, that the court may inquire into the cause of imprisonment or detention with a view to protect the right of personal liberty. Properly speaking, this writ is known in law as *habeas corpus ad subjiciendum*. The term *habeas corpus* is, however, used as the formal commencement of several other legal writs known to English and American law, and of a character closely identified with the writ of *habeas corpus ad subjiciendum*, to wit: The writ of *habeas corpus ad respondendum* is a writ issued by a common law court to bring up a prisoner to be served with a writ in another action. The writ of *habeas corpus ad satisfaciendum* is a similar writ to take the prisoner in execution for another cause of action. The writ of *habeas corpus ad testificandem* is the writ by which a prisoner is brought up by the jailor to testify in a court of justice. — This writ of *habeas corpus ad subjiciendum* is the writ, however, which holds its exalted place in history as one of the greatest barriers ever erected by a people against the encroachment of executive authority and the oppression of a tyrannical sovereign, and is universally acknowledged as the chief safeguard of English liberty. It is of ancient origin, and came into existence amid the early struggles of our English ancestry for personal freedom. It is one of those great unrepealable laws which without the aid of legislation became a part of the common law of England and is of greater age than *magna charta* itself. — In his "History of the Middle Ages," that great historian, Hallam, referring to its ancient origin, says, "Whether courts of justice framed the writ of *habeas corpus* in conformity to the spirit of this clause, or *found it already in their register*, it became from that era (*magna charta*) the right of every subject to demand it." The origin of this writ is, however, commonly referred to the clause to which Hallam alludes, in the great charter of English freedom granted by King John to the barons of England, in June, 1215, at Runnymede. — Again, in 1 Const. History, 16, Hallam also states in reference to this writ: "From earliest records of English law no freeman could be detained in prison except upon a criminal charge or conviction, or for a civil debt. In the former case it was always in his power to demand of the court of king's bench a writ of *habeas corpus ad subjiciendum* directed to the person detaining him in custody, by which he was enjoined to bring up the body, with the warrant of commitment, that the court might judge of its sufficiency, and remand the party, admit him to bail, or discharge him according to the nature of the charge."— Sir William Blackstone, that great expositor of English law, in one of those Commentaries (1 Bl. Com. 135) which form the groundwork of all modern legal acquirements, thus presents the social and political influence of that particular clause of the writ which declares that every English freeman shall be entitled to a trial by a jury of his peers: "Of great importance to the public is the preservation of this right of personal liberty. for if once it were left in the power of any of the highest magistrates to imprison arbitrarily whomsoever he or his officers thought proper, there would soon be an end of all other rights and immunities. Some have thought that unjust attacks even upon life or property at the arbitrary will of the magistrate are less dangerous to the commonwealth than such as are made upon the personal liberty of the subject. To bereave a man of life, or by violence to confiscate his estate without accusation or trial, would be so gross and notorious an act of despotism as must at once convey the alarm of tyranny throughout the kingdom; but confinement of the person by secretly hurrying him to jail where his sufferings are unknown or forgotten, is a less public, a less striking, and

therefore a more dangerous, engine of arbitrary government. And yet sometimes when the state is in real danger, even this may be a necessary measure. But the happiness of our constitution is, that it is not left to the executive power to determine when the danger of the state is so great as to render this measure expedient, for it is the parliament only or legislative power that, whenever it sees proper, can authorize the crown, by suspending the habeas corpus act for a short and limited time, to imprison suspected persons without giving any reasons for so doing."— The origin of this writ for the protection of personal liberty is frequently, although erroneously, stated to be in the passage of the English statute called the habeas corpus act. This act was passed during the reign of Charles II., over 450 years from the time of magna charta (31 Car. II, c. 2), and neither added to nor detracted from the fundamental principles of that efficacious writ, but was passed in order to define with clear precision the appropriate remedies attendant upon the invasion of personal rights. This passage of the act appears to have been induced by certain rulings and frivolous objections made by judges of English courts during the preceding reign when relief was applied for under the provisions of the writ. — The great charter had laid the foundation of this part of English liberty; the petition of rights had renewed it; and the bill of rights had extended it. There were, however, certain provisions still wanting in the manner and form of its execution to render it complete and prevent all evasion or delay on the part of judges who were disposed to interfere with the personal rights of the subject.—This act provided that, when any person was committed charged with crime, the lord chancellor or any of the judges should, upon proper application, issue the writ and order the prisoner to be brought up and discharged, either with or without bail. That the writ should be more or less promptly obeyed according to the distance. Should the jail lie within twenty miles of the judge, the writ must be obeyed in three days, and proportionably so for greater distances; but on no account whatever must the delay exceed twenty days. That any officer or jailor who should neglect to deliver a copy of the warrant of commitment, or who should convey the prisoner to another jail or place of custody without cause, should forfeit £100, and for the second offense £200, and be forever debarred from again holding office. That no person once liberated by the operation of the writ of *habeas corpus* should be recommitted for the same offense, under a penalty of £500. That every person committed for treason or felony should be tried at the next assizes following, or admitted to bail, unless the attendance of the witnesses for the crown could be enforced at that session of the court; and if not tried at the next succeeding session of the assizes, he should be discharged from further imprisonment. That no justice, under a penalty of £500, should refuse to any prisoner a writ of *habeas corpus*, and that application for the writ might be made to either the court of chancery or to the court of queen's bench, common pleas or exchequer, and that the writ might be applied for by persons imprisoned in any part of England, Guernsey or Jersey. — It has been held by some of the English courts that this power extended over all of England's colonies, and the judges of the queen's bench once held that this prerogative power had always been inherent in English courts in favor of British subjects wherever imprisoned, save of course in a foreign country. A statute (Vict. 25) is now in force taking away from English courts this jurisdiction over the colonies of England, whenever such courts exist as can exercise such a jurisdiction. — The act of habeas corpus passed during the reign of Charles II. related alone to persons imprisoned on criminal charges; all other cases demanding relief were left to the operations of the common law. These operations were ascertained to be entirely inadequate to the required relief; and to institute the proper remedy the statute 56 Geo. III., c. 100, was enacted by parliament, extending the action of the writ of *habeas corpus* to other than criminal cases. Under the provisions of this statute any person restrained of his liberty, (those in custody for criminal matters and persons imprisoned under a judgment for debt excepted, as coming under the act of Charles II. for relief), could apply to any judge of the common law courts for a writ of *habeas corpus* provided that by affidavit a reasonable and probable ground of complaint was shown. — Thus by the enactment of this statute the chain of defenses erected and established by law for the protection of the personal rights of the subject, and to guard against their infringement by the crown, was rendered perfect and complete. And to-day, whenever within the physical boundaries of England a subject of either sex or any age is unlawfully imprisoned, he or she, or, if a minor, by his or her next friend or guardian, may apply for relief under the operations of the writ of *habeas corpus*, and if a *prima facie* case can be shown, a writ will be immediately issued by the judge before whom the information is filed, directed to the person or jailor who unlawfully holds in custody such person, and if he fail to make prompt and proper return by showing good and sufficient cause on legal grounds for detainer in his custody as a prisoner such person, he will be committed by the court for contempt. If it be ascertained that the party is confined under legal authority, the court will compel the production of the warrant of commitment, and the warrant of commitment must plainly set forth the cause of detainer and the jurisdiction of the judge or justice committing the accused, upon which the reviewing court shall pass, in determining the legality of the imprisonment. — The act of parliament known as the habeas corpus act (31 Car. II., c. 2,) does not extend in jurisdiction to Scotland, but

in that country the subject is protected in his personal rights and liberty, by the provisions of an act passed in 1701, c. 6 (*q. v.*), known as the "Wrongous Imprisonment Act," and which by many is called the "Scotch Habeas Corpus Act." — Under the power conferred by the constitution of the United States, establishing within its physical boundaries the privilege of the writ of *habeas corpus*, congress at various times has enacted such wholesome laws as have proven efficacious in promoting the operations of this writ for the defense of the personal rights of the citizen. It has ordained, That the supreme court and the circuit and the district courts shall have power to issue writs of *habeas corpus*, and that the several justices and judges of the said courts, within their respective jurisdictions, shall have power to grant writs of *habeas corpus* for the purpose of an inquiry into the cause of restraint of liberty, provided that the prisoner is in custody under or by color of the authority of the United States, or is committed for trial before some court thereof, or held for an act done or omitted in pursuance of a law of the United States, or of an order, process or decree of a court or judge thereof, or is in custody in violation of the constitution, or of a law or treaty of the United States; or, being a subject or citizen of a foreign state and domiciled therein, is in custody for an act done or omitted under any alleged right, title, authority, privilege, protection or exemption claimed under the commission or order or sanction of any foreign state, or under color thereof, the validity and effect whereof depend upon the law of nations; or unless it is necessary to bring the prisoner into court to tes tify. That application for the writ of *habeas corpus* shall be made to the court or justice or judge authorized to issue the same, by complaint in writing, signed by the person for whose relief it is intended, setting forth the facts concerning the detention of the party restrained, in whose custody he is detained, and by virtue of what claim or authority, if known. That the facts set forth in the complaint shall be verified by the oath of the person making the application. That the court or justice or judge to whom such application is made shall forthwith award a writ of *habeas corpus* unless it appears from the petition itself that the party is not entitled to it. That the writ shall be directed to the person in whose custody the party is detained. That any person to whom such writ is directed shall make due return thereof in three days thereafter, unless the party be detained beyond the distance of twenty miles; and if beyond that distance and not that of a hundred miles, within ten days; and if beyond the distance of a hundred miles, within twenty days. That the person to whom the writ is directed shall certify to the court, justice or judge before whom it is returnable, the true cause of the detention of such person, and that the person making the return shall at the same time bring the body of the party before the judge who granted the writ. That when the writ is returned, a day shall be set for the hearing of the cause, not exceeding five days thereafter, unless the party petitioning requests a longer time. That the petition of the party imprisoned or restrained may deny any of the facts set forth in the return, or may allege any other facts that may be material in the case. Said denials or allegations shall be under oath. That the return and all suggestions made against it may be amended by leave of the court or justice or judge, before or after the same are filed, so that thereby the material facts may be ascertained. That the court or justice or judge shall proceed in a summary way to determine the facts of the case, by hearing the testimony and the arguments, and thereupon to dispose of the party as law and justice require. That when a writ of *habeas corpus* is issued in the case of any prisoner who, being a subject or citizen of a foreign state and domiciled therein, is committed or confined or in custody, by or under the authority or law of any one of the United States, or process founded thereon, on account of any act done or omitted under an alleged right, title, authority, privilege, protection or exemption, claimed under the commission or order or sanction of any foreign state, or under color thereof, the validity and effect whereof depend upon the law of nations, notice of the said proceedings, to be prescribed by the court or justice or judge at the time of granting said writ, shall be served on the attorney general or other officer prosecuting the pleas of said state, and due proof of such service shall be made to the court or justice or judge before the hearing. That from the final decision of any court, justice or judge inferior to the circuit court, upon an application for a writ of *habeas corpus*, or upon such writ when issued, an appeal may be taken to the circuit court for the district in which the cause is heard. 1, In the case of any person alleged to be restrained of his liberty in violation of the constitution, or of any law or treaty of the United States; and 2, In the case of any prisoner who, being a subject or citizen of a foreign state, and domiciled therein, is committed or confined or in custody by or under the authority or law of the United States, or of any state, under an alleged right, title, authority, privilege, protection or exemption, set up or claimed under the commission, order or sanction of any foreign state or sovereignty, the validity and effect whereof depend upon the law of nations, or under color thereof. That from the final decision of such circuit court an appeal may be taken to the supreme court in the cases just described, and that these appeals shall be taken on such terms, and under such regulations and orders, as well for the custody and appearance of the person alleged to be in prison or restrained of his liberty, as for sending up to the appellate tribunal a transcript of the petition, writ of *habeas corpus*, return thereto, and other proceedings, as may be prescribed by the supreme court, or, in default

thereof, by the court, justice or judge hearing the case. That pending the proceedings or appeal in the cases enumerated and until final judgment therein, and after final judgment of discharge, any proceedings against the person so imprisoned or restrained of his liberty, in any state court, or by or under the authority of any state for any matter so heard and determined, or in process of being heard and determined, under such writ of *habeas corpus*, shall be deemed null and void —The constitutions of the various states composing the federal Union, in their bills of right or otherwise, have likewise provided for the privilege of the writ of *habeas corpus* for all matters that might arise under state laws and regulations, within their several boundaries, requiring the privilege of this writ for the protection of the personal liberty of the citizen. The courts empowered to grant the writ have also been designated by the state constitutions, and a majority have conferred upon their supreme courts original jurisdiction in all cases arising under *habeas corpus*. They have likewise in most cases adopted the exact language of that part of section nine of the constitution of the United States which declares that "The privilege of the writ of *habeas corpus* shall not be suspended unless when in cases of rebellion or invasion the public safety may require it." Thus the people of the United States have enacted the same barriers against the encroachment of executive authority as did the people of England against the oppression of sovereignty, upon the personal rights of the citizen and the subject. Notable instances of its suspension, however, have occurred, in time of war, and one at least in time of peace, when the national life was not endangered by armed invasion or rebellion. It was, indeed, after the close of a long and disastrous war between the government and the seceding states of the south, and those whose legal judgment was shrouded by strict partisan feeling have claimed for it the color of right. Nevertheless the suspension of this writ was ordered by the president of the United States at a time when peace had been declared, after all the armed forces of the so-called confederate government had surrendered to the authority of the government of the United States, and its safety was no longer endangered, and after a period of several months had intervened between the day on which peace had been declared, and that on which the writ was suspended. On the morning succeeding the promulgation by the president of the order of execution of Mary E. Surratt, charged with conspiring with others in the murder of the president, in accordance with the judgment of the military commission before which they were tried, upon application by the counsel of Mary E. Surratt to Judge Wylie, of the District of Columbia, for a writ of *habeas corpus*, ordering the commandant of the military district in which she was confined to produce her body before his court to determine by what authority it was held in custody of the military authorities, the judge ordered the writ to issue, and placed it in the hands of the U. S. Marshal, who served it upon Gen. Hancock, the commandant of the said military district. The president, however, believing that Gen. Hancock would obey the writ, and having determined upon the execution of the woman, directed the attorney general of the United States to appear with Gen. Hancock in obedience to the summons, before Judge Wylie, and as the representative of the president, present to the court the following return, which was an executive order suspending the writ of *habeas corpus*, to wit:

EXECUTIVE OFFICE, July 7, 1865, 10 A. M.

To Major General W. S. Hancock, commanding, etc.

I, Andrew Johnson, President of the United States, do hereby declare that the writ of *habeas corpus* has been heretofore suspended in such cases as this, and I do hereby especially suspend this writ, and direct that you proceed to execute the order heretofore given upon the judgment of the Military Commission, and you will give this order in return to this writ.

(Signed) ANDREW JOHNSON, *President*.

Notwithstanding the affirmation in the foregoing order of the president, it does not appear that the writ was ever before, and certainly not since, suspended in any case of similar purport, and consequently stands alone, in the executive and judicial history of the country, as an example to be lamented and execrated by all men who love liberty. —With regard to the application of *habeas corpus* in exterritorial cases, it has been held that a writ of *habeas corpus* may be awarded to bring up an American subject unlawfully detained on board of a foreign ship-of-war; the commander being fully within the reach of, and amenable to, the usual jurisdiction of the state where he happens to be. (Case of an American citizen on British ship, 1 Op., 47, Bradford, 1794) —It has been again held, that a prisoner of war on board a foreign man-of-war, or of her prize, can not be released by *habeas corpus* issuing from courts either of the United States or of a particular state. But if such prisoner of war be taken on shore, he becomes subject to the local jurisdiction or not, according as it may be agreed between the political authorities of the belligerent and neutral power. (Case of the President and Prize, 7 Op., 122, Cushing, 1855)— These cases appear to establish the principle that an American citizen is entitled to the privileges of *habeas corpus*, when unlawfully detained on board of a foreign man-of-war, while lying within the jurisdiction of the United States, not having committed an offense amenable to the law of nations. But if held as a prisoner of war, on board such foreign vessel—that is, having committed a crime amenable to the law of nations—the ship-of-war possesses in the ports of the United States the rights of exterritoriality, and is not subject to the local jurisdiction, and the party held in custody, although an American citizen, can not be released by *habeas corpus*. Once removed, however, from the ship-of-war, within the land jurisdiction of

the United States, his *status* is immediately changed, and he becomes, like all others, subject to the local jurisdiction, and can not lawfully *vi et armis* be reconveyed to the exterritorial jurisdiction of the ship-of-war. JNO. W. CLAMPITT.

HABEAS CORPUS (IN U. S. HISTORY). The nature and classification of this writ are elsewhere treated (see preceding article). I. It is grantable as a matter of right, on a proper foundation being made out by proof, and was familiar in England under common law from very early times; but the judges, who were dependent on the king's pleasure for their tenure of office, evaded giving it whenever the king's pleasure was involved. The personal liberty of the subject was therefore at the king's mercy whenever the words "*per speciale mandatum regis*" (by special command of the king) were inserted in the warrant. After a long struggle the famous *habeas corpus* act of 31 Car. II, c. 2, was carried through parliament in 1679, and gave a sanction to that which before had none, by imposing heavy penalties on the refusal of a judge to grant, or of any person to obey promptly, the writ of *habeas corpus*. The bill had several times passed the house of commons, but failed in the upper house; and its final passage by the lords was by a trick, if we are to believe Burnet's story. "It was carried by an odd artifice in the house of lords. Lord Grey and Lord Norris were named to be the tellers. Lord Norris being a man subject to vapors, was not at all times attentive to what he was doing; so, a very fat lord coming in, Lord Grey counted him for ten, as a jest at first; but, seeing Lord Norris had not observed it, he went on with his misreckoning of ten. So it was reported to the house, and declared that they who were for the bill were the majority, though it indeed went on the other side." —This act, in substance, has been made a part of the law of every state in the Union, and the constitution of the United States has provided that the privilege of the writ shall not be suspended unless when, in cases of rebellion or invasion, the public safety may require it. It has been judicially decided (see CONGRESS, POWERS OF, X.) that the right to suspend the privilege of the writ rests in congress, but that congress may by act give the power to the president. Such an act bears some resemblance to the decree of the Roman senate, in civil dissensions or dangerous tumults, that the consuls "should take care that the republic should receive no harm" (*ut consules darent operam ne quid detrimenti respublica caperet*). The resemblance, however, must not be carried very far: the Roman decree gave the consuls absolute power over the life of any citizen, and power to levy and support armies; but a suspension of the privilege of the writ of *habeas corpus* by congress only allows the executive to detain in custody without interference by civil courts, or to try by military law, prisoners who are taken in battle, or are residents of hostile territory, or are in the military or naval service, or are within the actual circle of armed conflict where courts are impotent; and no power in the United States can lawfully take away the privilege of the writ from private citizens in territory not rebellious or invaded, and where the federal courts are in regular operation. (See "Milligan case" below.) Nevertheless, the suspension of the writ is in so far a suspension of the personal liberty of the citizen. In such an extraordinary emergency as that of April, 1861, when congress is not in session to pass a suspending act, the president may suspend the privilege of the writ within the theatre of actual warfare, by virtue of his powers as commander-in-chief; if he chooses to risk any more general suspension he must trust for validation of his action to a subsequent act of congress. (See REBELLION.) —II. The writ is granted by state courts as a general rule, and by federal courts only when the imprisonment is under color of federal authority, or when some federal right is involved in the case. The act of 1789 gave federal courts the power to issue the writ when necessary for the exercise of their respective jurisdictions, except that prisoners in jail under sentence or execution of a state court could only be brought to the federal court under *habeas corpus* as witnesses. The troubles in 1831-2 (see NULLIFICATION) caused the passage of another act giving the power to federal courts to issue the writ where a prisoner was committed by a state court for an act done in obedience to a federal law (such as a tariff act). In 1842 McLeod's case caused the passage of an act which gave federal courts the power to issue the writ where a prisoner was committed by a state court for an act done in obedience to a foreign state or sovereignty and acknowledged by international law. (See MCLEOD CASE.) In 1867, in order to carry out the amendment abolishing slavery, an act was passed which gave federal courts the power to issue the writ where a person was restrained of his liberty in violation of the constitution or of any law or treaty. But the supreme court has determined that in no case can a state court on *habeas corpus* release a prisoner committed by a federal court, and that in case of such a writ being issued the officer is not to obey it further than to make return of the authority by which he holds the prisoner. Nevertheless such writs are issued and obeyed, but only by acquiescence of federal officers.— III. In the United States the privilege of the writ was never suspended before 1861 by the federal government, though state governments, as in the case of the Dorr rebellion, had done so, and federal officers, as in the Burr conspiracy, and in Jackson's case at New Orleans, had refused to obey the writ. Jan. 23, 1807, the senate, moved by a message detailing Burr's progress, passed a bill suspending the writ for three months in case of arrests for treason, and requested the speedy concurrence of the house. Jan. 26, the house, by a vote of 123 to 3, decided not to keep the bill secret as the senate had done, and, by 113 to 19, voted that the bill "be rejected," a contemptuous and unusual mode of procedure.

(See BURR, AARON.)—ARBITRARY ARRESTS. On the breaking out of the rebellion President Lincoln, after calling out 75,000 men and proclaiming the blockade, authorized the commanding general, April 27, 1861, to suspend the writ of *habeas corpus* between Philadelphia and Washington, and, May 10, extended the order to Florida. May 25, on the application of John Merryman, Ch. J. Taney issued a writ of *habeas corpus* to Gen. Geo. Cadwallader, and, on his refusal to obey, attempted to have him arrested. When the attempt failed, the chief justice transferred the whole case to the president. July 5, Atty. Gen. Bates gave an opinion in favor of the president's power to declare martial law and then to suspend the writ, and the special session of congress, to avoid all question, subsequently approved and validated the president's acts in all respects as if they had been done by express authority of congress. Thereafter "arbitrary arrests" proceeded with great vigor throughout the north, by orders from the state department alone at first, and then concurrently with the war department until Feb. 14, 1862, when the latter department, under Secretary E. M. Stanton, assumed the entire power of arrest. From July to October, 1861, 175 persons were summarily imprisoned in Fort Lafayette alone, and the arrests were kept up through 1861 and 1862, including state judges, mayors of cities, members of the Maryland legislature, persons engaged in "peace meetings," editors of newspapers, and persons accused of being spies or deserters, or of resistance to the draft. Sept. 24, 1862, the suspension was made general by the president so far as it might affect persons arrested by military authority for disloyal practices. These summary arrests provoked much opposition throughout the north, and influenced the state elections of 1862 very materially; and an order of the war department, Nov. 22, 1862, released all prisoners not taken in arms or arrested for resisting the draft. — As yet the suspension had been only by executive authority, and the writs which were still persistently issued by state courts were founded on a long line of express decisions that the power to suspend the privilege of the writ lay in congress, not in the president. By act approved March 3, 1863, congress authorized the president whenever, in his judgment, the public safety might require it, to suspend the writ anywhere throughout the United States; but the power to issue the writ was reserved to federal judges wherever—the federal grand jury being in undisturbed exercise of its functions—a prisoner was detained without indictment at the grand jury's next session. The arrest, May 4, 1863, of C. L. Vallandigham, ex-member of congress from Ohio, his conviction and banishment to the rebel lines, and the arrest of other persons, renewed the excitement in the north. Sept. 15, 1863, the president by proclamation suspended the writ throughout the United States in the cases of prisoners of war, deserters, those resisting the draft, and any persons accused of offenses against the military or naval service. The arrests were thereafter continued with little interference by any authority until August, 1864, when the arrest of a congressman was made in Missouri. The house of representatives then ordered an investigation, which exposed and helped to remedy many of the abuses which were inevitable, perhaps, under a suspension of the writ. Its military committee found in the Old Capitol prison officers of rank, some of them wounded in service, who had been in close confinement for months without charges and without the trial which the act of congress of March 3, 1863, had ordered to be secured to the accused. The exposure was sufficient to prevent a recurrence of the evil for the future, but could do nothing for the past. — Oct. 21, 1864, a general court martial was held in Indiana and passed sentence of death upon several citizens of the state for treasonable designs; and the case became known as the "Milligan case," from the name of the principal prisoner, Lamdin P. Milligan. The federal circuit court in Indianapolis granted a writ of *habeas corpus* for them May 10, 1865; was divided in opinion as to releasing them; and certified the whole case to the supreme court. Its decision, given in the December term of 1866, overthrew the whole doctrine of military arrest and trial of private citizens in peaceful states. It held that congress could not give power to military commissions to try, convict or sentence in a state not invaded or engaged in rebellion and where federal courts were unobstructed, a citizen who was not a resident of a rebellious state, nor a prisoner of war, nor in the military or naval service; that such a citizen was exempt from the laws of war, and could only be subject to indictment and trial by jury, that the suspension of the *privilege* of the writ of *habeas corpus* did not suspend the writ itself; that the writ was to issue as usual, and on its return the court was to decide whether the applicant was in the military service, or a prisoner of war, and thus debarred from the privilege of the writ; and that, in short, neither the president, nor congress, nor the judiciary could lawfully disturb any one of the safeguards of civil liberty in the constitution, except so far as the right is given in certain cases to suspend the *privilege* of the writ of *habeas corpus*. All the justices agreed that Milligan was not lawfully detained, and should be discharged. Four of them, Ch. J. Chase being spokesman, dissented so far as to hold that congress *might* have provided for trial by military commission in cases like that of Milligan, without violating the constitution, but had not done so. — Dec. 1, 1865, President Johnson, by proclamation, restored the privilege of the writ, except in the late insurrectionary states, and in the District of Columbia, New Mexico and Arizona. April 2, 1866, a proclamation restored the writ everywhere, except in Texas; and another proclamation, Aug 20, 1866, restored it in Texas also. — The records of the provost marshal's office in Washington show 38,000 military prisoners reported there during the

rebellion. Among these there were undoubtedly many cases of extreme hardship, the relief of which was always grateful to President Lincoln, when his attention could be directed to them. But, under cover of the necessity of guarding against extensive conspiracies in the north, political and private hatreds were frequently gratified by irresponsible subordinates in a shocking manner, and the trial provision of the act of March 3, 1863, was too often disobeyed; and it is to be feared that the number of cases of this kind which could never be brought to the president's notice was very considerable. Nevertheless, the suspension of the privilege of the writ, in the border states at least, seems to have been unavoidable; and the consequent abuses were but the effects of the wild and blind blows struck at internal treason by a republic unused to war. (See, in general, EXECUTIVE, WAR POWERS, INSURRECTION, REBELLION.)—In the confederate states the suspension of the writ by the federal government was made the theme of severe criticism; but when it was found that in a single year 1,800 cases had been tried in Richmond alone, based on writs of *habeas corpus* for relief from conscription, the confederate congress, late in 1863, suspended the writ until ninety days after the meeting of the next session. At the next session the suspension was made permanent, May 20, 1864.—IV. After the close of the rebellion the ku-klux difficulties in the south caused the passage of the act of April 20, 1871, whose fourth section authorized the president, when unlawful combinations in any state should assume the character of rebellion, to suspend the writ of *habeas corpus* in the disturbed district; but the trial provision of the act of March 3, 1863, was retained, and the whole section was to remain in force no longer than the end of the following session. May 17, 1872, a bill to continue this section for another session was passed by the senate by a vote of 28 to 15. In the house, May 28, a motion to suspend the rules and pass the bill was lost, 94 to 108. The bill was then dropped and has not since been revived. ALEXANDER JOHNSTON.

HALE, John Parker, was born at Rochester, N. H., March 31, 1806, and died at Dover, N. H., Nov. 18, 1873. He was graduated at Bowdoin in 1827, studied law, was a democratic congressman 1843–5, was "read out of the party" for opposing Texas annexation, became speaker of the state house of representatives, and free-soil U. S. senator 1847–53. In 1852 he was the free-soil candidate for president. (See FREE-SOIL PARTY.) He was a republican U. S. senator 1855–65, and minister to Spain 1865–9. A. J.

HALIFAX FISHERY COMMISSION. (See TREATIES, FISHERY.)

HAMILTON, Alexander, was born in the island of Nevis, W. I., Jan. 11, 1757, and died at New York, July 12, 1804. He left King's (now Columbia) college in 1776 to enter the continental army, was Washington's aide, until he returned to New York city to prepare to practice law, was in the continental congress 1782–3, and also in the convention of 1787. He was secretary of the treasury 1789–95, when he returned to New York city to resume the practice of law. He retained his liking for the army, and accepted the real command of the army in 1798, Washington being nominally commander-in-chief. (For his death at the hands of Burr in a duel, in 1804, see BURR, AARON.)—Few public men have been so bitterly attacked or so warmly defended as Hamilton, and it seems difficult at first sight to estimate correctly his character and services. There are not, however, many points of either really open to doubt. His amiability in private life is witnessed by all the testimony of the times; his wonderful ability as a political and financial writer is evidenced not only by his writings themselves, but by the unanimous testimony of his political enemies; and his exact rectitude of official life, despite some errors of private life,

has never been successfully impeached. On these points there is a singular concurrence of all trustworthy contemporary testimony. There remains but one point in which his political enemies considered him vulnerable, his alleged tendency to anti-republican thought and action. — There can be no doubt that Hamilton accepted the republican ideal of his time as a fact, but that he accepted it of necessity, not of choice. He represented the force of national law as Jefferson represented that of individual freedom, and neither of the correlative forces understood the other. To Hamilton, Jefferson's idea of liberty was only "that of a bear broke loose from his chains"; and to Jefferson, Hamilton's idea of law was only that of British law, then administered by the few and for the few, with little regard for the happiness or rights of the many. One thing is certain as to Hamilton: there is not in any of his letters or other writings a trace of desire to introduce monarchy or aristocracy into the American political system. The charge of anti-republicanism is, to that extent, unfounded, but it had, in reality, a different basis, which can best be seen by considering Hamilton's political work — When the American revolution was successfully accomplished there was but one field in which Americans had ever enjoyed republican government, the governments of their states, or "republics," as they were then often, and are still sometimes, called. In the government of the British empire they had never shared, and the government of the confederation was a shadow only of republican government. From 1781 until 1789 Hamilton was actively engaged in opening to them a new field for republican government, and from 1789 until 1800 he was as busily engaged in extending that field by establishing a broad construction of the powers of the new federal government. But in both of these endeavors he was really, so far as the experience of his opponents taught them, anti-republican in diminishing the powers of the first exponents of republican government; and here lies the real basis of the charge against him. In this respect there is great significance in the change of sentiment toward Hamilton shown by those of his opponents who remained longest in public life and in sympathy with the expansion of the country. Madison, Monroe, Giles and Gallatin grew in respect for him as they grew in experience; Jefferson alone, who remained aloof from public life after 1809, retained his opinion of him unchanged to the end. — The methods and extent of Hamilton's political work are considered elsewhere. (See CONVENTION OF 1787; FEDERALIST; CONSTRUCTION, III.; FEDERAL PARTY, I.) He was unfortunate, personally, in having a clearer view of the possibilities of the federal government than most of his contemporaries, and many of his theories were built on a scale more suited to the year 1882 than to the year 1791; but his influence upon the development of the theory of American nationality has been permanent. Even in his lifetime it was his privilege to see his opponents, when they had succeeded to the government which he had established, administer it in perfect accordance with his practice. (See JEFFERSON, THOMAS; DEMOCRATIC PARTY, III.) — Hamilton's *Works* have been collected in seven volumes. They will also be found in the *History of the Republic of the United States*, by his son, J. C. Hamilton; but this work is unfortunate in claiming too much for him. A fairer résumé of his work will be found in 1 Curtis' *History of the Constitution*, 406. See also J. A. Hamilton's *Reminiscences;* J. C. Hamilton's *Life of Hamilton* (1840); Renwick's *Life of Hamilton* (1841); Schmucker's *Life and Times of Hamilton* (1857); Riethmüller's *Hamilton and his Contemporaries* (1864); Morse's *Life of Hamilton* (1876); Shea's *Life and Epoch of Hamilton* (1879); Coleman's *Facts and Documents relative to the Death of Hamilton* (1804); 10 *New York Historical Magazine*, 5; *North American Review*, July, 1841, 70, April, 1858, 368, January, 1876, 60, and July, 1876, 113; *Atlantic Monthly*, November, 1865, 625; 24 *Nation*, 283 The favorable view of Hamilton and his work will generally be found in authorities cited under FEDERAL PARTY, I.; the unfavorable view in authorities under DEMOCRATIC PARTY, I.–III., and in 9 John Adams' *Works*, 272. Many of the almost forgotten contemporary attacks upon him, such as Callender's *Letters to Alexander Hamilton, King of the Feds*, have been republished by the Hamilton club. A history of one of the worst of them will be found in 5 Hildreth's *United States*, 108.

ALEXANDER JOHNSTON.

HAMLIN, Hannibal, vice-president of the United States 1861–5, was born at Paris, Me., Aug. 27, 1809, was admitted to the bar in 1833; was a democratic congressman 1843–7, and United States senator 1848–57, and, as a republican, 1857–61. He was again elected senator by the republicans 1869–81, and was appointed minister to Spain in 1881. A. J.

HANCOCK, Winfield Scott, was born Feb. 24, 1824, in Montgomery county, Pennsylvania, was graduated at West Point in 1844, and rose in the regular army to the rank of major general. His best known fighting was at Gettysburg. After the war he was placed in command of the 5th military district, with headquarters at New Orleans. (See RECONSTRUCTION.) Nov. 29, 1867, he issued a general order declaring that the rebellion was ended, that trial by jury, *habeas corpus*, the liberty of the press and of speech, and the natural rights of person and property would be maintained, and that crimes would be tried by the civil tribunals in his district. To republicans this seemed to be an unnecessary and officious interference with the congressional plan of reconstruction, and this feeling was not decreased by a message of President Johnson, Dec. 18, in which he suggested that congress should vote its thanks

to Gen. Hancock for his action. Gen. Hancock's order made him very popular with democrats, north and south, and he was mentioned at successive national conventions until 1880, when he was nominated June 24. In the presidential election he was defeated by Gen. Garfield. (See ELECTORAL VOTES.) — See Junkin's *Life of Hancock;* Freed's *Life of Hancock.*

ALEXANDER JOHNSTON.

HANSEATIC LEAGUE, an association of the principal cities in the north of Germany, Prussia, etc., for the better carrying on of commerce, and for their mutual safety and defense. This confederacy, so celebrated in the early history of modern Europe, contributed in no ordinary degree to introduce the blessings of civilization and good government into the north. The extension and protection of commerce was, however, its main object; and hence a short account of it may not be deemed misplaced in a work of this description. — *Origin and Progress of the Hanseatic League.* Hamburg, founded by Charlemagne in the ninth, and Lübeck, founded about the middle of the twelfth century, were the earliest members of the league. The distance between them not being very considerable, and being alike interested in the repression of those disorders to which most parts of Europe, and particularly the coast of the Baltic, were a prey in the twelfth, thirteenth and fourteenth centuries, they early formed an intimate political union, partly in the view of maintaining a safe intercourse by land with each other, and partly for the protection of navigation from the attacks of the pirates, with which every sea was at that time infested. There is no very distinct evidence as to the period when this alliance was consummated: some ascribe its origin to the year 1169, others to the year 1200, and others to the year 1241. But the most probable opinion seems to be that it would grow up by slow degrees, and be perfected according as the advantage derivable from it became more obvious. Such was the origin of the Hanseatic league, so called from the old Teutonic word *hansa,* signifying an association or confederacy. — Adam of Bremen, who flourished in the eleventh century, is the earliest writer who has given any information with respect to the commerce of the countries lying round the Baltic; and from the errors into which he has fallen in describing the northern and eastern shores of that sea, it is evident they had been very little frequented, and not at all known, in his time. But from the beginning of the twelfth century the progress of commerce and navigation in the north was exceedingly rapid. The countries which stretch along the bottom of the Baltic, from Holstein to Russia, and which had been occupied by barbarous tribes of Slavonic origin, were then subjugated by the kings of Denmark, the dukes of Saxony, and other princes. The greater part of the inhabitants being exterminated, their place was filled by German colonists, who founded the towns of Stralsund, Rostock, Wismar, etc. Prussia and Poland were afterward subjugated by the Christian princes and the knights of the Teutonic order. So that, in a comparatively short period, the foundations of civilization and the arts were laid in countries whose barbarism had ever remained impervious to the Roman power. — The cities that were established along the coast of the Baltic, and even in the interior of the countries bordering upon it, eagerly joined the Hanseatic confederation. They were indebted to the merchants of Lübeck for supplies of the commodities produced in more civilized countries, and they looked up to them for protection against the barbarians by whom they were surrounded. The progress of the league was in consequence singularly rapid. Previously to the end of the thirteenth century it embraced every considerable city in all those vast countries extending from Livonia to Holland, and was a match for the most powerful monarchs. — The Hanseatic confederacy was at its highest degree of power and splendor during the fourteenth and fifteenth centuries. It then comprised from sixty to eighty cities, which were distributed into four classes or circles. Lübeck was at the head of the first circle, and had under it Hamburg, Bremen, Rostock, Wismar, etc. Cologne was at the head of the second circle, with twenty-nine towns under it. Brunswick was at the head of the third circle, consisting of thirteen towns. Dantzic was at the head of the fourth circle, having under it eight towns in its vicinity, besides several that were more remote. The supreme authority of the league was vested in the deputies of the different towns assembled in congress. In it they discussed all their measures; decided upon the sum that each city should contribute to the common fund, and upon the questions that arose between the confederacy and other powers, as well as those that frequently arose between the different members of the confederacy. The place for the meeting of congress was not fixed, but it was most frequently held at Lübeck, which was considered as the capital of the league, and there its archives were kept. Sometimes, however, congresses were held at Hamburg, Cologne, and other towns. They met once every three years, or oftener if occasion required. The letters of convocation specified the principal subjects which would most probably be brought under discussion. Any one might be chosen for a deputy; and the congress consisted not of merchants only, but also of clergymen, lawyers, artists, etc. When the deliberations were concluded, the decrees were formally communicated to the magistrates of the cities at the head of each circle, by whom they were subsequently communicated to those below them, and the most vigorous measures were adopted for carrying them into effect. One of the burgomasters of Lübeck presided at the meetings of congress; and during the recess the magistrates of that city had the sole, or at all events the principal, direction of the affairs of

the league. — Besides the towns already mentioned, there were others that were denominated confederated cities, or allies. The latter neither contributed to the common fund of the league, nor sent deputies to congress; even the members were not all on the same footing in respect to privileges: and the internal commotions by which it was frequently agitated, partly originating in this cause and partly in the discordant interests and conflicting pretensions of the different cities, materially impaired the power of the confederacy. But in despite of these disadvantages, the league succeeded for a lengthened period, not only in controlling its own refractory members, but in making itself respected and dreaded by others. It produced able generals and admirals, skillful politicians, and some of the most enterprising, successful and wealthy merchants of modern times. — As the power of the confederated cities was increased and consolidated, they became more ambitious. Instead of limiting their efforts to the mere advancement of commerce and their own protection, they endeavored to acquire the monopoly of the trade of the north, and to exercise the same sort of dominion over the Baltic that the Venetians exercised over the Adriatic. For this purpose they succeeded in obtaining, partly in return for loans of money and partly by force, various privileges and immunities from the northern sovereigns, which secured to them almost the whole foreign commerce of Scandinavia, Denmark, Prussia, Poland, Russia, etc. They exclusively carried on the herring fishery of the Sound, at the same time that they endeavored to obstruct and hinder the navigation of foreign vessels in the Baltic. It should, however, be observed that the immunities they enjoyed were mostly indispensable to the security of their commerce, in consequence of the barbarism that then prevailed; and notwithstanding their attempts at monopoly, there can not be the shadow of a doubt that the progress of civilization in the north was prodigiously accelerated by the influence and ascendency of the Hanseatic cities. They repressed piracy by sea and robbery by land, which must have broken out again had their power been overthrown before civilization was fully established; they accustomed the inhabitants to the principles, and set before them the example, of good government and subordination; they introduced among them conveniences and enjoyments unknown by their ancestors or despised by them, and inspired them with a taste for literature and science; they did for the people round the Baltic what the Phœnicians had done in remoter ages for those round the Mediterranean, and deserve, equally with them, to be placed in the first rank among the benefactors of mankind. — "In order," as has been justly observed, "to accomplish their purpose of rendering the Baltic a large field for the prosecution of commercial and industrial pursuits, it was necessary to instruct men, still barbarous, in the rudiments of industry, and to familiarize them in the principles of civilization. These great principles were laid by the confederation, and at the close of the fifteenth century the Baltic and the neighboring seas had, by its means, become frequented routes of communication between the north and the south. The people of the former were enabled to follow the progress of the latter in knowledge and industry The forests of Sweden, Poland, etc., gave place to corn, hemp and flax; the mines were wrought, and, in return, the produce and manufactures of the south were imported. Towns and villages were erected in Scandinavia, where huts only were before seen; the skins of the bear and the wolf were exchanged for woolens, linens and silks; learning was introduced; and printing was hardly invented before it was practiced in Denmark, Sweden, etc." (Catteau, *Tableau de la Mer Baltique*, tom. ii., p. 175.) — The kings of Denmark, Sweden and Norway were frequently engaged in hostilities with the Hanse towns. They regarded, and, it must be admitted, not without pretty good reason, the privileges acquired by the league, in their kingdoms, as so many usurpations. But their efforts to abolish these privileges served, for more than two centuries, only to augment and extend them. — "On the part of the league there were union, subordination and money; whereas the half-savage Scandinavian monarchies were full of divisions, factions and troubles; revolution was immediately followed by revolution, and feudal anarchy was at its height. There was another circumstance, not less important, in favor of the Hanseatic cities. The popular governments established among them possessed the respect and confidence of the inhabitants, and were able to direct the public energies for the good of the state. The astonishing prosperity of the confederated cities was not wholly the effect of commerce. To the undisciplined armies of the princes of the north—armies composed of vassals without attachment to their lords—the cities opposed, besides the inferior nobles, whose services they liberally rewarded, citizens accustomed to danger, and resolved to defend their liberties and property. Their military operations were combined and directed by a council composed of men of tried talents and experience, devoted to their country, responsible to their fellow-citizens, and enjoying their confidence. It was chiefly, however, on their marine forces that the cities depended. They employed their ships indifferently in war or commerce, so that their naval armaments were fitted out at comparatively small expense. Exclusive, too, of these favorable circumstances, the fortifications of the principal cities were looked upon as impregnable; and as their commerce supplied them abundantly with all sorts of provisions, it need not excite our astonishment that Lübeck alone was able to carry on wars with the surrounding monarchs, and to terminate them with honor and advantage; and still less that the league should long have enjoyed a decided preponderance in the north." (*L'Art de vérifier les*

Dates, 8me partie, tom. viii., p. 204.) — As already explained, the extirpation of piracy was one of the objects which had originally led to the formation of the league, and which it never ceased to prosecute. Owing, however, to the barbarism then so universally prevalent, and the countenance openly given by many princes and nobles to those engaged in this infamous profession, it was not possible wholly to root it out. But the vigorous efforts of the league to abate the nuisance, though not entirely successful, served to render the navigation of the North sea and the Baltic comparatively secure, and were of signal advantage to commerce. Nor was this the only mode in which the power of the confederacy was directly employed to promote the common interests of mankind. Their exertions to protect shipwrecked mariners from the atrocities to which they had been subject, and to procure the restitution of shipwrecked property to its legitimate owners, though most probably, like their exertions to repress piracy, a consequence of selfish considerations, were in no ordinary degree meritorious, and contributed not less to the advancement of civilization than to the security of navigation. — A series of resolutions were unanimously agreed to by the merchants frequenting the port of Wisby, one of the principal emporiums of the league, in 1287, providing for the restoration of shipwrecked property to its original owners, and threatening to eject from the *consodalitate mercatorum* any city that did not act conformably to the regulations laid down. — *Factories belonging to the League.* In order to facilitate and extend their commercial transactions, the league established various factories in foreign countries, the principal of which were at Novogorod in Russia, London, Bruges in the Netherlands, and Bergen in Norway.—Novogorod, situated at the confluence of the Volkof with the Imler lake, was, for a lengthened period, the most renowned emporium in the northeastern parts of Europe. In the beginning of the eleventh century the inhabitants obtained considerable privileges, which laid the foundation of their liberty and prosperity. Their sovereigns were at first subordinate to the grand dukes or czars of Russia; but as the city and the contiguous territory increased in population and wealth, they gradually usurped an almost absolute independency. The power of these sovereigns over their subjects seems at the same time to have been exceedingly limited; and, in effect, Novogorod ought rather to be considered as a republic under the jurisdiction of an elective magistrate, than as a state subject to a regular line of hereditary monarchs possessed of extensive prerogatives. During the twelfth, thirteenth and fourteenth centuries, Novogorod formed the grand entrepôt between the countries to the east of Poland and the Hanseatic cities. Its fairs were frequented by an immense concourse of people from all the surrounding countries, as well as by numbers of merchants from the Hanse towns, who engrossed the greater part of its foreign commerce, and who furnished its markets with the manufactures and products of distant countries. Novogorod is said to have contained, during its most flourishing period, toward the middle of the fifteenth century, upward of 400,000 souls. This, however, is most probably an exaggeration. But its dominions were then very extensive; and its wealth and power seemed so great and well established, and the city itself so impregnable, as to give rise to a proverb, Who can resist the gods and great Novogorod? "Quis contra deos et magnam Novogordiam?" (Coxe's "Travels in the North of Europe," vol. ii., p. 80.) —But its power and prosperity were far from being so firmly established as its eulogists, and those who had only visited its fairs, appear to have supposed. In the latter part of the fifteenth century, Ivan Vassilievitch, czar of Russia, having secured his dominions against the inroads of the Tartars, and extended his empire by the conquest of some of the neighboring principalities, asserted his right to the principality of Novogorod, and supported his pretensions by a formidable army. Had the inhabitants been animated by the spirit of unanimity and patriotism, they might have defied his efforts; but their dissensions facilitated their conquest, and rendered them an easy prey. Having entered the city at the head of his troops, Ivan received from the citizens the charter of their liberties, which they either wanted courage or inclination to defend, and carried off an enormous bell to Moscow, that has been long regarded with a sort of superstitious veneration as the palladium of the city. But notwithstanding the despotism to which Novogorod was subject during the reigns of Ivan and his successors, it continued for a considerable period to be the largest as well as most commercial city in the Russian empire. The famous Richard Chancellour, who passed through Novogorod, in 1554, in his way from the court of the czar, says, that "next unto Moscow, the city of Novogorod is reputed the chiefest of Russia; for although it be in majestie inferior to it, yet in greatness it goeth beyond it. It is the chiefest and greatest mart town of all Muscovy; and albeit the emperor's seat is not there, but at Moscow, yet the commodiousness of the river falling into the gulf of Finland, whereby it is well frequented by merchants, makes it more famous than Moscow itself." — But the scourge of the destroyer soon after fell on this celebrated city. Ivan IV., having discovered, in 1570, a correspondence between some of the principal citizens and the king of Poland relative to a surrender of the city into his hands, punished them in the most inhuman manner. The slaughter by which the bloodthirsty barbarian sought to satisfy his revenge was alike extensive and indiscriminating. The crime of a few citizens was made a pretext for the massacre of 25,000 or 30,000. Novogorod never recovered from this dreadful blow. It still, however, continued to be a place of considerable trade, until the foundation of Petersburg, which immediately

became the seat of that commerce which formerly had centered at Novogorod. The degradation of this ill-fated city is now complete. It is at present an inconsiderable place, with a population of about 8,000 or 9,000, and is remarkable only for its history and antiquities. — The merchants of the Hanse towns, or Hansards, as they were then commonly termed, were established in London at a very early period, and their factory there was of considerable magnitude and importance. They enjoyed various privileges and immunities; they were permitted to govern themselves by their own laws and regulations; the custody of one of the gates of the city (Bishopsgate) was committed to their care; and the duties on various sorts of imported commodities were considerably reduced in their favor. These privileges necessarily excited the ill will and animosity of the English merchants. The Hansards were every now and then accused of acting with bad faith, of introducing commodities as their own that were really the produce of others, in order to enable them to evade the duties with which they ought to have been charged; of capriciously extending the list of towns belonging to the association; and obstructing the commerce of the English in the Baltic. Efforts were continually making to bring these disputes to a termination; but as they really grew out of the privileges granted to and claimed by the Hansards, this was found to be impossible. The latter were exposed to many indignities; and their factory, which was situated in Thames street, was not unfrequently attacked. The league exerted themselves vigorously in defense of their privileges; and having declared war against England, they succeeded in excluding her vessels from the Baltic, and acted with such energy that Edward IV. was glad to come to an accommodation with them, on terms which were anything but honorable to the English. In the treaty for this purpose, negotiated in 1474, the privileges of the merchants of the Hanse towns were renewed, and the king assigned to them, in absolute property, a large space of ground, with the buildings upon it, in Thames street, denominated the steel yard, whence the Hanse merchants have been commonly denominated the association of the steel yard; the property of their establishments at Boston and Lynn was also secured to them; the king engaged to allow no stranger to participate in their privileges; one of the articles bore that the Hanse merchants should be no longer subject to the judges of the English admiralty court, but that a particular tribunal should be formed for the easy and speedy settlement of all disputes that might arise between them and the English; and it was further agreed that the particular privileges awarded to the Hanse merchants should be published, as often as the latter judged proper, in all the seaport towns of England, and such Englishmen as infringed upon them should be punished. In return for these concessions, the English acquired the liberty of freely trading in the Baltic, and especially in the port of Dantzic and in Prussia. In 1498, all direct commerce with the Netherlands being suspended, the trade fell into the hands of the Hanse merchants, whose commerce was in consequence very greatly extended. But, according as the spirit of commercial enterprise awakened in the nation, and as the benefits resulting from the prosecution of foreign trade came to be better known, the privileges of the Hanse merchants became more and more obnoxious. They were in consequence considerably modified in the reigns of Henry VII. and Henry VIII., and were at length wholly abolished in 1597. (Anderson's *Hist. Com.*, anno 1474, etc.) — The different individuals belonging to the factory in London, as well as those belonging to the other factories of the league, lived together at a common table, and were enjoined to observe the strictest celibacy. The direction of the factory in London was intrusted to an alderman, two assessors, and nine councilors. The latter were sent by the cities forming the different classes into which the league was divided. The business of these functionaries was to devise means for extending and securing the privileges and commerce of the association; to watch over the operations of the merchants; and to adjust any disputes that might arise among the members of the confederacy, or between them and the English. The league endeavored at all times to promote, as much as possible, the employment of their own ships. In pursuance of this object, they went so far in 1447 as to forbid the importation of English merchandise into the confederated cities except by their own vessels. But a regulation of this sort could not be carried into full effect, and was enforced or modified according as circumstances were favorable or adverse to the pretensions of the league. Its very existence was, however, an insult to the English nation; and the irritation produced by the occasional attempts to act upon it contributed materially to the subversion of the privileges the Hanseatic merchants had acquired in England. — By means of their factory at Bergen, and of the privileges which had been either granted to or usurped by them, the league enjoyed for a lengthened period the monopoly of the commerce of Norway. — But the principal factory of the league was at Bruges in the Netherlands. Bruges became, at a very early period, one of the first commercial cities of Europe, and the centre of the most extensive trade carried on to the north of Italy. The art of navigation in the thirteenth and fourteenth centuries was so imperfect that a voyage from Italy to the Baltic and back again could not be performed in a single season, and hence, for the sake of their mutual convenience, the Italian and Hanseatic merchants determined on establishing a magazine or storehouse of their respective products in some intermediate situation. Bruges was fixed upon for this purpose; a distinction which it seems to have owed as much to the freedom enjoyed by the inhabitants, and the liberal-

ity of the government of the Low Countries, as to the convenience of its situation. In consequence of this preference, Bruges speedily rose to the very highest rank among commercial cities, and became a place of vast wealth. It was at once a staple for English wool, for the woolen and linen manufactures of the Netherlands, for the timber, hemp and flax, pitch and tar, tallow, corn, fish, ashes, etc., of the north; and for the spices and Indian commodities, as well as their domestic manufactures imported by the Italian merchants. The fairs of Bruges were the best frequented of any in Europe. Ludovico Guicciardini mentions, in his "Description of the Low Countries," that in the year 1318 no fewer than five Venetian galleases, vessels of very considerable burden, arrived at Bruges in order to dispose of their cargoes at the fair. The Hanseatic merchants were the principal purchasers of Indian commodities: they disposed of them in the ports of the Baltic, or carried them up the great rivers into the heart of Germany. The vivifying effects of this commerce were everywhere felt; the regular intercourse opened between the nations in the north and south of Europe made them sensible of their mutual wants, and gave a wonderful stimulus to the spirit of industry. This was particularly the case with regard to the Netherlands. Manufactures of wool and flax had been established in that country as early as the age of Charlemagne; and the resort of foreigners to their markets, and the great additional vent that was thus opened for their manufactures, made them be carried on with a vigor and success that had been hitherto unknown. These circumstances, combined with the free spirit of their institutions and the moderation of the government, so greatly promoted every elegant and useful art, that the Netherlands early became the most civilized, best cultivated, richest and most populous country of Europe. — *Decline of the Hanseatic League.* From the middle of the fifteenth century the power of the confederacy, though still very formidable, began to decline. This was not owing to any misconduct on the part of its leaders, but to the progress of the improvement which it had done so much to promote. The superiority enjoyed by the league resulted as much from the anarchy, confusion and barbarism that prevailed throughout the kingdoms of the north, as from the good government and order that distinguished the towns. But a distinction of this sort could not be permanent. The civilization which had been at first confined to the cities, gradually spread from them, as from so many centres, over the contiguous country Feudal anarchy was everywhere superseded by a system of subordination; arts and industry were diffused and cultivated; and the authority of government was at length firmly established. This change not only rendered the princes over whom the league had so frequently triumphed superior to it in power, but the inhabitants of the countries among which the confederated cities were scattered, having learned to entertain a just sense of the advantages derivable from commerce and navigation, could not brook the superiority of the association, or bear to see its members in possession of immunities of which they were deprived; and in addition to these circumstances, which must speedily have occasioned the dissolution of the league, the interests of the different cities of which it consisted became daily more and more opposed to each other. Lübeck, Hamburg, Bremen, and the towns in their vicinity, were latterly the only ones that had any interest in its maintenance. The cities in Zealand and Holland joined it, chiefly because they would otherwise have been excluded from the commerce of the Baltic; and those of Prussia, Poland and Russia did the same because, had they not belonged to it, they would have been shut out from all intercourse with strangers. When, however, the Zealanders and Hollanders became sufficiently powerful at sea to be able to vindicate their right to the free navigation of the Baltic by force of arms, they immediately seceded from the league; and no sooner had the ships of the Dutch, the English, etc., begun to trade directly with the Polish and Prussian Hanse towns than these nations also embraced the first opportunity of withdrawing from it. The fall of this great confederacy was really, therefore, a consequence of the improved state of society, and of the development of the commercial spirit in the different nations of Europe. It was most servicable so long as those for whom its merchants acted as factors and carriers were too barbarous, too much occupied with other matters, or destitute of the necessary capital and skill, to act in these capacities for themselves. When they were in a situation to do this, the functions of the Hanseatic merchants ceased as a matter of course; their confederacy fell to pieces; and at the middle of the seventeenth century the cities of Lübeck, Hamburg and Bremen were all that continued to acknowledge the authority of the league. To this day they preserve the shadow of its power; having been acknowledged in the act for the establishment of the Germanic confederation, signed at Vienna June 8, 1815, as free Hanseatic cities. But their enforced embodiment since 1866 in the North German confederation, and association with the other Germanic states in the Zollverein, will cause even this shadow to lessen very rapidly. — See Mallet, *La Ligue Hanséatique;* Schlözer's *Verfall und Untergang der Hansa;* Lappenberg's *Urkundliche Geschichte des Hansischen Stahlhofes zu London;* and *Report* for 1867 of Mr Consul General Ward of Hamburg.

J. R. M'Culloch and H. G. Reid.

HARPER'S FERRY. (See Brown, John.)

HARRISON, William Henry, president of the United States in 1841, was born in Charles county, Va., Feb. 9, 1773, and died in office at Washington, D. C., April 4, 1841. He was an officer in the regular army 1791–7, was appointed

secretary of the northwest territory in 1797, and remained identified with its history thereafter. He was governor of Indiana territory 1801–13, during which time he fought a successful battle against the British and Indians at Tippecanoe, Nov. 7, 1811; was representative from Ohio 1816–19, senator from Ohio 1825–8, and minister to Colombia 1828–9. He represented mainly the anti-masonic element of the whig party, but his general popularity made him the whig party's most available candidate for the presidency. (See WHIG PARTY, II.) — See Dawson's *Services of W. H. Harrison* (1824); Hall's *Life of Harrison* (1836); Hildreth's *People's Presidential Candidate* (1839); Jackson's *Life of Harrison* (1840); Burr's *Life and Times of Harrison* (1840); Montgomery's *Life of Harrison* (1860). A. J.

HARTFORD CONVENTION. (See CONVENTION, HARTFORD.)

HAWAII. (See SANDWICH ISLANDS.)

HAYES, Rutherford Birchard, president of the United States 1877–81, was born at Delaware, Ohio, Oct. 4, 1822. He was graduated at Kenyon college, in 1842, and was admitted to the bar in 1846. In June, 1861, he entered the army, and there reached the grade of brevet major general. He was a republican congressman 1865–7, and governor of Ohio 1868–70. In 1875 he was again chosen governor, having thus overthown the "Ohio idea" of paying in paper money that part of the national debt not specifically payable in coin (see OHIO), and the general attention which was attracted by the importance of the contest, and his hardly expected success, gave him the republican nomination for the presidency in 1876. (See DISPUTED ELECTIONS, IV.; ELECTORAL COMMISSION.) — The peculiar circumstances attending his election, and his immediate withdrawal of military support from the reconstructed governments of South Carolina and Louisiana (see INSURRECTION, II.), left his administration without any very cordial support in congress; and his embarassment was increased by the sudden rise to the surface of financial questions, on which neither party was ready to finally commit itself. Many administration measures were lost, or carried by democratic votes; the veto of the Bland silver bill, making the depreciated silver dollar a legal tender and directing its continued coinage, was overridden by heavy majorities, Feb. 28, 1878; and it was not until the extra session of 1879 (see RIDERS) that President Hayes found himself fairly supported by his own party's representatives in congress. Nevertheless, his administration was of incalculable advantage to the country, not only as a breathing spell from the almost intolerable violence of party contest, but also in its economic successes. For the final subsidence of the popular wave which for a moment seemed to threaten repudiation in its meaner forms, for the successful refunding of the public debt, for the enormous reductions in the rate and amount of the annual interest paid upon it, almost the entire credit is due to this administration; and the general want of exciting incident, which is sometimes adduced as a proof of its incompetency, is really the strongest proof of its competency and success. Even in the lower aspect of party success the result is the same. During this administration the party held its own for four years, for the first time since the close of the rebellion. From 1868 until 1876, in particular, it had been slowly but surely losing its hold on various states, and the loss was only hastened by the increased vigor of the measures taken to stop it. If the election of 1872 had not been darkened by democratic refusals to vote for Greeley, it would be evident that the republican party had entered every election since 1868 in worse condition than at the preceding election. In 1880, for the first time since 1868, the steady line of loss had been checked, and there was even a slight gain. — See Howell's *Life of Hayes;* Howard's *Life of Hayes.* A. J.

HAYTI. This island, one of the four great Antilles, is situated between 17° 43′ and 19° 58′ of north latitude, and 70°45′ and 76° 55′ of west longitude. Its length is 600 kilometres from east to west, and its width varies from 27 to 238 kilometres from north to south. Hayti was discovered by Christopher Columbus, Dec. 6, 1492, two months after the little island of Guanahani (now San Salvador) had first realized the dream of his genius. The name Hayti, in the language of the aborigines, signifies mountainous country. Columbus called it Hispaniola; the French and English called it San Domingo, from the name of the city founded in 1495 by Bartholomew Columbus, and which became the capital of the first Spanish settlement. Four great chains of mountains extend from east to west, and numerous rivers flow down from them. The peak of Cibas rises 2,400 metres above the sea, it is in the centre of the gold region which first of all excited the cupidity of the Spaniards. Copper, lead, silver, mercury, rock salt, sulphur and marble are also found. The existence of coal is indicated in several places. But it is not the working of these different minerals which at present constitutes the resources of Hayti. Its real wealth is dye and cabinet woods, and its tropical productions, coffee, sugar, cocoa and cotton, to which must be added cattle, hogs and sheep. To these advantages are added those of climate. Though very warm its climate is tempered by the trade winds, abundant rains and the almost equal length of day and night. If the climate in the valleys is a little unhealthy owing to the moisture, that of the plateaus is, on the contrary, very salubrious. Hurricanes and earthquakes sometimes produce ravages; but they are the only scourges to be feared, for there are no dangerous animals, the importunity of the musquitos being the only inconvenience to be met, or rather to be avoided. — The painful phases of the

history of San Domingo are known. In the sixteenth century the Spaniards worked the mines so actively that they sacrificed the Indians of the five states into which the country was divided at the arrival of Columbus, and according to one historian not 150 individuals were left at the end of that same century. The conquerors, themselves decimated by maladies and their own struggles, replaced them. In 1586 Drake ravaged the still feeble colony; later appeared the buccaneers, who from their little island *la Tortue*, attacked Hayti from time to time and established themselves in the west. This gave occasion to the occupation, in 1664, by France, who came to regulate the colony founded by the forlorn hope of her civilization, and who, in 1697, at the peace of Ryswick, had her right of possession sanctioned. This new colony prospered, but though less cruel than the Spaniards, the French, too, managed the country harshly by means of slavery. An insurrection of negroes, which took place in 1722, was soon repressed. At last the French national assembly, March 28, 1790, decreed that in the colonies mulattoes and free blacks were called to the rank of citizens and to equality with the whites. San Domingo was then deeply disturbed; the colonies wished to be freed from colonial dependence, and to win their administrative freedom, but they did not wish to share their advantages with men of mixed blood any more than they wished to free the blacks. The former revolted, the slaves joined their enterprise and the island was soon in a flame. — In 1793 the agents of France abolished slavery, and the following year (1794) the convention ratified this act. The colonists then called the English and Spanish to their aid, and took possession of a part of the territory. But Toussaint-Louverture, a negro chieftain, the most energetic, perhaps, but not the most intelligent, in the war of independence, repulsed the foreign troops and ended by making himself master of the part of the island which Spain had possessed up to that time and which she had just ceded to France by the treaty of Basle (April 2, 1795). He easily acquired the life title of governor general of the colony of San Domingo, as it was termed by the constitution of May 9, 1801, elaborated by a central assembly, that he himself had formed, of ten members, three mulattoes and seven whites, which constitution he submitted to the vote of deputies of the departments; but the consular government would not sanction the act. Therefore the first consul in 1801–2 sent his brother-in-law, Gen. Leclerc, with 20,000 men, to reconquer Hayti and re-establish affairs on a former footing. Leclerc seized Toussaint-Louverture by surprise and sent him to France, where he died April 27, 1803. The arrest and captivity of their chief exasperated the native population and they rose up under the command of two other leaders, Petion and Dessalines. The French then lost the advantages previously gained, and were driven back to the Cape. Rochambeau, the successor of Leclerc who had perished in the expedition, was forced to evacuate the French part of San Domingo at the end of the year 1803. The French maintained themselves only in the part ceded by Spain. The victorious insurgents then proclaimed their independence, and, as if recognizing themselves as avengers of the former population, they restored the ancient name of the island, Hayti. But these slaves who desired liberty, knew it not, and ranged themselves under the sceptre of Dessalines, proclaimed emperor under the name of James I. while Petion, in the south, founded a republican state. — After the death of Dessalines and that of a second slave, a king also, Christopher, otherwise Henry I., Boyer, successor of Petion, united the two states, and added, in 1822, the eastern part from which the French had been finally expelled. Three years later, in 1825, the French recognized the independence of Hayti, at the same time stipulating for the former colonists an indemnity of 150,000,000 francs, which the debtors themselves were the first to recognize as just, in principle at least. At the same time Hayti contracted in France a loan of 30,000,000 francs, at 6 per cent. But the amount of the indemnity was found exorbitant by the Haytians; they declared themselves unable ever to pay this sum, and lengthy discussions arose on this subject which were finally terminated in 1838 by a treaty of commerce and friendship between France and the republic of Hayti, (Feb. 12 in Hayti, and promulgated in France May 30). A consequence of this treaty was a financial arrangement by which the debt, reduced to 60,000,000 francs, and released from interest, was to be paid from 1838 to 1867 inclusive. This term of thirty years was divided into six periods of five years each, with the obligation of paying each year of the first period, 1,500,000 francs; of the second, 1,600,000; of the third, 1,700,000; of the fourth, 1,800,000; of the fifth, 2,400,000; and of the sixth, 3,000,000. Said sums to be paid in French money during the first half of each year in Paris, into the *Caisse des dépôts et consignations*. The 1,500,000 francs for the first year (1838) were brought on the ship in which the French commissioners, Baron Lascases and Capt. Baudin, arrived, as well as the two Haytian commissioners, Messrs. Séguy-Villevaleix and B. Ardouin, afterward minister resident of Hayti in France, both intrusted with making this first payment. Besides, the interest on the loan was reduced from 6 to 3 per cent.* Thus President Boyer had the honor of sealing the independence of his country by closing an affair which was the last mark of

* The first five annuities were paid; but after Boyer, President Herard was only able to pay the first annuity of the second series, and the payment of the debt was interrupted from 1844 to 1848 inclusive. These five years were added to the arrears by a convention of May 15, 1849, between Soulouque and the French consul, Levasseur. The payments have since been regularly made, and in October, 1861, Hayti owed no more than 38,909,000 francs. That year the minister resident of Hayti, in paying the stipulated annuity, paid besides 800,000 more as interest on the loan and for the redemption of 350 bonds of 1,000 francs, by drawing, as is done every year in the month of June.

the former enslavement of Hayti to the foreigner. Unfortunately for him, accused of having halted in his course, and of being incapable of all initiative, he was excluded from power and replaced in 1843 by Gen. Herard-Rivière, who was excluded in turn the following year by Guerier. In 1845 Piérrot, in 1846 Riché, and in 1847 Soulouque, succeeded to power.— Under Herard the eastern part of the island separated again and formed the Dominican republic, with Santanna as president, when the latter triumphed over the negro general, Soulouque, and a Dominican pretender, Ximenes. This new state was recognized in 1848 by France and England. But it did not last under the republican form; in 1862 it yielded to Spain, after profound misunderstandings among the citizens. This part of the country is the most extensive, comprising alone two-thirds of the former San Domingo; but it is the worst cultivated, though the soil is fertile, and the least inhabited since it does not contain 100,000 inhabitants. (See, for further details, *Etudes sur l'histoire d'Haïti* of M. B Ardouin, minister resident of Hayti, Paris, Dezobry, 1856, 11 vols. in 8vo.) — The republic of Hayti has in its turn suffered great vicissitudes. In 1849 its president, Soulouque, changed it into an empire, and was anointed April 18, 1852, under the name of Faustin I. His reign was not lasting, but still long enough to inflict much harm. He was obliged to leave Hayti Jan. 15, 1859, and Gen. Fabre Geffrard proclaimed the republic, and was chosen president. The republic has existed under nine constitutions, from that of May 28, 1790, to that which has been in force since 1867. They are not all absolutely different from each other, nor equally adapted to democratic government: the first two, those of 1790 and 1801, bear the marks of the colonial system; the last one, voted in 1863, was the same as that of 1806, developed in 1816, revised in 1846, and re-established by Geffrard, in 1859, with some essential modifications. The constitution of June 14, 1867, introduced into it more profound changes. — The territory is divided into four departments, called departments of the south, of the west, of Artibonite, and of the north. These are subdivided into districts, which in their turn are partitioned into communes. The capital is Port-au-Prince, in the north. The extent of the republic is from 25,000 to 26,000 square kilometres. The population of Hayti is estimated at 850,000, but it appears not to exceed 570,000. More than four-fifths of the population are negroes; the rest are mulattoes. Port-au-Prince has 27,000 inhabitants. — All Haytians are equal before the law, and enjoy all civil and political rights. All Africans and Indians or their descendants may become Haytians; but the constitution provides that no white man, of whatever nationality, can acquire this character or own real estate in the republic. The constitution of 1863 re-established a house of representatives, president and senate. The president was appointed for life by the senate, and had to be thirty-five years of age, a Haytian, and a property owner; he received a salary of 130,000 francs, and his powers, as well as those of the representatives and senators, are nearly the same as those granted by the democratic constitutions of modern Europe. His prerogatives are the right of pardon and amnesty of sovereigns; a body guard, governed, however, by the military laws in force; and a species of *veto* for cases in which his explained opposition to a law is not regarded by the house of representatives. The members of the house were fifty-six in number, with as many substitutes. The age required was twenty-five years. The other conditions, for them as well as the senators, were the same as for the president. Elections were to take place every five years from Feb. 1 to 10; the annual session was for three months beginning on the first Monday of April. Members received a salary of 400 francs a month during the session, and one piastre or five francs thirty-three centimes for each league from their domicile to the capital. The electoral colleges were formed, according to a rather complicated system, of citizens twenty five years old, and electors chosen by citizens from twenty-one to twenty-five years, constituted in a primary assembly. The senate was composed of thirty-six members elected for nine years by the house of representatives, from a list drawn up by the president of Hayti, and containing three candidates for each senatorial seat. Senators were to be thirty years old, and to receive a yearly salary of 5,000 francs. They were the guardians of the constitution, in session all the year, or, if they adjourned, they were obliged to delegate to a committee the power of watching in their stead, and summoning them if necessary. To the senate belonged the nomination of the president of the republic, made in secret by a majority of two-thirds of the members present.— The constitution of 1867 gave the house of representatives the title of house of commons. The representatives are elected for three years directly by the primary assemblies. The senate is appointed by the house of commons from a list of candidates furnished by the electoral colleges. The senate is renewed every two years. The meeting of both houses constitutes the national assembly. This assembly alone has the right to declare war, of which the president has merely the direction. It adopts or rejects treaties of peace, of commerce, etc., drawn up by the president. It may impeach the president and depose him. The president is elected for four years. There are five secretaries of state, one for each of the following departments: finance and commerce; foreign affairs; war and the navy; the interior and agriculture; public instruction, justice and worship. They are appointed by the president, and are responsible like all other functionaries. There is an incompatibility between the functions of the legislature and those of the state. Before 1867 the tribunals were at once civil, correctional and criminal. There was no tribunal of appeal. The

only resort was to the court of cassation established for the whole republic. The constitution of 1867 created courts of appeal. Every extraordinary commission and court martial is prohibited. The French codes, with some necessary modifications of time, place and persons, form the Haytian codes, and the magistracy of the island bears the impress of French judicial organization. Justices of the peace may be removed, but other judges can not. Both are appointed by the president.—The municipal organization began to share in the general system of liberty in Hayti only since the new constitution. The common councils appointed by the chief of the state had very restricted powers. The magistrate sanctioned marriages and had a general supervision of registry; but the management of the greater part of affairs was taken from him, he had no initiative, and it might be said that the Haytian communes were in a certain sense under the guardianship of the president. Since 1867 the common councils are elective and in possession of their natural attributes.—The army was increased to 40,000 men; but since the time of Boyer, who commenced its reduction, it is considerably diminished. It contains scarcely 7,000 men at present. Formerly men were taken from eighteen to forty approximately. At present, when a regiment has to be filled, the commander of the district summons the young men who have least to do, those without profession or occupation necessary to the country, and finally those whose families can most easily dispense with them. He thus forms the required contingent. The term of service is twelve years. The national guard is formed of the remaining citizens. There are a few epaulettes too many in Hayti.—The navy is composed of two steamers and a number of small vessels. A line of commercial steamers was established in June, 1863, along the 350 leagues of Haytian coast; it touches at fourteen ports, from Port-au-Prince to Cayes and back, and from Port-au-Prince to Cape Haytien and back.—President Geffrard turned his attention especially to agriculture and public instruction. As property is much divided there is a large number of agriculturists to whom a little more enlightenment would be of great service. Negro immigrants, profiting by grants of land voted in 1860, came from the United States in search of liberty and well-being, and in payment brought good methods of cultivating valuable grains, especially better kinds of cotton. The law on public instruction provides punishment for parents who neglect the instruction of their children. There are 235 schools, attended by 15,000 children. Higher instruction, given in several colleges, principally in that of Port-au-Prince, is very flourishing. But it is wisely intended to form institutions on the model of the college Chaptal in Paris, in order to educate men who by avoiding Greek and Latin will be the earlier and better prepared for various duties, for commerce, industry and industrial arts.—The commerce of Hayti consists of the commission business, wholesale and retail. According to article seven of the constitution foreigners can only carry on a commission business with permission of the chief of the state. The collection of customs on exports and imports produces the largest net and the largest gross revenue of the country, the other taxes being few and small. The best hopes of income are founded especially on the exportation of coffee, and as the production of this article, as well as that of sugar and cotton, increases, and finally, as the movement of exports and imports tends visibly to increase, everything promises a satisfactory financial future for Hayti. Still it is not yet out of difficulty, for, besides its debt and loan in France, it has to provide for the issue of paper money, amounting, in 1859, to only 50 million gourdes (13 gourdes equal 1 piastre), but in 1870 to 600 million gourdes, with no other guarantee than this same exportation of coffee, and the redemption of which must be continued without fail. It is very difficult to reduce these figures to European standards. The value of the piastre (5 fr. 33 cent) varied during the single year 1871, from 350 to 170 gourdes. In 1859 the receipts were 9,291,460 and the expenditures 5,180,760 francs, which leaves a surplus of 4,110,700 francs. The budget presented in 1864 by the minister of finance was composed as follows. estimated receipts of customs, 33,843,000 g.; various imposts, 1,488,500 g.; total, 35,326,500 g.; or, in francs, 14,483,864 fr. 59 c. The expenditures were estimated at 37,331,811 g. 28 c.; or, in francs, 15,206,042 fr. 20 c. The minister proposed an additional tax of 10 per cent. on the customs, and insisted on the necessity of redeeming a million of paper annually until more could be done. The expenditures are classed as follows: finances and commerce, 4,066,583 g. 06 c.; foreign affairs, 10,309,699 g.; army and navy, 8,301,664 g. 60 c.; minister of interior and agriculture, 10,301,504 g. 44 c.; public instruction, 2,689,542 g. 06 c.; justice and worship, 1,662,818 g. 12 c.—The condition of the public debt, indemnity and loans to April 1, 1870, was 24,393,264 piastres, divided as follows: arrears, capital, 9,615,445 p.; interest, 3,365,405 p.; payments to date, 4,899,770 p.; loan, payable in 1883, 4,712,790 p.; current year, 1,799,852 p.—The commercial operations of Hayti during the year 1859 are classed as follows:

COUNTRIES.	Imports.	Exports.	Total
	Francs.	Francs.	Francs
United States of America	12,720,000	9,450,000	22,170,000
France	3,391,000	7,196,000	10,587,000
England and her colonies	4,922,000	5,315,000	10,237,000
Hanseatic cities	1,123,000	2,088,000	3,211,000
Denmark and her possess'ns	383 000	121,000	504,000
Belgium	94,000	382,000	476,000
Other countries	395,000	535,000	930,000
Total	23,028,000	25,087,000	48,115,000

During 1860, 60,000,000 pounds of coffee were exported. It was an exceptional year for this prod-

uct, it is true, but the exportation is maintained near this considerable amount, for 1862 furnished 54,529,059 pounds. In 1859 the figures were 41,712,106 pounds. Cocoa appears for 1,743,853 pounds, in 1862; cotton, for 1,473,853 pounds; logwood, 167,005,650 pounds; mahogany, 2,441,887 feet. Indigo will soon be added to the list of exports. According to the *Handelsarchiv*, the value of imports in 1866 was 8,423,585 thalers, and that of exports 11,813,732 thalers. The principal articles of export are always coffee, of which 55,090,000 pounds were exported in 1866, and 43,360,000 pounds in 1871; logwood, which furnished commerce in 1870 with 124,000,000 pounds; and cocoa, 1,820,000 pounds. — Navigation is concentrated in three ports: Port-au-Prince, les Cayes, and Cape Haytien. The movement at these ports was, in 1864, 879 incoming ships, carrying 135,488 tons, and 875 outgoing ships, with 145,454 tons.*—BIBLIOGRAPHY. HENDRICKS, Thomas Anderson, was born in Muskingum county, Ohio, Sept. 17, 1819, removed to Shelby county, Indiana, in 1822, was graduated at Hanover college in 1841, and was admitted to the bar in 1843. He was a member of the state house of representatives in 1848, and of the senate in 1850; was a democratic congressman 1851–5, commissioner of the land office 1855–9, and United States senator 1863–9. In 1859 and 1868 he was defeated as the democratic candidate for governor of Indiana; in 1872 he was elected (see INDIANA); and in 1876 he was the democratic candidate for the vice-presidency. (See DEMOCRATIC PARTY, VI.) A. J.

HENRY DOCUMENTS, (IN U. S. HISTORY), a correspondence, containing about twenty-six letters, between Sir James H. Craig, governor of British North America, H. W. Ryland, his secretary, and Lord Liverpool, of one part, and John Henry of the other. Henry had been sent by Craig's order, in January, 1809, to report upon the state of affairs and political feeling in the New England states. (See EMBARGO, II.) He remained until June, and, in order to magnify his office, painted the New England disaffection to the Union in very high colors throughout his reports to his principal. Disappointed of the reward he had expected, he returned to the United States, and, in February, 1812, sold the letters and documents to President Madison for $50,000. March 9, the president sent copies of the letters to congress, accompanied by a special message, in which he declared that they proved an attempt by Great Britain to destroy the Union and annex the eastern part of it to British America. Henry's letters contained no evidence whatever of any design at secession in New England; they were merely very unpleasant reading for the federalists of that section. (See FEDERAL PARTY, II.) — See 6 Hildreth's *United States*, 284; Carey's *Olive Branch*, 156; 1 *Statesman's Manual* (ed. 1849), 291; Dwight's *Hartford Convention*, 195; 2 *Niles' Register*, 19; 4 Jefferson's *Works* (ed. 1829), 171; 1 von Holst's *United States*, 221.

ALEXANDER JOHNSTON.

HESSE, Grand Duchy of, a state forming part of the German empire, traversed by the Rhine and the Maine, having as capital Darmstadt and as principal city the federal fortress of Mayence. It has an area of 7,676 square kilometres, with a population of 852,842 at the end of 1871; of these, 69 per cent. are Protestants, 28 per cent. Catholics, and 3 per cent. Israelites. The population numbered: in 1840, 811,503; in 1852, 854,314; in 1861, 836,808. — The constitution of Hesse dates from Dec. 7, 1820, but it has been modified more or less since then. According to this constitution the grand duke attains his majority at the age of eighteen. His civil list is 581,000 (or, according to another authority, 576,000) florins, and he governs with the assistance of *estates* which are divided into two chambers. The first (law of Nov. 8, 1872) includes princes of the blood, nobles formerly sovereigns, Baron Riedesel, the bishop of Mayence (or his representative), and a Protestant ecclesiastic appointed for life by the grand duke and bearing the title of *prelate*, the chancellor of the university of Giessen, two members of the territorial nobility elected for six years by their peers; finally, members, of which the maximum number shall be twelve, chosen by the grand duke among the most distinguished citizens. The second chamber, according to the law of 1862, amended by the law of Nov. 8, 1872, is composed of ten deputies of the eight largest cities and forty deputies of the other communes. The law of 1872 suppresses the six representatives of the nobility. The members of this chamber are chosen indirectly, but the deputies to the German Reichstag by direct election. — Members of the chambers must be twenty-five years of age at least. Deputies are elected for six years, one-half being elected every three years. No definite property

* The revenue and expenditure of Hayti are known only by estimates. The total public revenue is calculated to have amounted in recent years to about $4,500,000, and the expenditure to $7,000,000. There is a large floating debt, and also a foreign debt of $6,409,970. No interest has been paid for years on this debt. But still the government in 1875 issued with partial success a new foreign loan of $16,69.),600, in order to extinguish the old debt, home and foreign, and to employ the remainder in building two lines of railways. The total annual imports of Hayti averaged, in the years 1875 to 1877, $5,900,000, and the exports, $6,500,000.

qualification is prescribed either for primary electors or for those eligible to office; it is only necessary to be enrolled on the list of tax payers, but secondary electors must pay forty florins ($16.40). — The country is divided administratively into three provinces, but the chief division is that made by the Rhine. The part of the country situated on the left bank of this river retains the civil legislation of France, the Code Napoleon is still in force there, and until 1848 the jury system was not in existence on the right bank. By degrees, however, the legislation of both parts of the territory is becoming similar, and with the aid of legislation common to Germany uniformity will soon be established. A council of state is intrusted with the usual powers of bodies bearing this title. The communal organization resembles that of France; the government chooses the mayor from among the members of the municipal council, and administrative tutelage is not very rigorous. Town councilors are elected for nine years by all the inhabitants in the enjoyment of their rights; one-third are elected every three years. — Liberty of conscience is sanctioned by law. The ecclesiastical affairs of the Protestants are administered by the upper consistory of Darmstadt, having under its orders three superintendents, one for each province; under these superintendents are thirty-eight deacons chosen for five years from among 428 pastors. The concordat of 1830 regulates the Catholic worship, the interests of which are managed by the bishop of Mayence. There are 154 Catholic parishes, and seventeen clergymen bear the title of deacon. The Jewish religion has seven rabbis. — There are about 1,800 primary schools in the grand duchy. Instruction is obligatory (from six to fourteen years of age); there are two normal primary schools, six gymnasia, several special schools, and the university of Giessen. — In the financial period 1860–62 (three years), the receipts and expenditures were 9,000,000 florins ($3,780,000) annually, figures, which were not much exceeded in the budget of 1872, (if no account be taken of the balances of preceding years or the revenues ceded to the empire). The revenues come chiefly from the domains and forests, nearly 3,000,000 florins; direct taxes, 3,800,000; indirect taxes, 1,500,000; the rest from various sources. In 1821, when the constitution was proclaimed, the receipts were 5,996,510 florins, and the expenditures 5,995,735; direct taxes furnished 2,603,107 florins, and indirect taxes (liquors, salt, timber, and right of navigation), 1,299,903. In 1872 the expenditures of the grand duchy itself amounted to more than 9,500,000 florins, including the contingent paid into the treasury of the empire (a little more than one million). This treasury receives certain revenues in the grand duchy which belong to the German empire. On the other hand, there is nothing to pay for the army, which is maintained at the cost of the empire. The interest of the debt is less than 700,000 florins. The capital of the debt is about 4,000,000 florins, not including the 9,000,000 of railway debt. There are besides 4,000,000 florins in paper money. — The army forms part of the German army, 11th corps, 25th division, and is subject to the same laws. — The agriculture of this little country is far advanced. The soil, 3,365,671 morgens in extent, is divided into 1,656,385 morgens of arable land, 446,525 morgens of meadow and pasture land, 38,693 morgens of vineyards, and 1,059,628 morgens of forests; thus we see that but a small part of the soil is unfavorable to cultivation. There are about 40,000 horses, 295,000 horned cattle, 197,000 sheep, 128,000 hogs, and 59,000 goats. The value of cultivated lands is 226,000,000 florins; their products, 45,000,000. The circulating capital is 38,500,000 florins; the value of animals nearly 26,000,000. Industry and commerce are important. The Rhine and the railroads favor the grand duchy in regard to commerce; the Zollverein has been useful to industry, which in 1849 had 4,470 manufacturing establishments, and, in 1857, 113 steam engines. Hesse is a prosperous country, and its inhabitants are considered among the most liberal in Germany.—The population of Hesse at the last census was 882,349. The revenue for the financial period 1879–82 was estimated at 20,235,247 marks per annumn, and the expenditure at 17,142,497 marks. At the end of 1879 the public debt amounted to 25,382,000 marks, mainly incurred for the construction of state railways.—

HISTORICAL SOCIETIES. (See ACADEMIES.)

HISTORICAL SUMS, Valuation of. It is often a matter of great interest, as much from an historical point of view as for the solution of certain economic questions, to obtain an approximately correct idea of the relative values of things at different epochs, and to ascertain as nearly as may be the importance of certain amounts given by historians in the money of their times. It is on this account that some of the best known economists have devoted several pages of their works to what they term the "valuation of historical sums," while at the same time the subject is itself possessed of sufficient interest to furnish matter for several special treatises. What examination seems necessary will be given here, without, however, intrenching on the subject of money, which will be treated of in its own place.—There are two points to be looked at in considering the subject of historical sums. It must first be determined

what they represent in gold or fine silver, that they may be reduced to moneys of the present date, metal for metal and weight for weight. This reduction made, there remains to obtain the best idea possible of the relative values of the precious metals at the dates in question. With regard to the first point we possess at the present time tolerably exact data, at least with regard to certain countries and certain periods. The medals which remain to us in great numbers from the Greeks, the Romans, and European peoples of the middle ages, medals which for the most part are simply the moneys of those dates, have given us the opportunity, although they were often greatly altered by rust, of measuring with fair precision the actual weight of those coins and the proportion of fine metal which they contained. This material testimony has in addition been corroborated by the researches of antiquarians and savants. It is, however, only fair to admit that on this very subject grave differences of opinion exist. A savant whose name is well known to every economist, Count Germain Garnier, has advocated a new system, plausible enough even if it be not correct, which would wonderfully modify the deductions claiming to be derived from the inspection of ancient medals. According to his theory all or nearly all the sums mentioned in ancient history were given in an imaginary or counting currency, entirely different from the actual currency as it appears in the medals. Hence it would follow that the estimates made formerly would be misleading. We will recur presently to this assertion, if not for the purpose of determining its value, at least to show what would result from it. Meanwhile we may assume that the calculations based on the study of ancient medals are justified, and starting with this hypothesis we may affirm that the reduction of some ancient moneys to modern coinages presents at the present time no serious difficulties.—The same can not altogether be said with respect to the relative values of those moneys at the dates when they were current. Like everything else that is bought and sold, the precious metals are liable to fluctuations in value from time to time, in accordance with their greater or lesser abundance in circulation. These variations, although but slight at any given time, may, however, become very considerable after the lapse of several centuries. We know as a fact that between the times of the ancients and our own times, nay, even since the middle ages, the values of gold and silver have fallen considerably, so much so that the sums of money mentioned in the history of those times are invariably of an importance greatly superior to what might be attributed to them, were regard to be had merely to the actual quantity of the precious metals they represent. It would be of the greatest importance to know the exact extent of this depreciation, but unfortunately it can only be estimated by valuations at best somewhat vague and constantly subject to revision.—We will inquire presently into how the resolution of this last problem, so far as it has been resolved, has been set about. But we must first state, following the statistics of the most trustworthy authors, the relation borne by money of the present date to the most interesting and best known coinages of ancient times.—In ancient Greece the money best known to us is that of the Athenians. It is also the most interesting, both on account of the importance of the republic to which it belonged, and because, according to Xenophon, it was sought after by the merchants of all countries, and was used as a common medium of exchange in the international relations of that time. Beginning with the last century, minute and profound research has been made into the subject of Athenian money, and its value has been successfully determined with almost absolute accuracy. Mention must be made in particular of the works of the Abbé Barthélemy, who, in his *Voyage du jeune Anacharsis*, leaves little to be desired with regard to this. We prefer, however, to rely on the more recent works of Boeckh, who, in his "Political Economy of the Athenians," a large work and one of high reputation, has made a happy selection from the investigations of his predecessors, to which he has added the results of his own. Besides, the data given and the values arrived at by Boeckh vary but little from those of the Abbé Barthélemy, whose point of departure he adopts.—The monetary unit of Athens was the drachma, a silver piece of slightly inferior value to the French franc. The multiples of this monetary unit were the mina, which was worth 100 drachmas, and the talent, which was worth 6,000. The mina and talent were, however, only nominal money, for no coins of those values were struck. The circulating medium was then the drachma, although any calculation of large amount was made in minas and talents. In addition to this, the Athenians occasionally coined four-drachma pieces, named, consequently, tetradrachmas; but this circumstance did not alter the system. Of lesser value than the drachma, there were used in Athens, as small change and for the necessities of everyday life, the chalchus and the obolus, which were fractions of the unit. It would appear that this simple and fairly well organized monetary system underwent but slight variation during the time of Greece; and as the Athenian money had then, as we have said, an almost world-wide circulation, it is possible with a little attention to make use of it in most of the valuations which relate to those times. According to the Abbé Barthélemy, whose valuation is adopted by Boeckh, the weight of the ancient drachma ought to be, after making allowance for what it may have lost in the passage of centuries, 82 grains, which he reduced, however, on several considerations, to 79. Its standard of fineness was very high, seeing that it only contained $\frac{1}{72}$ of alloy. On this basis it is easy to compare this money with French money. 79 grains, ancient weight, correspond to 4.197 grammes, or, in round numbers, 4.20 grammes; deduct $\frac{1}{72}$ for alloy, .06

grammes, and there remains, in fine silver, 4.14 grammes. Supposing the franc to contain 4.5 grammes of fine silver, the Attic drachma is then to the franc as 414 to 450; giving as the value of the drachma, 92 centimes, or, to be exact, 91.66 centimes.—Without entering further into the details of the comparison we will give in a short table the relation borne by the Attic money to French.

ATTIC MONEY CONVERTED INTO FRENCH MONEY.

Obolus	0	15
Drachma	0	92
Mina	91	66
Talent	5,500	00

The practice of computing amounts by talents, says Boeckh, was not confined to Attica; it spread over almost the whole of Greece and even beyond it. The talent was worth 60 minas; the mina, 100 drachmas; and the drachma, 6 oboli. In Athens the obolus was divided into 8 chalchi; and the chalchus into 7 lepta. It may be said in passing that this last mentioned coin has no equivalent in French money, as it is of greatly inferior value to the centime.—With the assistance of the preceding comparative tables it is generally easy enough to convert into French money the sums mentioned in the history of ancient Greece. Attention must be paid to the fact that if the use of the talent was almost universal it was not everywhere of the same value. The talent of Eubœa, which was also greatly used in Greece, differed from the Attic talent, although not to a great extent. There was a wider difference between the Attic talent and the talents of Babylon and Alexandria, although the exact amount has not been accurately established. The last named, although mentioned sometimes in history, figure there less than the first two, about which more precise knowledge is fortunately possessed. Attic money, reformed in Solon's time, has scarcely varied since, and the talent of Eubœa is referable to a still more distant date.—The Roman monetary system was reformed or modified several times. This was first done in the year 490 after the foundation of Rome. Silver money coming into use about that time, it was judged expedient to reform, in consequence, the copper coinage with which the Romans had till then been content. At a later period two other reforms were made successively in the course of the sixth century, but these latter were mainly in regard to silver coin. As some differences of opinion exist among savants as to the nature and extent of these reforms the money current in Rome previous to those dates will not be spoken of, nor has it any particular interest.—"After the establishment of silver money," correctly says M. Germain Garnier, "the sesterce was the chief coin of the Romans, and it was in sesterces that they expressed all sums small or great, from two or three even to the highest numbers; tens, hundreds, thousands or millions." It then remains to settle what the sesterce represented in fine silver. Unfortunately, although the sources of information with respect to Roman money are very abundant, they are far from being in accord on this primary question.—Although the sesterce was the numerical term generally employed in calculations, it was not, for all that, the unit employed in the Roman monetary system. The monetary unit was the denarius, of the value of four sesterces, and which was besides more frequently a sum in computation than an actual coin. It is certain, and on this point all the savants are pretty nearly agreed, that the Roman denarius approximated closely to the Attic drachma. According to M. Germain Garnier, these two monetary values were absolutely identical, the object of the Romans in reforming their money system during the sixth century being to bring it into unison with that of Greece. According to other writers, who in this respect seem to us more accurate, although the Roman denarius and the Attic drachma were so closely allied that ancient historians when not speaking with rigid exactitude used the terms indifferently, there was, nevertheless, a distinct difference, the denarius being to the drachma nearly in the ratio of 8 to 9. But it is with respect to the actual intrinsic value of the two monetary units that there is a wide divergence.—It has just been said that Boeckh, agreeing in this with the Abbé Barthélemy and almost all other savants, gives the weight of the Attic drachma as 79 grains of fine silver. Admitting the proportion given for the two coins as correct, namely, as 8 to 9, the Roman denarius ought then to contain about 70 grains weight of fine silver. This closely approaches the value as given by several savants. M. Germain Garnier, however, values the denarius at only 31½ grains of fine silver, which, according to his system, would also be the exact weight of the Attic drachma. This is a wide departure from the former estimate. The difference would be more than half, and is sufficiently great to render hopeless all efforts at adjustment which it might be proposed to effect on such a basis. It is not for us to choose a side in the controversy. Political economy has to take note of the results only when they seem to be sufficiently established, and draw from them their proper sequences. We may, however, mention briefly how this extraordinary divergence of opinion which we have just mentioned is caused. According to M. Germain Garnier, savants until his time went astray through confounding the nominal money of the ancients with the current money which was of much higher value. With the Romans, the denarius, which was during their first centuries a current coin, became after the reforms mentioned above almost entirely a nominal sum whose value remained invariable. The silver coin in actual circulation was the argenteus, which was worth 2½ denarii. "The silver coin actually current was the argenteus, which some Latin authors have called the silver sesterce, *argenti sestertia*, because it consisted of two and a half denarii and formed literally the sesterce of the denarius as the first sesterce was of the as."

Now it is this argenteus, worth 2½ denarii or 10 sesterces, which antiquarians have constantly mistaken for the denarius mentioned by the ancient historians. A similar error, on the same authority, that of M. Germain Garnier, was made with respect to Attic money, antiquarians having taken for a tetradrachma or piece of 4 drachmas, a coin which really represented 10 drachmas. In each case, therefore, the savants were in error in a ratio of 2½ to 1. By multiplying by 2½ the value given by M. Germain Garnier, *i. e.*, 31½ grains, a result of 78¾ grains is obtained, which is almost identical with that previously given as the value of the Attic drachma. — The middle ages next claim our attention. Here, although there is still great cause for uncertainty, we are treading on firmer ground, for the history of modern coinages is, after all, better known than that of ancient times. We only intend to deal with French moneys, referring the reader for those of other countries to the works which treat of them in particular, and with respect to French money our purpose is merely to point out the principal changes it has undergone, leaving all details to works specially written on the subject. — In France, from the end of the eleventh century until the revolution of 1789, which completely altered the old monetary system, silver was always weighed and uttered by the mark. There were marks of different weights; but that of Paris, to which ancient prices are referred, was of eight ounces or 4,608 grains. The mark since the same period has also always been divided into livres and the livres into sous and deniers. But on account of the successive deteriorations of the coinage, often reduced in weight by the kings, the number of livres contained in the mark has gradually increased; at the end of the thirteenth century, for example, it but slightly exceeded 2 (2 livres 18 sous), and it was more than 54 at the end of the eighteenth; a fact which gives a general idea of the alteration which money underwent during that period. To know what the livre represented at each intermediate epoch it is necessary to determine into how many livres the mark was then divided. Tables have been compiled on this subject, for the most part fairly complete and satisfactory, although here and there are met with, if not positive errors, at least gaps and omissions. We will only give here the principal results, beginning at the end of the thirteenth century:

DATE.		Livres to the Mark.		
		Livres	s	d
Thirteenth century,	end	2	18	0
Fourteenth century	first half	3	0	0
	second half	4	0	0
Fifteenth century	first half	8	0	0
	second half	11	0	0
Sixteenth century	first quarter	12	4	6
	second quarter	14	13	6
	third quarter	16	0	0
	fourth quarter	21	0	0
Seventeenth century	middle	28	14	0
	end	33	0	0
Eighteenth century	before 1718	40	0	0
	after 1726	54	10	0

— The information possessed in respect to the condition of the coinages during the tenth, eleventh and twelfth centuries is very incomplete, but more is known of it at the end of the eighth century in the time of Charlemagne. The Carlovingian livre was, according to historians, of 13½ fine silver, and was subdivided into 20 sous. It remained pretty nearly the same during the ninth century, then the traces of this Carlovingian livre disappear, and the livre is recovered at the end of the thirteenth century considerably diminished, and it continues to lessen from century to century till 1789. — The preceding observations give an idea of the comparison possible between ancient and modern money. But to follow the parallel more closely, recourse must be had to special works of which we have here only given a glimpse. Let us suppose now that it is desired to know what a sum of money mentioned by the historians (in drachmas if Greek, in denarii or sesterces if Roman, in livres, sous and deniers if French) of the middle ages represents as a commercial value. The first step, as we said at the beginning of the article, is to determine the value of the sum in current specie, weight for weight, only fine metal, of course, being taken into account. It has been shown by the foregoing remarks what means are at hand for the solution of this first problem, and what reasons for uncertainty and doubt present themselves in certain cases. Let us suppose it solved. We should then know sufficiently accurately with what weight of fine metal we had to deal. But all would not then be said on the matter. There would remain still to be considered what this weight of metal represented in commercial value at the date in question. Here then is another side of the problem, and it is certainly not the least difficult of solution. — Whatever the value adopted, in fine silver, for the Attic drachma and the Roman denarius; whether adherence is given to the views of Boeckh, the Abbé Barthélemy, and almost all the savants who have given the subject their attention, or the preference is shown to those of M. Germain Garnier, the fact remains that that denarius and that drachma represented in ancient times a greater commercial value than the same weight of silver would have at the present time. But wherein lies the difference? That is what we have to determine. — To make at least an approximately correct estimate it has been usual to take as a standard of comparison certain marketable articles in common and regular use, whose commercial value during the course of centuries is supposed to be less subject to change than that of any other commercial articles, whether because they always represent a constant force expenditure or because the need of them is the same at all times. Thus, the daily pay of a common man, a day laborer, has sometimes been taken as the measure. It has been supposed that at all times the pay of an ordinary laborer, that is, of one with no special qualification, would be measured by what was necessary for a man's support;

a value subject, it is true, to variations, but not to any of great moment. At other times a soldier's pay has been taken, when it could be ascertained, the theory being that his pay was more regular and better gauged to the ordinary needs of life than even workmen's wages. Others again have taken as their test the price of wheat, which although occasionally very variable at a given time yet seemed to them more than anything else apt to return constantly to a given level. — Let us examine shortly the merits of each of these data. It need scarcely be said that no one has thought of giving these standards as absolute. There is no possibility of attaining by their means a rigorously exact estimate of the relative values of the precious metals in ancient times; all that can be hoped for is a satisfactory approximation, and it is to this end solely that the data must be considered. Even with this limitation it seems to us that each of these standards taken by itself is far from being adequate to the purpose in view, and the economists who have taken as the sole basis of their calculation one or other of these values seem to us to be liable to grave errors in their work. — J. B. Say adopts as his basis of valuation, wheat, which he supposes to have changed its real value very little during the course of centuries, except temporarily, because it is a necessary food substance whose scarcity or abundance has a powerful effect on population. But wheat, whatever may be said to the contrary, is liable to very marked oscillations and those not merely temporary but of considerable duration, in proof of which it is not necessary to have recourse to ancient times. Is wheat, for example, at the same price in Russia or America as it is in France or England? Far from it; the difference is great, going from once to twice as much, and even beyond that. But there is no need to leave France, in different parts of which will be found notable variations. Thus the price of the hectolitre of wheat is usually from 24 to 26 francs at Marseilles, while it is only from 13 to 15 francs in other parts of France, for example, in the Haute Marne. In old times, when communication was far from being as easy or as safe as it now is, the variations in price between one locality and another must have been even more marked than now. It may perhaps be said that Marseilles is a great centre of consumption, and that these centres of consumption ought to be compared with each other. Paris is a much greater centre of consumption than Marseilles, and yet wheat is usually cheaper there than in the last named place. Why so? Simply because the position of Paris, which has in its immediate neighborhood on one side the vast plains of Picardy and on the other the plains of La Beauce, is with regard to a wheat supply much more favorable than that of Marseilles. — It is manifest that in the study of ancient affairs account may to a certain extent be taken of similar circumstances. It will be said, for example, that Athens, obliged as it was to draw part of its wheat supply from abroad, and that too from great distances, through many difficulties and perils; obliged at times even to resort to force to obtain the necessary quantity,—that Athens in this situation would have to pay greatly in excess of the average cost of wheat. Those considerations have doubtless some weight, yet who could, after the lapse of so many centuries, estimate correctly the influence of these local circumstances? Could any one determine precisely the average cost of wheat at any given time or place, a thing very unlikely to happen, it would be but a very untrustworthy, very irregular test of the relative values of the precious metals at the same time. — The average rate of wages does not seem to us a much safer standard. Whatever may have been said about it, it is not the case that the wages of ordinary laboring men are measured everywhere by their bare needs, and therefore are based with fair accuracy on the actual cost of the means of subsistence. All that can be admitted with respect to this is, that the cost of the absolute necessaries of life forms, so to speak, the extreme limit below which wages can not fall, at least for long. But nothing prevents them rising far above it. Do we not see in our own times, that the average pay in the United States (and it has been so for a long time) is at least double what it is throughout the most of Germany, and yet the cost of subsistence in the former is not greater than it is in the latter? If we refer to the figures of M. Moreau de Jonnès, even in France the pay of farm laborers, which would seem to be less subject than any other to be acted upon and altered by external influences, is shown to be at present, due regard being had to the difference in the cost of living, at least double what it was in the reigns of Louis XIV. and Louis XV. And why should these differences that we see so distinctly in modern times not have existed in ancient times? It is besides very difficult to find the real rate of wages among the ancients, as the work then was generally done by slaves. We know, it is true, on the authority of certain ancient writers, what a slave brought in certain cases to his master when the latter hired out his services to strangers. But what a slave brought back to his master formed only a part of the real remuneration of his work. It was still necessary that this slave should be lodged and fed, and however trifling may have been the expense of so doing, it certainly consumed no inconsiderable part of the value of his labor. What he brought his master was in reality only the surplus. Now who can say what proportion this surplus bore to the total pay? In every respect, then, the rate of wages, as a criterion of the relative value of money, is at least as uncertain as the price of wheat.—As to placing any reliance on the pay of a soldier, as is done notably by M. Germain Garnier, we regard it as simply folly. It is perhaps true, as this author says, that as the pay of its soldiery constituted one of the principal expenses of every state, especially when the army was numerous, it has always been necessary

through mere stress of circumstances to reduce it to no more than was absolutely necessary, giving the soldier only what was imperatively demanded by his pressing needs. But, apart from the fact that these needs themselves vary, it is not easy always to establish the exact figure to which the actual pay of the soldier amounted. There almost always enter into the calculation, several different elements. It is a very unusual thing for a government to leave its soldiers to provide out of the pay given them, for all the expenses of their keep. It almost invariably charges itself directly with a part of the expense, and that part one that varies greatly according to the times. Sometimes it is contented with furnishing them their arms; at other times it adds to that, all or part of their clothing; at others it goes so far as to furnish them, in addition, with lodging, food and fuel. How, in such a case, is their real pay to be computed, as it is evident that what is then distributed to them in hard cash can be but a small portion of it? — The more closely this subject is examined, the more we are forced to admit that if it be desired to obtain an approximately correct estimate of the relative value of the precious metals in ancient times it will not suffice to take as the standard of comparison any one object, be it what it may. Neither the price of wheat nor the rate of wages can lead to any satisfactory conclusion. Still less can it be derived from the pay of a soldier. What then remains to be done that we may obtain as nearly as possible the desired result? What seems to us to be necessary is to find out, with reference to the time under consideration, the prices of a great number of the commonest articles and those subject to great variations in value, wheat or bread, meat, fish, common wine, the daily pay of a laborer when it can be ascertained, etc. However, it is not to economists, in their capacity as economists, that it belongs to make researches of this sort. Their part is limited to pointing out the necessity for them and the direction in which they should be made, that they may be profitable when made. They must rely for the execution of the work on scholars. — Such work has been done and well done for the France of the middle ages. Dupré de Saint Maur went far on the way in 1746, and he has been followed in it by a great number of deeply-read men, who have made their inquiries more precise and more searching. Among works of this sort we may mention specially that of M. C. Leber, published in 1847. He gives in it very extensive tables, showing satisfactorily the prices of a great many of the articles in common use at different times in French history since the thirteenth century, with comparisons showing what M. Leber happily terms the *power of money* at those times, that is to say, the relative value of the precious metals. — Unfortunately nothing similar exists in regard to ancient times. No one has yet had, so far as we know, the happy idea of giving, in connected tables, the prices of common things among the Greeks and Romans. It does not, however, seem to us impossible of accomplishment. "The knowledge of antiquity," says Boeckh, at the commencement of his great work, "is still in its cradle." We willingly believe it. And yet in Boeckh's own work there is already abundance of precious material for the execution of the work of which we speak. One first question would remain, it is true, to be solved, the actual weight of the current money of the ancients. Did the Attic drachma and the Roman denarius contain 79 grains of fine silver, as is held by Boeckh, the Abbé Barthélemy and the majority of scholars, or only 31½ grains, as M. Germain Garnier maintains? Without first having solved this main question it is easily seen that all other research is futile. But once suppose it solved and it seems to us that it would not be impossible, with the assistance of carefully compiled price tables, to arrive at a fairly satisfactory determination of the power of the precious metals in ancient times. Then also, in a general way, the importance of the majority of the sums of which mention is made in history would, by means of a most simple calculation, be arrived at.

CH. COQUELIN.

HISTORY is the great school of politics, and no man can be a statesman unless he is not only acquainted with the accounts and testimony of history, but with the history of history itself, and knows how, in the course and progress of ages, history began by being merely an art and at length became a science, the most philosophic, the most elevated and the most instructive of all sciences. *Historia vero*, says Cicero in his *De Oratore* (book ii., chap. ix.), *testis temporum, lux veritatis, vita memoriæ, magistra vitæ:* history is not only the witness of ages, the judge of buried men and nations, the charm of the living spirit; it is the nurse and preceptress of generations entering the field of action. In proportion as humanity nears its appointed goal, history becomes more useful to it. We know not whether poetry in its present form will in the most distant future accompany the human race, which was and still is indebted to it for so many hours of rest and pleasure, but we are sure that history will guide it to the end; and, however beautiful the models left us by antiquity, we may hope that at no epoch will beautiful historical works be wanting. It may even be contended that antiquity did not know real history, or at least did not know all the wealth, all the resources, all the lessons of history, because it was then too early for men to measure their future destiny by the past. And does history of a lofty character exist in fact where the eternal character of man is not represented, where the feeling of solidarity (oneness) among generations and centuries is lacking? — The ancients, then, were rather accomplished artists than historians. Herodotus told his story to rest the mind and charm the ear; Thucydides mingled more thought with his art, but he only touched an episode in the life of a people, and

almost the same may be said of Polybius. Cæsar merely collected materials; Sallust gave little thought to past and still less to coming ages. The field widens before Livy, but he had not the mind of a philosopher, and he sees only Rome in the universe. Tacitus himself, the great Tacitus, was the avenger of the outraged customs and liberty of one epoch, but he did not write a book in which the soul of humanity breathes The great Christian revolution was needed to raise on the ruins of ancient religions and empires a faith in the destinies of nations yet unborn. The name of this reason or this faith is the philosophy of history; we do not find it in literature till the St. Augustines and the Salviens, in presence of transient events, preached the eternal law of God, Creator of the universe. In 410 Rome was at last violated by the barbarians of Alaric; Symmachus, in his pagan grief, exclaimed that Rome had succumbed because Rome had become Christian. St. Augustine, to convict him of ignorance, then began his "City of God," which he finished in 426, and in which, for the first time, universal history was presented entire in the same picture, prostrate, it is true, at the feet of the God of the Bible and the Gospels. Under the same inspiration Salvien wrote his beautiful treatise *De gubernatione Dei*, and Orosius, his "History." Here at last is divulged the thought which connects all the acts of men each with the other True, Lucretius had announced it, but too briefly, in the beautiful verse: *Et quasi cursores vitæ lampada tradunt*. In the middle ages everything was submerged; no enlightenment, no philosophy, no history An attempt has been made to find in the dawn of the renaissance the first sign of the resurrection of real history; the prolegomena, in which Francis Baudoin recommends historians to study law, which is the bond of nations, are pointed to; John Bodin is cited, whose *Methode facile pour la connaissance de l'histoire* in which he desires to add to the study of laws that of constitutions and customs; Bacon, in his *Instauratio magna scientiarum*, declared that there was no history, unless the historian had made a profound study of the sciences and literature of the people whose life he narrated. Here are marks, doubtless, of that awakening of thought, which in the fifth century seized upon St. Augustine; but where is the work succeeding his? It appeared when Bossuet published his "Discourse on Universal History," unfolding the annals of empires, from the creation to the time of Charlemagne, to bear witness that since the calling of Abraham, the word of God was intrusted to a single people, and that around the destiny of this single people, ignored by antiquity, were grouped the destinies of the ancient and modern world, Roman, barbarian, once more Roman, but whose sacred edifice is the basilica of St. Peter's, and no longer the capitol! — Let us hear the last father of the church: "God used the Assyrians and Babylonians to chastise this people; the Persians to restore them; Alexander and his earliest successors to protect them; Antiochus the Great and his successors to exercise them; the Romans to maintain their liberties against the Syrian kings, who thought only of their destruction. The Jews continued under the power of the Romans till the time of Christ. When they disowned and crucified Him, these same Romans lent their hands unhesitatingly to divine vengeance, and exterminated the ungrateful nation. God, who had resolved to collect a new people, from every nation, first united the lands and the seas under one empire. The intercourse of so many nations, formerly strangers to each other, and then united under Roman dominion, was one of the most powerful means employed by Providence to spread the Gospel. If during three centuries the Roman empire persecuted this new people which increased on every side within its territory, this persecution strengthened the Christian church and illustrated its glory with its faith and patience. Finally the Roman empire yielded; and having met something more invincible than itself, it received quietly into its bosom the church against which it waged so long and so cruel a warfare. The emperors employed their power to enforce obedience to the church; and Rome became the head of the spiritual empire which Jesus Christ wished to extend over the whole earth."— Perhaps so, as Voltaire said, but the greatness of the Greeks and Romans have still other causes; and Bossuet did not omit them in speaking of the spirit of nations. Indeed the majesty of the theocratic politics of Bossuet astonishes us, but it no longer satisfies our intelligence, and is more divine than human; we feel that the times have passed in which its teachings suffice to rouse public virtue. Henceforth we need citizens, and another philosophy of history is alone able to produce them. The finger of God in all the pages of our past, is a kind of fatalism, which does not give energy to our souls in times when man should no longer doubt his liberty, and when he can no longer doubt his power. What miracles has not science called up around us from all the elements of which matter is composed, since, enlightened by the Bacons, the Descartes and all the luminous minds of the eighteenth century, it has regenerated physics and created chemistry! By dominating bodies and inherent powers we know that God has left us masters to act, and to modify even his work. Even before Bossuet, a tongue as eloquent as his, a believer more ardent, a mind more severely tempered in the struggles of faith and reason, a great scholar, Pascal, said: "By a special prerogative, not only each man advances day by day in the sciences, but all men together make continual progress in proportion as the universe grows old, because the same thing happens in the succeeding generations of men as in the different periods of individual life. So that all the succession of men, during the course of so many centuries, should be considered as one man, always living and ever

learning, from which we see how incorrectly we respect antiquity in its philosophers; for, as old age is the period most remote from infancy, who does not see that the old age of this universal man must not be sought in times nearest his birth, but in those which are most remote from it? Those whom we call the ancients were really new men in all things, and constituted the infancy of mankind, properly speaking; and as we have added to their knowledge the experience of the centuries which followed them, in us is found the antiquity we revere in others."—The age of gold is before us then and not behind, with mysteries and fables, with ignorance and misery. This is a commonplace truth to-day, or at least should be, if beside the theory of St. Augustine and Bossuet is to shine one which puts not more hope but more pride into our hearts. Pascal, however, was not talking politics in this case; he simply cast into circulation one of those great ideas of which his mind was full.—In 1725 Vico published his "Principles of a New Science relative to the Common Nature of Nations." The state has at last a place therein at the side of religion, and all history is divided into three ages: the divine age, in which the priest reigns, the heroic age, in which the brute force of the soldier triumphs; and finally, the human age, the age of instructed and disarmed men, the age of morals and laws, the age of civilization. But Vico confined each people within the circle of an individual life, and whenever they rose above it, he condemned nations to fall once more into the shade and to recommence their painful ascent toward the light.—If history will draw inspiration both from philology and philosophy, it will see that in the development of their languages, as in all the series of their social and civil acts, nations have followed a single and general law, that they have reached the same end, and that everywhere the same revolutions reappear, when crumbled nations rise from their ruins. This at least is the doctrine of Vico. The conclusion of the "New Science" is, that the social world is the work of the free development of human faculties, but that this world has nevertheless issued from an intelligence which is often opposed, and always superior to the particular designs which men propose to themselves. (See an article by Michelet in *la Biographie*, Michaud, 1827, in which is the first sketch of his great work on Vico.) Providence does not force us by positive laws, but employs, in governing us, customs which we follow freely.—This doctrine does not seem to be sufficiently clear to show man the object of the liberty which is granted him and almost immediately taken away. And besides, by confining us all in circles, from which we can not escape, from which we rise and to the bottom of which we always fall again, Vico has not lighted above our heads the beacon of a future worthy of the great intellectual and material works which humanity had then accomplished, and above all was about to accomplish. But it was much to have proclaimed the uniformity or the unity of peoples, to have accepted as first principle that man is sociable, and, while seeking for the laws of universal morality, to have removed from the field of experience the epicureans as well as the stoics, and with them all the disciples of extreme sects, to rely solely on the platonists, who recognize Providence, believe in the immortality of the soul, and hold to the necessity of being virtuous with human passions.—Nevertheless, Pascal had cast a more commanding and a broader glance over the earth and the paths upon which people toil so painfully, and it was not without reason that Goethe appeared at the end of that same great eighteenth century to change Vico's isolated circles into a single spiral, ever ascending and ever widening. Do we not touch at last upon the threshold of the universal human age, or at least do we not foresee it? "Humanity, begin thy reign, thy age has come, denied in vain by the voice of ancient echoes," said the great poet Beranger. This is henceforth the cry of every one weary of the hecatombs and funerals of the divine and heroic age. But though Vico did not raise his view above the horizons of particular nations, he expressed, nevertheless, the general law of the development of all human society.—Montesquieu's "Spirit of Laws" (1748) added something to the elements which already composed the substance of history. Those were not vain ideas with which Montesquieu decorated the vestibule of his edifice. "Man," he says, "as a physical being is governed, in common with other bodies, by invariable laws; as an intelligent being he violates unceasingly the laws established by God, and changes the laws established by himself. He must guide himself, and yet he is a weak creature, he is subject to ignorance and error like every finite intelligence; having gained some feeble lights he loses them again. As a sentient creature he becomes subject to a thousand passions. Such a being might forget his Creator at any moment: God reminds him of this Creator by the laws of religion. Such a being might forget himself: philosophers have warned him by the laws of morality. Made to live in society, he might forget others: legislators have bound him to his duties by political and civil laws." And further, when tracing the programme of knowledge and studies necessary to the philosopher and the historian, he adds: "Law, in general, is human reason in so far as it governs all the peoples of the earth; and the political and civil laws of each nation should be merely the particular cases in which this human reason is applied. They should be so appropriate to the people for whom they are framed that it is only by a rare chance that the laws of one nation are fitted for another. They must relate to the nature and principle of the government established or sought to be established, whether they form it as do political laws, or maintain it as do civil laws. They should have reference to the physical nature of the country, a cold, torrid or temperate climate, the quality of its soil, situation, size, and the occupation of the inhabitants, whether laborers, hunters or shepherds; they should consider the degree

of liberty which the constitution may allow; the religion of the inhabitants, their inclinations, their wealth, their numbers, their commerce, their habits, their manners. Finally, laws have relations with each other, with their origin, with the object of the legislator, with the order of things over which they are established. They must be considered from all these points of view." — We are now far from the pure theocratic doctrine, and the modern spirit has at last become its own master. Montesquieu directs the historian to study the harmonies which connect man with the earth; Voltaire in his *Essai sur les moeurs* (1757) gave the first sketch of universal history undertaken on the plan traced by the author of *l'Esprit des lois*, and if the execution is too hasty, at least the intelligence is everywhere felt of a man who, in default of evident truth, admits into history only probability, and who, in a country still monarchic, and himself the author of *le Siècle de Louis XIV.*, understands that events in the life of a nation are not merely to be named and dated with the reigns of kings. He says himself, "In modeling our work upon that of the great masters, we have to-day a more weighty burden to bear than they had. More details are required of modern historians, better authenticated facts, precise dates, authorities, more attention to usages, laws, customs, commerce, finance, agriculture, and to the population. It is with history as with mathematics and physics, the field has increased prodigiously. It is as difficult to write history to day as it is easy to make a selection from newspapers. Daniel thought himself an historian because he transcribed dates and descriptions of battles of which we can understand nothing. He should teach me the rights of the nation, the rights of the principal bodies of the nation, its laws, customs and manners, and how they have changed. The nation has the right to say to him: I ask you for my own history rather than that of Louis the Fat and Louis Hutin." — Toward the end of the century of Voltaire and Montesquieu appeared the book which, by taking advantage of all accomplished progress, and uniting all discovered truths, was destined to become, correctly speaking, the final programme of history. Herder's "Ideas on the Philosophy of Humanity," was in fact the résumé of what St. Augustine, Bacon, Pascal, Bossuet, Vico and the great French thinkers of the eighteenth century taught in succession. All their theories meet here, are completed here, and are fused into one same whole. — Vico first laid down the universal laws of humanity. As Edward Quinet, the eloquent translator of Herder, says, "From the representation he rose to the idea of phenomena, to their essence. Struck with the principle of the identical nature of all nations, he assembled all the phenomena which are common to them all in the different periods of their existence; and, taking from them their color and their individuality, he composed of their total an abstract history, an ideal form applicable to all times, and which is repeated among all peoples, without recalling any of them specially. What appears to us as the succession of nations, their birth, development, greatness and fall, is merely the expression of the relation of the world to that one indestructible city, which bends downward, and marks the world with its stamp; hence, an indefinite sequence of ruins, nascent empires, broken thrones, changes and fragments, all of which have their representations in the absolute. Imagine a method opposed in everything to that followed by Vico, and you will have Herder's method. If the first gives, as point of support to the series of human actions, thought in its most sublime essence, the second rises from the grossest manifestations of material being. He binds in a single idea, everywhere present and everywhere modified, the space which incloses the powers of creation, and time which perfects them, by development. From the plant that grows, and the bird that builds its nest, to the loftiest phenomenon of the social body, he beholds everything advancing to the blooming of the flower of humanity, which is still in the bud, but which sometime must bloom." — Herder begins his history of philosophy by a description of the earth. He first sets the stage upon which the human drama is to be played. If Carl Ritter wrote his admirable geography, if even Humboldt composed his scientific poem, the "Cosmos," it is because Herder published his "Ideas on the Philosophy of Humanity." No book has exercised more influence. "It is," says Gervinus, "the ferment of a century." And Goethe, still young, while reading in Italy these pages so full of thought, found in his heart the lyric enthusiasm of ancient times, to express the joy which he felt. All these great ideas have since made their way, and have become almost common property; but Herder's work is the source from which they have flowed, and if for the philosopher, the historian, the statesman, the diplomat, there is one and the same humanity, still young, but of age to-morrow, and soon to be mistress of the terrestrial globe, we owe it to Herder, the successor and the heir of so many geniuses. — Almost immediately came the French revolution of 1789, which itself may claim the honor of having enlightened history and elevated the thought of man. Thus historical labors rise, as it were, on all sides, at the time in which we live. What admirable works were produced in the beginning of this century, and how consoling it is when the poetic lyre seems broken, when eloquence has been forced into silence, to see, still seated at their tasks men who are to continue the glory of their predecessors, and make themselves illustrious in turn by masterpieces which will enrich the inheritance of humanity. Tacitus has left in his writings a sentence the sadness and bitterness of which we still feel: *Rara temporum felicitate ubi sentire quæ velis et quæ sentias dicere licet.* But at least we feel also that history will soon be entirely free, and that it will not need to

wait till a century has passed before daring to paint it. — This is a famous maxim: "We owe consideration to the living; we owe nothing to the dead but truth." This is a maxim of the past. True, we owe consideration to the living, and the private life of those should not be troubled, who have nothing to settle with the justice of contemporary history; but a democratic age will authorize the historian to exercise at all times his office of accuser and public judge. Whoever rises to power, becomes that moment a man of history; and henceforth history, the avenger of the rights of all, commences its rôle, even during the lifetime of the chosen ones of destiny, of those favorites of nature who can not claim the honor and advantages of public life, if at the same time they reject its duties and its charges. It would be rather to the dead that we owe consideration, for they are no longer present to defend themselves. — To claim these rights for the history of living men, is not to desire the revival of ancient satire; it is, as we think, to give an account of the mind of our generation which, after we have finished with the theocracy of the earliest age, and when we seek to finish with the heroic age of Vico, does not wish in the civil age to create a new fetichism and protect new heroes, and no longer understands that chiefs and statesmen are to be judged only according to the portraits and the inscriptions on medals. Saint-Simon, beginning even with the time of the monarchy, disaccustomed history from servile respect. It is to be desired that no epoch will lack a Saint Simon. Let us trust to reason to discern and honor truth. — History sees, therefore, its task grow greater every day and the difficulties of its work multiply. In proportion especially as material interests develop, the variety of studies to be undertaken threatens to discourage timid minds; but it is in the destiny of man that these faculties increase with the obstacles which they have to overcome, and we can hold it as certain, that historians will not be wanting to history, and that history will not be wanting to future societies, who will expect such great services from it. PAUL BOITEAU.

HISTORY, Economic and Legal, and the Historical Method of Investigation. The object of this article is to trace the connection between the economic movement of society and the development of its positive law; and to indicate some of the relations between both and other phases of social evolution. Few persons conversant with the fundamental ideas of modern science would hesitate to admit that the present economy of every civilized country—in respect of the directions given to national energies, the occupations of different classes and sexes, the modes of production, the constituents and forms of wealth and its amount and distribution—is the result of a long evolution. Writers on political economy have indeed always had in view a development which might be termed an evolution, giving rise, for example, to division of labor and exchange, to wages, profit and rent, and to changes in their relative proportions. But they have conceived it as a special movement, impelled and directed by special economic forces. The natural laws by which it is governed, are, according to their exposition, deducible from certain general principles, such as love of wealth and aversion from toil and sacrifice; or, as expressed in a single phrase, the personal interest prompting every man to acquire as much riches with as little trouble as possible. Historical inquiry which involves an induction ranging over the widest possible field, teaches us, on the contrary, to regard the economic development of a nation, not as a distinct movement carried on by special forces, but simply as a particular phase of their whole social evolution, inseparably related to its other phases, legal, moral, intellectual and political. Each nation, from this point of view, has evolved its existing economy as the outcome of its history, character, environment, institutions and general progress. What the economist has to investigate in the case of a modern nation, is not a mere assemblage of individuals actuated by personal interest in a commercial sense, but an organized society which has had a long historical career, and of which corporate bodies, orders and castes — families, townships, boroughs, churches, traders, fraternities, priestly, noble, free and servile classes— rather than individuals, long formed the main constituent units. To ascertain the genesis of the economy of the people of England, for example, or even of the people of the United States, an old people in a new country, we must carry our researches far behind modern times, and into regions beyond the province of commerce and individual pecuniary interest. The constitution, usages and character of early Teutonic society, the ideas and traditions of ancient civilization, Oriental, Greek and Roman; the institutions of the mediæval world with its monarchy, feudal aristocracy and Catholic clergy, its chartered cities and guilds; contributed so to the evolution both of English and of American economy, that what either might have been, had any of these elements been absent, is beyond conjecture. In the earlier stages of social growth the economy of each nation was a matter wholly of common life, usage, institution and thought; of custom, law, religion, morality, tradition, social opinion and observance. Even at the present advanced stage of development in civilized countries, where individuality has acquired a considerable sphere, the nation collectively, with its polity, laws, character, opinions and environment, is the chief factor to be kept in view in the study of national economy. Two distinct conceptions are commonly confounded by writers for whom individual interest is the source and mainspring of economic movement and organization. The bulk of their system is based on the assumption that the conduct of individuals may be inferred from propensities of human nature supposed to be universal. Some-

times, however, they have in view rather the individual diligence, enterprise, energy and originality, and the variety of effort and resource developed by liberty, as opposed to state regulation or other forms of social control. But what the study of history teaches is, that individual interest and individuality themselves, owe their developments to antecedent and surrounding social conditions and national culture, attaining their ends, moreover, not only by the efforts on the part of individuals to which they prompt, but through the laws and institutions to which they lead; that individual liberty, so far as it exists, is the product of a long evolution, and is everywhere subject to much limitation, direct or indirect, on the part of the community; and that the various species of wealth which in different countries and ages have been the objects of desire and pursuit, have derived their attraction not from the propensities either of human nature in general or of personal idiosyncracy, but from national history and the atmosphere of thought and habit in which each individual lives.—One of the principal modes by which the community collectively develops its economy is through its positive law. Much that economists have been wont to regard as the result of individual exertion, has been a product of national institutions and laws. The mere existence of personal wants or desires, having wealth of some sort for their object, could not have created it or maintained it. They would have prompted rather to strife, plunder and destruction than to labor, production and accumulation. The inferior animals covet certain possessions and use whatever weapon they are armed with to seize them. Human wealth is the result not of the disposition of each man to appropriate what he likes, but of the fact that other men, with similar wants and desires, have combined to secure to him the enjoyment of certain things under certain conditions. Nor without social combination and organization could powers of disposing of or exchanging articles of wealth exist. Society collectively must insure their ownership to purchasers, donees, mortgagees, heirs, devisees, as well as to their original possessors. The evolution of these powers through the legal progress of society forms one of the main subjects of economic inquiry in its proper extension. So intimately connected are the legal and the economic movements of society that each stands in the relation of both cause and effect to the other. Thus, the only mode by which some of the main motives to industry and thrift, which have their root in the family sentiments and affections, can become effectual, is through a law of succession; and it may be said both that these motives have generated the law, and that the law has given impulse to the motives. So again every step in the industrial and commercial progress of a community gives rise to new legal rights and obligations and new branches of civil law, which are in turn the indispensable conditions of advancement in wealth. The growth of the dimensions of the law of society as it moves forward in its economic career, attracted the attention of Montesquieu. A nation, he observed, which carries on trade or navigation, must have a much larger code or body of law than one which has not proceeded beyond agriculture, and the latter again must have a larger body of law than one which has not reached the agricultural stage. The economist, we may add, who studies the law of an advanced nation respecting property, tenure, conveyance, contract, inheritance, testamentary disposition, sale, loan, partnership, agency, pledge, inland trade, maritime commerce, banking, mining, railways, navigation and other departments of modern business, will find ample proof not only that the economic and the legal phases of social progress are closely related, but that one of the chief modes by which the economic structure of a community is conditioned, and its progress in wealth determined, is by the development which its positive law receives.—The course of society, it must be borne in mind, is not always or in all directions for the better, whether in its legal or in its economic aspect; although on account of the poverty of language, the terms progress and advancement may sometimes be employed to denote merely the reverse of a stationary condition, or, in other words, an onward movement of a community in a career which is not necessarily one of improvement. Feudalism, for instance, was a phase through which society in western Europe passed, and from both an economic and a legal point of view, one which, if not wholly retrograde, reproduced some elements of barbarism. In the long struggle that has gone on ever since in England between interests, principles and ideas, commonly contradistinguished as feudal and commercial, sometimes the feudal, sometimes the commercial have prevailed. Yet in both cases society has moved on in its natural course, that is to say, in one determined not by the ideal law of nature in which the economists of the last century believed, but by the actual laws of social evolution. Legal history has two great general lessons for the economist of our own day, namely, that, on the one hand, the economic progress of society is effected largely by law in the juristic sense, and that, on the other hand, law in the juristic sense is subject to law in the scientific sense of natural sequence and development. The greater part of the civil law of a civilized nation relates to property, industry, the commercial business of life, and the production, accumulation and distribution of wealth; and its provisions respecting them are no more arbitrary or accidental than the operations of the physical world.—The oversight, by so many eminent English writers on economic science, of the cardinal truths that some of the chief natural laws of economic progress must be sought in the history of positive law, is traceable to certain dominant ideas. Adam Smith, in the first place, like his French contemporaries, following the theory of the age respecting the system of nature and natural law, restricts

the sphere of positive law within the narrowest limits. The "natural order of things," or, to use another of Adam Smith's phrases, "the natural progress of opulence," was not in their view the actual economic movement of society under the real conditions of national history and life, but an imaginary course of things deduced from principles which at best took account of only a part of human nature. Bentham and his follower Austin, on the other hand, revolting against the nebulous conceptions of natural law pervading jurisprudence as well as political economy, sought to expel the term altogether from the nomenclature of political philosophy. With them law was simply the command, direct or indirect, of the supreme government of the state; and they concerned themselves with no ulterior source. —Both economists and jurists were thus estranged from the conception of natural law, in the proper sense of the term, governing the development of positive law, and carrying on in a great measure through it the movement of society. The opening passage of Montesquieu's "Spirit of Laws" has been censoriously criticized in nearly identical terms by Bentham and Austin for describing law as embodying relations necessarily flowing from the nature of things. Montesquieu's language was infelicitous, yet he brought out and illustrated with historical and philosophical genius the truth that human nature and the circumstances in which human communities are placed, the stage of culture which they have reached, especially in the economic sphere, the affairs and business of life, give birth to relations between man and man and between man and woman, which not only form the staple subjects of civil law, but mainly determine its character and course. The most fundamental doctrine of the science of law is, that society, as it advances, continually evolves new dealings and fresh rights and obligations for legal definition, generalization, classification, sanction and regulation. A community can not develop the proprietary and other relations respecting land before the nomad stage has been passed, nor the personal relations involved in the family before marriage has been instituted, nor relations of contract between individuals while all things are tribal property and in common, or while no definite individual rights are recognized. When the agricultural stage is reached, settled life and the partition and cultivation of the soil gives rise to new social conditions and usages; and in proportion as manufactures and commerce are developed, there is a further growth of transactions, rights and obligations which it is the office of the lawgiver, the judge and the jurist to define, declare, and subject to arrangement and general rule. Glanvill, Bracton, Fleta and other early legal authorities, though some of them were influenced by Roman doctrines, observed, classified and formulated relations between husband and wife, parent and child, guardian and ward, landowner and tenant, lord and serf, buyer and seller—relations of family, tenure, status, succession and contract—which had an existence anterior to their formal recognition, and which would never have formed the subject of judicial decision, legislation or judicial exposition had not society in its career naturally evolved them. For even feudal relations, rights and duties grew naturally out of the history and condition of society, and did not start up at the command of law-givers or rulers, whose power of shaping and regulating them was limited, and so far as it existed was itself of natural growth. The so-called analytical English jurists, Hobbes, Bentham and Austin, may be said to have given a modern dress to the maxim of imperial jurisprudence, *Quod principi placuit legis habet vigorem.* They speak of positive law as though they had got to the root and end of the matter when they have traced positive law to the visible proximate source of its sanction and compulsory obligation. The historical school, on the other hand, following Sir Henry Maine, regard law as embodying rights, duties and rules of contract evolved primarily by social life and intercourse. The law of a nation with respect to property, movable and immovable, to the family, to intestate and testamentary succession, to landlords and tenants, vendors and purchasers, creditors and debtors, lenders and borrowers, owner and carrier, principal and agent, master and servant, trustee and cestui que trust, has grown up naturally like the family union itself, the tillage of the ground, the rise of handicrafts, the development of commerce, internal and foreign, and the various departments of human affairs comprehended in the division of labor. In its natural state, positive law is, it is true, the result of two distinct movements, each combining the flow of several tributary streams; a movement, first of all, of society, developing modes of life and conduct, rights and obligations, acquisitions and claims; and a movement of legislation and jurisprudence, giving strict legal form to these products of social evolution and activity. In the earlier stages of national life the first of these two movements is the only one. The customs of the community, the usages and conduct held to be obligatory on its members, embody both the substance of its institutions, and the unorganized authority by which they are maintained. As the organization of society proceeds, a legislature and a judicature are developed, and at length law reaches a stage, through a combination of the two movements, at which it answers to the definition of the analytical jurist. Much barren verbal disputation might have been dispensed with, and a more scientific conception of the nature of positive law would have been gained, had it been perceived that it has stages of growth, and can not display in its infancy all the characteristics that distinguish it in its maturity. The English constitution under the Norman kings was not so fully and distinctly developed and organized that the seat of legislative power could be certainly ascertained; and it

was and is matter of controversy how far the barons shared it with the king, in other words, where the sovereign power resided; yet it will hardly be maintained that during that long period England was without a polity and without law, though neither the political constitution nor the law possessed the definiteness and distinctness of form given by perfect development. Not only to the substantial elements of law—the relations and dealings of men and the consequent rights and obligations of which law is the authoritative expression—shrink, as it were, and by degrees disappear, as we retrace the steps of a community, and unfold and multiply as we follow its onward movement, but the organization which at length exhibits itself in a determinate legislature and regular tribunals, is of such gradual growth that the functions of legislator and judge may long be indistinguishably blended, and at a yet earlier stage the national assembly, in which the supreme legislative power comes at length to reside, may be indistinguishable from the host in arms on the one hand, and the meeting of the people for religious and festive solemnities on the other. A conflict may sometimes arise and even long continue between the two movements which have been described as concurring to develop mature positive law. The movement of society may generate transactions, usages, relations and rights, which law makers representing class interests or ancient ideas may be reluctant to recognize. The individual needs both of the owners of land and other classes may call for the free disposal of it both by conveyance and will, which an aristocratic legislature may refuse. Powers of mortgage may be urgently wanted, yet landed property, being, according to feudal ideas, inalienable from the heirs, may be slow in becoming legal security for debt. Commercial exigencies may create borrowing and lending at interest, while the law makers, following early religious or moral conception, may prohibit it as usury. Women may be tardily emancipated from disabilities at variance with the opinion of a highly civilized age. Yet if any one on this account doubts that the currents of life, business, social arrangements and wants, and ideas of expediency and justice, govern the movements of law, and that it follows a course determined not by the will of governments or legislatures, but by natural laws of society, he may be referred to its ultimate forms. Law, as Sir Henry Maine observes, often lags behind morality, or represents the morality of an earlier age. It often, too, lags behind the dictates of experience, and the needs of industry, commerce and progress. Yet in the end these natural forces prevail. The history alike of English and of Roman law is a record of their slow but sure victory.—One of the main sources of light with respect to the natural cause of economic progress is that to be found in the movement of positive law. The uniformity of some of the main features of its development over a great part of the world could not have taken place accidentally. The student of its history finds, for example, on many sides evidence of a primitive co-ownership of land by groups of kinsmen, and the evolution everywhere by similar steps of separate property. He finds land at first inalienable from the agnatic line, and by degrees becoming salable, devisable and liable for debt. In the countries of mediæval Europe he sees the forms of individual landownership, called feuds, developed with striking uniformity, and giving place in turn, however slowly, to other forms which may be distinguished as commercial. As society advances, individual contract more and more supersedes inherited states as the sources of legal rights and obligations. Slavery softens into serfdom, and serfdom is at length superseded by free labor. Sons cease to be for life under paternal power. Women acquire proprietary rights equal to those of men. Procedure, civil and criminal, passes through some nearly similar stages of evolution. The laws even of two countries could not follow the same course of development by accident; and the uniformity, were it not the result of imitation—as, according to legendary fiction, the Twelve Tables were of the Laws of Solon—must have proceeded from natural causation and sequence. A philosophical Scotch lawyer of the last century, in a work deserving greater fame than it acquired (Dalrymple on "History of Feudal Property in Great Britain") has traced the resemblance between the course followed by the laws of England and Scotland in relation to the tenure of land, its voluntary alienation *inter vivos* and involuntary alienation for debt, its devolution by intestate and testamentary succession, the forms of its conveyance, and the constitution of the tribunals exercising territorial jurisdiction. The reader of the work will find that the author amply makes good the proposition laid down in the preface that "the progress of these laws is in both countries uniform and regular, advances by the same steps, goes almost in the same direction; and where the laws separate from each other there is a degree of similarity in their very separation." The similarity of the movement in the two countries proves, it is true, only the fact of natural sequence, if imitation be excluded, without disclosing its reason and cause, or putting us in possession of the laws of social progress at work. When, however, the author proceeds to show that commercial and other exigencies and interests were on the side of the changes that took place in the positive law of the two countries, how these forces gained strength as opposed to those on the side of feudal institutions, we not only obtain proof of regular order and natural growth, but get hold of the laws of nature governing the evolution. Even in the case of a single country, were it shown that positive law had followed a path which the events of a growing society, and of advancing industry, commerce and civilization demanded, we should be justified in concluding that the movement had been determined by natural laws of social prog

ress. The history of Roman law, for example, alike under the republic and under the empire, can not be studied without a clear conviction that it followed a path of development directed by natural causes. — It belongs thus to the province of the economist as well as of the jurist to investigate the history of positive law. The movement which the latter examines on its legal side, or in reference to the legal rights and obligations, capacities and incapacities, which it evolves, has also its economic side in reference to the development of industry, commerce, and the amount and distribution of wealth. The movement which Dalrymple showed that the laws of Great Britain had undergone in relation to the tenure, inheritance and transfer of land, is the same movement which the third book of the "Wealth of Nations" has traced, though somewhat superficially, on its economic side, showing how the towns contributed to the improvement of the country. The movement "from status to contract" portrayed by Sir H. Maine in its legal aspects, has been considered by a subsequent writer in its economic phases. Every law, as the latter observes, relating to property, occupation and trade, evolved by this movement, is alike an economic and a legal phenomenon. Changes in the law of succession, the growth of the testamentary power, the liability of property for debt, are economic as well as jural facts, both causes and effects of changes in the economic structure of society.— Some general outlines of the course of development which positive law has followed in western Europe, and of the causes directing it, may be briefly indicated. The economic movement of society has been similar in some essential features in several countries, and there has been a corresponding similarity in the development of their civil laws. The stages of progress, commonly distinguished as pastoral, agricultural and commercial, have been stages of legal as well as of economic development. There could be no law of either property or contract so long as communism prevailed; such general rules of conduct as existed at that stage related chiefly to offenses against the person. Even when separate property had come into existence, so long as cattle formed almost the only possessions of individuals, there could be few subjects of civil regulation. But with agriculture, rights of property, both in land and in new movable wealth, were evolved, and a multitude of new relations and dealings between individuals called forth a considerable body of law, though in a rude and embryo form, and with but an imperfect organization to enforce it. The subsequent devel opment of trade, the growth of towns, the multiplication of handicrafts, exchanges and contracts, gave birth to a fresh body of general rules, whether resting on local authority or on that of the central government. Family relations, too, with the motives to production and accumulation which they supplied, gave rise to new institutions respecting the succession to property, and to the testamentary power. Meantime, however, another source of law was at work. The political and civil organization of society took, under peculiar conditions, what is called the feudal form; land becoming the basis of a subordination of classes, and of a body of law to maintain it, essentially obstructive in many respects to social progress. As industrial and commercial improvement nevertheless advanced, at least in the towns, interests steadily multiplied demanding legal rules respecting property, tenure, transfers and succession fundamentally opposed to those of feudalism. Thus a conflict took place between two sources of law, attended with different results under different conditions in different countries. The statute of wills in the reign of Henry VIII., partially restoring the testamentary power over land which feudalism had extinguished, and assigning as a reason that without it parents could neither provide for younger children nor meet their obligations to their creditors, furnishes one of many illustrations that might be given of the nature of the conflict. There are doubtless diversities as well as similarities in the developments of law in different countries, as in the laws of succession in England and France, but even the diversities attest the subordination of civil law to law in the sense of causation and sequence, since they can be clearly traced to differences of history and surrounding conditions. In the same country there may indeed be different systems of law emanating from different sources, representing different ideas, interests and political or social forces, and consequently embodying different legal principles, as the common law, the statute law and equity did in England in the fifteenth century, where the statute *De Donis*, which the barons would not repeal, forbade the alienation of entailed estates, while the common law, following the interests of the public as well as the policy of the barons, eluded the statute *De Donis* by a fiction; and when the common law, on the other hand, adhering to feudal doctrine, deprived landowners of the power of devising their estates, while equity met an urgent social want by enforcing trusts in favor of devisees. The statutes of fines, uses and wills represent the finally dominant forces. — The connection between the legal and the economic phases of the social evolution, it is to be observed, does not consist only in the fact that the economic movement of society is effected in a great measure by the movement of positive law. The same forces that produce changes in law are also in active and constant operation in daily life. The wants and interests, for example, which create legal rights of individual property, foster agriculture, manufactures and commerce. The causes that lead to a law of transfer, multiply the wealth which forms the interest of transfer. The conditions that lead to the development of laws of tenure, partnership, agency, sale, mortgage, insurance, etc., create innumerable dealings to which such laws apply.

The sentiments that clothe themselves in laws relating to family relations and the succession to property, are at work within the family, influencing parental and conjugal conduct and promoting the accumulation of wealth as well as affecting its distribution. The action of the community through its institutions and laws, on the one hand, and individual action, on the other hand, are inseparably connected; and it is by the impulse and direction which they give both to the collective action of the community and to personal effort, that the motives comprehended in the phrase 'individual interest' make themselves effectual Positive law is, however, only one of the modes by which society collectively develops its economic career. Both the legal and the economic phases of social progress are closely connected with its intellectual, moral and political phases. The prosperity of a community depends much more on its intellectual and moral condition than on the intensity of the desire for wealth, often a cause of loss to nations as well as individuals. The main foundation of the superiority of modern over mediæval and ancient society in productive power lies in the direction given by the course of social development to the modern intellect toward scientific discovery and practical invention; and could we obtain a key to the laws determining the employment of the intellect of nations, we should vastly augment our knowledge of the laws of industrial progress. A light is thrown both on this problem, and on the relations between the legal and the other phases of social development, by the fact that the positive law has been the principal subject engrossing the mind of all great historical nations during an important part of their career. The structure of the Athenian courts of law prevented the growth of a regular jurisprudence, but legal proceedings constituted the main occupation of the Athenian citizen's mind from the days of Hesiod to those of Demosthenes. The chief product of the Roman intellect, from the Twelve Tables to the age of the Antonines, was law. In the middle ages, Roger Bacon complained that the main obstacle to the progress of physical science as of other studies, was, that law engrossed all the energies of the educated class. "In no other country in the world," said Edmund Burke, of America, in 1775, "is the law so general a study. All who read (and most do read) endeavor to obtain a smattering in that science." It is manifest from this general predominance of law during a great stage of social evolution that the path of the human intellect is determined not by logical sequence, or the filiation of truths, but by a combination of conditions, economic, moral and political. There must, first of all, be a sufficient development of individual property and of transactions relating to it, to give importance to general rules respecting its ownership and the procedure by which disputes relating to it are determined. The mental development again of at least a part of the community must be such as to enable them to generalize concerning the affairs and relations of life, and to comprehend the application of general principles to particular cases. Political organization must have so far advanced as to supply some sort of judicature and regular legal process. The moral state of society again must be such that a majority are willing to refrain from violence and strife when differences arise, and to submit them to judicial arbitration. On the other hand, the litigious spirit which invests law and legal proceedings with much of their popularity at periods of social history, such as the last four centuries of the middle ages, involves a survival in an outwardly peaceable form of much of the combativeness, vindictiveness and cunning which at an earlier stage, when passions were fiercer and more ungovernable, led to bloody feuds and cruel stratagems and ambuscades. In some of the conditions that make law, in the juristic sense, the main intellectual occupation at one period of national progress, Mr. Herbert Spencer might find an unexpected illustration of the general proposition which his philosophic genius has brought to light, that the discovery of law, in the scientific sense, itself conforms to scientific law. It has already been pointed out that positive law embodies a generalization of natural relations and uniformities, and is itself subject accordingly to regular evolution and growth. The early legists, judges and legislators who classified and formulated uniformities in the usages and affairs of society were unconsciously making scientific inductions and discovering sequences and co-existencies resulting from natural laws of society. The relations and uniformities which engrossed them had all the characteristics which, according to Mr. Spencer's doctrine, enable them to command early attention — urgent importance as affecting personal interests, conspicuousness, frequency of occurrence, and comparative simplicity and concreteness. There is, however, a point in which, as applied to positive law, Mr. Spencer's theory of the order in which relations are generalized and laws of nature discovered is incomplete; namely, that, as already pointed out, moral and political conditions must be taken into account. This observation extends to a wider problem, of which the direction of the highest intellectual faculties forms a branch, with respect to the natural laws determining generally the occupations of national energies and powers; a problem which most eminent writers on economic science have overlooked. Adam Smith might at first sight indeed appear to have had this inquiry in view when in the introduction to the "Wealth of Nations" he says that one of two main circumstances on which the amount of national wealth depends, is the proportion of the population engaged in useful or productive labor; the causes governing which he promises to expound in his second book. But his exposition touches only the surface of the question. The quantity of productive labor, he states, depends on the amount of capital, and the modes of its

employment. Deeper and more instructive inquiries, such as that into the causes that make a state of society military or industrial, find no place in the philosopher's discussion. Whether a society is mainly industrial or military and therefore mainly productive or unproductive, does not depend on the amount of capital; the amount of capital, on the other hand, largely depends on whether military or commercial tendencies are predominant, and this depends principally on moral and political conditions. And as the combative spirit of the middle ages helped to make law the most engrossing study, so, on the other hand, the general predominance of industrial interests and pacific tendencies gives to the modern intellect its prevailing bent toward physical discovery and invention, the most productive departments of national labor. — Examples of the connection between the economic and legal, and the moral and other phases of social development, might be multiplied. It may suffice to add that although the legal enforcement of contracts is one of the principal requisites of industrial and commercial progress, it is not until a comparative and advanced moral development has been attained that a true law of contracts is evolved, or could be tolerated. In early society it was not deemed immoral to break a contract, unless such contract had been solemnized by religious ceremonies. Harold was held bound by a promise to William of Normandy, though given under duress, because he was said to have touched a coffer containing sacred relics. To have violated an engagement entered into with no such solemnity would hardly have been deemed an offense. It was again because the observance of contracts and the fulfillment of trusts were regarded as matters of religious rather than of either moral or legal obligation, that the ecclesiastical court alone concerned itself with them generally in the twelfth century. The king's court in Glanvill's time took cognizance of few contracts, not only because its interposition in such cases would rarely have been remunerative, but also because the crown would have gained little prestige or popularity by it. The economic aspect of a state of society in which so much depended on religion, and so little on morality or law, is illustrated by the statement of a chronicler that the number of monasteries built in England during the reign of Henry I. was so great that almost all the laborers in the country became masons or carpenters. Exaggerated as the statement is, it covers the substantial truth that an immense part of the wealth of England belonged to monks, and that abbeys and churches were the main products of the national capital and labor. Nor can the economy of our own day be explained without reference to mediæval religion. Whoever reflects on the number and cost of ecclesiastical buildings, the great aggregate revenue of the clergy, the prodigious sale of religious publications, and the observance of Sunday and other sacred holidays, must perceive that the present economic structure of both European and American society is explicable only as the outcome of a long evolution in which there has been continuity as well as change, and over which religion has throughout exercised a powerful influence. — Were we to look only at modern production and exchange, industry and commerce, in the narrowest sense, we could clearly trace the development of modern from mediæval English economy, even where the two systems differ most. The most essentially different features may be said to be the direction of modern trade by individual interest and enterprise, as contrasted with the mediæval regulation of law, custom, town corporations and guilds; production on a great scale by large capitals in place of the mediæval system of small capitals; the predominance of towns, manufactures and commerce over the country; the dissolution of joint husbandry, and the nearly complete disappearance of peasant properties and farms. The germs of the modern system in respect of all these features are discoverable in the later stages of the mediæval. The growth of the spirit of civil and religious liberty discernible in the age of Wycliffe, led to the idea of individual liberty in the economic sphere also. The bent of political philosophy was in the same direction under the influence of the theory of natural law which came down from the middle ages with the laws of Rome. Inequality of capital had begun in the mediæval guilds, as a necessary consequence of division of labor, some trades being necessarily more lucrative than others, having a wider market, and being carried on upon a greater scale. Even within each guild restrictive regulations could not entirely repress superior industry, enterprise and thrift, or prevent some of the members from accumulating greater wealth than others. In foreign commerce especially capital grew with the growth of navigation, and the size and tonnage of ships. The regulations of Elizabeth's statute of apprenticeship were confined, like those of the mediæval guilds and corporations, to boroughs and market towns, and to old industries, and left free ground elsewhere on which production could assume larger dimensions, so that even before the mechanical inventions of the eighteenth century—themselves the offspring of the direction given by a long social evolution to mental energy—capital was gaining the ascendant, and the small system of production declining. Again, before the sixteenth century, the superior profit of wool and corn and the unproductiveness of joint husbandry had led to extensive inclosure and the consolidation of farms. And land laws of mediæval origin completed the evolution (for evolution takes at times the shape of revolution) which drove the English rural population to the towns, and made the country the pleasure ground of the rich instead of the home of the peasant. Such is, in brief, the genesis of modern English rural, industrial and commercial economy. — But the student of economic science must banish from his mind the idea that it relates only to production or exchange in the narrow sense, or to the farm,

the factory and the market, to capitalists, laborers and landlords. It is concerned with all the employments of national faculties and energies, and with all the conditions, moral, religious, intellectual and political, affecting the nature, amount and partition of national wealth. The political constitution, for example—with the bent it gives to the energies both of society at large and of particular classes, the field of civil and military occupation it creates, the laws of property and the territorial system it maintains, the expenditure of public revenue and the fiscal system it entails—forms as essential a part of national economy as the system of husbandry and trade. And the descent of every modern polity from a mediæval parentage will not be questioned. — Were further evidence needed that modern economy owes its structure to natural history and a long evolution, and that individual interest itself, of which alone the deductive economist takes account, is moulded and fashioned by social antecedents and surroundings, political, legal, moral, religious and intellectual as well as industrial, the economic position of women must complete the chain of proof. A passage in the "Wealth of Nations" indeed makes it plain that Adam Smith did not attempt to apply to women the fundamental principle of his system, that "the natural effort of every individual to better his own condition, when suffered to exert itself with freedom and security" is the source of national wealth and prosperity. In the only passage in which the philosopher alludes to women, he says: "They are taught what their parents or guardians judge it may be necessary or useful for them to learn, and they are taught nothing else. Every part of their education tends evidently either to improve the natural attractions of their person, or to form their minds to modesty, to chastity and to economy, to render them likely to become the mistresses of a family and to behave properly when they have become such." It has been justly said that when Adam Smith spoke of "the desire of every individual to better his own condition," he had only the half of society denoted by the masculine pronoun in view, he meant only what he elsewhere says, "the natural effort of every man." Yet he has in the single passage in which women are alluded to, pointed to a class of interests on which both the form and the stability of the economic structure of every society chiefly rest, the family affections and motives. It is these interests, not those which have personal gain for their object, that have everywhere done most to foster accumulation and to create durable wealth. The corner stone of the market itself is the old historical institution, the family. In the very country in which pecuniary interest is supposed to be strongest, and commercial principles to actuate human conduct most commerce would shrink into insignificant proportions were every man—to say nothing of woman—to seek only to better his own condition, and not to concern himself about that of his family. In the United States, the country in question, the national economy is, throughout, the result of a long history, though its later stages have been developed in a new country. The township, for example, which has played and still plays no insignificant part in the economic structure, is the old Germanic *vicus*. Had the leading colonies been founded by Frenchmen instead of by Englishmen, or by cavaliers and high churchmen instead of by republicans and puritans, American economy would to-day be materially different from what it is. Let it not be forgotten, too, that the discovery of America was the achievement of mediæval society, and that powers of navigation, the maritime enterprise and the process of thought that led to it, were of mediæval development.*

HOLY ALLIANCE. (See ALLIANCE, THE HOLY.)

HOMESTEAD AND EXEMPTION LAWS. The homestead may be defined as the house and land connected therewith, which forms the immediate residence of a family. The provisions of law by which homesteads are secured beyond reach of creditors or legal liabilities on the part of their owners, are wholly of modern growth. Fifty years ago no such exemption existed in any state. By the common law of England, frequently held judicially to govern this country, not only could all the property, real and personal, of a debtor be seized to satisfy creditors, but the legal monstrosity which merged the wife in the husband, seized the homestead belonging to the wife, though bought by her own money, and sold the roof from over her head to satisfy claims caused by the folly or improvidence of her husband. The distress and hardship widely consequent upon this stripping of families of all their possessions for debt, and reducing to penury wives innocent of any wrong, together with the steady growth of principles of legal reform, led to the enactment of the first homestead laws. These laws enacted by some states antedated by more than twenty years the homestead law of the United States (May 20, 1862), securing to actual settlers on the public lands 160 acres each. — This free homestead law of the United States has proved one of the most beneficent as well as successful measures ever adopted in any country. It has opened to immediate settlement millions of acres of the public domain which would otherwise have remained a wilderness for years. It has drawn to America millions of wealth-producing citizens, who without the attraction of free land would never have emigrated, and it has greatly enhanced the value of the remaining pub-

* This was, we believe, the last literary production of its rarely gifted, highly distinguished and widely lamented author. It was received about three or four weeks before his too early death. J. J. L., ED.

lic lands, thus directly enriching the treasury of the government. The free homestead law, though long agitated and several times passed by the house of representatives, was not finally enacted till the second year of the civil war. (Rev. Stat., secs. 2289–2317.) By its provisions any citizen, or applicant for citizenship, over twenty-one years of age, may enter upon 160 acres of any unappropriated public lands graded at $1.25 per acre, or 80 acres of such lands valued at $2.50 per acre by the government, on payment of the nominal fee of $5 to $10. After five years' actual residence on the land, a patent therefor is issued to the settler by the general land office at Washington. This patent is a valid title from the United States. If the settler wishes to complete his title before the five years, with a view to sell or remove, he can do so only by payment to the United States of the valuation price of the land. No individual is permitted to acquire more than 160 acres under the homestead act, but there is no limit to the quantity which may be purchased by individuals. There is a proviso in the law (modeled upon the exemption laws of the states), that no lands acquired under the provisions of the homestead act shall be liable for any debts of the settler contracted before the issuing of the patent for his homestead — The principle upon which homestead exemption laws rest, is claimed to be the dictate of enlightened public policy. Their intent is to secure to every householder the possession of a permanent home. Although in most of the states their immunities are limited to the heads of families, there is no uniform provision to that effect. The spirit of most of the laws aims at guarding the home from alienation through the improvidence or misfortune of the head of the family, and it is held to be the interest of the state, as a matter of public policy, to secure to each citizen so much of independence as is involved in the possession of a homestead. Said Senator Benton: "The freeholder is the natural supporter of a free government. Tenantry is unfavorable to freedom. The tenant has in fact no country, no hearth, no domestic altar, no household god. It should be the policy of republics to multiply their freeholders." The republic of Texas, in 1839, enacted the first American homestead law. In 1849 Vermont passed a homestead act, and thereafter this provision rapidly became the policy of nearly all the states. In fifteen states homestead exemption is a part of the constitution; in others it is provided for by legal enactment. The only states which have no exemption of the homestead from execution for debt, are Connecticut, Delaware, Maryland, Oregon, and Rhode Island. In Pennsylvania, however, the only exemption from liability is of property, either real or personal, to the value of $300. In states which have homestead exemptions, the variations are very great as to the value of the real estate exempted, running from a minimum of $500 in Maine, New Hampshire and Vermont up to $5,000 in California and Nevada. In other states, again, there is no limit fixed to the value of the homestead, which may embrace 40 to 200 acres in the country (the former in Michigan, the latter in Texas), or from one-fourth of an acre to one acre, with improvements thereon, in a city or village. — In the thirty-three states which protect the homestead from forced sale for payment of debts, there is usually a proviso excepting contracts made for the purchase of the homestead, or mechanics' liens thereon, or taxes, or debts due for the personal property itself which is the subject of exemption. These minor exemptions of personal property from sale or execution for debt are found in the statute book of every state and territory in the Union. They also vary greatly in the amount and value of property exempted, from $100 to $1,000 money value, while some states protect the means of living of the debtor's family by exempting from seizure not only clothing and necessary furniture, but tools, farming utensils, sewing machines, domestic animals, professional libraries and instruments, provisions, and even stock in trade. — The beneficent object of homestead exemption laws, like that of many other liberal social or legal provisions, has been much perverted in some states by loose legislation and by still looser judicial construction. It results that in some cases not only the needful shelter and immediate provision for family wants have been exempted, but nearly all the property of the debtor has been sequestered from liability for his debts. In Iowa or Wisconsin a rich debtor might legally reserve a private palace worth hundreds of thousands of dollars, if located in a city, claiming it to be exempt from forced sale as his homestead. Some state laws go the length even of prohibiting the alienation or mortgage of the homestead by the head of the family, unless the wife joins in the deed. These restraints upon alienation have produced a plentiful crop of frauds, and have led to much litigation. In Illinois the legislature enacted that no release of the homestead should be valid unless subscribed by the householder and his wife, if he had one. After this much money was loaned on homesteads upon mortgages, in the ordinary form, signed by husband and wife, with the usual full covenant of warranty. But the supreme court of Illinois decided that these mortgages were invalid, because the right of homestead had not been expressly mentioned in them, although conveying in terms every claim, interest and estate, whether at law or in equity. Thus the fraudulent debtor was allowed to keep both the money and the homestead upon which it was borrowed; and the same doctrine has been judicially declared in Massachusetts and in Tennessee. In several states the courts have held that a widow takes a homestead in addition to her dower. The supreme court of Louisiana has held that a mortgage upon a homestead can not be enforced because the law declares it exempt from seizure and sale. It results that the owner of such property may sell it free from the mortgage he has imposed upon it. This judicial construction goes on the

principle which has led some courts to hold that the engagement of a debtor, in contracting a debt, not to avail himself of the benefit of the exemption laws, is void as against public policy, upon the same principle which avoids a usurious con'ract. — Among the many discordant decisions of judicial tribunals, it is evident that those dealing with property interests can not be too careful in guarding against contingencies which may arise to affect their rights. The table below summarizes the legal or constitutional provisions in force in 1882, exempting real and personal property from liability for debt, in all the states and territories.

A. R. SPOFFORD.

HOMESTEAD AND OTHER PROPERTY EXEMPTIONS.

(Compiled from the Revised Statutes and Session Laws of the several States and Territories.)

STATES.	Real Estate Exemption.	Personal Property Exemption.
Alabama	160 acres with house in country, or lot and dwelling to value of $2,000 in city.	To amount of $1,000.
Arkansas	160 acres in country, or city lot with improvements to value of $2,500.	To amount of $200 and clothing, if unmarried; or $500 and clothing, to heads of families.
California	Homestead to value of $5,000, to heads of families, or $1,000 to single persons.	$200 worth of furniture, and a multitude of special articles.
Colorado	Homestead not over $2,000 in value.	Furniture $100, stock in trade to amount of $200, and various articles.
Connecticut	No real estate exemption.	Furniture and clothing to amount of $200; library $500, and many specific articles.
Delaware	No real estate exemption.	Household goods $200 in Newcastle Co.; $150 in Kent Co; wearing apparel, tools, and library in whole state worth $50 to $75.
Florida	160 acres of land in country, or ¼ acre and residence in town.	To amount of $1,000.
Georgia	Real estate or personalty to the value of $1,600.	Real estate or personalty to the value of $1,600.
Illinois	Residence worth $1,000 to a householder with family.	Clothing, and $100 worth of other property; $300 more when debtor is head of a family.
Indiana	To each householder $600 real or personal, or both.	Property real or personal to the amount of $600.
Iowa	40 acres in country, or ½ acre with house in town: value not limited.	$200 furniture, also clothing, tools, farm animals, etc. $1,200 printing press and type for printer.
Kansas	160 acres in country, or 1 acre with improvements in town: value not limited.	$500 furniture, library, clothing, tools, farm animals, $300 farming utensils, $400 stock in trade.
Kentucky	Land with dwelling to value of $1,000, to a householder.	$100 furniture, clothing and domestic animals.
Louisiana	Homestead and personal property limited to $2,000.	Homestead and personal property limited to $2,000.
Maine	Land and dwelling, value of $500, to a householder.	$50 furniture, $150 library, $300 farm animals, clothing, tools, etc.
Maryland	No real estate exempted.	Necessary tools, apparel, books, etc., and $100 other property.
Massachusetts	Homestead to value of $800 to households having families.	$100 furniture, $50 library, clothing, farm animals, stock and materials, $100.
Michigan	40 acres in country, or city lot and residence to value of $1,500.	$250 furniture, $250 stock in trade, $150 books, farm animals and minor articles.
Minnesota	80 acres and dwelling in country, or lot and house in town.	$500 furniture, $400 tools or stock in trade, $300 farming utensils, library, clothing.
Mississippi	80 acres in country, or $2,000 town property, including homestead.	Furniture $100; to residents of cities and towns $250.
Missouri	160 acres, worth $1,500 in country, or buildings in city to value of $1,500 to $3,000.	Furniture $100, provisions $100, domestic animals $150; or, in lieu of all specified, $300 net exemptions.
Nebraska	Homestead not exceeding $2,000 in value	$500 exempted when no real estate is owned.
Nevada	A homestead not exceeding $5,000 in value.	Furniture $100; farmers' utensils $200; mining outfit $50; domestic animals, etc.
New Hampshire	Homestead worth $500, or so much thereof as does not exceed in value $500.	$100 furniture, $200 in library, $100 in tools, $50 fuel and provisions, clothing, domestic animals.
New Jersey	Homestead to amount of $1,000 to householder.	To amount of $200, and clothing.
New York	Homestead to value of $1,000 to householders.	$250 in furniture, mechanics' tools, instruments, library, etc.
North Carolina	Homestead to value of $1,000 to occupant of an estate.	To value of $500.
Ohio	To amount of $1,000 to heads of families only.	Clothing, furniture, tools, etc., and $500 additional exemption if no real estate is owned.
Oregon	No real estate exemption.	$300 furniture, $100 clothing, or $50 for each member of family, $400 tools, etc., farm animals.
Pennsylvania	Property, either real or personal, to the value of $300.	$300 value of property, either real or personal, besides wearing apparel.
Rhode Island	No real estate exemption.	Clothing $300, furniture $200, tools, etc.

STATES.	Real Estate Exemption.	Personal Property Exemption
South Carolina	Homestead worth $1,000.	Furniture, etc., value of $500.
Tennessee	Homestead worth $1,000.	Clothing, furniture, and a long catalogue of miscellaneous articles.
Texas	200 acres with house in country, or lot worth $5,000, and residence in town, to a family	$500 furniture, clothing, tools, domestic animals, and one year's provisions.
Vermont	Homestead worth $500, to any housekeeper.	Clothing, furniture, farm animals, and sundry stores, $250 in teams, $200 professional library.
Virginia	$2,000 in real or personal property to head of a family.	Clothing, furniture, library, domestic animals, besides $2,000, real or personal.
West Virginia	Homestead worth $1,000 to head of a family.	Personal estate not exceeding $200 in value.
Wisconsin	40 acres with house in country, or house and ¼ acre in town.	$200 furniture, farm animals, $50 farm tools, $200 mechanics' tools, $200 professional library
TERRITORIES.		
Arizona	Homestead to value of $5,000	$600 furniture, and many specific articles.
Dakota	Homestead in country, 160 acres; in town, 1 acre; no limit as to value.	Any goods or money to amount of $1,500.
District of Columbia	No real estate exemption.	Clothing, furniture, etc., to value of $300; merchants' stock or mechanics tools $200, family library $400, and other articles.
Idaho	Homestead not exceeding $500 in value.	Furniture $200, farm utensils $300; mechanics' tools $500, and many specific articles.
Montana	In country, 160 acres; in town, ¼ acre, value limited to $2,500.	Clothing, furniture $100, domestic animals, farm utensils $600, etc.
New Mexico	Real estate to value of $1,000.	Clothing, tools, and a few necessary articles.
Utah	Homestead to value of $1,000 to head of family, with $250 additional for each member.	Furniture $100, clothing, tools, domestic animals, etc.
Washington	Homestead to value of $1,000 to head of family.	$150 furniture, clothing, domestic animals, $500 tools and materials etc
Wyoming	Homestead to value of $1,500 to each head of family.	Clothing, $500 furniture, $300 tools or professional library.

HONDURAS is one of the five republics of Central America. Its area is calculated to embrace 39,600 English square miles, with a population of 250,000 souls, consisting principally of Indians and half-breeds. Both area and population are only estimated. The state of Honduras, which, after its separation from Spain, at once became part of the confederation of Central America, together with Guatemala, San Salvador, Nicaragua and Costa Rica, is bounded on the north and east by the Caribbean sea, on the west and south by Guatemala and San Salvador, and on the southwest by San Salvador. Its political organization is the same as that of most of the American republics. The executive power is vested in a president, elected for four years (constitution of 1865), aided by a council of state composed of two ministers, appointed by the president, one senator, elected by both houses of congress, and the judge of the supreme court. The legislative power is divided between a chamber of deputies composed of fourteen members, and a senate consisting of seven members. — The public revenue of Honduras in recent years is valued at about $388,000, about one-third derived from customs duties, and another third from the government monopoly of the sale of aguardiente, or native rum. At the end of 1876 the foreign debt of Honduras amounted to a total of $29,950,540. It consists of three loans. The interest in arrear in 1875 was $6,150,820. If paid, the interest and sinking fund of the three loans would amount to an annual charge of $3,478,500 on the public revenue, or more than eight times the estimated total receipts of the government. The state of perpetual agitation in which these little republics exist is due to the imperfect condition of their military force. Public instruction is entirely in the hands of the clergy. The lower classes are almost utterly devoid of education. The total value of the exports of Honduras, which consist chiefly of mahogany, hides, tobacco, cattle and indigo, is estimated at about $1,000,000. The imports comprise cotton goods, silk and hardware. The resources of the country are at present wholly undeveloped. Comayagua, the capital of the state, has a population of 10,000, but most of the import trade is carried on in the seaport towns of Omoa and Trujillo on the Atlantic coast, and Amapala on the Pacific. Here, as in the other parts of Central America, the commerce is almost entirely in the hands of the English. — British Honduras has an area of 13,500 English square miles. Its population, according to the latest census returns, is 24,710. In 1869 the public revenue was $183,150, and the expenditures amounted to $152,020. In the same year its imports were valued at $755,945, and its exports at $875,165. These figures are lower than those of the fifteen years previous. The value of the colony's commerce seems to be steadily diminishing, although the tonnage of the vessels entering and leaving its ports remains almost the same. In 1869 the total capacity of all the vessels entering and departing from its ports amounted to 58,116 tons. — BIBLIOGRAPHY.

HOSTAGE. We consider the practice of taking or offering hostages as barbarous, unworthy of civilized nations. This practice is established only because little faith can be placed in the promises of rude men, who do not think themselves bound to conquer their passions, in order to keep their promises. Therefore the necessity of legitimate defense may excuse, in a certain degree, the demand for hostages in savage countries, especially if the hostage is chief of a tribe, or one of his relatives, and even in this case the hostage will be rather an incumbrance than a guaranty. It is nevertheless to be feared that this practice will not be easily suppressed in time of war, and that it will be the more frequently applied, the more enraged the combatants. Passion is the counselor of bad faith on one side, causes the demand for hostages on the other, and unfortunately makes the innocent frequently suffer for the guilty. (See Vattel, book ii., chap. xvi., § 245.) M. B.

HOURS OF LABOR, Regulation of, by the State. Early in August, 1871, the engineers of Newcastle, England, formally put forward the demand that a day's work should consist of nine hours. The masters refused to yield. The workmen thereupon carried out their threat to desist from work; and a general strike ensued. Although efforts at conciliation were repeatedly made, the dispute continued to rage fiercely for many weeks. Various persons offered themselves as mediators, in the hope of suggesting some compromise. But compromise after compromise was unceremoniously rejected by the masters. Many circumstances combined to arouse strong and angry feelings. At the outset a bitter personal enmity had been excited by the workmen being told that the masters would not hold interviews with them, but that they must have their views represented by some legal adviser. Still more angry passions were aroused when the manufacturers attempted to replace the labor of which they had been deprived, by the importation of foreign workmen. Agents were dispatched to Belgium, Germany and other places to engage at remunerative wages artisans who had been accustomed to engineering work. The English workmen, on their side, put forth equally strenuous efforts to check this importation of labor. Strong appeals, based on international principles, were addressed to the continental workmen; they were entreated to be loyal to the cause of labor, and they were told that the employed would be always vanquished unless the laborers of different countries were not only ready to unite, but were also prepared to make some sacrifices for the common cause. In spite, however, of all these efforts the manufacturers obtained a considerable number of continental workmen. After their arrival, however, not a single moment was lost in bringing every possible kind of pressure to bear upon them to induce them to return. Occasionally the pressure assumed the form of threats of violence to any who might continue to work. Such threats, however, were exceptional; it was generally found that after the exact position of affairs had been explained to these foreign workmen, there was little difficulty in inducing them to return to their own countries if they were provided with the requisite funds. The funds required for this purpose were promptly procured by subscriptions raised among the artisans in every important centre of English industry. In consequence of these exertions the manufacturers gradually became convinced that it was hopeless for them to expect to keep their works open by substituting foreign for English labor. The alternative, therefore, which was presented to them was, either to suspend business or to grant the demands of those whom they employed. The adoption of the former course involved many formidable difficulties. It has been often remarked, that workmen, in the disputes which they have had with their em ployers, have very generally shown themselves to be extremely bad tacticians. They have generally struck work in order to resist a decline in wages consequent upon dull trade. But when trade is dull the victory of the employer is almost insured, for at such a period it costs him little—in fact, it is often a positive advantage to him—temporarily to suspend his business. But, whether from accident or design, the Newcastle workmen commenced the nine hours movement at the very time above all others when they were most likely to obtain success. The engineering trade was in a state of unprecedented activity and prosperity; unusually large profits were being realized, and the order book of every manufacturer was filled with lucrative contracts. Victory, therefore, was virtually insured to the employed when they deprived the employer of an adequate supply of labor; for he had the strongest possible inducement not to curtail, much less to suspend, his business at a time when it was exceptionally profitable, and when the non-fulfill ment of extensive contracts would render him liable to extremely onerous fines. After a struggle, which was prolonged for fourteen weeks, the masters were compelled to succumb; and the demands put forward by the workmen were fully conceded to them. No sooner was the nine hours movement successful in the engineering trade at Newcastle, than similar demands were immediately put forward by workmen engaged in a great variety of trades in different parts of the country.

The battle having been once fairly fought out, employers very generally adopted the wise and prudent conclusion that it was far better not to renew the contest. It therefore came to pass that in a few weeks, throughout no inconsiderable portion of the industry of England, the principle obtained practical recognition that nine hours was to be considered a day's work. — I have thought it important to give this description of the nine hours movement in order to show that in the course of a few weeks the workmen, entirely relying on their own efforts, and without any resort to state intervention, secured a valuable concession for themselves, and introduced a most important social and economic reform. Having thus seen what was done without resorting to the state, let us proceed to inquire whether the workmen would have secured that which they desired more promptly and more efficiently if, instead of relying on their own efforts, and their own powers of organization, they had rested their hopes on state intervention. If the latter course had been adopted, I think there would be no difficulty in showing that the shortening of the hours of labor might have been either indefinitely postponed or might have been so prematurely and inconsiderately introduced that confusion would have been created, and more evil than good resulted. If the workmen throughout the country should have united they would at once have secured a predominance of power in the legislature. Let it be supposed that having gained this predominance they at once passed a law applying the nine hours principle to every employment throughout England. Such legislative interference constituted a part of the programme of the international; and as there is reason to believe that many who are generally opposed to the doctrines of socialism would support such a demand, the subject is evidently one of great practical importance. — It will scarcely be denied by any one who has practical knowledge of trade, that various employments differ so greatly in the circumstances and conditions upon which they are carried on, that the general application of a rigid rule as to the length of a day's work would produce the most inconvenient and incongruous results. Some kinds of labor are, for instance, far more exhausting and injurious to health than others. Six hours spent in an imperfectly ventilated mine probably involve a greater amount of fatigue, and cause a greater strain upon the constitution, than ten hours passed in some out-door occupation, or in some delicate and skilled handicraft. Then again, in an industry such as agriculture, a day's work can not exceed a certain number of hours during the winter, whereas during a few weeks in the summer or autumn, when the harvest is gathered in, a considerable portion of the crop would often be lost if men were legally prohibited from working more than nine hours a day. In answer to these objections, it will probably be urged that the legislature might provide for the different circumstances of various employments; and that it is not proposed to fix an absolute limit of nine hours to the day's work, but simply to enact that all work done beyond this shall count as over-time, and be liberally paid for accordingly. With regard to the first of these pleas it is sufficient to remark that it would be necessary for legislatures to acquire an amount of administrative skill which they have never before shown any signs of possessing, in order to frame a measure which, while making proper allowance for the varying circumstances of different trades, would fix an appropriate limit to the day's work in each particular branch of industry. The second plea, however, is that upon which the advocates of a law for shortening the hours of labor chiefly rest their case. During the agitation that then took place throughout the country in favor of the nine hours movement, it was made perfectly clear that those who advocated the shortening of the day's work did not contemplate the passing of any enactment to forbid a man working beyond a specified time. It was evident that such a law would have been strongly resisted by the workmen who favored the nine hours movement. At Newcastle and other places they always showed great anxiety to secure a recognition of the principle that over-time was to be paid for upon a liberal scale. It certainly, however, seems to me that in thus sanctioning over-time, every argument which might be advanced in favor of regulating the hours of labor by state intervention falls to the ground. The law might be so easily evaded and ignored, that it would soon be regarded as a useless and ridiculous farce. Suppose, for instance, the legislature should say that in a certain trade, such as building, a day's work should consist of only nine hours. Employers and operatives who desired to continue work for a longer time would not have the slightest difficulty in doing so. They would simply have to consider each hour beyond the specified period as over-time, and the law would consequently be as completely inoperative as if it had never been passed. — It may, however, be said, that the argument just advanced rests on the assumption that the employed are willing to work over-time, whereas it may be maintained that a law is needed for the protection of those who are coerced to work for an excessive number of hours. In the first place, there are many reasons which may make us feel incredulous about such coercion being resorted to; in the second place, it may be maintained that if workmen are thus coerced it is their own fault, because it has been frequently shown that they are perfectly well able to offer successful resistance if they choose to do so. It is impossible to have a more striking illustration of the power possessed by the workmen than is afforded by the completeness of the triumph which they obtained at Newcastle. Sometimes, however, it is urged that although workmen can not be forced to labor for an excessive number of hours, if they are resolutely resolved not to do so, yet it is main-

tained that there are some workmen who do not know what is good for themselves and their class; and that there are others who, if they do know it, have not the courage to act in a manner which is right. Consequently, state intervention is needed for those who are thus weak and erring. This is the old story; this is, in fact, what state interference generally comes to. Certain persons arrogate to themselves infallibility of judgment—assume that they know the precise course which ought to be adopted, and the exact thing which ought to be done by every human being; they consequently appeal to the state to give them the power to make each individual conform his life to the pattern which has been chosen by their faultless judgment. If these doctrines are sanctioned, and if these demands are conceded, individual liberty and freedom of action will cease to exist, and we shall have to submit to a thralldom more galling and more degrading than the worst form of political despotism. It will be impossible to foresee from day to day what we shall each one of us in private life be permitted to do and what we shall not be permitted to do. The state is not unfrequently spoken of as if it were a receptacle of the most perfect justice, the noblest benevolence, the most far-seeing sagacity, and the highest wisdom. The state, however, even in a country which possesses representative institutions, instead of being endowed with all these qualities of superhuman excellence, embodies nothing more than the fluctuating and shifting opinions which are held by the majority of a majority of the constituencies. The legislature can not have any claim to the possession of an amount of collective wisdom which enables it to form an unerring judgment as to the mode of life which ought to be followed by each individual. It can, in fact, scarcely be denied that law-making is carried on by persons who have not a greater amount of virtue, sagacity and wisdom than ordinarily falls to the lot of the average of their fellow-countrymen. Those, therefore, who are constantly appealing to the state to meddle in the affairs of private life, seem to forget that the carrying out of this policy virtually obliges people to surrender their freedom of action to a predominant majority, which can not be expected to possess higher qualities than the units of which it is made up.—It is necessary to consider the subject from this point of view, in order adequately to appreciate the injustice which would be sanctioned if a law were passed fixing the length of the day's work, and if many other demands for state interference were conceded which are now being pressed with such frequency and urgency. Those who thus propose to enlarge the scope of state intervention are no doubt very confident in the belief that they know what is right, and they wish to call in the power of the law to coerce people into right doing. A teetotaller finds that he has derived great advantage from abstaining from all alcoholic drinks; and in order that others may participate in the advantage, he would like to see every one forced to do as he has done. It never seems to strike him that there can be any tyranny in resorting to state intervention; he, on the contrary, would think it was the most exalted kind of benevolence to force people to do that which he believes is certain to prove beneficial to them. Ideas exactly analogous to these prompted the most cruel religious persecutions of the middle ages. Those who persecuted were very confident that they knew which was the road that led to heaven. If they observed people persistently straying away, it seemed that it was justifiable to resort to any means to force them back into the right path Bodily torments were not worth considering when it was a question between eternal happiness and eternal perdition. Such sentiments as these are not extinct; they have, in fact, lost little of their former vitality; they are constantly coming into activity in other forms and other aspects. As it has been in the past, so will it probably be in the future. Individual liberty will be constantly subject to attacks from various phases of fanaticism. We have not only to be on our guard against extreme socialists, but similar dangers may any day be brought upon us by well-intentioned philanthropists and mistaken enthusiasts. If it is urged that a man who is willing to work for ten or eleven hours a day should be permitted to do so, it will be thought sufficient to say in reply that it is evident such a man does not know what is good for himself, and that others who do know are performing an act of kindness if they debar him from pursuing a course which will prove injurious to him. If private life is to be thus interfered with, where is such interference to end? Analogous reasoning would lead to the conclusion that the state should decree the quantity of food and drink which a man should consume, the number of hours that he should be permitted to study, and the amount of exercise he should be allowed to take. Other forms of excess may be as injurious as over-work, and if it is right for the state to protect people against an undue amount of labor, might it not be legitimate to protect them against the evils resulting from undue eating and drinking, from over-fatigue and over study.—It is, however, probable that motives very different from these actuate many who most earnestly appeal to the state to impose a legal limit upon the day's work. This particular movement may be, to a great extent, regarded as a revival of the old fallacy that the wages of labor can be regulated by law. Signs are not wanting to show that the opinion widely prevails, although it is rarely distinctly avowed, that if a law were passed reducing the day's work from ten hours to nine hours, as much would ultimately be paid for nine as for ten hours' labor. If, however, this should prove to be the case, then it would appear that the state has the power to regulate the remuneration of labor; it would consequently follow that wages depend upon legal enactments, and are not regulated by the recognized principles of economic science. I shall not attempt to argue the case by

referring to such well known facts as that the English parliament for centuries tried to control the wages of labor, and that all the numberless statutes that were passed to effect this object signally failed. Neither shall I refer to the general principles of political economy to establish the conclusion that the wages of labor can not be controlled by the state. Such reasoning would not, in any way, affect the opinions of those who are most strongly in favor of the hours of labor being regulated by the state. According to their views the interposition of the state in this matter involves very different consequences, and is to be defended by very different arguments from any attempt which may be made to fix the rate of wages by act of parliament. The following may be considered a correct description of the opinions which are widely held on this subject. It is maintained that in many employments the day's work is a great deal too long, the strain upon the constitution is too severe, and physical strength is so much exhausted that a man is unable to labor hard during the whole time he is at work. It is therefore urged, that if the day's labor were shortened, as much or even more work would be done in the shorter as in the longer period; employers would, consequently, be able to pay at least as much for a day's work after its length had been thus shortened. Many facts can, no doubt, be adduced in support of this opinion. It can scarcely be denied that in some employments the hours of labor are habitually too long. Some very striking examples can be quoted to show that the shortening of the hours of labor confers a most important advantage both upon employers and employed. More work is done in less time, and the greater productiveness which is thus given to labor enables not only the wages of the workman but also the profits of the employer to be increased. — Among many remarkable examples of the truth of this statement, it will be sufficient to refer to one case which is mentioned by Mr. Macdonnell, in his "Survey of Political Economy." He states, on the authority of M. Chevalier, that a manufacturer employing 4,000 hands reduced his spinners' time half an hour per day, and that this reduction, contrary to all expectation, was accompanied by an increase in production of one-twenty-fourth. An admission that this fact is typical of what would generally take place if the hours of labor were shortened, would undoubtedly afford a powerful inducement and strong justification to the workmen to extend throughout the country the movement which was commenced at Newcastle. Such an admission, however, does not, to my mind, supply any argument in favor of a resort being had to state intervention. It has been proved that the workmen can succeed when they have as good a case to urge as they had at Newcastle; and the masters would, in every instance, be compelled to yield, even were it not their interest to do so, when facts can be adduced to warrant the conclusion that the hours of labor prevalent in any particular trade are too long to secure the maximum of industrial efficiency. But the point on which I particularly desire to insist is this: Are not the circumstances peculiar to each trade best known to those who are engaged in it, and are they not, consequently, in a far better position to judge of the number of hours of labor appropriate to it than the heterogeneous assembly called the state?—It must be also borne in mind that a grave risk is always associated with legislative interference with trade; it is simply a question of taking something from the pockets of the employer and adding it to the wages of the employed; unwise and misdirected meddling on the part of the state may so much impede industrial development as to bring ruin upon a trade, and thus masters and men will be involved in a common disaster. Formerly each country was, in its industrial position, far more isolated from its neighbors than at the present time. Inferior means of communication and prohibitory tariffs powerfully impeded commercial intercourse. As commercial relations between different countries have extended, a keen and closely contested competition has arisen between them in various branches of industry. The competition is, in fact, frequently so close that a country may often lose a trade if it is hampered with legislative restrictions which are not imposed upon it in other countries. At the present time it is difficult in many branches of industry for the English manufacturer to compete with the foreigner even in English markets. England can now scarcely hold her own in some trades in which she once had almost undisputed supremacy. When railways were first introduced, nearly every locomotive engine throughout Europe was of English manufacture. Not only do many continental countries now make their own engines, but it occasionally happens that foreign engines are to be found on English railways. There are, no doubt, many trades in the position just described; but when this is the case, it is obvious that a country may not only be driven from a foreign market, but may also find it impossible to retain a satisfactory position in the home market if restrictions are imposed upon her which either interfere with industrial efficiency, or artificially increase the cost of production. It must be perfectly obvious that the length of the day's work may be unduly reduced; in fact, the reduction may be carried so far as most seriously to impede industry. Encouraged by the success of the nine hours movement, it was said in certain quarters that there should be an agitation in favor of the day's work consisting of only eight hours. This was, in fact, one part of the programme of the international. If successful in an eight hours agitation, an agitation might commence in favor of fixing the day's work at seven or even at six hours. If, however, such restrictions were imposed in England, it can scarcely be doubted that industry would be placed in so unfavorable a position that it would be hopeless for England to attempt to compete with foreign countries. It might thus

happen that not only her foreign trade would be sacrificed, but she would be undersold in her own markets (and so of other countries). It is not too much to say that her commercial prosperity would cease, and that a fatal blight would be thrown upon her industry. Employers would not continue business under such unfavorable conditions. If men were only permitted to work six or seven hours a day, machinery would be lying idle for so long a period that the returns yielded to its owner would be greatly reduced. The diminution in profits might be so serious that employers might think it to their interest to take their capital out of business, and either invest it in some other security or apply it to the carrying on of some industrial undertaking in a country which was not subjected to such legislative interference. The workmen might thus find that an undue limitation in the number of hours of labor had ruined many branches of industry, and had thus brought upon them the greatest disasters. — In making these remarks I should much regret if it were thought that I did not most entirely sympathize with those who desire to see a great diminution in the excessive toil of so many workmen. There is nothing perhaps more to be regretted than the fact that extraordinary commercial prosperity and an unprecedented accumulation of wealth have hitherto done so little to shorten the workmen's hours of labor. As previously remarked, the undue length of time which men have been accustomed to work represents, so far as many branches of industry are concerned, a thoroughly mistaken policy. In many instances it is undeniable that men would not only get through more work, but would do it more efficiently, if they had more opportunity for mental cultivation and for healthful recreation. No small part of the intemperance which is laid to the charge of laborers is directly to be traced to excessive toil. When strength becomes exhausted, and the body is over-fatigued, there often arises an almost uncontrollable desire to resort to stimulants. Again, it is unreasonable to expect that the moral qualities in man's nature can be duly developed if life is passed in one unvarying round of monotonous work. We are constantly being reminded of the ennobling and elevating influence produced by contemplating the beauties of nature, by reflecting on the marvels which science unfolds, and by studying the triumphs of art and literature. Yet no inconsiderable portion of the toiling masses are reared in such ignorance, and surrounded from early childhood to old age by so much squalor and misery, that life could be to them scarcely more dreary or depressing if there were no literature, no science and no art, and if nature had no beauties to unfold. At a meeting held at Newcastle by some of the prominent advocates of the nine hours movement, artisans were encouraged to look forward to a time when the condition of laborers generally throughout England would be so much improved that they would have time for mental cultivation and various kinds of recreation; a hope was even expressed that the day might come when they and their families would be able to enjoy an annual holiday, gaining health and vigor either from the sea breeze or the mountain air. It is, however, particularly to be remarked, that those who shadowed forth these bright anticipations showed no tendency whatever to seek state intervention The leaders of the nine hours movement at Newcastle, having won a great triumph, have just confidence in their own powers; they truly felt that what they had done might also be done by others, and they therefore objected to the demands for state interference, which were constantly put forward by the members of the international, and by many other workmen. The speeches, to which I have just referred, were delivered at a meeting of the members of a co-operative engineering company. This society had grown out of the nine hours dispute. The leaders of the movement having once learned the invaluable lesson of self-help, had the practical wisdom to see that the best way to emancipate themselves from what the international called the tyranny of capital, is not to indulge in idle declamation, nor to embark in schemes which are either impracticable or mischievous. They, on the contrary, came to the conclusion that if they wished to render themselves independent of capitalists they might do so by supplying the capital which their own industry requires. They had little difficulty in gathering together a sufficient amount of money to commence business on their own account. There is no reason why an establishment thus founded should not gain as great a commercial success as that which has been achieved by any private firm. Even if it should fail, there would be no grounds to feel discouraged. The experience which is obtained from failure often enables the road to be discovered which leads to future success. HENRY FAWCETT

HOUSE OF COMMONS, the supreme governing body in the British empire; otherwise, and nominally, the "lower house" in the British parliament. The house of commons was founded in 1265 by Simon de Montfort, earl of Leicester, after his glorious victory over the royal forces at Lewes. Down to this time, the king had summoned only the great barons to attend his council, and it had become customary to continue summoning every baron who had once been summoned, so that there grew up a "right of summons," which became hereditary. Persons who possessed a right of summons to the king's great council were regarded as peers or lords; and thus the English peerage was established. Thus, down to 1265, the only parliament was the king's great council, which was simply the house of lords. But in 1265, when the barons had conducted, against Henry III., a struggle somewhat similar to that which the parliament conducted four centuries afterward against Charles I., the barons, in order henceforth to guard more effect-

ually against the encroachments of the crown, sought the aid of the commons, that is, of the wealthy landed gentry and powerful citizens who did not belong to the peerage. In accordance with this policy, Simon de Montfort, one of the most glorious names in the history of English liberty, summoned to the parliament of 1265 two landholders from each county, known as "knights of the shire," two citizens from each city, and two burgesses from each borough. These were to be representative members, elected by their constituents in town or county; and this was the beginning of a national representative government in England. And from the fortunate union of rural and urban representatives, including even the children and younger brothers of peers, in a single legislative body, the house of commons became at once the representation of the entire nation, and not of any separate class or order in the nation. The work of creating the house of commons, which was begun by Simon de Montfort, was fully completed thirty years later by Edward I. From 1295 onward it was a thoroughly recognized principle that every parliament should consist of a house of commons in addition to a house of lords, and that the members of the lower house should be elected by the people. As it had always been recognized, with more or less clearness, that the fundamental element in an Englishman's liberty was that no one could take away his money without his consent, the right of the house of commons to vote all taxes became almost immediately established; and this point having been once gained, the gradual acquirement of supreme legislative power by the lower house was only a question of time. Three times during the reigns of Edward II. and Edward III. it was enacted that a parliament should be held at least once a year, and that in some convenient place, for the redress of grievances and the maintenance of the statutes. The necessity of repeating this enactment shows that the unwillingness to assemble a parliament, which had become so flagrant in Stuart times, had begun to show itself already on the part of the Plantagenets. The old English sovereigns always preferred to reign without the assistance of parliament, so far as possible; but sooner or later the need of money compelled them to summon it. Until the middle of the seventeenth century there was no legal limit to the duration of a parliament, except that it was always regarded as dissolved by the death of the sovereign. But after Charles I. had suffered twelve years (1629–40) to pass by without assembling a parliament, one of the first measures passed by the long parliament in 1641 was the triennial act, whereby every parliament was to expire at the end of three years from the first day of its session (or, if then sitting, at its first subsequent adjournment), and a new parliament must be elected within three years from the expiration of the preceding one. This act, however, was disregarded by the very parliament which passed it, which did not terminate its existence until 1661. In 1694 the duration of parliament was again limited to three years; in 1715 the period was extended to seven years by the septennial act, and this arrangement has continued in force ever since. Since the revolution of 1688 no year has elapsed without at least one session of parliament. This annual session has been secured partly through the necessity of passing the annual mutiny act, whereby alone it is possible to maintain the legal existence of the army. It is partly due also to the great increase in public expenditure, making an annual appropriation of money an absolute necessity. Within the limits imposed by these necessities and by the septennial act, the crown can summon, prorogue and dissolve parliament at its pleasure; but the practical employment of this, as of nearly all the prerogatives of the sovereign, has now passed entirely into the hands of the prime minister. — At the accession of Henry VIII. the whole number of constituencies in England and Wales was 147; but in this new reign several new seats were added for Wales; and considerable additions to the borough franchises were made in all the following reigns, down to the restoration. A large proportion of these newly added boroughs were "rotten boroughs," and the purpose of granting them the franchise was to increase surreptitiously the royal influence of the house of commons. From Edward IV. to Charles I. the new additions consisted almost exclusively of borough members. In the later Stuart reigns the house of commons contained about 500 members. The union with Scotland in 1707 added 45 new members; and the union with Ireland in 1801 added 100 more. Since that time the number of the house has remained at about 650, with a slight tendency to increase through the extension of the suffrage, and the formation of new constituencies, chiefly among the universities. The number of members at present is 658. These 658 members are returned as follows by the three divisions of the United Kingdom:

England and Wales:		
52 counties and Isle of Wight	187	
200 cities and boroughs	295	
3 universities	5	
		487
Scotland:		
33 counties	32	
22 cities and burgh districts	26	
4 universities	2	
		60
Ireland:		
32 counties	64	
33 cities and boroughs	39	
1 university	2	
		105
Seats vacant by disfranchisement		6
Total		658

In a parliamentary paper of 1876 it was stated that if the distribution of representation were determined solely by population, the number of members would be 476 for England, 70 for Scotland, and 112 for Ireland; if determined solely by contributions to revenue, the numbers would be 514 for England, 79 for Scotland, and 65 for Ireland; if determined by these two circumstances taken

together, the result would be the mean between these two sets of numbers, that is, 494 for England, 75 for Scotland, 89 for Ireland; in all, 658. So that at present, while the proportional representation of England is strictly equitable, it appears that Scotland has a much smaller and Ireland a much larger share than that to which these countries are equitably entitled. — By the reform bill of 1832 the county constituencies in England were increased from 52 to 82, by dividing several counties into electoral districts, and the number of county members was raised from 94 to 159. No change was made in the county representation of Scotland and Ireland. In England, 56 boroughs, containing a population of less than 2,000 each, and returning altogether 111 members, were disfranchised; 30 other boroughs, with a population of less than 4,000 each, were deprived each of one of its representatives. On the other hand, 22 new boroughs, each containing 25,000 inhabitants and upward, were endowed with the full franchise of returning two members; and 21 new boroughs, each with a population of more than 12,000 and less than 25,000, were empowered to return one member. This wholesale disfranchisement and enfranchisement marks the extent to which—partly through the corrupt creation of rotten boroughs already noticed, partly through the natural growth of great industrial centres and relative decline of other places—the house of commons had, previous to 1832, fallen short of truly and accurately representing the country. This change also increased the independence of the house of commons, as a very large proportion of the disfranchised boroughs were virtually at the disposal of members of the house of lords. In Scotland the reform bill increased the town members from 15 to 23, and this number has since been increased to 26. — After 1832 no change worthy of mention was made in the constituency of the house of commons until the reform bills of 1867 and 1868, which considerably extended the electoral franchise. By these acts the borough franchise was given in England and Scotland to every adult male, after a residence of one year within the borough, either as a householder paying the poor-rate, or as a lodger in lodgings that would let unfurnished for at least £10 per year. In Ireland, instead of the household franchise, votes were given to persons occupying houses or land within the borough of not less than £4 net annual value. In England and Scotland the county franchise was extended to all persons possessing land within the county of the clear yearly value of £5 or more, and to all tenants paying poor-rates, and occupying land within the county of the ratable value of at least £12 in England and £14 in Scotland. No change was made in the county franchise of Ireland, as it stood already at about these same figures. At the same time several changes were made in England in the distribution of members among the boroughs, and the number of members was fixed at 493 for England and Wales, 60 for Scotland, and 105 for Ireland.— The only qualification necessary for a member of parliament is to have attained the age of twenty-one. Naturalized foreigners were formerly ineligible, but were made eligible in 1870 by an act which abolished all distinctions whatever, political and civil, between British-born subjects and naturalized aliens. But all clergymen of the established church are ineligible; and all government contractors, as well as all sheriffs and other "returning" officers, are disqualified, not only from sitting in parliament, but even from voting at elections. Irish peers may be elected to the house of commons, as was the case, for example, with the late Lord Palmerston; but English and Scotch peers are ineligible. No member of the house of commons is allowed to accept any office of profit from the crown. It was enacted in 1872 that all parliamentary elections must be conducted by ballot, except in the universities; one of the chief reasons adduced for this measure was the existence of bribery and intimidation. By an act of 1812 bankruptcy was made a disqualification for sitting in the house of commons. Members of the house are, during the sessions, exempt from liability to arrest or imprisonment, but civil actions may be brought against them at any time. — The reform bill of 1867, among its other provisions, completed the formal independence of the house of commons by decreeing that the parliament "in being at any future demise of the crown shall not be determined by such demise, but shall continue as long as it would otherwise have continued unless dissolved by the crown." If at the time of the sovereign's death, parliament be adjourned or prorogued, it must immediately be assembled; and in case the death of the sovereign should occur after the dissolution of a parliament, but before the day appointed for the meeting of a new one, the old parliament must be assembled again, but in such case its duration is limited to six months.—For information regarding the supreme legislative authority of the house of commons, and its relations to the house of lords and to the crown, see the article GREAT BRITAIN, section "Constitution." Practically the house of commons is omnipotent throughout the whole extent of the British empire; its authority extends to all matters whatever, ecclesiastical or temporal, civil or military. JOHN FISKE.

HOUSE OF LORDS. The house of lords is the lineal descendant of the witenagemot, or "meeting of wise men," of the times preceding the Norman conquest. Its prototype was the county assembly of early Saxon times. The difference between a *tungemot* or "town meeting" and a *witenagemot* or "meeting of wise men," answered exactly to the difference between a primary and a representative assembly as now understood. The little town meetings were, as a rule, attended by all freemen of the township, but in the case of the shire assemblies distance and difficulty of travel made such universal attendance impracticable, and so each township

sent a delegation of "wise or discreet men" to represent it. Hence the county assembly came to be known as a meeting of the wise men of the shire. And as the shires gradually became consolidated into the little kingdoms formerly known as the "heptarchy," and at last into the single great kingdom of England, a great assembly of wise men grew up after the model of the little county assemblies, and was known as the witenagemot of the kingdom. It was attended by the heads of the principal families of the kingdom, including such local sovereigns as the great earls. When it was desirable to discuss some question of public policy, the king summoned by writ his most powerful subjects to talk it over with him. Such was the origin of the English parliament; the house of commons being a later addition, as I have explained under that head. In early times the summons of the great nobles or landholders to attend parliament seems to have depended in great measure on the royal will. But by the time of Edward I. it had become customary to summon the same persons again and again until through prescription there grew up the "right of summons," which, like most rights and franchises in that feudal age, forthwith became hereditary. The modern peerage of England consists, therefore, simply of those persons who have inherited a right of summons to attend parliament; and in this respect it differs essentially from the nobility of any other country in Europe, or indeed, in the world. For as this right of summons is a right to a legislative and judicial office which can be filled by only one person at a time, it is only the head of a noble family who is a peer, and this dignity can be inherited only by that one of the children who becomes in turn the head of the family. The rest of the noble family are all commoners. This, as elsewhere pointed out, has prevented anything like a severance between the interests of the higher and of the lower classes in England, and has had a great deal to do with the peaceful and healthy political development by which that country has been above all others distinguished. — As at present organized, the house of lords consists of peers who occupy their seats: 1. By hereditary prescription; 2. By direct creation of the sovereign; 3. By virtue of office, as the English bishops; 4. By election for life, as the Irish peers; 5. By election for duration of parliament, as the Scottish peers. As regards the second class, it may be said that the crown has an unrestricted power of creating English peers. This power, which, like most of the royal prerogatives, has come in modern times to be wielded by the prime minister, is in the last resort an effectual safeguard against a deadlock between the two houses of parliament. If the house of lords is obdurate in its antagonism to a strong majority in the house of commons, the prime minister has it in his power to create enough new peers, from his own political party, to reverse the majority in the house of lords. In point of fact it is seldom necessary to resort to this somewhat violent remedy, since the mere knowledge that such a power exists is ordinarily sufficient to prevent the lords from too obstinately withstanding a policy which is clearly favored by public opinion. In the reign of George I. an attempt was made to restrict the royal prerogative of creating peers; but this attempt, which if successful would have gone far toward converting the English peerage into a rigid and obstructive aristocracy, most fortunately failed. In the case of Scottish and Irish peerages, however, the royal prerogative is restricted by statute. The sovereign can not create a new Scottish peerage, except in the case of younger branches of the royal family, though he may revive an extinct or forfeited peerage. A new Irish peerage can be created only when three existing peerages have become extinct; and this rule is to be maintained until the number of Irish peers is reduced to one hundred, after which a new peerage may be created as often as an old one becomes extinct. But these restrictions in the case of the Scottish and Irish peerages do not affect the constitutional character of the house of lords, so long as the prerogative of creating peers of Great Britain is left free. — The house of lords at present consists of 502 members, of whom there are 6 peers of the blood royal, 2 archbishops, 21 dukes, 19 marquises, 118 earls, 26 viscounts, 24 bishops, 253 barons, 16 Scottish representative peers, and 28 Irish representative peers. Of the hereditary peerages, 3 date from the thirteenth century, 4 from the fourteenth, 7 from the fifteenth, 12 from the sixteenth, 35 from the seventeenth, and 95 from the eighteenth, while 341, or more than two-thirds of the whole number, have been created during the nineteenth century. — The only British subject who is born a peer is the prince of Wales, the other children of the sovereign being commoners unless raised to the peerage by letters patent like any other commoners. The highest rank in the peerage is that of *duke*, the title of "prince" being merely a courtesy-title applied indiscriminately to members of the royal family without regard to their rank. The eldest sons of dukes take, by courtesy, their father's second title; the younger sons and the daughters are styled Lord Arthur, Lady Alice, etc. Thus William Cavendish, duke of Devonshire, is also marquis of Hartington; his eldest son, John Cavendish, though a commoner, is called marquis of Hartington by courtesy; his younger sons are called Lord Frederick, Lord Edward, etc. Americans often erroneously omit the Christian name in speaking of such persons, saying simply "Lord Cavendish," but this is a gross blunder. The second rank in the peerage is that of *marquis*. The eldest sons of marquises take their father's second title, while the younger sons and the daughters are called Lord Arthur, Lady Alice, etc. The third rank is that of *earl*. The eldest sons of earls take their father's second title; the younger sons are styled the Hon Charles,

etc.; the daughters, however, are styled Lady Mary, etc., like the daughters of dukes and marquises. The fourth rank is that of *viscount*, and the fifth is that of *baron*. The eldest sons of viscounts and barons have no distinctive title; the sons and daughters are styled indiscriminately the Hon. Charles, the Hon. Mary, etc. The archbishops of Canterbury and York take rank immediately after the royal family and above dukes. Bishops rank between viscounts and barons. An archbishop is addressed as "My Lord Archbishop," or "Your Grace." A duke is addressed as "My Lord Duke," or "Your Grace." A marquis is addressed as "My Lord Marquis." Earls, viscounts, bishops and barons are addressed as "My Lord." — The lord chancellor is the speaker of the house of lords. He may speak and vote like the other peers, and he has no casting vote. By the custom of the house a tie vote is equivalent to a negative. Since the middle of the sixteenth century peers have been allowed to record, in the journals of the house, their dissent from measures which they may have unsuccessfully opposed; and about a century later it was further provided that they might put on record the grounds of their dissent. Peers formerly possessed the privilege of voting by proxy, but, as this practice was found to diminish the personal attendance of peers in parliament, it was formally discontinued in 1868 by a resolution of the house. — The crown has the prerogative of creating peerages for life, but it was decided in 1855 that a life-peerage does not confer upon its possessor the right to a seat in the house of lords. — The house of lords, in its judicial capacity, is the highest court in the kingdom, though it has no original jurisdiction, except in cases of political impeachment. It receives appeals from the common law courts and also from the court of chancery. But as regards courts in which civil law is administered, such as the ecclesiastical and admiralty courts, it was decided in 1678 that an appeal should lie, not to the lords, but to a special court of delegates appointed by the crown. In the trial of cases brought on appeal from lower courts, only those peers take part who have held or are holding at the time judicial offices — The house of lords approves or rejects bills sent up from the commons, exercising a veto power that is sometimes very useful, though sometimes obstructive; and it can originate bills, which can not become law, however, without the concurrence of the commons. The house of lords has no control whatever over taxation, but simply accepts the bills as passed in the commons. — The following table shows the composition of the house of lords at different times, from 1295 to the present day.

HOUSE OF REPRESENTATIVES (IN U. S HISTORY), the name of the lower house of many of the state legislatures (see ASSEMBLY); but more specifically applied to the lower house of congress. (See CONGRESS.) — The formation of the house of representatives, in which membership was assigned to the states in proportion to their population, was directly due to the dissatisfaction of the large states. Massachusetts, Pennsylvania, and Virginia, with the equal vote

enjoyed by all the states, large or small, in the congress of the confederation. (See CONVENTION OF 1787; CONGRESS, CONTINENTAL; SENATE) The small states insisted on a single house of congress, with an equal state vote, as under the confederation; the large states on two houses, with a proportionate vote in each. As a compromise, the large state plan was followed so far as to erect two houses, but with a proportionate vote in the lower only; and the smaller states were placated by an equality of representation in the senate, but with permission to the senators to vote separately, not by states. (See COMPROMISES, I.) — The structure of the American congress is, upon the surface, so strikingly similar to that of the British parliament, that there is a strong temptation to force a parallel between the house of representatives and the house of commons, by calling the former the "popular house," or the "lower house"; terms which, though convenient in practice, are false and misleading if used in their full import. 1. The house of representatives is certainly *a* popular house, but not *the* popular house in contradistinction to the senate, as the house of commons is in contradistinction to the house of lords. Both the house of representatives and the senate represent the people, each in a different aspect. The former represents the people in their numerical aspect; the latter in their aspect of commonwealths; what Brownson would call the "territorial democracy": both together make up the *national* legislature. Nevertheless a superior sanctity for the house, as the "popular branch of the legislative," has always been asserted by the party in control of the house, but has as regularly been forgotten when the control which produced it has been lost. 2. On the other hand, it is not true that the house of representatives is a "lower house," as the house of commons once was. In some respects, as in the powers to originate bills for raising revenue, to impeach delinquent officers, and to elect a president in default of a choice by the electors, the house is superior to the senate; in others, the senate is superior to the house; but neither is really the "upper" or the "lower" house in power or dignity: the two are co-ordinate parts of the governmental machinery. Nevertheless, the greater number of members in the house, their comparative brevity of service (two years, as compared with six in the senate), and the consequent consciousness of inexperience in many of the members, has always put the house at somewhat of a disadvantage when it has undertaken to run counter to the senate. The house, in short, has considerable deference for the parliamentary training of the senate—a feeling fairly indicated, in counting the electoral votes in 1873, by a remark of Mr. Garfield on a proposition to modify a house resolution: "I hope that will be done. The senate resolutions are short and crisp." For much the same reason, the committees of conference, which follow a disagreement between the house and the senate, generally result in verbal concessions by the senate and very material concessions by the house. There is no other warrant for the term "lower house." — MEMBERSHIP. The constitution provides that members of the house must be twenty five years of age, citizens of the United States for seven years, and inhabitants of the states in which they are chosen. There is nothing, therefore, in the constitution to prevent the choice by a district of an inhabitant of some other district in the same state; and any further restriction by a state legislature in this direction would seem plainly illegal and extra-constitutional. It has, therefore, often been suggested that able men outside of the district should be chosen as representatives, somewhat as in Great Britain; but the only approach to this has been the system of electing all the congressmen of a state by "general ticket," voted on throughout the state. The apportionment act of June 25, 1842, whose second section for the first time directed that representatives should be chosen by districts "formed of contiguous territory, no one district electing more than one representative," broke up this general ticket system. — The admission of delegates from the territories, with the power to debate (but not to vote), to make motions (except to reconsider), and to act on committees, was begun in the case of the northwest territory by the congress of the confederation (see ORDINANCE OF 1787), and has been continued by law in the case of other territories since. It has no constitutional sanction, and rests only on the control by the house of its own floor. Jan. 7, 1802, the first rule to admit to the floor others than members was adopted; it admitted "senators, officers of the general and state governments, foreign ministers, and such persons as members might introduce." It was gradually enlarged until it was fixed in its present form, March 19, 1860; it now includes the president and vice-president, their private secretaries, supreme court judges, members of congress and members elect, contestants, the secretary and sergeant-at-arms of the senate, heads of departments, foreign ministers, governors of states, the architect of the capitol, the librarian of congress and his assistant, persons who have received the thanks of congress, ex-members, and clerks of committees. — The number of members is fixed by law after each census. (See APPORTIONMENT.) A quorum is a majority of the members chosen, and not of those apportioned. Their pay is $5,000 per annum, with twenty cents per mile going and returning. That of the speaker is fixed at $8,000. — ORGANIZATION. The list of members of a new house is, by law, made up by the clerk of the last house, who calls the members elect to order at noon of the day on which they are to meet. If a quorum answers the roll, the house proceeds to elect a speaker as the clerk calls his roll. The speaker is then sworn in, usually by the oldest member of the house; he administers the oath to the members and delegates; and the house is organized. From a box con-

taining marble balls, consecutively numbered, a page then draws one at a time, and as each is drawn, and its number called, the member whose name is opposite the number chooses his seat. There are very many changes, however, by mutual agreement.—OFFICERS. The principal officers of the house are the speaker, the clerk, the sergeant-at-arms, the doorkeeper, the postmaster, and the chaplain. The speaker's power is enormous. He is usually a skilled parliamentarian, and, backed by skill, prestige, and the party majority which elected him, his decision is generally final. He appoints the committees, except when otherwise ordered by the house, and almost all the work of the house depends on the committees. By law he is next to the president of the senate in the succession on the decease or disability of the president and vice-president; but in practice he is, next to the president, the most important officer of the government. The clerk is the secretary of the house, the doorkeeper its janitor, and the sergeant-at-arms its treasurer and keeper of the peace; but their functions are much more complicated and difficult than these general terms would indicate. In any unusual disorder the sergeant-at-arms carries his "mace" among the members to recall them to order. This symbol of his office was first ordered by a house resolution, April 14, 1789. It consisted of the *fasces*, in ebony, bound with silver bands in the middle and at the ends, each rod ending in a spear head; at the end a globe of silver, and on the globe a silver eagle, ready for flight. The whole mace was three feet in length. It was destroyed in the fire of Aug. 24, 1814 (see CAPITAL, NATIONAL), and a substitute of common pine, painted, took its place until 1842. The present mace, after the original design, was then procured. — RULES. (See PARLIAMENTARY LAW.) The house is governed by the rules of parliamentary practice comprised in Jefferson's Manual, as modified by the standing rules and orders of the house and joint rules of the senate and house. The rules of the house are so contrived as to be one factor in throwing the control of the house into the hands of a few so-called "leaders," whose chief title to that position is their knowledge of these "house rules." The other factors are the power of the committees, and the general practice of writing during sessions by the members. The power of the committees comes very largely from the fact that so much of the business which the house tolerates is not properly public business at all, but private business, which interferes with and throws back the legitimate business of the house, and makes the activity and favor of the committee more important to a claimant than the hurried vote of the house itself. Many efforts have been made to exclude writing desks from the hall, and provide writing accommodations for the members near at hand. This was actually ordered by the house at the end of the session of 1858–9, but at the next session the house returned to the old arrangement. (See CONGRESS, SESSIONS OF.) — The *Rules of the House*, and its *Parliamentary Practice*, have been digested and published by H. H. Smith, the journal clerk, under the act of March 3, 1877 Further authorities will be found under articles referred to; the act of June 25, 1842, is in 5 *Stat. at Large*, 491. ALEXANDER JOHNSTON.

HOUSTON, Samuel, was born near Lexington, Va., March 2, 1793, and died at Huntersville, Texas, July 25, 1863. He removed to Tennessee in 1807, was adopted into the Cherokee tribe of Indians, but left them and studied law at Nashville. He was a democratic congressman 1823–7 and governor 1827–9, but rejoined the Cherokees in Arkansas before his term was ended. He emigrated to Texas in 1833, and as commander-in-chief defeated Santa Anna at San Jacinto, April 2, 1836. He was president of the republic of Texas 1836–8 and 1842–4, United States senator 1846–59, and governor 1859–61. (See TEXAS.) A. J.

HUNGARY. (See AUSTRIA-HUNGARY.)

HUNKERS (IN U. S. HISTORY), a name taken originally by conservative democrats in New York state, but used occasionally also in other states. — Although the name was not used until about 1844, the faction to which it was applied may be traced through New York history from 1835 until 1860, in opposition successively to the "loco-foco" faction, the radicals and the barnburners; and finally divided into the "hards" and the "softs." In all these divisions the hunkers represented merely the inertia of the state democratic party, and its dislike to the introduction of new questions. From 1835 until 1840 the hunkers, though not yet named, were opposed to the loco-foco war on bank charters (see Loco-Foco), but yielded so far as to pass a satisfactory state banking law in 1838. From 1840 until 1846 they opposed, with the same final want of success, the demand of the radicals for a revision of the state constitution, an elective judiciary, and a cessation of unprofitable canal enterprises. From 1846 until 1852 they were finally successful, though at first defeated, in opposing the maintenance of the state branch of the democratic party in antagonism to the national party. (See BARNBURNERS, FREE-SOIL PARTY.) After 1852 the Marcy portion of the hunkers, commonly called "softs," supported the Pierce administration, while the Dickinson wing, the "hards," opposed it. During the civil war the latter were generally "war democrats." During the last eight years of the period 1835–60, the division line was fainter, but in general the hunker leaders were Daniel S. Dickinson, Edwin Croswell, Wm. C. Bouck, Wm. L. Marcy, Horatio Seymour, and Samuel Beardsley; and their leading opponents were Martin Van Buren, Silas Wright, A. C. Flagg, John A. Dix, Reuben E. Fenton, Samuel Young, and Michael Hoffman. (See also ALBANY REGENCY.) ALEXANDER JOHNSTON.

I

IDAHO, a territory of the United States, part of the Louisiana cession. (See ANNEXATIONS, I) It was originally a part of the territory of Oregon, was then transferred to the territory of Washington, and was organized as a separate territory, March 3, 1863. As first organized it covered 326,373 square miles; but, since then, the whole territory of Montana, and nearly the whole territory of Wyoming, have been taken from it. It now comprises 86,294 square miles, lying between Washington territory and Oregon on the west, Montana and Wyoming on the east, British Columbia on the north, and Utah and Nevada on the south. Its population in 1880 was 32,610. The capital is Boise City, and the governor John B. Neil.—The act of March 3, 1863, is in 12 *Stat. at Large*, 808. ALEXANDER JOHNSTON.

ILLINOIS, a state of the American Union, formed mainly from territory ceded by Virginia, March 1, 1784. The extreme northern part of the state formed part of the territory ceded to the United States by Massachusetts and Connecticut in 1785–6. From Indiana territory, comprising all of these cessions outside of the modern state of Ohio, the territory of Illinois was erected by act of Feb. 3, 1809, comprising the modern states of Illinois, Wisconsin and part of upper Michigan. (See TERRITORIES, ORDINANCE OF 1787, INDIANA.) —April 18, 1818, an enabling act was passed by congress authorizing the formation of a state government by the inhabitants of that part of Illinois territory included within the following boundaries: "Beginning at the mouth of the Wabash river, thence up the same, and with the line of Indiana, to the northwest corner of said state; thence east, with the line of the same state, to the middle of Lake Michigan; thence north, along the middle of said lake, to north latitude forty-two degrees thirty minutes; thence west to the middle of the Mississippi river, and thence down, along the middle of that river, to the confluence with the Ohio river; and thence up the latter river, along its northwestern shore, to the beginning." —In accordance with the enabling act, a convention was held at Kaskaskia, Aug. 26, 1818, and adopted the first constitution of the state of Illinois. It gave the right of suffrage to all white males over twenty-one years old on six months residence; fixed the governor's term of office at four years, but prohibited his immediate re-election; prohibited slavery; and fixed the seat of government at Kaskaskia (since changed to Springfield by the legislature). Under this constitution the state was admitted by joint resolution, Dec. 3, 1818. A more symmetrical constitution was adopted in convention at Springfield, Aug. 31, 1848, and ratified by popular vote March 5, 1849. It prolonged the residence necessary for electors to one year, and prohibited the immigration of free negroes into the state or the bringing of slaves into the state to be emancipated. The present constitution was adopted in convention at Springfield, May 13, 1870, and ratified by popular vote, July 2, 1870. Its leading objects were to limit the powers of the legislature and to establish the powers of the state over railroads and other corporations. It forbade special legislation by the legislature in a number of specified cases, the contraction of indebtedness by municipal corporations to an amount in excess of 5 per cent. of their taxable valuation, municipal subscriptions or loans of credit to private corporations, the bringing of suits against the state in its own courts, or the consolidation of parallel or competing railroads; and it declared all railroads hereafter constructed to be public highways, authorized the passage of laws limiting railroad rates, and placed warehouses under state control. It also provided for minority representation as follows: "In all elections of representatives, each qualified voter may cast as many votes for one candidate as there are representatives [three in each senatorial district] to be elected, or may distribute the same or equal parts thereof, among the candidates, as he shall see fit; and the candidates highest in votes shall be declared elected" (See CONSTITUTIONS, STATE.) —The political history of Illinois was for a long time very much influenced by its southern vote. So late as 1850, 16 per cent. of the population of the state was born in southern states, and over half of this fraction was from Kentucky and Tennessee. Geographical names still show the influence of this immigration, particularly in the southern part of the state, commonly called "Egypt"; but soon after 1850 the current of immigration began to come more rapidly from the east. In 1870 this proportion had decreased to 9 per cent. The general rule, however, has been that the southern part of the state has been democratic, and the northern part anti-democratic. —In national politics the electoral votes of Illinois were invariably democratic until 1860, and have been as invariably republican including and since that year. (See DEMOCRATIC PARTY, V.) In 1848 and 1856 the democratic electoral ticket was successful only by a plurality; in all other years the successful ticket has had a clear majority. —The congressional elections have followed the course of the presidential elections quite closely. Until 1834 they were regularly democratic. After that year two of the three districts were usually democratic, and one (the northern district) whig by a small majority. The census of 1840 gave the state seven representatives; until 1852, six of these were democratic and one whig. The whig district lay along the Sangamon river. It was represented in 1847–9 by Abraham Lincoln, in 1849–51 by E. D. Baker, and in 1851–5 by Richard Yates. Douglas' district lay west and southwest

of it. In 1852, under the new apportionment, the first break was made in the democratic districts by the increase of the free-soil vote. Of the nine representatives, four were so-called northern whigs, afterward anti-Nebraska men and republicans. Their districts embraced the old Sangamon district and thence all the northern and northeastern part of the state, except the Chicago district, which was narrowly carried by John Wentworth, then a democrat. In 1854 the republicans really gained a district farther south by the election of Lyman Trumbull, an anti-Nebraska democrat. The legislature, which was anti-Nebraska, sent Trumbull, who was now a republican, to the senate, the first anti-democratic senator from Illinois. The southern part of the state still remained democratic, and until 1864 congressional elections regularly resulted in heavy democratic majorities in the south, heavy republican majorities in the north, and very small democratic majorities in the centre of the state. In 1858 the election of the state legislature, which was to choose a senator to succeed Douglas, assumed a national importance. Douglas and Lincoln spoke throughout the state in joint debate, and, though Lincoln was beaten, the ability, clearness and simplicity of his speeches gave him a national prominence and the republican nomination for the presidency in 1860. In that year Illinois was called upon to choose between two of her own citizens, Lincoln and Douglas, for the presidency; her electoral vote, after a close contest, was given to Lincoln, but the congressional districts remained as before. The census of 1860 gave the state fourteen representatives; of these the republicans elected those from the five northern districts in 1862, and the democrats the rest, including the congressman at large. In 1864 the republicans carried ten districts and elected the congressman at large. This result was largely due to the accession of war democrats, several of whom carried southern districts hitherto democratic. The congressional proportions then remained almost unchanged until 1874, when eight of the nineteen districts became democratic, seven republican and four independent, two of the democratic districts being in the north. In 1878 the congressional proportion became thirteen republican representatives to six democratic, as it has since remained (to 1883), the democratic districts being still in the southern part of the state. — In state politics every governor until 1857 was a democrat, and every governor since that year has been a republican. Until 1854, when an anti-Nebraska legislature was chosen, the legislatures were democratic; since that year they have been quite steadily republican, and have elected republican United States senators with three exceptions. In 1858, as above stated, Douglas was elected to the senate. In 1863 Wm. A. Richardson, a democrat, was chosen to serve out Douglas' unexpired term. In 1877 David Davis, an independent, was sent to the senate by a combination of democrats and independents. The system of minority representation in the lower house of the legislature, above referred to, went into operation in 1872, and worked so exactly as to give each party within four-tenths of one per cent. of its legitimate representation, according to its vote for governor. Since 1872 the only important movement in strictly state politics has related to the attempts to control and limit the rates of the railroads of the state, in accordance with the provision of the constitution of 1870 under that head. Several state judges gave decisions unfavorable to the constitutionality of the railroad laws, and efforts were successfully made to prevent the re-election of the offending judges. The case of Chief Justice C. B. Lawrence was the most notable. — Three of the most distinguished leaders in American politics, Abraham Lincoln, Stephen A. Douglas and Ulysses S. Grant, have been citizens of Illinois. (See those names.) The names of others, prominent in state and national politics, will be found in the list of governors of the state. In addition to these, brief reference should be made to Edward D. Baker, whig representative in 1845–6, and 1849–51, senator from Oregon 1860–61, killed at Ball's Bluff; Sidney Breese, democratic senator, 1843–9, state circuit judge 1855, and chief justice 1873; Orville H. Browning, republican United States senator 1861–3, afterward secretary of the interior (see ADMINISTRATIONS); John F. Farnsworth, republican representative 1857–61 and 1863–73; Ebon C. Ingersoll, republican representative 1864–71; Robert J. Ingersoll, noted as a republican orator; John A. Logan, democratic representative 1859–61, republican congressman at large 1867–71, and United States senator 1871–7 and 1879–85; John A. McClernand, democratic representative 1843–51 and 1859–61; James Shields, democratic United States senator 1849–55; Lyman Trumbull, republican United States senator 1855–73; Elihu B. Washburne, whig and republican representative 1853–69, and minister to France 1869–77; and John Wentworth, democratic representative 1843–51 and 1853–5, and republican representative 1865–7. — The name of the state was given from that of its principal river, the Illinois, which is said to have been named from the Illini, an Indian tribe formerly living near it. The popular name for the state is the "prairie state," and for the people "suckers." The latter term, of doubtful derivation, is accepted without demur by the people of Illinois. — GOVERNORS: Shadrach Bond (1818–22), Edward Coles (1822–6), Ninian Edwards (1826–30), John Reynolds (1830–34), Joseph Duncan (1834–8), Thomas Carlin (1838–42), Thomas Ford (1842–6), Augustus C. French (1846–53), Joel A. Matteson (1853–7), William H. Bissell (1857–61), Richard Yates (1861–5), Richard J. Oglesby (1865–9), John M. Palmer (1869–73), Richard J. Oglesby (1873, resigned), John L. Beveridge (1873–7), Shelby M. Cullom (1877–85). — See Poore's *Federal and State Constitutions*, and *Political Register;* Reynolds' *Pioneer History of Illinois* (to 1818); Birkbeck's *Letters from Illinois* (1818); Ford's *History of Putnam* [and other] *Counties*

(1860); Beck's *Gazetteer of Illinois* (1823); Edwards' *History of Illinois* (to 1833); Mitchell's *Illinois in* 1837; Brown's *History of Illinois* (to 1844); Ford's *History of Illinois* (to 1847); Carpenter's *History of Illinois* (to 1854); Gerhard's *Illinois as it is* (1857); Eddy's *Patriotism of Illinois;* Wright's *Chicago* (1870); Davidson and Stuvé's *History of Illinois* (to 1873); Matson's *French and Indians of the Illinois River* (1875); the act of Feb. 3, 1809, is in 2 *Stat. at Large,* 514; the act of April 18, and the resolution of Dec. 3, 1818, are in 3 *Stat. at Large,* 428, 536; Porter's *West in* 1880, 157.

ALEXANDER JOHNSTON.

IMMATERIAL PRODUCTS. To "produce," in the economic sense of the word, is not to create matter, which is beyond human power, but a *valid* utility, that is to say, one that may be exchanged for other utilities. Now utility in itself has nothing material in it; it is a quality, a property which only exists by its relation to our wants. From this point of view all products without exception are immaterial; but it has been thought desirable to distinguish, among the utilities produced, those directly connected with man, and these have been called "immaterial products." — Adam Smith, Malthus, and other economists, did not admit this last class of products. Smith, while recognizing the utility and even the necessity of the services of functionaries, magistrates, the army, etc., did not admit that these services were productive. "Their service," he says, "how honorable, how useful or how necessary soever, produces nothing for which an equal quantity of service can afterward be procured. The protection, security and defense of the commonwealth, the effect of their labor this year, will not purchase its protection, security and defense for the year to come. In the same class must be ranked, some both of the gravest and most important, and some of the most frivolous professions: churchmen, lawyers, physicians, men of letters of all kinds; players, buffoons, musicians, opera singers, opera dancers, etc. The labor of the meanest of these has a certain value, regulated by the very same principles which regulate that of every other sort of labor; and the labor of the noblest and most useful of these professions produces nothing which could afterward purchase or cause an equal quantity of labor to be performed. Like the declamation of the actor, the harangue of the orator, or the tune of the musician, the work of all of them perishes at the very instant of its production." — Malthus thought that "from the moment the line of demarcation between material and immaterial objects is taken away, the explanation of the causes which determine the wealth of nations and every means of appraising it become extremely difficult, if not impossible." — J. B. Say thus sums up the characteristics which seem to him to distinguish the products in question: "An immaterial product," he says, "is any sort of utility which is unconnected with any material body, and which consequently is consumed as soon as produced. Certain immaterial products, although consumed as soon as produced, are susceptible of accumulation, and consequently of forming capital when their consumed value is met with and fixed on a durable basis (*fonds*). It is thus that the oral lesson of a teacher of the art of healing is reproduced in the industrial faculties of those of his pupils who have profited by it. This value is then attached to a durable subject, the pupil." M. Dunoyer seems to us to have considerably elucidated and perfected the idea of immaterial products; he does not admit that they are consumed as soon as produced, and he thinks that this statement has only been made on account of a want of distinction between work and its results. M. Dunoyer has himself recalled in his article headed "Production," the theory evolved by him on this subject in his great work on "Freedom of Labor." His observations seem to us completely justified; but great care must be taken, in considerations relative to the class of products which we are dealing with, never to forget the distinction between labor and its results, a point on which in some respects, perhaps, M. Dunoyer has not sufficiently insisted. It is certain that all useful labor is productive, and that everything which can satisfy our various wants or assist in perfecting our intellectual or moral nature is useful; but the labor performed on man or his faculties, which, to use M. Dunoyer's expression, has man for its subject, is far from being always useful and productive. Too often, on the contrary, this labor is not only useless and unproductive, but to the last degree hurtful and destructive. It is then absolutely necessary, before deciding if labor having man for its subject is or is not productive, to examine its object and its results.— An armed force, used exclusively, according to the need there may be of it, in preserving national independence, in assuring internal tranquillity and respect of persons and property, performs an unquestionably productive labor; for, on the one hand, it represses collective or individual violence with all its accompanying evils; while, on the other hand, it gives to all that feeling of security which is indispensable to activity and productiveness in labor. But an army which should become the tool of the ambition, pride or vanity of certain personages; which should serve to maintain at home an oppressive and grasping rule, and to carry abroad war and its devastations, would no longer be a productive force, but a scourge.— Magistrates who conscientiously fulfill their duty, who administer with rigid impartiality the laws of justice as the general condition of enlightenment has established them, are eminently producers; for they contribute to insure to the nation security and at the same time to perfect the morality of the people. But a magistracy which should make itself the accomplice of a destructive and tyrannical power, would by so doing only contribute to produce evils of every description.— A civil administra-

tion which applied itself to attending to, by efficacious means, but as simple and as little costly as possible, collective interests of such a nature that they could not be left with advantage to the care of individual activity; to collecting the taxes which the public service might render indispensable; to protecting without harassing the regular growth of general activity; to preventing dangers or hurtful acts in the few cases where the evil resulting from preventive measures would not equal or exceed that which the action is taken to prevent, would fulfill a mission whose usefulness and consequently whose productiveness could not be contested. But an administration, which, instead of confining its efforts to protecting, in the best way possible, the free and legitimate application of general activity, should pretend to direct and regulate it on all points; which supposed itself authorized in many cases to take from some to give to others; which, in order to extend its action everywhere, should complicate more and more the public service, and should without stay or limit increase the personnel of the administration, would only succeed by such a course in trammeling all useful works, in producing a forced and unjust distribution of part of the values produced, a more and more energetic and general desire for public employment, a progressive increase in the parasite population, the weakening and discouragement of productive activity in proportion to the development given to destructive activity, and finally, the insecurity and disorders inseparable from all these causes of disturbance. Such an administration, taken as a whole, would little merit to be considered productive of utility.— Ministers of a religion, who, to propagate their faith or their beliefs, used no other arm than persuasion, the only one for that matter of any avail; who made themselves the teachers of ethics and the consolers of their adherents; who, by the help of religious sentiments, strove to elevate and purify more and more their intelligence and their habits, to develop and enlighten their better feelings, to resist and diminish their evil and mischievous propensities—in a word, to direct their desires, their tendencies and their activity into the path most beneficial for all, would undoubtedly be the most valuable of all producers, the most worthy of respect and veneration; for they would contribute more than all others to the perfecting of human life, to raising men to the highest level it is given them to attain. But a clergy who, to establish their influence, counted less on persuasion than on authority; who lacked the necessary enlightenment to enable them to act on the affective faculties of their followers in such a way as to improve them and wisely guide their natural tendencies; who, besides, ignored the importance of this part of their mission and devoted themselves mainly to obtaining a submission, a passive obedience, voluntary or forced, to all the tenets or forms prescribed by them, and should be contented with such a result as sufficient to assure their power and serve their temporal interests—could a clergy, we ask, who employed such means for such an object, be fitly classed among producers? — The same may be said about the labor of the teacher, the professor, the man of letters, or the artist. We might ask if secondary education, as it exists in France for example, is in accordance with the needs or the real interests of the population; if the study and praise bestowed on the manners, the institutions, the opinions and the actions of the ancient peoples of Greece and Rome, are well fitted to make honorable and useful citizens; if the ideas drawn from such teaching are really utilities; if there might not be something better to teach, etc. We might ask if all authors, poets and artists have a good effect in improving the mind, elevating the soul, or refining the taste; but the reader can easily supply for himself what is here omitted. What has been said seems to us sufficient to establish our statement that all labor which has man as its object is not productive. And that to distinguish such as is from such as is not, it is necessary to examine its results.— It is of importance, however, to explain that utility "can not be estimated in political economy as it is in ethics, and that we must recognize here as useful everything which has an exchangeable value. There must in consequence be admitted as veritable products, all the results of the labors of the author, the artist, the doctor, etc., to which the public attaches a price freely agreed upon, even when to the eyes of reason some of these results are worth nothing or less than nothing, but it is quite otherwise with the labor whose wages are not freely determined, and the results of which men are forced to accept, whatever they may be, such as those regulated by authority; the effects of this labor have no price current which the economist is obliged to accept, whether reasonable or not, and their appraisement is entirely a matter for the decision of enlightened reason.

A. CLÉMENT.

IMMIGRATION. (See EMIGRATION.)

IMPEACHMENTS (IN U. S. HISTORY). The constitution only provides that the house of representatives shall have the sole power of impeachment of the president, vice-president, and "all civil officers of the United States"; that the senate shall have the sole power to try impeachments; that judgment, to be given by two-thirds of the senators present, shall only involve removal from, and disqualification to hold, office under the United States; that a person convicted shall not be pardoned by the president, and shall still be liable to indictment and punishment at law. When the president of the United States is tried, the chief justice presides over the senate.—The constitution has not attempted to ascertain and classify the offenses which are impeachable. It has only stated (Art. I., § 3, ¶ 7) that "the party convicted shall, nevertheless, be liable and sub-

ject to indictment, trial, judgment, and punishment according to law;" and (Art. II., § 4) that "the president, vice-president, and all civil officers of the United States shall be removed from office on impeachment for and conviction of treason, bribery, or other high crimes and misdemeanors." From this omission of specification two antagonistic opinions have arisen. 1. It is held that the power of impeachment extends only to such offenders as may afterward be indicted and punished according to law; that is, that the house can only impeach, and the senate remove, for indictable offenses. This would make the power of impeachment defined and circumscribed. 2. On the contrary, it is held that the phrase "high crimes and misdemeanors" was intentionally left undefined in order that the power of impeachment might embrace not only indictable offenses, but also that wider and vaguer class of political offenses which the ordinary courts of law can not reach. This would make the power of impeachment under the American constitution closely similar to that which has been exercised under the British constitution. It would then include all misdemeanors which might seem to a majority of the house, and to two-thirds of the senate, so heinous or so disgraceful as to make the offender's exclusion from office necessary to the well-being of the country; and the punitive effect of the popular vote would be relied upon to deter a dominant party from abusing the power for selfish ends. The best results have probably been reached by leaving the question open to individual judgment. — Many minor questions are still unsettled, and will probably long remain so. 1. It can not be considered settled that an office-holder may escape impeachment for acts done while in office, by resignation, expulsion, or the close of his term of office. The point was made, but not decided, in Blount's case (see I.), and although it prevented a two-thirds majority in Belknap's case (see VII.), the power of impeachment was there maintained by a very decided majority of the senators, including nearly all the ablest lawyers of the senate. On the one hand is the provision that only "civil officers" are liable to impeachment; and the conjunction of "removal from office *and* disqualification" would seem to imply that the removal was the first essential to punishment, and that disqualification could not be inflicted where removal had for any reason become impossible. On the other hand is the obvious objection, on the score of public policy, to allowing a suddenly discovered criminal in office to escape impeachment by an aptly timed resignation. 2. Blount's case has apparently settled that senators and representatives are not impeachable; but the decision in that case was made against strong opposition at the time, and has been repeatedly objected to since. In favor of the decision is the language of the constitution; it limits the power of impeachment to "the president, vice-president, and all civil officers," but in other places mentions members of congress and "civil officers" in distinct categories. Against it is the decision by the senate, in January, 1864, that an oath prescribed for "civil officers," by the act of July 2, 1862, must be taken by senators also. 3. The power of the senate to arrest the accused, or "sequester" or suspend him from office, pending judgment on the impeachment, is very doubtful, and is defended mainly by parallel with the practice in English impeachments. The language of some of the framers of the constitution and their contemporaries, however, goes to show that they considered the power of suspension to be in the senate; and Senator Sumner, on Johnson's trial, argued that the selection of the chief justice to preside over the trial of a president was not because the vice-president was supposed to be an interested party, but because he was presumed to be engaged in performing the duties of the president during the necessary suspension of the latter from office. The power of arrest was exercised by the senate, though under peculiar circumstances, in Blount's case. It is, however, usually a power not necessary to secure attendance, since the only judgment in case of conviction is the stigma of inability to hold office, and punishment does not extend to death or deprivation of property; nor, in any event, is the attendance of the accused necessary; since he may be tried and condemned in his absence, as in Blount's, Pickering's and Humphreys' cases. (See I., II., V.) 4 Can an unjust conviction on impeachment ever be reversed by a subsequent congress? This is a question which has never been raised, and the now acknowledged equity of the whole line of senatorial decisions in impeachment cases gives strong reason for hope that it will never be necessary to raise it. — The impeachment cases in our national history are given below. It has not been considered necessary to go into impeachments by state legislatures, but reference is made among the authorities to several important cases of this kind. — I. WILLIAM BLOUNT. July 3, 1797, the president sent to congress a number of papers on the relations of the United States and Spain. Among them was a letter from United States Senator Blount, of Tennessee, to an Indian agent among the Cherokees, from which it appeared that Blount was engaged in a conspiracy to transfer New Orleans and the neighboring territory from Spain to Great Britain, by means of a British fleet and a land force to be furnished by Blount. On receipt of notice that the house intended to impeach him, the senate at first put him under $50,000 bonds to appear for trial, but afterward expelled him, July 9. His sureties then surrendered him to the senate, but he was again released on decreased bail. The whole of the next session, Nov. 13, 1797 – July 16, 1798, hardly sufficed for the preparation of the five articles of impeachment, which were finally brought to trial, Dec. 24, 1798. Blount, who had in the meantime been elected to the senate of his state, did not appear, but his counsel plead, 1, that, as senator, he was

not a "civil officer" liable to impeachment, and, 2, that, since his expulsion he was no longer a senator. The senate sustained the first plea, and Blount was acquitted for want of jurisdiction. — II. JOHN PICKERING. March 3, 1803, the house impeached Judge Pickering, of the federal district court for the district of New Hampshire. The four articles against him charged him with decisions contrary to law, and with drunkenness and profanity on the bench, and were tried by the senate at once. Judge Pickering did not appear, but his son attempted to prove his father's insanity. The managers on the part of the house, in reply, maintained that the insanity was a consequence of his habitual drunkenness. He was convicted March 12, by a party vote, the federalists voting in the negative, and removed; the further disqualification to hold office was not inflicted. — III. SAMUEL CHASE. One of the ablest of the federal justices of the supreme court was Chase, of Maryland, appointed Jan. 27, 1796. The practice of adding disquisitions on current politics to charges to grand juries was then common with American judges, as it had long been in Great Britain; and after the downfall of the federal party in 1801 Chase kept up the practice with a bitterness and ability equally displeasing to the dominant party. In the house, Jan. 5, 1804, Randolph obtained a committee to investigate Chase's official conduct; and on their report Chase was impeached, Nov. 30, 1804, and Randolph was appointed chief manager. The articles of impeachment were presented to the senate, Dec. 7, 1804, and the trial was begun Jan. 2, 1805 There were eight articles. 1, for arbitrary and unjust conduct in the trial of John Fries for high treason, in April, 1800, in refusing to allow the prisoner's counsel to argue various law points, and in announcing his opinion as already formed, so that the prisoner's counsel threw up the case; 2, for refusing to excuse a juror who had prejudged the guilt of J. T. Callender, in a trial under the sedition law, in May, 1800, at Richmond; 3, for refusing to allow one of Callender's witnesses to testify; 4, for interrupting and annoying Callender's counsel, so that they abandoned his case; 5, for arresting, instead of summoning, Callender in a case not capital; 6, for refusing to allow Callender a postponement of his trial; 7, for urging an unwilling Delaware grand jury to find indictments under the sedition law; and 8, for "highly indecent and extra-judicial" reflections upon the government of the United States before a Maryland grand jury. The eighth article covered his real offense; the others were the fruits of the committee's zealous research into his past official life. — The defense disproved very much of the matter alleged, and as to the remainder Chase's counsel argued successfully that his conduct had been "rather a violation of the principles of politeness than of the principles of law; rather the want of decorum than the commission of a high crime and misdemeanor." On the 3d, 4th and 8th articles Chase was pronounced guilty by a small majority, the largest, 19 to 15, on the 8th; on the other articles a majority found him not guilty; and as a two-thirds majority was not given for any article, he was pronounced not guilty on all, March 1, 1805. The result of the trial led to some efforts on the part of the democratic leaders to change the tenure of federal judges. (See JUDICIARY, VII.) Judge Chase held his seat on the bench until his death, June 19, 1811. — IV. JAMES H. PECK. Dec. 13, 1830, Judge Peck, of the federal district court for the district of Missouri, was tried on an impeachment passed by the house at the previous session. The article against him alleged arbitrary conduct, in 1827, in punishing for contempt of court an attorney who had published a criticism of Judge Peck's opinion in a land case. In this case the vote of the senate was 21 guilty, 24 not guilty, and Judge Peck was acquitted. — V. WEST H. HUMPHREYS. At the outbreak of the rebellion the district judges of the federal courts in the seceding states, and one of the justices of the supreme court (James A. Campbell, of Alabama), resigned. Justices Catron, of Tennessee, and Wayne, of Georgia, notwithstanding the secession of their states, retained their positions as justices of the supreme court, and their loyalty was never questioned. On the other hand, Judge Humphreys, of the federal district court of Tennessee, while actively engaged in the rebellion, had not resigned, and impeachment became necessary in order to vacate his position. Recourse was had to a secession speech made by him in Nashville, Dec. 29, 1860, and this, and his acceptance of the office of confederate judge, were made the basis of seven articles of impeachment by the house, on which he was convicted by a unanimous vote of the senate, June 26, 1862 —VI. ANDREW JOHNSON. Jan. 7, 1867, Jas. M. Ashley, of Ohio, submitted a resolution in the house directing the judiciary committee to investigate his charge that President Johnson had corruptly used the appointing power, the pardoning power, the veto power, and the public property, and had corruptly interfered in elections. The house adopted the resolution, and five of the nine members of the committee reported, Nov. 25, 1867, in favor of impeachment. Their resolution to that effect was lost, Dec. 7, by a vote of 56 to 109. — In March, 1867, congress had enacted (see TENURE OF OFFICE) that civil officers "holding or hereafter to be appointed" to any office by confirmation of the senate, should retain office until a successor should be confirmed by the senate, except that cabinet officers, unless removed by consent of the senate, should "hold their offices for and during the term of the president by whom they may have been appointed, and for one month thereafter." At the same time congress had practically taken the command of the army from the president (see RECONSTRUCTION), and had made the secretary of war really independent of, as well as irremovable by, the executive.—All the cabinet, except the secretary of war, E. M. Stanton,

seem to have been in sympathy with the president in March, but the estrangement between Stanton and Johnson increased so rapidly that the president suspended the secretary of war, Aug. 12, 1867, as he was allowed to do, by the tenure of office act, while the senate was not in session, and appointed the general of the army, U. S. Grant, secretary *ad interim*. Within twenty days after the senate should meet, the president was required by the tenure of office act to lay before the senate his reasons for any suspension during its intermission; in Stanton's case he did so, and the senate, Jan. 13, 1868, by a party vote of 35 to 6, nonconcurred in Stanton's suspension. Gen. Grant at once notified the president that his functions as secretary *ad interim* had ceased. Secretary Stanton immediately resumed his place, and kept it throughout the subsequent proceedings until May 26, when he finally relinquished it. — The suspension of Stanton was a mistake, in so far as it recognized the mode of procedure laid down in the tenure of office act, since the vital point in Johnson's case was the applicability of that act to Secretary Stanton. The president, indeed, asserted that Gen. Grant had promised to hold the office in spite of the senate's non-concurrence, and thus force Secretary Stanton, by an appeal to the courts, to test the constitutionality of the act; and the assertion was sustained by all the cabinet officers except Stanton, but was denied by Gen. Grant. The plan, which had been baulked by Grant's surrender of the office to Stanton in January, was resumed in February with a more reliable instrument, and apparently with better legal advice. Feb. 13, the president desired Gen. Grant to appoint Gen. L. Thomas adjutant general, and the appointment was made. Feb. 21, the president removed Stanton, as if the tenure of office act did not apply to his case, and appointed Thomas secretary of war *ad interim*, under the law of Feb. 13, 1795, which allowed the appointment of such officers, in emergencies, for not more than six months, without confirmation by the senate. Stanton refused to vacate the office, and notified the speaker of the house of his attempted removal. Feb. 24, the house adopted a resolution of impeachment by a vote of 126 to 42, and on the following day a committee impeached the president at the bar of the senate. By tacit consent, all attempts to obtain possession of the war department were dropped to abide the result of the impeachment. — The house managers of the impeachment were John A. Bingham of Ohio, Geo. S. Boutwell and Benj. F. Butler of Massachusetts, Jas. F. Wilson of Iowa, Thomas Williams and Thaddeus Stevens of Pennsylvania, and John A. Logan of Illinois. — The president's counsel were Henry Stanbery and W. S. Groesbeck of Ohio, Wm. M. Evarts of New York, Thos. A. R. Nelson of Tennessee, and Benj. R. Curtis of Massachusetts. March 4, the managers presented eleven articles, impeaching the president of the following high crimes and misdemeanors: 1. The issuance of an order removing Stanton, with intent to violate the tenure of office act, after the senate had refused to concur in his suspension; 2, the issuance of an order to Thomas to act as secretary of war *ad interim* while the senate was in session, no "vacancy existing" in the war department, with intent to violate the tenure of office act and the constitution, and 3, without authority of law; 4, conspiracy with Thomas and other persons with intent, by intimidation and threats, to prevent Stanton from acting as secretary; 5, to prevent the execution of the tenure of office act; 6, to seize the war department's property by force, and, 7, to violate the tenure of office act; 8, the appointment of Thomas with intent to control unlawfully the disbursement of the war department's moneys; 9, an attempt to induce Gen. Emory, commanding the department of Washington, to disobey the act above referred to, regulating the issuance of orders to the army; 10, the use, in regard to congress, of "utterances, declarations, threats and harangues, highly censurable in any, and peculiarly indecent and unbecoming in the chief magistrate of the United States, by means whereof said Andrew Johnson has brought the high office of president into contempt, ridicule and disgrace, to the great scandal of all good citizens"; and 11, his public declaration that the 39th congress was no constitutional congress, but a congress of part of the states, "thereby denying and intending to deny that its legislation was obligatory upon him, and that it had any power to propose amendments to the constitution," and designing to prevent the execution of the tenure of office act, the act for the government of the army, and the reconstruction acts. The last two articles were additions to the original nine articles, based upon certain speeches made by the president during a tour to St. Louis in August and September, 1866. — The answer of the president, through his counsel, may be reduced to four heads. 1. As to articles 1–3, he averred that Stanton, having been appointed by President Lincoln, Jan. 15, 1862, having served out "the term of the president by whom he had been appointed," and never having been reappointed, was not embraced in the terms or the intention of the tenure of office act, of March 2, 1867; that Stanton had taken office and kept it "during the pleasure of the president," according to the terms of the act of Aug. 7, 1789, organizing the war department, and according to the practice of all presidents and congresses down to March, 1867; that Stanton's removal was not in violation of the tenure of office act; and that the appointment of Thomas was to fill an existing vacancy. 2. As to articles 4–7, he denied any conspiracy, any intimidation, or any authority to use force given by him to Thomas, and asserted that the only connection between him and Thomas was an order from him as superior and obedience to it by Thomas. 3. He denied the truth of article 8. 4. As to articles 9–11, he claimed the right of freedom of opinion and of freedom of speech; he asserted that his declarations to Emory

and to public meetings were identical with his messages to congress; and called attention to the fact that the allegations in these articles did not "touch or relate to any official act or doing" of the president.— The trial, beginning with the organization of the senate as a court to try the impeachment, March 5, ended March 26. Excluding the twenty senators from southern states not yet admitted, the total number of senators was fifty-four; the two-thirds vote, needed for conviction, would, therefore, have been 36 to 18. There were twelve democratic senators, all of whom were quite certain to vote not guilty, so that it was necessary that at least seven republican senators should vote against conviction on all the articles in order to secure an acquittal. Before a vote was reached it was very apparent that there were but three articles (2, 3 and 11) on which a conviction was possible. On the "conspiracy" articles (4–7), and the "Emory" article (9), the proof had failed to convince many republican senators. The "Butler" article (10) consisted of unofficial utterances of the president. On the "Stanton" articles (1, 8) several republican senators asserted that the tenure of office act was admitted at the time of its passage not to apply to President Lincoln's secretaries, Sherman, of Ohio, one of the senate conferees on the act, says in his opinion, "Can I, who still believe it to be the true and legal interpretation of those words, can I pronounce the president guilty of crime, and by that vote aid to remove him from his high office, for doing what I declared and still believe he had a legal right to do? God forbid." May 16, by order of the senate, the vote was taken on the eleventh article first, and was found to be 35 for conviction and 19 for acquittal, seven republican senators voting in the minority. The senate adjourned at once until May 26, when a vote was taken on the second and third articles, with exactly the same result as on the eleventh. The senate then adjourned *sine die*, without voting upon the other articles, and the chief justice directed a verdict of acquittal to be entered upon the record. — The strength of the eleventh article lay in its charge that the president had not faithfully executed the tenure of office act or the reconstruction acts, his declarations that congress was "not a congress" being apparently intended to show his *mala fides*. Its weakness lay in its vagueness, and in the fact that it charged the president with "designing and contriving" means to avoid the execution of the law, rather than with any overt acts. As to this article, then, the difference of opinion went mainly to the meaning of the language. The second and third articles, particularly the former, seem to have been lost because of their complication with Stanton's removal, and their statement that "no vacancy existed" when Thomas was appointed. If Stanton's removal were legal, the tenure of office act would then seem to apply to his office for the first time *after* he had been removed; and the absolute prohibition, in the second section of the act, of *ad interim* appointments, except in cases of suspension, would seem to hit the case of Thomas' appointment exactly, though even then there would have been a fair question whether the appointment were a high crime and misdemeanor. Those of the seven acquitting republican senators who filed opinions seem to have voted not guilty on these articles because of the "no vacancy" clause, and because a vote for conviction would have stultified their opinions on the first and eighth articles (Stanton's removal); but, even without the objectionable clause, it is extremely probable that they would still have voted not guilty on the general ground of want of evil intent in the president's action. The only conclusion to be drawn from the conduct of the whole case is that the house was too hasty in impeaching; if it had waited patiently for some overt act to complete the eleventh article, that article would have been impregnable, and it is difficult to see how conviction could have been avoided honestly. — VII. WILLIAM W. BELKNAP. In February and March, 1876, the house committee on expenditures in the war department, discovered that Secretary Belknap, of that department, had for six years been receiving money for the appointment and retention in office of the post-trader at Fort Sill, Indian Territory. The total amount received was about $24,450. The house voted unanimously to impeach him, March 2, 1876, but a few hours before the impeachment resolution was passed, Belknap resigned, and his resignation was accepted by President Grant. April 4, the managers of the impeachment on the part of the house appeared at the bar of the senate, and exhibited five articles of impeachment, covering the various receipts of money charged against Belknap. In his reply the defendant claimed to be a private citizen of Iowa, and denied the power of the house to impeach any one who, by resignation or otherwise, had ceased to be a "civil officer of the United States." May 4–29, the question whether Belknap was, under all the circumstances, amenable to trial by impeachment was argued and decided in the affirmative by a vote of 37 to 29; but the vote proved the hopelessness of conviction, since the minority was too large to allow a two-thirds vote of guilty. The evidence and argument on both sides continued from July 6 until August 1, when the vote stood 36 guilty to 25 not guilty on the second, third and fourth articles, 35 to 25 on the first, and 37 to 25 on the fifth article. The majority for conviction not being two-thirds, a verdict of acquittal was entered. The vote of the minority was given on the ground of want of jurisdiction. ALEXANDER JOHNSTON.

IMPRESSMENT. (See EMBARGO, in U. S. History.)

IMPRISONMENT FOR DEBT. (See DEBT.)

INCOME TAX. A tax upon income has many qualities which recommend it to the economist. It accords perfectly with the first maxim of taxation as laid down by Adam Smith: "The subjects of every state ought to contribute toward the support of government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state." It would fall upon that portion of the community which is best able to contribute to the expenses of government, for it presupposes an income, and justice demands that it shall be levied only upon income that is not essential to the existence of the payer. Moreover as a direct tax it falls more upon the richer classes than upon the poorer, for this is the general tendency of direct taxes, and this tendency is further increased by an exemption from taxation of incomes below a certain amount. An income tax may then be regarded as a compensatory tax, as a tax which is complementary to a system of indirect taxes; because indirect taxes, falling upon consumption, require a relatively greater sacrifice from the poorer classes, and as the expenditure of people upon taxed commodities bears no regular proportion to their wealth, these indirect taxes touch but slightly the rich. While an indirect tax upon consumption will reach every class in the community, an income tax will, as has already been noted, fall upon that class which is in the enjoyment of an income over and above a certain sum. But the crowning merit of a tax upon income is that, if justly assessed, it would not act upon prices, like a tax upon a commodity; nor would it affect the normal distribution and employment of capital, or interfere with the free action of labor; nor finally, would it favor any particular class or classes of the community at the expense of any other class, or of the great body of the people, the consumers—effects which are apt to be produced by indirect taxation. All this supposes that the tax is equitably levied, and were this condition possible no tax would be more in accordance with correct economic principles. It is moreover an elastic tax, for as the wealth of a people increases, the proceeds of the tax must increase, and at the present time (1882) there is no surer index of England's advance in material prosperity than the slow increase in the returns of the income tax. No objection, based upon general principles, could be raised against the assessment and collection of a moderate tax on incomes above what is necessary to existence, if it could be assessed equitably and without causing injustice to any one, and if it could be collected with facility. — But such a tax can exist only in theory, and when an attempt is made to put it in practice it becomes one of the most unequal taxes that can be imposed, the difficulties being almost wholly in the assessment. Such a tax can not, under any of the methods that have been suggested, be made an equal tax without raising up such a complex system of assessment and collection as to create insuperable obstacles to its collection. We can only approximate to an equal assessment. The first difficulty lies in the determining of what is the income to be taxed. Either the personal statement of the tax payer of the income he enjoys must be depended on, or there must be a body of trained officials for determining the income of each contributor; or the two methods must be combined. The weakness of depending upon the statement of the tax payer is at once apparent, and unless there is an open and honest declaration on the part of the individual, the tax either becomes nugatory, or arbitrary and oppressive. The interest of the tax payer will induce him to evade his share of the burden by concealing a part of or underrating his true income, and the higher the rate of the tax the greater is the inducement offered to evasion. Moreover, while the conscientious tax payer makes a full and honest return of his income, the dishonest one will seek to escape his burden, and in this way the tax will be an unequal tax. For this reason the tax has been called "a tax upon honesty and a bounty on perjury and fraud." This is illustrated by the manner of collecting this tax as now practiced in England. The bank of England when it pays the dividends on the funds deducts the income tax and credits it to the government; the salaries of those employed in the government offices and in the army and navy are definitely known to the officials, and not one of these fund holders and government employés, can escape the payment of

his full tax. The income of farmers is roughly estimated to be one-half the rental of the farm, and the tax is levied on that basis. But for the incomes of all engaged in manufacturing or other industrial enterprises, and of those engaged in professions, the statement of the interested parties must be depended upon, and undoubtedly evasion of taxation is practiced to a great extent among these classes. So that there are certain classes of the community taxed either upon their full incomes or upon a portion of them fixed on a well-defined principle, from which there can be no escape, side by side with others who may wholly escape taxation. The result is, that such a system is a discriminating and therefore unjust system, and the difficulty thus raised has never been successfully overcome. So long as the income tax rests mainly upon voluntary assessment it will be an unjust tax, and on that ground stands condemned. Yet there is one very curious instance in which this principle of voluntary assessment was carried to its fullest extent. "At Hamburg every inhabitant is obliged to pay to the state ½ per cent. of all that he possesses, and as the wealth of the people of Hamburg consists principally in stock, this tax may be considered as a tax upon stock. Every man assesses himself, and, in the presence of the magistrate, puts annually into the public coffer a certain sum of money, which he declares upon oath to be ½ per cent. of all that he possesses, but without declaring what it amounts to, or being liable to any examination upon that subject. This tax is generally supposed to be paid with great fidelity." And, Adam Smith adds, it is not peculiar to the people of Hamburg. To attempt to put into practice any such tax at the present day would be absurd, and it could never be said of it that it was paid with great fidelity. — A system of government officials to decide on a person's ability to pay, has become a necessary appendage to an income tax, and unless the rate of taxation is very low there should be some means of establishing the correctness of the individual return, and of making such corrections as may be deemed necessary. But if voluntary assessment causes inequality of taxation, an official assessment only increases this inequality, though at the same time it may serve to remedy some evils incident to such a system. Thus, in their report for 1861–2, the inland revenue commissioners gave some instances where official interference had remedied some glaring abuses of voluntary assessments. "We have already reported to your lordships one remarkable case of recent occurrence, where a trading firm having returned 'nil' as their profits for the year 1861–2, the surveyor induced the district commissioners to assess them at £12,000, and upon appeal obtained a close confirmation of his estimate by proof from their own books that the correct charge was rather more than £12,000 as the average of the three preceding years. To take another example from a different part of the kingdom: A. B. some years ago returned £15,000 as his assessable income, but the amount was raised by the commissioners to £20,000, which he paid. The following year he made no return, and the assessment of the commissioners was again £20,000, but the surveyor charged him on £45,000, the duty on which was paid without appeal. Again, the next year he made no return, and again the charge was raised by the surveyor, who raised him to £60,000, with the same result as in the former instance."— Yet official assessment is an arbitrary assessment. All income is not derived from the same source, but from many; and some of these are of an intangible nature, and will escape the closest official scrutiny, while others are not easily appreciated. So that such assessment is at best guesswork. Nor is the situation improved by introducing any artificial measure of income, such as the size of the house, the number of horses, or of servants, the rental paid for a farm, etc., etc. Expenditure is no true gauge of income, for a man may be induced to spend more than he can reasonably afford, to maintain appearances. But the greatest objection to official assessments is that they require inquisitorial proceedings which are more suited to a despotic than to a liberal and enlightened government; they require a constant interference with the affairs of individuals, and while they often fail to discover what it is their object to learn, they serve to keep up a feeling of irritation and discontent. The tax is regarded as obnoxious chiefly on the ground that it is inquisitorial. — An objection that is urged against the English income tax, by which all incomes above a certain limit are taxed at the same rate without regard to the sources from which they are derived, is, that no distinction is made between transient and permanent incomes. It is urged that professional incomes, which are in their nature precarious, depending upon the continuance of the life, health, or other physical or mental quality of the receiver, should be taxed at a lower rate than permanent incomes, such as are derived from land or from investments in the public funds. This objection is a just one, but in order to remedy it such a complex and cumbrous scale of duties and exemptions must be introduced as to create obstacles as great, if not greater, than those now existing. A uniform rate is easily collected, and this question of administration is an important one. The inequality caused by taxing both classes of income alike would be somewhat diminished were the income tax made permanent. Thus, to take the example of Mr. Fawcett, the sum of £10,000 will purchase a life annuity of £600 or an annuity of £300 forever, supposing the rate of interest to be 3 per cent. "But if the income tax were permanently fixed at the uniform rate of 5 per cent., A's £10,000 would have to pay an income tax of £15 a year forever, because he is supposed to invest it in the form of a permanent annuity. B's £10,000, however, would only have to pay £30 a year during his lifetime, because his annuity of £600 will

cease at his death. If A and B wished to redeem the income tax on the £10,000 they respectively possess, they would each have to pay exactly the same sum to the government; for the present value of an annuity of £30 to be continued during B's lifetime must be equivalent in value to a permanent annuity of £15, because it has been assumed that the present value of these annuities is equal." And he goes on to show that if the tax was not permanent an injustice would be done to A were temporary incomes taxed at a lower rate than permanent incomes. But these conditions are not fulfilled. The English income tax is not a permanent one, but is renewed from time to time, although it might, for all practical purposes, be regarded as a permanent tax; because while it has ever been considered a temporary tax, to be maintained only so long as it is necessary, yet the state of the British revenues is such as to preclude the possibility of its suppression for some time yet to come. — The justice of exempting small incomes from the income tax can not be questioned, for, as has been said, this tax is in modern systems of finance intended to supplement indirect taxation, which falls most heavily on small incomes, and this object would be defeated were additional burdens imposed through its agency on the incomes of the lower classes. But at what point to limit the exemption is a difficult and important question to decide, because on the correct solution of this question depend the incidence of the tax and its productiveness. A sum sufficient to obtain the necessaries of life should be exempted, for otherwise the condition of the people would deteriorate, a recourse to a lower standard of living being enforced. But any further exemption must be decided by the amount of taxes to be levied, the state of public opinion respecting taxation, and, above all, the economical condition of the people. Thus, in England the limit of taxable income may be fixed higher than in France; for in the former country the wealth is massed chiefly in a comparatively few hands, and the incomes of a large portion of the people average much higher than in France, where wealth is more evenly distributed among the population and the average income is comparatively small. The exemption of all incomes below £150 is estimated to exempt from taxation one-half of the taxable income in England; under a like exemption three-fourths of the taxable income of France would escape taxation. On the other hand, when the limit is fixed too high the tax becomes a farce. Thus, in the United States in 1868 when incomes below $1,000 were exempt, the number of persons who paid the tax was 259,385; but when the amount of exemption was raised to $2,000, the number of taxable persons was reduced to 116,000, and subsequently fell to 71,000 out of a total population of about 40,000,000. Experience, therefore, demonstrates that an exemption in the United States of $2,000 of income will exempt more than nine-tenths of the entire property of the country, and more than ninety-nine-hundredths of the property owners from the tax. The results proved that the limit was absurdly high. — In England not only are all incomes below £150 exempt, but a deduction of £120 is made on all incomes between £150 and £400, so that an income of £400 is taxed only on £280. But if some inequalities are abolished by this generous allowance, others as glaring and unjust are created. Thus, an income of £150 will pay the full tax, but an income of a few shillings less will be exempt. Again, an income of £400 is taxed on £280 only, but one of £401 is taxed at its full value. To correct this manifest injustice Mr. Mill proposed to determine the limit of exemption, fixing it at as low an amount as possible, to be determined as nearly as may be by the bare cost of subsistence, and to deduct this sum from all incomes whatever, only taxing the remainder. Thus, if £100 was selected as the limit, then an income of £350 would be taxed on £250; one of £500 on £400, etc., etc. This plan, which was actually in operation in this country, does away with whatever injustice is incident to the system of allowing a deduction from certain incomes as just described. — An income tax can be levied with profit only in a country where capital is abundant, manufactures and commerce well developed and progressive, and where there is a marked tendency for the national wealth to increase. The distribution of wealth in a country affects the rate of the tax and the limit of exemption, both being lower in countries where wealth is evenly distributed and the average income is small. But the lower a nation stands in material wealth and commercial and industrial activity, the less is it fitted for an income tax. Thus, in India there is an immense population, but very little wealth, and an attempt to introduce an income tax in that country signally failed. In the Chittagong district of Bengal, which may be taken to illustrate the operation of this tax, the population numbered 1,127,402 souls. Yet in the whole district only 876 incomes were assessed in 1870–71, as exceeding £50 per annum. The total amount of these 876 incomes was about £100,000, and the amount of income tax realized was £3,161. In the following year the rate was reduced from an average of $3\frac{1}{8}$ per cent. to $1\frac{1}{24}$ per cent., and the minimum of income liable to assessment was raised to £75 per annum; the amount of the tax then realized for 1871–2 was only £809, which probably did not cover the cost of administration. The impossibility of continuing such a tax was soon recognized, and it was abolished. — To return again to the maxim of Adam Smith: "The subjects of every state ought to contribute toward the support of the government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state." Many economists and financiers have believed that to carry out this maxim it is necessary to tax income in proportion to its amount; to frame a scale of rates increasing with

the amount of the income, so that the higher the income the greater in proportion is the tax paid. If, they say, a man with $1,000 income pays a tax of $50, one with $10,000 income should pay, not $500—not at the same rate—but at a higher, say $1,000. But this, apart from the difficulty of framing a scale of rates, would be an extremely vicious method of imposing a tax. For no two persons are circumstanced alike, although both may receive the same income as measured in dollars; for the one may be able to spend all in his personal enjoyments, while the income of the other may be already burdened by necessary charges, which consume a large part of it. To tax these incomes at the same rate would cause hardship and gross injustice; for what is to one a comparatively small contribution, to the other amounts to confiscation. Suppose the amount of tax is tripled every time the income is doubled—a progression that does not appear to be rapid—a point is soon reached where the whole income is absorbed by the tax. Thus:

INCOME.	Tax.	Rate per cent
$ 500	$ 5	1 0
1,000	15	1.50
2,000	45	2 25
4,000	135	3.375
8,000	405	5 0625
16,000	1.215	7 6
32,000	3,645	11 4
64,000	10.935	17.0
128,000	32.805	25 6
256,000	98.415	38 4
512,000	295,245	57.6
1,024,000	885,735	86 5
2,048,000	2,657,205	129 7

Such a tax would discourage all saving and end by driving from the country those with large fortunes unless by fraud they could escape the tax. It is moreover a communistic tax, because it seeks to equalize fortunes by discrediting saving, and in so doing aims at a more general distribution of the wealth of a country. In a country with democratic institutions there is danger that the income tax even when levied as in England at the present time, may be used by the poorer classes as a means of oppressing the richer classes on whom the tax falls, and this tendency has been noted in England by Prof. Fawcett, and in this country by Mr. David A Wells. A graduated or progressive income tax is but a logical sequence of the theory that the state may properly interfere with the distribution of wealth, a theory that rests on purely sentimental grounds, and has no basis in fact or reason. In many of the cantons of Switzerland the tax upon income is made a progressive tax, only a certain portion of the income being taxed, or a graduated scale of rates is framed. Thus, in Zurich incomes of 20,000 francs pay on only one-half of this amount, or on 10,000 francs; incomes of 30,000 francs pay on six-tenths; of 50,000 francs on seven-tenths; of 100,000 francs on eight-tenths, and of 200,000 francs on nine-tenths. But the tax is not levied on a like method in other cantons in which a progressive tax is imposed. (See *Traité de la Science des Finances*, Leroy Beaulieu, vol. i., p. 151.) — HISTORY. In the United States but one tax upon income has been imposed by the federal government, and it arose from the necessities of the government incident to the rebellion. An act of congress of Aug. 5, 1861, authorized an income tax of 3 per cent. on all incomes over $800 per annum, but this law was in the following year superseded by that of July, 1862. Under this act incomes under $5,000 were taxed 5 per cent., with an exemption of $600 and house rent actually paid. Incomes in excess of $5,000 and not in excess of $10,000 were taxed 2½ per cent. in addition, and incomes over $10,000 5 per cent. additional, without any exemptions whatever. Further taxes of 5 per cent. on incomes accruing to Americans residing abroad, and 1½ per cent. on incomes from interest on securities of the United States were imposed, but these expired after 1865 In estimating the income, all other taxes, national, state and local, were first deducted, as well as the $600 exempted as above. In 1864 a special tax of 5 per cent. was imposed on all incomes above $600, as well from banks, railroads and salaries, as from other sources, and produced to the treasury $28,929,312.02. In the same year the income tax was readjusted, and all incomes between $600 and $5,000 were taxed at the rate of 5 per cent.; and incomes above $5,000 at 10 per cent. The revenue obtained from this source reached its highest point in 1866 under these rates. Mr. Fessenden, at that time secretary of the treasury, in his annual report for 1864, suggested that "the income tax should be collected upon all, without exemption. As the law is, it opens the door to innumerable frauds, and in a young and growing country the vast majority of incomes are small, while all participate alike in the blessings of good government. The adoption of a scale, augmenting the rate of taxation upon incomes as they rise in amount, though unequal in one sense, can not be considered oppressive or unjust, inasmuch as the ability to pay increases in much more than arithmetical proportion as the amount of income exceeds the limit of reasonable necessity." Fortunately for the country, at that time burdened with one of the most oppressive systems of taxation ever imposed, neither of the secretary's recommendations were acted upon, and the nation escaped adding to the already long list of its financial and commercial blunders, those of a universal and a graduated or progressive income tax. Although when incomes below $5,000 were taxed at one rate, 5 per cent., those between $5,000 and $10,000 at a somewhat higher rate, 7½ per cent., and finally incomes above $10,000 at 10 per cent., there was a moderate progression, it was not such as is recommended by Say, or like the tax we have described in a previous paragraph.— In 1865 the limit of exemption was raised from $600 to $1,000, being rendered necessary by the great rise in prices consequent upon the onerous

internal and customs duties on commodities and the great depreciation of the currency, and the differential taxes on incomes in excess of $5,000 were repealed. — In 1866 the whole number of persons assessed on the annual list was 460,170. In the following year the full effect of the changes in the amount of exemption and in the rate of the tax began to be felt; and as showing these changes and at the same time as giving a rough indication of the distribution of the wealth in this country, the following table will be instructive:

CLASSES.	Number of persons assessed for income in			
	1867.	1868.	1869.	1870.
Tax $30 or less	101,219	100,558	107,997	112,874
Tax from $30 to $50	68,680	55,949	69,184	68,900
Tax from $50 to $100	40,899	38,957	41,196	40,839
Tax from $100 to $200	46 055	51,188	45,002	44,732
Tax over $200	9,282	7,965	9,464	9,316
Total	266,135	254,617	272,843	276,661

And further as showing the unequal incidence of the tax it may be noted that in 1869 the states of Massachusetts, New York, New Jersey, Pennsylvania, Ohio, Illinois and California, paid three-fourths of the entire income tax collected in that year, although they possessed but 40 per cent. of the assessed property and 40 per cent. of the total population of the country. — The tax was to expire in 1870, but it was renewed, the rate of tax being reduced to 2½ per cent. and the sum allowed to be deducted from each person's gross income was raised to $2,000. Whatever reasons there were for raising the limit of exemption from $600 to $1,000. they did not exist for still further raising it to $2,000, and as if to make the tax a still greater absurdity all state or local taxes paid in the preceding year, and all losses "actually sustained during the year from fires, floods, shipwreck, or that occurred in trade; the amount of interest paid during the year; the amount paid for rent, or labor to cultivate land; the amount paid for rent of premises actually occupied; and the sums expended for the usual and ordinary repairs of such premises," could be deducted before the tax was assessed. The result of such sweeping exemptions and deductions could easily have been foretold. The number of persons assessed for income fell in 1871 to 74,775, and in 1872 to 72,949; while the proceeds of the tax practically hardly afforded revenue sufficient to pay the cost of collection. The tax expired in 1872, not being renewed. It was but a war measure, and it is doubtful if another such tax will be again imposed in this country unless a like necessity arises. The amounts collected from income, including salaries, for each year from 1863 to 1872 are given in the following table:

1863	$ 2,741,858.25	1868	$41,455,598.36
1864	20.294,731 74	1869	34,791,855 84
1865	32,050.017.44	1870	37,775.813.62
1866	72,982,159.03	1871	19,162,650.75
1867	66,014,429.34	1872	14,4 6,861.78

Together with the arrears collected since 1872 the total amount raised from income was $346,911,760 48. — We have purposely omitted to speak of the question of the constitutionality of an income tax as levied under the act of 1864, because the question never came before the supreme court for adjudication, and it would be useless to revive the question now, and the main reasoning on either side will alone be noticed. The supreme court had already decided that according to the constitution direct taxes are only such as fall upon land or upon polls, and the economic definition of a direct tax was thus thrust aside. But it is urged that a tax upon income is in reality a tax upon the property from which the income is derived, and under such a theory a tax upon income derived from land would fall under the constitutional definition of a direct tax as explained by the courts, and should therefore be apportioned among the states according to their population. Moreover internal revenue law seems to recognize the principle that a tax upon income is a tax upon the property from which the income accrues. Thus by section 127 of the act of 1864 a tax was laid on succession to real estate, and such succession was defined to be every such disposition of real estate whereby any person should become entitled to any real estate or the income thereof. Furthermore it is established by statute law in this country that a grant or devise of the income of real estate in perpetuity is a grant or devise of the fee itself In Dobbins *vs.* the Commissioners of Erie County (16 Peters, 435), it was held that a tax upon income or profits of real estate is a direct tax, upon the principle that a tax upon the income of a thing is the same as a tax on the thing itself. And many more cases in which the same principle was recognized could be cited. The tax was however levied and collected, and, although a most unpopular tax and regarded as a fit subject of evasion, was endured so long as congress deemed it necessary to continue it. It is a curious fact that the dissatisfaction against the income tax was most loudly expressed while the $2,000 exemption was in force, or, in other words, while it fell upon the rich alone. — The history of income taxes as practiced by other nations has been often told, and we have space only for a statement of the general principles of these taxes. In England the income tax is rather a collection of different taxes, and, as Mr. Gladstone said in 1853, is more of a code or system of taxation than a single tax. To the bulk of the people, however, it is known in its most obnoxious form as a tax upon ordinary incomes—salaries, professional earnings, profits of trading, etc. Assessments on these are now made under schedule "D," which is the most important of all the five schedules into which this system of taxation is subdivided; for it comprises, in addition to incomes of this private character, the profits of public companies, such as gas and water works, or railways, dividends on foreign and colonial investments, as well as the profits on working mines

and quarries, the rents of fishings and shootings, etc. The next in importance is schedule "A," which comprises incomes from the rent of land and houses, proceeds of tithes, royalties, etc. With this may be classed schedule "B," which embraces the tax payable by occupiers of land, except nursery gardens, the profits on which are assessed, like those of trades and professions, under schedule "D." Schedule "C" regulates the assessment on incomes from the public funds, and schedule "E" that on incomes derived from official appointments, whether in the public service, or in the service of corporate bodies. These duties yielded in the year ending March 31, 1881, the sum of £10,776,000. They are the most elastic of the English taxes. — In Prussia are found two taxes, the *classensteuer* and the *einkommensteuer*, the former reaching only incomes of less than 1,000 thalers. The *einkommensteuer* is assessed in forty classes, and varies from 2¼ to 3 per cent. In Austria the tax is divided into four parts, and varies from 1 to 10 per cent. Its product is but small. In Italy a tax is imposed on all incomes other than that derived from land, and is even more complex than that first levied by the United States. Moreover it is a tax of a very burdensome nature, amounting to no less than 13⅓ per cent on the incomes taxed, although certain allowances and exemptions reduce its burden on incomes of an uncertain nature. Thus, all incomes below 400 lire are exempt, and the tax falls upon only three-eighths of incomes derived from labor alone, and upon one-half of incomes derived from public offices or pensions. The elaborate attempts made to render the incidence of this tax equal have signally failed. Of the 184,000,000 lire collected in 1877, 85,000,000 lire were obtained from incomes derived from state pensions and salaries, interest on the public debt, gains of lotteries, and other forms of income which can not possibly escape the cognizance of the government. The remaining 99,000,000 lire represent what was collected on incomes derived from all sources apart from land, and should represent a very large share of all the private income of the Italian people, and these figures prove to what an extent the tax is evaded. (See *L'Impot sur le Revenu Mobilier en Italie*, by M. Vesséolovsky, St. Petersburg, 1879.) — BIBLIOGRAPHY. *First and Second Reports of the Select Committee on the Income and Property Tax*, London, 1852; Leroy Beaulieu's *Traité de la Science des Finances;* M'Culloch, *Taxation and the Funding System;* Levi, *On Taxation; Reports of the Commissioner of Internal Revenue.*

WORTHINGTON C. FORD.

INDEMNITY IN CASE OF WAR. When a war has desolated a country, leaving destruction and ruin behind it, is there reason for an equalization of the burden of material damage (more or less approximate)? This question would be rarely presented if a country were invaded throughout its entire territory, and all its provinces suffered almost equally; but when only one part of a country has been occupied, while the rest has not seen the enemy, the question of compensation, of a general sharing in the whole amount of damages, naturally arises, and the provinces visited by the scourge present their claims. Claims are made even in districts where all the inhabitants have not suffered equally. Are these claims well founded? Is there cause for compensation, for indemnity, for equalization of damages? We shall examine this briefly. — The question of indemnity in case of war is much more complicated than might be supposed. In the first place, damages inflicted by the national army must be distinguished from those caused by the enemy. The acts attributed to the military authority of the country may have taken place during peace; in that case there is reason for an indemnity, regulated in France, for instance, according to the law of eminent domain (May 3, 1841). In time of war, when the enemy is still at a certain distance and preparations are made to meet him, the decree of Aug. 10, 1853, article 38, admits rather a limited right to indemnity. But in article 39 of the same decree we read the following: "No occupation, no deprivation of use, no demolition or other damage resulting from *an act of war*, and from a measure of defense taken either by a military authority, during the state of siege, or by an army corps or detachment, in presence of the enemy, gives a right to indemnity." This provision does not exist in the decree of July 8, 1791, (as to which see articles 35 to 38.) — What is to be understood by *an act of war?* The law does not define it, but jurisprudence has determined certain cases, the most prominent of which we shall cite. The following have been declared acts of war giving no right to indemnity: the cutting of timber at the order of the commander in-chief to cover the retreat of troops manœuvering in presence of the enemy (council of state, March 26, 1823, Bellamy); the removal of timber by hostile troops, for the use of these troops, by order of the mayors, to satisfy the requisitions of the enemy (Nov. 16, 1825, Schoengrun); the destruction of a house caused by the explosion of a powder magazine by order of French authority in presence of the enemy (March 15, 1826, Dassy). This has always been the rule in France, and in this regard the chief of the executive power was right in appealing to it when he maintained in the discussion of the law, Sept. 6, 1871, that in principle no indemnity was (legally) due French citizens who had suffered from damages inflicted by the invasion, and that at most only assistance was due them. — In the same discussion (session of Aug. 5, 1871, *Journal Officiel* of Aug. 6,) Thiers maintained a different doctrine in relation to damage caused the inhabitants of Paris by the bombardment of May, 1871, during the insurrection of the commune. "And as to those quarters of Paris," said he, "of which you have just spoken, and concerning which you have said that we wish to do nothing for the cottages, while we are about to rebuild the mansions of

the wealthy, in the part of the city which we have attacked. Gentlemen, you have not seen those quarters which you describe so strangely. Where is the mansion of the wealthy? Look for it in those quarters ruined by the bombs and bullets, not of the enemy, but of our own army, of France, of the national right, which strove at all cost to re-establish order, indispensable to the very life of the nation. And do you know what principle created the right in this case? The principle that when a government commits an act intentionally, with a definite will, not by chance, but after reflection, it owes a complete indemnity for the damage which it causes. Read our laws, study the principles of public justice, and you will see this is the distinction always made. "The state never indemnifies for the chances of war, it only indemnifies for voluntary, intentional, foreseen damages of which it is the author"*— We do not know whether jurisprudence is always in accord with the second half of the proposition which we have just cited, but we find it (this second half) excellent; it is not for us to discover whether any one can hold a contrary opinion. Therefore we consider it as established, that acts originating with a national army, damages caused by the order, and in the interests of a country, should be repaired by that country.† We may mention here for a similar reason the law of 10 Vendémiaire, year IV. (Oct. 2, 1795), which makes the French communes responsible in case of riots, etc., and obliges them to indemnify sufferers. — We come now to the cases in which damage was caused by the enemy. In the decisions of the council of state cited above, and the complete sketch of which is before us, no law was quoted; the decision was founded on simple reasoning, or rather on the simple assertion, *nothing is due for acts of war*. Still there is a law of Aug. 11, 1792, (see *Journal Officiel*, 1871, pages 2457 and 2459), and another of 1793 (Aug. 14 and 16), which declare "in the name of the nation that it will *indemnify* all citizens for all losses which they have sustained, or may sustain in consequence of the invasion of the enemy." Later, in 1816, a sum of one hundred millions was in like manner granted to the invaded departments. But whatever the previous jurisprudence, and even legislation, since the law of Sept. 6, 1871, the principle of indemnity is—if not completely, at least partially—adopted, in France, by article 1, which we here quote: "Compensation will be accorded to all who have been subjected during the invasion to contributions of war, requisitions, either in money or kind, fines and material damages." The word compensation is the result of a compromise. The government wished to grant only aid, "relief," without recognizing a right; the deputies demanded an indemnity: the term chosen seemed vague enough to satisfy both parties, but in reality the word compensation is a synonym of indemnity, and has nothing in common with aid The French law of April 7, 1873, is to the same effect, and the principle of national solidarity may be considered established.‡ The following, among others, are the terms employed by Casimir Périer: "I admit also, and I go further, I maintain that it is out of the question to impose the special burden of military contributions and military requisitions in money levied by the enemy, on the invaded departments, on the departments which bore them in addition to all the other misery which they suffered." And further, "I maintain that these are facts affecting the whole nation, and it is impossible to avoid distributing the burden of them over all the national territory" Let us add that Bouffet, rejecting the word aid, said, "The reparation which the invaded departments demand is the reparation of a damage of which the whole state is the cause and for which the whole state is responsible."— There is scarcely any other country except Germany in which the question is important. It can have no importance in England, which is protected against invasion by the waters which wash its shores, and when necessary by its "wooden walls" Germany, on the contrary, has long been the battle ground of European passions, therefore the doctrine of indemnification prevailed there at an early period. We have before us a work published in 1798, at Wurzburg, with the title: Weber (councilor, etc.), *Ueber die Repartition der Kriegsschaden*. (On the distribution of the burden—of damages caused by war—on the entire nation.) This work cites and discusses a great number of earlier publications, and, like the majority of previous authors, concludes in favor of indemnity, resting on the argument of national solidarity. We regret that we can not make numerous extracts from this very interesting work, in which questions are discussed from a legal point of view, and texts or precedents are freely used in their support. Among the different opinions examined is that also which considers acts of war as acts of chance, cases of hazard or superior force, cases which among others the French code declared as not justifying indemnity. (See Civil Code, article 1148, and many others.) But Weber does not admit this argument. Chance, if there is any, consists in this, that one district was visited rather than another, or that such a house or such

* Vattel, book iii., chap. xv., § 232, asks no more than this. He is satisfied with aid since it seems impossible to him to indemnify every one for the damages caused by the chances of war. Grotius, book iii., chap. xx., § 8, recognized the solidarity of the nation.

† The "Times," of Aug. 9, 1871, in giving an account of the above discussion, in a leader, treats the doctrine of national solidarity with reference to acts of war (first part of proposition) as *extravagant theories*, and recalls the fact that, in a similar case, Cavour held analogous language, in 1859, which was approved by the parliament of Turin. For our own part, we can not admit recruiting by lot, and many other institutions which impose sacrifices on some citizens for the advantage of all, unless we rest on the principles of solidarity.

‡ Passy's report will be found in the *Journal Officiel* of the first days of April, 1873.

a field was damaged rather than another, but the fact itself of damage has nothing fortuitous in it. The state desired or allowed the war, and as the damage is the natural or inevitable result thereof, there is nothing unforeseen in it. The states are at war, and it is for them to bear the consequences, and not individuals who are unable to do so. We shall add that if the conflagration caused by lightning, the destruction produced by an earthquake, the ravages occasioned by a flood, are examples of superior force, giving no chance of indemnity, it is because the lightning, the earthquake and the flood are not personalities that may be called to account. But let a cannon ball throw down my garden wall, let a locomotive in running off the track cause me damage, and I shall find some person to summon before the tribunals. — Weber next discusses the law *Aquilia* (Roman law), according to which a damage which I cause in the interests of my own legitimate defense does not make me responsible. Thus, if I destroy my neighbor's house during a fire to keep my own from burning, I am within my rights. In like manner the state may demolish your house, fell your forest, cut up your field, if this is necessary for state defense. But, says Weber (omitting the objections which the principle raises in itself), the law *Aquilia*, which is private law, does not apply to the case in point: it is not a question of law among individuals, but a burden imposed by the state in the interest of all.—There is also the law *Ithodia* This law is found in the French Code of Commerce, article 400, and elsewhere; it declares as a common duty the reparation of all damage happening to a vessel, and more especially the indemnity to be paid to the owner of the merchandise thrown overboard to lighten the ship in danger. The owner of the merchandise bears his part, but the others bear theirs also. The principle is beyond attack, but its formula is perhaps not happy when applied to war. But we are not obliged to stop here, since we have clearer and more applicable modern formulæ. It only remains, in summing up, to cite some of the most recent cases of indemnities, granted to invaded provinces. — In 1866, immediately after the conclusion of peace, the Austrian ministry named (Aug. 3) a commission entrusted with investigating the damages in order to discover their total amount. The word employed is *Schaden-Ersatz*, compensation or indemnity. Still a complete indemnity was not granted. Saxony, by vote of Jan. 17, 1867, seems to have been more generous. In 1871, the German law of June 14 indemnified completely the inhabitants of Alsace-Lorraine. (See the law in the French journals of the last days of June, 1871.) At the same date, June 14, 1871, a commission was appointed at Berlin to fix the indemnity due German shipowners, in consequence of war. In fine, modern law is in favor of indemnity, without, however, imposing on the nation the payment of the whole damage; for the person injured must also bear his share, since he too is a part of the nation.

MAURICE BLOCK.

INDEPENDENCE. "Every nation, as well as every individual, has the right not to allow any other nation to assail its safety or its integrity," says Vattel in his "Treatise on the Law of Nations," in the beginning of the chapter entitled, "On the law of safety, and the effects of the sovereignty and independence of nations." These few words contain the whole secret of the development and the life of nations. Self-preservation and improvement form the two-fold aim of true activity; independence to attain this end is a necessary right. — A nation is a collective being, and all the ideas which we form of its rights, its duties, its action, its end, are derived from our knowledge of the human individual. Like the individual, it must apply itself to the preservation of its own existence, to the care of its interests, and to the development of its faculties. Hence, independence is, for the nation as for the individual, the primary law of its existence, and the first condition of development. If a nation desires to improve its institutions, it must have full liberty to change, if necessary, the basis of its constitution and its form of government. It must be sole and supreme judge upon this point. No power can be allowed to argue against it that the changes which it makes within itself are dangerous examples for its neighbors. Nor can any fault be found with it because it seeks to establish whatever is favorable to its progress. It possesses the right to develop in every sense of the word, and it can be stopped only when it encroaches upon the development of some other nation, and lays itself liable to the charge of hindering it in its natural development. — Together with the right to improve its condition, a nation possesses the right to defend itself. A people has an absolute right to create what establishments it pleases, to develop and organize its forces, to multiply and improve all the means of action at its disposal, army, navy, fortresses, in order to provide for its safety. So long as it does not become aggressive, it is free to act, and if it does not feel itself inviolably guaranteed by the strict enforcement of international legislation, it has a right to provide for its own defense as it sees proper. This right results from the right of self-preservation, and is inseparable from the idea of independence. — A nation may make treaties of peace, friendship, commerce and navigation, as also any alliances it may judge favorable to its interests. But a nation in enriching itself or in fortifying itself by alliances or otherwise, may give umbrage to neighboring nations; wherefore Martens, one of the foremost among modern publicists, has established certain rules of courtesy. According to him, every nation is bound to give satisfactory explanations of all preparations made and all enterprises undertaken with a view to its aggrandizement or security. Its conduct will be still more praiseworthy, if in certain cases it reply in anticipation to the questions which might be asked of it. It certainly would be well to observe these considerations, it being distinctly understood, however, that

they must never constitute either a right of superiority or interference on the one hand, or a duty of condescension or feeling of inferiority on the other. But is it quite certain that these explanations will always constitute a perfect guarantee, or will it not frequently be necessary to await that reprobation with which public opinion more and more severely regards conquest, and which will one day secure to every man the free possession of his home? — The idea of independence excludes the idea of the interference of one nation in the affairs of another; but when this interference is consented to by the other nation which is to profit by it, it is perfectly just and legitimate. In a word, independence guarantees to all nations that none of them shall be impeded in its development, to the end that each one may lend its aid to progress in every direction. This assistance, however, must not exceed what is necessary to procure the relief needed by the nation that is in distress. Vattel thinks that this interference should not go beyond the clear and precise terms of a treaty entered into beforehand. It must never by any means become a source of profit or aggrandizement for the nation which contributes the assistance required. A nation, in fact, has not only rights but also duties; and, to resume the parallel which we established in the beginning of this article between a nation and an individual, we believe that when it does not observe these duties and commits faults or crimes, it should be subjected to the inflictions of the decrees of the same justice in so far as this justice can be exercised when passing from an individual to a collective being. But a distinction must be made between the faults a nation commits outside its own boundaries and those committed at home. In the latter case its independence must be respected like the conscience of an individual. But when it is guilty of offensive acts against other collective beings living around it, then it is necessarily open to their vengeance and their repression. — All nations are equal among themselves, for they all possess the same rights and the same duties. Grotius is of opinion that all states have equal rights, no matter how unequal their strength. Baron de Wolf laid it down as a fundamental maxim that all nations are with respect to one another in a state of independence and natural equality. G. F. de Martens says that between nations as between individuals there is a perfect equality of natural and absolute rights. Equal rights necessarily imply equal duties. In virtue of their equality all nations are entitled to the same regard and respect, and no nation should be exposed to anything which might wound its personality. The independence of each must harmonize with the equality of all, and, in like manner, the independence of all with the equality of each. — Every nation has the right to recognize or to refuse to recognize the government which another nation has adopted, the sovereign whom it has chosen, or the title which this sovereign assumes. But equality exacts that no nation be made to suffer for the changes it may see proper to make in its own state, provided it does not cause detriment to any other nation. — It is customary for a sovereign or his representative when traveling outside his own territory to receive certain honors; but these can not be exacted of a people, who, without any feeling of contempt whatever, do not consider themselves bound to give such tokens of attention; nor of a nation whose manners and constitution forbid too great a deference to crowned heads. An illustration of this latter case might be found in a republic. In Switzerland, for example, honors, particularly military honors, are never accorded to any monarch traversing the territory or sojourning therein. It may, however, happen that the sovereign in question will receive a visit of high courtesy from some members of a cantonal government or from the president of the federal council. The United States follow about the same rule, though they seem to find no difficulty in departing from this custom according to circumstances. — The right of precedence has sometimes caused ruptures between governments and produced wars, because pride, presumption and vanity have often taken the place of a sentiment of equality. When carried to such an extreme, the exactions of rank are at once puerile and cruel. But men are more frequently prompted to action by their rights than they are actuated by a sense of their duty, and hence it is necessary to establish rules and customs in order to prevent contests. Formerly these rules were numerous and often whimsical; but most of them have now fallen into discredit. There are in our time too serious interests to discuss, for nations to insist upon details dictated by vanity.

G. CHAMPSEIX.

INDEPENDENT IN POLITICS. (See PRIMARY ELECTIONS.)

INDEPENDENT TREASURY (IN U. S. HISTORY). — I. Until 1840 the United States government never ventured to assume entire control of its own funds. These were left with the two corporations known as banks of the United States, 1791–1811 and 1816–36 (see BANK CONTROVERSIES, II., III.), and in other years with various state banks selected by the secretary of the treasury. The agreements with the state banks usually provided, 1, that they should receive all moneys collected by federal receivers; 2, that they should pay at sight all drafts from the treasury; 3, that the treasury should maintain in each bank a sum, fixed by agreement in each case, as a permanent deposit, the use of which without interest should repay the bank for its trouble and responsibility. Such agreements were also made with state banks during the existence of a United States bank, but with the additional proviso that the state bank should, on request, transfer to the United States bank, or one of its branches, any money received in excess of the amount of the permanent deposit. These agreements were legal even during the

existence of the second bank of the United States under that clause which directed deposits to be made in the bank or its branches, "unless the secretary of the treasury shall at any time otherwise order and direct." (See DEPOSITS, REMOVAL OF.) The permanent deposits amounted, in 1824, to about $900,000 in twelve banks of the western and southwestern states. They were made for the convenience of the government in localities where there was no branch of the national bank; and Jackson's "removal of the deposits" was an expansion of this temporary provision into a medium for the overthrow of the national bank itself. — The first annual message of President Jackson, in which the first vague menace to the recharter of the bank of the United States was given, suggested the creation of a national bank whose functions and employés should be under the direct control of the treasury department; but this project, under the new system of dismissals from office for political reasons (see DEMOCRATIC PARTY, IV.), would have only needlessly intensified the opposition to the administration, and it was abandoned. Just before the removal of the deposits in 1833, the president had suggested the employment of state banks as depositaries of revenue, and his idea was carried into effect by the act of June 23, 1836. It authorized the secretary of the treasury to select at least one bank in each state and territory, and to order the revenue to be deposited therein. The deposit banks, or "pet banks," as they were commonly called, were to discharge all the duties heretofore performed by the bank of the United States, were to pay in specie, and were not to issue small notes. The surplus revenue was to be "deposited" with the states, nominally as a loan. (See INTERNAL IMPROVEMENTS, II.) — During the whole of Jackson's second term economic changes were taking place, which were hurried by some of the results of his political warfare into a rapid and unhealthy development. The first 1,200 miles of the American railway system had been built, and the steam navigation of western waters had been begun; the number of immigrants reached 275,099 in the years 1831–7, as against 79,741 for the seven years previous; the sales of public lands had increased from $2,329,356.14, in 1830, to $24,877,179.86, in 1836; the payments for public lands gave employment to the notes of countless new banks, with and without capital; and the deposit of this sudden and enormous increase of federal revenue in the pet banks stimulated them also to operations far beyond the limits of their legitimate capital. July 11, 1836, the secretary of the treasury issued his "specie circular," ordering government agents to receive only gold and silver in payment for public lands. This checked the stream of paper in its movement to the west, and turned it back upon the east; and the banks which had issued their notes so lavishly, unable to redeem them, suspended specie payments in May, 1837. The result was the panic of 1837. — II. As the federal government, whose entire resources were on deposit in the pet banks, was included among the creditors to whom payment was refused, President Van Buren, soon after his inauguration, found himself at a loss to defray the government's running expenses, and was compelled to call an extra session of congress for Sept. 4, 1837. His message at the opening of the session declared that the national bank and the state bank systems had both had a fair trial and both had failed, and that the people were now anxious to entirely separate the fiscal concerns of the government from all banking corporations. To this end he suggested that the revenues of the government should be left in the hands of the collecting officers, or assistant treasurers, throughout the country, to be disbursed, transferred, and accounted for to the secretary of the treasury, the fidelity of the agents to be secured by bonds. This was the independent treasury or sub-treasury plan, which had been introduced into the house in 1834, by Gordon, of Virginia, and had then received but 33 votes, only one of these being given by a democrat. President Van Buren now adopted it, against the wish of the great majority of his party, and almost the whole of his single term of office was devoted to the establishment of it. — Congress was nominally democratic in both branches. In the senate there were 33 democrats to 19 whigs (Calhoun being included in the latter), and in the house 125 democrats to 116 whigs. But a part of the democrats (4 in the senate and 14 in the house) called themselves conservatives, and opposed the adoption of the sub-treasury system as an attempt to ruin the state banks by depriving them of the funds of the government; and in the house these conservatives held the balance of power. In the senate Silas Wright, of New York, chairman of the finance committee, reported a sub-treasury bill which, as amended after its reception, prohibited the government agents from receiving anything but gold and silver. This was the realization of the long cherished wish of Benton and other leading democrats, to base the party policy absolutely on "hard money," leaving paper entirely to the credit of state corporations and private citizens. In the states, furthermore, the advanced democrats (see LOCO-FOCO) wished to prohibit charters for any such purpose, and to leave paper entirely to individual credit. The whigs hoped to gain a new national bank out of the confusion; the conservatives merely desired the continuance of government support for the state banks. — The Wright bill passed the senate by a vote of 26 to 20, and was tabled in the house by a vote of 119 to 107; evidently, excluding "pairs," which were just beginning to be recognized in congress, the conservative vote had been decisive in the house. In the first regular session, beginning Dec. 4, 1837, and in the second regular session, beginning Dec. 3, 1838, the same process was repeated, the Wright bill being passed by the senate, and voted down by the house. The only attempts at remedial legislation by this congress were the acts of Oct.

16, 1837, ordering the public moneys to be withdrawn from the deposit banks, and mulcting delinquent banks in interest and damages, and of Oct. 12, 1837, authorizing the issue of $10,000,000 in transferable treasury notes, payable in one year with 6 per cent. interest. The specie circular still controlled the agents of the government, and a two-thirds majority was not available in congress to over-ride the veto which it was known would be laid upon any paper money legislation. All parties were waiting for the country's decision in the congressional elections of 1838, which proved to be the most closely contested in our history (see BROAD SEAL WAR); but, while waiting, the government, which had deposited $37,000,000 with the states, and had claims for $15,000,000 against banks and individuals, came so near insolvency that congress was forced, May 21, 1838, to authorize the issue of fresh treasury notes in place of those canceled. — In the 26th congress, which met Dec. 2, 1839, the nominal control of the house depended on the admission of the New Jersey members, and was given to the democrats by the admission of their contestants. The balance of power, however, was now held by the few sub-treasury whigs, whose importance was recognized by the election of one of their number speaker, supported by the democrats. The conservatives had almost entirely disappeared; only four of them had been re-elected to the new congress, and these had nearly ceased their opposition to the sub-treasury. The Wright bill was again introduced, was debated through the session, passed both houses by votes of 24 to 18 in the senate, and 124 to 107 in the house, and became a law, July 4, 1840, by the signature of the president. It directed rooms, vaults and safes to be provided for the treasury, in which the public money was to be kept; it provided for four receivers general, at New York, Boston, Charleston and St. Louis, and made the United States mint and the branch mint at New Orleans places of deposit; it directed the treasurers of the United States and of the mints, the receivers general, and all other officers charged with the custody of public money, to give proper bonds for its care and for its transfer when ordered by the secretary of the treasury or postmaster general; and enacted that after June 30, 1843, all payments to or by the United States should be in gold and silver exclusively. — The results of the first brief trial of the sub-treasury system, July 4, 1840–Aug. 13, 1841, totally failed to verify the prophecies of the whigs and conservatives. It inflicted no damage upon the state banks, or upon business at large; it did not increase the number of offices at the disposal of the president and his party, or the power of the president over the commercial interests of the country; it laid no "cornerstone of despotism"; its practical operation was much more smooth and successful than might have been anticipated in a civil service already so far debased; and it plainly relieved the government from any except indirect and remote consequences of suspension of specie payments by the banks, and the country from the difficulties and dangers incident to the control of a national bank by a representative body. Its passage opened a hitherto unthought-of door of escape from a national bank so inviting that it would have been foolish for the dominant party not to have availed itself of it, and so convenient, when tried, that it would have been impossible on a fair test to induce the country to retrace its steps. Only the momentum of the whig party proper, acquired by years of struggle for a national bank, compelled its leaders to keep up for a time a contest whose futility they were quick to perceive. The first successful execution of the independent treasury act made a national bank an impossibility with general popular consent, and completed the "divorce of bank and state," for which the president had for three years been exerting all his energy and influence. The result must be accredited mainly to Van Buren; usually regarded as a shuffler and intriguer, he had in the midst of the most wide-spread panic yet known in America, unshrinkingly and openly committed his political future to the then unpopular doctrine of non-interference by government, had forced his party to concur with him, and had finally, after three failures in as many sessions of congress, been successful in establishing the independence of the treasury. — III. The election of Harrison in 1840 was accomplished by a union of all the heterogeneous elements of opposition, and by that double-faced promulgation of different policies for different sections which the democrats imitated with equal success in 1844. (See DEMOCRATIC PARTY, IV.; WHIG PARTY, II.) Nevertheless it brought into the house a majority of whigs whose party training had predetermined them to one purpose, the renewal of the bank of the United States. (See BANK CONTROVERSIES, IV.) To this end the repeal of the independent treasury act was essential, and the repealing act was passed by votes of 29 to 18 in the senate and 134 to 87 in the house, and became law, Aug. 13, 1841. The next congress, 1843–5, although it had a democratic majority in the house, had a sufficient whig majority in the senate to defeat any effort to renew the sub-treasury system. For five years after its repeal, therefore, the treasury was managed practically at the discretion of its secretary, and with no adequate regulation by law. Where depositaries were absolutely necessary the banks of the different states were used, and the secretary of the treasury obtained collateral security for the deposits from such banks as were willing to give it. Polk's election brought in a congress democratic in both branches. The sub-treasury system was again introduced, passed both houses and became law, Aug. 6, 1846. This act was essentially the same as that of July 4, 1840, and has remained in force almost unchanged. The act of Feb. 25, 1863, creating a system of national banks, authorized the secretary of the treasury to

make any of these associations depositaries of public money, except receipts from customs; the original sub-treasury act had provided but seven places of deposit· New York, Boston, Charleston, St. Louis, the mints at Philadelphia and St. Louis, and the treasury at Washington, the first four being under the control of assistant treasurers. (See, in general, BANK CONTROVERSIES; DEPOSITS, REMOVAL OF; DEMOCRATIC PARTY, IV.; WHIG PARTY, II.) — (I.) ALEXANDER JOHNSTON.

INDIA. (See EAST INDIES.)

INDIANA, a state of the American Union, formed mainly from the Virginia cession, and in the north from small strips of the Massachusetts and Connecticut cessions. (See ORDINANCE OF 1787, TERRITORIES, ILLINOIS.) May 7, 1800, the northwest territory was divided, Ohio being made a separate territory, and the remainder erected into the territory of Indiana. In 1805 and 1809 the territories of Illinois and Michigan were set off from Indiana, thus reducing the latter territory to its present limits. — April 19, 1816, an enabling act was passed by congress for the formation of a state government by the people of Indiana territory, the following boundaries being assigned by the act to the new state: "Bounded on the east by the meridian line which forms the western boundary of the state of Ohio; on the south by the river Ohio, from the mouth of the Great Miami river to the mouth of the river Wabash; on the west by a line drawn along the middle of the Wabash, from its mouth to a point where a due north line drawn from the town of Vincennes would last touch the northwestern shore of the said river; and from thence by a due north line until the same shall intersect an east and west line drawn through a point ten miles north of the southern extreme of Lake Michigan; on the north by the said east and west line, until the same shall intersect the first mentioned meridian line which forms the western boundary of the state of Ohio." The state convention met at Corydon, June 10, 1816, ratified the boundaries established in the act of congress, and formed the first constitution of the state of Indiana. It fixed the governor's term of office at three years, but prohibited the holding of the office by one person longer than six years in any term of nine years; provided for a popular vote every twelfth year on the question of calling a convention to revise the constitution; gave the right of suffrage to "white male citizens of the United States, of the age of twenty one years and upward," on one year's residence; prohibited slavery, and provided that no alteration of the constitution should ever introduce slavery into the state, "since the holding of any part of the human creation in slavery or involuntary servitude can only originate in usurpation and tyranny;" prohibited the chartering of any banks in the state, except a state bank and branches; and made Corydon the seat of government until 1825, and until removed by law (as it has since been removed to Indianapolis). The state was admitted by joint resolution, Dec. 11, 1816. A new and more complete constitution was formed by a convention at Indianapolis, Feb. 10, 1851. It provided that no negro or mulatto should have the right of suffrage; changed the governor's term to four years; prohibited local or special legislation in seventeen specified cases; provided for a general banking law; prohibited the entrance of any negro or mulatto to the state; and made the employment of such negroes or mulattoes, or the encouragement of their immigration, a punishable offense. The last named provision was decided by the supreme court of the state, in November, 1866, to be repugnant to the constitution of the United States, and invalid. The constitution was ratified by popular vote, and went into effect Nov. 1, 1851. An amendment has since been made to it, repudiating any liability for certain certificates of stock, and prohibiting the state officers from paying them. (See CONSTITUTIONS, STATE.) — Indiana originally had a larger southern population than Illinois. In 1850 this part of the population amounted to near 20 per cent. of the whole, mainly from Virginia, North Carolina and Kentucky. In 1870 the proportion had decreased to less than 10 per cent. This element has apparently had a considerable influence upon the state's political history. A straight line drawn across the middle of the state would separate the southern counties, which have been quite steadily democratic since 1850, from the northern counties, which have been as steadily anti-democratic. — In presidential elections the vote of Indiana until 1860 was cast for democratic candidates, except in 1836 and 1840, when it was cast for Harrison, the whig candidate. In 1860 the state voted for Lincoln, and its vote has always since been given to republican candidates, except in 1876, when it was given to the democratic candidates by a plurality. The result in 1876 was probably due to the popularity of Hendricks, the democratic candidate for the vice-presidency, in his own state, Indiana. — Until

1822 the one representative to which Indiana was entitled was a democrat (William Hendricks), but until 1825 the representatives and United States senators were chosen more for personal than for political reasons. Upon the re-formation of parties in 1825–8 (see DEMOCRATIC PARTY, IV.) the state became democratic and remained so until 1836, with the exception of the congressional district formed from Wayne and the few surrounding counties of the east-central part of the state. This district has been steadily whig, anti Nebraska or republican since 1830. From 1836 until 1842 the senators and nearly all the representatives were whigs, the democrats, however, carrying three southern and two northern districts in 1840. In 1842, eight of the ten representatives were democrats, and two whigs, but from this time the central line of demarcation between the democratic and anti-democratic districts becomes more plainly marked. It was obscured from 1848 until 1854, during the upheaval of the national parties, there being only one whig district in the state, and, on the other hand, in 1854, all but two of the eleven districts gave anti-Nebraska majorities (see REPUBLICAN PARTY); but in 1856 the districts settled to the proportions of six democratic to five republican, the former the southern half and the latter the northern half of the state. In 1858–60, the democrats lost two of their districts, and in 1862 regained them and added two northern districts. In 1864 the republicans regained their two districts and gained four of the southern districts. These were successively regained by the democrats until, in 1870, the parties stood about as they had done in 1856. Since 1870 the current has been slightly in favor of the republicans, until in 1881 the proportion is eight republican to five democratic representatives. In the election of 1878 the republicans carried the extreme southwest, or Posey county, district, which had chosen democratic representatives since 1846. — The state elections have always been closely and stubbornly contested. The governors were democratic until 1857, with the exception of governors Wallace and Bigger, who were whigs. Since 1857 the governors have been republicans, with the exception of governors Hendricks and Williams, who were democrats. The election of 1872, at which the former was chosen, was probably the most closely contested in the history of the state, and Hendricks' election was mainly due to his personal popularity. Out of over 375,000 votes he had but 1,148 majority; the two republican candidates for congressman at large had but 126 and 533 majority respectively. — The political complexion of the legislatures has generally followed that of the congressional representation. The manner of districting the state for representation in the legislature has always been a theme for political declamation, each party accusing the other of gross unfairness. (See GERRYMANDER.) In the years of presidential elections the Indiana state elections, which occur in October, are contested with still more bitterness, because the result is supposed elsewhere to be a foreshadowing of the result in November, and money is largely sent into the state from other states to affect the election. The resulting demoralization induced the legislature, in 1877–8, to prepare an amendment to the constitution transferring the date of the election to November. This, with six other amendments (the principal ones being to prescribe a registration of voters, to strike the word "white" from the constitution, and to allow negroes and mulattoes to vote) was submitted to the people at a special election, April 5, 1880, and all received a heavy majority of the votes cast. A majority of the state supreme court, however, decided that the amendments were not adopted, as they had not received the votes of a majority of all the electors of the state, as shown by other elections. — A peculiar provision of the constitution of 1851, requiring two thirds of each house of the legislature as a quorum to do business, has often been utilized in state politics. In 1856 the state senate had two republican majority, and the house twenty-eight democratic majority. The republican senate, therefore, refused to go into joint ballot to elect United States senators, as the democratic senate had done in a similar case two years before, and claimed that neither house could take part without a quorum. The house and a minority of the senate met in joint convention and elected senators, who were seated by the United States senate after a long contest. In 1863 the republican minority withdrew, and virtually dissolved the legislature, in order to prevent the passage of a bill which deprived the governor of the power to appoint militia officers. In March, 1869, the democratic minority resigned in a body in order to prevent the ratification of the 15th amendment. A special election having been ordered, and a special session of the legislature called in April, the democratic minority, after passing the necessary appropriation bills, again resigned, but the speaker of the house ruled that a quorum was present, and the amendment was ratified. The state supreme court afterward indirectly upheld the validity of the ratification. The next legislature was democratic in both branches, and in February, 1871, the republican minority in the lower house resigned in a body in order to prevent the redistricting of the state and the passage of a resolution declaring the ratification of the 15th amendment null and void. — The most distinguished citizens of Indiana in national politics have been Thos. A. Hendricks, Oliver P. Morton, Schuyler Colfax and Wm. H English. (See those names.) Among the leading names in state politics are those of Jesse D. Bright, democratic United States senator 1845–62, expelled for treason; John W. Davis, democratic representative 1835–7, 1839–41, 1843–7, and speaker of the house 1845–7; Edward A. Hannegan, democratic representative 1833–7, senator 1843–9, and minister to Prussia 1849–50; Benjamin Harrison, republican United States senator 1881–7, William S. Holman, dem-

ocratic representative 1859–65 and 1867–77, "a better critic of appropriation bills than any opposition party ever had before or since"; George W. Julian, one of the founders of the free-soil and republican parties, free-soil candidate for the vice-presidency in 1852, and republican representative 1849–51 and 1861–71; Michael C. Kerr, democratic representative 1865–73 and 1875–6, and speaker of the house; J. E. McDonald, democratic senator 1875–81; Caleb B. Smith, whig representative 1843–9, and secretary of the interior 1861–2 (see ADMINISTRATIONS); Richard W. Thompson, whig representative 1841–3 and 1847–9, and secretary of the navy 1877–81 (see ADMINISTRATIONS); James N. Tyner, republican representative 1869–75, and postmaster general 1877–81 (see ADMINISTRATIONS); and D. W. Voorhees, democratic representative 1861–6 and 1869–73, and senator 1877–85. — The name of Indiana was coined for the territory and state as a memorial of its original inhabitants, the American Indians; the derivation of the popular name of its people, "Hoosiers," is unknown. — GOVERNORS: Jonathan Jennings (1816–22), William Hendricks (1822–5), James B. Ray (1825–31), Noah Noble (1831–7), David Wallace (1837–40), Samuel Bigger (1840–43), James Whitcomb (1843–9), Joseph A. Wright (1849–57), Ashbel P. Willard (1857–61), Henry S. Lane (1861, resigned), Oliver P. Morton (1861–7), Conrad Baker (1867–73), Thomas A. Hendricks (1873–7), James D. Williams (1877–81), Albert T. Porter (1881–5). — See Poore's *Federal and State Constitutions* and *Political Register;* 2 *Stat. at Large,* 58, and 3:289 (for the acts of May 7, 1800, and April 19, 1816); Dillon's *History of Indiana* (to 1816); Chamberlain's *Indiana Gazetteer* (1849); Sutherland's *Biographical Sketches of Members of the State Government* (1861); Drapier's *Brevier Legislative Reports of Indiana;* Scribner's *Indiana Roll of Honor* (1866); Wilson's *Digest* (1867); Barber and Howe's *History of the Western States* (1867); Brown's *History of Indianapolis* (to 1868); Ball's *History of Lake County,* 1834–73; Brown's *State Government* (1875); Goodrich and Tuttle's *History of Indiana* (to 1875); Porter's *West in* 1880, 132. ALEXANDER JOHNSTON.

INDIAN TERRITORY, The, a portion of the public lands of the United States, not organized in preparation for becoming a state, but set aside as a residence for various Indian tribes. — That consistent friend of the Indian, Jefferson, seems to have been the first to form the idea of transferring the Indian tribes across the Mississippi to the new acquisition of Louisiana. (See his proposed Louisiana amendment, CONSTITUTION, III.) This policy was carried out by various Indian treaties thereafter (see CHEROKEE CASE), and by the act of June 30, 1834; all the territory of the United States west of the Mississippi, and not included within Missouri, Louisiana or Arkansas, was to be "taken and deemed to be the Indian country." By another act of the same date a superintendent of Indian affairs was to be appointed, and no one was to trade or settle in the Indian country without his permission or that of one of his agents. The Indian country, or Indian territory, has since been diminished by the erection of various organized territories, until it now comprises the 68,891 square miles, bounded on the north by Kansas, east by Missouri and Arkansas, south by Texas, and west by the 100th meridian. The narrow strip of territory north of Texas, west of the 100th meridian, and east of New Mexico, has never been placed in any organized or unorganized territory by law. — The capital of the Indian territory is Tahlequah, and the population is about 75,000. The leading tribes are the Cherokees (19,000), the Choctaws (16,000), the Creeks (14,000), and the Chickasaws (5,000), but there are a large number of smaller tribes. At the outbreak of the rebellion most of the tribes were divided in sympathy, and many of them formed treaties with the confederate states, but these were readmitted to their former privileges in 1865–6, slavery being abolished among them. In 1870 a convention at Ocmulgee formed a state government, with a governor; a senate composed of one member from each nation, or group of nations, having over 2,000 population; and a house of representatives, elected in the ratio of one representative to 1,000 population. This was rejected through the objections of the smaller tribes to the composition of the senate. Efforts have since been made to organize the Indian country as the territory of Oklahoma, but the Indians object to this step strongly, and congress has not yet taken it. In 1881–2 an organized expedition from southern Kansas, styling itself "the Oklahoma colony," made persistent efforts to settle in the Indian country, in defiance of the ancient prohibitions against settling there without the consent of the government; but they have as yet been intercepted and turned back by the army. The final breaking up of the Indian *imperium in imperio* will probably come through the agency of the treaties made by the Indians in 1866, by which they agreed to grant the right of way through their country to railroads. Interests were thus developed which almost immediately led congress to extend the revenue laws and taxation to all territory "within the bounds of the United States," although the treaties with the Indians guaranteed to them freedom from taxation. The supreme court has upheld the power of congress to thus change the treaties, and their final abrogation is evidently only a question of time. — The act of June 30, 1834, is in 4 *Stat. at Large,* 729; in 2 *Stat. at Large,* 139, 146, will be found a summary of previous Indian acts, and supreme court decisions thereon.

ALEXANDER JOHNSTON.

INDIVIDUAL AND THE RACE, The. How to account for the contrast between the aggregate will (the will of the state) and the single will of individuals, is confessedly one of the most difficult problems of political science. The caprice of individuals is as manifold as their peculiarities,

while the aggregate will can and must indeed be only one. How is it possible to base the aggregate will, which rules in the state, on the multiformity of divergent individual wills? — Rousseau, who explains the state as the agreement of individuals who come together as if by contract, had indeed some idea that the general will was other than the will of all. But he endeavored to evade a problem, which he could not solve, by a fiction, which stands no test. As it is very seldom that all agree, he says, the average will of the majority must pass for the will of all. This is jumping from the frying pan into the fire. In the state we are forced to respect the aggregate will as authority, that is, to respect it in all things as just; and who warrants us that the will of the majority is more just than that of the minority? Almost all great improvements, both in the state and in law, were in the beginning advocated only by single individuals, as were the blessed revelations of religion and the most fruitful discoveries of science, and were understood and accepted by a few enlightened adherents. Only after long and severe struggles with the prejudices, ignorance and crudeness of the multitude did they gradually obtain recognition. If the majority be eventually rational and just, certain it is that it is not so at all times. Therefore to assert that the aggregate will and the will of the majority are the same thing, is to set coarseness above culture, and ignorance above wisdom. — But the unity of the will of the state can be explained in this way still less than the wisdom and justice of the will of the state. The mere counting together and bringing together of many or even all separate wills can never produce one aggregate will. Millions of grains of sand thrown together will make a sand bank, but no whole. A hundred thousand dollars piled one on another is a handsome sum of money, but not a fortune. The vessel, which is baked from the grains of sand, is a whole, and so is a property or an establishment of a hundred thousand dollars a fortune, but only because upon a summing up of the different parts an idea of unity has been added, which has formed them into a whole. In the case of lifeless things this union may come from without. But if the living wills of thousands are to become one will, the unity must be found in themselves. — Hegel had remarked the want of coherence and the contradiction existing between all these separate wills, and perceived that from this confusion no unity of law could be formed. He, unlike Rousseau and Kant, understood the will, which formed the state and the law, to be, not individual caprice, but the general will, grown conscious of itself, really true and rational. But this only tells us how the will of all should be constituted in order to be recognized as the universal will; it does not explain why this universal will is right, rational, or one. — Scarcely a philosopher or jurist has recalled that we have within ourselves the contrast between the aggregate will and the individual will. Only by the double nature of man, from the contrast which we as individuals and as belonging to a race find associated in ourselves, can this two-fold character of the will be explained, but it is completely explained by that. The credit of first recognizing this, and proving the very decisive significance of this contrast for all psychological questions, belongs to Friedrich Rohmer. — We are conscious of our individual will with the same certainty as of our individual thoughts. By wishing something exclusively for myself, something which others do not wish or will not allow me, I am conscious of the opposition between my will and the will of others. Because Cæsar willed to rule Rome, Brutus willed to kill him. It is possible that both wills were only individual, but if one of them was likewise the Roman aggregate will, it is impossible that the other could be so too. — The difference of the two wills is clear enough. But how do we become conscious of the aggregate will? How, except by the opposition which arises in ourselves when we wish something for ourselves, which injures the common nature, of which we, with others, form a part? When a son raises his hand against his father, when a brother wishes to make a slave of his brother, when the thief takes another's property, a voice is audible within him which opposes his individual will. When the indolent man sinks into laziness, and the inactive man buries his talents, he is sensible of an admonition which urges him to activity. In the first case the individual will is checked; in the second it receives an impulse to action. In both cases the inner voice announces the existence of a will, which strives to contend with the will of the individual. Some call this voice the conscience, through which God speaks to man; others call it the conscience, which is immanent in human nature, and which bears testimony to the moral order dwelling in it. At bottom, both mean the same thing; but the former admit that this voice is heard in human feelings, ideas and words; and the latter do not deny that the inner harmony of human nature was given with the creation of man, and is hence in the divine order. A moral spirit lives in the conscience, which is different from our individual spirit. Our individual will is often unjust and irrational; the human will of the conscience is always just and rational. The many individual wills contradict one another; the common will of the conscience is in itself harmonious. The individual will belongs to me alone; the aggregate will, which stirs as conscience, is common to me with my family, my people, and the human race. We can call it the will of the species, or the will of the race, for the species and the race are common to all, and make a unit of all. — In the individual will is a clearer self-consciousness and a higher freedom. In the will of the species the order of nature and instinctive necessity chiefly work. Separate wills give rise to multiformity; the will of the species preserves unity and insures equality. Individual

will lives only in the individual; the will of the species works through the whole species. — In each man the contrast of the race and the individual is found in one person. To the extent that we distinguish and more closely examine both these sides of our being, we obtain great light upon numerous questions. Let us endeavor to establish a few chief principles, although their exhaustive demonstration may not fall within the province of a work like the present one.

RACE.	INDIVIDUAL.
1. The race at first glance is visible in the sameness of the human frame.	1. One's special individuality is, as a peculiar faculty of the mind, concealed in the body.
2. The race is, however, not mere corporeal matter; the organs of the body are at the same time psychic organs. There are also universal instincts of the race, as for instance, the instinct for nourishment, the sexual instinct, the universal moral faculties.conscience, the universal intellectual faculties, human intellect; therefore, in a word, in the race there is also a common spirit.	2. The hidden nature of the mind of the individual strives to become visible, and becomes most clearly so in words and deeds. In exalted and excited moments it is radiated visibly from the body, and its finer or coarser lines impress lasting traces on the body.
3. The human race is originally the work of the creation, but since then has been transmitted from parents to children. The human race rests, therefore, upon propagation through human beings. It preserves its coherence through ancestors and descendants, under the generations, which follow one another. Natural right of inheritance is an effect of race.	3. The individual mind is not the continuation of the parents'. Its production is a new act of creation. Talents and the particular spirit are not transmitted, and an individual may have an entirely different disposition from his parents or his family. Individuals create the new in the world.
4. Race is necessarily bound to the surface of the earth, which nourishes and supports it. It is essentially earthly.	4. The individual mind is not bound to the earth. The whole terrestrial globe is a plaything for it, and it translates itself without trouble to the most distant stars.
5. Race undergoes necessarily a series of transformations. In regular order the different steps of age succeed each other. After youth follows old age, as death follows birth. No one, who lives long, can avoid this evolution, which is independent of him as a power of nature.	5. The individual mind remains essentially the same from childhood to old age. A youthful individual mind remains young, although the hair may be white; while an oldish mind is old, even in childhood. The individual develops himself by his work. His works are like himself.
6. In the external nature of man, in the human race, a complete system of faculties in perfect order is visible. Man is created in relative perfection, a microcosmic picture of the perfection of God.	6 Individual minds are endowed, for the most part, only deficiently and incompletely They are generally only incomplete thoughts of God; single living words, not a complete language. But, with the help of the race, they work themselves up to perfection.
7. Race is similarity. In all essential relations the thousands of millions of men, who have already lived or shall yet live, are endowed with the same physical organs in the same order, and the same psychic powers; and all are subject to the same development with age.	7. Difference is the characteristic quality of the individual. Talents and all special gifts are distributed unequally. Achilles and Thersites, Cæsar and Lucullus, were infinitely different, although as belonging to the same race of people and living in the same period they were classed together
8. Race unites its members in a necessary community. Whoever tries to withdraw himself from this community revolts against nature and breaks the faith which he owes his kind.	8. The individual is first of all interested in himself and has his own life, distinct from other individuals. With free choice he seeks his own companions, and extends his hand of his own free will to them for common work.
9. The human race means the unity of the human kind. The history of the world is the record of the fulfillment of its destiny.	9. Individuals are multiformity. The tasks of individual life promote, but sometimes impede, the progress of human society.
10. The aggregate will has its natural founuation in the community and unity of the race.	10. The individual will is the expression of the individual mind.
11. When the aggregate will rules one-sidedly, the freedom of the individual is lost, and the despotism of the whole prevails: the reciprocal action between the freedom of the individual and the despotism of the whole is unavoidable.	11. When individual will asserts itself, without regard to the aggregate will, then we have anarchy.
In the repose of man the life of the race predominates.	In the work of man the life of the individual is heightened.

— There can be no doubt what relation human law bears to this contrast. Race is visible; and only exteriorly perceptible relations are taken cognizance of, and determined, by the law. In race, psychic and physical elements are combined into unity, and all law is made up of an intellectual-moral and a physico-formal element Race is earthly-human, and so also is law. Race is transmitted from generation to generation, and law also outlasts the life of individuals. Race has an organic growth, and experiences regular transformations; and so the history of law is the organic growth and the regulated transformation of the laws. The life of the race is chiefly a necessity of nature, and the fundamental character of law is the moral necessity of human relations. Race is similarity, community and unity; and these are also the qualities of law. Race is the repose, and the perfection, so to speak, of law and order. — It was, therefore, a great and a fatal error of the philosophy of law to have deduced law and the state from the life of the individual and the will of the individual. Law and the state refer indirectly to individuals, inasmuch as they guarantee them protection in their action, exactly as does the corporeal race serve the mind of the individual as a dwelling place and an instrument. But the law and the state have no measure for what is most individual in the life of the heart and the mind, nor do they exercise any power over that life. Not only is the order of the state based upon the race, and in the first place upon the race to which the people belong, but the life of the state, politics, is the development of

community and unity; therefore of the race. But the life of the individual has also an important share in politics; it is not merely the development of the race There are also certain men who in their capacity of individuals are made for the state, and who give their individual life to the state. All real statesmen are such individuals. Such men are a living embodiment on a large scale of the reciprocal action of the two natures. The state is not exclusively the formation of the common nature of the people or the national race; it is indebted for a part of its existence and its importance to the individual labor of its leaders. — This leads to a further distinction within the race. There is an inborn race and an inculcated race. Whoever wishes to obtain a clear idea of the power of education not only on individual men, but in the formation of whole races or entire classes, has only to consider the influence of Moses on the Jews, of Lycurgus on the Spartans, of the government of Rome on all Roman peoples, or of the clerical education on the whole deportment of the Catholic clergy. Race, which is in the first place a natural idea, is thus changed to an idea of culture. The state gradually and by piecemeal transforms the nation, which is educated by it, through its ever active institutions. The necessity of common nature thus experiences the power of individual freedom. — The most important of the narrower circles of the race, into which the one human race is divided, are: 1. What we, in a psychological meaning of the expression, call the different races of mankind, those great differences which constitute the natural varieties of mankind. How these contrasts, which are apparent in the complexion, the structure of the hair, the form of the skull, and, still more, in the difference in the sensuous and intellectual faculties, and which for thousands of years have remained substantially the same, originated in the first place, whether by different creative acts, or by later workings of nature, has not yet been decided by science. But two things we know. In the first place, we know that this difference in the races of mankind is not a work of human culture, but essentially a product of macrocosmic nature, and it therefore must be accepted as a necessity. In the second place, we know that this very thing is of the highest significance in politics. Only the white race is, in the highest sense of the word, given to the formation of the state; of the white race, again, the Aryan subdivision is here in advance of the Semitic. The black Ethiopian race is evidently assigned to the tutelary training and sway of the Aryan and Semitic races. Only the yellow Mongolian race and perhaps also in other times the red (Indian) race have brought themselves to a real civilization of their own, and by themselves have developed a state, relatively speaking. 2. Races which form nations and peoples are essentially a product of human history; and human history itself is the result of the cooperation of human freedom, a natural necessity and fate. A mere glance can distinguish between the Englishman and the Frenchman, the Italian and the German, although the European culture of to day, at least in the educated classes, has effaced and destroyed a multitude of the old differences. More important than the difference in national traits, the shades of which can hardly be depicted in language, is the race contrast in national character and spirit, which chiefly determines political life. The manly pride of the Englishman is a characteristic of race, like the love of fame of the Frenchman, the calculation of the Dutchman, the philosophical nature of the German, the craftiness of the Slave, and the deceit of the Italian. The peculiarity of nations is their race. 3. Within the nation, the race of single tribes of people is modified, as among the people that of estates and classes is. 4. The family forms the narrowest circle of race. Whoever compares the family portraits of the Hapsburgs or the Bourbons for hundreds of years, will be surprised at the energy and tenacity with which nature so long held fast a fixed family character. The very same thing is repeated in families of the middle class. With family traits are also transmitted a definite family character and family spirit. The mental side of the race of families is therefore no less worthy of attention than the physical. — All these races together, of the family, of the nation, and of mankind, form the animated instrument, which the individual living therein uses during his earthly life. The race serves him; but it demands in return also from the ruling individual, respect for the conditions of its life, and due regard for its limited faculties. Happy, the intellectually powerful individual, who has at the same time received a strong and enduring race as an inheritance. Unhappy, the man in whom race and individual struggle with each other in continual dissension. So, happy is the state, whose race of people is guided by statesmen, whose individual nature is the loftiest expression of their race; and miserable is the state, whose rulers are not worthy of the better race.

BLUNTSCHLI.

A. D. HALL, *Tr.*

INDIVIDUALITY. This word suggests a problem which our age is compelled to propound if not to solve, namely, the respective parts which should be assigned to the individual, to the state and to society. This problem has undoubtedly existed from the very beginning of civilization, but only in a latent state. The three interests, when confronted with one another, have not been slow to conflict, each of them exhibiting considerable strength and corresponding with some one of the human passions: egoism in the individual, affection in society, ambition in the state. — For the harmonious development of humanity it is necessary that no one of these forces should destroy the others. This necessity has at all times been instinctively felt, but it is only in our day that men have become conscious of it. So also is it only in our day that the problem has

been formally propounded, and the attempt been made to bring direct influence to bear upon its solution. — As Lapalisse would say, it is better to understand the problem clearly than to guess at it blindly. However, we are tempted to believe that a clear understanding of the problem will render its solution all the more difficult. In fact, an interest which is conscious of its own legitimateness is much less disposed to make concessions than a mere tendency whose action we feel perhaps while disproving it. — But it is rare to find men such perfect masters of their inclinations that their reason is not affected by them. And was reason ever found wanting in arguments to serve human passions? Hence it follows that a passionate man is apt to become a more exclusive individualist, socialist or adherent of the government than one of a different disposition. — What we have just given expression to, is merely an apprehension; but by consulting certain famous works from the "Leviathan" of Hobbes to the "Icarie" of Cabet, it will be found that this apprehension is not entirely without foundation. However this may be, let us endeavor, if not to define the part of the individual, in relation to society and the state, at least to collect the principal elements of a definition. — The individual can, strictly speaking, exist without society, but he could not improve without it. It is society that makes of man "a two-legged animal without feathers." Nature likewise has endowed man not only with all the selfish inclinations which constitute his instinct of self-preservation, but also with the affection which attracts him toward his like. But affection is often weaker than egoism; in other words, interest often prevails over morality; this is unfortunate, but experience proves that it is true. The élite of men endeavor first of all to strengthen society, and the more brutal and ignorant nations are, the more ingeniously the eminent minds of the period try to increase social tendencies and forces. — Among the manifestations of this tendency, we will mention, in the economic order, art and trade organizations and castes, and in the spiritual order the rule of the church. But at a given moment a part of society becomes too large, the various institutions which were intended to protect it separate from it and form themselves into individual establishments which possess a collective egoism; and a reaction becoming both necessary and inevitable, the part of the individual increases. The force of this reaction spent, we are now no longer over passionate, and it will be possible for us to examine the question coolly. — *Mens sana in corpore sano.* In like manner society is sound when the individual is not corrupt. Man, like water, becomes corrupt by stagnation. Advancement and *progress* are what the body needs as well as the mind. Man, if his faculties have not been compromised by domestic education, or by social and political influences, is naturally progressive: an invincible curiosity urges him to acquire knowledge; an insatiable avidity prompts him to appropriate to himself all that he possibly can. When we build air-castles, do we not begin our dreams with the most modest desires, and behold them increase before our eyes until they surpass the bounds of the marvellous? — Such is man And we should congratulate ourselves that he is such. Without this stimulant how would our will overcome the inertia which characterizes the purely material part of our being, the clay of which we are made? how would we overcome the pain which labor causes? But, without labor, there can be no progress. Hence it follows, that the individual, in order to prosper, must have the fullest possible liberty to work, materially and intellectually. It would not be at all difficult for us to deduce from this proposition the necessity of enjoying all the political, religious, civil and other liberties which this age so energetically claims. But the developments would oblige us to repeat what has already been said elsewhere. — Society should therefore restrain the individual as little as possible, and ask of him only such sacrifices as are indispensably necessary. This is, at bottom, really to the interest of society. In restraining man's inclination to injure his neighbor or to appropriate the fruit of his labor, society protects the weak, without really giving the strong any reason to complain. It teaches him so to direct his efforts that humanity will profit by them, either against his evil passions, or against the brute forces of nature. The object of society is *par excellence* the moral and intel lectual culture of man. To it we owe the development of our sentiments of affection, as well as all our scientific discoveries. Without society there can be no morality, and without morality man would become the most relentless and formidable enemy of his fellow-man. — From these propositions one might be led to infer that society should take precedence of the individual, just as the mind rules the body. We willingly admit this formula, for the very reason that it is vague. In these matters it is impossible to be very precise. But we must be on our guard against the abuse which may be made of it to oppress the individual. It must ever be borne in mind that the individual is the raw material of society, and that whatever is injurious to one is injurious to the other. In like manner, the thought is assuredly infinitely more precious than the brain in which it is elaborated, no one knows how; but be careful not to injure the brain, if you would preserve the thought. — The *individualistic* and social tendencies of men, when left to themselves, are often the first to prevail. We have already said that egoism is stronger than affection. It was necessary that some institution should come to the aid of society, and this institution was found in the state. In fact, many states are formed by means of which morality does not approve, but time purifies almost as much as fire; and in a word, the state has become the frame-work of society, and to a certain extent the body in which it has become incarnate. — The state was not slow to constitute itself the arm of society. If it had

stopped with the fulfillment of this task, all would have been well. But the more society became incarnate in the state, the more the state became incarnate in men, and these men, say what we will, have not always been the élite of our species. If not their personal interests, at least their views and opinions always exerted more or less influence over their public acts, and as they had the power, they circumscribed the liberty of the individual, first for the greater good of society, then for that of the state, and finally for his own benefit: some of them would willingly have made man a mere automaton. Did they not oblige him to believe what the authorities believed, to work according to methods prescribed by law, to adapt his clothing and diet to rules, to retire at sound of the curfew bell, and not to take a step except in official leading strings? — It is against these exaggerated pretensions that we contend. Let us give to society and to the state what belong to them, but let us maintain the rights of the individual. We are ready to make every possible sacrifice for society and for the state: we will open our purses, we will shed our blood, we will restrain our passions for them; but in return, leave us the right to use and abuse our individuality. We wish to belong to ourselves; protect us against others; it is each one's own duty to protect himself against himself. Are we not responsible agents? — We will not insist any further; but will merely propound our theory, and demonstrate how it can be applied in a very few words. Whatever belongs exclusively to the domain of individual interest, should be left entirely free. Society should use only moral force; public opinion and human respect are, besides, powers of the first order. The duty of the state is to watch over the general interests of the nation, political, legal and moral; and as to the province of economy, it should occupy itself only with things that are beyond the power of the individual, or which the individual could not reach without its assistance; this does not clash with its duty to maintain order and respect for morality, and to protect the weak. MAURICE BLOCK.

INDUSTRIAL ARBITRATION AND CONCILIATION is the name given to certain methods of preventing labor disputes or settling them when they arise, by their submission to the decision of umpires or judges, or by conferences between the parties to the dispute or their authorized representatives. — Though the terms arbitration and conciliation are jointly used to name this system, and though in many instances, in recent years, the best results came from their joint operation, yet they are by no means the same, though having the same object in view. Arbitration implies a more or less formal hearing of the matter in dispute before an umpire or umpires, with a formal decision or award which the parties are legally or morally bound to accept. Under conciliation there is no umpire, nor any power lodged with any one or more persons to make a binding award. Any decision arrived at is the result of conferences, and is of the nature of an agreement. As in arbitration, there are a hearing and discussion of the questions at issue, but usually very informal. The result of arbitration partakes of the nature of a binding judgment; of conciliation, of a mutual agreement. — In their origin and modes of working, arbitration and conciliation are either, 1, *Legal*, that is, established and operated under statute law with its sanctions and power for enforcing awards; or, 2, *Voluntary*, that is, established and operated by mutual agreement. The submission of disputes under legal arbitration and conciliation is either, 1, *Compulsory*, that is, the question must be submitted for decision upon the application of either party; or, 2, *Voluntary*, that is, it can be submitted by mutual agreement. In either case, while there may be a choice as to the submission of the dispute, yet when so submitted the decision is binding upon both parties, and can, so far as its character permits, be legally enforced. Of course, the submission of questions to voluntary arbitration and conciliation is always voluntary, and the awards are only morally binding and can not be legally enforced. — The method of compulsory arbitration and conciliation, under the forms and sanctions of law, which has existed in France and Belgium since early in the present century, and which in the former country succeeded to some of the powers of determining trade and labor disputes possessed by the ancient trade guilds until they were abolished in 1791, is treated of under the title CONSEILS DES PRUD'-HOMMES, which see. The only other country in which arbitration and conciliation has been employed to any considerable extent is England, though the forms and methods used differ materially from the French and Belgian. In treating of English arbitration and conciliation it will be most convenient to consider its history and methods under two heads, Legal and Voluntary. — I. *Legal Arbitration and Conciliation in England.* Under the Elizabethan statutes concerning labor which codified many of the rules and regulations existing for centuries among the English craft-guilds, the assessment of wages and settlement of disputes between masters and apprentices, as well as the protection of the latter, were placed entirely in the hands of magistrates. Under the decisions of the courts these statutes were only applicable to the trades existing at the time of their passage, and to these only in certain localities. During succeeding reigns these statutes were modified and enlarged. New industries were included in their scope and additional provisions and statutes enacted providing various means for the settlement of labor disputes, gradually taking from the magistrates their arbitrating power and developing the idea of arbitration by chosen or appointed referees. In 1824 all these acts were consolidated and replaced by that of the 5 Geo. IV., cap. 96, entitled "An act to consolidate and amend the laws relative to the arbitration of disputes between masters and work-

men." This act, which was one of the outcomes of the investigation of the operation of the labor laws by a committee of the house of commons, was evidently modeled after the French law establishing conseils des prud'hommes, but adapted to the different character of English industry and institutions. In it provision is made for the compulsory submission to arbitration, upon the request of either party to the same, of disputes arising between employer and employed in certain specified trades and upon certain subjects, which are also specified in the act. The justice of the peace, before whom the case is brought, or arbitrators elected by a board, composed equally of employers and employed, nominated by the justice, hear and determine the dispute; or any other method that may be mutually agreed upon by the disputants can be adopted; but it is carefully provided that "nothing in this act contained shall authorize any justice or justices acting as hereinafter mentioned to establish a rate of wages or prices of labor or workmanship at which the workman shall in future be paid, unless with the mutual consent of both masters and workmen." The awards under this act could be enforced by legal processes. Though this act is still in full force in England, it has rarely, if ever, been used.—Shortly after the passage of this act voluntary boards of arbitration and conciliation were introduced into some of the industries of England. In addition to the formal arbitration of existing disputes contemplated in the act of 1824, these boards considered and fixed future rates of wages, and also provided for conciliation committees, whose province was to adjust differences between employers and employed by mutual good offices without a formal hearing and award. In 1867 these boards had become so numerous and successful that an attempt was made to give them a legal basis, if they so chose, by the passage of the 30 and 31 Vict, cap 105, commonly called Lord St. Leonards' Act. This act is entitled "An act to establish equitable councils of conciliation to adjust differences between masters and workmen." It provides for the formation of a council of conciliation under authority of the home secretary, upon the joint petition of the masters and workmen of any particular trade working in the same locality. It also specifies the method of election of this council, the qualifications of electors, and other matters necessary to its proceedings. The council is to hear all differences between masters and workmen, as set forth in the act of 1824, that may be submitted to them by both parties. The award is to be final and conclusive, and may be enforced by proceedings of distress, sale or imprisonment, as provided in the recited acts. It is, however, specially provided that "nothing in this act contained shall authorize the said council to establish a rate of wages, or price of labor, or workmanship, at which the workman shall in future be paid." The quorum of the council is to consist of three members, but a committee called the committee of conciliation, appointed by the council, and consisting of one master and one workman, shall endeavor to reconcile all differences in the first instance. The chairman is to be unconnected with trade, and has a casting voice. No counsel, solicitors or attorneys are to be heard before the council or committee without the consent of both parties — In both of these acts especial care is taken to provide against the fixing of future rates of wages—one of the most prolific sources of dispute. This was a serious defect. Accordingly, in 1872 an act was passed, the uses of which, briefly stated, are three, viz.: 1. To provide the most simple machinery for a binding submission to arbitration, and for the proceedings therein. 2. To extend facilities of arbitration to questions of wages, hours, and other conditions of labor, and also to all the numerous and important matters which may otherwise have to be determined by justices under the provisions of the master and servant act, 1867. 3. To provide for submission to arbitration of future disputes by anticipation, without waiting until the time when a dispute has actually arisen, and the parties are too much excited to agree upon arbitrators. These acts have been of but little practical value. In their best features the recent ones have followed, not preceded, the voluntary practice of arbitration and conciliation, and they have only sought to give the forms and sanctions of law to a practice that was successfully in force without such forms and sanctions. If the same (if not better) results can be attained without an appeal to law, the English character is such that it will always prefer the non-legal to the legal. — II. *Voluntary Arbitration and Conciliation in England.* Prior to 1860 there had been in England frequent settlements of labor disputes by their voluntary submission to boards of arbitration and conciliation. These had attracted but little attention, however, and the system was making little or no progress. In this year, through the efforts of Mr. A. J. Mundella, the first permanent or continuous board of arbitration and conciliation in England was established in the hosiery and glove trade at Nottingham. This was soon followed, though without any knowledge of the existence of the Nottingham board, by the establishment of a board in the Wolverhampton building trades, through the efforts of Mr. Rupert Kettle, who has since been knighted for his services in behalf of this system. Boards were soon formed in the manufactured iron trade, and in the coal and other trades, and for nearly twenty years many labor disputes and the rates of wages for many thousands of workmen have been settled by these boards without strikes or lockouts. These boards are purely voluntary. They have no sanction of law—no legal existence. There is no forced submission of disputes, nor is there any power except a man's sense of honor, public opinion, and the aggregate honor of the trades unions or the employers' associations to enforce the acceptance of the awards; and to the honor

of the parties involved be it said, that except in a very few isolated and unimportant cases, these have been found sufficient. — The boards are made up of an equal number of employers and employed, each class electing its own representatives. In some boards each establishment has a representative of each class, as in the north of England iron trade. In other cases groups of establishments elect the members, as in the lace trade of Nottingham. The officers of the boards are generally a president and a vice-president, one an employer and the other an employé, and two secretaries, one for each class. The two classes have equal influence and an equal vote on all questions. Meetings are held monthly, quarterly or less frequently, at which all subjects at issue are discussed and settled, if possible. In all of these boards there is a provision for settling minor disputes by conciliation without convening the entire board. Failing a settlement in this way, however, the dispute is referred to the board, when it is generally adjusted, unless it is a subject of some moment. Broader questions, those that affect the trade of an entire district, or of a class, are in the first instance generally referred to the board, and, in case the board can not agree, to an umpire. In the Nottingham board there is no umpire, the board deciding all questions. This referee or umpire is in some cases a regularly elected officer of the board—a standing umpire or referee, as he is often termed—or he may be chosen for the decision of a particular question. His decision is final. The members of the board are clothed by their constituents with plenary powers. The expenses are met equally by each class. The course of proceedings before the board is very simple. In case of a claim for an advance in wages, for example, the employés' representatives submit, through their secretary, a formal statement setting forth the reasons for the demand, such as an increase in the demand for the goods manufactured and in the selling price for the same, increased demand for labor, or higher prices paid in other districts manufacturing similar goods. The representatives of the employers submit a formal statement in reply, stating their reasons for refusing the demand. With these statements before them the justice and advisability of the demand are discussed by the members. The proceedings are without ceremony. No valuable time is wasted discussing parliamentary rules. Statements are made, and questioned or impeached. Proofs are demanded and furnished. The circumstances surrounding the market and the trade are canvassed, estimates compared, statistics set forth, and the strength of competition measured. As the outcome of all this, a result is generally reached that, if not entirely satisfactory to one or the other party, is accepted as preferable to a strike or lockout. — Arbitration and conciliation has not been generally adopted in England as a means of settling labor disputes. In many trades it has prevailed through a series of years and then been abandoned and the method of strikes and lockouts substituted; but in those trades in which it has been most thoroughly and systematically used during the time it prevailed, strikes and lockouts were almost unknown. One great advantage of these boards is, that they form a market where labor and capital can come together and in a friendly spirit fix what is "a fair price for a fair day's work." Judge Kettle admirably expresses this when he says, "I verily believe that, without limiting the influence of fair competition, boards of arbitration, properly worked, afford the best means of fixing the market price of a fair day's work." They also have served to bring employer and employé into closer relations. Under their action a most friendly feeling has taken the place of hostility, and confidence and mutual respect have been inspired where formerly all was suspicion and hatred. The changed relations of employer and employed have been recognized. They have met around the same table as equals, and out of all this have come juster and truer views of their mutual rights and duties. — For further and more detailed information on this subject consult *Industrial Conciliation*, by Henry Crompton, London, 1876; *Strikes and Arbitration*, by Rupert Kettle, London, 1867; *Masters and Men*, by Rupert Kettle, London, 1871; *Report of the Trades Union Committee of the British Social Science Association*, London, 1860; *Report on the Practical Operations of Arbitration and Conciliation in the Settlement of Difficulties between Employers and Employés in England*, by Jos. D. Weeks, Harrisburg, Pa., 1879; *Industrial Arbitration and Conciliation in New York, Ohio and Pennsylvania*, by Jos. D. Weeks, Boston, 1881.

INDUSTRIAL EXPOSITIONS. (See Expositions)

INDUSTRY. I. Definition of the Word; Explanation of the Subject. The meaning of this word, at first quite restricted, has gradually extended, in proportion as the importance of the phenomena to which it relates and the connection of the various labors of man were better understood. It may be recognized, however, as having at present three distinct acceptations. — In common language, the word *industry* most frequently means nothing more than manufacturing industry, whose special object it is to transform, in the working, the raw materials furnished by agriculture or mining. We usually say, for example, *commerce* and *industry*, when we wish to distinguish the shop from the workshop, the store from the factory. We also say *agriculture* and *industry* when we wish to compare farming with the activity of cities. This popular acceptation is moreover the one which long prevailed, and which still prevails quite frequently in official language and law. — Nevertheless, a broader meaning is sometimes given, in ordinary speech, to the word *industry*. It is used in a general way

to describe all material labors, agricultural as well as manufacturing or commercial, in distinction from those which appear to have a more elevated character, such as the labors of scholars, artists, public functionaries, etc. In this case, industry forms in a certain way an antithesis to all that is embraced under the term liberal professions. We say, for instance, that a man begins an industry when he becomes an agriculturist, a manufacturer or a merchant, and that he abandons industry, when he exchanges one of these occupations for that of an artist, an advocate, a physician or a public functionary. This interpretation, like the first, has gone into official language and law, in which the restricted meaning which we have just mentioned, or the broader one to which we call attention, is given to the word *industry* according as it is desired to express one sense or the other. — Though neither of these acceptations of the word belongs really to economic language, for the reason that each one of them seems to create an absolute separation between labors which are only distinguished by differences of kind or species, still they are both found in the works of the principal economists. Adam Smith uses no other, and they appear frequently enough in the writings of his successors. It is difficult, moreover, to reject either of them absolutely, since they are sanctioned by use, and there is perhaps no inconvenience in adopting them sometimes, provided that care be taken clearly to define their application. But we must hasten to say that, in proportion as the field of economic science extended, while being cleared from obscurity, in proportion as the resemblances between human labors as well as the force of the ties which connect them were more clearly explained, the necessity was felt of giving a broader meaning to the word. The distinction so frequently established between the industrial arts and the professions called liberal, seems false or empty, at least when taken in an absolute sense. It was understood that these labors, no matter how different they may be in their processes and in their relations to their immediate object, are connected, bound together, lend each other a mutual support; that they are governed by the same laws, and lead in reality to the same ends; that there is, consequently, a reason to include them under a common designation. In this way, by the natural movement of economic studies, men came, gradually, to include under the general name of industry, all labors, of whatever nature, which contribute directly or indirectly to satisfy the wants of man. — So that, in genuine economic language, industry is human labor, without distinction of kind; labor considered in the infinite variety of its applications. The word industry would even be the exact synonym of labor, were it not necessary to recognize for it a higher meaning in some respects. But, while we can scarcely understand by the term labor, only the exercise pure and simple of the physical forces, or the intellectual faculties of man, we must include under the term industry the employment of these same forces, these same faculties, with all the social combinations which increase their power, and the concurrence of all the physical agents which favor their action. It is, in one word, labor; but labor raised, if it be permitted to say so, to a higher power, both by the agency and combination of individual forces, and the aid of auxiliary agents which man has been able to gather around himself. — Considered from this broad and general point of view, industry is, as we shall see in the article POLITICAL ECONOMY, the real object of the investigations of economic science, which studies its organization and explains its laws. By taking it up in this way we are evidently relieved from exalting its importance. We have no need of dwelling on those commonplace considerations which are usually brought forward to extol its advantages and merits; considerations which to our thinking are always of meagre fitness, since they lower what they pretend to exalt, and which would be particularly out of place here. Industry, as we look upon it, is not a secondary fact seeking its place; it is the active life of man; it is, in some respects, the man altogether. When addressing men there is no need of wasting eloquence to heighten the importance of such a fact. — But if we are freed from insisting on this point, we have another task to fulfill, that of showing at a rough estimate how industry is organized as a whole; to present a miniature picture of this organization, and indicate at least its principal features. This is the place to group and collect the general phenomena presented to us in the field of industry, and which form the ordinary text of economic studies. It is necessary to show, as far as is possible in a summary analysis, how these phenomena are arranged and connected, in order to point out the place which each one of them occupies in the industrial order; this is the best way of showing, at the same time, the extent of the field which economic science must cover. — To attain this object successfully, it is well understood that what we have to consider is industry as it exists, such as civilization has made it, that is to say, with all the organic elements developed in it by time. Still, as industry, considered with reference to the organization of the labors which it embraces, is an essentially progressive phenomenon, which, though subject to certain invariable laws derived from the nature of man itself, is built up in a gradual and progressive manner; since it begins in a rude state and rises gradually to the miracles of organization, which we witness to day, like the tree which, contained at first in the germ, develops only with time, and throws out its branches successively, it seems to us useful to consider it in its rudimentary and primitive state. This is the more important since it is not developed regularly, in the sense that its organization is equally advanced everywhere; it is, on the contrary, very unequally developed according to locality, and we find here and there, in places.

even far advanced in civilization, remnants of its primitive organization. — II. PRIMITIVE AND RUDIMENTARY CONDITION OF INDUSTRY. The condition of industry which we call rudimentary consists essentially in this, that the most varied functions are united in the same hands; that exchange is almost unknown, and consequently the division of labor also, which is induced by exchange. All those occupations, so numerous and diversified, which are carried on separately in society as it now exists, opening a field to so many professions or different careers, were then in a certain way mingled and confounded, in the sense that they were exercised in turn by the same individuals, though in a very imperfect and rude manner. Another distinctive trait of this primitive organization is, that a sort of intimate community existed in it among men, at least among those forming the same society, in such a manner that they performed the greater part of their labors in common, and made a direct division of the fruits of these labors. — We have tried to give an idea of this state of things in several articles in this Cyclopædia, especially under the word EXCHANGE; but we think it our duty, in order to preserve the connection of ideas, to recall it in a few words here. In order to find its traces it is not absolutely necessary to go back, as we have done previously, to the infancy of society, or to follow man in the savage state; we can find a more or less faithful picture of it, even to-day, wherever a small group of men live separate from the rest of society, or without ordinary communication with it. If, for example, we go to the remote frontier of the United States, we shall find here and there isolated farms, on which a small number of men, belonging in most cases to the same family, live together, and satisfy all their own wants themselves without contact with the rest of the human race. This picture of primitive society is not complete, it is true, but it is near enough to the type which it represents. No matter how remote these men may be from the great society of mankind, they do not cease to borrow from it largely: first, they obtain their arms from it, as well as most of the implements which they use in their labor. Besides, having issued from that society themselves, they took from it at their departure a portion of the enlightenment and acquired knowledge which it had accumulated for the use of all. This gives them a decided advantage over their savage neighbors. With this exception, they embody the type of primitive industry, in the sense that all labors necessary to their support are carried on by themselves, and all the functions of social life are united and concentrated in the little group which they form. — A truer picture of this primitive constitution of industry can be found, perhaps, in the lives of the patriarchs, as presented to us in the Scriptures. Abraham and his earlier successors lived alone with their families and their servants by isolated agriculture, and without ordinary contact with the rest of the world. These patriarchs, it is true, knew the use of money, which shows that exchange was practiced among them to a certain extent; but it is evident that they had recourse to exchange only at long intervals, in exceptional cases, and that in general they themselves supplied everything which was needed to satisfy their daily wants. In their activity, as in that of the farmers of the American border, all industrial labors were united, all social functions brought together, with this additional circumstance, that as the patriarchs recognized no superior authority to which they owed obedience, they held besides the functions of the government in their hands. — On considering industry in this primary stage we perceive clearly the intimate connection of all its branches. On close examination all the functions of social life are found there united, though many of them appeared only in germ. Around agricultural industry, which in a certain way formed the basis of the common labors, were gradually grouped manufacturing industry, commercial industry, the fine arts, which were not unknown there, as well as the labors which to-day form the appanage of the professions called liberal, including even the functions pertaining to public authority. Land was cultivated and flocks were raised; this was the chief occupation of the tribe, an occupation altogether agricultural. But the fruits of the earth once gathered, it was necessary to prepare them for common use. It was necessary also to collect the wool of the flocks, to spin and weave it, to make garments for each one. This was manufacturing industry with all the distinguishing characteristics which belong to it, but closely connected with agricultural industry, of which it was merely the accessory, so to speak. Next, it was necessary to distribute all these products among the different members of the tribe; and what is this but the foundation itself of those occupations which constitute commercial industry? The fine arts were cultivated, even if only in the song and dance at leisure moments. Man observed the stars, while cultivating the earth, or watching his flocks; this was the beginning of science, which was connected with the advancement of the most common labors. At intervals, also, the properties of certain medicinal plants were studied, plants suited to the cure of certain diseases; medicine took its place side by side with the plow of the laborer. Arms were sometimes taken up in self-defense, either against wild animals, or against other enemies more dangerous, and the art of war was practiced by the same hands which were devoted to the arts of peace. Those who had committed crimes were judged and punished; and thus, in the midst of so many other labors the solemn functions of justice were performed. Finally, there was a government, a chief to direct, and agents to serve it, and a police of some kind. It is true, therefore, that in this small group, composed of so few men, all the essential functions of the social order were united. It was a small picture of the world, as it exists in its pres-

ent condition; with this sole difference that, in the world of the tribe, all these functions were mingled, confounded, exercised by the same agents, while in the world of to-day they are separated and intrusted to different agents, without ceasing on that account to be united and dependent on each other, as much as they could possibly be the first day. We shall now see how, in consequence of the progress of exchange, all these elements, mingled at first, became detached from each other, and what the new order was which was established. — III. ORGANIZATION OF INDUSTRY. *Exchange; division of labor; subordination of labors; money.* In proportion as the number of exchanges increases, under the influence of causes which we have enumerated elsewhere (see EXCHANGE), a division of labor takes place, in the sense that each individual chooses a distinct occupation to which he devotes himself exclusively, leaving to others the task of carrying on those which he has abandoned. In this way the functions of industry, at first closely connected, and executed by the same hand, separate; the mingled elements become detached from each other, and a new organization is established with exchange and division of labor as essential bases. — The first general effect of this movement of division is to set free manufacturing industry, which settles into a distinct branch of labor, through separation from agricultural industry, with which it was at first confounded and of which it formed, so to speak, merely an appendage. We have seen that, in the primitive organization, agriculturists themselves prepared the wool of their flocks, or the flax which they had harvested, in order to turn them into clothing; just as they also produced every change required by the other products of the earth. This part of labor, which consisted in fashioning and working up all the raw products of the soil, in order to adapt them more completely to our wants, was at that time only a kind of accessory of the first; in appearance, as well as in reality, there was at that period but one industry: agriculture, with its dependencies. But gradually, in proportion as exchanges became more frequent, these accessory labors separated sharply from agricultural industry, where they were always out of place and imperfectly executed. They acquired a greater importance by the separation itself, and tended to constitute, under the name of manufacturing arts, or manufacturing industry, a perfectly distinct branch of industry which, feeble at first and in the infancy of society, now occupies a high position among civilized nations. We are indebted to it in general for the creation of cities; for it is the nature of the manufacturing arts, which are not, like agriculture, fastened to the soil, to associate in groups, to concentrate and form by their union those masses of population which are called cities. Once established, they become still more special, through separation into a great number of distinct branches. Exchanges consequently multiply more than ever, and by their increase lend a new importance to that other branch of general labor, whose object it is to facilitate exchanges, and which is known as *commerce*. At the same time several other labors, previously without distinct character and confounded in the general mass, are detached from the common trunk: labors of art, of science, those relating to government, the police, and in general all those which form the object of what is called at present the liberal professions. Thus, everything which was formerly united now tends to separation, specialty is introduced everywhere, and exchange, originally the exception, becomes the universal law. — Exchange and the division of labor are therefore the fundamental bases of the new organization of industry; to speak more correctly, they are the points of departure for every genuine organization. In truth, it can not be said that this primitive condition which we have endeavored to describe had really an organized industry. All these isolated groups of men appearing on different parts of a territory, each one working indifferently the tract of territory which fell to its lot, were too unconnected to exhibit any general order in their relations. They formed, perhaps, industrial workshops, but workshops without connection, without tie, among which, therefore, no trace of general organization could be noted; and as to the particular organization of each one of them, it was the ruder and more imperfect since the most varied functions of labor were mingled and confounded, and no assistance from without could be expected to favor its action; it was, besides, unstable, depending essentially on the changing views of those who directed it. It was only when exchange became more frequent, that regular relations were established between these workshops, and it was then also that general organization began to appear. This was completed by the division of labor, which freed each one of these workshops from the parasitic functions with which it was overburdened, confined it to its own specialty, and made every separate workshop an integral part of a great whole — An imperfect idea would, however, be formed of the general order of industry unless to these two essential conditions, exchange and a division of labor, a third and no less important one be joined, which completes them, namely, the connection, the mutual dependence in which the various functions separated by the division of labor are placed with regard to each other. To say, as is often said, that labor is divided in the progress of industry, is not enough; this is to omit another important phenomenon, which beyond a doubt has an intimate connection with that of the division of labor, but which in many respects is distinct from it, and would on this account deserve a separate title. We wish to speak precisely of this principle by virtue of which the various labors of industry, though separated from each other and executed independently, continue nevertheless in such a reciprocal dependence and subordination that they all seem to form the different links of an

endless chain. Economists in general do not, perhaps, dwell sufficiently on this phenomenon, to which, as appears to us, they do not attach due importance. But what other phenomenon shows more clearly the elevated character, the eminently social character of industry, so different from that which so many unjust detractors attribute to it? In virtue of the division of labor, different kinds of labor are separated in view of more convenient and better execution; it might be believed that they continue thus without relations; nothing of the kind; once separated, they come together again, and are reconnected; without being confounded, however, as they were before, they are subordinated to each other, but solely for purposes of mutual support. There is not, therefore, a single one of the great functions of industry which is not connected with a thousand others, from which it obtains the materials which it works up, the instruments which it uses, the buildings which it occupies, or the technical processes which it employs. This is what we shall permit ourselves to call the *subordination of labors;* the necessary crowning of the division of labor, from which, however, it is distinct; an interesting phenomenon which characterizes, better than any other, this organization at once simple and complex, to which human industry lends itself. Another no less interesting phenomenon, which completes the foregoing, is the use of money, without which any active system of exchanges would be impracticable. — Exchange, the division of labor or the separation of tasks, the subordination of the different kinds of labor, and the use of money: these are the four essential elements which constitute the industrial order as it exists; they are the fundamental bases on which the whole edifice rests. It will be understood that this is not the place to dwell on these elements, which will be more properly explained elsewhere. It is sufficient for us to call brief attention to them, to assign them their proper place in the industrial system. Let us merely repeat that together they form the whole industrial order, and it is not necessary to go outside this circle to include the total of economic phenomena. It remains, however, to see what results from the action of these elementary phenomena, and how in the movement of affairs originated by exchange, order is introduced among all these industrial elements separated by the division of labor. — IV. Consequences of the Preceding. *The industrial world constitutes a great society.* In the primitive state of things, a feeble sketch of which we have tried to present, there was, properly speaking, no human society; the world was divided into a certain number of isolated groups of close communities, little disposed, as a general thing, to come together, and between which a state of war often created a gulf. But when exchanges increased and the division of labor began, all these isolated groups dissolved, they became merged into each other, and finished by forming together a great society, whose tendency, as we shall point out in the article Political Economy, is to become universal. This is human society, very different from political society, with which it is sometimes improperly confounded, and which is never greater than a more or less considerable fraction of it. — Now what are the bonds of this society? Precisely those which we have just enumerated: exchange, division of labor, subordination of the different kinds of labor, and money. By exchange, men supply each other with the fruits of their labors, products for products, services for services. By the division of labor, they share the different parts of a common task. This is enough to create between them a social tie so intimate that no human power can break it, and from which no individual can free himself. The subordination of the different kinds of labor strengthens this bond, which the use of money cements, by making it general. The existence of this great human society has often been denied or ignored. Some look on it merely as a promise of the future. They are mistaken; it is a reality of the present. This society exists to day, though it has not yet arrived at the last stage of its development, and continues to extend and multiply its bonds daily. Its existence is shown clearly enough, it appears, by that intimate solidarity of interests which becomes more and more evident, which is established especially between all parts of the civilized world, and which makes them all sensitive to the same accidents, to the same catastrophes. It is shown by the simple fact, that any individual hidden away in a corner of this civilized world may deliver the fruits of his labors to his neighbors, and, provided that he has them accepted, may receive their equivalent in any other part of this habitable world. He has worked for the French, the Germans or the Russians; he can be paid the price of his labor by Americans, Indians or Chinese. Its existence is shown further by this other no less significant fact, that nations most different from each other, not only agree to effect an exchange of products, but, in addition, aid each other in a certain way in completing the successive processes which certain products require, and bearing them by a series of uninterrupted labors to their final termination. Thus the cotton fabrics which we wear are the combined result of the labor of North Americans and Europeans; leaving out the fact that several other nations have contributed to their manufacture, some by furnishing dye-stuffs which color them, others by furnishing the instruments which were used in their manufacture. The wool of flocks raised by Australians is brought to Europe by English seamen; it is distributed by English merchants over the European continent; where it is converted into thread and cloth by German, Belgian or French laborers, dyed with stuffs furnished by Central America; again it is transported, in the form of manufactured cloth, by the sailors of every country, into every part of the world, including that in which it grew. Is it possible to fail to recognize in such movements the intimate

community of interests which is established between the inhabitants of countries most different from each other, and the existence of a social bond which connects the whole world? — Our intention, however, was not so much to prove this great fact here as to mention it. We shall say simply, in passing, that it is just this human society, thus formed and constructed of the elements which we have just examined, whose laws are studied by political economists. It remains now to see what the principles and general facts are from which these same laws are derived. — V. MOTIVES AND REGULATORS OF INDUSTRY. *Personal interest; supply and demand; competition.* The great motive of industry is personal interest, which is besides the essential motive of all human actions. When God created animated beings he endowed them with a profound and indestructible sentiment: love of self, as necessary to their preservation. It is his will, however, that this sentiment, too exclusive, should be tempered in each individual by a more or less pronounced sentiment of sympathy for his fellow-men. This same sentiment, personal interest, love of self, imparts movement to the whole industrial machine; but it finds here an additional moderator, the balance of opposing interests, which confine each individual interest within its limits, and from this, final harmony results. — The pretense has sometimes been made of substituting another motive for this natural one: devotion to others. This was a desire to interfere in the work of the Creator, who assigned its place to each sentiment, when he admitted sympathy or devotion merely as a corrective. Suppose this project to have been successful (an impossible thing), its success would have merely enervated man, by depriving him of his most active principle. For what other sentiment can rival self-interest in energy and perseverance? What other, inherent in man from the cradle to the grave, could apply the same spur to his activity? Happily these absurd projects have never had a chance of success. Personal interest may sometimes be perverted or corrupted, by turning it from its path, but it can never be destroyed. — The great motive of industry is, therefore, the same which has determined human activity in all directions and at all times: personal interest. But it would be a mistake to suppose that from the movement and conflict of diverging individual interests anarchy or disorder must necessarily result. This would have doubtless been true in those systems of an absolute community of labor and wealth which existed at the beginning of human society, and which certain misguided minds have sometimes been bold enough to propose to us as an improvement on our present condition. With such an arrangement personal interest, without ceasing to be as active as in our present society, would be absolutely deprived of a rule of action: therefore it would become lawless at every moment through brutal violence, passionate disputes over places, by a rivalry of slothfulness in labor, and a culpable disregard of the service of the community, unless continually reproved, directed and restrained by the all-powerful and despotic will of a director. But this is not the case in the industrial system founded on exchange, in which order springs from the very principle in virtue of which society moves. As soon as exchange has become in practice the universal law, as each individual is forced to count on others for the satisfaction of his wants, and as he has no right to their services except in so far as he brings them to accept his, he is led by his own interest to labor for his fellow-men, to study their wants, their tastes, and to make the satisfaction of these wants the sole object of his activity. Thus, in this system, personal interest, without losing any of its native energy, tends unceasingly toward order, while subordinating itself in each of its manifestations to the interests of all. — In the midst of this extreme complication of phenomena, which exchange and the division of labor produce, there remain nevertheless certain grave questions to be solved, which touch upon the very existence of the industrial order; that of knowing, for instance, on what basis products and services are to be exchanged, and how equal values are to be established. This is the great problem of value. This problem is solved by the beautiful law of supply and demand, which has been explained before (see DEMAND AND SUPPLY), and by competition which is its complement. Let each man be obliged to offer his services to his neighbors, and have them accepted by those who demand them before being able to claim a part of the fruit of their labors in his turn; this arrangement suffices to make the personal interest of each individual tend to satisfy the wants of all the others; but it is inadequate to effect a balance and equilibrium between all the individual interests which are put in movement, and give to each one in a just measure the satisfaction due it. What would happen, for instance, if each individual, when he offered his products and his services to others, were able to fix his price arbitrarily according to his will? Another rule is needed. Where does it come from? The decrease of the demand suffices, in a certain measure, to moderate the claims of those who offer the supply; it is the commencement of a rule. But it would still be insufficient, if competition which grows up naturally between the latter did not impose on them a more rigorous law, by forcing them to be satisfied with the lowest price which the exigencies of production can admit. It is competition then, finally, which determines the relative price of things. It renders many other services, and in the last analysis it may be considered as the supreme regulator of the industrial world. But having already explained this truth, in some of its developments, under the word COMPETITION, we shall not return to it here. It only remains for us to do what we have omitted elsewhere: to determine the conditions of competition and the limitations to which it is naturally subject. — VI. CONDITIONS AND

LIMITS OF COMPETITION. *Interference of political authority; necessity and danger of this interference; natural monopolies.* Such is the power of the principles of order which we have just mentioned, and especially of competition, that sovereign regulator of industrial affairs, that if the action of these principles were never opposed or limited, if it were not submitted to conditions which frequently distort its effect, all the functions of the industrial world would be carried on without trouble, and with perfect regularity. We have stated elsewhere that, if competition had always ruled without obstacle, if it could have fully developed in the midst of human societies, such is the power, the inexhaustible fruitfulness of this principle, that humanity would have advanced, and with an incessantly increasing rapidity, toward a future of prosperity, of wealth and of general well-being, of which it has perhaps yet no idea. More than this: the industrial mechanism, so admirable already, would be free from all the disorders which impede its action. — The action of competition supposes the reign of justice and right; it supposes that, in every operation of exchange, the contracting parties will be free to refuse or accept the conditions proposed them, and even to apply elsewhere if such is their good pleasure; it supposes, in a word, the absence of constraint, of fraud, of violence in human transactions; for if one of the parties may, in any manner, impose his conditions on the other without the latter being free to weigh, to measure and reject these conditions, there is no longer any competition, and equilibrium between the respective interests of the parties ceases to exist. Under the empire of the law of exchange, personal interests continually tend toward order, since no one can pretend to obtain values which he seeks, unless at the cost of furnishing equivalent values to his fellow-men, and of subordinating his labors to their wants. But it is always under this essential condition, that no one of these interests in question should prevail over the others through violence and injustice; that, on the contrary, each man should be bound to respect in all other men the free manifestation of their wants. Otherwise, the tendency of individual interests toward order immediately changes into a contrary tendency. Now, it is precisely this essential condition, this necessary condition of order, which is almost never completely realized. — In view of the evil passions of men, which but too easily incline to violence and injustice, when urged by personal interests, and when they have force on their side, justice and right can prevail in human transactions only so far as there is a superior power above individuals, which holds the balance between them, and which has both the force and the will to prevent all their deviations from justice; this is the political power, whose interference, understood in this way, is always necessary. The task of this power is a great and admirable one. It consists essentially in holding the balance between individuals, to make the liberty of each one of them respected, and to keep them within the limits of their respective rights, without speaking of the corresponding mission which is intrusted to it, of defending the population of the country which it governs against foreign attacks—a negative rôle, when properly considered, since it consists almost entirely in repressing violence and preventing evil, but which is nevertheless of considerable importance. It is owing to the continual interference of this power, an interference altogether salutary and beneficial when it does not exceed proper limits, that freedom reigns in private transactions, and it is in this case alone that competition becomes possible. If the political power is not the creator of the industrial order, whose principle lies elsewhere, it is at least its guarantee, and the necessary guarantee. Under its wing, so to speak, individual interests are secured, and competition gains its vigor. We can therefore consider the different political powers which divide the world between them as so many indispensable wheels in the great industrial mechanism. — But these political powers are exercised also by men who are no more exempt than others from the evil passions which it is their duty to restrain; this is the weak side of human society; it is the gate through which every evil enters. In addition to the fact that those who wield power in each country (we mean here governments in general) do not always show themselves sufficiently active in repressing excesses, and thus fail in their exalted mission, they too frequently permit themselves to commit like excesses. Subject to all the impulses of human nature, they often yield, like other men, to their evil inclinations, and the unjust acts which they commit at such times have consequences all the graver since they have a loftier origin. To find a government which makes justice respected and which respects it scrupulously itself, is the political problem, but a problem which still awaits solution. This is why the industrial system, in spite of its admirable structure and the regulating principles which it possesses, forced as it is to lean on the political order, which does not enjoy the same advantages, still finds itself tainted with a great number of partial disorders from which perhaps it will never be entirely exempt.— Thus in the industrial order, everything is good in so far as we consider it governed by the economic law; but this law, more general in its application than the political law, is nevertheless subject to it, in certain respects, within the territory embraced by the latter, since it is everywhere incomplete without its co-operation. From this arises disorder wherever disorder reigns; from this come the vexatious imperfections to which the industrial system is still subject. The mass of men have no reason to complain, since the primary cause of the evil is in the violence of their own evil passions. It must be said, however, that independently of this severe condition to which competition is subject, of being unable to act except

under the protection and guarantee of the political powers, it meets also here and there necessary limits, which the nature of things imposes on it. — It is evident, to begin with, that competition can not act in all its completeness except when the number of men occupied in the field of industry is so large that each one of those who offer in bulk services of a certain kind should meet competitors or rivals. It is evident that where population is sparse, or the groups of men are few and far between, this beneficent principle is scarcely felt. It is almost entirely absent in that primitive condition of society which we mentioned above; and this is one of the causes which explain why progress is generally so slow in nascent societies. It only begins to exhibit all its effects when men collect on narrow spaces, or when among sparse populations means have been found to establish numerous and easy communications, which bring producers into contact with consumers. — But even where the population is dense, competition always meets certain limits, if nowhere else, in the existence of certain absolute monopolies which arrest its activity. We do not speak here of artificial monopolies, of those which the negligence of governments has allowed to spring up, or which they have by design unjustly established. We speak of natural monopolies, of those which are necessary, unavoidable, and which the most careful vigilance of the political power could not remove. There is in every country a certain number of this kind of monopolies; and though inevitable and necessary, they do not in general fail to produce certain disorders followed by pernicious effects. The first and most considerable of all these monopolies, the most unfortunate perhaps, but surely the most inevitable, is precisely that which is enjoyed by these same political powers just mentioned. In every country, the established government, whatever it be, acts alone in its sphere, and suffers no competition of any kind in the exercise of the functions intrusted to it. This is inevitable, we say, and results from the truths which we have just explained. Since in fact competition even between one individual and another is only possible on condition of equal freedom for the contracting parties; since it supposes, consequently, the existence of a superior power, which holds the balance of justice between the contracting parties, and forces each to respect the rights of the other, how could it be practiced with reference to a government which knows no superior, and which could accept one only by abdicating? Contracts are made between individuals under the guarantee of public authority which prevents violence; this is what produces freedom of agreements and makes competition possible. But under what guarantee can a contract be made between a government and an individual? There can be none. In this case the strongest carries the day and imposes the law. The strongest is the government, which, instead of bargaining, of discussing as individuals do in their affairs, dictates and imposes its conditions. This is what has been seen in all times and which will always be seen, since the nature of things has thus ordained it. — But if this monopoly of political powers is inevitable, it nevertheless produces very annoying results. Since they never feel the spur of competition, which alone is able to enforce activity, economy and order on men of whatever condition, all the governments of the world grow slack. Consider what really happens in every state, and you will see that of all industrial enterprises undertaken, the enterprise of government—and we can call it that—is, beyond comparison, the worst administered. There are doubtless differences between states, but they are merely differences of degree. Besides, these same governments always sell their services too dearly. The price of these services, not being determined by the general laws which determine the relative value of things, is arbitrarily raised, with no other certain limit than the resources of the people. We are not criticising one particular government or another, since, on the contrary, we are establishing a general law. We simply say it results from the very nature of things that the functions peculiar to governments are always badly executed and paid for at too high a price. It is another consequence of this same fact, that the remuneration of services rendered by governments always assumes a particular form, that of a tax or impost—an annoying form, for more than one reason, though it is, in some respects, inevitable. Taxes are nothing else in principle than the remuneration for services rendered by those who govern; but they are a remuneration which, instead of being voluntarily and freely paid like all others, is exacted and collected with authority by those who receive the remuneration. From this there results both an underhand resistance on the part of those who pay, and who endeavor by various means to escape from the burden imposed on them, and a want of equilibrium in the assessment of taxes, which scarcely ever are proportioned to the importance of the services received by each individual, and besides a considerable increase in the cost of collection, aggravated by the resistance of tax payers; without considering that the precautions taken to insure this collection almost always become serious hindrances to industry, and nearly as oppressive as the taxes themselves. — Thus from the natural monopoly which governments enjoy, it results that the functions belonging to these governments are badly executed, that their services are always too highly remunerated, though there are great differences of degree between them. Besides the natural monopoly of political powers, there are others, which always involve consequences more or less lamentable. But it is not our intention to enumerate them here, still less to analyze all their effects, this subject being specially treated, like all others, in its own place. It is sufficient here to point out the principle, in order to compare it

with the other principles which govern the industrial world and indicate in what sense it modifies the action of this world. — VII. INSTRUMENTS OF INDUSTRY. In the preceding pages, we have passed in rapid review the series of great industrial phenomena, stopping only at the chief points. We showed first that industry, in its general expression, embraces all human labors, of whatever nature they may be. We then stated that when scarcely out of its cradle, this industry tended toward ordering itself by exchange, division of labor and subordination of the different kinds of labor, by the aid of money which favored their action; that thus organized it constitutes a great society, the tendency of which is to become universal; that its principal motive is personal interest, the same that directs all human actions, but subordinate in this case, in virtue of the law of exchange, to the general interest; that the great principle governing it, and from which all its laws spring, is competition, a principle both of progress and order, which directs it incessantly toward an organization more and more satisfactory and perfect. We added that if this principle reigned in the industrial world alone and without division, all would be for the best, and that the wealth or general well-being would be as great as the degree of civilization at which nations have arrived would permit; but that competition has its conditions and its limits, which arrest its action and neutralize in a certain measure its beneficial effects; that it is subordinated, for example, to the action of governments, which not being subject themselves to its influence, do not subordinate themselves to the general order; that it is, besides, limited by a certain number of artificial or natural monopolies; that this is the weak or vulnerable side of human society; that by this, that is to say, the irregular action of governments, and by the disastrous influence of monopolies, disorder is introduced into the world; and that this explains why the organization of industry, so beautiful and marvelous as a whole, still continues to be tainted with numerous imperfections. — We have in a certain fashion summed up all the economic truths in this miniature picture. It must be understood, of course, that each one of these truths would require lengthy explanations, necessary to illustrate and bring out all its applications, but which we refrain from making because they will be found elsewhere. There would be a lack, however, in this general picture, if we should pass over, without mentioning them, the instruments of industry, that is to say, the agents of different kinds which are of assistance to man in his labor. — Man does not labor alone; he calls to his aid, as far as possible, all the forces of nature, all the powers of the physical world. Among the instruments which he uses, some, created by his own hands, were slowly accumulated by saving; others, given by nature, were merely conquered and subjected by him. But all lend him a powerful aid, without which the most energetic development of his activity would remain comparatively barren. This is a great and general fact, which could not be omitted, and whose place it was necessary at least to indicate. — There is really no particular law to be established in regard to the instruments of labor. Considered in their general bearings, the principles which we have already laid down apply to everything, to the simple agents of labor as well as to men. Men and capital are subject to the great law of competition, which arranges and classifies all things, which fixes everywhere the value of services rendered. Everything is subject in like manner to the influence of monopolies, which are connected with things as well as with men, and everywhere produce the same effects. The only difference is in the applications, which still offer, it is true, a vast field of study, but into which we can not enter at present. But if there is no particular law to establish here concerning instruments of labor, there are at least a few observations to make — To begin with, it is not uninteresting to see what kind of assistance is furnished to man by tools and machines in general, how far they are necessary to the development of his productive faculties, and how their increasing multiplication raises the level of humanity every day. So far as various kinds of capital are particularly concerned, the accumulated fruits of the labor of man, it is of interest to see how they are formed and accumulated by saving; in what conditions this accumulation is quickest, and what are the circumstances which favor it most—an important subject in itself, with which many others are connected, which are not devoid of importance either. There is less to be said, it appears, about appropriated natural agents. As they are given by nature, they do not increase by saving; though saving almost always adds something to them by means of the capital which it connects with them They are purely and simply conquests of man over nature, conquests which are happily extended from day to day. There is, however, an important observation to be made on this subject, it is that appropriated natural instruments are more subject to monopoly than capital, and to monopolies frequently complicated, whose effects are not always easily analyzed. As to agents not appropriated, however valuable be their aid, we may omit them entirely, since, their services being always gratuitous, they do not enter into the current of exchanges, and thus escape all the effects of economic law. — Moreover in all we have just stated, though here and there a glimpse may be had of a vast series of interesting studies, no new principle appears; at least none of those primordial principles, those generative principles, so to speak, like those which we laid down earlier in this article, and to the explanation of which we desired to confine ourselves. In fact, since the instruments of labor, those at least which are appropriated, follow, as we may say, the fortunes of the human race, and are subject, saving a few differences and restrictions, to the same general laws, what principle could be appealed to con-

cerning them which would not be simply derived from these same laws? — VIII. CLASSIFICATION OF INDUSTRIES. Industry is one in this sense, that all its parts are connected, and that it would not be possible to suppress a single one of them without leaving an evident breach in the whole. Nothing, however, prevents our dividing it into several branches, for the convenience and facility of the studies of which it is the subject; there is no difficulty in doing this, provided the necessary connection of all the branches with each other is never lost sight of. — "There is but a single industry," says J. B. Say (*Cours*, part i., chap. vii.), "if we consider its object and general results; and there are a thousand, if we consider the variety of their methods and the materials on which they act. In other words, there is but a single industry and a multitude of different arts." Though J. B. Say takes the word industry here in a more restricted sense than that which we have given it, since he applies it only to that kind of labor which acts on matter, his observation is correct. It has even a higher significance than he gives it, and we can apply it to universal industry with the same authority. "Nevertheless," adds the same author, "it has been found convenient, in studying industrial action, to classify its operations, to unite in the same group all those which have a certain analogy among them. Thus, we say that the industry which brings products from the hands of nature, whether it has promoted their production, or whether that production has been spontaneous, would be called *agricultural industry* or *agriculture;* that the industry which takes products from the hand of their first producer, and subjects them to any change whatever, by chemical or mechanical processes, should be called *manufacturing industry;* and that the industry which takes products from one place to transport them to another, where they are nearer the consumer, should be called *commercial industry*, or simply *commerce.*" This classification is, in fact, that which is most generally followed. It has passed from everyday language into books, and nothing prevents its adoption, since after all, as the writer we have just quoted very aptly says, every classification is arbitrary, having no other object than to direct study or simplify operations of the mind. Still, it is necessary to remark how insufficient and incomplete this classification is in certain respects. It comprises under the same denomination, that of agricultural industry, several kinds of labor, which have without doubt an analogy to each other, as all human labors have, but which surely differ for many reasons; for instance, the venturesome labors of the man who is engaged in whale fishing and the uneventful occupation of the laborer who cultivates his field in peace. The man engaged in the whale fisheries in the southern seas, would surely be astonished to learn that he exercises an industry similar to that of the gardener who furnishes the market of Paris with fruits or vegetables. On the other hand, how many industries remain outside of this classification, even if we give it every possible extension. We find here, for example, no place for the labors of scholars, physicians, advocates, artists, professors, public functionaries, nor for those of the men devoted to the professions called liberal; for all these men, each one of whom exercises an industry, and often a very active one, could not be considered as merchants, manufacturers or agriculturists. — Struck with these considerations and some others in addition which he has developed with much force, Ch. Dunoyer has endeavored to establish a new classification, more scientific and complete, in his excellent work, *Sur la Liberté du Travail.* He begins by dividing industry into two categories or two orders; embracing in the first category those which act on things, and in the second those which act on men. The industries which act on things, are: 1, extractive industry, that is to say, that which wrests from nature spontaneous productions, and in which must be comprised fisheries, the chase, and the working of mines; 2, the industry of transportation, that is to say, that industry which transports objects by land or by water; 3, manufacturing industry; 4, and last, agricultural industry. The last two, the author defines very nearly as they are defined everywhere. In the category of industries or arts which are exercised on men, Ch. Dunoyer includes: 1, those occupied in the perfecting of our physical nature; 2, those which have for special object the cultivation of our imagination and sentiments; 3, those whose office it is to educate our intelligence; and 4, those which contribute to the perfecting of our moral habits. This classification, more regular than the other, more satisfactory, perhaps, and surely more complete, has nevertheless the great drawback of not being usual, and not presenting, in the terms used, a meaning understood with sufficient ease; a serious drawback, especially in a publication like the present, which should, by the simplicity of its nomenclature, make itself easily understood at once by every one. Is Dunoyer's classification itself complete? Is it satisfactory, speaking in the language of science, in the sense that it comprises without distinction, while ranging them in their real order, all kinds of labor? We need not examine this question here; we shall merely say that, satisfactory or not, it may be considered at least, as a new elaboration of a subject which still leaves much to be desired — a rational, judicious elaboration, always very useful to consult. — Notwithstanding the relative merit of this classification, we are forced by the decisive consideration which we have just mentioned to return to the other. We adopt, then, the distinction established between the agricultural, manufacturing and commercial industries; but we would remark that this classification, which only applies to the great divisions of industry, does not comprise everything. In the first place we can not permit ourselves to confound under a common denomination agriculture, fisheries,

working of mines, or even the chase, which we consider rather as special industries, and very important ones. It seems to us necessary, besides, to make another reservation in favor of the industries connected with the professions called liberal, which we have already enumerated.

CH. COQUELIN.

INDUSTRY, Agricultural. (See AGRICULTURE.)

INDUSTRY, Manufacturing. I. Next to the chase, which alone supplied the wants of man in a savage state, agricultural industry, which includes the raising of flocks as well as the cultivation of the soil, is the first to which man devotes himself; it is the original, the mother industry, which long continues to be the only industry of nascent peoples. Manufacturing industry appears only later, with the arts which complete and attend it. As its particular object is to prepare the raw materials furnished by agriculture, in order to make them more suitable to satisfy our wants, it naturally succeeds agriculture in the order of time, as it does in the logical order of facts; this industry, therefore, does not generally appear until the first advances have been made in civilization, and when there begins to be a surplus of field labor, in an already well-settled region. Not that we fail to find the first rudiments of manufacture in the very infancy of society, and even among savage tribes devoted entirely to the chase. It is not entirely unknown in any stage of civilization; the savage fashions wood and some other materials into a bow and arrows; he turns, in some fashion, the skins of beasts which he has killed, into clothing for his person; he pounds and rubs different dye-stuffs to color his face and his body; he makes an ornament or a distinguishing mark of the feathers of certain birds; and these are so many attempts at manufacturing industry—an industry still very rude, it is true, but which has already the distinguishing characteristics which it afterward maintains. In passing from this first stage, in which the chase is their only occupation, to the raising of flocks and the cultivation of the soil, men make a further advance: they use for clothing the wool of their flocks, which they learn to spin, weave and dye; they sometimes also employ for this purpose the fibre of certain plants, such as flax and hemp, of which they also make cloth. This is, it would appear, the result of an established industry. But in this condition of society, labors of this kind are not separated from agricultural labors, to which they are, so to speak, only accessory; they are carried on together with field labor, by the hands of those who cultivate the soil, and in the intervals of leisure which they have in these labors, it is less, therefore, a branch of distinct industry than an appendage of this primitive industry whose object is the cultivation of the soil.—In order that manufacturing labors should become detached from those of agriculture with which they are closely connected in the beginning, and form an industry apart, they must have acquired a certain importance and made some progress. For this purpose it is necessary that the agriculturist should have grown wealthier and consequently more exacting, so that, no longer satisfied with the rude garments which he can make himself in his leisure moments, or the rough instruments which he used at first, he prefers to obtain both from specialists whose only occupation is to make them. It is also necessary that the number of workers of the soil scattered through the country, and using manufactured products, should be great enough to furnish these specialists with continuous labor throughout the year. This supposes a more numerous population, more extensive wants, a more advanced civilization. Such progress is not made in a day; neither is it always made regularly nor in exactly the same manner everywhere; but it is necessarily the first step toward manufacturing industry proper. — When manufacturing arts are separated from agricultural labors, they are in the nature of things united and grouped. Since men occupied with these arts are not obliged, like tillers of the soil, to live scattered over the country, so as to be near the lands they cultivate, they can move their shops almost wherever they please; and as they have frequent need of each other, it is natural for them to unite, and associate in groups at certain given points. This is the origin of those collections of houses, which form at first villages, later towns, and finally cities. It is in cities that the manufacturing arts concentrate. We still find, it is true, even in our time, and in countries most advanced, certain great workshops scattered here and there in the country where there are special local advantages, either on account of water power, or some other cause, but it is none the less in the nature of things for them to be brought together in the cities. Manufacturing arts are best developed in cities through the aid which they lend each other, and the growth of public enlightenment; we see, therefore, that they tend continually to confine themselves to cities, or draw near them. This at least is the general rule; the contrary is, in every country, the mere exception. — If the separation of manufacturing labors from those of agriculture marks the earliest steps of civilization, it is far from being complete at first. Far from taking place suddenly, at a given moment, it is effected slowly, gradually, in a progressive manner, and often almost imperceptibly. It is, so to speak, the work of centuries. Thus, there is not yet a country in the world, even in the Europe of to-day, where it is complete. — Reduced to its most simple expression, agriculture consists in cultivating the earth in order to obtain, in a raw condition, the various products which it is capable of giving. Strictly speaking, agricultural labor proper stops here. All subsequent modifications given to these products, all changes to which they are submitted, may be considered

as belonging, or capable of belonging some day, to one of the branches of the manufacturing arts. Now agriculture is far from being brought to this state of final simplicity in any country; on the contrary, it still retains possession of some of these processes or modifications which follow cultivation proper and the harvest; it is still only a question of degree according to the stage of advancement in each country. There are several of these processes, it is true, which it would seem should always belong to agriculture, because they can be conveniently carried out only on the spot; such as threshing wheat in the bundle to get the grain. — In some countries of Europe, the greater part of the spinning and weaving of flax and hemp is still carried on in the country, on farms, and thus continues to form a sort of appendage to agriculture. Not long since this was the case in all France, and is still so to a greater or less degree in a large number of French provinces. Nevertheless these two operations tend more and more, especially since the invention of machinery, to leave the country, to abandon the farms for the industrial centres. In England especially (we speak of England proper, leaving out Ireland), this separation is almost complete. But this is not true of retting and hackling, which continue to belong almost everywhere to rural industry. It is easy to foresee, however, that they will be detached from it sometime. Even now in some parts of Belgium, where flax culture has reached the highest degree of perfection, it is nothing rare to see a farmer sell his crop of flax standing, or after it is pulled, to persons who make retting and hackling a specialty. It is true that these persons still work in the country, for the most part, because the present conditions of retting demand it; but suppose that the question of retting by chemical means, which has been so much studied and the solution of which is so desirable, should be finally settled, we may believe that this operation, as well as hackling, would be soon separated from rural industry, to extend, with so many others, the domain of city industry. — II. Thus it is that, in the succession of ages, in proportion as progress is effected, manufacturing industry increases and extends by detaching each day some one of the branches of this mother industry from which it sprang. Agriculture, which was complicated in its origin by a great number of operations, foreign to its nature, frees itself gradually from these parasitic functions; it leaves them to the workshops of cities, to which they belong, to confine itself more strictly to its special functions, the improvement and cultivation of the soil. The causes which favor this movement are the same which determined it in the beginning: the progress of arts, the increase of wealth, and, above all, the increase of population in a state of civilization somewhat advanced. In order that the separation between the manufacturing arts and agriculture should continue to grow more definite, it is necessary, above all, that exchanges between the city and the country should be easy, so that the agriculturist may always transport to the city, without too much trouble, the raw products which his industry gives, and obtain the finished products which he consumes. If numerous ways of communication contribute to this facility of exchanges, which is not doubtful, this same facility also demands, we can see, a dense population, which increases the number of towns and cities, so that they are never too distant from every part of the country. — Of all the countries of Europe, and probably of the whole world, England (we always speak of England proper) is that in which the separation between the manufacturing arts and agriculture has made most progress; it owes this advantage to its wealth, its enlightenment, the number and perfection of its roads and canals, but, above all, to the density of its population. With an amount of wealth almost the same comparatively, with as much enlightenment in the masses of the people and a very considerable development of roads and canals also, North America is in this respect much less advanced, because its population is scattered over a great extent of territory. In England, where the agriculturist is exclusively an agriculturist, agriculture is reduced, or nearly so, to its most simple expression; and this explains an interesting phenomenon which has often occupied men's minds, without their referring it, so far as we know, to its real cause, which is the numerical inferiority of the agricultural population of England, compared with that of all other countries. English agriculture, it is said, is enormously productive, much more, in proportion, than that of any other country, especially France, and still it employs fewer men, which is true: whence it is concluded that England has acquired an immense superiority in agricultural processes. The superiority of English agriculture is real, no doubt, but not to the degree which seems to result from these comparisons. English agriculture employs fewer men in a greater production, because the work is simpler, that is to say, freer from foreign elements; because the men it employs are occupied only in performing special functions, the improvement and cultivation of the soil, while elsewhere the same number of men is divided among a great number of different kinds of labor. — It is sometimes asked whether the removal into the cities, of the manufacturing arts which previously formed an appendage to agricultural labor, is in itself a good or an evil. If this question be considered in a general way there can be neither hesitation nor doubt on the subject. The separation of manufacturing labors from those of agriculture is the beginning and the point of departure of that division of labor which forms the wealth of civilized nations, and which has so greatly increased the power of man; it is the first condition of progress; we might say it is progress itself. To ask whether this separation is a good one, is in other terms to ask whether civilization is superior to barbarism. But that it should be really favorable, it must be produced

under normal conditions, that is to say, slowly, progressively, and under the influence of those natural causes which determine it everywhere: otherwise it may become really the occasion of cruel suffering and fatal confusion. The reason for asking if this removal is not an evil was, no doubt, because in our day it has sometimes taken place suddenly, and violently, under the influence of artificial inducements and restrictive laws. — III. In proportion as agricultural industry is freed from the foreign elements which complicate it, it acquires more energy and power. The cultivator of the soil, whose attention was at first divided among a great number of different labors, turns it entirely to those which belong to him; he devotes himself solely to the cultivation of the earth, and invests in this all the capital which he can command. Thus the soil, being better and more diligently cultivated, yields much more on a given space, though a smaller number of laborers may be employed on it. But manufacturing industry gains most from this separation. So long as it is scattered, so to speak, among rural occupations, it is necessarily imperfect, rude, and besides incapable of any connected progress. How in fact could field laborers, whose first care is cultivation, and who become manufacturers only in moments of leisure, producing for a limited consumption, sometimes one object, sometimes another, give to everything they touch the time and attention necessary to bring it to perfection? Should they become skillful, which is not possible, they would be stopped in the way of improvement by the single fact that they could use only imperfect materials in each one of these divided manufactures. In these conditions, therefore, the manufacturing arts are forced to remain stationary. It is only when freeing themselves from the restraints of agricultural industry, and taking up their abode in cities, they commence their upward and progressive movement. Scarcely have they settled in the cities when they assume a new character. The men who carry them on being now in a position to see each other daily, begin an exchange of ideas, and each profits by the advance of general enlightenment. These arts thus brought together and grouped, are soon arranged into classes. Labor is divided. Each one chooses a specialty to which he devotes himself. He becomes more experienced in it, more skillful in everything relating to the execution of his daily labor, and especially more apt to perfect his labor by the application of new processes. For the same reason he is no longer obliged to scatter his capital; he applies it all to this single object, with the greatest success, since he supplies a great number of consumers; and therefore devotes more complete material and a greater quantity of it to its special manufacture. These are not the only advantages which the manufacturing arts gain by going to cities. To them should be added the development of credit, greater where population is massed, the relative ease of the circulation of products, and, above all the instruments of labor, the mutual assistance which the arts lend each other and which becomes for them, especially in certain branches, a daily necessity; but we have said enough to make it clear that their concentration in cities is for them the principle of progress. — All this does not mean, and we have already said so, that in certain given circumstances manufacturing establishments may not be situated here and there in the country, to make use of particular advantages, such, for instance, as a water power, a coal pit, a mine, etc., without giving up, on this account, the benefit of progress. Properly speaking, when establishments of this kind are indeed special, that is to say, devoted to a single manufacture, even if they are scattered through the country, they belong rather to city than rural industry. They share, like all the others, in the general movement. Still it is necessary, even in this case, that they should maintain constant relations with the cities. — The more manufacturing industry, considered in all its branches, is freed from the restraints of agricultural industry, the more active and powerful it becomes. Those luminous centres which it creates in cities are the brighter for being composed of a greater number of rays. When a particular manufacture is detached from rural industry, in order to join the groups already formed in the cities, it not only acquires a new force from its contact with the others, but it brings a new contingent to the common centre. A sort of fermentation takes place among these industries thus united and grouped. They continue to be classed, and divided, becoming more specialized every day, not only by reason of the absolute number of various operations which they embrace, but in a much greater proportion. Taken together, they gradually reach an incomparable degree of power, owing to their increasing subdivision, and the mutual assistance which they give each other.—IV. The country pre-eminently manufacturing is, therefore, naturally that in which manufacturing arts are most completely separated from agricultural industry. In such a country the industrial system develops in its greatest fullness and exhibits the faculty of progress in the highest possible degree. And as, on the other hand, of all the causes which favor this movement of separation, density of population is beyond contradiction the most powerful, it seems we may conclude *a priori* that, all other things being equal, the sceptre of manufacturing industry should of right belong to the most populous country. — Moreover, this conclusion obtained from theoretical data alone is not disproved by experience; on the contrary, facts are generally at hand to confirm it. Of all European countries, England is surely greatest in manufactures, and it is also, in proportion to the extent of its territory, nearly the most populous. With regard to the continent of Europe, it may be said that it is more or less devoted to manufactures in proportion as it contains on a given space a population more or less numerous. On the other hand, the United States—the rival of England in so

many regards, almost equaling it in wealth, and surpassing it in some respects in prosperity and well-being—presents the most striking contrast to it on the particular point with which we are concerned. Its manufacturing system is comparatively as undeveloped as England's is advanced. And why? Because its population is scattered over large spaces, especially in the regions of the west. This sparseness of population has not allowed the manufacturing arts to separate from agricultural industry so completely as elsewhere, and this is the reason why these arts have not kept pace in their development with the general progress of wealth. To this consideration is added another no less decisive. So long as populations, scattered over a considerable extent of territory, find themselves at ease in the territories which they occupy, and land is not wanting to their labor, they have a natural tendency to devote themselves by preference to agriculture, and they do so almost exclusively, merely adding, as we have just said, certain rather rude manufacturing labors to agriculture. This is especially true when they can dispose of the surplus products of their lands abroad and obtain in return the manufactured articles which they do not make themselves. But when these populations once begin to press upon each other, and grow dense on a limited territory, and agriculture no longer suffices to occupy them all, they naturally seek a new object for their activity elsewhere. This they commonly find in the practice of the manufacturing arts. These arts then develop with an irresistible power; they increase and improve in proportion to the amount of activity, and as in such a case they do not delay in finding a market for a good part of their products abroad, they discover in this extension of the markets which they open, and in the growing division of labor which is the natural consequence of this, a new means of improvement and progress. — These observations so simple, and yet so fruitful in consequences, destroy many systems. They relieve us from searching so far away, as is sometimes done, for the reason of the manufacturing superiority of one country over another. Wealth being equal, this superiority is essentially connected, we find, with the relative density of population. Other circumstances may no doubt concur in this result, but it is none the less the first and ruling cause. This does not mean, as is sometimes supposed, that the most populous country should secure the monopoly of manufacturing industry, for such a monopoly belongs to none; but it does mean that it should occupy the first rank, according to the natural order of things. For the same reason, all other countries will have a rank in the development of their manufacturing industry answering to the relative density of their population. Next to England, for instance, will come France and Belgium; then, certain German states and Switzerland; and, at last, on a decreasing scale, the almost uninhabited regions of Russia and South America. On this point notable differences will be observed in the same country in going from one province to another, according as the population is more or less dense. Lancashire, for example, so rich and, above all, so populous, will be found far superior in manufacturing development to all the other counties of England. In France, the departments of the north, and of the lower Seine, without mentioning the department of the Seine, will be found superior, for the same reason, to all the other departments of France. Finally, in the United States, the eastern states which have been longest settled, and for this reason are the most populous, will be found the only ones in which the manufacturing arts have acquired any power, while the western states, which are younger, are almost entirely strangers to them. It may be said, it is true, that if the density of population acts on the development of manufacturing industry, the growth of this industry, favored by certain local circumstances, influences in its turn the increase of population. Thus the effect would react on the cause and become a cause in its turn. Who knows even, it will be said, if we shall not invert the rules here? Is it by reason of the relative density of its population that Lancashire is superior to all the other provinces of England in the manufacturing arts? or is it not rather to its manufacturing superiority, itself due to other causes, that we must attribute the relative density of its population? Does it not owe this superiority to the exceptional advantages which it has enjoyed for so long a time; to the wealth of its coal mines, and the ease of working them; to the great number and convenience of the water-ways which furrow it; to the neighborhood of the port of Liverpool, so convenient for supplying raw materials and for the exportation of manufactured products; finally, to the relative freedom which a number of its industrial cities have enjoyed, having been freed from the brutal tyranny of trade corporations earlier than others? These doubts are well founded, and we are far from denying all their force. Applied to certain restricted localities, the observation may even be found strictly correct. But it is none the less true that density of population, to whatever cause it be due, and it may come from the age of the nation alone, is one of the necessary conditions, we may even say the first and essential condition, of the manufacturing superiority of a country. The advantages of situation which Lancashire enjoys are not so peculiar that other places do not share them. They may be found, for example, in the United States, a region where the coal mines are not less rich nor less easily worked; where navigable highways are not less numerous; where industrial freedom is as great; where credit, another source of activity and power, is as great; where this other advantage is found which Lancashire has not, of having the raw material near at hand, without the manufacturing arts having as yet attained the same activity. It is because the United States, a new country, has not had the time, in spite of the real advantages which it enjoys, to

be covered with a population equal to that which is crowded into the regions of western Europe occupied since ancient times. It will have this population some day, perhaps, and then, but only then, will it be able to rival Europe in the perfection of its manufactures. In contrast to the United States, China enjoys almost none of the advantages which Lancashire possesses, save, perhaps, the number and extent of its canals. It has no coal mines, or it does not know how to use them. The resources of the mechanical arts, which contribute so much to increase the industrial power of Europe, are almost unknown. China has no idea, it appears to us, of the marvelous power of credit; and a deplorable policy, followed for a long time, of refusing all regular communication with other nations, deprived its industry altogether of the active stimulus given by foreign competition, and of that increase of vigor received from the increase of markets. Notwithstanding this, the Chinese people are superior to the Americans in nearly every branch of the manufacturing industry, except the mechanical. They are even superior, in many respects, to the English people, whom they surpass at least in the ingenious subtleness of their processes and the perfection of their workmanship. And to what circumstance is this superiority, otherwise so difficult of explanation, to be attributed unless to the extraordinary density of the Chinese population, which has increased and multiplied upon the same territory during a long succession of centuries? So true is it that this is a ruling circumstance, and that it triumphs even over obstacles of various kinds which a nation may meet. — What has not been tried to invert this natural order of things? What systems have not been imagined and put in practice? All the governments of Europe, struck with the prestige which manufacturing industry gives countries where it is exercised, and even attaching an exaggerated importance to the possession of this industry, have tried to anticipate its appearance, by enforcing an artificial activity upon it within the limits of their respective states. They first acted by means of tariffs, drawn up in such fashion as to favor the importation of raw materials, and to hinder that of manufactured products, in order to assure for their own manufactures on the one hand the exclusive advantage of the home market, and on the other, a greater or less advantage over foreign markets. They did more; they encouraged and excited the manufacturers of their countries by exceptional favors, by advances of money or prizes. Vain efforts! The superiority in the manufacturing arts remained where the nature of things put it, that is to say, in the midst of dense populations, whose activity could not find sufficient employment in the cultivation of the soil. Was there at least success, by all these artificial means employed, in hastening the advent of industry one step? On the contrary, we might venture to maintain, though we do not intend to insist on this side of the question, we might make bold to maintain, we say, that by these means their progress has been retarded rather than hastened; and if anything might have hurried the course of time, it is much less the artificial activity forced on them, than the enjoyment of a perfect freedom. Beyond a doubt, certain manufactures may be raised up here and there before their time by exceptional favors, prohibition or subsidies, but to make them prosper is another thing. And at what a cost have these sickly establishments been maintained! At the price of heavy sacrifices by the country; at the price of a harmful misdirection of capital, which was withdrawn from more fruitful investments in which it was employed; finally, at the price of a relative decrease of agriculture. In reality there was no success, therefore, in this method except a success in lessening the natural resources of the country, in checking the increase of population, and in retarding, after all efforts, the natural advent, the final and really fruitful advent of this same manufacturing system so much desired. — V. We have no desire, however, to belittle what the development of the manufacturing arts adds to the brilliancy, the greatness and the power of the civilization of a great country. The manufacturing arts contribute more than any other power to attract and fix in industrial centres the liberal arts and positive sciences whose promoters they are, and whose co-operation they require at every step. By the uninterrupted communication which they establish among men, they favor the progress of enlightenment in every direction, and by this greatly contribute even to the advancement of agriculture to which they seem foreign. To them, and to commerce which assists them, we owe most of the works of public utility, roads, canals, railroads, harbors, and great monuments of architecture. A German writer, whose name has gained a certain celebrity on the other side of the Rhine, has developed, in a work, otherwise of no great real value, this thesis successfully, though he has almost everywhere exaggerated the truth and drowned just conclusions in the floods of an exuberant imagination. However this may be, we can agree with Fr. List, that the development of the manufacturing arts is one of the most powerful motors of progress, nothing perhaps contributing so greatly to the growth of civilization in all its aspects. But should we conclude, with this writer, that we ought to force this development and endeavor to produce it prematurely by artificial means? Certainly not; for in addition to the fact that such an attempt would certainly fail, it would, we repeat, postpone the realization of its object. — On the whole, a dense population is in some respects a great disadvantage for a country; the raw products of the soil are generally more costly there than elsewhere, and living more difficult. As a compensation for this disadvantage, it seems to be the will of Providence that densely populated countries should have a natural superiority in enlightenment, civilization and in-

dustry, which serves as an offset to the relative drawbacks of their situation. Is the compensation sufficient? We shall not examine this question here; but we can not deny its existence. To undertake the reversal of this law of Providence, by guaranteeing to a new and thinly settled country all advantages at once, is a chimerical and foolish project. — VI. It will be understood, after a proper consideration of what we have just stated, that it is the nature of the manufacturing arts to extend their domain incessantly and to acquire in time a relatively greater importance. Though agricultural industry is not absolutely stationary, though, like all other branches of human labor, susceptible of progress, still it has its limits, marked both by the extent of territory under cultivation, and the number of its productions; the field of manufacturing industry, on the contrary, is limitless, and the number of its productions infinite. "That part of agricultural industry," says J. B. Say, "which is devoted to the cultivation of the soil, is necessarily limited by extent of territory. Neither individuals nor nations can make their territory greater than it is, nor more fruitful than nature wished it to be, but they can increase their capital continually, and consequently extend almost indefinitely their manufacturing and commercial industry, and in this way multiply products which are also wealth." (*Cours*, part i, chap. viii.) In every country marshes can be drained, wild lands brought under cultivation, greater fertility imparted through cultivation to lands already tilled, but the number of these improvements is not infinite; an impassable limit is always met in the extent of the territory occupied. In like manner, the number of the products of the soil may be increased with time; in addition to the fact that this increase is itself limited, it is to be remarked that the cultivation of one of these productions of the soil necessarily encroaches on that of the other. In manufacturing industry, on the contrary, in which immense values can be produced on a very small space, by the aid of a large amount of capital, there are really no limits to production except the amount of capital and the number of wants. The variety of its products also is unlimited. It is therefore, we repeat, in the nature of things that manufacturing industry should increase in importance, in proportion as civilization progresses; while agriculture, without losing its rank of mother industry and feeder of nations, tends nevertheless to descend to the level of those which it ruled so long.—This change of position, evident in history everywhere, becomes especially striking when we compare the old condition of the nations of Europe with their present state. Consider, for example, what England was in the time of the Norman conquest and what she is today. She was then an almost exclusively agricultural country. The agricultural interest, the agricultural movement, dominated everything. A simple appendage of agriculture, manufacturing industry occupied a very humble position at its side, and was scarcely counted in the balance of the nation's interests. Consequently it arrested the attention of the sovereign but rarely. Several countries of continental Europe were more advanced in this direction, especially Italy, the Netherlands and some provinces of France, where from that time forth a certain number of cities were found which gave a rather striking activity to manufacturing industry; but even in those countries the agricultural interest had a visible preponderance — It is generally said in all the legislative assemblies of Europe, in speaking of each country separately, that agriculture is the great business of each country, in particular that agriculture is its predominant interest. This statement is often repeated in France; it is made even in England, and, for stronger reasons, in other countries. It may be there is right on both sides. But it is a remarkable sign of the times that it should be necessary to put forth and defend propositions of this kind, which formerly were so strikingly self-evident that the contrary could not even be conceived. These propositions alone prove that a certain change of front is gradually going on, and that the time draws near when manufacturing industry will occupy decidedly the first rank in the most advanced countries. There is no reason to complain of this. The relatively higher position which manufacturing industry occupies, is the most evident sign of a growing civilization. In the earlier ages of the world, when men were satisfied with the roasted flesh of animals as their only food, and their rough skins as their only clothing, with a hole in the ground or a hut made of mud and reeds or sticks as their only dwelling, it is quite clear that manufacturing industry had little to do and occupied but a small place. It is quite as clear that manufacturing industry occupied a greater place in proportion as the human race required better food, lodging and clothing, and raw products of the earth needed, in consequence, a more complicated and skillful manipulation.— VII. To obtain a correct idea of the importance which manufacturing industry has acquired, in civilized societies, we must not examine it merely in great establishments which are commonly called manufactories. It is far from being in these places in its totality. On the contrary, it is rather to be found in the infinite number of shops of the second or third order; in those of small manufacturers, artisans, of the men of all trades. Shops that are inconsiderable, when each is taken alone, are so superior to the others in number that when taken together they exhibit an amount of labor far beyond that which is executed in the great manufactories. "All labor," says J. B. Say, "expended on purchased material, even when it is fashioned for one's own consumption or that of one's family, may be classed with manufacturing industry. The mother of a family who spins flax or knits stockings for herself or her children, carries on a manufacturing industry. A tailor is a manufacturer, since the same quantity of cloth has a somewhat greater value when it is

cut and sewed into clothing than it had before. A locksmith, a bookbinder, are manufacturers; a baker, a pastry-cook, the keeper of a restaurant, are also manufacturers, since they purchase provisions and by a certain process render them fit for our use, and thereby increase their value. In cities manufacturing labors are carried on in every story of every house. In one place, buttons are made; in another, snuff-boxes; in a third, the links of a watch chain are made and put together; in a fourth, gloves are made or shoes bound. The perfumer plucks rose leaves; the apothecary pulverizes drugs; the optician polishes eye-glasses. All these labors are of the same kind, whether performed on a grand scale, in vast workshops where two or three hundred men are at work, or on a small scale, by the chimney corner." Much more subject to the division of labor than agriculture, manufacturing industry is usually divided into an infinite number of branches, so that it is nearly impossible to follow it in all its subdivisions. — VIII. Like agriculture and commerce, manufacturing industry has had serious difficulties to overcome at various times, without speaking of the natural difficulties connected with its own task. It has met the resistance of man and of things, especially in the imperfections of civil and political laws. If commerce has often been trammeled with artificial barriers, such as tolls, home and foreign tariffs, etc.; if agriculture, on its part, exercised all through the country, undefended, was more exposed than any other branch of human labor to exactions, violence and brigandage of every sort; manufacturing industry had to suffer also from many kinds of oppression. Despised and abased in antiquity, left almost entirely to the hands of slaves, it was generally trampled upon by governments and citizens. In the middle ages, though preserved in a certain measure, by the walls of the cities where it took refuge, from the exactions, the robbery and the despotism of the lords, it had to endure the almost equally brutalizing yoke of trades corporations. Later, it had still to struggle, particularly in France, against manufacturing regulations. It was in spite of these obstacles that it grew, and rose to the point at which it has arrived. — IX. Some are alarmed at the increasing predominance of manufacturing industry, to which they ascribe the greater part of the evils which afflict modern society. They are especially alarmed at seeing populations concentrate as they do in cities, and gather in great masses, whose existence seems often precarious, and who even sometimes become dangerous to the public peace. It would be better, they say, for this multitude to remain scattered through the country, devoted to the labors of the field, which would procure them a more assured existence and a better morality. Crowded together as they are in cities, they grow corrupt by contagion. Moreover, there is nothing less certain than the refined labor which the manufactories in cities offer them; generally better remunerated than labor in the country, it is more precarious, and the manufacturing industry is not seldom seen to abandon in distress and give over to despair the mass of those it has supported. — Those who reason in this way forget, first of all, that there is no choice to be made in this question: the relatively greater concentration of population in cities is the inevitable consequence of its increase. We have already stated that the field of agriculture has its limits; it has its natural limit in the extent of territory, in the possible extension of cultivation. Now, when population, by increase, has exceeded its limits, what is to become of it? Would it be convenient and profitable, would it moreover be possible to detain men in the country when they could no longer find employment there? True, it is sometimes said that masses of unemployed laborers are crowded together in the cities, while the country lacks laborers; but this is a mistake; these words are generally in the mouths of those who use ready-made phrases, and repeat them blindly, without examination. This state of things is impossible in principle, and does not exist in fact. The influx to the cities is the surplus of the country, nothing more; sometimes even the reflux is not so rapid as is necessary to maintain the just equilibrium of functions and forces, because the domestic hearth has its charms and the native village its attractions, and neither is abandoned without effort. This is proved by the single fact, that in ordinary times the wages of labor are less in proportion in the country than in the cities. There is a mistake, therefore, on this point; it is forgotten also that men multiply chiefly in the country; therefore, whatever may be said and done, is not the influx of the country population to the cities a necessary and inevitable movement? It is necessary also that this population should move toward the cities in greater numbers in proportion as it increases, because there at least manufacturing industry opens up to it an indefinite field of labor. — Is it true, on the other hand, that this labor is more hazardous, more subject to chance, than field labor? It is true, in fact, that in many branches of manufacturing industry, production has its intermissions, its moments of activity and languor; most economists have made this remark. Manufactured products which mainly answer to change in taste and fancies, are more subject to the fluctuations of demand than agricultural products which answer more to constant wants. When, however, it is merely a question in the tastes or the fancies of consumers, the evil is generally not so serious, because capital and labor are transferred without much trouble, whatever may be said to the contrary, from one kind of production to another, and the damage resulting from displacement is generally compensated for in advance, by the relative increase of wages and profits. What is more serious is this, that there is sometimes a general stagnation of production in manufacturing industry. "There are," as J. B. Say justly remarks, "periods in a

country where manufacturing industry is highly developed, in which there is no movement of labor, and when the whole laboring class suffers." (*Cours*, part i., chap. xviii.) In practice, nothing is truer than this. But we believe there is a mistake as to the ordinary causes of these stagnations of labor, when they are attributed to the uncertainties peculiar to manufacturing production and industry itself. However variable the tastes and wants may be to which this industry answers, they may be quite constant enough when taken together, unless other causes foreign to industry suddenly disturb production and labor. We have pointed out some of these causes under the heading COMMERCIAL CRISES (which see): there are also other causes in the uncertainty of political movements. Manufacturing industry, therefore, is unjustly blamed for those fatal crises which descend upon it without provocation on its part, and of which it is merely the earliest victim. — We will admit, however, that when these calamities come they affect field labor less than the labor of cities, because the first answers more to wants which can not be put off. But if manufacturing industry and commerce find causes of suffering in the irregular movements of political bodies, and the defective constitution of credit which affect them more directly, agriculture has its causes of suffering also, and perhaps more incurable ones, in the uncertainty of harvests and unfavorable seasons. A failure in the vintage threatens the existence of rural populations in the south of France, and a failure in the grain crop has more general and not less disastrous effects. If the sufferings of these people are less noticed it is perhaps only because being scattered over great spaces their complaints are less audible. — X. There is, besides, a general consideration which dominates this whole subject. It is this, that the concentration of a great manufacturing system in cities is the best guarantee, we might even say the only guarantee, of the tranquillity, the security and the liberty of the country. It has often been said, with justice, that manufactures nourish and vivify agricultural labor, because they absorb its products. Nothing could be truer. But it might be added, with no less truth, that the manufacturing population collected in cities are, with regard to the inhabitants of the country, vigilant sentinels who watch for them, advanced corps who defend them. Is it believed that the inhabitants of the country in Europe have always enjoyed the comparative liberty which is assured them to-day? Has their labor always been as regular, and their existence as peaceable? No matter how little any man has studied history, he knows that they have not. Now these populations have not risen to this superior position which they occupy without effort and trouble. Let us add that they have not won this position by themselves, and that they owe it above all to the manufacturing and city populations, which opened up to them in so many directions the way of civilization and progress. This remark is not a new one. It was made by Adam Smith, who himself borrowed it from Hume. "Commerce and manufactures," says he, "gradually introduced order and good government, and with them the liberty and security of individuals among the inhabitants of the country, who had before lived in an almost continual state of war with their neighbors, and of servile dependency upon their superiors. This, though it has been the least observed, is by far the most important of all their effects. Mr. Hume is the only writer who, so far as I know, has hitherto taken notice of it." ("Wealth of Nations," book iii, chap. iv.) An important result indeed, and which would suffice to destroy all the critical observations which the development of manufacturing industry has occasioned, by compensating richly for the real or supposed evils which this development may produce. Even if we consider the marvelous activity of manufacturing industry in modern times, we need not ask if the extension of industry has not been attended by some evils. We need not trouble ourselves to learn if in the present state of things manufacturing industry is as sure and as profitable as agricultural labor. We must ask, first, if this increase of manufacturing industry was not inevitable; then, if, in spite of partial suffering which it engenders, or which we wish to attribute to it, it has not produced a greater general benefit. In other terms, if the general condition of the human race is not to-day, owing to this same increase of manufacturing industry, greatly superior to what it was formerly. Thus stated, the question will be quickly solved. (See FREE TRADE.) CH. COQUELIN.

INDUSTRY, Progress of. In political economy this expression ought to be understood as the improvement of all the conditions on which the power and productiveness of labor depend. To appreciate correctly the magnitude of the results which we owe to industrial progress, as well as to distinguish with certainty the general characteristics which mark it, thought must go back to man's primitive condition, and the attention be given for a little to the principal industrial achievements which, in the course of centuries, have gradually brought about the present condition of things. — The immense multitude of different kinds of matter and force, of organized and living creatures which compose the terrestrial creation, was not, from the beginning, more particularly appropriate to our existence than to that of most other animate beings, but we received, more than they, the faculty of altering extensively, of completing in some sort to suit our own needs, the primitive creation, and thus only is it that this world has really become man's domain. — It is to the successive developments of this faculty, too little thought of, that we owe all the means of existence and of well-being accumulated by our race—means which have permitted it to multiply to a thousand times greater extent than it could have done had it been compelled to subsist

on the spontaneous productions of nature. To this faculty do we owe our success in changing completely, to our own advantage, the original proportions of the different species of living creatures; in substituting for the forests and plants which covered a great part of the earth irrespective of their suitability to our wants, those that might prove most useful to us; in arresting the increase of numerous species of noxious creatures; and in subduing and then multiplying at will all such as were of a nature to be useful to us. It is also by the more and more extensive employment of this powerful faculty that we have succeeded in fertilizing large tracts of desert, in drying up large tracts of marshy land, and in making the watercourses nourish our crops, move our machines, and transport us and our products; that we are enabled to extract from the bosom of the earth the shapeless metals destined to become the instruments of our labor and of our exchanges, the coal which we use in our homes and our manufactories, and from which we distil the inflammable gas which gives light to us in the night; that we can quarry from the mountain side and the crag those myriad buildings, palaces, temples, cities, roads, canals, etc., which are the boast of civilization; that we have discovered in compressed steam one of our most powerful natural helpers; that we have made of the seas and winds one of the great means of communication between the peoples distributed over the earth; that we have found in magnetism the guide to show us the way across the vast expanse of the ocean; and lastly, that we have made of that other mysterious force which we name electricity, the marvelous messenger which instantaneously transmits our thoughts to distances of thousands of miles. The faculty which has already been successful in obtaining such admirable results from the wonderful world which it has to explore, and which is possibly destined to obtain others still more astonishing, is that known to political economy as *industry*. We must then admit as industrial progress everything which tends to increase the power and productiveness of this faculty, all that contributes to swell the mass or the importance of the utilities of every sort which are the ultimate end of its action, the satisfaction of our wants and the necessary basis of the amelioration and diffusion of human life. Hence it follows that industrial progress can be shown in all useful works, without exception; in those of the savant, the statesman, the magistrate, the clergyman, the artist or the author, as well as in those of the agriculturist, the manufacturer or the merchant. The first named labor, or at least may labor, to develop and improve our intellectual and moral faculties, which are so closely bound up with our industrial faculties that the latter are necessarily elevated or debased with the former. Thus the labors of the savant, by extending our acquaintance with nature and with the properties of the objects submitted to our action, manifestly increase the real power of industry, and it is commonly labor of this sort which paves the way to the greatest industrial advances; the labor of the statesman or the magistrate has as its legitimate object to fit us for social life, to protect our life, liberty and property against violence or any attack that might be made on them, thus giving to all the security, lacking which, industry would soon cease to be productive; the labor of the clergyman or the moralist may, if it be well directed, tend to the same result by adding to the force of authority used by the legislator or the magistrate, the force of persuasion; they may, in addition, impart to life consolation and hope, which are utilities of no mean order, and they may also influence our passions and our habits by enlightening us as to their consequences in the manner most favorable to the productive power of our industrial faculties; finally, the labor of the artist and the author may also tend to the same result by cultivating and purifying our imaginations, our affectional faculties, by inspiring us with a taste for the beautiful and the good. True it is that the different kinds of labor have not always the tendency we have just attributed to them, and that instead of contributing to the amelioration of our intellectual and moral faculties they have often for effect, if it be not their aim, to deteriorate and degrade them; but if such be the case they are no longer useful works, and, far from assisting industrial advance, they are powerful obstacles to it. — The first want of all animate beings is food. As long as men look to hunting, fishing, or the few vegetable foods which the earth produces spontaneously, for their livelihood, their existence is a wretched one and little above that of the beasts; their wants, like their industries, are limited, and yet to live thus even in the sorriest way each individual must occupy a square league or more of fruitful soil. The first step in advance is taken when, abandoning the pursuit of their prey in the forest or the waters, men learn to assure themselves of their daily food by capturing the creatures most easily tamed and forming them into flocks which they feed, wandering with them from pasturage to pasturage which the untilled soil affords. But this means of providing food demands also the occupation of immense tracts of country by a small population, and in that case wants and industry continue extremely limited. The most important step in industrial progress is taken when populations, recognizing that they can by cultivation substitute alimentary vegetation for that which has not that quality, determine to exchange a savage or a pastoral existence for an agricultural one. — When it reaches this last degree of development, industry is in possession of the most powerful means which have been given it for the improvement and spread of human life; agriculture soon succeeds in producing a quantity of substances far in excess of that needed for the sustenance of the cultivators of the soil, population increases, and some are able

to turn their attention to other labor; henceforward wants increase progressively, and food, shelter, furniture, clothing, fuel, the want of utensils and machines of all sorts, of communication, of transport, etc., put to work whole masses of laborers, divided into series corresponding to each particular class of wants, then subdivided into a multitude of different professions, which form the special occupation of those who practice them. Since this specialization of labor rapidly increases the force of industry, wealth accumulates, and as its sum increases, populations find it easier to create new wealth; it is then that numerous classes can be exempted from material labor and may apply their energies to the cultivation and perfecting of human faculties. This last named variety of labor is no less necessary than any of the others to the continuation of industrial progress, for the obstacles to this progress appear as much in the imperfection of our moral faculties, in the evil bent of our passions, in the wrongs we are too prone to do each other, as in the things on which we act. — In the present state of civilized communities the main conditions most necessary or most favorable to industrial progress seem to consist: 1st, In security, which includes the maintenance of peace and the guarantee, as complete as possible, of property; 2d, In specialization of employments; 3d, In abundance of capital; and 4th, In freedom of labor and contract. —It will be needless to dwell at length on the intimate relations between industrial progress and security. In times of agitation, of trouble or of war, multitudes of men who might contribute to this progress, are occupied, on the contrary, only with what injures and arrests it, and those who are not directly engaged in hurtful acts, weakened in general by anxiety and by the uncertainty of the future, lose much of their energy. The experience of all ages proves that the most fruitful periods in industrial progress have always been those in which security and peace seemed best assured. It has only been through chance or by the efforts of men of genius that important discoveries destined to increase greatly the power of industry, have been made in a time of violence or disorder, but it is evident that it was not this condition of affairs which gave birth to them, and it was only after the restoration of peace and security that all the benefits derivable from them were obtained. — The security of property is the indispensable condition of industrial progress; for this progress is generally the result of a succession of efforts which no one would make unless certain of reaping the fruit of them. Without this guarantee, industry, far from making progress, would rapidly slip back to its original starting point. Where property is not secure, men must necessarily look upon one another as enemies rather than as friends. The idle and improvident constantly seek to take possession of what has been earned by steady and industrious men; and if the strong arm of the law did not hinder their aggressions they would become, by destroying all security, an obstacle to industry and to all idea of accumulation, and would thus drag down all classes of society to the level of hopeless destitution to which they have themselves fallen. (See M'Culloch's "Principles.") It is certain then that, all else being equal, industrial progress will be most rapid and most extensive where property is best guaranteed, not only against illegal attacks, but against those made on it in the name of the law itself or of public authority. — Adam Smith, in his endeavor to determine how it is that division or rather specialization of labor develops greatly the power of industry, assigns three principal reasons as its cause. The first, is the increase in aptness and dexterity which workmen gain by the constant repetition of one operation; the second, is the saving of the time which is unavoidably lost, in labor not sufficiently specialized, by passing from one operation to another; the third, is the facility given by specialization of labor, to the discovery of machines or of natural motors which may save human labor. It is especially by the last named of the three causes that division of labor contributes powerfully to industrial progress; by concentrating the attention of each worker on operations reduced to their simplest elements, it has paved the way for a multitude of inventions and discoveries. It would be an error to suppose, as has often been done, that division of labor does not sharpen and improve the inventive faculties, among workmen and artisans. As society advances, the study of the different branches of science and of philosophy becomes the principal or the exclusive occupation of the most intelligent men, and each of them, by concentrating his research and his thought on one special branch of knowledge, arrives at a degree of perfection or experience never, or at most very rarely, attained by those who busy themselves with all the sciences. (M'Culloch's "Principles.") — The possibility of specializing labor depends evidently on the power of exchange; without this power each one of us would be obliged to produce by himself all the objects of his different wants; it may therefore be affirmed that all which serves to extend the power of exchange, permits the increased specialization of labor, and in consequence contributes to the industrial progress which depends on that specialization. — It is easy to understand how this progress is furthered by abundance of capital; without tools or machines, without materials, without supplies resulting from previous labor, the most highly perfected industry could effect but little; it was only by the continued accumulation of capital that industry became powerful; and its power necessarily increases as capital increases. Suppose, for example, that it be desired to bring under cultivation a distant and uninhabited land; if those who undertook such a scheme began it with their hands only to help them, it would not be long before they would perish of want, however industrious they might be; but if

they arrived at the place well supplied with all the implements needed for cultivation, for clearing land and for transport; with provisions, cattle, seeds, etc., their enterprise might succeed, and their success would be the more assured the greater the capital they could devote to it, the better they were in a position to renew at need their supplies, until the newly broken land could furnish them itself. That a people may establish canals, railways, steam engines, electric telegraphs, etc., they must previously possess a multitude of workshops and of instruments necessary to the preparation of all the materials used in producing these things, unless they receive them ready made from some other people, in which case they must give in exchange other capital of the same value; they must also be provided with provisions of every description in sufficient quantity to support the workmen, while they are being established. Without those conditions, and as long as they can not fulfill them, they must resign themselves to remain deprived of these powerful means of progress and civilization. — We have enumerated, among the main conditions needful in industrial progress, freedom of labor and of contract. By this freedom all men are occupied with the career in which it is likely that they will contribute most to the production of wealth, because each man has been able to choose for himself the career which seemed to him best suited to his position and to his peculiar talents; on the other hand, each is urged by all the force of personal interest to multiply and improve the services which he can render others in the career which he has chosen, for with entire freedom in transactions, the rewards which he can obtain will necessarily be proportioned to the quantity or the value of his services, a value determined by the free judgment of the interested parties. Hence, it follows that the more extensive this liberty of the individual is, the more universal, persevering and fruitful will be the efforts which urge men to industrial progress. Experience also amply bears this out, for the history of industrial development shows that it is more powerful in proportion as each person is free to choose his own profession, to practice it as he understands it, (under the sole condition of respecting the liberty and property of others), and to dispose at will of the products he obtains. In our times the industrial power of any nation may be judged of by the extent of the liberty assured to its labor. The most progressive are those which have best known how to guarantee to every man the free disposition of his useful faculties and of what they produce; the least so, those where that freedom is most restricted, where work and commerce are most subject to regulation by the state. — We have already alluded to the fact that the division of labor is closely allied to the exchange of wealth, and that in restricting the latter, obstacles are thrown in the way of the industrial progress depending on the former. We may here remark, that on the day industrial populations shall have done away with or greatly diminished the legislative obstacles in the way of international trade, they will have opened the way to immense industrial progress; for these obstacles oblige each nation to devote part of its energy to those kinds of labor which with it are less favored by natural circumstances than they are elsewhere, and oblige it to restrain within the limit of what it can consume the exploitation of the special advantages of the country it occupies, which is simply squandering the gifts of Providence. — Industrial progress is rarely made without entailing some partial suffering, for it almost always consists in a new and more perfect mode of satisfying certain classes of wants which were formerly met by other means. The industrial faculties engaged in the abandoned processes can not always be turned immediately to other occupations; there is, therefore, more or less intense and more or less extended suffering undergone by all those whose special industry is thus rendered, at least temporarily, useless, and who are consequently obliged to change their calling. This is unfortunately an inevitable inconvenience connected with the gradual progress of industry. A. CLÉMENT.

INGERSOLL, Jared, was born in Connecticut, June 14, 1749, and died in Philadelphia, Oct. 21, 1822. He was graduated at Yale in 1766, was a delegate to the continental congress from Pennsylvania, 1780–81, and to the convention of 1787 (see CONSTITUTION), took the federalist side in politics, and was supported by the federal party for the vice-presidency in 1812. (See FEDERAL PARTY, II.) A. J.

INHERITANCE. The right of inheritance is the right by virtue of which goods of every kind are transmitted, after the death of those who possessed them, to their heirs or descendants. The person who succeeds to another's goods is called his heir; heritage is either the fact of transmission, or the thing transmitted, the right of inheritance is the principle by virtue of which the transmission is made. We shall here treat only of the right of inheritance. — The right of inheritance flows naturally from the right of property itself. "The right to dispose of what one owns," Charles Comte justly remarks, "is one of the essential elements of property." In fact, the owner's right over what he possesses is absolute, so that no one else can have any pretension thereto, either in the present or in the future, so long as he has not transferred it by his own act. This is a consequence of the very nature of property, and of the original causes of the institution of property. Hence the owner has the right to dispose of his goods in favor of whomsoever he pleases in the present, and, for the same reason, to dispose of them also after his death. This is a natural and simple conclusion, so simple and so natural that it has been sanctioned by the unanimous consent of all nations. — Nevertheless this conclusion has been con-

tested at different times by certain adventurous and frivolous spirits, who have pretended to oppose the rights of nature, such as they understood them, to what they have been pleased to style a mere social convention. "Can a man who is dead," asks Raynal, "have any rights? By ceasing to exist has he not lost all his powers? Did not the great Being, in depriving him of life, deprive him also of everything that was dependent on his last wishes? Can these wishes have any influence over succeeding generations? They can not. As long as he lived, he enjoyed, and rightly, *the land he cultivated.* Upon his death it belongs to the first person who takes possession of it and chooses to cultivate it. Such is nature."—It will be noticed, and is evident from the words which we have underscored, that Raynal here refers only to landed property, apparently not suspecting that there is any other kind of property. It is scarcely necessary to say that we give to the word *property* a much larger scope, applying it to goods of any kind that men can possess. If Raynal had taken it in this sense, which is the only one in which it should be taken, he would perhaps have realized, from the first, the injustice of his proposition. But what must we think of the singular plan which this writer proposes, even considering it from his own standpoint? After the death of a landowner, the first comer takes up his land, and cultivates it in his place; but he probably would not do this, without taking at the same time his plow, his oxen, his barn, his farm house, the unharvested crops, and those already gathered; for men do not labor with their hands alone, nor do they sow without seed, nor live upon air from seed-time to harvest. It is plain from the inconsistency and frivolousness of his proposition that Raynal did not even ask himself, if a landowner or farmer would take much pains to gather together all these things upon his place, when he knew that they would become, after his death, the booty of the first comer. Would he not, in this case, rather consume in his lifetime all he possessed, and leave after him but the bare land? Our author did not stop to inquire whether there would not always be, on his hypothesis, a number of new comers ever ready to quarrel over the dead man's spoils; he did not think of informing us how their rival pretensions could be reconciled. It is truly astonishing to find so much inconsistency in a man who, in the last century enjoyed considerable reputation as a philosopher and writer.—The plan which he afterward proposed seems not quite so thoughtless. He says: "Among the different possible methods of inheritance to citizens after their death, there is one which might perhaps find some supporters: it is that the possessions of the dead man should form part of the mass of public goods, to be employed first in relieving the indigent; next in continually restoring an approximate equality in private fortunes; and, these two important points accomplished, in rewarding virtue and encouraging talent."—This plan, which is not quite so absurd as the former one, has found supporters. It has been adopted, with some modifications, by a certain number of modern sectarians, who believed they were making a discovery in bringing it to light, and were astonished at the fertility of their own brains. Although it has become utterly impossible of application to landed property in modern society in its present state of civilization, this was not always the case, nor is it equally the case in all nations even at the present day. In fact, we find an institution somewhat similar to this in many barbarous nations, among whom the possession of the land is only for life, and this land, after the death of the titular owner, reverts to the public domain. This was the case in France, at least for certain landed estates, under the first French dynasty; and it is the case to-day in some very remote countries of the east. Applied to landed property, therefore, this system is not impossible of realization. The only strange feature about it is, that any one should dare to propose to us as progress, this practice, borrowed from barbarous countries and times, beyond which we have, most happily, so far advanced. As to personal property, which is by far the most important in our times, this system has been found impracticable in all countries and at all times. It would be, in the first place, a revolting injustice. Personal property, which constitutes what is called capital in political economy, is essentially the fruit of the possessors' labor. It has in some sort been created by them. By what right, therefore, can it be disposed of, even after their death, without their approval? To whom would the right of thus disposing of it belong? Do not our natural feelings tell us that property of this kind can legitimately go only to the natural heirs of those who produced it, or to those whom they themselves designated? Besides, even if we should refuse to recognize the force of these considerations, the system must inevitably fail, through the obstinate resistance of those interested, who would easily find means of saving their personal property from the hands of the usurpers. We may remark, moreover, that the most violent enemies of the right of inheritance have been themselves so strongly impressed by the evidence of this right, when considering the question, that they have rarely attacked the right of inheritance to personal property. They almost always limit the application of their system to landed property.—But within these limits, it is evident that the system is applicable only as long as the land remains unimproved, that is to say, as long as the owner has not collected and placed there the capital necessary to improve it: barns, stables, cattle, farming implements, etc., not to speak of the innumerable works of improvement which all lands require. This capital once collected and these improvements made, as both are almost always inseparably connected with the land itself, the same difficulties of fact and right arise as in the case of capital. The

truth is, therefore, that this system is applicable only in the infancy of nations, when men content themselves with performing on their land the transitory work of to-day, without establishing anything permanent thereon. The country which would undertake to perpetuate such a system would remain forever in that infant state in which alone it is possible. — "If I wished," says Charles Comte, "to refute the errors, borrowed from the Abbé Raynal, concerning the right of children to enjoy the goods left by their parents when dying, I could not help calling attention to the fact that the family spirit is one of the principal causes of the production and preservation of wealth; that a man, to insure his children a living, performs labor and undergoes privations, to which no other consideration would induce him to submit. I would point out to my readers that families conform their manner of living to their means, while, if the wealth of a man were not to pass to his descendants, he should accustom his children to the severest privations, and himself set them the example; that, consequently, he could derive scarcely any real advantage from his property, even during his lifetime. I would show to them, finally, that a nation in which children were excluded from succeeding to their parents, would, in a very few years, fall a great deal lower than the inhabitants of Egypt under the domination of the mamelukes, or the Greeks under the domination of the Turks." — We will not here insist too strongly upon these considerations, which will naturally recur under the word PROPERTY, where they more properly belong. But we must add a few words upon another phase of the question. — Although the right of inheritance, like the right of property itself, is absolute, it can and ought to be equally regulated by law. The provisions of the law are not, however, more arbitrary in this matter than they are on many other points. Their general object should be, in the first place, in some sort to force the dying man to fulfill the formal or moral obligations contracted in his lifetime; next, to avoid possible embarassments and litigation. — Since every man can dispose of his own goods, it is an undoubted principle that a dying man has the power to determine by will what division he will make of the fortune which he leaves after him. But if this man leaves children, shall he have the right to dispose of this fortune to the exclusion of his children? This does not appear to us as a logical consequence of the right which he enjoys. By bringing into the world beings who depend upon him, he has contracted toward these beings and toward society itself, the obligation to support them, to educate them, and to leave them, after his death, as far as his means will allow, in a position corresponding to that which he assured them in his lifetime. His right, therefore, here finds a natural limit in the obligations which he may have contracted. There are others of a different nature, equally deserving of notice, but which we shall not enumerate here, because it is the principle alone that we have here undertaken to lay down. CH. COQUELIN.

INSTRUCTIONS. This word, in politics, refers to the right in a government or in any portion of the people to direct or control the conduct of its or their agents, delegates or representatives. The existence of the right is determined by the nature of the agency or trust, and no more general rule can be laid down than this, that in all cases where the relations between the parties are essentially those of principal and agent a right to prescribe what the agent may or may not do is unquestioned, and that in the case of other relations, such as those arising from a trust, the right is uncertain. A distinction may be made between cases in which instructions are given to a person who is merely delegated to express in any assembly, such as a nominating convention, the predetermined wishes of his principals, in which case the instructions when given by the actual principals are properly controlling, and other cases in which the right of instruction is asserted over persons sent to a deliberative body, as a legislature, in which case they are not, since a legislator is not an agent, but a representative. But no invariable rule can be laid down in any case. In the diplomatic service instructions are specific and obligatory, but our diplomatic officers are strictly agents. The United States has never sent out a diplomatic officer with the representative character of an ambassador; our highest officers have been envoys, with full power for particular purposes, and their instructions have become more specific as the means of communication between states have been facilitated, and as the necessity of depending upon their discretion has thereby been lessened. In the last century a much wider latitude was allowed to all diplomatic officers than now, and their instructions were then more general, although defining their limits and manner of negotiations. The first of our own diplomatic officers, Commissioners Adams, Jay, Laurens and Franklin, accompanied the preliminary articles of peace transmitted to congress in 1783, some of which they had signed, without, as they had been directed to do, communicating them to the French government through Count Vergennes, with excuses for having "so far deviated from the spirit of our instructions"; and their disobedience seems to have been very kindly acquiesced in. At a much later day, however, the deviation from instructions was the reason alleged by the administration at Washington for the recall of Mr. Motley from his post as minister to England, although so far as can be ascertained from the publications relating to this particular case, Mr. Motley's deviations from the instructions of the state department were scarcely perceptible. — The instruction of members of constitutional conventions has been claimed as a right, but principally through the limitations of the powers of the convention by the legislature which called the convention. Thus, it seems to be decided that a legislature

may call a convention to amend certain articles of the constitution, and the convention so called can not propose amendments to other parts of the constitution not specified. (Mass. Sup Ct., 6 Cushing, 573; N. C. Convention, 1835.) In the Ohio constitutional convention of 1850 there was also some attempt to instruct delegates by the constituencies, and one delegate, who had been called upon to adhere to the instructions given him "strictly, or to resign," chose the latter course, without, however, expressly admitting the validity of such instructions. A conspicuous instance of the disobedience of all such instructions is afforded by the federal convention of 1787. All of the delegates to that convention, excepting those from New Jersey, were by their credentials restricted to the task of revising and amending the articles of confederation, and all of them disregarded that limitation on the plea of necessity. —The right to give instructions is of importance in connection with legislative bodies, and with nominating conventions. Blackstone says, that in the British parliament "every member, though chosen by one particular district, when elected and returned, serves for the whole realm, for the end of his coming thither is not particular, but general, * * and therefore he is not bound, like a deputy in the United Provinces, to consult with or take the advice of his constituents upon any particular point, unless he himself thinks it proper or prudent to do so." This principle was first asserted in parliament as early as 1571. It is admirably emphasized by Burke in defining the true relations of a legislator to his constituents, in the speech made by him to the Bristol electors after he had voted to extend the privileges of the Irish trade in opposition to their express instructions. In the United States the same theory of the general character of the duties of the members in both the upper and the lower chambers of a legislature has finally prevailed, although the history of the subject shows some wavering and a distinct tendency in one party toward the narrower view. During the debate on the first proposed amendment to the constitution in the house of representatives, in August, 1879, it was moved by Mr. Tucker, of South Carolina, to add to the clause which prohibits congress from making laws abridging various specified rights, these words, "to instruct their representatives." The proposition was vigorously supported by Elbridge Gerry, who said: "I presume that the gentlemen of this house do not mean to arrogate to themselves more perfection than human nature has as yet been found capable of; if they do not, they will admit an additional check against abuses, which this, like every other government, is subject to. Instruction from the people will furnish this in a considerable degree. * * * Now although I do not believe the amendment would bind the representatives to obey the instructions, yet I think the people have a right both to instruct and bind them." The motion was opposed by Madison, Fisher Ames and Roger Sherman, the latter saying: "It appears to me that the words are calculated to mislead the people by conveying an idea that they have a right to control the debates of the legislature. This can not be admitted to be just, because it would destroy the object of their meeting. I think when the people have chosen a representative it is his duty to meet others from different parts of the Union, and consult and agree with them to such acts as are for the general benefit of the whole community. If they are to be guided by instructions there would be no use in deliberation; all that a man would have to do would be to produce his instructions and lay them on the table and let them speak for him." The amendment was lost by a vote of 10 to 41. The feeling, however, was still very general that the people had some power of instructing their representatives, and of course that disobedience to such instructions entailed some penalty, though no attempt was ever made to specify what it was. John Adams, for instance, says ("Works," vol x., p. 605), "The right of the people to instruct their representatives is very dear to them and will never be disputed by me." Judge Tucker, speaking of the embodiment of a constituency in its representative, and its consequent right to instruct him, says (1 Black, 193 n), "However inadmissible this doctrine may be in Great Britain, it seems perfectly adapted to the principle of our government." This feeling found expression in the constitutions of several of the states, in provisions that the people have the right to petition, etc., and "to instruct their representatives." This is found in the constitutions of the following states: Arkansas, 1868, Art. I., Sec. 4; California, Art. I.; Florida, Art. I., Sec. 2; Indiana. Art. I., Sec. 31; Kansas Bill of Rights, Sec. 3; Maine, Art. I., Sec. 15; Massachusetts, Art. XIX.; Michigan, Art. XVIII., Sec. 10; Nevada, Art. I, Sec 10; New Hampshire, Part I -XXXII.; North Carolina Dec., Art. I., Sec. 25; Ohio, Art. I., Sec. 3; Oregon, Art. I., Sec. 27; Pennsylvania Dec. Rights, Tennessee, Art. I., Sec. 23; Vermont, Chap I.-XX; West Virginia, Art. III., Sec. 16. The words are substantially the same in the constitutions of each of these states, but they have been omitted in the latest constitutions of Arkansas and of Pennsylvania, and the clause was altered in the last constitution of Illinois so as to read that the people shall be secure in their right to "make known their opinions to their representatives" The same phraseology is also used in the constitution of Iowa, Art. I., Sec. 20, and in that of New Jersey, Art. I., Sec. 19. It is difficult to discover the object of such provisions The latter is obviously absurd, and if the language used in the greater number of the constitutions is to be construed as protecting the right of the people to give their representatives advice or information, it seems useless and equally absurd. If it is to be construed as meaning anything more than that, it not only does violence to the true and established conception of the function of

representatives, that they are to deliberate and to legislate for the *general* good, but it is also futile. No such provisions could give the instructions any coercive effect unless some penalty was attached to the disobedience of them, and no penalty in such cases has ever been imposed or suggested. — These provisions can be considered only as an expression of a feeling prevalent at the time of their adoption, of a vague distrust of any central government, and of the necessity for the fullest protection of individuals against it. Such provisions have, however, in conjunction with the earlier democratic theory of the sovereignty of the states, served to give color of authority to the frequent assertion of the right of a state legislature to instruct its senators in congress. Upon this topic Rawle says: "Some of the state legislatures appear to have viewed the relative duties of the senators whom they have appointed in a more restricted light than it is apprehended the constitution implies. It seems to have been supposed that the senators were bound to obey the directions of the state legislatures, and the language of some resolutions has been, that the senators be 'instructed' and the members of the house of representatives from the particular states 'requested' to make and support certain resolutions. But surely the opinion is erroneous; a senator is no more bound to obey the instructions of the state legislatures in opposition to his own judgment than a representative of the people in the other house is bound by the occasional instructions of his constituents. They are both elected for the purpose of freely and honestly exercising their own judgment according to the best of their capacities." (Rawle on the Constitution, p. 38.) The history of many states furnishes instances of the assertion of the right. John Adams bewailed it in Massachusetts in 1820, and in the same year the New York legislature passed a resolution "instructing the senators and requesting the representatives" from New York to vote against the admission of a slave state to the Union. The legislature of the same state also instructed its senators to vote for the tariff of 1828, and Van Buren, then a senator, obeyed these instructions in opposition to his personal wishes, although Webster insinuates that he procured them to be passed in order that he might, on the ground of a state's right to instruct its senators, excuse his tariff vote to the state's-rights and free-trade wing of his party in the southern states. — It would be difficult and unremunerative to ascertain how often this right to instruct senators has been asserted. Benton, speaking of the resignation of senator Hugh L. White of Tennessee, says that it took place "under circumstances not frequent, but sometimes occurring in the senate—that of receiving instructions from the general assembly of his state, which either operate as a censure upon a senator or which require him to do something which either his conscience or his honor forbids." While in the case of such instructions there has never been any attempt to provide means for enforcing them, the acquiescence of senators in the view that states had the right so to instruct, has sometimes given them a binding force. Thus in the case of Mr. White, who had been instructed to reverse his course of voting on certain measures and to support Mr. Van Buren's administration, Benton continues: "He consulted his self-respect, as well as obeyed a democratic principle, and sent in his resignation." A more conspicuous instance occurred in 1840. Messrs. Brown and Strange, both democrats, were at that time senators from North Carolina, and the whigs controlled the state legislature. The whig party had disavowed the doctrine of state instruction, but nevertheless in 1838 this particular whig legislature passed a set of resolutions denouncing the passage of the expunging resolutions by the senate, and also the course of the administration generally, and further resolved "that our senators in congress will represent the wishes of a majority of the people of the state by voting to carry out the foregoing resolutions." To this the two senators responded in a letter, dated Dec. 31, 1838, as follows: "The resolutions do not expressly instruct us to carry into effect the opinions expressed therein, nor are we able to perceive in them impliedly any authoritative command, such as instructions convey. We are therefore left to infer that it was the intention of the general assembly not to assert or to exercise the right of instruction. We have therefore publicly declared that whenever instructions are given us by the legislature we will either obey them or resign. We therefore respectfully ask your honorable bodies if we err in our construction of the resolutions, that we may be set right." The legislature, in reply, resolved that "the resolutions are sufficiently plain and intelligible to be comprehended by any one desirous of understanding them;" and it was insisted by Mr. Clay in the senate, and by whig newspapers, that the resolutions in question were really instructions, and that Messrs. Brown and Strange were, therefore, on their own theory, bound to resign. They presented the resolutions to the senate, but did not at once resign, presumably because that course would have destroyed the democratic majority in the senate. But their failure so to do subjected them to so much criticism at home that, in 1840, they tendered their resignations in such manner as to make the propriety of their course an issue at the ensuing state election, in which, as it resulted, the whigs won a decided victory. The case of the censure of Charles Sumner by the Massachusetts legislature, in 1872, may be referred to in this connection as an illustration of an entirely different and more modern view of a senator's duty under such circumstances. — The passage of resolutions in state legislatures requesting the representatives and senators from each state to pursue a particular course in congress, is still not infrequent, as, for instance, the resolutions passed by the New York legislature in 1881, urging the confirmation of President Garfield's

nominee for collector of the port of New York, which had been vehemently opposed by the New York senators, and the free-trade resolutions passed by the Iowa legislature in 1882. — The doctrine of instructions has been applied more frequently and more variously to delegates to nominating conventions than to members of legislatures, and perhaps properly, on the theory of the mere agency of such delegates. Without reference to local conventions it will be sufficient to trace the usage in this regard in the national conventions. From that usage it appears that the doctrine of instructions has been applied, first, to the instruction of district delegates by their actual constituents, through the caucus or convention selecting them; second, to the instructions by a state convention of all the delegates from that state, however chosen—but in such cases the instructions have in later years rarely extended to a direction to vote for a particular person, and have not gone further than to instruct the delegation to vote as a unit in accordance with the decision of the majority, thus constituting the well-known "unit rule"; third, the adoption of the unit rule by the delegation itself, and its own instruction to its chairman to cast all the votes of the delegation in one way or for one person. The democratic party has leaned toward the validity of the instructions in each of these cases, while the whig and republican parties have favored the opposite view, and it seems to be now settled in the latter party that delegates are not in any sense agents and bound by their instructions, but that each may vote his own sentiments. The principal instances in which the right of instruction has been asserted in national conventions are as follows: In the democratic convention of 1840 the delegates from most of the states were instructed to vote for Van Buren. In the democratic convention of 1844 the delegates from Massachusetts, Pennsylvania, Ohio, Michigan, Maine, New Hampshire, Vermont, Connecticut, Rhode Island, Louisiana, Alabama, Mississippi, Arkansas, Illinois and New York, were instructed to vote for Van Buren by the conventions which selected them, or else Van Buren had been actually nominated by those conventions. In this convention of 1844, also, the unit rule seems to have been asserted for the first time by Virginia. The delegates from that state were appointed en masse, and it was resolved that the votes of her delegates should be settled by the majority and counted per capita. In reference to this, Mr. Calhoun, in an address to his political friends and supporters, dated February, 1844, after animadverting severely upon the manner in which the convention was being packed, and refusing to allow his name to go before it, says: "I object not less strongly to the mode in which Virginia has resolved her delegates shall vote. With all due respect I must say I can imagine nothing more directly in conflict with the principle of our federal system of government, or, to use a broader expression, the principles upon which all confederate communities have ever been united. I hazard nothing in saying that there is not an instance in our political history, from the meeting of the first revolutionary congress to the present day, of the delegates of any state voting by majority and counting per capita." (Calhoun, "Works," vol. vi.) — In the democratic convention of 1848 delegates from North and South Carolina stated that they voted in accordance with their instructions. In 1852 the democratic convention resolved that each state should be entitled to the same number of votes to which it would be entitled in the next electoral college, without reference to the number of delegates in attendance, and "that the manner in which the said vote is to be cast shall be decided by the delegation of each state itself." The whig convention of this year adopted the same resolution excepting the last clause, and the whole of the resolution was readopted by the democratic convention of 1856. In 1860, at the Charleston democratic convention, the Georgia delegation was "requested" to vote as a unit, and Mr. Caleb Cushing, the chairman, decided that this amounted to an instruction which must be obeyed. The New Jersey delegates were "recommended" to vote as a unit, and this Mr. Cushing decided was likewise a binding instruction; but on this point his decision was reversed by the convention, which also decided that in the absence of instructions to a delegation to vote as a unit its members might cast individual votes. There was in this convention much intelligent discussion by the chair and others, of the whole subject upon instruction, and while the right to instruct seemed to be unquestioned, it was not clear what amounted to an instruction. — In 1860, also, the republican convention granted the right to two delegates from Maryland, after the vote of that state had been cast as a unit, to vote as individuals, and at this convention the unit rule was imposed upon the New York delegation by a vote of the delegates in caucus, under circumstances which are worthy of mention. It was feared that the delegation, which had been expected to vote unanimously for Mr. Seward, might break, and to avoid that contingency a caucus was called, from which all persons not delegates excepting Mr. Thurlow Weed were excluded, and through his instrumentality a resolution was adopted by a large majority instructing Mr. Evarts, the chairman of the delegation, to cast the solid vote of New York for Gov. Seward, and although this resolution was bitterly opposed as a gag law by several delegates, it was acquiesced in by all, and the vote of New York was cast as directed. — In 1868, in the republican convention, the Pennsylvania delegation presented a candidate for the vice-presidency under instructions, but when one member of that delegation refused to be bound by those instructions, and pleaded "the great principle of individual right to be represented in that convention," he was overwhelmingly sustained by the convention. — In 1876 a caucus of the New York delegation to

the republican convention attempted to instruct its chairman to cast the solid vote of the state for Mr. Conkling, as had been done in 1860 for Mr. Seward; one delegate, however, Mr. George William Curtis, asserted the right of every delegate "to vote his own sentiments," and declined to be bound either by the unit rule or the instructions of his colleagues; and the convention, by a vote of 395 to 353, sustained his position. In the same convention the Pennsylvania delegation was stated to have been instructed by the state convention to vote for Gov. Hartranft, and to vote as a unit under the direction of the majority. Four members of the delegation declined to obey these instructions, on the ground that they held credentials from their own districts and owed no allegiance to the state convention, and after debate they were allowed, by a vote of 395 to 354, to vote as individuals for Mr. Blaine. — The occurrences in the republican convention of 1880 are too recent to need more than a bare reference. The delegations from New York, Pennsylvania and Illinois were "instructed," and the convention, by a decisive vote, refused to consider them bound by their instructions. — In democratic conventions the validity of instructions and even their necessity is still recognized. The convention of 1876, for example, resolved "that the states be requested to instruct their delegates to the democratic national convention which is to be held in 1880, whether it is desirable to continue the two-thirds rule longer in conventions," and in democratic conventions the unit rule based on instructions is still in vogue, but it is to be presumed, only because of the lack of desire on the part of the delegates to break or violate it. Considered altogether, instructions for legislators or delegates appear, therefore, to be passing away with the ultra-democratic theory of the rights of states and of constituencies upon which they were founded; and happily, for the doctrine of instructions seems inconsistent with the theory of an intelligent and free representative system, and in practice it had become a mere instrument in the hands of machine politicians for the accomplishment of selfish ends and the perversion or the defeat of the wishes of the actual constituents.

FREDERICK W. WHITRIDGE.

INSURANCE is a contract by which one party undertakes to protect the other, to a greater or less extent, against the pecuniary consequences of certain accidents to which men are liable, such as the loss of property by fire or shipwreck, or the loss of future earnings by sickness or death. I. *The Need and Basis of Insurance.* The material possessions which constitute the property of man are, aside from the destruction of value which occurs in consequence of their use, constantly exposed to all kinds of injuries and losses, which are occasioned partly by human actions and partly by the hostile forces of nature. Even human labor is not exempt from this destiny, and, as it creates property, its temporary or permanent loss is connected with loss of property, not only to the laborer himself, but also to those dependent upon him. Of course many of these dangers can be warded off by the owner himself. His power to do so increases with increasing education, which teaches him caution, makes him acquainted with the causes of the dangers, and enables him to protect himself against the inimical forces of nature. Education has, of course, the same effect upon the diminution of those willful and careless actions by which the rights of others are invaded. Against other dangers of the same sort, whose removal exceeds the strength of the individual, the state protects by its courts and police. But it is impossible for the individual or the state to protect against all dangers to property, even with the best intentions. In spite of education, in spite of the best ruled state, serious accidents will happen, such as sickness, which disturbs or ends human labor; premature death of fathers, which exposes the widows and orphans to want; conflagrations, hail storms, floods, earthquakes, bad harvests, cattle plagues, shipwrecks, accidents in travel, bankruptcies, panics, crises, etc., etc. Losses of property by such occurrences are unavoidable. It goes without the saying that such losses may easily become ruinous to those upon whom they fall, and may prevent them from again taking up any remunerative employment. Since the loss is unavoidable, there is only one course to meet it—restitution. But who shall make this? In the case of malicious or careless actions of others, there is a legal claim to damage from that person. But what if the offender is unable to meet the obligation, or can not be ascertained? What of those losses caused by natural forces or by accident? The loser must bear all the loss himself in such cases unless he is assisted by charity. But it will not do to rely upon this source, since, as it is purely voluntary, no claim can be made to it, either upon the state or the individual. Nor would it be desirable to do so, since individual independence would thus be impaired. Fortunately there is another way to replace these losses. Human society suggests it by affording a kind of help which is perfectly consistent with the self-respect of the receiver, viz., self-help. A loss which is distributed among many is scarcely felt by the individual. When, therefore, a large number of persons who are threatened by the same danger unite and declare the loss which may happen to any individual in the union from this danger to be a common one, *i. e.*, to be a burden resting equally on all, a means of securing full restitution has been found. This will be made up by the shares of all members in the loss which by the terms of the society is to be a common one. By accepting the share which falls to him, every member secures the right of claiming full restitution in case a similar loss should occur to him. This is generally a small sacrifice in comparison with the advantage secured by it, which often consists in the averting of complete ruin. The injured party owes his

security against loss, therefore, not to any act of another's liberality, but to his own resources realized by union with others. The help afforded has the nature of an economical undertaking, and rests, therefore, on reciprocity of service. The individual member helps the others make restitution and receives in return restitution from them. This reciprocal aid is afforded by the contrivance of *insurance*, which has acquired in modern times such great importance and extension. The matter is so simple and the principle underlying it so plain that it is astonishing that such an institution did not exist in ancient times, that it was not born until the middle ages and did not acquire a really great importance until within a comparatively recent period. — II. *Object of Insurance.* We have described this in general already, but it needs a more careful definition. Not every direct or indirect loss is adapted for insurance. A loss intentionally inflicted by a person on himself can not be an object of insurance; the loss must be more or less accidental. It is not necessary, however, that the injury done shall be absolutely accidental. It is enough that it be accidental so far as the injured party is concerned, *i. e.*, not intended by him but caused by the actions of other parties which he could not hinder. It makes no difference whether the action of others which caused the injury was done on purpose, or carelessly or in ignorance of the consequences. Even loss which occurs through one's own negligence, if it is not too gross, does not exclude from insurance. However, in the present stage of the development of insurance, accident plays the principal part, and, in insuring, regard is had first and chiefly to it. But the object of insurance is still more limited. The injury must not be of such a kind that it can happen at the same time to a very large number of the owners of those objects threatened by it, or that it threatens a small class of persons very often and most others very seldom or not at all. If the first were the case, the amounts devolving upon the individuals to pay in order to indemnify the rest would reach such a height that it would be better for each one to bear his own loss. If the second should be true, there would be, in addition, the fact that the number of participants would be so small that no considerable advantage could accrue from a distribution of the losses. This is the reason that losses from floods, earthquakes, volcanic eruptions, avalanches, locust plagues and war are not proper objects for insurance, and why even insurance against the damage by hail storms has never become universal. The loss to be insured against must be, further, capable of estimation by statistics; it must occur with a certain regularity; the causes and occasions of its now frequent, now rare occurrence must be known. And even if these can not be traced back to certain natural laws, yet the "law of large numbers" must be applicable, and the long-continued and comprehensive observations necessary to ascertain this must not be neglected. Otherwise, there would be no basis for a decision as to the practicability of insurance, and as to whether and how far it would be advantageous; and thus the *sine qua non* of a sound insurance would be lacking. The science of statistics is, therefore, of great importance to insurance. With its development not only will the existing branches of insurance gain a firmer foundation and a wider extension, but it will render possible the establishment of new branches hitherto unknown. Thus it is possible that with the further evolution of the statistics of crime, insurance against theft, robbery, deceit, etc., will have a future, while, on the other hand, the failure of insurance against hail and the cattle plague to become as wide spread and firmly established as fire or life insurance is to be ascribed mainly to our present defective knowledge of their statistics. Finally, the injury to be insured against must be capable of easy investigation, both as to the manner of its occurrence and its amount. The exact investigation of its origin is especially necessary when it could have been easily caused by the insured party himself. — III. *The Insurance Premium and its Standard.* It has already been remarked that insurance is no one-sided transaction in which only one party gives and the other receives—it is not an act of charity. It rests upon service and counter-service, it is a contract. The service of the insured by which he acquires the right to indemnification for loss we call the insurance premium. It is the share of the total losses of all insured parties which the individual assumes when he joins the association. The premiums must also furnish the means of covering the running expenses, of accumulating the necessary reserves, of paying the interest on any borrowed capital which may be necessary, and, in case the insurance is undertaken as a business venture, of yielding a fair return on capital and labor to the undertakers. As a matter of course the amount of the premium can not be the same for every one insured, but must be regulated according to the eventual advantage which the insured party will get from the insurance. The value of the object insured is, of course, the most important element. The greater the value, the greater the injury which the loss of the same inflicts upon the possessor, and the greater the advantage which the latter derives from insurance. But there is also a second consideration. The insured objects are not all equally exposed to the danger, but some of them more and some less. In the former case the insured party will sooner and oftener be in a condition to make demands on the insurer than in the latter, from which it follows that the premium should be different in the two cases. The basis of the premium, therefore, is a double one, and consists in the value of the insured commodity and the degree of danger to which it is exposed. And it is only when the premium is fixed with reference to these two points that service and counter-service become equal. With a uniform rate of premium the possessors of the

more valuable and more exposed property would have a great advantage over the others. The value of the insured object is generally easily ascertained and its determination can generally be left to the owner. For, as the premium varies with the value and is expressed in per cent. of the latter, and as the increase of the premium consequently tends to prevent over-valuation, there is no great danger in so leaving it, provided that no restitution shall be made in case of intentional destruction on the part of the owner, and that the sum paid shall in no case exceed the actual loss sustained. On the other hand, it is difficult to estimate properly the danger. This depends upon various circumstances and relations which can not always be foreseen. And even if these should be known, their effect is oftentimes very various. The degree of danger can be most easily determined in the case of life insurance, since it depends in this case upon the rates of mortality, with which we are tolerably well acquainted, owing to the statistics which have been carefully kept for several generations. In other cases we must rely altogether on the law of general average, which needs longer continued observations to establish it thoroughly, than any we have yet obtained. According as the insurance is temporary, *i. e.*, relating to a single definite accident, or permanent, *i. e.*, relating to such accidents in general for an indefinite period, the rate of premium will be different. In temporary or occasional insurances the rate varies merely as the sum of the actual or probable losses in one definite instance; in permanent insurances, on the contrary, as the number and extent of the losses during a giving period, generally a year. In permanent insurance the premium is, therefore, periodical and generally annual, and is paid regularly every year as long as the insurance continues. The premium, of course, like the payment of every other service, is subject to the law of competition, which begins to make itself felt when competing insurance companies meet each other in the same field. Economy in administration, great extent of business, which effects an evener distribution of losses, exactness and caution in insuring and estimating losses, careful regard to the degree of danger, and rejection of all hazardous risks, permit a reduction of the premium without depriving the institution of its ability to meet its obligations. — IV. *Systems of Insurance.* The various systems of insurance may be classed, in the first place, as public and private, according as the insuring party is the state (or municipality) or an individual, either alone or in union with other individuals. The respective merits of the public and private systems of insurance will be examined when we come to discuss the relation of the state to insurance. There is another division of insurance systems into the industrial and mutual systems. The former has been sometimes called the joint stock or premium system. These terms do not seem very happy, inasmuch as a private individual or a political organization may adopt the industrial system, *i. e.*, the system in which the business of insurance is conducted for the same purpose as any other business, viz., to make profits for the undertakers, and since in both kinds the premium appears. Nor does the term "mutual" seem to be a good one, since all insurance is mutual and could not exist on any other basis. The only difference between the so-called mutual and the industrial systems consists in the peculiar way in which the principle of reciprocity expresses itself. While in the former case every participant is at once insured and insurer, and thus the element of mutuality appears directly, in the industrial system this takes place through a third party, the insurance undertaker, who assumes the rôle of insurer toward all insured and receives from them the premiums. In this system insurer and insured are distinctly opposed to each other in consequence of a division of labor. Instead of the owners of property performing for one another the service of insurance, they have this done by a third party who makes a business of it, and whom they pay for his services. The real distinction between the two systems lies in the speculative character which the industrial system possesses, and must possess, but which the mutual system lacks. The better terms, then, would be, the speculative and non-speculative systems. — The mutual insurance system needs no capital stock. The means of repaying losses comes exclusively from the contributions, or premiums, of the members. If the losses increase, the premium must be raised in order to make full restitution, as it may be diminished with every decrease in the losses. The premium is, therefore, variable, and is determined by the losses to be made good. As no profit is intended, these two items correspond almost exactly, the premium including a small per cent., in addition, to defray expenses of administration. The simplest way to manage the mutual system is to reckon up, after the lapse of a certain length of time, the losses which have occurred within that period, and to distribute the amount necessary to make them good among the individual members in proportion to the value of their insured property and the danger to which it is exposed. The premiums are then paid in. Of course, there is no reference here to any estimation of probabilities in reference to the happening of any accident; the premium varies exactly with the actual losses incurred. On the other hand, annual premiums may be fixed which the insured parties must pay in advance, these to be determined with reference to the average of losses likely to occur within the space of a year. If the amount of the premiums exceeds the demand of any year, the surplus may be added to the reserve, or treated as a profit and written to the credit of the various members on their next premium. If the losses exceed the premiums, the deficit may be made up from the reserve, or, in case there is no reserve, must be made good by subsequent payments. — In the

industrial or speculative system the premium is a fixed sum, by the payment of which the insured party secures the right of complete restitution under all circumstances, and nothing more. The insured can not be called upon to make good any deficit nor can he lay claim to any share in the profits of the undertaking. If the premiums amount to more than the losses and running expenses, the surplus belongs to the insurer as undertaker. It is his profit — the only consideration which can move him to carry on insurance as a business. On the other hand, if the premiums do not cover losses and expenses, the insurer must bear the loss himself; he has no further claim upon the insured. It makes no difference to the insured whether there are many or few accidents, whether the damage done is great or small. The responsibility of the insurer in this system necessitates a capital stock, which is usually collected by the sale of shares. The nominal sums are not generally paid up in full, but only from 10 to 20 per cent. of the same. It is seldom that further payments are necessary; for the premiums must equal the losses and running expenses. The amount paid up is used in getting a fair start, and if anything remains it constitutes a guarantee fund. The losses would have to be enormous if this fund could not cover them, or if it could not be easily replaced if it were necessary to take a portion of it. Masius makes the statement that in the course of forty years there was only one case in fire insurance and ten in hail insurance where further payments toward the capital stock were necessary. In order to be sure of punctual payment, however, in case of need, the shares are generally in the names of the shareholders, and these must bind themselves to make further payments, if called upon. The paid-up capital must, of course, pay ordinary interest, and the premium must be arranged with reference to that also. — Since the speculative system aims at a profit and can not exist without it, and since it needs, further, a capital stock on which it must pay interest, it does not seem probable that it can furnish insurance at the same rate at which the purely mutual system could do it, which does not care for profit and needs no capital. It would not seem, then, that the former could compete with the latter. For why should a man pay a higher sum than necessary for a given service? And yet we see that as a matter of fact the speculative system is not only able to compete with the mutual system, but is continually gaining ground upon it. Why is this? In the first place, the premium in the former is fixed; in the latter it is variable. Most men, if they have to make periodically recurring expenditures for any purpose, prefer a definite to an indefinite sum, as they know then what amount they must save and have at hand. And most men prefer to have the sacrifice which insurance demands measured in advance by a fixed sum, which they gladly pay even though it be higher than the average rate of the mutual system. For in this way they have one less variable item in their expense-list, and escape the unpleasant after-payments whose amount can never be determined beforehand. Further, and what is more important, the speculative companies, in spite of their profits and of their capital stock, often succeed in keeping their fixed premiums at the same height as the average rate of the mutual companies and sometimes even reduce them lower. They make this possible when they organize their administration simply, judiciously and economically; when they proceed with great caution in the acceptance of insurances, exclude objects of great risk altogether, accept very valuable ones only at a part of their value, and limit themselves to a certain amount in any one place; when they invest their premiums profitably and reinsure in other companies, and thus make them liable also. Of course, speculative insurance has the advantage over small mutual companies, since in the latter the distribution is not extensive enough to make the premiums reasonable. In short, here, as in other matters, the service which another renders us as a matter of business in return for pay, is frequently cheaper than that which we perform for ourselves. Some other advantages are claimed for the mutual system, but they are more apparent than real, and in no case important enough to give it the preference over the speculative system. A glance at the previous course of development leaves no room to doubt that the speculative system, even where it has as yet gained no foothold, is destined to take the lead. But it is desirable that mutual companies shall continue to exist side by side with the speculative companies, since their competition can not fail to have a good effect upon the latter, and they will find a wider field opening up to them whenever the speculative companies in their pursuit of gain lay themselves open to the charge of abusing the interests of the insured. — V. *Branches of Insurance.* Insurance is divided into several different branches, according to the kind of accident insured against or according to the object insured. The branches which have won a firm footing are fire insurance, hail insurance, animal insurance, transportation insurance, life insurance, mortgage insurance, glass insurance, and re-insurance. The limits of the present article forbid more than a brief notice of the two or three more important branches. — *Fire Insurance* covers those losses of property which occur through the destructive agencies of fire. Not every conflagration gives to the insured a claim against the insurer. If the fire arose from earthquakes or other unusual natural occurrences, or if it was occasioned by war or riot, no restitution is made, and of course none is made to him who caused the fire on purpose or through very gross carelessness. On the other hand, not only are damages paid which are occasioned by the fire, but those also inflicted in attempts to save the property. Fire insurance may be subdivided into insurance on buildings

and on movable property of various kinds, including not only the furniture in a house but also instruments, machinery, supplies of agricultural commodities, etc. Some companies take both kinds of insurance, some only one kind. Certain objects are generally excluded from insurance, partly on account of their great risk, and partly on account of the difficulty of protecting the company from being cheated, such as powder mills, smelting works, glass factories, theatres, cash, bonds, stocks, etc. As in other insurance the premium varies with the value of the object and the degree of the danger. In the valuation of buildings the cost of rebuilding in case of total destruction is the standard. In the case of old buildings a deduction is generally made to allow for diminution in value from age. In the valuation of movable property the average price forms the extreme limit. Several circumstances affect the fire risk in buildings, such as the style of building, whether more or less fire proof; the business which is pursued in it; the commodities stored in it; the condition of the building and the purposes for which the neighboring buildings are used; the position of the building in reference to its distance from other buildings; finally, the condition of the fire companies and the means of extinguishing fires. Buildings are divided by the insurers into several different classes according to these circumstances, and the premium is graded accordingly. So far as movable property is concerned, the degree of risk is determined both by the kind of commodity and the character of the building in which it is stored. Full information on these points is absolutely necessary to a proper determination of the amount of the premium, and the applications for insurance to be filled out by the insured party should contain corresponding questions. The application forms are consequently of considerable importance, and the careful investigation of all statements made therein is a life-and-death question with the companies. This investigation is the business of the local agents who effect insurance in the names of the companies by which they are appointed. Very much depends, therefore, on the proper choice of such agents. The companies can be more secure if they require an official attestation to the truth of the statements in the application. Especial care must be taken to prevent the company from being exposed to loss by a too high valuation, or by insurance of the same object in several different companies. Over-insurance may be prevented, if the company never pays more than the loss actually suffered, and if the nominal sum is paid only in case it is equal to or less than the loss. Many institutions attempt to protect themselves by refusing to insure for more than a part of the value. This precautionary measure has the wholesome effect of leading the insured party to leave nothing undone on his part which may serve to prevent or diminish the injury; while, on the other hand, it has the great disadvantage that it does not fulfill the aim of insurance. A double insurance of the same object deprives the owner of all claim on either of the companies. As to the period of insurance, the mutual companies generally issue no policies for less than six months, and many of them not for less than one year. The speculative companies insure for one month or even less, but charge a higher premium for doing so, while they make, also, important reductions in premiums on policies which run for several years. After every fire which has destroyed insured property the company makes a careful investigation of the accident, not merely to ascertain the amount of damage done, but also to find out the cause of the fire, as in certain cases already mentioned, the company is under no obligation to pay the policy. — *Marine Insurance* is the most important form of transportation insurance. Its object is the partial or entire cargo of the ship and the ship itself. It insures against the accidents which may happen to a ship during the sea voyage. The danger of such accidents depends upon the length of the voyage and the time necessary to make it, upon the character of the route, the season, the condition of the ship, the crew, and the degree of security from piracy. An experience of several hundred years has established pretty accurately the average number of such accidents, and their causes in the various seas, and the influence of the season on their frequency. As to the condition of the ship, there are companies of underwriters in the chief commercial cities, particularly in London and Paris, which keep experts in most seaboard cities of any importance throughout the world, whose business it is to investigate every ship coming in as to quality, condition and seaworthiness, and send them the information. On the basis of this information they classify all the ships yearly. The registers they keep are open to all marine insurance companies for a small consideration, and as they all make use of them they are acquainted with the facts in regard to any ship applying for insurance. They thus have little difficulty in fixing the premium according to the risk. The premium varies, of course, in the first place as the amount of the policy, and the latter as the value of the insured commodities. In fixing the amount of the insurance, so far as the ship is concerned, not only is its value but also that of its equipments and the costs of fitting for sea taken into consideration. The amount of insurance on the cargo is measured by the invoice value of the commodities, plus the costs of transportation to the place of destination, plus the insurance premium and some other items, among which is often found an imaginary profit of 10 per cent. The amount of insurance must not exceed the valuation; if it should do so in any case the company is not liable for the excess. The liability of the insurer extends to "adventures and perils of the sea, men-of-war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and counter-mart, surprisals, takings at sea, arrests, restraints, and detainments of all kings, princes, and people of what nation, condition or

quality soever, barratry of the masters or mariners, and all other perils, losses and misfortunes that have or shall come to the hurt, detriment or damage of said goods, merchandise and ship or any part thereof." But the insurer is not liable for losses occasioned by unseaworthiness, insufficient equipment, ordinary wear and tear, age, rottenness, or worm-eatenness of the ship, by the condition, decay or careless packing of the cargo, or by the fault of captain if he be owner of ship and cargo. The insurer is liable also to the insured for his share of the general average, by which is understood all injuries intentionally inflicted by the ship master on the ship or cargo or both, in order to save them from a common danger, and also all expenses incurred for the same purpose, for which ship and cargo are liable in common. If the ship should be laid under embargo by a belligerent nation, the owner has the privilege, after a certain length of time, to cede his rights in the same to the insurer and receive the insurance in full. — *Life Insurance* is a misnomer, since it is not the life that is insured, but a certain sum of money which the insurer must pay to the heirs of the insured after the latter's death. There is a marked difference between life insurance and other kinds of insurance. The insurance of houses and goods against fire is a contract of indemnity against loss, and in like manner an insurance on human life may be regarded as indemnifying a man's family or creditors or others interested against the loss of future income by premature death. But it does not necessarily take the value of such income into account, nor does it relate to any intrinsic value of the subject of insurance, which is the life of the insured party. Again, in fire or marine insurance the loss may be either total or partial. In life insurance the event insured against can not take place in any limited degree, and there is thus no partial loss. And again (in the ordinary kind of life insurances), the event is certain to occur, and the time of its happening is the only contingent element. In other kinds of insurance the events are wholly of a contingent character. The ordinary case of life insurance is that in which the service of the insured consists in an annual premium, and the payment of the sum follows upon his death. The insurance may be effected upon a single life or upon two united. The insurance upon a single life may be permanent, if it exists for its whole period, or temporary, if it is effected only for one or more years or against some particular danger (such as would occur in a journey) without any reference to time. The insurance upon two lives (survivorship insurance) is effected in such a way that the insurance is paid only on condition that the first mentioned outlives the other. Other forms of survivorship insurances occur in which the amount is paid to the survivors of a series after the death of any member. A person is permitted to insure not only his own life but also that of another, although it is taken for granted that he has some special interest in the life of the insured party, growing out of business or relationship. Life insurance assumes other forms also. The insured party may invest a certain amount of capital at the time of paying his first premium, or his service may be limited to a single investment of capital. He may contract that the sum insured him shall be paid to him during his life after reaching a certain age, or when some accident may happen to him by which he becomes unable to work. Insurance can be effected for another party in such a way that a certain sum of money shall be paid to him on reaching a certain age. Such insurances are effected by the children's providence associations and the dowry associations. The children's providence associations accept either single investments of capital or yearly contributions from parents, which they make, as a rule, in the early years of their children's lives, and insure to the children a certain sum when they have attained their majority. The payments made for children who die before they become of age are forfeited to the associations, and the latter are thus able to increase the amounts insured to the survivors. In a similar way are managed the dowry associations, except that in the latter case the money is paid on the marriage of the insured party. Many other forms of life insurance might be enumerated—over forty different kinds have gained a more or less solid foothold — but our limited space forbids pursuing the subject farther. — Without the assistance of an insurance office the ordinary individual would not be able to collect as large an amount of capital as he can by its aid. Even savings banks and other credit institutions, by means of which even small savings become profitable investments, can not supply the place of insurance companies. As a man does not know how long he will live, he can not tell how much he must save each year in order to leave his heirs a certain amount of capital But even if he could safely reckon on a long lease of life and should at an early period begin to save, it is questionable whether he would have strength of character enough to continue his savings in the way he began, and to resist the temptation to abridge or cease making them altogether and to consume what he had already saved. A man is too easily led to do one or the other when he has complete control over his own savings. One consoles one's self with the hope of soon being able to make up for lost time. Thus, after even a long life the fruit of saving is relatively very small. So much the more insufficient for the needs of the family must be the savings of him who is cut off early in life. Life insurance helps over all these difficulties. It secures to the individual a substitute for the guarantee of life which he can never have, by putting him in a condition in which the advantages connected with an average length of life are assured him, and by fixing his service with reference thereto; it keeps him from touching the savings accumulated, by depriving him of control over them; it prevents him from growing negligent in his economy by making him lose all he has

saved if he fails to pay one premium; it offers him, finally, in the insured amount a return for the sacrifices he has made, which is on the whole far beyond the average which any other plan would offer him. The pecuniary means of meeting their obligations are derived by the insurance offices from several sources. They come, in the first place, from the premiums which those pay yearly who maintain their policies, then from the money coming to them from temporary insurances, when the person has escaped the accident against which he was insured; from survivorship insurances, etc.; from the premiums of lapsed policies, and of those which they do not have to pay on account of violation of contract on the part of the insured (such as suicide, death in duels, execution, etc.); finally, from the income of premiums, etc., which they invest as soon as they are collected, so far as they exceed running expenses. — The service of the insured party, the premium, varies with the amount of the insurance, and the earlier or later occurrence of the contingent event. As this event is generally the death of the insured, it becomes of the highest importance to ascertain how many years are likely to elapse between the time of taking the insurance and the death of the party. The most important element in this calculation is the age of the party insured, as on an average a young person has a longer life before him than an older one. The insurance offices must, therefore, obtain exact information as to the expectation of life at different ages. This knowledge, without which its whole work would be unsound, is furnished to a satisfactory degree by statistics which can boast of greater success in this field than in any other, and has given life insurance a firmer foundation than any other form of insurance. Statistical observations on the rate of mortality at the various ages, and on the average duration of life, are tabulated in the mortality tables, which, beginning with a fixed number of persons of the same age, show for each year the proportion of deaths in that number and the expectation of life of the survivors. The first mortality table was constructed by Halley in 1693. Many others have since been published. The later ones, of course, are more valuable, since they are based on a larger number of cases, and because there has been a marked change for the better both in the rates of mortality and in the expectation of life within the present century. Many companies now use the seventeen offices' experience table, constructed in 1840, and based upon the experience of seventeen offices from 1762 to 1840, embracing 83,905 policies. With the aid of such tables the premium can be determined, so far as the probable time of the death of the insured is concerned, with almost exact mathematical accuracy, for all the different ages. The general rate of mortality is, however, affected by all sorts of modifications, such as the condition of health, the mode of life and the occupation of the different persons. It is necessary, of course, to take all these points into consideration in passing upon individual applicants. Weak and sickly persons, particularly those suffering from chronic diseases, as well as those engaged in dangerous occupations, are very properly excluded from insurance. As a consequence, not only the agents of the company but physicians also must be consulted in each case, and their decision considered. In recent times some companies have been formed to insure the lives of such as are ordinarily rejected, but it goes without the saying that such institutions rest on a very insecure basis and can not probably increase to any great extent. The minimum and maximum of insurance effected on one life by one company is often fixed by their rules, so as to prevent, on the one hand, the accumulation of small policies attended with a relatively great expense of administration, and on the other, the payment of many large sums at once which might endanger their solidity. — The *reserve* is an object of great importance to life insurance companies. Those who take out policies for life or for several years continue to pay the same annual premium which was fixed with reference to their ages on entering. They ought really to pay a lower premium at first, and as they grow older a higher one. The establishment of a uniform premium for the period of insurance which is calculated as the average of their yearly service, means, therefore, that in the early years they pay more, and in the later less, than the average rate of mortality would demand. It is necessary, therefore, for the company to save up the surplus received in the early years to cover the deficit of the later ones, when the risk increases. This accumulation is called the premium reserve. No solid institution with an eye to the future can afford to neglect it; it is one of the conditions of continued existence. — Since the great development of railroads the *Accident Insurance Companies* have grown rapidly. A company was established in London, in 1849, for insuring against the consequences of railway accidents. In 1856 the business was extended to all sorts of accidents, and there came into use a system of premiums graded according to the risk supposed to attach to various conditions and occupations of life. Many other similar companies have been established in nearly all civilized countries, and their business is growing rapidly. — *Annuity Insurance* is opposed to life insurance in two respects. While the latter insures the possession of new capital, the former converts capital on hand into yearly payments. And so, in life insurance the service of the insurer is not performed until after the death of the insured, while in annuity insurance it ceases at death. The early death of the insured is, therefore, as desirable to the office in the latter case as it is undesirable in the former. There are many different kinds of annuity insurance. The simplest form is that in which the payment of an annuity is assured until death to a person in return for the deposit of a fixed amount of capital. The

insured begins to receive the annuity at once or at some later period, usually after reaching a certain age. An annuity payable in the future is called a deferred annuity. The claim to an annuity of the latter kind can be acquired by yearly payments. The amount of the annuity depends upon the amount of capital invested, and the yearly payments (if any), upon the rate of interest, upon the time to elapse between the contract and the beginning of the annuity (in the case of deferred annuities), and, finally, upon the probable duration of the annuity, which, since it ends with the death of the insured party, is determined from the mortality tables. An annuity can be insured to a company of persons as well as to individuals. If it be given in such a way that the annuity of each member after his death is divided among the survivors until the last survivor receives the annuities of all, it is called a *tontine*. This system of annuities has been adopted by several companies. Annuity insurance enables the insured to receive a higher return on his capital, either immediately or in his later years, than the ordinary rate of interest would give him, or to secure to his family after death a considerably larger income than he could usually accumulate and leave them. He could not do this from his own resources, but the annuity office offers him this opportunity—at the cost, it is true, of the loss of his capital, which becomes the property of the office. The resources of annuity offices are in general the same as those of life insurance companies. — The other forms of insurance, although in some places well developed, are, compared with the preceding, unimportant. The guarantee of employers against the fraud or insolvency of their servants, has become of late years of considerable importance, carried on by the fidelity guarantee offices. Companies have been formed to insure against loss by hail, loss by cattle plague or horse diseases; to insure traders against loss from bad debts, money-loaners against loss from mortgages, etc., tradesmen against loss from breakage of plate-glass in shop windows, etc., etc. The practice of re-insurance has developed of late years into great importance. No one company, however large its resources, deems it prudent to undertake a risk to an unlimited amount in connection with any one locality or one kind of goods. An office might restrict its liabilities by refusing to insure to a larger amount than what it pleased to run the risk of, and although some offices have done so, yet the convenience of the insured and the interest of its own agents, to say nothing of other considerations, make it difficult for any office so to limit its responsibilities. It, therefore, issues a policy for the amount proposed to it, but reinsures a part with some other office or offices. Business to a very large amount is exchanged in this way, and there are some offices which professedly, and others which practically, live by the premiums paid over to them by other offices. Such a plan has many plain advantages for the public. It saves a man, among other things, all the trouble of hunting after offices willing to take heavy risks, since any one will take it. — VI. *The Economical Significance of Insurance.* It would be a chimerical idea to expect from insurance companies that they would undo the work of destruction, restore the destroyed values, and thus make good immediately the loss to the national wealth. No power on earth can do that. What has been destroyed remains destroyed; what has been done can not be undone. The only thing that we can get from insurance is a substitute for what has been lost. This substitute can come only from the stock of existing capital, and must therefore produce gaps elsewhere. The one loss can be made good only by other losses. The great significance of insurance, its inestimable service, consists in this, that it enables us to furnish a substitute without diminishing the capital employed in production. The premiums furnish the means of indemnity, and they are so small in proportion that they can be saved from the running expenses. Destroyed capital is, therefore, by the aid of insurance offices, replaced by small surpluses of income, by small savings from personal expenses And thus those far-reaching disturbances are avoided which the loss of so much capital would have caused in the national economy, since the individual injured would scarcely be able of himself to cover his loss without the use of his own or another's capital, and would, therefore, if not assisted, be compelled to limit his production. Of course, the accumulation of new capital is delayed by this method of indemnification, since the savings employed in paying premiums would often be invested. But a great point is gained if the existing capital is preserved unimpaired. The loss need not in that case affect the rate of interest on capital. Production suffers no limitation on its account, and there is, therefore, no diminution in the demand for labor—an unmistakable advantage for the laboring classes. And as the loss of invested capital may be prevented by a small outlay, insurance effects a material reduction of the industrial risk and consequently of the undertaker's profits, contributes thereby to an increase in the number of competing undertakings, and leads ultimately to lower prices of products. This is particularly true of commercial wares brought from a distance which could never be furnished so cheaply were it not for insurance. And thus production and consumption derive incalculable advantage from the way in which insurance companies procure the substitutes for the destroyed values. Without going any further into detail we may say that insurance has conferred the greatest immediate benefits on commerce, navigation and agriculture. Commerce and navigation could never have attained to their present wonderful development (a development of which antiquity and the middle ages never even dreamed) if transportation insurance had not stood by and taken upon itself the liability even into the most distant seas, for the danger which hourly threatened ship and cargo. As to agriculture, there

are two brancnes of insurance which exist for its sake alone—animal and hail insurance. The former protects a very considerable and valuable portion of agricultural capital, the latter protects the agricultural product through all the stages of its growth until its maturity and its harvest, upon which fire insurance continues this service until its consumption or its sale, while it secures, at the same time, the dwelling and working buildings of the farmer. But the advantage of insurance does not cease with what has been said, it reaches much farther. By replacing the lost capital and thus preserving production in its usual course, it contributes to the extension of credit which sets in motion the power of capital, makes it accessible to unpropertied brains, and increases production to the full extent of existing capital. By insurance the insured gains more credit, and the danger of giving credit is less to the creditor. This effect is visible enough in the case of owners of buildings which are insured. It is still plainer when credit itself becomes the object of insurance, as in mortgage insurance, which enables a landlord to exploit his credit to its extreme limit. Insurance does not limit itself, however, to the mere work of replacing lost capital; it appears in one of its chief branches—life insurance—as the accumulation of new capital. Of course, we might feel tempted to oppose to life insurance as the accumulator of capital, annuity insurance as the destroyer of capital. And yet in spite of the fact that the latter has some dark sides, and sometimes in the case of tontines degenerates into a mere game of chance, it has its unmistakable advantages, which make it in more than one respect a necessity. There will always be a great number of persons who will be much better provided for, much more effectually secured against poverty by means of an annuity than by a fixed sum of money. Of what advantage to a person unable to work, or to one economically untrustworthy, is the possession of a certain amount of capital if it is not large enough for him to live on the interest of it. He can not employ it himself, and is consequently much better off in possession of an annuity. If, moreover, the interest on the capital which a man possesses is not sufficient to support him, and, in lack of any other source of income, he is compelled to encroach on his capital, a systematic consumption of the same, such as is secured to him by an annuity, is certainly much more advantageous to him, because it secures him a higher rate of interest until his death, while without its assistance in the uncertainty of the length of human life he is exposed to the danger of consuming his capital prematurely and coming to want in his old age. Life and annuity insurance exercise, moreover, beneficent influences which extend beyond the sphere of economical life, and are yet indirectly of great importance to it. The father is thereby freed from the tormenting fear of leaving poverty and distress as a legacy to his family, or of seeing them suffer when he, on account of age, has become unable to work. By comparatively small annual payments which he can save from his income, or by a small investment of capital in such an institution, he can secure a round sum of money or an annuity which will raise those dependent upon him above the fear of poverty or will procure for himself a pension in his old age. This prospect increases his self-confidence, encourages industry and saving, keeps him from useless expenditure, and favors the growth of an economical sense. Life and annuity insurances, therefore, contribute essentially toward establishing happiness and content in the family, and to strengthen the family spirit—that pillar of all social and political order. This moral influence inheres indeed in all branches of insurance, since all insurance rests on the basis of self-help, which has an undeniably moral value, not only on account of the above-mentioned personal and material conditions which every one who wishes to take advantage of it must realize in and about himself, but also in view of the effects it has upon him. It raises him above the sad necessity of relying in misfortune upon the pity and charity of his fellow-men, and saves him from the humiliating feeling connected with it. Whoever receives alms from others has lost his independence and can no longer consider himself their equal. In the consciousness of equality and independence lies the richest source of moral improvement Insurance, by opening up the way to an effectual self-help in a wide sphere, becomes, therefore, a moral educator, and a political one as well, since a free state in order to continue must have self-responsible, self-helping citizens. But quite as striking as the moral side of this self-help is the economical side. It reveals to us insurance as a contrivance which counteracts pauperism with a marked success. In numberless cases pauperism springs from such misfortunes as are the objects of insurance, and whose consequences can be avoided by taking advantage of it. If there were a universal participation in the various branches of insurance the sacrifice which the support of the poor demands of society would be very much less, and the public support of the poor, which is of very questionable advantage, and, therefore, condemned by many economists and statesmen, would be largely unnecessary. The presence of insurance offices in such numbers as to make them accessible to all, would justify the state in refusing public aid in all misfortunes against which they insure, for the sufferer who has neglected to insure is responsible for his own loss. When we consider, further, that we owe to fire insurance a better condition of our buildings, all sorts of precautions against fires particularly in manufacturing districts, and essential improvements in the fire extinguishing systems (which are in some places in the hands of the insurance offices); that transportation insurance has improved the construction of ships and other means of transportation; as well as contrivances for saving lives and goods in shipwrecks; and that animal insurance has led to a better

treatment and a more careful management of animals, to greater attention to all kinds of animal diseases, and more frequent recourse to veterinary help; we can hardly doubt that insurance should be classed among the most beneficent and public-spirited devices which the mind of man ever conceived. — VII. *The State, and its Relations to Insurance.* The first question arising in this connection is, naturally enough, Should insurance be a public enterprise undertaken by the state or municipality? Insurance was first introduced into many of the continental nations by the government, and for a long time nearly all insurance was effected by the state. Even now many cities and states carry on some particular branches of insurance. The history of insurance justifies us in laying it down as a rule, with few exceptions, that the state should not attempt to perform the office of insurer. Wherever private institutions have been allowed to compete with public ones they have slowly but surely driven them from the field in spite of many obstacles placed in their way. Nor is this surprising. The state is not suited to prosecute speculative insurance, because it lacks all those qualities which are necessary to the profitable pursuit of an industrial undertaking. The zeal animating a private undertaker to attain the greatest possible results with the least possible expenditure, and to appropriate to his own use without delay for this purpose every technical improvement, is foreign to the state, nor has the latter the same watchful eye for the wants of the public as the former. Since the industry must be carried on by hired servants whose slack zeal needs constant supervision, everything which the state undertakes in the commercial or industrial field acquires a character of painful smallness and clumsiness; everything bears the stamp of bureaucracy instead of commerce. The state spends more and accomplishes less, and consequently it is at a disadvantage as compared even with those private associations which seek to satisfy their need of insurance by mutual institutions. For a private association has more freedom and less expense of administration. From which it is clear that those are seriously mistaken who expect a cheaper and better service from the state in such matters than from private companies. There are circumstances, however, we must admit, which not only justify but demand public insurance. If public spirit and a tendency to association are lacking in a people; if the desire for far-reaching undertakings has not shown itself, and at the same time an appreciation of the advantages of insurance has not yet grown up; in a word, if all the presuppositions of the establishment of insurance offices by private parties are wanting, then the state may wisely take the initiative and proceed with the institution of public offices. Otherwise, the nation might have to wait much longer for the introduction of these beneficent institutions. And yet, even in such cases, the state should aim at educating the people as soon as possible to such an extent that private enterprise would take the business off its hands. — It is interesting to notice the very different attitudes of various governments toward insurance. Continental states began, as a rule, with the closest and most detailed supervision of the insurance business. To examine their laws on the subject, their limitations, prohibitions, precautions, etc one would think that they were intended to make a dangerous enemy harmless, instead of being intended to control one of the most beneficent of human institutions. Continental progress has constantly been toward a broader liberty, toward less interference. England, on the contrary, and particularly the countries of the new world, began with the utmost liberty and have been moving toward a limitation and supervision of the insurance business. Neither party will ever reach the point from which the other started, nor can it be said that any state has yet reached the true policy in reference to public control of insurance. Our American states have tried numberless plans, all of which have proved to be complete or partial failures. Nor has any scheme been devised of preventing huge frauds from being perpetrated on the public in the name of insurance. Governments have not even been successful in securing full publicity. Government inspection is open to the serious objection that, while it is notoriously unsuccessful and inefficient, it yet lulls the public into a false security as to the stability and soundness of inspected companies. The attempts of our state governments to control the insurance business have often had the effect of embarassing and endangering perfectly sound companies and knocking the foundation of a solid business from under them. The legislation has been uniformly in the supposed interest of the policy holder. But, as often happens in legislation for a particular class, the matter is carried too far and results in injury where benefit was intended. Thus, any control which seriously increases the cost of insurance must redound, in the long run, to the disadvantage of the insured. Laws to prevent the forfeiture of insurances by the failure to pay premiums, and regulating the payment of surrender values and the grant of paid-up policies, are too favorable to withdrawing members and tend to weaken the companies by encouraging the retirement of the most healthy and profitable lives. In a word, the tendency of state supervision is "to interfere injuriously with honest and well-conducted companies and to afford but a feeble protection against those of a different class; to involve the state in the odium of failures which it is supposed to be its duty to prevent; to lessen the sense of responsibility among those who control the offices and the spirit of prudence and watchfulness among the public; and to place in the hands of public officials a power and influence which are apt to be abused and are always open to suspicion."—VIII. *Literature.* The literature of the subject is large and constantly increasing. The articles on insurance in the various general

cyclopædias contain brief and interesting summaries of information on special points. The article on *Versicherungsanstalten* in Bluntschli and Brater's *Staatswörterbuch* formed the basis of the present article, portions of it being simply an abridgment of the former. A very full summary of the literature on the subject in German is appended to the article just mentioned. All the standard works on political economy in German contain sections on insurance, treating it among the promoters of production. The special cyclopædias, in German, French, Italian and English, treat the subject with more or less completeness. Among the works in English the following deserve especial mention: the *Insurance Cyclopædia*, by Cornelius Walford, a work now in progress and covering the whole subject of insurance; the British *Blue Books*, containing full information as to all British companies; the *Reports of American Commissioners* in the various states; *Insurance Handbook*, by Cornelius Walford; the *Law of Fire Insurance*, by C. J. Bunyon; *Observations on the Rate of Mortality of Assured Lives*, by James Meikle; the publications of the institute of actuaries in England: and the various periodicals published in the interests of insurance in Great Britain, Germany, France and America. E. J. James.

INSURRECTION. Of all the trials to which political societies are unfortunately submitted before attaining their final constitution, the armed revolts attempted by minorities, either to obtain concessions from the ruling power, or to deprive it of its very authority, are not the least. When parties engage in strife with one another, insurrection is, so to speak, the last resource of the vanquished, and by its means force and audacity frequently triumph over right and reason. But if, on the one hand, history recalls instances of disastrous disorder, caused by popular revolt, it tells us also that, at periods of social transformation, the most certain elements of political progress have been produced many a time by insurrections. When despotism, thanks to the reaction which always occurs in a single day of these violent shocks, has not been able to strengthen itself, the bold attempts of minorities, who are forced to act against the laws, have the happy effect of robbing absolutism of all its prestige, and of hastening the realization of the conquests which public opinion had demanded in vain. — We repeat, it is only in transformation periods that these phenomena can prove beneficial. As much as we applaud them then, just so much must we mistrust or resist them when progress, guaranteed by the institutions themselves, can follow its normal course. Nothing, therefore, can justify insurrection in principle, neither recollections of the past, nor any laws the parties may invoke. Robespierre has pompously styled it "the holiest of duties"; it is in reality neither a right nor a duty, but at most, under given circumstances, a sad necessity. And these circumstances must be carefully studied, in order that the responsibility for the results may always rest upon the authority which provokes them, and not upon the men whom they let loose upon a society already threatened. We here anticipate a sort of displacement of rights, or inversion of their order, that is, the case in which the government, being assailed, itself sets the example of rebellion, by the arbitrary suppression of constitutional rights, and the promoters of an insurrection find themselves the natural defenders of the laws and institutions. — It is true, perhaps, that by this doctrine we still leave a wide door open to popular excesses. What party will not be ever ready to invoke, for the benefit of its passions, the exceptional circumstances which place on its side the merit of a grand initiative? What facilities do not bold agitators possess to lure the excited crowd on to their path, and urge them to a resistance so much the more energetic and violent as the means used consist entirely in working upon popular credulity and ignorance? It is natural for low minds to seek the realization of their hopes in the most brutal exercise of their rights. — But these fears will gradually disappear, for the favorable opportunities formerly left to turbulent or audacious minorities are made fewer every day by the concessions made to democracy, and especially by the introduction into all political constitutions of guarantees for the free expression of the popular will and of respect for the same. One might say that the masses can henceforth, in the struggles which may arise between themselves and the authorities, seek shelter under a more worthy rampart than the barricades of the highways, we mean the rights, every day more extended, whose peaceful and steady use has made of them an arm ever raised against arbitrary power and despotism. When embodied in constitutions, these rights paralyze revolutionary efforts and destroy beforehand the ambitious calculations of those who foment insurrections. — France is perhaps the country in which popular insurrections have occurred most frequently. After France comes Spain But in Spain, as all know, these uprisings have generally been of a military character, stirred up by pretenders or by chiefs of parties, the prime movers being officers of the army, opposing flag to flag, or waving the national flag at the very foot of the throne. Italy also has had her bloody pages, the saddest of which is one which dates from the epoch of her political reconstruction, and bears inscribed upon it the name of one of the most popular heroes of Italian independence. Insurrections are not unknown in Germany, nor even in Switzerland; Belgium is itself the fruit of a popular uprising. In Spanish America, examples are even of more frequent occurrence than in Europe. The South American republics, not firmly established or badly governed, found from the beginning that they had borrowed from European civilization the most lamentable excesses of political agglomerations. — So much for

what we call internal insurrections. There are others of which we will speak here. The reader will readily divine that we refer to those insurrections that are fomented by a whole people, and have for their object either to break a federal compact, or to abolish treaties which weigh down a vanquished nation. These occupy in history a place apart. They very frequently involve all political and social equilibrium, by calling into question again an organization which had been established at the cost of great labor and care. On the continent of Europe they have often led to the alteration of ideas of diplomacy and given rise to important questions of principle. The first of these questions is that of the enfranchisement of nationalities, which immediately provokes inquiry as to the right of intervention or non-intervention. — The principle of nationality can not be made the subject of particular observations in this article. (See NATIONALITY.) Let us merely state that it is in this principle that these national insurrections, which are to internal insurrections what riots are to revolutions, find their source. In like manner, we shall not dwell upon the principle of intervention, whose application may exercise a direct influence upon the results of an insurrectional movement. (See INTERVENTION.) In general, we think that all interference on the part of foreign governments in the affairs of a country where questions of partial enfranchisement or of restoration are being agitated, is blameworthy. If there be diplomatic action in favor of any cause, it is proper in certain cases, and the law of nations enjoins it whenever the rights of humanity and civilization are involved in the political interests of the debate. But, beyond this moral intervention, it is apt to lead to a breach of international pledges, respect for which forms the basis of political societies. — To sum up, the insurrectionary movements that have occurred in the past seem to have been, not unfrequently, explosions which a careful authority would have easily prevented, by making honorable concessions, or by allowing greater liberty to political life. When nations have been compared to the impatient and restive children of a family, over whom paternal severity is called upon to exert itself, it should have been added that none of these régimes in which no account is taken either of age or temperament, should have been applied to either one or the other. Nature which has its wants, has also its revolts. Thus it was that insurrections were nearly always the consequence of restrictions too long imposed upon the satisfaction of the wants of nations, and thus it is also that we see them nearly always preceded by the same phenomena. Let us hope, therefore, that the progressive extension of public liberties will entirely prevent the return of those catastrophes, formerly of periodical occurrence in certain countries; for liberty is ever the best preservative against excesses of every kind. The evils attendant upon liberty, carry with them their own remedy, and nations can be really educated only under a system which facilitates the combined action of all minds and forces. ERNEST DRÉOLLE.

INSURRECTION (IN U. S. HISTORY.) I. The constitution (Art. I., § 8, ¶¶ 11-16,) has given power to congress to declare and maintain war, and to provide for organizing, arming and calling forth the militia to execute the laws, suppress insurrections and repel invasions. The power has been exercised, 1, by the passage of the several general acts hereafter specified, and 2, by the suppression, through the president and the federal forces under his command, of two insurrections. (See WHISKY INSURRECTION, REBELLION.) — The act of May 2, 1792, authorized the employment of militia by the president to suppress insurrections, upon notification by a federal associate justice or district judge that the execution of the laws was impeded by combinations too powerful to be suppressed by the ordinary course of judicial proceedings. The act of Feb. 28, 1795, amplified the foregoing act by authorizing the president, on application of the legislature of a state, or of the governor when the legislature could not be convened, to call forth the militia of other states to suppress an insurrection against the government of the state. The act of March 3, 1807, provides that, "in all cases of insurrection or obstruction of the laws, either of the United States or of any individual state or territory, where it is lawful for the president of the United States to call forth the militia for the purpose of suppressing such insurrection, or of causing the laws to be duly executed, it shall be lawful for him to employ, for the same purposes, such part of the land or naval force of the United States as shall be judged necessary, having first observed all the prerequisites of the law in that respect." It is important, therefore, to remember that the "prerequisites" under this act were, 1, the notification of an associate justice or district judge that the execution of the laws is obstructed, or 2, the application of a legislature or governor. No further provisions against insurrection were made until 1861. — The breaking out of the rebellion brought out a state of affairs unprovided for by law. None of the governors or legislatures of seceding states were at all likely to call for federal interposition; the district judges in those states, as well as one of the associate justices, had resigned; and no associate justice appears to have notified the president that the laws were obstructed—at least there is no assertion of any such notification in the president's proclamation of April 15, 1861, calling for 75,000 militia. It is apparent, then, that the "prerequisites" for calling forth the militia, or employing the regular forces to suppress insurrection, had not been observed; and that the proclamation, though the war department's notification to the state governors based it on the act of Feb. 28, 1795, could not be defended by referring it to that or any of the other acts above referred to. — The procla-

mation, however, and the other steps to suppress the insurrection which were taken before the meeting of congress in July, have a different ground of justification in those clauses of the constitution which make the president commander-in-chief, and direct him to "take care that the laws be faithfully executed." His powers and duties under these clauses can hardly be more clearly stated than in the opinion of the supreme court in the case of The Brilliant cited below. "If a war be made by invasion of a foreign nation, the president is not only authorized but bound to resist force by force. He does not initiate the war, but is bound to accept the challenge without waiting for any special legislative authority. And whether the hostile party be a foreign invader, or states organized in rebellion, it is none the less a war, although the declaration of it be unilateral. * * * The president was bound to meet it in the shape in which it presented itself, without waiting for congress to baptize it with a name. * * * Whether the president, in fulfilling his duties as commander-in-chief, in suppressing an insurrection, has met with such armed hostile resistance, and a civil war of such alarming proportions, as will compel him to accord to them the character of belligerents, is a question to be decided by him." (See WAR POWERS.) — The unusual circumstances of the case, and the criticisms of some of the president's measures (see HABEAS CORPUS), induced the passage of the act of Aug. 6, 1861, whose third section approved, legalized and made valid all the acts, proclamations and orders of the president after March 4, 1861, "to the same intent and with the same effect as if they had been issued and done under the previous express authority and direction of the congress of the United States." This validation seems hardly more necessary in this case than in that of a neutrality proclamation; it was given more effectually and more properly by the act of July 13, 1861, restricting intercourse with the insurrectionary states, the act of July 29, 1861, authorizing the employment of the militia and land and naval forces to suppress insurrection whenever it should become impracticable, *in the judgment of the president*, to enforce the laws by ordinary process, and the various acts appropriating men and money for the support of the president in suppressing the rebellion. (See REBELLION.) The dividing line between the functions of the various departments of the government in making war and in suppressing an insurrection is not a bold one, and yet it is not difficult to trace it, except where it is obscured by party passion. — The power given to the president by the enforcement act of April 20, 1871, to suspend the privilege of the writ of *habeas corpus*, and to employ the militia in suppressing any combinations which, in the judgment of the president, should prevent the execution of the laws, and the provision of the same act that such combinations should "be deemed a rebellion against the government of the United States," were more objectionable on the question of expediency than on that of constitutionality; the strongest arguments against them were drawn from the bad character and untrustworthiness of many of the executive agents in the south, on whose report the provisions of the act were to be put into operation. (See generally, EXECUTIVE, CONGRESS, WAR POWERS, RECONSTRUCTION, CIVIL RIGHTS BILL.) — II. DOMESTIC INSURRECTION. The constitution (Art. IV., § 4) makes it the duty of "the United States" to guarantee a republican form of government to every state, and to protect each state against invasion and against domestic violence. No evidence of invasion is required; the application of the state legislature, or of the governor when the legislature can not be convened, is to be taken as evidence of domestic violence. As the duty is imposed upon "the United States," it is imposed not upon any one department alone, but upon all — upon the federal courts in their decisions, upon congress in its legislation, and upon the president in his execution of the laws. — It would be easy to name many forms and features of government which are not republican; it is not at all easy to define a republican form of government as intended by the constitution. The essence of it seems to be in the untrammeled existence of a legislative department chosen by popular vote. So long as this feature is present, the United States do not interfere to correct abuses, or what seem to be abuses, which the people of the state do not care to correct. To do so would be to keep the people of the state in a condition of pupilage far more emasculating and inconsistent with the idea of a republican government than the abuses from which they had been rescued. If the people of a state, as represented in their legislative assemblies or constitutional conventions, choose to limit the suffrage unreasonably, or to disfranchise for petty offenses, or to entrust the count of their votes to irresponsible boards, these are evils which involve their own punishment and ultimate correction. (See SUFFRAGE, RETURNING BOARDS.) So long as a state remains peacefully in the Union, and its state constitution or legislature does not assume to exercise powers prohibited by the constitution of the United States, to establish a state church, or to grant hereditary tenures of office, it is difficult to conceive of any alteration in their present forms of government which would be considered unrepublican or demand the active interference of the federal government. — When a state, by the action or acquiescence of a majority of its people, undertakes to sever its relations to the Union, the case is very different. As the controlling theory of the American system of government is that a state has no existence apart from the Union, the action of the people of the state is taken as a voluntary abrogation of their state government; it then becomes the duty of the federal government, in its various departments, to fulfill the guarantee of the constitution, and in reconstructing the state governments the law-making power

may rightfully reject any features which seem to it unrepublican. If there is any hardship in this, the blame must fall upon those who made the reconstruction necessary. (See RECONSTRUCTION.) — It is still more difficult to define "domestic violence." It is easy to see that such outbreaks as Shays' rebellion, which occasioned the insertion of this section (see CONFEDERATION, ARTICLES OF), or the railroad riots of 1877, are cases of domestic violence, and that such a struggle between two opposing parties for the possession of the state government as that which occurred in Maine, in 1879–80, is not; but it is difficult always to draw the line exactly between the two classes of cases. The general rule may be laid down that the federal government will not recognize the subversion of a *form* of state government, which it has once recognized as republican, until the subversion is accomplished according to the rules of the established form, and that it will support the established form of government against all irregular attacks upon its existence. But when the validity of the form of government is undisputed, and the conflict is between opposing parties for the control of it, the federal government will not interfere unless actual violence occurs, and then only to prevent anarchy and maintain the *status quo* until the people of the state can speak and decide. The rule is open to the obvious objection that evil men, in control of the machinery of a state government, might easily provoke violence by efforts to retain it after a defeat at the polls, or, when out of possession, might similarly provoke violence by illegal efforts to obtain it; but this is the common and underlying peril to all republican governments, and, when a state is unable to surmount it, it is unfit for a republican government. It would be unfair to quote precedents for or against the rule from the revolutionary period, hereafter referred to, which immediately succeeded reconstruction; it is sufficient to say that no state now appears to be thus unfit for republican government, and that the future prospects are for improvement, not for deterioration in this respect. — The "domestic violence" clause was practically a dead letter until after the suppression of the rebellion, and is only lightly touched upon in the treaties upon constitutional law published before 1870. The disturbances in Pennsylvania in 1794 were not aimed at the state government but at the government of the United States; they were therefore suppressed by the president's direct action, on the certificate of the federal judge, and without any call from the state authorities. (See WHISKY INSURRECTION.) In 1838–42 two appeals were made by governors, one from Pennsylvania, and one from Rhode Island. (See BUCKSHOT WAR, DORR REBELLION.) In the former case federal interference was refused; in the latter case it was held in readiness, though it proved unnecessary, and the power to grant it was maintained by all the departments of the government. The two cases deserve study as fair examples of the propriety and impropriety of federal interference. Throughout the war the legislatures and governors of states in sympathy with the federal government had no occasion, and those opposed to the federal government had no desire to call for federal interference. Throughout the period of reconstruction, 1867–70, there were no recognized state legislatures or governors in the unreconstructed disturbed states; but military assistance was furnished from Washington to federal marshals, whenever necessary, under the provisions of the reconstruction acts, the civil rights act, and the freedmen's bureau act. (See titles of acts named.) — From the completion of reconstruction until 1874 federal interference to sustain the reconstructed governments was in constant demand. In almost all the states a regular sequence of events took place: 1, the formation of a state government under which negro suffrage was permitted and former rebels were, in some of the states, disfranchised (see SUFFRAGE); 2, the election of a republican governor and legislature; 3, disorders in the election of the legislature for the purpose of securing a majority in that body for the impeachment and removal of the governor; and, 4, an appeal by the governor or legislature for federal troops to keep the peace. In Florida and Georgia the final step was not taken, as the republican administration was ousted peaceably. In many of the states there were variations in the process, usually from the utilization of the state courts in the political struggle; but the general course of events was as above given. — The process began in the first state reconstructed, Tennessee. From July, 1866, until December, 1867, frequent applications were made to Gen. Thomas by the governor for troops to keep order at elections and elsewhere, but these were refused, except as *posses* in aid of the civil authorities, since no insurrection was alleged. In 1869 the legislature passed under control of the democrats, and in February, 1870, the governor applied to the president for troops, on the ground that the legislature was unwilling to suppress violence. This, however, was designed rather to influence congress to again undertake the reconstruction of the state, and when congress refused to interfere, the application for troops was not renewed. — In July, 1870, Gov. Holden, of North Carolina asked for and received troops to suppress insurrection in two counties of his state, and in November of the same year Gov. Smith, of Alabama, informally obtained a platoon of federal soldiers to aid him in resisting the inauguration of the opposing candidate. In January, 1874, Gov. Davis, of Texas, applied for troops to aid him in preventing the meeting of a legislature which, he asserted, had been illegally elected, but the request was refused. April 19, 20, 1874, application for federal troops was made by both the rival claimants of the office of governor of Arkansas, but this was refused until the legislature met and decided in favor of Baxter. (See ARKANSAS.) In November, 1874, V. V. Smith, lieutenant governor of Arkansas, claiming to be governor because of

Gov. Baxter's submission to his supersedure by the new constitution, called upon the president for troops, but as he fled from the state immediately afterward, his request was ignored. Sept. 8, 1875, Gov. Ames, of Mississippi, called for troops, but was advised to call the legislature together and defend his state and constituents. — The two states from which federal interposition was oftenest called for during this period were Louisiana and South Carolina. The disturbances seem to have been caused mainly, in the former state, by the extraordinary, rigid and inquisitorial restrictions upon the right of suffrage in the original reconstructed constitution of 1868, and, in the latter state, by the preponderance of the negroes in the numerical vote and of the whites in the tax paying class. (See the states named.) Louisiana really led in direct applications to the president, the first having been made in July, 1868, and the step was then so unusual and so little understood that the legislature at first mistakenly addressed the application to the general of the army at Washington, ignoring the president; and Gen. Grant, in sending instructions to the commanding officer of the Louisiana department, felt obliged to detail at length the constitutional provisions and acts of congress covering the case. In 1872 the republican party of the state split, and the Packard-Kellogg faction, securing the support of the most influential federal office-holders in the state, secured with it the support of the federal government. From that time appeals for federal interposition became chronic, and until its final downfall the Kellogg government never claimed to be able to control the state without the support of federal troops. In September, 1874, it was suddenly and entirely overthrown by an armed force of its opponents, and the rival McEnery government took its place, but on the 15th of that month, by orders from Washington, the latter was expelled by federal troops and the Kellogg government was restored. Jan. 4, 1875, after the democrats had got control of the legislature, apparently by sharp practice, Gen. de Trobriand entered the hall with a force of federal troops, removed certain members whom the democratic majority had seated, and restored control of the body to the Kellogg party. Both houses of congress, by party votes, approved the president's action in the case. Finally, March 3, 1877, the retiring president notified the Kellogg governor, Packard, that "public opinion would no longer support him in the maintenance of the state government in Louisiana by the use of the military," and, as the incoming administration concurred in this belief, the Kellogg Packard government disappeared from Louisiana politics. — In February, 1871, the legislature of South Carolina called for and received federal troops to suppress insurrection in two counties of that state, and in October and November, under the enforcement act of April 20, 1871, the president by proclamation suspended the privilege of the writ of *habeas corpus* in nine counties until disturbances should cease. In October, 1876, Gov. Chamberlain renewed the application for federal troops, which thereafter maintained his state government until April, 1877. The result of the election for governor in November, 1876, was disputed, and in the lower house of the legislature the parties were so evenly divided that the control of the body depended upon the result in two counties. In these counties the democratic members claimed to be elected, but the returning board refused to give them certificates on the ground of violence and fraud in the election. The governor surrounded the state house with federal troops, who prevented the admission of the democratic members whose election was disputed. Thereupon the whole body of democratic members refused to enter, and two state governments appeared. One, the republican, had an undisputed senate and a disputed governor and house of representatives, and was supported entirely by federal troops, the other, the democratic, had a minority in the senate and a disputed governor and house of representatives, and was supported by the judiciary and tax-paying classes of the state. The withdrawal of the federal troops, as in the case of Louisiana above, resulted in a similar downfall of the Chamberlain (republican) government, April 11, 1877. — In all the states, except in the southern states during the abnormal period above referred to, there has always been a great and jealous unwillingness to call for federal assistance except in a case of extreme necessity. Even in the disorder following the great Chicago fire of October, 1871, the governor of the state took strong exception to the hasty action of the mayor of the city in calling in the aid of federal troops to maintain order instead of applying for state militia. This systematic policy has had the good result of maintaining the efficiency and importance of the militia as the usual state police, and of giving extraordinary effect to the occasional appearances of federal troops in aid of the state. The disorders attendant upon the great railroad strikes of 1877 were suppressed mainly by unaided state power; but when, as in Pennsylvania, July 18, federal troops were brought into play, the strongest and most triumphant mobs refused to attack them, and quietly retired before their advance. In a single instance, at Baltimore, some stones were thrown, in other cases the mere appearance of federal troops was sufficient to restore at least temporary order. Since that time the "domestic violence" clause has been as inoperative as before 1860 — 1. tional Law, § 568; Cooley's *Constitutional Limitations*, 169; authorities under RECONSTRUCTION, and states referred to.

ALEXANDER JOHNSTON.

INTEREST is the product, the increase (*incrementum*), the return (*reditus*) from capital. When interest represents the sum paid at fixed periods by the borrower to the loaner of capital, it retains its generic name, or takes the more special designation of rent or income. The price charged by the proprietor for the use of land leased by him, is rent. The term income is more particularly applied to the product of capital employed in commerce, agriculture or manufactures. In brief, interest signifies equally the profit the capitalist derives from the direct employment of his capital, and the return he receives for granting its use to others for a certain length of time. — No difficulty can arise with respect to the profits of a capitalist who employs his own capital: the interest on capital is in this case blended with the product of his labor. If a field be cultivated, or a workshop used by its owner, he has to render no account to any one. The operation is in a certain sense a domestic one, giving rise to nothing requiring regulation. Whether the capital employed by its possessor returns 5 per cent. or 20 per cent., whether it is productive or unproductive, concerns only the producer—pertains only to the proprietor. Nothing in relation to it comes within the province of legislation, which only extends to matters which affect relations among men. But the moment the owner of capital so far relinquishes its use as to lease it, if it be immovable property, or to loan it at interest, if it be movable property, a contract is formed between the one who delivers and the one who receives. From this contract arise rights and obligations for each of the contracting parties, which it is for the law to determine for the advantage of both parties; and consequences also arise from it which it is the mission of political economy to observe, in order to deduce from them, as much for the benefit of individuals as of society, the lessons of experience. — I. LOANS AT INTEREST. Is it permissible to loan at interest? Can one legitimately derive a product from his capital, a revenue from his money? On this question, which no longer seems to be one, the world, until toward the latter part of the last century, was divided. Loans at interest had in their favor the constant practice of peoples, especially of those noted for their progress in wealth, commerce and industry; on the other side were the oracles of religion and the doctors of the law. Now that theology has become more humane on this point, and jurisprudence has relaxed its rigor, socialism has taken up the thesis of the abolition of interest. The sophism has only changed defenders. Instead of justifying this interference with capital on the ground of charity or in consequence of unenlightened views in regard to morality, appeal is now made to envy and the anarchical passions. — The (so-called) laws of Moses recognized the legitimacy of loaning at interest, for it was only prohibited the Jews in their relations with their own countrymen, who were considered as members of the same family; and credit transactions with foreigners, as well as commercial ones, were wholly free. The laws of Solon, made for an essentially commercial people, placed no restriction or limit on the employment of money. At Rome, the severity of the legislation on this subject only provoked disobedience. Capital, which was persecuted, became exacting in proportion to the risks to which it was exposed. Nowhere was theory more strangely in contradiction with practice. Cato, who compared usury (*i. e.*, interest) to assassination, was himself an avaricious and pitiless usurer; and the stern Brutus loaned at 48 per cent. per annum. — In the middle ages the civil and religious authorities were in accord in prohibiting loans at interest. This interdiction, already written in the capitularies of Aix la Chapelle, in 789, was perpetuated in French law until the revolution of 1789. But, during this long millenium, the observance of the legal precept was purely nominal. To evade it, recourse was had to subtleties without number. First the bill of exchange, and afterward the establishment of annuities, furnished the most simple and usual means. Later, people came to tolerate loans by note, discount, and every species of money negotiation between tradesmen. Sovereigns themselves needed to borrow, and were obliged to submit to the conditions of money-lenders. Everywhere the force of circumstances overcame the obstacle of antiquated and anti-social legislation. — The prejudice against loans at interest may be traced back to the time of Aristotle, and has its source in his writings. The following are the terms in which the Greek philosopher teaches the too-well-known doctrine of the sterility of money: "The acquisition of wealth being double, that is to say, at once commercial and domestic, the latter necessary and rightfully esteemed, the former not less justly despised as not being natural and not resulting from the sale of commodities, it is quite right to execrate usury, because it is a mode of acquisition born of money itself and not giving it the destination for which it was created. Money should serve only for exchange, and the interest of it increases it, as its Greek name sufficiently indicates. Here the fathers are absolutely like the children: interest is money which is the issue of money, and of all acquisitions, it is that most contrary to nature." The anathema pronounced by Aristotle against trade in money, extends, as may be seen, to every kind of commercial operation. He did not comprehend, though living in the midst of people pre-eminently commercial, the utility of the rôle commerce plays in society. He did not see that to bring nations into contact with each other, to open the ways to markets, to place products within the reach of consumers, was to give them value, was, in a certain sense, to produce

them. — In a treatise aimed against loans at interest, another Greek moralist, Plutarch, exclaims: "What! you are men, you have feet, hands, and a voice, and you say you do not know how to get a living! The ants neither borrow nor lend; yet they have not hands, or arts, or reason; but they live by their labor, because they are content with things necessary. If people were willing to be content with things necessary, there would be no more usurers than there are centaurs." Plutarch here alludes to the rich who expended money in excess of their income, and who ruined themselves by loans contracted to give free indulgence to passing fancies; but, even in those times, the debauchees and prodigals were not the only ones who borrowed. There were already industries which needed capital, and traders who had recourse to interest loans, or loans for a share in the profits to bring their operations to an end or to extend them. The treasures accumulated by saving acquired by commerce, or obtained by victory, were not always dissipated in luxury and in pleasures; they sometimes served to stimulate production and to develop wealth. Money was at that time an instrument of labor. The capitalists who loaned it for that use, rendered service to borrowers and to society. They had consequently a right to receive pay for this service. Plutarch, on account of his preoccupation with the abuses of loans at interest, failed to perceive their good results. — The fathers of the church who treated this question, only copied Aristotle and Plutarch. "The lenders," said St. Basil, "enrich themselves by the poverty of others; they derive advantage from the hunger and nakedness of the poor. To take interest, is to gather where one has not sown." St. Chrysostom, insisting on this argument, exclaims, in a style loaded with metaphors: "What is there more unreasonable than to sow without land, without rain, without a plowshare? All those who devote themselves to that damnable agriculture, harvest only tares. * * * Let us, then, cut off these monstrous children begotten of gold and silver, let us stifle this execrable fecundity * * *." St. Ambrose, St. Augustine and St. Jerome held the same language. The following is a dilemma of the latter, which, if it is inspired by charity, is hardly so by logic: "Have you loaned to him who had, or to him who had not? If he had, why loan to him? If he had not, why do you ask of him more, as if he had?" — It is easy to reply that if one loans to those who have, it is because they do not always hold all their resources at their full disposal, and a timely loan of money permits them to await the receipt of their revenues. As to those who possess nothing, by loaning them capital one gives them the means of making their labor productive; one places in their hand the lever of wealth. If they had no credit, they would be still poorer; and they should at least, in consideration of the unexpected good, pay for the use of the money they have borrowed. — Another doctor in the church, Gerson, the author of "Imitation of Christ," says: "It is better that there be some light usuries which procure help for the indigent, than to see them reduced by poverty to theft, waste of property, and selling their furniture and immovable property at a very low price." — The church also condemned sales on time, as a stipulation was made in them in regard to interest on deferred payments. This was, according to the schoolmen, "to sell time, which can not be sold, since God has made it common to all." Strange to say, this maxim of the canon law was first proclaimed by the council of Coventry, in England, the very country where the popular adage, "Time is money," was afterward invented. — But no one carried the prejudice against loans at interest (which, since the ninth century, had been stigmatized by the name of usury) farther than Luther, the originator of the religious reformation. His view of the subject is thus given in his "Table Talk": "The civil laws themselves prohibit usury To exchange anything with any one and gain by the exchange is not a deed of charity; it is robbery. Every usurer is a robber worthy of the gibbet. I call those usurers who loan at five or six per cent. To-day, at Leipzig, he who loans a hundred florins, asks forty for them at the end of the year as interest on his money. Do you think God will tolerate such a thing? There is nothing under the sun I hate so much as that city of Leipzig; there is so much usury, avarice, insolence, trickery and rapacity there." — More passion than knowledge entered into the judgment given by Luther. The Roman church had at that time relaxed its severity in regard to loans at interest. Its allies, the Florentines, had become rich by trading in money throughout Europe. In inveighing against bankers, Luther thought he was also inveighing against popes. Calvin showed better judgment, in not allowing himself to be turned from the examination of doctrines by considerations of party or of persons. He vigorously attacked the economic theory of Aristotle on the sterility of money. "Money, it is said, does not beget money. And does the sea produce it? Is it the fruit of a house, for the use of which, nevertheless, I receive a rent? Is money begotten, to speak properly, from the roof and walls? No, but the earth produces it; the sea bears ships which serve in a productive commerce, and with a sum of money a comfortable dwelling may be procured. If, then, more profit can be derived from money negotiations than from the cultivation of a field, why should not the possessor of a sum of money be permitted to derive from it any sum whatever, since the proprietor of a sterile field is permitted to lease it for a farm rent? And when land is acquired by the payment of money, does not this capital produce an annual revenue? What, pray, is the source of the profits of the merchant? His industry, you will say, and his diligence. Who doubts that money unemployed is useless wealth? He who demands capital, apparently wishes to

use it as an instrument of production. It is not then from the money itself that the profit comes, but from the use that is made of it." (Calvin's letters.) — Doctrines have as much influence as laws on the development of public prosperity. Protestant nations certainly owe to Calvin their superiority to Catholic nations, since the sixteenth century, in commerce and manufactures. Freedom to loan for interest gave rise in them to credit; and credit has doubled their power. — Not until two centuries later did Montesquieu dare, for the first time in France, to profess the same principles. "Money," says the author of the "Spirit of Laws," "is the sign of values. It is clear that he who needs this sign should hire it, as he does other things he needs. * * * It is indeed a very kind act to loan money to a person without interest; but we perceive that this can only be a religious precept and not a civil law. In order that commerce be successful, money must have a value. If money has no value, no one will loan it, and the merchant can no longer undertake anything. I err in saying that no one will loan it. The business of society must always go on: usury becomes established, but with the disadvantages always experienced from it. The law of Mohammed confounds usury with interest. Usury increases, in Mohammedan countries, in proportion to the severity of the prohibition. The lender indemnifies himself for the peril of the contravention"— Montesquieu here, under cover of his criticism of the laws of Mohammed, brings a charge against Christian society. Loaning at interest was still under condemnation in France, both by the canons of the church and the laws of the state, at the time when the "Spirit of Laws" appeared. A magistrate could less openly brave that double authority than any other citizen. Hence the artifice of the author. He applies his criticism to the past, or transfers it to the Orient. It is for French society to recognize itself in the picture, if it desires. The following reign relieved writers from that somewhat hypocritical reserve; and political economy, in the writings of Turgot, set forth principles with entire freedom. — The constituent assembly sanctioned these principles. The law of Oct. 12, 1789, by proclaiming the legitimacy of loans at interest, put an end to a controversy which had been prolonged for twenty centuries: "All private citizens, bodies, communities and mortmain people" (*i. e.*, those holding property which they could not alienate) "shall be able henceforth to loan for a fixed time, for interest stipulated according to the rates determined by law." The new law was written, in terms no less explicit, in article 1905 of the civil code, thus: "It is permitted to stipulate interest for a simple loan, whether of money or provisions or other movable property." — Since that time loans at interest have been in accordance with civil law in France. Is this likewise natural law? Can reason, based upon the principles of morality and public utility, approve what the law declares? The Catholic church itself no longer contests it. If any are still doubtful on this point, we would refer them to the fine dissertations of the Cardinal of Luzerne and Cardinal Gousset. And as to the jurists who still rely on the arguments of Pothier, they have only to read the learned and often eloquent refutation of them given by M. Troplong, in his "Treatise on Loans." But the thesis which jurisprudence and theology have abandoned, has become a revolutionary commonplace. Loans at interest could find no favor with the socialistic school, which has declared war on capital, and on whose banner is inscribed: "Property is robbery." The theological school, in its arguments against interest loans, showed itself inconsistent. While it forbade the capitalist to collect a monthly or an annual due for the money borrowed of him, it permitted the landowner to lease his land in consideration of a farm rent, and to grant the use of his house to a tenant for a stipulated sum. The prohibition consequently applied to the form of the investment and not to the investment itself. The capitalist was prohibited, not from investing his capital, but from investing it in a certain manner. For lack of having analyzed the nature and having followed in its course the circulation of wealth, and, in consequence, of taking the sign for the thing signified, and the precious metals for value, a sort of embargo was put on money. In virtue of a preconceived theory which represented money as a sterile metal, they really impressed it with sterility. — It is clear, however, that if the possessor of a sum of money has not the right to make it productive and to derive a revenue from it, the possessor of land could not, with any better right, lease it to a farmer to cultivate, in consideration of an income or rent from it. The earth, in fact, does not spontaneously engender a revenue any more than does money. Under both forms, capital is only the instrument of labor. He who receives it, must pay the price to him who leases it. The borrower owes the price in both cases, or he owes it in neither There is no way of getting out of this dilemma. — "Coined money," says M. Troplong very justly, "the creation of man and not of nature, is in turn utilized as a commodity, or as a sign of values, without there being any reason to cry out against this two-fold employment of it. It must submit to the condition of matter, which is to be a slave of man, and must serve all the uses and necessities that it can reasonably satisfy. So far, then, from disparaging the means of acquisition invented by the genius of man, in imitation of the natural and primitive means of acquisition, we should, on the contrary, recognize that this is the masterpiece of civilization, which opens to social activity new careers, new sources of labor, new and admirable means of promoting comfort among the classes who have inherited no wealth. Plutarch thought he was overwhelming the loaners by an irresistible argument, when he told them that they made something out of nothing. But, without knowing it, he gave the finest eulogy on

credit which derives wealth from sterility. Money is no more impressed with infecundity than everything around us; for there is nothing productive for man save what is fertilized by labor or utilized by necessities which pay for their satisfaction. What would the earth produce, save tares and thistles, without the plowshare? What revenue would a house give its owner, if the necessity of a dwelling did not oblige a neighbor to lease it? * * Money becomes productive by the need the borrower has of it, the same as a building becomes productive by the need the tenant experiences of occupying it. Money is sterile only when it remains unemployed. Hence we see the confusion into which the canonists fall, when, granting that money may be made productive by industry, they insist on saying that in interest loans, it is the industry of the borrower, which, keeping the money active, renders it productive, and that, since the lender has no part in that industry, he should have no part in the benefits it procures. But what matters it to the lender what use the borrower makes of the loan? * * It is about as if the lessor of property should have scruples about the legitimacy of his contract because the tenant who rented his house did not occupy it. * * The price the lender receives is not a part of the profit the borrower will make by his industry; it is the price of the transfer which the lender makes to him, for a certain time, of the ownership of a sum that he has declared will be useful to him: a price the legitimacy of which rests on the deprivation the lender imposes upon himself, and on the advantage alleged by the borrower, *usura propter usum.*" — What M. Troplong here affirms, with general assent, is exactly what socialism denies "He who lends," says Proudhon, "in the ordinary conditions of the trade of the lender, does not deprive himself of the capital which he lends; he lends it, because he has nothing to do with it for himself, being sufficiently provided with capital; he loans it, in short, because it is neither his desire, nor within his power, to give it value himself; because in keeping it in his hands, this capital, sterile by nature, would remain sterile; while, by the loan and the interest resulting from it, he produces a profit which enables the capitalist to live without labor." (From third letter to M. Bastiat.) — That eminent economist, M. Bastiat, whose early loss to economic science we deplore, has remarked that this argument attacks sales as well as loans. If it can be alleged that the possessor of a sum of money does not deprive himself of it by loaning it, why could we not say the same of the one who sells commodities which he possesses in too great abundance? The system of Proudhon would render every commercial transaction impossible, because there is not a single one which is not based on interest on the capital invested. — But we do not need to appeal to analogies nor to enter upon comparisons, to refute a theory based on a position outside of facts accepted by everybody, and in opposition to these facts. Let us go directly to the root of the sophism. Socialism claims that the loan should not bear interest while the one who loans does not deprive himself, and that the lender suffers no privation while the capital loaned would remain sterile in his hands. This is an absolutely gratuitous allegation. First, if the capital borrowed must not produce interest, I can not see why the capitalist should part with it in favor of the borrower. People keep money only to derive an income from it; and if money must remain unproductive, people will cease to loan it. This will be the end of credit. — But nothing appears to have a weaker foundation than this thesis of the necessary unproductiveness of capital in the hands of the capitalist. In one form or another, a capitalist always employs his money. He loans it at interest only when other forms of investment offer either a less return or one more uncertain; but in lack of a profitable loan, what prevents him from employing his money in agriculture, manufactures or commerce? It is surely lawful for him to buy land or a manufactory; and if he does not wish to put his own hand to the work, he can always take an agriculturist or a manufacturer as a partner, invest his funds in a joint stock association, or obtain shares in some marine enterprise or in railroads. In interdicting loans at interest, the socialists have forgotten to interdict association or to close the ways to human activity. — The socialists, however, more consistent in this than the canonists, prohibit rent of land as well as interest on money. For them, the productiveness of capital, as Proudhon does not hesitate to say, is a pure fiction. What is there, if one reasons in this way, real in the world? Will the socialists always have eyes only not to see? The earth, from one end to the other of the countries which civilization has touched with its wand, recounts the marvels of capital. Capital is everywhere present. It is the universal motor, the soul of industry; it is the trace of the sojourn or the passage of man on the earth, that which distinguishes culture from barbarism. The power of a people is measured by the extent of its accumulation of labor. A farm in Beauce, in France, of the same extent of land as could be bought in Canada or New Zealand for $800, would cost $80,000; and in an uninhabited country it can be had for nothing. Whence the difference in value? From the fact that the land which the colonists buy in New Zealand, for instance, is land yet to be tilled, land without capital; while he who acquires a domain in Beauce pays for the capital incorporated in it. The productiveness of soil enriched by fertilizers, improved by cultivation, provided with cattle and instruments of tillage, furnished with farm buildings and dwellings, and near to great markets—all these make the difference. — And should the owner of this wealth, which often represents the accumulated labor of many centuries, rent it for nothing, like land covered with bushes and

brambles, such as met the eyes of the first occupant? Not only would this be contrary to equity, but it would be physically impossible. A state of society in which proprietors who did not cultivate the soil with their own hands should be condemned to give it over, without compensation, to farmers who would derive the benefits of the labor previously expended on it, in addition to the profits from their own labor, would not be long in coming to an end. The abolition of rent would speedily entail the abolition of property. — The socialistic theory of exchange belongs to a purely imaginary world. At no period of history has it even begun to be applied. Suppose men reduced to their own powers in a newly forming society. As certain individuals prove to be more richly endowed by nature or make a better use of their faculties, there will necessarily be workmen who will produce more than others, whose products will not find their equivalents in exchange, and will form an excess, a reserve, a capital; hence inequality of conditions and of fortunes. This inequality, when it exists, is transmitted or may be transmitted. Property implies inheritance. When we recognize in man the right to dispose of the results of his labor, we are inevitably led to admit that he may dispose, by the same right, of the results of labor which have been accumulated by him or his ancestors—in a word, of capital. To arrest this natural direction of human activity, the *Banque du Peuple* is a poor invention. [An allusion to a "People's Bank" instituted by Proudhon for the suppression of capital. E. J. L.] It would not, in fact, be sufficient to abolish rent of money and rent of land; it would be necessary, by a more radical and more logical process, to go so far as to abolish property. Communism is the last term of that theory, in which a subtle mind has imperfectly succeeded in disguising the absurdity and violence of the ideas by the novelty and charm of the form. — II. Rate of Interest. The legitimateness of loans at interest is to-day recognized in the principal states of Europe. But while abandoning the ground of absolute prohibition, governments have not had the courage openly to avow the doctrines of liberty. Just as it is sought to protect agriculture and manufactures against foreign competition, it is claimed that the cause of the borrower may be defended against the lender, and of the poor against the rich, by fixing the rate of interest or limiting it by the establishment of a maximum. Whoever, in loaning, exceeds this legal rate, exposes himself to a penalty. Usury no longer signifies the interest on money. This word, modified from its primitive sense, takes an opprobrious meaning, and becomes a mark of infamy. To invest one's money at a rate the law discountenances, is called practicing usury, and is to commit a crime. — The laws which interdicted loans at interest have had their day; the laws which regulate the rate of interest will pass away in like manner. By examining the effects of this legislation, it is easy to show that it defeats its purpose. What is proposed to be accomplished by excepting money from the common rule of values, the level of which is determined by competition in the market? It is desired to prevent the price of that commodity from rising beyond measure, or, in other words, to oppose a barrier to the rise in interest. Now, observation teaches us that the more restrictions the laws have placed upon trade in money, in the past, the higher has become the rent of capital. The penalties against usury give rise to it or develop it; they are an added risk to those naturally connected with investments of capital. In compensation for this additional peril, the lender can not fail to demand a premium. The laws which augment the risk also discourage competition. The number of lenders and the amount of the disposable capital then diminishes, the number and eagerness of the borrowers remaining the same; and people are then astonished at the high price of the commodity, when they have done all they could to produce this condition of the market! — In ancient times, the peoples who allowed the greatest liberty in the investment of capital were also those who saw commerce and the industries flourish in their midst, and among whom borrowers obtained the most moderate terms from lenders. The nations, on the contrary, who gave no latitude to credit transactions, or security for credits, were obliged to submit to pay more dearly than others for money. The history of Athens and that of Rome present conspicuous and instructive types of this contrast. At Rome a debtor who did not meet his engagements when due became the slave of the creditor. At Athens the right of the creditor to the person of the debtor was abolished by the laws of Solon. Solon did not attempt to regulate the interest on money, and no trace of usury laws is found in the annals of that commercial republic. The rate of interest at Athens varied according to the circumstances and with the security offered by borrowers. The lowest rate appears to have been 10 per cent.: this was in fact a very moderate charge for movable capital, at a time when the income from land was 12 per cent. to those who did not work their lands themselves, and when maritime commerce, which attracted money as well as men, borrowed at from 20 per cent. to 36 per cent., and when the industries, employing slaves as workmen, returned fabulous profits. The interest on money was in proportion to the profits on labor; and here we see why the question of debts, that permanent cause of troubles in the Roman empire, never excited either commotions or political agitations in Greece. — In the early days of the Roman republic the rate of interest was not regulated by law. M. Troplong considers this latitude in regard to transactions as the cause of the oppression the people suffered from the patricians. But did the law of the Twelve Tables, which fixed the interest at 10 per cent. per annum, diminish the ravages of usury at Rome, and bring about a fall in interest? M. Troplong himself

cites from Titus Livy and Plutarch numerous instances which superabundantly prove the contrary. Montesquieu was not in error on this point. "As the Roman people," he says, "were daily becoming more powerful, the magistrates sought to flatter them by having such laws enacted as were most pleasing to them: capital was restricted; interest diminished and finally prohibited; bodily constraint was taken away; and at last the abolition of debts was proposed, whenever a tribune wished to render himself popular. These continual changes, either by laws or by plebiscits, naturalized usury at Rome; for the creditors, seeing the people their debtors, their legislators and their judges, had no longer any confidence in contracts. The people, like discredited debtors, could borrow only at high rates; and this was the more so, because, though the laws only occasionally interfered, the complaints of the people were continuous, and always intimidated the creditors. Thus were all honorable means of louning and borrowing abolished at Rome, and a frightful usury became established." — The results in modern times have been the same. The only nations or states in which the trade in money has been most regular and confined to reasonable limits, are the very ones where the greatest freedom in money transactions has been tolerated or authorized. It is sufficient to mention Genoa, Venice, Florence, Holland and England. Holland, in the seventeenth century, although its credit was weakened by war, borrowed at 4 per cent.; in England, the current interest was 3 per cent. toward the middle of the eighteenth century. Owing to their ability to give value to their capital, the Florentines and Milanese, in the sixteenth century, under the name of Lombards, took the place of the Jews, in a large way, and became the bankers of Europe. Freedom in the matter of interest favored the establishment of credit institutions. The foundation of the bank of England and that of Amsterdam were nearly a century earlier than that of the bank of France. — Moreover, the fall in interest and the development of commerce, in the states where there was the greatest toleration for credit transactions, appear to have followed step by step the progress of this liberty. Thus, in England, Henry VIII. had fixed the rate of interest at 10 per cent. Edward VI. absolutely interdicted loaning at interest. Elizabeth gave an impulse to trade by abrogating the statute of Edward and re-established 10 per cent. as a maximum rate, thus indirectly giving much latitude to traffic in money. — The statute of Queen Anne fixed the rate of interest at 5 per cent. per annum, and pronounced every contract void in which the interest should exceed this rate. In accordance with the usual practice of the English, who rarely act from general principles, this statute was long nominally in force after being allowed to become practically obsolete. Then it was abrogated by successive degrees, a part at a time. The act of the fifty-ninth year of George III. (1819) was the first attack made on the principle. It was enacted that a bill of exchange or a bill payable to order, which might be declared void because of usury, should be valid in the hands of one who had taken it in good faith. Then came the act of the fourth year of William IV. (1833), which, in renewing the privilege of the bank of England, abrogated the usury laws in the kingdom, so far as bills of exchange and notes payable to order on three months or less were concerned. The act of the first year of Victoria's reign extended the exemption to bills of exchange and notes payable to order, the term of which did not extend beyond a year; and the act of the third year of the same reign comprehended also all loan contracts made for sums which exceeded £10, provided the loan was not secured by a mortgage on real estate. — In consequence of the latter provision, landed property had now to pay higher than the current market rates for money, and was, therefore, at a disadvantage in comparison with manufactures and commerce. Such an inequality before the law could not permanently continue. In 1854 a law was enacted (17 and 18 Vict., ch. 90) repealing all existing statutes against usury, though not touching the statutes in reference to pawnbrokers. These were modified later (35 and 36 Vict., ch. 93). — The above-mentioned changes in the laws made to regulate the rate of interest appear to have been a result of the celebrated resolutions which were reported to the house of commons in 1818, in the following language. "1st, *Resolved*, that it is the opinion of this committee that the laws regulating or restraining the rate of interest have been extensively evaded, and have failed of the effect of imposing a maximum on such rate; and of late years, from the constant excess of the market rate of interest above the rate limited by law, they have added to the expense incurred by borrowers on real security, and that such borrowers have been compelled to resort to the mode of granting annuities on lives, a mode which has been made a cover for obtaining higher interest than the rate limited by law, and has further subjected the borrowers to enormous charges or forced them to make very disadvantageous sales of their estates. 2d, *Resolved*, that it is the opinion of this committee that the construction of such laws, as applicable to the transactions of commerce as at present carried on, have been attended with much uncertainty as to the legality of many transactions of frequent occurrence, and consequently been productive of much embarrassment and litigation. 3d, *Resolved*, that it is the opinion of this committee that the present period, when the market rate of interest is below the legal rate, affords an opportunity peculiarly proper for the repeal of said laws."—As to the effect of the repeal of these laws, unexceptionable official documents permit us to judge. In the year 1841 the bank of England took the initiative in that regard, and, in a country where it is customary to follow public opinion rather than to lead it, did not hesitate to give an

impetus to public thought. On May 13, its court of directors met and embodied the results of eight years' experience in the following declaration: "*Resolved*, That the modification of the usury laws at present existing has contributed greatly to facilitate the operations of the bank, and is essential for the proper management of its circulation." Parliament, on its side, determined to obtain evidence of the good or bad results of the partial repeal of the usury laws. The house of lords, in the year 1841, investigated the subject, and the testimony brought before it (published in 1845), casts much light on the question. — A distinguished economist, Mr. Norman, after having called attention to the fact that the bank of England, thanks to freedom of interest, had successively fixed the rate of discount, following the variations of the market, from 4 to 4½ per cent. on July 21, 1836; at 5 per cent. on Sept. 1 of the same year; at 5½ per cent. on June 20, 1839; and at 6 per cent. on Aug. 1 of the same year; terminated his deposition in these terms: "I have always regarded with surprise and admiration the way in which the mercantile pressure of 1839 was borne. It was very severe, and the number of failures of consequence was certainly small; and I can not help attributing in some degree the manner in which that pressure was sustained, comparing it with what had occurred on similar occasions previously, such as in 1826, to the state of the law which enabled capital and loanable accommodation to flow into those channels where it was most wanted and could be best paid for—in fact, into its natural channels." — One of the most eminent practical bankers, Saml. J. Loyd (afterward Lord Overstone), confirmed this opinion by the following explanation: "Had the law which fixed the maximum rate of discount at 5 per cent. been maintained in operation, it would have produced inconveniences of two kinds: in some cases, parties requiring the command of money would have been unable to obtain it, and would consequently have been subjected to many very serious evils, such as forced sales of their goods at ruinous prices, injury to their general credit, and, in many cases, actual suspension of their payments; in other cases, parties would probably have obtained the money by resorting to circuitous contrivances for the purpose of evading the law, which would necessarily have entailed upon them great additional trouble, discredit and expense." Mr. Loyd hence concluded that the act of 1833 had saved British commerce, in the pressure of 1839. — This was also the conclusion to which Mr. Samuel Gurney, one of the most able bankers and most revered men in London, finally arrived, who called attention to the fact that in 1818, when the state loans were the only ones exempt from the operation of the usury laws, and when considerable loans had been issued by the government, capital deserted the commercial market, which was subject to the legal limit, for the market of public funds; and commerce had to suffer much in consequence of the restrictions which fettered business. Mr. Gurney entered into detailed calculations which brought into relief the consequences of the two systems of restriction and freedom in the matter of interest. "The advantages of the relaxation in the law to the trading community," he said, "are that under every circumstance they are able to procure supplies of money and to carry on their business with facility. In the two or three last pressures which we have had, we have had very few failures. I will now take the other side. What is the disadvantage? It is that they have to pay this high interest for a limited time; the calculation of that disadvantage brings it to a very small sum. A firm of large extent may have under discount to the extent of £50,000, and have to pay 6 per cent. interest for that £50,000 instead of 5 per cent. for six months; this is the extent of loss, which comes to only £250. For that loss he gets the advantage of general facility, a less risk, as credit is much better preserved—advantages greatly beyond the loss. One other great advantage is the ability to borrow money upon the security of his goods, or sell them. If he borrow money upon his goods, it resolves itself into a calculation of a similar character; if he thus borrow £100,000, there will be a loss of £300 or £400; but if he is compelled to sell his goods, he can not, under such circumstances, at a less loss than from 10 per cent. to 20 per cent.; and therefore, on the one hand, he may have to lose some £300 or £400; but, on the other, if compelled to sell his merchandise, which he must do were he unable to pay more than the legal rate of interest upon a loan, the loss would be, under forced sales, of from £10,000 to £20,000." We might extend these quotations. The witnesses summoned, in the course of the inquiry, were, with scarcely an exception, unanimous. — Some persons have observed that, if merchants in high position gained by the repeal of the usury laws, the same was not true of those whose credit was less firmly established, and that usurious rates were demanded of this class. But what does that prove? That there was, apparently, a certain risk in lending. If the usury laws had been operative, the embarrassed merchants would not have found money, or they would have had to pay still more to procure it. In either case, failure was imminent. Thus much for the example of England: let us now pass to France. — Interest on money was certainly much higher at the time when legislation interdicted interest loans and burned Jews, than under the far more mild régime which authorized loans under the form of annuities, and fixed by law the rate at which loans could be made by alienating capital in this manner: it had become still lower, and commerce had become extensive at the time when Turgot wrote these remarkable lines: "It is a well-known fact that there is not a commercial place on the earth where the greater part of the commerce does not depend on money borrowed without alienation

of capital, and where interest is not regulated by a simple agreement, according to the greater or less amount of loanable money in the place, and the degree of solvency of the borrower. The rigor of the laws has yielded to the force of things; jurisprudence has been obliged to modify in practice its speculative principles, and people have long since come to openly tolerate loaning by note, discount, and every species of money negotiation between parties. It will always be thus whenever the law prohibits what the nature of things renders necessary." — The constituent assembly only half adopted the ideas of Turgot. The law of 1789 permitted loans at interest under any form, but it reserved to the legislator the right to fix, or at least to limit, the rate of interest. The civil code, promulgated in 1804, stipulated a similar reservation; these were mere preliminary and tentative changes, which prepared the way for the law of Sept. 3, 1807. — We say nothing of the intermediary régime. Some claim that the convention declared money merchandise, and that in consequence of that unlimited freedom, usury for some years invaded and ravaged the country. The laws of the convention were contradictory. At one time, to raise the price of the assignats, it interdicted trade in the precious metals: again, it removed the prohibition and left every one free to buy and sell gold and silver at their actual value. Interest, the rent of capital, only resumed its liberty as a consequence.* This liberty was the result of the toleration of the government, and not of a clear perception of a principle which it firmly proclaimed. But what matter is it whether the convention, in removing the barriers it had itself raised, removed also others or not, and rendered homage to political economy without willing it or knowing it? The events which occurred in the commercial world, during that period of anarchy and the disturbed times which succeeded it, prove nothing either for or against any system. — We are, however, inclined to believe that, notwithstanding the calamities which were the inevitable result of the civil disorders and of war, and although commerce, manufactures and credit were nearly paralyzed in France from 1793 to 1797, the toleration accorded meanwhile to pecuniary transactions bore more good fruit than bad. People have quoted the protests of some chambers of commerce, which complained at that time of the dullness of trade, the great numbers of failures and the cupidity of loaners. In reply we will say, without having regard to these particular cases, that the speech of Joubert, who proposed the law of 1807, itself shows that interest on money had generally fallen. But, were it otherwise, can any one really suppose that laws more restrictive would have procured money for trade at a low price, at a time when the risks connected with every negotiation or credit transaction were so great, and when confidence was so weak? — The legislators of 1804, more favorable to liberty than those of 1807, had left the way open. Article 1707 of the civil code provided that the interest agreed upon might exceed the rate fixed by law, whenever the law contained no prohibition to the contrary. This was directly to recognize that the value of money, like all other values, results from the state of the market and the terms arranged between parties. The legislators of 1807 shut this half-open door, by putting agreed-on rates of interest in the same line as legal interest. It may be well to quote here the language of a law which can serve as a starting point in the discussion. "Art. 1. The interest agreed upon shall not exceed 5 per cent. in civil matters [*i. e.*, those coming under the cognizance of what are known as *civil* courts, in France, in distinction from mercantile courts. E. J. L], nor 6 per cent. in mercantile matters, without retention. Art. 2. The legal interest shall be, in civil matters, 5 per cent., and in mercantile matters 6 per cent., also without retention. Art. 3. When it shall be proven that a loan has been made at a rate exceeding that fixed by Art. 1, the lender shall be condemned by the court before which the case is brought, to restore this excess, if he has received it, or to suffer a reduction of the principal of the debt, and he may even be remanded, if cause appear, to the court of correction, and, in case of conviction, condemned to a fine not exceeding half the capital he has lent on usury. If the result of the law process shows that the lender has practiced fraud, he shall be condemned, besides the above fine, to imprisonment for a term not exceeding two years." — The economy of the law of 1807 consists entirely in a small number of rules. It lays down as a principle that freedom of agreement in regard to rate of interest must be exercised only within the limit of the legal maximum. Provisionally, this maximum is fixed at 5 per cent. in civil matters, and at 6 per cent. in mercantile ones. — The law of 1807 makes usury a crime. But what is usury? Bentham said truly that it was not susceptible of definition. And in fact, if usury consists in loaning at a rate higher than that fixed by the legislature, one may be a usurer in England while loaning at a rate which would be permissible in France, and *vice versa*. In France the offense depends, not on the nature of the act, but on the quality of the lender. One is a usurer if he loans at 6 per cent. in civil matters, but ceases to be so if he loans at the same rate to one engaged in commerce. These inconsistencies in legislation prove that an attempt has been made to regulate that which, from its nature, evades legal rules. The authors of the law of 1807 perceived this; for, after having made the act of loaning at an interest in excess of the legal rate a crime, they did not affix any penalty. The court, in this case, can only sentence the lender to restore the excess. The sentence can

* "Not that the laws of the convention ever meant to proclaim the principle of absolute liberty in the matter of interest. It would be an error to suppose this: they only intended to remove the prohibitions on payments in money." (Troplong.)

only extend to a fine in the case of habitual usury, that is to say, when the offense becomes changed; when, instead of having to deal with parties whose bargains depend upon the variations of the market, the court finds before it a speculator who makes a business of seeking the most risky investments, those which serve as an excuse or pretext for unlimited profits. — The law of 1807 has only one kind of merit. In a country where there is too little general information on matters of political economy, and where anti-commercial prejudices have still much influence, it bears a certain relation to the average level of intelligence and the state of morals. In 1836 a motion was made by M. Lherbette aimed at the repeal of this law and the restoration of freedom in the matter of interest; but it failed because of the unenlightened opposition of the elective chamber. In 1850 the proposition of M. Saint-Priest to modify the law had no better success: the law which was enacted Dec. 15, instead of punishing the simple contravention of the law prescribing the legal interest, is only aimed against the habit of disregarding it, and confines itself to increasing the penalties. — The law of 1807 governs the trade in money in all the countries of Europe which have adopted or imitated the French civil laws. To examine into the effects it has produced in France, is then to obtain the elements which may serve to give the most general view of the question. The law of 1807 did not, as we know, bring about a fall in the rate of interest, which is, notwithstanding the solidity of the operations, much higher in France, in every scale of credit, than in England, Holland and Belgium. The absolute prohibition it contains has not prevented the loaner, wherever there were risks to be incurred, from stipulating for excessively high interest which was legally usurious. That has been accomplished in a contraband way instead of openly. But the troubles from it have been only the greater; for the interest must include, besides the premium for the risk arising from the small degree of solvency in the borrower, that of the risk arising from contravention of the law. — The *mohatra*, so much branded by Pascal, has reappeared, and the usurious loan has been disguised under the form of a sale. In other cases the fraud has been accomplished under the form of a donation; besides the legal interest, the lender has required a supplementary interest, under the title of gift. Sales with privilege of redemption have also served to conceal usury, which has, besides, taken place under cover of an exchange. But the most usual as well as the most simple form has consisted in stating in the loan contract, or on the notes given to the loaner, a sum higher than that which the borrower had received. —The defenders of the system sanctioned by the law of 1807 themselves recognize that this law, far from uprooting usury, has perhaps aggravated it. Usury, it has been said, is devastating French rural districts; and it is certain that the debts of small property-holders had much to do with the socialism of the central and eastern departments of France in 1849 and 1850. — A representative of the upper Rhine, M. Cassal, cited in the tribune curious examples of frauds practiced in Alsace to evade the provisions of the law of 1807. "The usurer," he said, "no longer proceeds in this fashion: 'I lend you one hundred francs in consideration of ten francs.' Nothing like that is written. A note of a hundred francs is made, but only ninety of it are given. Care is taken that it be done with no witnesses present, and then you have the provision of article 1322 of the civil code, which establishes a legal presumption in favor of the creditor who has a writing. In this case itself it is very difficult to prove usury. More frequently sales with power of redemption occur: property is bought for the consideration of one hundred francs, and only ninety are paid; and when the debtor wishes to obtain his property again, he is obliged to pay back the sum stipulated in the contract as price, and happy is he, too, if the purchaser will consent to restore him his property. In this case, also, the stipulations of article 1325 of the French civil code are exactly fulfilled: you have no witnesses, and it is impossible to prove usury. When one of these men loans at 5 per cent. on a simple note, there is much reason for mistrust; the lender has evil designs. When the note falls due, the debtor can pay; but the creditor promises to wait. When the time comes that the latter knows the former has no money, he becomes pressing, prosecutes, hounds the debtor, forces him to make an assignment, lays down orders, and, finally, compels the unfortunate to pay what is called the *interest of patience*. Then he takes everything the former can give: fifty francs, a pair of sabots, a batch of bread, per week. But all this is the A B C of usury. The usurer but rarely makes his bargain in his own name. The borrower sometimes does not even know him; the business is done through an intermediary, a sort of broker, who, ordinarily, has nothing to lose, not even honor, who also takes brokerage, and thus increases still more the interest on the money. When loans are made, the first step is to ask for security. This security is the person who signs the note and carries it to the borrower, or *vice versa;* the intermediary likewise signs the note, and it is sometimes covered by three, four or five signatures before reaching the real lender. The usurer is then in the position which, in the language of the law, is called 'a third carrier in good faith.' The aim of the business is to make some kind of a bargain: in primitive times, a trade in flocks or herds; later, in real estate. This is how it is effected. Sometimes one lends a sum, always by an intermediary, on a simple note or an obligation acknowledged before a notary, and on the other hand, he has a field or other real estate sold to him at an extremely low price. Care is taken, however, that the matter be so arranged that the lesion of the seven-twelfths may not be reached. These men, who thus exploit French rural districts, have divided the territory: each one has his chosen

portion to exploit, and it is rare for another to permit himself to go there to do business. You comprehend then that they are perfectly well acquainted with the value of the estates, better than the peasants themselves. Consequently there may be usury of 100 per cent. or 200 per cent. without the cognizance of the law. At other times, and this is far more serious and more common, they force the borrower, giving him meantime the funds for the purpose, to buy a piece of land or some other commodity at a very high price. Here they do not take the trouble to put as large a sum as possible into the contract: they put the property at double or triple its value. Let them succeed in making a man contract a debt, and nothing can save him; he is soon dispossessed of his property. I know entire villages which do not contain two solvent private citizens." — Looking at this social condition, one would think he was living in the middle ages. Is it necessary, in order to remedy this, to make the penalties greater and to increase the legal restrictions? M. Cassal, who is not, however, an economist, but who has had a near view of the evil, does not think so. "I know the country usurer well enough," he said, "to apprehend that our law (that of 1850) instead of producing the extinction of usury, may perhaps produce the contrary effect, by closing the purse strings and shutting out all credit. Usury is the only means, the single source of credit to the countrymen; and if that source dries up, I fear they may be more miserable than before." — The defenders of restrictive laws in the matter of interest would do well to reflect upon this remarkable avowal. They think they have replied to all objections when they say: "If the borrower is not sufficiently solvent for loans to be granted him at the legal rate; if an additional premium is necessary to cover the risk—well, people will not lend to him at all." Shall credit be thus obliged to stop rather than exceed the level of interest which the legislator has supposed legitimate? But credit can no more be arrested in society than the circulation of blood in the human body. For the one as for the other, motion is life. You say that loaning at high interest will in the long run ruin the borrower. This is possible; but he will be ruined without usury, if he does not find a way to borrow what he needs to meet his obligations when they fall due! — The capitalist who speculates upon the temporary distress of the borrower is a wretch. Science has no intention of sheltering such under her mantle. If usury extends to direct or indirect fraud, there are laws to punish it. But let no one attack the freedom of mercantile transactions, under pretext of preventing usury. Provided the loaner and borrower are free to make a bargain, the contract should be valid. It matters little at what rate the investment be made: the interest of money is naturally subject to one law alone, that which determines that the price of things, instead of being fixed arbitrarily by the civil power, results from the essentially variable relation between supply and demand. There is but one way to abolish usury, and that is to extend to property the benefits of credit institutions, and accustom proprietors punctually to fulfill their obligations. For the rest, the relation of demand to supply so bears upon the contracting parties, that governments, when they wish to borrow, are themselves subject to it. Whenever it was necessary to contract public loans, the French government took good care not to appeal to the law of 1807. In difficult circumstances it has borrowed at 7 per cent. and even at 8 per cent.; and instead of then considering the capitalists who undertook the loan at these high rates as usurers subject to the penalty of the law, it sought to attract them by all means in its power. Not to speak of the profits they have made by loaning to embarrassed governments, have not bankers obtained all the marks of distinction which could flatter their vanity? Have they not been covered with *cordons* and admitted to the ranks of the aristocracy? — Thus the state itself sets the example of violation of the law. It seems that the legal rate of interest is obligatory on every one except itself. To loan at 6 per cent. to private individuals, is to expose one's self to the severity of the courts; to loan at 6 per cent. to the state, to cities, to departments, is to merit public gratitude. Who can henceforth take seriously this pretended crime of usury, which is not such for states, but is such in private transactions?—This is not all. In testimony of the powerlessness of the legislator when he attempts to do violence to the nature of things, the French law of 1807 was obliged, in fixing a maximum rate of interest, to admit of exceptions and establish categories. Thus, loans on property security, on pledge, on provisions, and discount, escape its rules. The same observation applies to commissions charged by banks, and to the premium given to brokers who answer for the persons to whom they sell merchandise; as well as to those commercial practices which are so many additions and supplements to the interest stipulated in the money loans. — III. Loans which exceed the Legal Rate. The loan on pledge (or pawn), which entails at once numerous risks and considerable expenses of administration, is one of those which can be made only at a relatively high interest. All the pawnbrokers in Europe would be ruined in a few months, if they were compelled to loan at a rate corresponding to the price current of money in the market. The exception which has been made in their favor, or rather, the freedom in regard to interest which is allowed to be the rule in their case, has been favorable to those who patronize these institutions. To speak only of the *mont de piété* at Paris, the interest asked of borrowers has constantly diminished since the last century: it was 5 per cent. per month in the year III. (1795–6), 2½ per cent. per month in the year VIII. (1800–1), and 1¼ per cent. in 1831. As the rent of money becomes lower in the general market of capital, the pawnbroker will lend at a

lower interest to necessitous families. — As to the loan of provisions, which the law of 1807 does not govern, and in which one may always, by the terms of article 1907 of the civil code, exceed the legal interest, jurists have found a reason to justify that exception, which, if they were disposed, might be made to apply equally well to loans of money. "How can we think," says M. Troplong in his "Commentary on Loans," "that the legislator could have intended to impose the same rate of interest on loans of provisions as on money? How can we suppose that he would have taken no account of the risks, which are much greater in the loan of provisions than in the loan of money; in the loan of provisions, we say, where an abundant harvest at the time of payment may take away so much of the value of the thing lent in time of dearth? Would he have condemned the system followed in all ancient nations by legislators and economists, of fixing the interest on provisions higher than the interest of money? We think, then, that there would be nothing illicit in an agreement which should obligate the borrower of a hundred measures of oil, grapes, or apples, to repay a hundred and ten or a hundred and fifteen at the following harvest."— When one borrows money, it is not the metal exactly which one wishes to possess, but the value it represents. Under the form of money or under the form of provisions, the lender delivers capital: capital is the object of the contract. From the essential point of view, which is that of value, there is no difference. In vain has it been objected that the value of grain was variable; for the same objection would apply to the value of money. Who does not know that the power of the precious metals was much greater in the time of Charlemagne than in the reign of St. Louis; in the time of St. Louis than in the reign of Louis XIV.; and in the reign of Louis XIV. than in our day? No doubt money presents a more fixed and certain measure of value from one year to another than wheat; but from one century to another the advantage of fixity and constancy passes to the wheat. The price of cereals is, in fact, the light by the aid of which we find our way in studying the economy of society in the past. — Under one form as well as another, the rent of capital depends on its abundance or rarity compared with the urgency of the demand. It is not the nature of the loan which can raise the premium; it is the situation of the borrower. Why did the legislator of 1809 allow the rate of 6 per cent. in mercantile bargains, while he imposed the minimum limit of 5 per cent. in civil matters? Apparently, that difference of interest signifies that the risks are greater in one case than in the other, and that the trader who invests his funds in uncertain operations does not give the same security for payment. Why does M. Troplong recognize in the lender of provisions the right to demand from 10 to 15 per cent. interest, if not because the certainty of payment is less in transactions of that nature? Starting there, to be consistent, one step more should be taken: the principle should be separated from the example, and one should say that the premium on the risk, which is one of the elements of interest, increases naturally in proportion as the certainty of reimbursement diminishes. In loans at interest, the premium on the risk acts as a sort of insurance on capital; this is why there are no reasons for refusing to allow it in the loan of money, when it is allowed in the loan of provisions. Credit is naturally personal. There exists no such thing as one rate of interest belonging to provisions and a different interest belonging to the precious metals. It is because those who borrow provisions generally place themselves in a more hazardous situation, that high interest is demanded of them. But a good number of borrowers to whom money is loaned personally merit still less confidence; why should it not be permitted to stipulate with them a premium for insurance, commensurate with the perilous chances they cause one to incur? The principle is admitted in wholesale contracts. Do you suppose that there is not, as M. Sainte-Beuve has so well said, any such debtor whose solvency makes the loaner run as much risk as he would incur from tempests? To sum up, either the exception made in the case of the loaner of provisions has no *raison d'être*, or the considerations which have determined it tend invincibly to liberty in the rate of interest, under a general law. —On the question of discount the subtleties of jurisprudence are freely exercised. Certain jurists rank it in the category of sales; others, in that of loans. "The banker who discounts," says M. Troplong, "only makes a loan. Accustomed to trade in money and notes, he only purchases a credit; and as 10,000 francs, payable in one year, are not worth 10,000 francs payable now, he gives a less price than the nominal one. This price is calculated on the time to run, on the solidity represented by the signature of the one who signs it, the value of that signature, the place, etc. Discount is only the difference between the nominal and the real value. I have said that the banker buys a credit; I add that, on his side, the borrower buys a present sum for a sum not due. In all cases, the borrower who sells his credit does not contract the obligation of returning the same thing, characteristic of the loan; his obligation is, to deliver the chose and guarantee its payment. On the other hand, the banker becomes proprietor of the effect, with the same title as if he had bought any other article; he uses it as he pleases, and has nothing more to do with the one who assigned it to him except so far as pertains to the security."—We see that if the rate of discount escapes in France the rules laid down by the law of 1807, it is not through respect to a theory which takes its point of support outside of realities. The legislator has yielded to the force of things, either by formally accepting or by tolerating usages which he could no more modify than destroy. — M. d'Esterno has cited, in the *Journal des Economistes*, curious examples of loans at a high

rate, which are negotiated, to the mutual satisfaction of borrower and lender, in the department of Saône-et-Loire. "There are," he says, "small farmers who buy, in May, cattle for labor, and sell them again in November. If they buy them for cash, they pay 600 francs for them, for instance, but, as they only pay 300 francs at the time of getting them, and promise the other 300 at the time when they count on having sold them, they consent to give 50 francs more for that accommodation. This transaction is usual, and it is repeated in the case of other animals, hogs, for example." Thus, farmers who would probably not consent to borrow at the rate of 7 per cent. upon mortgage, willingly borrow under that form at 33 per cent. The transaction has no relation to the current rate of interest; but it is within the ability and convenience of the parties who contract. That is sufficient to explain it. Credit institutions, by furnishing circulating capital at lower rates to property owners and farmers, will alone be able to supplant this custom. — Contraventions of the law of 1807 are especially frequent, and occur with impunity in civil matters. One has only to consult the notaries to be convinced that, if mortgage loans were confined to the strict limits of the legal rate, there would be to-day, outside of Paris and the range of the capital, few serious and effective loans. By means of accessory agreements, immediate deductions, and various compensations, people succeed, while inscribing only the legal rate in loan contracts, in winning and retaining capital in liens on real estate. — As a general statement, it may be said that the only loans which the restrictive laws affect, are the large transactions in which an habitually low price for money renders that intervention at least useless. Those, on the contrary, which escape the action of the legislative enactments, and of the law of 1807 as well as the others, consist of transactions of slight importance and in which a high rate of interest is invariably found to be stipulated This is true, especially of loans in retail trade and for a short term of credit. Those who loan by the week figure largely in that category. Those who loan by the day are a class of capitalists that should not be forgotten, and who, notwithstanding the high interest they obtain, render real service. — "In the Paris provision market," said M. Aubrÿ in his speech against the proposition of M. Saint-Priest, "a well-known trade in money is carried on: one keeps a shop of five-franc pieces, that is to say, a certain variety of a banker keeps an office in the market and delivers to merchants of the four seasons and to vegetable gardeners a five-franc piece. With this five-franc piece the small trader buys provisions and food which he goes and sells about the city. At the end of his day's work he returns; he has often earned two or three francs with the aid of that five-franc piece. Do you suppose it is hard for him to pay the banker who furnished him the instrument of labor the sum of 25 centimes from his day's profits? * * In this case the interest of the money is 1800 per cent. Some people wished to enter complaint in the name of the law; but the magistrates of the bar of Paris were obliged to recoil before the numerous and incessant cries of the opposition; this resistance derived its strength from the good sense of the people and the benefits of liberty "— It would seem that an investment by which money brings 1800 per cent. would call in the competition of capitalists, and that this competition would lower the rent of capital. Yet the loans which have taken in the French language the name of "loans by the little week" remain at a rate that varies little. The reciprocal advantages of the borrower and lender would not suffice to explain the permanency of so high an interest in these investments. To understand it we must consider the risks to which capital is exposed. The ambulating tradesmen are an essentially nomadic portion of the population: it is the business to which those have recourse, who, for the time being, can do no other, or whose indolence makes them shun labor. From such customers one can not expect great scrupulousness in the fulfillment of their obligations. Five-franc-piece bankers are those who most frequently become bankrupt The petty dealer, who often spends in drink the day's earnings, consumes both capital and profits. To escape the surveillance and pursuit of the creditor, the debtor has only to migrate from one occupation to another, in the infinite circle of petty trades which spring up and multiply in the streets of Paris. The capitalist lends to strangers, to people who have neither a sou nor a trunk, and without other guarantee than their interest to meet punctually their obligations so as to create for themselves a species of credit, an interest which all do not comprehend. If the debtors were punctual and scrupulous, the creditors, renewing their capital eighteen times a year, would very quickly make their fortune. Many, however, become ruined; and the sphere of these transactions does not appear to enlarge, which proves that there is in them a commingling of good and bad chances. — And now, I ask, are not the laws which restrict liberty of interest judged, when we see that, for one transaction at 6 per cent. which they prevent in the average sphere of credit, they tolerate or do not prevent a little lower down the scale of loans, numberless public operations every day, in which the usury extends to 1800 per cent. per year? — IV. Basis of Interest. It is time to abandon the historical controversy to examine the foundation of interest. Three principal elements co-operate to determine it: the rent of capital; the premium on the insurance to cover the risk, and, in a great number of cases, the charge for commission; and the salary of the intermediary who puts the borrower in communication with the lender. The rent of capital, the instrument of labor, the motor which sets commerce, agriculture and manufactures in motion, is the principal element in interest. How is its rate determined? and what is its measure? Has this element anything fixed, which depends not on places,

time or persons? or must it vary with circumstances and according to individuals? There is, we know, no such thing as unchangeable value; the notion even of value, arising as it does from the idea of relation, implies change. The rent of capital, like the price of all things, must vary under the action of demand and supply; and the law of demand and supply is itself subordinated to all the vicissitudes of production as well as of consumption, not to speak of the influence which progress or decline in means of transportation may exercise. One may not, then, prejudge what the rent of capital should be; but should confine himself to stating what it is. The observation of facts must rule in this matter. No doubt it is recognized in studying the economic history of peoples, that the rent of capital diminishes as wealth increases. But it should also be remarked that, through that incontestable tendency to a fall, the oscillations of interest become more frequent in proportion as commercial relations, developed by increased comfort and intelligence, come to multiply. The rent of capital varies, perhaps, less, in that descending progression, from one century to the following one; but from one year to another, it changes more. Credit, which formerly seemed to have nerves of steel and a hardened epidermis, has contracted the impressionable nature and delicate temperament of the sensitive. One can then determine the rent of capital only approximately, under given circumstances and while these circumstances continue. The system which would make the government regulate the rate of interest, to remain true and not deviate from the facts, would require the rate to be revised each month, each week, and, in some cases, each day; but a rule that required incessant alteration would not be a rule. This system is then condemned either to unchangeability of interest which is contrary to justice, or to an incessant change which would be the negation of law. As to the theories whose pet chimera is a fixed and in some sort normal interest, we will speak of them only to recall a few facts. The bank of France attempted to put them in practice, by maintaining the rate of discount at 4 per cent., in times of pressure as in periods of prosperity; but its resistance was finally overcome: in 1847 it was obliged to raise its rate of discount to 5 per cent. in order to arrest the export of specie; and in 1852, not to remain outside of the business world, it reduced it to 3 per cent. — The second element in interest is the tax for insurance or risk. This may be considered as still more variable than the preceding, and is certainly more difficult to estimate. The rent of capital is, as it were, the *real* part of interest, the part which is regulated by the value of things, the state of the market; and insurance is the *personal* part. The risk changes not only with the circumstances, but also with the situation and character of the borrowers: it is almost nothing in loans made on bills of exchange or notes payable to order which have several good indorsers; it is considerable in the case of a borrower who gives only his guarantee, and the lender raises the premium for the risk in proportion to the lack of solidity in the guarantee. This weakness of the guarantee may be diminished by the confidence of the lender or increased by his mistrust. This is an element to be taken into account, which, because it is personal on both sides, touches closely upon the arbitrary. "He who loans his capital," says M. Aubréy, "with risk of losing it in whole or in part, renders a greater and consequently better remunerated service than he who loans his capital without risking anything; this is what constitutes the difference between the lessor of real estate and of personal property; because the capital of the one always preserves its identity easy to establish, and is often secured by privileges and mortgages, while, on the contrary, the capital of the other is capable of being consumed by use and absorbed without return, as interest and principal; this is also the difference between the civil and the commercial loan, as well as the loan on pledge (pawn-loan), between obligations on short time and on long time, between maritime contracts and land contracts." The extent of the service is not measured by the extent of the risk; but he who consents to loan his capital, without the certainty of recovering it when due, is right in demanding of the debtor a premium for insurance against this danger: this is not a remuneration, it is simply a compensation, a guarantee. But whether remuneration or guarantee, in doubtful cases a prudent creditor would not dispense with this supplement to the rent of capital; yet it is not always sufficient to preserve him from ruin. When M. Proudhon said that the interest of money represented the risk, the chance that might befall, *alea*, he then exaggerated the truth, he took the part for the whole, he left out of account the very basis of interest, which is the rent capital gives. But even this shows that he took account of one element which all legislation has disregarded. — The socialist school, in the theory of gratuitous credit, substitutes for the premium on the risk, a sort of mutual insurance which unites all those making exchanges in the bonds of universal solidarity, and which makes every member of society bear his part in the consequences of the bad speculations or bad chances of all. This is not distributive justice: for the people who offer securities are put in the same category as those who offer none. The socialists make the moral being which they call society intervene in human affairs in exactly the same way as the ancients had their gods engage in them. Society, as they picture it in their romances, distributes subsistence and even wealth to all individuals; all the difference consists in having the manna come from the bank of the people, or the phalanstery, instead of descending from heaven. The people's bank having failed, and the phalanstery having aborted, we have to examine if it is possible, in the ordinary course of transactions, to establish any test or measure whatever of

the risk. This element of interest obeys no rules, even for a day, even for a given case; it is an affair of opinion, a question of individual chances. There is nothing in it which one can generalize sufficiently to establish an economic principle, or a legal regulation. The element of risk interposes still greater obstacles than does the element of rent, to any attempt to fix or limit the interest on money. — The third element of interest is thus defined by M. Aubréy, who, as a banker, could speak from acquaintance with the subject: "The instruments of labor only reach the laborers through intermediaries; this is the consequence of progress. Capital in the form of money, being an instrument of labor, is as much under the law of division of labor as capital in any other form. As every one knows, capital is put in motion and circulates by the aid of motive agents called banks; labor improves and prospers by reason of the activity and abundance with which capital circulates in these great reservoirs; but every one should also know how much accumulated wealth, moral power and dignity of character is necessary, properly to direct these credit institutions Now just these rare and valuable qualities, and this difficult and necessary labor in credit institutions, are remunerated by a charge for commission, which increases the interest on the capital furnished. M. Proudhon, in his people's bank, does not contest the legitimacy of this charge; for, when he decreed gratuitous credit, he reserved a discount of from 1 per cent. to 2 per cent. for expenses of administration. Is it possible to determine the measure of this third element? Evidently not. There are credit establishments of different kinds. The banker whose operations extend to millions in a day, takes only a very small commission and yet makes much money, while the petty dealer, who operates only with some thousands of francs, or with five-franc pieces, may charge a very high commission and yet earn but little; though he may give the same measure of his time and labor as the banker." — The above definition is neither complete nor altogether correct. Although it no more belongs to the government to regulate this part of interest than other parts, we must recognize that this contains an element more easy to estimate and less fluctuating. The institution of banks of circulation and discount has reduced the commission charge to small proportions, wherever their influence extends; yet even the state has a share in it, under the form of the stamp duty it puts on their notes. The commission charge of the intermediary bankers is often blended with the premium for risk: it is thus, for example, at Paris, where a discounter, for giving the third signature, and rendering a commercial bill acceptable at the bank of France, takes a premium or duty of 1 per cent., ¾ per cent. or ½ per cent. — In analyzing the elements of which interest is composed, we have seen that there is not one which gives a sure basis for estimating it. This has led M. Lherbette to say: "If you think there is a fixed, invariable basis for interest, why do you make it vary according to circumstances? and if you believe, on the contrary, that its basis is variable, why do you fix upon a rate from which the contracting parties shall not be allowed to vary according to the particular circumstances in which they find themselves and which they will understand better than you? In any case, if you determine to fix it, it will have to be continually modified; for circumstances constantly change; it would be necessary to establish mercurials for money as for bread." [The *mercurials* were registers of the price of grain and some other necessary provisions, and were formerly required to be kept in a public place in the market towns of France. E. J. L.] Even that would not be possible. The tax on bread embraces two or three qualities, of which it fixes the price by consulting the price of grain of corresponding quality; but the tax of interest does not depend on such simple calculations: in its case the rate in the mercurial would have to include as many qualities as there are particular situations, or individuals having recourse to credit. In the domain of credit, the list of classes is infinite: and this will infallibly baffle any pretension to a rule. Freedom in the matter of interest results not less from the powerlessness of the restrictive system than from the right which belongs to the contracting parties to dispose of their property as they think best. The experience of the past is here the most direct auxiliary of principles. — It is henceforth a recognized fact, thanks to the intelligence of our time, that interest on money is a legitimate value; why, then, should other conditions be imposed on it than on other values? When merchandise is in the warehouse or brought into market, its price is freely discussed between the buyer and seller; both find this method to their advantage; and the seller would carry away his goods as well as the buyer his money, if any one pretended to dictate to them the conditions of sale and purchase. In the matter of guarantees, both spurn the intervention of the state, and think themselves better off with free competition. Is there the least reason at all serious why trade in money should be excepted from the general law of trade? Sometimes society enjoys a tranquillity favorable to business, while again it passes through periods of monetary pressure in which every enterprise becomes difficult, and the activity of labor seems paralyzed. Money is sometimes scarce and sometimes abundant; the rent of capital must then vary, like any other value, according to circumstances. As to borrowers, they are not all equally solvent: on the contrary, they occupy, according to their morality, their reputation, and the competence they enjoy, various degrees in the scale of securities. Shall one say to a lender: "Whatever be the state of society, tranquil or disturbed; whatever be the abundance or scarcity of money; whether capital moves in full security or under the pressure of great anxiety; you shall loan your money on the same

conditions and to all"? That would be unjust and absurd; one of two things would inevitably happen: either the prohibition would not be regarded, or capital would be refused, and society would have to manage as it could, to live without credit. Let us change the hypothesis. If a limit may be imposed on the profits of money capital by establishing a maximum rate of interest for money, why may not a maximum be fixed for every species of revenues, all kinds of transactions, and every sort of merchandise? If it is forbidden to lend above a certain rate of interest, why should it not be prohibited to sell above a certain price? The people have a much greater interest in not paying a high price for wheat in time of scarcity, than in finding loans at a low rate of interest. If money capital must not bring its possessor more than a certain per cent. yearly, why should the profit from capital in machines, land or manufactures be unlimited? Suppose I lend my neighbor $20,000, with which he purchases a spinning mill which gives him an annual return of 50 per cent.; why should not I be permitted to obtain what interest I can for my capital, when the borrower who receives this capital from me is free to derive any profit he can therefrom? — It is claimed that the interest of money is an exception to the general rules of trade. M. Paillet said that property rights must yield, the same as others, to public utility; and he compared the prohibition to loan above a certain rate, with the interdiction to build within the line of fortresses, with expropriation for the public good, with the prohibition to clear land, with all measures, in short, which society takes to protect the weak against the strong. Political economy does not contest the right of society; but it denies its applicability in this case. What public interest requires the state to regulate the rent of money? We find none. In a theocratic government, where the state is everything and does everything, that would perhaps be conceivable. The priests in that case fix the price of provisions, the form of garments and the number of ablutions. People are not astonished to see them interfere in the system of industries, when they behold their authority reaching even to the domestic hearth. But since the industries have come forth from their swaddling bands, and citizens of the same state can freely trade with each other, it is the interest of each and all that trade in money should be as free as in other commodities. What would the ability to buy and sell products signify, without any other rule than the price resulting from the relation between demand and supply, if capital, which begets the products, were subject to different conditions on the market? Competition determines the rent of capital as well as the price of merchandise; and that alone can bring about and surely will bring about a fall in the rate of interest. Only chimerical or violently-disposed persons demand other methods. — The adherents of the doctrine of *the balance of trade* thought that money, instead of representing the capital in circulation, was the capital itself of each country. This is why they subjected money negotiations to special rules. It was with this feeling that M. Jaubert, who reported the law of 1807, said: "If commerce gives itself up to speculations in interest, it goes out of its way, and will in the end arrest the progress of industry." As if capital, or rather accumulated labor, was intended for anything else than to serve as a motor, and to procure profits for those who possess it. Communities live by tradition as much as by progress. We increase in stature because we rise on the shoulders of our fathers. Capital prepares the way for labor. The regulation of interest, as we know from the experience of our predecessors, is of no more service to labor than it is to capital. If it makes the latter unproductive, it prevents the former from development. But this system has consequences still more fatal to society than to the individual. It was decreed in France, by the law of 1850, that the maximum interest should remain fixed at 5 per cent. in civil matters. But that did not satisfy either M. Pelletier, who demanded money at 3 per cent., nor M. Proudhon, who aimed to reduce it to zero. The moment the people get the idea that it belongs to the law-making power to determine the rate of interest or to fix a limit to it, we are exposed to all the demands of anarchy. When the people, complaining rightly or wrongly of the hard times, come to demand a reduction in the annual interest, by what right can opposition be made? Will it be said, "We can not"? The legislators would then falsify their own action Will they respond, "We will not"? That would be opening the way to revolution. The people would withdraw to the Aventine Hill, claiming abolition of debts; or, perhaps, to avoid paying them, or to pay them in paper money, they will send to the legislature, as certain departments did in 1849, socialistic revolutionists. Regulating interest by legislation is the first step of society toward bankruptcy; for it is the substitution of arbitrary law for the right to make agreements freely. — Freedom in the matter of interest is proper for all peoples who have attained their majority and who are governed by laws of their own making: but it is especially appropriate in republics. Where the right of a citizen to take part in governmental affairs is recognized, he can not, without injustice and contradiction, be denied the power to regulate as he pleases his own affairs; to buy, sell, lend or borrow on such conditions as the market offers. The component parts of the sovereign power can not be held in tutelage. It is ridiculous that the law should stipulate for them as for aliens or prodigals put under an interdict. Let them not be called upon to deliberate on the nature and direction of the government, if they are judged incapable of comprehending and defending their true interests; or if that honor is accorded to their independence and intelligence, let the horizon of sovereignty be at least extended to private transactions and the domestic hearth. — The United States probably owe some measure of their prosperity to

the comparative freedom in the matter of interest. In New York discount has sometimes been taken as high as 18 per cent. per annum. At San Francisco money has been worth 4 per cent. or 5 per cent. a month. What matters it, after all, if those who borrow at this rate employ it so as to make still greater profits? — The rate of interest is generally in proportion to that of profits. Where industrial investments bring 12 per cent. to 15 per cent., it would be foolish to claim that one ought to borrow money at 4 per cent. to 5 per cent. The trade in money would, in fact, cease, if it could not take place under conditions similar to those prevailing in other industries. When, on the contrary, capital employed in agriculture and manufactures brings a return of 5 per cent. to 6 per cent., a moderate interest, say from 3½ per cent. to 4 per cent. is generally sufficient for the capitalist. Where the profits from agriculture are considerable, as in many of the western states, the remuneration of labor and of capital is high. Interest is high as well as wages. In Great Britain, on the contrary, where manufacturers, in order to become rich, must operate on immense quantities, the profit being very small on each fraction, capital obtains only a moderate interest. The abundance produced by the treasures accumulated by industry makes capital less in demand there than labor. — Harmony of these diverse functions in society can only result from liberty. It is liberty which has caused the growth of manufactures and has given wings to commerce. Liberty can alone regulate the interest of money, to the satisfaction of everybody. Capital can have no other master than itself; and its tyranny will be best avoided by not seeking to reduce it to slavery. A just balance will here arise from the relations naturally established between men and not from the laws they may be tempted to enact. — BIBLIOGRAPHY. *A Tract against the High Rate of Usury, etc.*, by Sir Thomas Colepeper, London, 1623, 4to; *Interest of Money Mistaken*—or, a treatise proving that a fall in interest is the effect and not the cause of the wealth of nations, London, 1668, 4to—(this treatise was written against the work by Child, who had maintained the opposite opinion); *Brief Observations concerning Trade and the Interest of Money*, by Josiah Child, London, 1668, 4to; *Usury Explained and Condemned by the Holy Scriptures and by Tradition*, by Father Thorentier, Paris, 1673, 12mo; *Treatise on the Practice among Merchants of dealing in Bills and Money Loans*, by a doctor of theology, 1684; *Treatise on Money Negotiations and Usury*, by Father Thomassin, Paris, 1697, 8vo; *Usury, Interest and the Profit derived from Loans*, or the ancient doctrine opposed to the new opinions, by J. INTEREST, after the Historical Method. Several distinct yet fundamentally related inquiries arise with respect to interest. What are the causes that determine in a given age and country its general or average rate? What are the causes that determine its tendency to rise, to fall, or to remain stationary in the progress of society? What are the causes that determine its temporary

fluctuations?—The causes determining its average rate have differed essentially in different ages and even in different parts of the same country in the same age. At a primitive social stage interest was unknown, and when the practice of exacting it emerged, it was considered immoral and generally prohibited by law. Archbishop Whately incorrectly defined man as an exchanging animal; exchanges did not take place in the earlier communistic stages of human progress. For a similar reason man can not be defined as an animal that pays interest on loans. The owner of superfluous wealth was in primitive times considered bound to lend it or give it gratuitously to any one in need; a distinct conception of individual proprietary right not having been developed. It was not until late in the reign of Henry VIII. that the payment of interest was legalized in England; a maximum rate of 10 per cent. being at the same time fixed. Before this act the receipt of interest was branded as usury, and contrary to both the common law and the canon law; although social exigencies, stronger than law, had in the later middle ages firmly established the practice of paying it, subject, however, to very different conditions throughout the country generally on the one hand and among mercantile people in the principal towns on the other.—Throughout the country generally, there was but little accumulation in the middle ages. If we take the produce of taxes as evidence, the pecuniary value of the whole movable property of England during the thirteenth and fourteenth centuries never amounted to a million. So late as 1523, it was estimated in parliament that all the movable wealth of the kingdom, money included, was under the value of three millions. A case, indeed, is reported in one of the year books of the reign of Edward III. from which it would appear that a deceased person had left goods and chattels to the value of 200,000 marks (£133,333), of which his widow claimed a moiety; but the amount is incredible, and is probably ascribable to some mistake of a copyist in the numerals. But if there was little accumulation, there was still less loanable capital. The great mediæval landowner was commonly needy, and his accumulations, if any, took the form not of loanable capital but of castles or manor houses, cattle, sheep, horses, arms, clothing, together with some plate and jewelry. One of the most instructive inquiries in economic history relates to the forms of accumulation in different states of society and different countries, and their causes; and it is an inquiry closely connected with variations in the rate of interest. One can without difficulty understand that the feudal lord built strong and imposing dwellings for power, consequence and security; and his possessions in cattle may also be easily explained. They were the natural produce of his land, and they fed a host of dependents in his hall. But if he rarely amassed money, it was not that the love of money was not strong in his breast, but because it was so scarce that even a thrifty noble with immense landed estates found it hard to procure. From the reign of Edward I. to the accession of Henry VIII. the entire amount of silver loaned in England was below £1,200,000, and the drain of money to the continent, especially by the papal court, during that period, was relatively enormous. Hence there was little money to lend in the country. Land, houses, cattle, sheep, and such kinds of property, movable or immovable, did not constitute loanable wealth. Loans, too, could not be effected by means of credit; the actual intervention of coin was necessary, and few persons had sums by them to put out at interest. The risk of the penalties on usury, and the rigor of the terms extorted by lenders under various covert devices, contributed to the difficulty of procuring loans, but the scarcity of money was a principal cause of the exorbitant rates of interest prevailing throughout Europe in the middle ages. Payments even to mercantile people in London itself were sometimes made partly in skins for lack of coin. Had banking and instruments of credit made it possible to effect loans without money, much lower rates of interest might have prevailed in spite of the penalties on usury. Hence the fall in the rate of interest in England, in the latter part of the sixteenth century, was undoubtedly caused in a great measure by the increase in the accumulation of money and the greater quantity entering the loan market after the influx of the precious metals from the mines of Potosi and the new coinage of Elizabeth's reign. In later times the growth of a system of credit has added so vastly in effect to the amount of loanable capital, that, unless in critical times when credit collapses, the quantity of loanable coin has no appreciable influence on the rate of interest, and would hardly be missed from the loan market.—It should be added, with respect to mediæval interest, that the customs of trade at length established in the commercial towns a rate with which the ordinary tribunals did not interfere. In England, in the reign of Edward III., the customary rate in London was 10 per cent., or half the customary rate of profit. We find here the emergence of the condition which in modern times has become the dominant one determining ordinary interest, but which in the middle ages operated only among the small number of trading people in towns, namely, the rate of commercial profit. The ordinary borrower in old times did not borrow to make profit, but because he was in immediate need of money to pay his debts. In modern times the fluctuations of interest are often caused by borrowing, irrespective of profit, on the part of persons or governments in immediate want of advances; but unless in critical states of trade, or on other extraordinary occasions, modern borrowing is chiefly on the part of people in business seeking to make profit on the capital thus obtained, and the interest they can pay is accordingly limited by the profit they can make. Thus, one of the fundamental differences between the causes determin-

ing mediæval and modern interest is, that the greater part of the capital lent in our age is lent to producers, and the main source of interest is the profit they make on production. There are still some unproductive private borrowers, and governments may pay interest out of taxes, but the general rate is determined by a commercial or industrial standard. — There is no other country in the civilized world in which the modern movements of interest, and the conditions affecting them, can be so advantageously studied as in the United States. Here the causes governing the rates in both old and new countries, and the course they follow as social and economic progress advances, can be investigated together. For, relatively speaking, the eastern states form an old country, the western states a new one; and again in the latter we can observe new regions at different stages of early development. The salient facts as regards interest are, in the first place, in the eastern states an average rate of interest not much above that prevailing in the chief countries of Europe; secondly, in the newest regions of the west an extraordinarily high rate, which has sometimes reached 25 per cent.; thirdly, a fall of interest in these new regions after cultivation and industrial development have gained considerable ground. To understand the significance of these economic phenomena we must take in connection with them some others no less remarkable. Wages, too, are found at their highest point in the new regions of the west at the beginning of their industrial career; they are lowest in the long settled eastern states; and they begin to decline in the western states when the first stage of their development has been passed. The explanation of the concurrent phenomena thus exhibited in the movements of interest and wages is simple. With the aid of the scantiest supply of capital the first Californian gold diggers might count on winning, on an average, an ounce of the precious metal, equal to sixteen dollars, a day. The first farmers could raise enormous cereal crops by merely plowing and sowing; and horses and herds, which they had only to take possession of, covered rich natural grass lands. Out of such returns both high wages and high interest could easily be afforded, and the scarcity of capital enabled lenders to exact a considerable proportion of the whole produce. But when the cream, as it were, had been skimmed by the first comers, both capital and labor had to content themselves with a poorer and harder earned yield. Gold was no longer to be won by mere digging, and needed deep and costly mining. The soil was found to require irrigation after a few crops had been raised, and even manure came into request. Not a herd was to be seen on the plains that was not marked with an owner's name. Capital was no longer scarce, but the returns were comparatively scanty. Nature did less and less to assist the advance of each successive wave of immigrants, until the difference between the productiveness of capital and labor in the new state and the old eastern states became one only of degree, not of kind. — It is objected, however, to this simple explanation of the phenomena of the coexistence of extraordinary high interest and extraordinary high wages in new and naturally prolific regions, and of the decline of both as such regions are peopled, brought under cultivation and developed by capital, so as to begin to display the features of long settled and advanced states, that the productiveness of labor and capital, that is to say, their wealth-producing power, is not less but greater in old than in new countries. In old countries, it is argued, the subdivision of labor is carried to a much farther point and directed with much greater skill, and their wealth is such that they not only support a large unproductive population, but have a numerous and rich idle class, whereas in new countries in their earliest stage every one is a producer. The richest states of America, it is pointed out, are not the western but the eastern, and the richest state in the world is Great Britain, with natural resources far inferior to those of Mexico or Brazil But the single fact that labor and capital desert Great Britain for new countries affords conclusive proof that they are more productive, and therefore find more remunerative employment, in the latter. The wealth of England is no doubt greater than that of any new country, but a great part of its wealth is made not in England but in the very new countries in question. And the total wealth of England would be much less than it is, were the returns to English capital no greater in any other region than in England itself. England is rich because, on the one hand, it reaps harvests all over the world, and gathers the produce together into its granaries, and because, on the other hand, the aggregate capital it employs in production transcends calculation, although part of it yields but scanty returns from poor soils and inferior mines. A million might return 25 per cent. to the Californian corn grower and only 5 per cent. to the farmer in Middlesex, yet if for every million in California, there be a hundred millions in Middlesex, with London in its midst, Middlesex may have a revenue equal to that of twenty Californias; no inconsiderable fraction of it being, perhaps, actually drawn from California. — In these facts we find also a refutation of the theory that the appropriations of land and the growth of rent are the causes of the decline of interest in new countries in proportion as cultivation, industrial progress and population advance. When the farmer and the miner are compelled to resort to much more laborious and costly methods than those by which they gathered the first fruits that Nature laid at their feet, wages, profit and interest must decline, whether land be appropriated or not, and whether there be or not some fortunate owners of virgin soil and rich deposits of gold, from which a large rent can be drawn. There might be no rent, were all the more fertile soils and mines so exhausted that capital and labor were driven altogether to parts

of the new state which the earlier immigrants had passed by with contempt, but the absence of rent would not prevent a fall of both wages and profit, and of the interest which the lender of capital derives from the gross profit it yields. To call the rise of rent the cause of the fall of interest, is to mistake the effect for the cause. As population advances, land with inferior natural powers or advantages is resorted to, and superior fields for the employment of labor and capital can thus afford a rent. Whether this rent is appropriated by the central government, or belongs to the first settlers, wages and interest must fall. It is true that were the government to become the sole landowner, its revenue in rent might enable it to dispense with taxation, thereby setting trade free from fiscal burdens and fetters, and so raising indirectly the return to labor and capital. But this would be the result of the absence of taxes and restraints on production and commerce, not of the absence of rent. — The general rate and movement of interest thus depend mainly on the profit which the capital employed in production holds out, and the movement will be downward as resort to less productive natural resources becomes requisite, unless science and art supply the deficit created by the failure of the bounty of nature In the infancy of their development new countries afford a rate of interest which will never again be attained in later stages of their career, but whether interest must continue to decline throughout every stage of social advancement, is a question that can not be decisively answered, because the resources of science and art and the future powers of production of the human mind are beyond prediction. The human mind is a source to which capital may look for profit after some of the chief material sources at present known shall have begun to fail. — Although, however, the rate of profit determines the limit or maximum of interest, because the managers or employers of borrowed capital can not pay more than they make by its use and must reserve part for their own remuneration, it does not determine either the proportion of gross profit that interest absorbs, or the temporary fluctuations of the latter, which often bear no relation to profit. The proportions of profit falling to the share of lenders as interest depends on the amount of loanable capital, on the one hand, and the demand for it on the part of both productive and unproductive borrowers, on the other hand. A high rate of interest tends to diminish the number of persons engaged in business and employing their own capital, and therefore increases the supply of loanable capital; while a low rate forces a greater number of capitalists to employ it themselves and to add the remuneration of management to interest, and thereby diminishes the supply feeding the loan market. — Temporary fluctuations of the rate of interest result from a variety of causes, of which the chief is the state of credit. In ordinary times considerable loans are for the most part effected without the intervention of money in the proper sense of the term, but when credit collapses, nothing but cash is an available medium. The need of loans on the part of traders in difficulty becomes at the same time more and more urgent in proportion as credit contracts, so that at such periods the interest even people in business are ready to offer may bear no relation to the rate of profit in commerce. There are occasions, too, on which an urgent demand on the part, not of people in trade but of governments, is the chief condition operating on the loan market, and trade profit here again supplies no standard by which to estimate the terms on which loans are effected. Many other causes produce sudden divergences of interest from the rate which the standard of commercial profit would fix. The supply of money at call, for instance, may be abundant, and loans for a few days be obtained at little above 1 per cent., while the rate of discount on advances for three months may exceed 3 per cent. — It must not be forgotten that the profit which trade offers is, after all, speculative only; it holds out, not a certainty, but a probability or expectation. The interest, therefore, which lenders of capital can look for is likewise speculative or probable only. Nevertheless this speculative interest is the principal condition governing the rate on the safest investments, such as the government stocks of countries like the United States, Great Britain and France, and determining their price in the market. If a man has drawn a ticket in a lottery which gives him an even chance of winning $100, the ticket is worth $50, and he is not likely to part with it for $40. In like manner, if he has a probability of making 20 per cent. on an investment in trade, he will give only half the price for government stock that he might have given were 10 per cent only the expectation, on equal probability, held out by trade.

T. E. Cliffe Leslie.

INTERESTS, Moral and Material. Man can not do without bread, and the expression of this daily need forms part of the short prayer which Jesus himself taught his first followers; but it is equally true that man does not live by bread alone. He is composed of two elements, soul and body, intellect and matter; and this duality of his nature involves a duality of desires and appetites, one belonging to his soul, the other to his body; hence also that duality of interests which are qualified as *moral* and *material*, the former tending to the more and more complete satisfaction of certain spiritual wants, and the latter to the acquisition of the greatest possible amount of physical well-being. — Moral interests are to-day understood to mean the practical advantages which result from the progress of sound public education and advancement in the philosophical and moral sciences; and by material interests are meant the developments made by human industry and the conquests which the progress of the natural and physical sciences necessarily

secures for it. These two kinds of interests are then, in their final analysis, the two terms of the great synthesis expressed by the word *civilization*. Hence, it is in this same sense that it has been said that "the two great means of advancing civilization are to propagate morality and industry, in order to render customs more benevolent and competency more general;" and moral civilization has been defined "the sum of the faith, laws, manners and virtues of a people, that is to say, the very end of the existence of nations;" and material civilization "the progressive development of trades and arts purely manual, or of industry."—Bossuet says, in speaking of the Egyptians, whom we may style civilization's first-born, "they knew from the first *the true end of politics, which is to render life comfortable, and the people happy.*"—No one says to-day, with J. J. Rousseau, that "everything is good when it leaves the hands of the Creator, but everything degenerates in the hands of man;" no one any longer maintains, with him, that man necessarily recedes, in a moral point of view, every time that he makes a step forward in the way of material civilization. No one now refers us back to savage life as an ideal of happiness, from which we are to be every day farther and farther removed; and the golden age which the poets showed us in the past, at the beginning of the existence of our race, is henceforth to be seen only in the future, as the end and recompense of man's efforts through the ages. Indeed, moral and material interests are not contrary one to the other, nor even essentially distinct. It is not true that the easy life, as Bossuet says, or the prosperity and morality of a people, are exclusive of one another, and that material well-being is developed only at the expense of public morality. It can not be truthfully said that men become morally corrupt in proportion as their condition improves materially, and that their civilization, so brilliant on the surface, is at bottom nothing but rottenness. This has been already absolutely demonstrated by the distinguished economist, de Molinari. — "In the first place," says this illustrious writer, "the history of civilization proves that those branches of human knowledge which contribute to the moral improvement of mankind, develop no less rapidly than those which tend to increase his material prosperity. Religion, for example, has, through the course of ages, improved and refined itself, and thereby exerted a more efficacious influence over man's morals. In this respect how far superior is Christianity to paganism! And can we not easily perceive a progress even in Christianity? Is not the Christian religion of to-day a more perfect instrument of moral development than it was at the time of St. Dominic and Torquemada? Do not the philosophical sciences, and especially political economy, succeed every day more effectually in rendering men more moral by showing them more and more clearly that the observance of the laws of morality is an essential condition of their happiness? In the second place, ought not material progress, far from being an obstacle to the moral development of the human species, contribute, on the contrary, to hasten it? Should it not, by rendering labor more fruitful, diminish the intensity and the frequency of the temptations which urge him to violate the laws of morality in order to satisfy his material appetites? Besides, these inductions, drawn from the observation of our nature, are confirmed by experience. The records of crime prove that the poor, other things being equal, are guilty of a greater number of crimes than the rich; they prove also that base criminality and crimes diminish in proportion as comfortable circumstances become more general in the lower walks of life The objection of a pretended demoralization of the nation occasioned by the development of material well-being, is therefore at variance with observation and experience."—In fact, we can not see how the improvement of the conditions of our terrestrial existence, the invention of gunpowder, the discovery of printing, the innumerable applications of steam and electricity—we are at a loss to imagine how all these marvels of material progress, which have renewed the face of the earth, can be of themselves and virtually causes of corruption and moral decline. Is it not rather whatever binds man to the earth, whatever renders him dependent upon man, that is to say, slavery, that renders him brutal and degraded? Is it not whatever frees him from the fetters of matter, whatever emancipates him, that is to say, liberty, that elevates him and renders him capable of perfection? Does not the philosophy of history show that every revolution accomplished in the domain of industry is followed sooner or later by a corresponding moral progress? We say sooner or later, and it is in these words we must seek an explanation of the apparent contradictions which the gradual development of material and moral interests sometimes presents. This development is not always simultaneous and immediate on both sides. Moral progress, rendered possible by material progress, does not always go hand in hand with it; it delays sometimes, and it has its periods of interruption, but it infallibly follows material progress. To cite only one example, does any one believe that railroads, those powerful agents of equality and sociability among men, have already borne all the fruit that their establishment and actual extent render it possible for them to bear? Certainly not; but these are merely temporary inequalities, which will, when the time comes, be changed into brilliant harmonies. — If we but cast a glance at the comparative state of nations during the different phases through which they pass during even a single century, we shall readily appreciate, as in a tableau, this unequal but parallel and sure march of the progress of the human mind, this general equilibrium, which never fails to show itself, sooner or later, between the material and the moral interests of each country and of different na

tions considered in their entirety. We often hear our age reproached with its "worship of material interests," as if material interests were not worshiped in all ages, or as if our times alone were guilty of selfishness, thirst for gain and love of pleasure. We find these reproaches even in writers who, some pages further on, undertake to demonstrate that man is everywhere and always the same, that his surroundings change, but not his passions; and they support their doctrine by other analogous truths, which are the best refutation of our pretended exceptional perversity. For, as every one knows, the "worship" of material interests necessarily goes hand in hand with corruption. Now, we ask any one that has ever opened a volume of history, whether material interests and corruption are more prevalent in the nineteenth century than they were in the time of Louis XV., or of the regent, or of Louis XIV., or of the league, or of Louis XI., or when priests did not know how to read, or, finally, than among the Romans and Greeks. While writing these lines, facts crowd into our memory which demonstrate that men's passions have remained the same, that their expression alone is modified, and, thanks to the progress of education, improved. — In fact, the only difference there is between the past and the present is, that we have one additional means of restraining men's passions, or of moderating them, or of forcing them to conceal themselves. And it must be remarked that, *in default of a higher motive*, it is better that men should conceal their vices out of human respect, or for any similar reason, than flaunt them boldly before the eyes of all. The community is thus spared corruption by bad example at least; and besides, restraint is thus put upon one's self, and the number of one's defects lessened. This means is public opinion. There has existed a public opinion at all times, but its action was very restricted. There were at first very few educated men, and between the opinions of the learned and the ignorant there was an abyss. The invention of printing, the creation of a daily press, the diffusion of education, have increased a hundred-fold the force of public opinion. Public opinion has become a check upon evil, a stimulant to good, and as the average of education has been raised, which means that education is enjoyed by millions of individuals who were formerly left groping in superstition, and in the fanaticism which springs therefrom; as the average of education has been increased, we say, men know better how to distinguish good from evil, and this knowledge is frequently all that is needed to determine their choice. — This century is reproached with the worship of material interests! But this worship has never existed in a less degree than now. Material interests can never be suppressed. So long as we have material wants, we shall have material interests, and if the progress of the sciences renders it possible to more than satisfy these interests; if physics, chemistry and mechanics multiply wealth, so much the better, for wealth increases education, and education strengthens morality. Our opponents think they have closed the discussion when they have spoken of stock-speculations and luxury; but did not our forefathers dabble in stock-speculations? It is true that they did not speculate in railroad stock in the time of Cicero. As to luxury, you will find it in the stone age, for what else but luxury are those rude designs that embellish the ancient relics of this period? Luxury and art go hand in hand, and just as poetry preceded prose, so also has art preceded science. Who knows but that our most important inventions are due to the need we feel of embellishing what surrounds us. — To sum up, if vice unfortunately abounds in our day, it is certainly less wide-spread than formerly. No matter what may be said to the contrary, our age is more disposed to sacrifice material to moral interests than any that has preceded it, for formerly the very name of virtue was unknown to the uneducated masses; in the middle ages, the idea of fatherland was but very little diffused; the political passions that play so important a part in our time were scarcely known; in fine, the very idea of moral interests is modern. An epoch should not be judged by certain prominent and exceptional facts; we must examine it in its entirety, deliberately and impartially. We allow ourselves to be too much impressed by certain kinds of opposition, and take certain sayings too literally; it is not possible that we are worse than our fathers; sound reason and facts concur in refuting such assertions; but everything imposes upon us the duty of using every effort to make our children better than we are ourselves.

MAURICE BLOCK.

INTERIOR, Department of the. While every European government has long had its ministry of the interior, or department of internal affairs, it was not until 1849 that the United States established what is called in the title of the act (though nowhere else), the home department. Up to that time the important functions now exercised by the secretary of the interior were distributed among four other departments of the government: the secretary of state had charge of patents, copyrights, the census, and public documents; the secretary of the treasury had the business of the public lands, mines and mining, and judicial accounts; Indian affairs were in charge of the war department, and the business of pensions was divided between the secretary of war and the secretary of the navy. All these varied departments of the public business (except copyrights), to which were added by subsequent laws the bureau of education, the Pacific railways, the public surveys, the territories, and the charge of certain charitable institutions in the District of Columbia, were assigned to the secretary of the interior by act of March 3, 1849. (9 Stat. at Large, 395).— The secretary of the interior is appointed by the president and

senate, salary $8,000, and is by custom, though not by law, one of the seven members of the cabinet. He is required to make an annual report as to the public documents received and distributed under general laws, and he makes frequent special reports to congress, on call of either house or otherwise, concerning the business of any of the half-dozen bureaus subject to his supervision. All communications to the president or to congress from the heads of these bureaus are required to pass through his hands.—There are in the interior department, besides the clerical force attached to each bureau, an assistant secretary of the interior, salary, $3,500; a chief clerk, salary, $2,750; and 103 clerks, laborers and watchmen, drawing, in aggregate salaries, $115,190 per annum. There is also an assistant attorney general for the interior department, with five clerks, whose salaries aggregate $9,450 per annum. The secretary's office has seven divisions, each with a chief and clerks attached, these are known as those of appointments, of disbursements, lands and railroads, Indian affairs, pensions and miscellaneous, public documents, and stationery and printing. The vast extent and variety of the public business which passes through the office of the secretary of the interior demands executive abilities of the highest order in the head of that office. The rapid territorial development of the country, the public geological and mineralogical surveys, the sales, settlement and surveys of the public lands, the legal relations of the transcontinental railroads to the government, the care of the great Indian population with the purchase of their supplies, the execution of treaties with the tribes and the constantly recurring removals of the aborigines, the enormous business of pensions for army and navy service, the great and rapidly increasing business of patents for inventions, the census office with its periodically recurring and complicated labors, the custody and distribution of the vast series of public documents, the charge of hospitals and asylums at the seat of government; these and other weighty public interests demand a comprehensive skill, wide legal and general knowledge, and prompt capacity for business scarcely paralleled by any other department of the government service. While the heads of the various bureaus in the interior department have entire charge in detail of the business belonging to their offices, the secretary of the interior has the ultimate decision of all questions involving government action, with few exceptions. The secretary has also the power of appointing the clerks and subordinate officers in most of the bureaus, thus constituting a large patronage. All patents issued in the name of the United States must be signed by the secretary of the interior.—The multifarious business of the department of the interior, originally concentrated into one extensive building near the centre of Washington city, has expanded so prodigiously as to require many of its bureaus and more than half its official employés to be colonized in other localities. The bureau of education has its offices opposite; the geological survey is established at the National Museum; the pension bureau occupies a large building on Pennsylvania avenue; and the various divisions of the census office are distributed in rented buildings elsewhere.—The following is a list of the secretaries of the interior from the first, with the time of their respective appointments:

1.	Thomas Ewing	March 8, 1849
2.	Alex. H. H. Stuart	Sept. 12, 1850
3.	Robert McClelland	March 7, 1853
4.	Jacob Thompson	March 6, 1857
5.	Caleb B. Smith	March 5, 1861
6.	John P. Usher*	Jan. 8, 1863
	"	March 4, 1865
	"	April 15, 1865
7.	James Harlan	May 15, 1865
8.	Orville H. Browning	July 27, 1866
9.	Jacob D Cox	March 5, 1869
10.	Columbus Delano*	Nov. 1, 1870
	"	March 4, 1873
11.	Zachariah Chandler	Oct. 19, 1875
12.	Carl Schurz	March 12, 1877
13.	Samuel J. Kirkwood	March 5, 1881
14.	Henry M. Teller	April 6, 1882

* Reappointed.

A. R. SPOFFORD.

INTERNAL IMPROVEMENTS (IN U. S. HISTORY), a party question in the United States from 1820 until 1860. There has been very little objection to internal improvements where the jurisdiction of the improved property passes to the United States, as in case of lighthouses, forts, etc. The opposition has been to improvements where the jurisdiction has remained in the states, as in case of canals, rivers, harbors, etc.—I. 1789–1820. Under the articles of confederation each state exercised the right to control commerce, to levy duties, and to expend the proceeds at its discretion, with the proviso that the imposts or duties should not be levied upon the property "of the United States or either of them," should not conflict with treaties of the United States already concluded or provided for, and should not prevent the transfer to other states of goods imported.—In the convention of 1787, Sept 15, after the control of commerce had been given to the federal government, a provision was offered that "no state shall be restrained from laying duties of tonnage for the purpose of clearing harbors and erecting lighthouses." It was at once suggested that there were other purposes for which tonnage duties might conveniently be levied by the states; and the provision was altered to the more general form, "no state shall, without the consent of congress, lay any duty of tonnage." It was then incorporated into article one, section ten, paragraph three, of the constitution as it now stands. (See CONSTITUTION.) The intention of this provision is very evident, if we consider its original form, as above given, the geographical position of the states which then composed the Union, and the practice under it for thirty years. Every state, at the time, had seacoast, a seaport or seaports, and ocean commerce, more or less important. It was not until 1791 that Vermont, the first entirely inland state, was admitted. The original intention of the

constitution, then, was that each state should control entirely the improvement of its own seaports, levying for that purpose duties upon the commerce which should enter them; but that the consent of congress should first be obtained, in order to guard against abuses — This was for many years the invariable practice. Whenever a state wished to improve any of its seaports or navigable rivers, its legislature passed an act to levy tonnage duties upon the commerce of the place to be improved; an act of congress approved the levy, for a limited time, and gave it validity; and the proceeds were expended under the direction of the state. One act of this nature, passed by Maryland in 1790, was continued in force until 1850, by successive "assents" of congress. There is no instance during this period, nor, indeed, until the act of March 3, 1823, hereafter referred to, of the expenditure of the national revenues for the improvement of rivers and harbors. Two "assenting" acts of congress are cited among the authorities, as instances of the practice during this period; the whole number (34) is too large for special reference to each. All the "internal improvements" provided for on the coast during this period were those in which the jurisdiction remained in the United States, such as "lighthouses, beacons, buoys, and public piers," for which congress appropriated money steadily after Aug. 7, 1789. These appropriations required as a prerequisite that the states should cede the sites of lighthouses, etc.— Since the original thirteen states ratified the constitution, no other states fronting on the ocean have been admitted, excepting Maine and Florida on the Atlantic, and California and Oregon on the Pacific. During the remainder of this period nine new states were admitted, all of which were growing rapidly, and none of which touched the Atlantic. This rapid influx of inland representation into congress soon began to work a change in the original conception of the powers of that body as to internal improvements. It seemed unfair that states which possessed seaports should be allowed to provide for internal improvements by levying duties, to be paid ultimately by inland consumers, while inland states should be left to make their necessary internal improvements at their own expense. In 1806 this idea took shape in a provision for a great turnpike road, to be built at national expense. (See CUMBERLAND ROAD.) It was to penetrate the western states and be the means of transmitting emigrants and mails in peace, and troops in war. Its constitutionality was variously defended upon the ground of the powers of congress "to provide for the common defense," "to establish post roads," and "to pass laws necessary and proper for carrying into execution" the foregoing powers; but the system found then, as it has always since found, a solider justification in the idea of "an equal division of benefits." In this instance the division recognized both the northwest and the southwest, for the bill for the Cumberland road was balanced by a bill for opening a road through Georgia on the route to New Orleans. From this time for thirty years bills for the construction of roads through the various territories were passed in great abundance. In congress it was first suggested by Henry Clay in the senate, Jan. 12, 1807, that a quantity of public land should be appropriated for the construction of a canal around the falls of the Ohio; and a bill for that purpose passed the senate, Feb. 28, but was not considered in the house. March 2, a senate resolution called on the secretary of the treasury for a plan for opening roads, canals, etc., at national expense. April 4, 1808, Gallatin submitted a voluminous report recommending a system of roads to cost $16,000,000. It was not acted upon. — From the beginning the constitutionality of appropriations for the construction of roads was warmly denied, and by none more steadily than by the successive presidents, Jefferson, Madison and Monroe. All of them refused to be convinced that the building of roads in different parts of the country was such a matter of "general welfare" as to justify the expenditure of the public moneys. All of them, however, approved the advisability of such measures, if they could be constitutionally effected, and urged an amendment to the constitution, to give congress the doubted power. (See CONSTITUTION, III., B. 3.) But in deference to the scruples of the presidents the roads were built through the territories, or, where they passed through a state, were constructed under a compact with the state, and by its consent. — During the war of 1812 the American armies on the frontiers labored under great disadvantages, owing to the almost entire want of efficient means of transportation. One consequence was, a great development of the idea of internal improvements, and its extension to include canals. In the great state of New York it took shape in the construction of the Erie canal. (See NEW YORK; CLINTON, DE WITT.) In congress a bill to set apart the bonus and government dividends of the national bank (see BANK CONTROVERSIES, III.), as a fund "for constructing roads and canals and improving the navigation of watercourses," passed the house Feb. 8, and the senate Feb. 27, 1817. Among its warmest advocates was Calhoun, who had introduced the proposition both in this and in the previous session, and who defended it on the broad ground that "whatever impedes the intercourse of the extremes with the centre of the republic weakens the Union," and that it was the duty of congress to "bind the republic together with a perfect system of roads and canals." Henry Clay, however, had been the real father of the scheme, and he never deserted his offspring. March 3, 1817, in the last moments of his official life, President Madison vetoed the bill, for the reason that congress had no constitutional power to expend the public revenues for any such purpose. An effort to pass the bill over the veto failed. The new president, Monroe, in his first annual message,

while admitting the great advantage to be derived from a good system of roads and canals, declared it to be the settled conviction of his mind that congress did not possess the right to construct it. The attempt was therefore dropped temporarily, with the salvo of a house resolution, passed March 14, 1818, that congress had power to appropriate money for the construction of roads and canals, and for the improvement of watercourses. — II. 1820–60. The pronounced success of the Erie canal, and its evident bearing upon the prosperity of the state of New York, gave a new impetus to the internal improvement idea. Appropriations had already been made by congress for the preservation of exposed islands, and occasionally army officers had attended to the removal of annoying obstructions in navigable rivers. March 3, 1823, the first act for harbor improvement at the expense of the United States was passed by congress. It seems to have been due, in great measure, to an expression in President Monroe's veto of the bill for the preservation of the Cumberland road, May 4, 1822. He had vetoed it because of its attempt to assert jurisdiction by establishing turnpike gates, tolls, and penalties for their infringement; but he acknowledged a considerable modification of the opinions given in his first annual message. While his own opinion still was that an amendment to the constitution was necessary to give congress the power to construct a general system of internal improvements, he now held that congress had the power to appropriate the public moneys at its discretion; and that though it was in duty bound to select objects of general importance, it was not the province of the president to sit in judgment upon its selections. This idea was more fully exemplified in the act of April 30, 1824, appropriating $30,000 for the survey of such roads and canals as the president should deem of national importance, and in the act of March 3, 1825, ordering a subscription of $300,000 to the stock of the Delaware and Chesapeake canal. — The inaugural address of the new president, John Quincy Adams, warmly commended Monroe's internal improvement policy, and promised an adherence to it. Through his term of office appropriations for this object increased in number very rapidly; the board of engineers appointed under the act of April 30, 1824, was steadily engaged in pushing forward the surveys for new improvements; and every annual message of the president laid special stress upon the importance of this feature of the government's operations. This part of the "Adams and Clay policy" was one of the great moving causes which led to the new development of two opposing parties, and the overthrow of Adams at the election of 1828. (See DEMOCRATIC PARTY, III.; WHIG PARTY, I.) — In his first annual message President Jackson condemned the constitutionality of an internal improvement system, but advised the adoption of an amendment to allow congress to apportion the surplus revenue among the states. The first session of congress under his administration did not agree with his views. Internal improvement bills, aggregating $106,000,000, were reported by the committees, and the probabilities were in favor of the passage of very many of them. The first important one which reached the president was the bill to authorize a government subscription to the stock of the Maysville and Lexington turnpike road, in Kentucky. May 27, 1830, the bill was vetoed in a message which summed up all the objections to the internal improvement system. The bill was not carried over the veto. May 29, two similar bills were passed. The president got rid of these by a "pocket veto." (See VETO.) — The Maysville road veto ranged the president distinctly against the internal improvement system. Throughout the remainder of his two terms of office few acts were passed for this object, and these were vetoed. But through that feature of the presidential veto by which the president is compelled to sign or veto an entire bill in gross, without the privilege of vetoing particular provisions (see RIDERS, VETO), appropriations for detached improvements in great number were every year included in the general appropriation bills. The president was thus compelled either to approve the objectionable minor features of the bill, or, by vetoing the whole bill, begin a war of annoyances with congress. This is the form which appropriations for internal improvements have ever since regularly taken. — This change in the method of appropriations should be remembered in connection with the following table of appropriations for internal improvements under different administrations, as collected by Wheeler, cited among the authorities: Jefferson, $48,400; Madison, $250,800; Monroe, $707,621; Adams, $2,310,475; Jackson, $10,582,882; Van Buren, $2,222,544; Tyler, $1,076,500. — The two new national parties at once began the system of nominating conventions which has ever since obtained. (See NOMINATING CONVENTIONS.) The first convention of the national republicans (see WHIG PARTY, I.) asserted, in one of its resolutions, that "a uniform system of internal improvements, sustained and supported by the general government, is calculated to secure, in the highest degree, the harmony, the strength and the permanency of the republic." In 1836, 1839 and 1848 the whigs adopted no platform; in 1844 they approved the distribution scheme, hereafter referred to; in 1852 they finally approved the conjunction of protective tariffs and internal improvement known as the "American system." (See WHIG PARTY, II.) Their opponents were not ready to formulate a platform until 1840; from that time until 1864 they quadrennially condemned the internal improvement system in every form. Practically, however, "internal improvement," in its original form, died with the Maysville road veto. After that time the whigs had but one opportunity, after the election of Harrison, to enforce their views,

and then they chose the "distribution scheme," hereafter referred to, instead; and the democrats, while condemning an internal improvement *system*, saw no objections to voting for isolated improvements in the general appropriation bill. Aug. 3, 1846, President Polk vetoed a river and harbor improvement bill which both houses had passed, and it failed. March 3, 1847, the last day of the next session, a bill for certain improvements in Wisconsin was passed and disposed of by a "pocket veto"; but at the opening of the following session the president sent his reasons for refusing to sign it, in a special message. The house, by resolution, declared that congress possessed the power to appropriate money for internal improvements; and with that the matter slept again until 1854, excepting that the house, in March, 1849, passed a river and harbor bill, which was not acted upon by the senate. In the session of 1853-4, President Pierce vetoed two bills, one for the appropriation of 10,000,000 acres of public lands to the states for the relief of insane paupers, and one for the improvement of rivers and harbors. Dec. 30, 1854, he gave his reasons for the latter veto in a special message, whose arguments were those of President Polk in 1847. This phase of the question of internal improvements then slept until 1870. — DISTRIBUTION. In 1829 Jackson had suggested a distribution of surplus revenue among the states, provided an amendment for that purpose could be ratified. In the following session a house resolution was passed for the distribution of the proceeds of land sales among the states. When the project next appeared, it had become a whig measure. April 16, 1832, Clay introduced a bill in the senate to provide for the distribution of the proceeds of public land sales among the states. It passed the senate, and failed in the house. At the opening of the next session, the president's message advised the reduction of the price of public lands to a nominal amount, or the cession of the lands to the states in which they were situated. On the other hand, Clay again introduced his bill, Dec. 12, 1832, which was debated, and passed both houses, March 2, 1833. It was not signed, and a special message of Dec. 4, 1833, assigned cogent reasons for the refusal to sign it. The bill appropriated 12½ per cent. of the proceeds of public land sales to the seven states last admitted (excluding Maine) for "objects of internal improvement or education," and 87½ per cent. to all the states according to population, to be distributed as the legislatures should deem proper. The objections were, in brief, 1, that the bill violated the compacts by which the original states had ceded their claims to the United States (see TERRITORIES); and 2, that congress had no power to appropriate the public revenues, directly or indirectly, for internal improvements. The bill was not passed over the veto. — The sales of public lands grew suddenly and enormously after 1830. For the previous ten years they had averaged about $3,000,000 annually; in 1836 they reached nearly $25,000,000 (see BANK CONTROVERSIES, IV.), and Calhoun estimated that at the end of the year the country would have $66,000,000 surplus in the treasury. He therefore introduced, May 25, 1836, an amendment to a bill to regulate deposits of public moneys in state banks (see INDEPENDENT TREASURY), providing that at the end of each year the money remaining in the treasury, reserving $5,000,000, should be "deposited" with the several states, in proportion to their representation in congress. The act became a law June 23. The president signed it with the greatest reluctance, and only in consideration of the amount of paper money already in the treasury; and his "specie circular" of the following month (see BANK CONTROVERSIES, IV.) seems to have been his method of cutting the Gordian knot, wiping out a paper money surplus, and checkmating Calhoun's distribution bill and internal improvements together. It ultimately had greater consequences. The first installment of the "deposit" was paid in January, 1837; the second in April, both in specie or its equivalent; and the third in June, in paper. By that time the "panic of 1837" had burst upon the country, and the fourth installment, in October, was never paid. The act of October 2, 1837, postponed it until 1839, when the treasury was in no better condition to pay it, and the law was repealed. The amount "deposited" was $37,000,000, which has never been recalled. — The return of the whigs to power with Harrison's election was marked by the passage of the act of Sept. 4, 1841, to distribute the proceeds of public land sales among the states. In this case, however, the distribution was to be suspended as soon as, and as long as, the duties on imports should rise above the maximum fixed by the compromise tariff act of 1833, which was to expire in June, 1842. Before this last date arrived, the conflict between Tyler and the whig party had become flagrant, and the majority in congress were disposed to put a new pressure on the president. June 27, 1842, they passed an act for a provisional tariff, raising the duties above the compromise maximum, and yet retaining the distribution clause. Tyler had obtained the opinion of the attorney general that the compromise duties would remain in force after July 1, in default of the passage of a new tariff act; he therefore vetoed the bill, June 29. Aug. 5, a tariff bill, still including the distribution clause, passed both houses by narrow majorities, 25 to 23 in the senate, and 116 to 112 in the house; and Aug. 9 this bill was vetoed. (See CENSURES, II.) Aug. 27 congress yielded and passed the tariff bill without the distribution clause, and three days later it became law. Thereafter the distribution of public revenue or of proceeds of land sales among the states was no more heard of. — IN THE STATES. Space will not permit any full treatment of this division of the subject, for which the reader is referred to the authority cited below. The success of the Erie canal in New

York state had prompted other states to imitate its design. Most of the state constitutions adopted from 1830 until 1850 contain either directions or permissions to the legislatures "to encourage internal improvements within the state." Where such enterprises were undertaken in states whose interests were agricultural, not commercial, and whose people were impatient of abstinence from the present enjoyment of capital for the prospect of possible future profit, the state's irresponsibility in courts of law led to but one result, "repudiation," a term whose first application in this sense is ascribed to Governor McNutt, of Mississippi, in 1841. European capital, tempted by high interest, and undeterred by any thought of "repudiation," flowed rapidly to the United States after 1830. The state debts, which were but $13,000,000 in 1830, reached $50,000,000 in 1836, and about $100,000,000 in 1838. When, after the crash of 1837, foreign capitalists undertook to withdraw, they found it easier to get their capital into state securities than to get it out. On one pretext or another, and sometimes on no pretext at all, a number of states repudiated, in whole or in part, their internal improvement debts, and, as they were irresponsible in their own courts, and, by amendment XI (see CONSTITUTION) irresponsible in the federal courts to citizens of other states, creditors were without recourse. (See also MINNESOTA.) The worst cases, at this period, were Maryland, Louisiana and Mississippi in the south, and Pennsylvania, Indiana, Illinois and Michigan in the north. Most of these have since paid or "accommodated" their debts. — The unwillingness to allow foreigners to brand all the states, separately or collectively, as "repudiators," was the parent of a proposition to assume the state debts for internal improvements. It was formally introduced in congress in July, 1842, met with warm opposition, and fell through in the following year. (For further information see STATE DEBTS, under the article DEBTS.) — III. 1850–82. LAND GRANTS. A grant of 5 per cent. of the public land sales within the state had regularly been made to new states at their admission, the consideration being the exemption of the remainder of the public lands from taxation. Grants had been made also for state capitals and for universities. In 1850 began the system of grants of specified amounts of public lands to states for the encouragement of railroads. The first grant of this nature was by the act of Sept. 20, 1850, for the benefit of the Illinois Central railroad, coupled with a grant for the Mobile and Ohio railroad. Its inside history will be found in Cutts' work, as cited below. The number of acres, 2,595,053, was the largest granted by any single act until 1860. — The growth of the Pacific states, the difficulty of communication with them, and the vast extent of the intervening unsettled country, made very evident both the necessity of a Pacific railroad and the impossibility of constructing it by private capital. Before 1855 government surveys had ascertained practicable passes through the Rocky mountains; and in 1860 both political parties had declared, in their national platforms, in favor of the completion of the work by the federal government. The outbreak of the rebellion, and the necessity of a closer military connection with the Pacific, made the need for the road immediate and imperative, and it was begun by act of July 1, 1862, in favor of the Central Pacific, Kansas Pacific and Union Pacific railroads. The number of acres granted to railroads in every part of the country has grown enormously since that date; they will be found in the land office report cited below. The largest grants to single corporations have been 47,000,000 acres to the Northern Pacific railroad, and 42,000,000 acres to the Atlantic and Pacific railroad. The amount of bonds issued to the various Pacific railroads, interest payable by the United States, was $64,623,512. The grant of lands directly to corporations interested began with the act of July 1, 1862; before that date the grants were made to the states for the benefit of corporations. — RIVER AND HARBOR BILLS. After the veto by President Pierce of the river and harbor bill which was passed in 1854, this species of appropriation lapsed until 1870. Improvements which were imperatively needed were classed under "fortifications" and similar heads. The cessation of expenditures under this head, however, was far more than balanced by the appropriations for postoffices, custom houses, and other public buildings in various parts of the country. These increased until, in 1873–4, they amounted to $12,341,944. — In 1870 a river and harbor appropriation was made, amounting to $2,000,000. From this time appropriations of this nature were no longer covered up in other appropriation bills, but took distinct rank for themselves. In 1873 the appropriation rose to $5,286,000, and they have since generally remained above that amount, as follows: 1873–4, $7,352,900; 1874–5, $5,228,000; 1875–6, $6,648,517.50; 1876–7, $5,015,000; 1877–8, ——; 1878–9, $8,322,700; 1879–80, $9,577,494 61; 1880–1, $8,976,500; 1881–2, $11,451,300; 1882–3, $18,743,875. This last increase in the appropriations provoked a veto by President Arthur, Aug. 1, 1882, but the bill was immediately passed over the veto. In such a mass of appropriations it is impossible that there should not be very many objects well worth the care of the national government; but, with every allowance, the amount of absolute plunder in the total must have been enormous. In debating one of these bills a member of congress declared from personal knowledge that one "river," for which an appropriation had been inserted, could be fitted for commerce only by being paved or macadamized; and this instance was certainly not an isolated one. In many cases the coveted appropriation is only to "secure the work," and compel succeeding appropriations to eight or ten times the original amount to complete it. Many appropriations are inserted, not upon their merits, but by "log-rolling," by an under-

standing among a number of members that each will vote for the appropriations demanded by all his associates. In fact, most of these appropriations are not for the public benefit at all, but for the personal interests of the legislators, for the re-election of a congressman often depends upon his success in "bringing money into the district" through the river and harbor bill, or the erection of public buildings. In this manner congress has probably squandered in twelve years money enough to have built a railroad from the Mississippi to the Atlantic, whose running expenses could be paid by the similar appropriations for the future. It is hard to say which of the two methods of getting rid of surplus revenue would be most demoralizing to the people. — See CONFEDERATION, ARTICLES OF, VI, IX; 5 Elliot's *Debates*, 548; 1 *Stat. at Large*, 184, 190 (assent of congress to acts of Maryland legislature), 1 *Stat. at Large*, 54 (first lighthouse act, Aug 7, 1789), authorities under CUMBERLAND ROAD; Adams' *Life of Gallatin*, 351; 2 Adams' *Writings of Gallatin*, 72; Tanner's *Memoir on Internal Improvements* (1829); 5 Benton's *Debates of Congress*, 665, 711; 3 *Statesman's Manual* (edit. 1849) xxviii., (Madison's veto) II. For this period in general the best authority is 2 Wheeler's *History of Congress*, 109; 1 *Statesman's Manual*, 491 (Monroe's Cumberland road veto); 3 *Stat. at Large*, 781 (act of March 3, 1823); 4 *Stat. at Large*, 23 (act of April 30, 1824), 124 (March 3, 1825); 2 *Statesman's Manual*, 719 (Maysville road veto); 3 Parton's *Life of Jackson*, 285, 340; 3 *Statesman's Manual*, 1635, 1711 (Polk's vetoes); 1 Webster's *Works*, 169, 347; 2 *ib*, 238; 4 *ib*., 247, 252; 5 *Whig Review*, 537; 1 Colton's *Life and Times of Clay*, 428, 1 Benton's *Thirty Years' View*, 102, 130, 167, 275, 362; 2 *ib*., 125, 171; Cluskey's *Political Text Book*, 540; Bradford's *History of the Federal Government* (see its index); Cutts' *Treatise on Party Questions*, 41; Gillet's *Democracy in the United States*, 132 DISTRIBUTION. 12 Benton's *Debates of Congress*, 124, 765; 2 von Holst's *United States*, 181, 454, 2 Calhoun's *Works*, 620; 5 *Stat. at Large*, 52, 201, 453 (acts of June 23, 1836, Oct 2, 1837, and Sept. 4, 1841); 2 Benton's *Thirty Years' View*, 36; 4 *Opinions of the Attorneys General*, 60, 63; 14 Benton's *Debates of Congress*, 443, 456. IN THE STATES. The best authority is 2 B. R. Curtis' *Works*, 93, being his article "Debts of the States" from the *North American Review*, January, 1844. III. Cutts' *Treatise on Party Questions*, 187; 9 *Stat. at Large*, 466 (act of Sept. 20, 1850); *Reports of the General Land Office* (1873); the same in substance is more easily accessible in Spofford's *American Almanac* for 1878, 237, and in Appleton's *Annual Cyclopædia* for 1871, 674. The first Pacific Railroad act of July 1, 1862, will be found in 12 *Stat. at Large*, 489; a convenient summary of Pacific Railroad legislation is the long preamble to the act of May 7, 1878 (20 *Stat. at Large*, 56); *Report of the Secretary of the Treasury* (Dec. 5, 1881), 25; Major H. M. Robert's *Index to Reports on River and Harbor Improvements* (Art. "Appropriations"); Porter's *West in* 1880, 585 (and Map).

ALEXANDER JOHNSTON.

INTERNAL REVENUE OF THE UNITED STATES. Under the constitution congress has power to lay taxes, duties, imposts and excises. This provision includes every species of taxation, direct and indirect, specific and ad valorem; poll taxes, taxes on property, income, business, licenses, imports and tonnage. The only limitation placed upon this taxing power is that these taxes shall be uniform throughout the United States, and that direct taxes shall be apportioned among the several states which may be included within the Union, according to their respective numbers. In practice the national government has obtained its revenues from taxes on imports, and has resorted to internal imposts only when such have become necessary. The term "internal revenue" has been restricted in its meaning to such revenues only as are collected under the internal revenue bureau connected with the treasury department, and does not include all revenues that are, properly speaking, from internal sources, that is, from sources other than duties levied at the frontiers upon foreign commodities. Thus, moneys arising from the sale of public lands, from patent fees, or the revenues of the postal service, are not generally known as "internal revenue." As will be seen, a large number of taxes, direct and indirect, have been under the management of this bureau, which did not exist until 1862; so that no more exact definition of this branch of the public revenue system can be framed — At the close of the revolution, to raise money by any internal taxes was hardly thought of. It is true that the provision in the constitution shows that the possibility of having recourse to such taxes was not overlooked; but in the then existing temper of the people it would have been impolitic, if not impossible, to put in operation any system of excises. Hamilton, in No. XII of the "Federalist," writes: "The genius of the people will ill brook the inquisitive and peremptory spirit of excise laws. The pockets of the farmers, on the other hand, will reluctantly yield but scanty supplies, in the unwelcome shape of impositions on their houses and lands, and personal property is too precarious and invisible a fund to be laid hold of in any other way than by the imperceptible agency of taxes on consumption"; and again he writes: "It has been already intimated that excises, in their true signification, are too little in unison with the feelings of the people, to admit of great use being made of that mode of taxation"; and he goes on to show that the possessors of land would not, in all probability, bear the burdens of any internal taxes. So strong was the prejudice against excises, that it was twice moved, in the New York convention for adopting the constitution, that the power of laying excises be prohibited to congress. Nor can this feeling against such taxes be

referred only to a prejudice inherited from England, for there was a sound economic reason which effectually prevented the application at that time of internal duties and taxes. An elaborate system of internal taxes supposes a country well advanced in manufactures and general wealth, and at the close of the revolution the economic condition of the people and of manufactures was not such as to invite taxation. The country was impoverished by the long war, trade was confined within narrow limits, and manufactures were few in number; and forced, as many of them were, into an unhealthy existence, they could ill endure any increased burdens in the shape of taxes. On the other hand, the resources of the country had been severely strained by the war, there was no central government, and when such a government did exist, one of its first acts was to bolster up these manufactures by tariff duties on imported manufactures. — But an excise was soon proposed. In 1790 a measure for taxing distilled spirits of domestic manufacture was introduced into congress, but the opposition it at once aroused was sufficient to defeat its passage. The legislature of Pennsylvania instructed its representatives in congress to oppose the passing of an excise, "the horror of all free states"; and in a petition to congress the inhabitants of Westmoreland, Pa., claimed that to convert grain into spirits was as clear a natural right as to convert grain into flour. The proposed taxes would weigh heavily upon the farmers of the western counties of Pennsylvania. Owing to the distance of the markets and the great difficulty and expense of transporting such a bulky commodity as grain, the farmers were in the habit of converting their grain into whisky, and transporting it in that shape. Mr. Breckenridge, in his "History of the Western Insurrection," states that the still was the necessary appendage of every farm, where the farmer was able to procure it. And this petition from Westmoreland recites that "for these reasons we have found it necessary to introduce a number of small distilleries into our settlements, and in every circle of twenty or thirty neighbors one of these is generally erected for the accommodation of the neighborhood."— In the following year, under the advice of Hamilton, a like measure was introduced, and, after a bitter contest, was passed, March 3, 1791. Under this act spirits distilled from foreign materials (molasses) were taxed at a somewhat higher rate than those from domestic materials (grain and fruit), the discrimination amounting to from two to five cents per gallon, according to proof. There was also a difference made in the taxes imposed upon spirits distilled in cities, towns or villages, (nine to twenty-five cents per gallon), and those distilled in other places, (at the option of the distiller he could pay a yearly tax of sixty cents per gallon upon the capacity of the still, or nine cents for each gallon distilled). Notwithstanding the low duties charged, the opposition to it was very determined. The tax bore with great severity upon the distillers in the western part of Pennsylvania, at that time very thinly populated, for with them money was very scarce, and as trade was carried on by barter, spirits served as money. The most determined opposition came from that quarter. In May, 1792, with the hope of allaying in some degree the discontent, the rate of excise was somewhat reduced, and a further concession was made by giving to the distiller the alternative of paying a monthly instead of a yearly rate, with liberty to take out a license for the precise time he intended to work, and to renew it for a further term.* And at the same time, with a view to possible resistance, measures were taken to provide for calling out the militia; thus curiously fulfilling a saying made sixty years before by an Englishman, "we know what a general excise is, and can not be ignorant that it hath an *army* in its belly." But the concessions made were not enough, and in September of the same year Washington issued a proclamation admonishing all persons to refrain from unlawful combinations tending to obstruct the operation of the excise laws; and it is worthy of note that he struck out from Hamilton's draft of this proclamation the sentence, "these laws were dictated by weighty reasons of public exigency and policy." But the open resistance to the measure (whisky insurrection, which forms an important chapter in the political history of this country) was soon put down. The general dislike, however, to the excise prevented an early and complete organization of the excise system. As late as 1795 the law had not extended to Kentucky and Tennessee, and the tax was but imperfectly collected in North Carolina; nor until that year was the system put in full operation in any part of Pennsylvania. However, the government had carried its point, and had not only established its right to impose an excise, but shown its power to enforce such a tax. — In 1794, under a fear of renewed hostilities with England, but ostensibly to defray clerk hire in the department of state, a fee was charged for all patents issued for inventions and discoveries; and to provide means for paying the interest upon money borrowed to pay the expenses attending the intercourse of the United States with foreign nations, internal duties were laid upon carriages for the conveyance of persons; upon licenses for selling wines and foreign distilled liquors by retail; upon snuff (eight cents per pound) and refined sugar (two cents per pound) manufactured in the United States; and on sales at auction (¼ per cent. of the purchase money arising from the sale of any right, interest or estate, in lands, tenements or hereditaments, utensils in hus-

* What good use was made of this alternative is shown by what Gallatin wrote in 1801; that, owing to improved methods of manufacture, distilleries had reduced the tax to three cents per gallon, and in a short time, by further improvements, would reduce it to three-fifths of one cent per gallon.

handry, farming stock, or ships and vessels; and ½ per cent. of the purchase money arising from the sales of any other goods, chattels, rights or credits). The proceeds of these taxes, together with what accrued from the postoffice, land sales, and dividends on bank stock, formed the only sources of the internal revenue of the government. Of these, the land sales, postage on letters, patent fees and taxes on distilled spirits were permanent taxes, or commensurate with the existence of the debt for the payment of the interest of which they were pledged; and the dividends from bank stock were commensurate with the duration of the property in the stock. The other taxes were only temporary taxes, and were to continue no longer than till the end of the session of congress next after the expiration of two years from the respective times of passing the laws which established them, though their operation was extended in 1795. It should be noted that the debate upon this measure assumed a sectional character. Thus it was claimed that the tax upon tobacco fell almost wholly upon the middle and southern states; and as to the carriage tax, it was stated that there was not a single vehicle in the state of Vermont, and but two in the whole state of Connecticut, which would be subject to that tax. In his report for 1795, Hamilton says of these taxes, when discussing the advisableness of extending their operation, which was done: "It is believed that there can not be devised objects of revenue more proper in themselves, or more generally acceptable to the people. Whatever interested parties may allege, it seems self-evident that there can hardly be a reasonable question, except as to the best mode of collection. The objection that part of them falls on manufactures, has no weight. The manufactures on which they fall are *complete luxuries*, and *completely established;* consequently fit objects of revenue. The increased duties on the rival foreign articles are a full protection to the manufacture. Whatever may be the appearances in the infancy of the tax, it is certain, in principle, that it will finally fall on the consumer, as generally as duties on imported commodities." — Yet in spite of this able defense of his policy, the results of these taxes, when viewed in 1796, after an experience of from two to four years, did not prove their fitness to the circumstances or disposition of the people. The tax on spirits was openly resisted and secretly evaded; the tax on carriages produced but little on account of an uncertainty whether it was a direct or an indirect tax, a question which was finally settled by the supreme court of the United States; the drawback allowed upon exported snuff was so high as to act as a bounty, and so large were the quantities exported that the drawback paid exceeded the amount of collections, and this law was soon suspended. The sugar tax was productive, because, owing to the high import duty on sugar, the domestic manufacturers almost wholly supplied the home demand. Mr. Gallatin, in 1796, estimated the annual produce of all these internal taxes at $416,000. — In 1797 congress laid duties on stamped vellum, parchment and paper. Of this tax Mr. Gibbs, in his "Administration of Washington and Adams," writes: "The stamp act, although a very necessary one, as a certain means of raising money, had the misfortune of being exceedingly unpopular; certain disagreeable associations being connected with the name, which gave a handle to the opposition to work upon those who did not understand the relations between taxation and representation. It also, curiously enough, furnished a cause of jealousy to the president, who, from some reason, supposed it to exalt the powers of the secretary of the treasury at his expense." These stamp duties were however continued, but only as a temporary expedient, and yielded a moderately large revenue. — In the following year, when the relations between France and the United States were far from friendly, in order to put the country in a state of defense, a direct tax of $2,000,000, the first of its kind, was apportioned among the states. It was proposed that this tax should be assessed to individuals as follows: 1, on dwelling houses, which were distributed into nine classes according to the value, and taxed uniformly in each class; 2, on slaves, and 3, on lands, to be taxed at such rate ad valorem in each state as, with the sums assessed on houses and slaves, will produce the entire amount of the sums apportioned to the respective states; and, in anticipation of the amount of this tax, the president was authorized to borrow $2,000,000. — But with the accession of Jefferson to the presidency, an attack was made upon the system of internal taxes, and on his recommendation the act of April 6, 1802, to repeal all internal taxes, was passed, with outstanding, uncollected duties amounting to nearly $700,000. This sacrificed a large portion of the revenues of the government, but from 1802 to 1813 no internal duties on articles grown or manufactured in the United States were imposed. These taxes were to be laid only in the last resort, and were classed with loans, as extraordinary resources, and during that interval when a larger revenue was needed, the duties on imports were increased. In 1808, when a war cloud was impending, Gallatin wrote that no internal taxes, either direct or indirect, were contemplated, even in the case of hostilities carried on against two great belligerent powers; and he only expressed the general feeling of the people, who were strongly prejudiced against internal duties. — This early attempt to impose internal duties has thus been dwelt upon at length because it served as a model for later systems. The opposition that it engendered was not due so much to the taxes laid, for there could be no doubt that most of the subjects were eminently fitted for taxation, as on account of a strong prejudice against the method of collecting. In order to prevent fraud and evasion of excises, a body of officials must be kept up, with powers of entering and searching the houses of those who deal in excis-

able commodities. The tax gatherer comes into direct contact with the tax payer, and in the strict performance of his duty creates a strong prejudice against himself, and renders himself odious to the people. Jefferson said, in his annual message of 1805, with his customary exaggeration, that the internal taxes covered the land with officers, and opened "our doors to their intrusions, beginning that process of domiciliary vexation, which, once entered, is scarcely to be restrained from reaching successively every article of produce and property." Herein is shown the true ground of popular dislike to internal or excise duties. — The existing revenues of the national government were wholly inadequate to meet the increased expenditure occasioned by the war of 1812, and in order to meet the deficits of 1812 and 1813 recourse was had to loans and issue of treasury notes. But it was soon seen that the revenues, including these loans, would not prove sufficient, and early in 1813 the foundation of a system of internal revenue was laid, by imposing those taxes which had been recommended by the experience of a former period, and which included a direct tax as well as excises. Again were these taxes, known as "war taxes," regarded as temporary, and their operation was to cease one year after the termination of the war; but with the exception of the tax on refined sugar, and the stamp duties on bank notes, bills of exchange, and other notes, they were afterward extended and pledged to the payment of the interest and principal of the national debt, or until they might be replaced by other taxes equally productive. All of the old taxes were imposed, excepting a tax per gallon on distilled spirits, which was replaced by a license tax to distillers. It was estimated that these taxes would produce a revenue of $3,500,000 annually, but this could not be had until the year following the passage of the act, and the inconvenience thus occasioned was commented upon by the secretary of the treasury in his report for 1815. "It may, perhaps, be considered as a subject for regret, and it certainly furnishes a lesson of practical policy, that there existed no system by which the internal resources of the country could be brought at once into action, when the resources of its external commerce became incompetent to answer the exigencies of the time. The existence of such a system would probably have invigorated the early movements of the war; might have preserved the public credit unimpaired; and would have rendered the pecuniary contributions of the people more equal as well as more effective. But, owing to the want of such a system, a sudden and almost exclusive resort to the public credit was necessarily adopted, as the chief instrument of finance. The nature of the instrument employed was soon developed; and it was found that public credit could only be durably maintained upon the broad foundations of public revenue." But in spite of loans and taxes the public revenues were not adequate, and in the middle of 1814 the national government found itself seriously embarrassed, a situation which was rendered more precarious by a decrease, due to the war, in the product of duties, and by a sudden suspension of specie payments by the banks throughout the country, which was followed by all the evils of a variable currency. A special session of congress was called, and further loans authorized; the annual direct tax was doubled, and its operation extended to the District of Columbia; the duties on carriages, auctions, licenses and the rates of postage were increased; new taxes were imposed, and for the first time in the history of the nation taxes were laid upon domestic manufactures other than spirits, snuff and sugar. Specific taxes were laid on iron and candles; and ad valorem taxes on hats and caps, umbrellas, playing cards, leather and plate, beer, ale, harness and boots. Household furniture was taxed according to its value, and gold and silver watches paid duties. The necessity of the treasury being pressing, a loan was raised on the pledge of the direct tax and the excises on distilled spirits. With the return of peace steps were at once taken to revise the existing taxes In 1821 the estimated deficiency, due in great part to unliquidated war claims, was only $3,500,000; and as the revenues were $4,000,000 in excess of the requirements of the government in a time of peace, it was thought that the country should not be burdened any longer than was absolutely necessary with war taxes. In 1816 the direct tax was reduced one-half, and in the following year every internal tax was repealed. From 1818 to 1861 no direct tax of any kind, duties of excise, or other internal tax, was in operation in the United States. Though it was at times proposed to lay such taxes, it was never actually done, and whatever resources were required were obtained by modifying the tariff, customs and land sales forming the permanent sources of revenue. — Not until 1861 was an elaborate system of internal revenue imposed upon the country, for the two attempts we have just described were remarkably simple and included few articles And again was a recourse to internal taxes an outcome of necessity, and was regarded as a temporary measure. With the outbreak of the rebellion, and the various expedients then taken to raise the necessary revenues, we enter upon one of the most curious, vast and complex experiments in taxation ever attempted, and one so burdensome in its results as to afford a most striking proof of the wonderful elasticity and vigor of the national resources, because it caused no permanent injury to the productive capacity of the nation. An enormous debt was created in a very few years, and its creation was accompanied by heroic measures to extinguish it. Loans, customs and internal taxes were made use of to an extent hitherto unknown in this or any other country, and this too while the country was engaged in a long and exhausting war. Internal taxes had remained unused for nearly half a century, and were known

to the people only by tradition; in the changed conditions of the country there was little in past experience that could serve as a guide, and there was no opportunity afforded to study the systems of other countries; there was no existing machinery for assessing and collecting such taxes; and finally, in the excited condition of public opinion it was uncertain how such a system, if imposed, would be endured by the people, for it was feared that such a measure would only alienate from their allegiance to the central government the people of some states up to that time loyal. The first movements were made cautiously and tentatively. Money was required to carry on the operations of government and to support the charges of the war, but it was a very delicate matter to decide in what manner this money should be raised, for never before had the country stood in need of such resources. In the first years of the war almost entire reliance was placed upon loans to supply extraordinary demands, and it was not until 1863 that internal taxes were recognized as an essential part of the settled revenue policy of the government. But even before that year it had been clearly seen that some great alterations in the sources of government revenue were required. Import duties were largely increased, heavy loans authorized, and the "act to provide increased revenue from imports, to pay the interest on the public debt" included sections which contained the germs of the present internal revenue system. It provided for an annual direct tax of $20,000,000, to be apportioned among the states—a tax which was assessed and collected only in the first year after the passage of the act—and also for a tax of 3 per cent. upon the excess of all incomes over $800. It is a curious fact that these provisions should have been attached to an act providing in its title for an increase of customs duties only, and it can only be explained by supposing that it was from doubt on the manner in which a direct tax or an income tax as separate measures would be received, or to avoid any disputes on the income tax, that being essentially a direct tax, and would, under the constitution, have to be apportioned among the states as there directed. However, this incongruous measure was passed, but its practical enforcement was postponed until the following year, and it was seriously expected to employ state machinery in its collection, in this way avoiding any contact between a tax collector of the national government and the tax payer. The demands of the government rapidly increased, and it was soon seen that no half measures would prove sufficient. The act known as the internal revenue law was passed July 1, 1862, which is a complete code of taxation, and one of the most extraordinary which any country has ever seen. Under this law was organized the bureau of internal revenue, and provision was made for the machinery necessary to collect the taxes imposed by the act. To show the general scope of this law, it may be stated that it provided for taxation upon trades and occupations; upon sales, gross receipts and dividends; upon incomes of individuals, firms and corporations; taxes upon specific articles not consumed in the use; stamp duties; taxes upon various classes of manufactures; as well as taxation upon legacies, distributive shares and successions. — The extent to which taxation was carried under this and subsequent acts can not be better expressed than by the words of Sydney Smith written forty years before. "Taxes upon every article which enters into the mouth, or covers the back, or is placed under the foot; taxes upon everything that is pleasant to see, hear, feel, smell, or taste; taxes upon warmth, light and locomotion; taxes on everything on earth, and the waters under the earth; on everything that comes from abroad, or is grown at home, taxes on raw material; taxes on every fresh value that is added to it by the industry of man; taxes on the sauce which pampers man's appetite, and the drug which restores him to health; on the ermine which decorates the judge, and the rope which hangs the criminal; on the poor man's salt, and the rich man's spice; on the brass nails of the coffin, and the ribands of the bride: at bed or board, couchant and levant, we must pay." This is no exaggeration of the system imposed by the act of 1862. — In other countries the systems of excises and internal taxes have usually been the product of long experience, and have been frequently modified so as to be adapted to the economic condition of the country, its population and material prosperity. Being moreover of slow growth and of long standing, and, generally speaking, subject not to violent alteration but to gradual modification, they fall more equally upon the people, and are less burdensome than would be an entirely new system, ill-adapted to the condition of the people, and subject to frequent and violent alterations. For time is required to allow the conditions of an industry or occupation to adapt themselves to a tax; and in time it is the tendency of a tax to diffuse itself, and to bear with less weight upon the commodity or person primarily taxed. But at the time of the passage of the internal revenue law the necessities of the government were so pressing that no regard was paid to any of the principles of taxation, to the experience of other nations, or to the conditions of trade and industry and their consequent ability to bear a tax; and there is no knowledge of economic doctrines displayed in the debates in congress upon this and subsequent measures. The country, from being very lightly taxed, passed at once under a system of excessive and burdensome taxation. Processes were taxed as well as products of industry, taxes were laid upon all labor, upon all tools by which work was to be done, and upon all classes and conditions of men. Every branch of trade and industry, every kind of manufacture, raw materials and net results, alike bore the burden of taxation. "No other nation," said the London "Economist," "would have endured a

system of excise duties so searching, so effective, so troublesome." System there was none. "The one necessity of the situation," writes Mr. Wells, "was revenue, and to obtain it speedily and in large amounts through taxation, the only principle recognized—if it can be called a principle—was akin to that recommended to the traditionary Irishman on his visit to Donnybrook Fair, 'wherever you see a head, hit it.' Wherever you find an article, a product, a trade, a profession, or a source of income, tax it!"—A system of taxation so comprehensive and minute in its details, in which the exemption of any article from taxation was the exception rather than the rule, imposed with so little thought and discrimination, was naturally found to be unsuitable in many particulars to its purpose, and was subject to frequent alterations and modifications. At least one revenue bill was passed at every session of congress, and within the period 1861-7 more than twenty-five such bills became laws. The pendency of such a measure furnished frequent opportunities for numerous amendments, some of them not important in themselves, but by changing the language, rendered valueless many precedents and regulations of the bureau and well-considered decisions of the courts. For the first years after the passage of the internal revenue law the action of congress was directed to its increase, and new objects of taxation and additional sources of revenue were sought for; and not until the close of the war was there any movement looking to its decrease. —These many changes in the internal revenue laws naturally produced great uncertainty in their application, and consequent injury to trade and industry, confusion in the revenues, and inequality of taxation, for an uncertain or arbitrary tax is an unequal tax. So that it was impossible to estimate with even a near approach to truth what these taxes would yield. Nor was there any stock of economic knowledge or accumulated experience to assist in framing such estimates. And in support of this statement the following incident may be noted. Secretary Chase, in his report for 1863, states that, with a view of determining his resources, he employed a very competent person, with the aid of practical men, to estimate the probable amount of revenue to be derived from each department of internal taxation for the previous year (1862). The estimate arrived at was $85,000,000, but the actual receipts were only $37,000,000.—Among the effects of the practical application of this law may be mentioned the following: 1. Many industries found themselves too heavily burdened by the taxes imposed upon them, and were forced to choose between the alternative of producing at a loss, or of ceasing to produce. While the instances are few in which trades were actually taxed out of existence (for an example see article DISTILLED SPIRITS in this work), yet owing to the effects of the war, and the alterations in customs duties and internal taxes, the conditions of production were disturbed, and every branch of trade and industry was to some extent affected. In many branches there was a forced reduction in the production of from 30 to 75 per cent. One of the first recommendations of the revenue commission in 1866 was to entirely exempt the manufacturing industry of the United States from all direct taxation (distilled and fermented liquors, tobacco and possibly a few other articles, excepted). 2. Duplication of taxes. In imposing a general excise tax upon all manufactures, it necessarily entailed a system of duplication of taxes, for the finished product of one manufacture is the raw material of another, and is almost always itself an aggregate of several distinct and separate manufacturing processes. Some examples of this duplication of taxes may be cited. "It was formerly the practice of umbrella makers to manufacture the main constituents of their product as one business; but now the business of an umbrella manufacturer is rather to assemble the various constituents of an umbrella or parasol, which are made separately, and in different parts of the country. Thus, for example, the sticks, when of wood, are made in Philadelphia and in Connecticut, part of native and part of foreign wood, on which last a duty may have been paid. If the supporting rod is of iron or steel, it is the product of still another establishment. In like manner the handles of carved wood, bone or ivory, the brass runners, the tips, the elastic band, the rubber of which the band is composed, the silk tassels, the buttons, and the cover of silk gingham or alpaca, are all distinct products of manufacture; and each of these constituents, if of domestic production, pays a tax, when sold, of 6 per cent. ad valorem, or its equivalent. The umbrella manufacturer now aggregates all these constituent parts, previously taxed, into a finished product, and *then pays 6 per cent. on the whole.*" And another example is found in the manufacture of books. Every separate item which entered into this manufacture—paper, cloth, boards, glue, thread, gold leaf, leather, and type material—paid from 3 to 6 per cent. in the first instance, and then 5 per cent. on the whole combined; and this not on the *cost*, but on the *selling price*. So that the finished book, and its constituent materials, paid from twelve to fifteen distinct taxes before they reached the reader. This recalls what was said of Amsterdam, that in that city a dish of fish with its sauce, before it was served up to the table, paid excise "thirty several times." 3. As every tax is so much added to the cost of production, the cost to the consumer was greatly enhanced by this load of taxation, and to this is in part due the great rise in prices; for the government actually levied and collected from 8 to 15, and in some instances as much as 20, per cent., on the finished industrial product. 4. The frequent changes in the taxes created a spirit of speculation, and rendered uncertain the revenue from those sources to which these changes applied. On July 1, 1864, when the advance in the

tax on distilled spirits, of from sixty cents to one dollar and fifty cents per gallon, took effect, there were in store, in anticipation of this advance, at least forty millions of gallons, or a quantity that was believed to be sufficient to supply the wants of the country for at least a year in advance. From July 1, 1864, to the time of the first report of the commission, the receipts of the government from distilled spirits were, from this cause, necessarily inconsiderable. Of cigars, in like manner, it was estimated that from seventy to eighty millions were manufactured and stored in the city of New York alone, in anticipation of the tax, while in the case of the insignificant article of matches, on which the tax was only one cent per bunch, the stock accumulated in anticipation of the tax was so large that it had not been entirely exhausted by January, 1866. So that from August, 1864, the date at which the match stamp tax was introduced, to January, 1866, the government failed to derive its legitimate revenue from that source. These variations in the taxes and their effects upon production, naturally disturbed and rendered uncertain the amount of revenue to be derived from each particular source. This will be made clear by a reference to the following table, which shows the collections in the same month for three years, the differences being caused by alterations in the tax law:

MONTHS.	1864.	1865.	1866.
July	$18,570,548	$21,693,470	$27,079,103
August	15,712,066	34,067,539	38 043,340
September	15,819,770	37,939,415	33,714,718

The table shows how uneven the production of taxable articles was; of some the production was stimulated, while of others it was retarded or perhaps altogether destroyed. 5. The vast system of internal revenue was imposed without reference to the existing tariff, or to the conditions imposed by the treaty of reciprocity with Canada, which was to expire in 1866. There was no equalization or adjustment between the tariff and internal taxes, and this resulted in frequent discriminations against the American producer and in favor of his foreign competitor. "In the case of the umbrella manufacture, the cover, as a constitutent element of construction, represents from one-half to two-thirds the entire cost of the finished article. The silk, the alpaca, and the Scotch gingham, of which the covers are made, are all imported; the former paying a duty of 60 per cent., and the latter two about 50 per cent. ad valorem. The manufactured umbrella, covered with the same material, whose constituent parts are not taxed, either on the material used in their fabrication or on their sale, is, however, admitted under the present [1865] tariff at a duty of 35 per cent. ad valorem, or at a discriminating duty, against the American and in favor of the foreign producer, of from 15 to 25 per cent. If we make allowance for the various United States internal revenue taxes, it is claimed by the American manufacturers that the discrimination in favor of the foreign producer is fully equal to 40 per cent." Other examples could readily be given. Under the reciprocity treaty the products of American industry subject to high rates of excise were injuriously brought into competition with similar products of provincial industry, which were subjected to little or no excise, and then admitted into the United States free of duty. — In treating of the effects produced by the actual operation of this measure, no attempt has been made to maintain a chronological order, for in some cases the ultimate effects of a tax would not appear until the lapse of a certain length of time. — Yet owing to the enthusiasm and patriotism of the people this system was cheerfully welcomed and endured by them, and was successful in its main object. The revenues collected under it have never since been equaled, and judged from this standpoint it was most effective. Yet a more burdensome and diffuse system could hardly have been framed, as a simple calculation will show. In an early report Secretary Chase estimated that the internal revenue system would produce $50,000,000, and he thought that this sum was equal to about one-sixth of the surplus earnings of the country. In 1869 the special commissioner of the revenue made an extensive examination of the wealth and resources of the country, and was led to the conclusion that the annual increase of active capital in the United States, arising from the excess of production over expenditure, could not at that time be considered as in excess of 8 per cent. of the gross annual product, or $546,000,000 per annum. The collections from internal taxes, which were in 1863 but $43,000,000, rose rapidly to $117,000,000 in 1864, $211,000,000 in 1865, and culminated in 1866 with the enormous sum of $310,000,000; this last sum being equal to nearly 57 per cent. of the actual annual surplus wealth of the nation. Yet a large portion of the taxable property in this country escaped its proper charges through fraud or an imperfect administration of the laws. Under a perfect administration the revenues would have been much greater; for at that time the sources of national revenue were commensurate and co-extensive with every department or subdepartment of trade or industry in the country, as well as every form of fixed or circulating capital. For the purpose of placing in a clear light the burden of taxation, attention may be called to the following table, which shows the amount per capita, collected by various forms of direct and indirect taxation in the United States for 1865-6, and in several of the leading states of Europe for the year 1865, (the revenues from the public or crown lands, postoffice receipts, and colonial subsidies, being excluded from the estimate); also the amount of the public debt in the same countries per capita:

COUNTRIES.	Taxation, per capita.	National Debt, per capita.
United States	$11.46	$ 74 28
Great Britain	10.92	125.00
France	7.97	53.00
Belgium	5 59	26.00
Prussia	5.43	12.00
Austria	5.27	45.00

Nor, generally speaking, were manufactures at all depressed by this enormous burden of taxation. On the contrary, owing to the demand for most manufactured and agricultural products, and the great rise in the prices of commodities, the profits of the producer were actually enhanced by reason of the taxes to an extent considerably greater than they would have been had no taxes whatever been collected. Thus, in the case of distilled spirits, the advances in the tax were foreseen, and large quantities were manufactured before the increased tax took effect, in order to be sold at the higher price which followed the imposition of a higher tax. "In the case of raw cotton, which advanced mainly through conditions affecting its production or distribution, it was shown by actual calculation, in respect to one manufacturing corporation in New England, that if they had at the commencement of the war burnt their mills, lost their insurance, and sunk their capital, other than what was invested in cotton, and had subsequently sold their cotton at the highest prices obtainable, in place of manufacturing it, the result would have afforded to the stockholders a permanent annuity of at least 12 per cent. on their original investments."—Mr. Mill admits that a tax upon profits may give a stimulus to inventions, and the use of them when made. This may produce a cheapening in the products of manufactures and so raise profits to such an extent as to make up for all that is taken from them by the tax. This seems to have been the condition of the United States, for it is known that few industries were permanently injured by the taxes, so great are the natural advantages and productive capacity of the country. The rapid increase of population, the great progress of agriculture and manufactures (though accompanied by no corresponding increase of commerce), and the large number of expensive undertakings entered upon with a return of peace, showed beyond question the resources of the country. In fact, the conclusion of Mr. J. R. M'Culloch in regard to the continental wars, 1775–1812, might almost be accepted as applicable to the condition of affairs at that time: "An increase of taxation has the same influence over nations that an increase of their families or of their unavoidable expenses has over individuals. The constantly increasing pressure of taxation during the American war, and the war begun in 1793, was felt by all classes, and gave a spur to industry, enterprise and invention, and generated a spirit of economy, which we should have in vain attempted to excite by any less powerful means. * * Man is not influenced solely by hope; he is also powerfully influenced by fear. Taxation brings the latter principle into the field."—We have no more space for examining further into this most interesting chapter of the financial experience of this country, nor can we trace its ultimate effects upon prices, upon production and consumption, and upon foreign commerce. With the close of the war a reduction in taxation was demanded by the people, and was soon effected. Between Sept. 1, 1865, and July 1, 1869, taxes yielding, in the aggregate, upward of $200,000,000 per annum were abated or relinquished, chiefly on the recommendations of the revenue commissioner. When Mr. Fessenden assumed the office of secretary of the treasury in 1864, recognizing the incongruity and burdensome nature of the tax system, one of his first recommendations to congress was the formation of a commission to inquire into the most profitable sources of revenue, and to devise improvements in the modes of its collection; but his recommendation was not at that time adopted. In his annual report for that year he again returned to the subject, and in March, 1865, such a commission was appointed, and included David A. Wells, Stephen Colwell and S. S. Hayes. The creation of this commission was the first practical movement toward a careful examination of the business and resources of the country, with a view to the adoption of a judicious revenue system. The commission made a report in 1865–6, and as it showed how necessary such an examination had become, in 1866 the office of special commissioner of the revenue was created, to continue the labors of the commission, and Mr. David A. Wells was appointed to the office. It is in the reports of this able economist that we find the best and most thorough examination of the revenue system of the government, and we have depended chiefly upon them for our information on the practical effects of the act of 1862. The office was discontinued in 1870.—Large reductions were made by the statutes of July 13 1866, ($65,000,000); March 2, 1867, ($40,000,000). Feb. 3, 1868, ($23,000,000); and March 31, and July 20, 1868. Under the act of March, 1868, which took off taxes from all manufactures of the country other than distilled spirits, fermented liquors and tobacco, no reduction in the prices of commodities followed, as would naturally be looked for. As it was an unexpected measure, it was thought to be but a temporary measure, to be soon replaced by other taxes; so that producers made no reduction in their prices. Many of the taxes had become unproductive, and hardly figured in the returns; for in 1869 upward of 90 per cent. of the internal revenue was collected from a few objects and sources, all of which might be classed as luxuries, or as the accumulated wealth of the country. The act of June, 1872, made important reductions by repealing the taxes on incomes, and gas, and abolishing all stamp taxes under sched-

ule B (1864) except that of two cents on bank checks, drafts or orders. — The effect of this great reduction of taxation, accomplished in so short a period and with as little discrimination as was used in imposing these taxes, must have had some effect upon the industries of the country which had accommodated themselves to the burdens imposed upon them, though it would be difficult to determine to how great an extent they were injured or benefited. The theory has been advanced by a competent authority, Mr. Abram S. Hewitt, that the revulsion of 1873 was in great part due to this reduction of taxes. This could, however, have been but one out of many causes, and it would be a mistake to insist too strongly upon this as an active cause. — The sources of internal revenue were now nearly reduced to what they are at the present day; so that a large number of intermediate measures, either reducing or abolishing taxes, regulating the machinery of collection, or providing against fraud, may be passed by. Nor need anything be said of the system of informers and spies, or of the great frauds perpetrated upon the government. — The receipts for the fiscal year ending June 30, 1881, under internal revenue laws, were drawn from the following sources:

Spirits	$67,153,974.88
Tobacco	42 854,991 31
Fermented liquors	13 700,241.21
Banks and bankers	3,762,208.07
Adhesive stamps	7,375,255 72
Penalties and miscellaneous	383,241.11
Total	$135,229,912.30

Thus it may easily be seen that the most objectionable features of the system have been gradually removed, and the taxes now included in it are such as weigh but lightly on the industry of the country, and for the most part fall ultimately upon those who of their own free will pay them. But as the revenues of the government are at the present time far in excess of its legitimate needs, justice and public policy alike demand a still further reduction. The stamp tax on matches, though small in amount and easily collected, is a very unequal tax, and on that ground should be condemned; the tax upon bankers and banks might be reduced or repealed, for the circumstances that existed when the tax was first imposed, and which rendered it a comparatively light tax, have changed, and it is claimed that the tax has now become very burdensome. In fact, the internal revenue taxes could be reduced to those on spirits, tobacco and fermented liquors, and the rates on these commodities could even be reduced. But no other changes could be defended on grounds of public policy or of sound economy. The cost of collection was for the year 1881 but 3.64 per cent. upon the amount collected — Yet a movement looking toward the repeal of the whole system of internal taxation has found great favor among the leaders of the protectionist party, for it would of necessity require a continuance of the present tariff. It is difficult to speak of such a proposition with any moderation. The objections that were urged against internal taxes in the last century will not apply at the present time, for the country is well advanced in wealth and material prosperity, and can easily bear such taxation. Moreover, as we have said, the present system of internal taxes falls, with some exceptions, only upon such articles of voluntary consumption as may be dispensed with and may be taken in excess, and therefore fulfills in the highest degree the requirements of just taxation. While valid objections may be urged against the stamp taxes and those on bankers and banks, no reason that will bear examination can be found for taking off the excises on tobacco and distilled spirits. To maintain that these last named taxes fall chiefly upon the poor affords no sound plea for their repeal. That the necessaries of life consumed by the poor should remain untaxed, is in accordance with the demands of humanity and sound economic doctrine, and on this ground the tariff needs revision. But when a man spends a part of his income on indulgences, as spirits and tobacco confessedly are, it is fit and proper that he be taxed; for the lower strata of society escape most other forms of taxation, and it is through indirect taxes alone that they may be reached and made to pay their quota to the expenses of the state; and there is no more just method of doing this than by taxes on their indulgences. In fact, the objections urged against the internal revenue system of the country are rather of a sentimental character, and are not based upon a careful survey of the resources of the country, the incidence of taxation, and the most fitting objects of taxation; and the various schemes looking to "free whisky and free tobacco" belong more to the doctrines of demagogues than to the principles of true statesmanship. They are vulgar appeals to the uneducated masses who do not know their own interests, and are thus misled into indorsing a scheme that will only serve to fasten upon the country a system of taxation by customs duties that is far more onerous and inequitable, and therefore more indefensible, than the taxes now imposed as internal taxes. — Following we give a table of receipts of the United States from internal revenue from March 4, 1792, to June 30, 1881, (by calendar years to 1843, and by fiscal years from that time):

1792	$ 208,943 81	1863	$ 37,640,787 95
1793	337,705.70	1864	109,741,136.10
1794	274,089.62	1865	209,464,215.25
1795	337,755 36	1866	309,226,813 42
1796	475,289.60	1867	266,027,537.43
1797	575,491.45	1868	191,087,589 41
1798	644,357 95	1869	158,356,460.86
1799	779,136.44	1870	184,899,756.49
1800	809,396.55	1871	143,098,153 68
1801	1.048,083.43	1872	130,642,177 72
1802	621,898 89	1873	113,729,314 14
1803	215.179 69	1874	102 409,784 90
1814	1.662,984 82	1875	110,007,493.58
1815	4.678,059 07	1876	116,700,732.03
1816	5,124,708.31	1877	118,630,407.83
1817	2,678,100.77	1878	110,581,624 74
1818	955,270 20	1879	11 5,561.610.58
1819	229,093.63	1880	124,009.373 92
1820	106,260.53	1881	135,229,912.30

In the intermediate years some outstanding amounts were collected, but they are not of sufficient importance to be given in this place. The total amount derived from internal revenue since the formation of the government is $2,807,357,366.28.—AUTHORITIES. *Reports* of the Secretary of the Treasury and the Commissioner of Internal Revenue; *Report* of the Revenue Commission and of the Special Commissioner of the Revenue, David A. Wells, in the *Cobden Club Essays;* and also his article on DISTILLED SPIRITS in this work. Compilations of the revenue laws have from time to time been issued by the government. A great mass of information is contained in the *Internal Revenue Record.* (See EXCISE, INCOME TAX, STAMP TAX.)

WORTHINGTON C. FORD.

INTERNATIONAL, The, or the **International Association of Workingmen.** This too notorious association owed its origin to the relations which were established at the time of the universal exposition at London, in 1862, between the socialistic French workmen who were sent there at the expense of the government, and the English workmen belonging to the trades unions Up to this time continental socialism had scarcely descended to the ground of realities. It had contented itself with making plans for the organization of labor, of which the essential feature was the substitution of association for wages and the subordination of capital to labor. But in 1862 the contact of the French socialists with the English unionists gave the former an opportunity to become acquainted with the organization and powers of the trades unions, and they determined to import these powerful machines to the continent, and press them into the service of their theories, that is to say, employ them systematically in the war against capital. It was at a meeting in favor of Poland held at St. Martin's Hall, Sept. 28, 1864, that the foundations of the international were laid. A provisional rule was adopted, appointing a committee to draw up the laws of the association, and to summon the affiliated societies to a congress, by which these laws should be definitively adopted. A preamble, purposely expressed in terms rather vague, so that they might be accepted by the different socialistic sects, was placed at the head of the provisional rule and afterward at the head of the laws. In this it was particularly stated "that the subjection of labor to capital is the source of all moral, political and material slavery; that on this account the economic emancipation of the working class is the great end to which all political movement should be subordinated; that thus far all efforts in this direction have failed for want of thorough cooperation among the workmen of different trades in each country, and of fraternal union among the workingmen in different countries," etc., etc. The conclusion was, that the workmen of all nations ought to unite, taking "for the basis of their conduct toward all men, *truth,* justice and morality, without distinction of color, faith or nationality." The terms of this programme were sufficiently general and elastic to exclude no one; however the association was slow in forming, though the annual assessment had been fixed at one shilling; still, a bureau was established in Paris, rue des Gravilliers, where the first group of internationalists assembled; but, according to the testimony of Mr. Fribourg, "from the outset of the enterprise money was lacking." This was the case also in London. "But for the proceeds of a family tea, with a concert, lecture and ball, which the English members gave to the London public, the want of money would, perhaps, have prevented the work from taking root in England for a long time." (*L'Association international des travailleurs,* by E. E. Fribourg, p. 23.) It was not until Sept. 3, 1866, that the nascent association held its first congress at Geneva, under the presidency of Yung, a member and delegate of the central committee of London. The number of delegates from the sections already formed or in process of formation in France, Germany, England, Switzerland, Spain and Italy was about sixty. The congress first adopted the manifesto and by-laws of the association which a committee had been ordered to prepare, and then discussed a certain number of social and political questions which were made the order of the day. In the following years the association held three other congresses, one at Lausanne in 1867, at Brussels in 1868, and at Bâsle in 1869. The events which followed compelled it to suspend these international reunions, and they were not resumed until September, 1872, at the Hague, where a division took place, following which an opposition congress was held at London.—The by-laws adopted by the congress at Geneva consisted of eleven articles, with regulations in the form of an annex containing fifteen articles. The first article of the by-laws was as follows: "This association is established to provide a central point of communication and co-operation for the workingmen of different countries seeking the same end, namely, the mutual co-operation, progress and complete enfranchisement of the working class." The succeeding articles treat of the "general council" which was to be composed of workingmen of different nations. Each year the congress or general assembly of the delegates of the association was to elect the members of the council and determine where the council should sit. As a matter of fact it always met in London. The general council was not invested with any authority over the association, its duty was simply to establish relations among the workingmen's associations of different countries, and endeavor to increase the sections of the association; these associations or sections, however, preserving their autonomy. Each section, whether large or small, had the right to send a delegate to the congress, and when it reached 500 members, one delegate more for such number. Each section or federation of sections

managed its own affairs, fixed the amount of its assessments, and disposed of them as it saw fit. Nevertheless, a general assessment was levied upon all the members of the sections or affiliated societies for the benefit of the general council; but this assessment was very small: ten centimes per capita each year. The total of these receipts for the year 1866, presented at the congress at Lausanne, did not exceed sixty-three pounds sterling, and it is doubtful whether it was much higher in the following years. In this respect the writers who have occupied themselves with the international have fallen into very serious exaggerations. For lack of resources the "general council" was compelled to give up the publication of a bulletin of international statistics which was to have furnished the societies affiliated to the international with regular information as to the state of the labor market, the rate of wages, etc., and it was not able even to maintain a special organ. The Belgian, Swiss and other sections had their journals, such as the *Egalité* of Geneva, the *Mirabeau*, of Verviers; but the general council had none. In short, the international association formed a vast federation of "sovereign sections," of which the general council was the bond of union, but without exercising any effective authority over them. The regulations annexed to the by-laws were intended to render it entirely subordinate to the congress or general assembly of the delegates of the sections which it was commissioned to organize, and whose resolutions it was obliged to execute, (art. 1), with this express stipulation, that the congress should assemble freely, without special convocation, at the times and places which had been fixed upon the preceding year. It is easy to recognize here the spirit of jealousy and defiance of all authority which has always characterized democracy. — Thus constituted, the association had before it, from the beginning, a double end: one purely theoretic, which consisted in discussing, in its congresses, its journals and its special publications, all questions of interest to the working class, and fusing together, if possible, the different socialistic doctrines; the other object, of a practical character, consisted in multiplying its sections so as to include within its pale, in time, all the working masses, thus forming an innumerable army, acting principally by means of coalitions and strikes, for the overthrow of capital. At each congress a great number of "questions" were submitted to the sections, among which, as in most other congresses, the work to be done was divided. Those which were discussed were made the subject of a report which was further debated in the general assembly. Finally, they voted on "resolutions" summing up the opinion of the majority on these questions. Among the subjects which gave rise to the most important discussions may be mentioned property in general, landed property, property in railroads and mines, the laws of inheritance, interest on capital and mutual credit, machines, the reduction of the hours of labor, strikes and societies for resistance, co-operation, education and war. It is needless to say that opinions hostile to property predominated. Thus at Bâsle, in 1869, the congress declared by a vote within four of being unanimous, "that society has the right to abolish individual property in the land, and restore the land to the community." But, by a singular inconsistency, in the same congress, the abolition of the right of inheritance did not receive the necessary majority, (32 of the delegates voting for the abolition, 23 against it, and 17 not voting at all). On the other hand, there was almost perfect unanimity for restoring railroads, mines and forests to the domain of the community, and organizing mutual credit for the purpose of suppressing interest and "releasing labor from the domination of capital by restoring the latter to its natural and legitimate rôle, *which is that of the agent of labor.*" (Resolutions of the congress of Brussels, 1868.) The co operative societies which retained interest were condemned as "transferring that egoism which is the bane of modern society from the individual to the community." As to strikes, while declaring "that strikes are not a means to the complete freeing of workingmen, the association was of opinion that they might be considered as a necessity in the actual situation," and that it was desirable to multiply societies for resistance in order to sustain them. In regard to the introduction of machinery, the association was of opinion that it ought not to take place without guarantees and compensation to the workmen. It finally pronounced for the legal limitation of the hours of labor, and the establishment of "complete education." Very energetic and radical resolutions against war were voted in each congress. As to the future political constitution of society we note the following resolution adopted at the congress of Bâsle: "The groups (trades unions) will constitute the commune of the future, and government will be replaced by councils of bodies of tradesmen." However, there was a difference of opinion as to whether the international ought to occupy itself with purely political questions; in 1869 the question was decided in the affirmative. The congress of the friends of peace, composed of a group of republicans, met at Lausanne, while the congress of the international was sitting at Bâsle. The two congresses, between which could be perceived the old antagonism of politicians or Jacobins and socialists, made peace, under the auspices of M. Victor Hugo, who proclaimed "the union of the republic and socialism." — To sum up, although the economic and political doctrines represented by the international present singular inconsistencies, they were generally agreed on these different points, to wit, that there must be a breaking up of existing society; a transforming of property or its suppression; the abolition of wages by transferring existing enterprises to the hands of associations or companies of workingmen, in which work alone would be remunerated,

capital, for the future, furnishing its services gratis; and finally, that the government should be only a sort of delegation of the federated communities of workingmen. Such were the doctrines that the international strove to popularize and finally to realize. As to the way in which they were to be realized, opinions differed: some favored political means, otherwise called revolutionary; others favored the economic procedure of strikes. While the British trades unions regarded coalitions and strikes simply as a means of raising wages or shortening the hours of labor, the international saw in them a power destined to make the war against capital general and finally to bring under subjection that tyrant of labor. With this object, the international strove to extend its thread of local sections and federations over the entire civilized world; the general council, which served as a medium of communication, was to enable them to render each other mutual aid, so that each strike, if regarded as opportune, should be sustained by subsidies from all the sections or federations. Thus was created an instrument which in time might acquire irresistible power, and the international would end, at least so it flattered itself, by controlling the labor market and dictating the conditions of wages to capitalist employers. If it found them too hard, its intention was to purchase their enterprises and hand them over to associations or communities of workingmen, and thus put an end to the odious régime of wages and the tyranny of capital. This is why from 1867 the international took a part more or less direct in numerous strikes in France, Belgium and Switzerland. We read, for example, in the report on strikes presented to the council of Brussels, in 1868, by César de Paepe, that "the house builders in Geneva saw their strike succeed because the workingmen of France, Italy, England and Germany came to their aid. The sections of the international organized a vast subscription, and the bureau of Paris alone procured the sum of 10,000 francs." Besides the assistance collected usually by way of subscriptions in the sections, the international undertook to transmit all the advice and information which might aid the cause of the strikers. Thus, during another strike of the same house builders at Geneva, the journals of the international induced masons, stonecutters, etc., to refrain from going to Geneva until further orders. At Lyons, the strike of the female silk spinners (June, 1869) was encouraged by the international, which sent them a small sum of money (1,323 fr. 30 c.) collected from the sections. (Oscar Testut, *L'Internationale*, p. 72.) At Paris, the strike of the leather-dressers and bronzers was sustained by similar support. The bronzers, an exception which Mr. Fribourg points out, afterward paid it back. The international interfered in an equally active manner, in the strikes at Creuzot and Fourchambault (April, 1870), in the strike at Seraing (Belgium), etc., etc. But, following the example of the trades unions, it interfered only when the circumstances seemed favorable. In the strike at Renaix, it even attempted to exert a pacifying influence. A proclamation from the bureau of Paris, signed by Messrs. Tolain, Fribourg and Varlin, condemned the destruction of machinery. But the international did not often hold such moderate language; the workmen themselves have accused it, at different times, of having encouraged strikes without giving them any assistance beyond proclamations and the exhortations of its agents. However, it acquired such an influence that the imperial government, after trying to negotiate with it, became alarmed. The bureau of Paris had to stand three law suits, (March and May, 1868, and July, 1870), several members of the bureau were condemned, first to pay a small fine, afterward to a year in prison. These sentences do not seem to have arrested the progress of the international. The events of 1870 exercised a decisive influence over the destinies of the international. It is only justice to it to say that at first it protested vigorously against the war. In this spirit, the Parisian members published a "manifesto to the workingmen of all countries." On the 23d of July the general council published a similar manifesto. "We declare if the working classes of Germany permit the present war to lose its strictly defensive character and degenerate into an offensive war against the French people, victory or defeat will be equally disastrous" According to Mr. Fribourg, the international, as a corporate body, took little part in the revolution of September 4th; nor do we find it much more active in the defense of Paris. (*L'Internationale*, p. 143.) At this time the place of its meetings had been transferred to rue de la Corderie-du-Temple, and in the room of the Cour-des-Miracles, near the passage of the Caire, its members had a club, very meagrely attended (club of the Cour-des-Miracles). The international gave few signs of life until the eve of the commune. What part did it take in the insurrection of the 18th of March? It is difficult to say. Only two of its members, Varlin and Avoine *fils*, figured among the thirty-six members who composed the "central committee of the national guard." On the other hand, among the seventy-nine members of the commune, twenty belonged to the international; a few, Ch. Beslay, Theisz and Longuet, were among the moderates; others, on the contrary, such as Vésinier, Pindy and Varlin, figured among the promoters of violent resolutions and measures. On the 23d of March, a circular emanating from the "federal council of the provisional sections," and from the "federal chamber of the workingmen's societies," urged the people of Paris to vote for the commune, which was to be elected three days later (March 26th). This is the only thing emanating from the association which we find in the collection of documents of this epoch. (*Le Gouvernement du 4 Sep-*

iembre et la Commune de Paris, by Émile Andréoli, p. 215.) But immediately after the repression of the insurrection (May 30, 1871), the general council at London published a long manifesto addressed "to all the members of the association in Europe and the United States," in which the insurrection of the 18th of March was justified and the commune glorified. (This document will be found in the *Histoire de l'Internationale*, by Edmond Vélletard, appendix, p. 327.) — A general outcry was then raised against the international, and there was even a question of a convention between governments to prohibit it. This project did not amount to anything, but in France a law was passed, under date of March 14, 1872, forbidding, under heavy penalties, all affiliation with the international, and even the giving publicity to its documents. Whether the international thought it prudent to let the storm pass over, or whether it was weakened by the internal dissensions which broke out a little later, little was heard of it for more than a year. The congress did not assemble in 1871; there was only at London a simple "conference" whose deliberations were not made public. The following year the general council of London, of which the celebrated socialist, Karl Marx, had been made president, took courage and convened a congress at the Hague. But in the meantime the centralizing tendencies of the general council had roused intense opposition, and Karl Marx was accused of aspiring to the dictatorship. On the eve of the congress at the Hague, Aug. 4, 1872, at the congress at Rimini, the Italian federation formally broke with the general council. On the other side, the Jura federation sent a delegate, Guillaume, to the Hague, expressly commissioned to demand "the abolition of the general council and the suppression of all authority in the international." This burning question was made the order of the day at the opening of the congress, and called forth the most stormy debates.— Thanks to the gathering of a certain number of the old members of the commune, Ranvier, Dereure, Vaillant, etc., the majority pronounced in favor of maintaining the general council. The federalist minority then withdrew from the congress. But it was not long before the majority was itself divided; it embraced two very distinct elements: those who wished to confine themselves to the economic struggle, at the head of whom was Karl Marx; and those who demanded that the international should take upon itself, in the first place, to organize the proletariat as a political party. The old members of the commune, who formed the party called the "Blanquists," especially sustained this opinion; but Karl Marx and his friends refusing to agree to it, the politicians, in turn, quitted the congress, thus leaving the field open to the partisans of the economic struggle. The latter resolved to transfer the seat of the general council from London to New York, and after taking this resolution, the congress adjourned. Some days later, on the 15th of September, the dissenters, to the number of twenty-five, assembled in the Science Hall, Old street, London, to protest against the decisions of the congress of the Hague, accusing that congress of having "compromised and betrayed" the cause of the international. This opposition congress, led by the two communists, Vésinier and Landeck, pronounced the dissolution of the international, and decided that it should be replaced by a "universal federal association." — The history of the international ends here. Created under the influence of the false idea which has been at the bottom of all socialistic ideas for the last half century, that labor is necessarily defrauded (*exploité*) by capital under the wages system, the object of the international was to suppress wages and substitute associations in which capital would be subordinate to labor for the existing enterprises of production and exchange. To attain this end, it employed sometimes the novel mode of procedure of the trades unions whose forms of organization it had borrowed, and sometimes the old revolutionary methods. Neither of them has succeeded, and it may be hoped that the association will never recover from the blow dealt it by the dark events of 1870–71; but it is less certain that it will not have successors. G. DE MOLINARI.

INTERNATIONAL LAW. (See LAW, INTERNATIONAL.)

INTERPELLATION, a question propounded to a minister by a member of parliament. Many arguments can be offered in favor of the right of interpellation, even setting aside those founded upon ministerial responsibility. Has not the nation a right to be informed about its own affairs, and can its mandatories exercise their control without asking for the information they may need? When the law does not allow deputies to interrogate the representatives of the government in a legislative assembly, it frequently happens that the questions arise of themselves, and the government immediately answers them. The government may even sometimes be glad of the opportunity thus presented of expressing its opinion. The solemn preparation of these questions only has been removed. Where the right of interpellation is admitted, in Europe, the ministers are informed of the subject of the interpellation, the day is fixed by mutual consent, and the government has an opportunity to prepare itself; but it is not always obliged to answer. The public good may sometimes require the refusal to grant interpellation. The government may also, it is true, pretend a necessity for silence, based upon this motive, and thus avoid a difficulty.

MAURICE BLOCK.

INTERREGNUM is the interval between one reign and another. In an hereditary monarchy the heir to the throne is king by right after the death of his predecessor; every one knows the

expression: "The king is dead, long live the king." An interregnum can occur only in states where, at the end of one dynasty, the new prince succeeds only after a certain interval. — There is no interregnum in a republic, for the supreme magistrate is elective; he does not reign, but governs. The end of his government being known beforehand, the election of his successor can be held, and the one enters into office the moment the other departs from it. In this case, also, there is no break in the continuity. — It is not so in an elective monarchy. The king having been elected for life, the precise date of the end of his reign is not known, and it would not be pleasant to tell a man that you believe he will soon die. In these states, then, there is an interregnum, the time of election. The evils that result from these momentary removals of the representative of supreme authority, are well known. Thus at Rome, after the death of a king, the senate nominated a substitute for the performance of the religious functions that could not be performed by other magistrates. The wars of the pretenders which, in the Roman empire, followed the death of Galba, and of Didius Julianus, were veritable interregnums. In France we may cite the interregnum from 736 to 741, from the death of Thierry II. to the accession of Childeric III Charles Martel governed France during this period, as he had governed it under Thierry II., and as his son, Pepin the Short, governed it under the succeeding monarch There was also an interregnum of one year between the death of Charlemagne and the accession of Charles the Simple; an interregnum of five months in 1316, from the death of Louis the Quarrelsome to the birth of John I, who reigned four days. The most celebrated in history was the great interregnum of the German empire, which lasted twenty-three years, from the death of Conrad IV. (1250) to the election of Rudolph of Hapsburg (1273). Three emperors were elected at the same time during this interval: William of Holland, Richard of England, and Alphonsus of Arragon. None of them reigned. It was a period of discord and violence. — The great improvement in political institutions has, in the different countries, either suppressed the royal power, or extended to the mode of transmitting it the increased regularity of all political movements. Thus the interregnums which were so terrible and so disastrous in ancient history, are accidents entirely foreign to the history of modern times.

JACQUES DES BOISJOSLIN.

INTERVENTION. By intervention, in politics, is meant the influence exercised by one or several governments over another or several other governments regarding internal or external affairs, of a nature to compromise the general peace. Taken in its etymological sense, the word *intervention* should signify arbitration; but as the duty of an arbiter supposes absolute disinterestedness on the part of the one who takes this character, the term certainly can never be rigorously applied in politics, for the interference of a nation in the affairs of a strange state rarely possesses and still more rarely preserves this noble character. Still, the principle on which the right of intervention is based, is theoretically the recognition of a human right, the affirmation of the unity of human reason, the attestation of the moral and material solidarity of all nations and all individuals, independent of and superior to the constitutions and particular laws that govern them.—*Nil humani a me alienum puto:* I esteem nothing human foreign to me; such is the profession of faith of every man of progress, no matter what his nationality. Surely, nothing can be nobler than this. In France the right to interfere in the internal and foreign debates of other countries is considered almost as of divine investiture, and this generous passion has often made the French forget even the care of their own independence.— Can it be said that there is a human law, fixed and invariable, accepted by all, and calculated to serve as a rule for all relations of people to the government, and of state to state? We need but cast a glance at contemporaneous events and recall the history of past times to recognize how far we still are from such a realization. However, the right of intervention is exercised every day, either openly or covertly, to the detriment of universal morality. It has served and may still serve as a pretext for every species of usurpation, iniquity and spoliation. Instead of preventing war, it most frequently leads to a general conflagration; from a circumscribed debate, colored with some show of justice, it leads to the most audacious attempts against the independence of nations and the liberty of individuals. — There are several kinds of intervention. intervention simply by means of notes called *verbal*, delivered by the ambassador of the intervening power; official intervention by notes publicly delivered; pacific intervention, which nearly always has for result a congress or international conference, and armed intervention, preceded by an ultimatum, accompanied by military demonstrations and followed by a declaration of war.— The principal authors who have treated of the law of nations have vainly endeavored to circumscribe the right of intervention, but they have not succeeded in giving a positive definition of it, or defining its limitations. Vattel, Wheaton, de Martens, Pinheiro Ferreira, admit that it should apply only to the purely external acts of nations, and that the circumstances in which a foreign government may intervene in the internal affairs of a state are very special and restricted; but these authors have taken care not to specify the particular cases in which intervention appears to them legitimate, and thus the way is left open to all interpretations.—Some modern publicists have professed the principle of non-intervention in opposition to the principle of intervention; endeavoring (so lacking in precision is political language) to give a positive value to a negation. In

stead of considering in itself the right of nations to dispose of themselves, to form their institutions, to contract alliances, and to conclude treaties of commerce, they have reduced the declaration of independence of nations to this lamentable formula: Each one for himself, and at home. — In 1820 at the time of the meeting of the congress of Troppeau and Laybach, the English government endeavored to establish more definite limits to the exercise of the right of intervention: the question arose apropos of the Neapolitan nation, which, in the course of an uprising, had wrested from its sovereign certain guarantees against arbitrary power. The popular movement had been successful, the king abdicated in favor of the duke of Calabria, and granted a constitution. The emperors of Russia and Austria, and the king of Prussia, interested themselves in the matter, and convoked a congress of the powers that signed the treaty of 1815, to take counsel, in their common interest, as to the revocation of the concessions granted; England declined to attend, and her declaration deserves mention here, for it inaugurated the policy of non-intervention which secured to Europe so long a period of peace. — While acknowledging that a government might have the right to interfere seriously and directly in the affairs of another state, the English government deemed this right justifiable only by the most urgent necessity; it did not admit that this right could receive a general and unrestricted application in all cases of popular movements, and it believed especially that it should not be employed as a prudential measure, nor form the basis of an alliance. *This right*, it said, *should be an exception to the most essential principles;* it could be allowed only in special circumstances. The liberal attitude of England, at this period, is not to be attributed to a respect for the independence and autonomy of nations; policy proceeds from interest, more or less correctly understood, and not from principle. — The most curious result of the congress of Laybach, was the pretension (a pretension made by the intervening powers) to prevent a sovereign from granting, or, to speak more accurately, from restoring to his people the liberties which had been taken from them. Its decision was to the effect that the absolute principle should be re-established at Naples, that the former king should resume his crown, and that, if necessary, force should be employed to obtain this end. Austria was charged with the execution of the decree; her armies invaded the kingdom of the Two Sicilies, and during several years occupied, at the expense of that country, the principal cities of the kingdom. — One year later Piedmont rebelled, and proclaimed a constitution copied after the Spanish constitution of 1812. Again there was a new intervention, a condemnation of the insurrectionary action of the Piedmontese people, and a restoration of absolutism; and again it was Austria that had the honor of the repression. The allied governments thus justified their intervention: "It was a right which, in this special case, became an urgent necessity to unite in common measures of security against the states in which the overthrow of the government effected by revolt could be considered but as a dangerous example, which would result in an attitude hostile to legitimate constitutions and governments." — Two years passed, and Spain in turn demanded the constitution of 1812; this time France was the executor of the decrees of the holy alliance; her arms overthrew the national compact of Spain and restored absolutism beyond the Pyrenees. — Upon the revolt of the Spanish colonies, the desire to intervene was again manifested, but here the United States upheld the revolted provinces, and England declared herself ready to recognize the independent governments that had been formed, and the holy alliance was obliged to withdraw before the consequences of its own principle. — In 1825 the death of John VI. called to the throne of Portugal his eldest son, Dom Pedro, then emperor of Brazil. The constitution of the latter country being opposed to the reunion of the two crowns, Dom Pedro abdicated in favor of his eldest daughter, Donna Maria, who inaugurated her new reign by according a constitution to Portugal. A competitor arose to oppose her, under the auspices of the great powers. France supported Dom Miguel, but England declared openly for the constitutional power of Donna Maria, and disembarked a body of troops in Portugal; this effective intervention a second time foiled the retrograde action of the French, Russian and Austrian governments. — In 1826 a new coalition was formed, in which England participated in the intervention demanded by France and Russia in favor of the Greek insurrection. The united powers burned the Turkish fleet at Navarino. Fourteen years later, France intervened in favor of the Turkish government, and all Europe was prepared to take up arms in defense of an empire which it had so terribly ill treated but a few years before. — Since 1848 interventions have followed one another pretty steadily: the intervention at Rome to re-establish the temporal power of the pope; the intervention in the Crimea to insure the integrity of the Turkish empire; the intervention in Italy for the re-establishment of Italian nationality; the intervention in Syria for the protection of the Christians of Libanus; the intervention in China and Cochin China, under pretext of suppressing acts of cruelty committed upon the missionaries, and in reality to enlarge the circle of the commercial relations of France and England; and French intervention in Mexico, the sad results of which are well known. — To sum up, intervention is war, and war is the subordination of civil to military genius, and as a talented author has very forcibly expressed it: "As dangers accumulate, war opens the era of saviours. Scipio makes us forget the Gracchi, and prepares the way for the Cæsars. The austerity of public morals gradually disappears before the corruption of ill-ac-

quired riches; the glory of the great generals eclipses all social virtue. War is as disastrous to morals as to the public finances." It was in the name of the right of intervention that Catharine II. prepared the way for the division of Poland; it was by an appeal to the same right that Prussia and Austria sanctioned this usurpation by taking part in the spoliation of the Polish nation; it is under color of intervention that England even successively dispossessed the native princes of Hindostan. It was under the pretext of intervention that Brunswick addressed to revolutionary France the insulting manifesto to which she replied by so many victories However, the French revolution was an entirely internal matter; when it broke out it had not the character of propagandism which it assumed later. We may say that the intervening powers violated the autonomy of nations, and that the principle of intervention which they wished to legitimatize by a series of manifestoes, proved, in the absence of a well-defined human right, applicable to all peoples, whatever degree of civilization they may have reached, solemnly and directly accepted by them without the compulsion of their respective governments, to be nothing more than a modern disguise of the right of force.—It is this so-called right that legalizes those military establishments which absorb so many useful arms, and so much fruitful capital; appealing by turn to the right of nations and the interest of sovereigns, the right of conscience and the interest of religion, it will destroy to-morrow what it erected yesterday; it changes arbitrarily the balance of international relations, and under pretext of establishing between nations one common law of justice and civilization, fosters their mutual enmities.—What would be said of a tribunal passing judgment under pressure of the interests and passions of the moment; applying a law which has neither been defined nor confirmed, and executing its own sentences? Such, however, is the power exercised to-day by the right of intervention. Does this mean that the juridical idea, the thought essentially human whence intervention proceeds, shall never be satisfied? I do not think so; the question ought to be put thus: Above the arbitrary conventions of politics, above treaties, above governments, above nationalities themselves, so frequently appealed to in our day, does a human law exist? Can it be established upon a serious, durable, respectable basis? What international convention could draw up this code of civilized nations? How should the members of this convention be chosen? What sanction should the constitution which might result from these deliberations, have? What tribunal would take cognizance of offenses against this new code? What would be the means of enforcing obedience to it, and the manner of executing the decisions of this international tribunal when it would have summoned before it a dispute between two nations, or the protestations of a nation against the despotism of its rulers? It is thus the question should be put, if we would give a respectable foundation to the right of intervention; if we would substitute reason for force, right for brutality, peace for war, a stable equilibrium for an insecure one, and economy for prodigality Until it be resolved in this manner, we must condemn intervention, under whatever disguise it may conceal itself; for, springing from force, it can lead to nothing but arbitrary power.

FRANCIS EDWARD HERVÉ.

INVASION. In every European continental war there is an invasion. When France, for instance, goes to war, either she invades the enemy's territory, or the enemy invades the territory of France. Undoubtedly it is to each nation's interest to carry the evils of war into the enemy's country, but they should not, in these circumstances, forget the precept: "Do unto others as you would that others should do unto you." It is, in fact, a rule that the invader should respect the persons and property of private individuals; it is a rule also that the civil population of the country invaded should be allowed to continue, as far as possible, their peaceful occupations. The question may, however, be asked: In case of an invasion, what should the citizen do? The question is a difficult one to answer, particularly if the answer required be a general one. Should the entire population rise as one man? We should incline to an affirmative reply, if the fear of a general uprising would be likely to prevent the invasion. But little attention is paid to theories in these matters. The people will take up arms if conquest be the object of the invasion, or if they are in sympathy with the government, or desire to expel the invader; but they may also remain indifferent. Indifference, however, in our day, is apt to lead to their own ruin. When the people take an active part in the war they no longer enjoy the immunities accorded to peaceable citizens. The enemy generally feel themselves justified in practicing greater cruelty upon armed citizens than upon soldiers properly so called. Specialists maintain that the enemy is obliged in self-defense to treat with severity every armed man who is not in uniform and does not form part of a regularly organized body; first, because they can not recognize him from a distance as a soldier, and can not guard against him; next, because the invading force spares men and property, only under the express condition that these men and this property shall not work them any injury. Nevertheless, we can not justify these excesses. All men taken with arms in their hands should be treated alike. Unfortunately, more attention is given to the voice of passion than to that of reason, in time of war, and men allow themselves to commit acts which they reprove and energetically denounce when committed by an enemy. MAURICE BLOCK.

INVENTIONS include all contrivances which increase the power of man in production. Their

economic effect is to take the place of the labor of man, and at the same time to multiply the results of this labor, either by utilizing the forces of nature, or by deriving a greater benefit from the men and the various kinds of capital, of which inventions are themselves one of the most important groups. — The considerations which we are about to present apply, in all respects, to mechanical, chemical and physical *discoveries* and *inventions* of every kind, to all processes of whatever nature they may be, to all displacements of capital and the industries, to all advancement resulting from the application of an economic truth hitherto unknown or misunderstood, and having for its final result to produce in a better manner, more quickly and more cheaply; and to do this in agriculture, in manufactures, in transportation, exchanges, sciences, the arts — in a word, in all avocations. In the number of these improvements we may mention those which result from greater freedom of trade, which, bringing about the importation of products prohibited or too highly taxed, and opening the way to markets, may be compared to the employment of a series of new machines. — It is at once evident how the subject enlarges; for it is impossible, so far as results are concerned, to make an economic separation between inventions or even simplifications in what is strictly a mechanism, and a method of cultivating the soil, the employment of a chemical apparatus, or any administrative or scientific work. In them all we have forces better combined, better employed, and which give a better result, that is to say, which produce more, more quickly and more cheaply. — I. *The Power of Inventions in Production.* To produce more, more quickly and more cheaply, is an expression for all economic progress obtained by a better employment of the instruments of labor, which are the earth and other natural agents, the physical and intellectual forces of man, and capital. A well-ordered division of labor, and the employment of inventions, are, perhaps, the two most striking general examples of this progress that can be given. Let us cite a few facts which will show what an enormous difference modern industry, with its astonishing means of action, with the machines and inventions whose power it has been able to utilize, has made between society at the present day and communities before our time, which were considered as endowed with a brilliant civilization. — Before the invention of water mills and wind mills, slaves, poor prisoners or unfortunate women turned the millstone; and ancient authors inform us how slow and laborious this operation was. According to Homer, twelve women were constantly occupied in the house of Penelope in grinding the grain needed for the household. On the other hand, the most simple water mill, a mill rented at about $600 a year, a mill which will in its turn become antiquated by the side of the improvements in mechanics, can grind in one day as much grain as one hundred and fifty men. If this mill is in operation three hundred days in a year, its cost is ten francs ($1.93) per day; on the other hand, the men would cost at least three hundred francs: so there is a saving of two hundred and ninety francs, which, apportioned on thirty-six hectolitres (about 100 bushels) constitutes half of the price of the grain itself. — Homer did not say how many persons composed the household of Penelope; but Michel Chevalier,* considering that Ulysses was king of a poor kingdom, thinks he exceeds the truth in estimating them at 300 in number. The same writer, considering, on the other hand, the mill of St. Maur, found that in this remarkable establishment, forty millstones under the charge of only twenty workmen, ground to flour 720 hectolitres (1,980 bushels), which would furnish food for 72,000 persons. In the time of Ulysses, the labor of one person was then necessary to produce the flour needed for twenty-five others. In our day, that operation has been brought to such a degree of perfection that one person can supply the flour for a population of 3,600 persons,† or 144 times as much: consequently, now, 278 workmen, distributed in fourteen establishments like that of St. Maur, can grind for a million of the inhabitants of Paris. At Rome or in Greece, an army of 40,000 slaves were needed to produce the same result. Besides, there is no possible comparison between the condition of those who work in the improved mills of our day and the slaves turning the millstone; between the flour of a mechanical mill and that of Penelope's house. The most wretched of the Parisians eat bread a hundred times preferable to the black cakes of Ithaca's queen, and each of the workmen we just mentioned can procure for his home more comforts than the prudent Ulysses. — In the Pyrenees, where the ancient mode of working iron is kept up, with some improvement, however, one still finds forges similar to those which must have been used centuries ago. The quantity of iron representing a day's work of a man with these furnaces, may be approximately estimated at about six kilograms (over thirteen pounds avoirdupois). Modern industry has constructed blast furnaces,‡ enor-

* *Cours d' Economie Politique*, 1st vol., 2d lesson. From this work we borrow such of these facts as relate to the mill of St Maur, to iron and to spinning, which are presented there more in detail.

† The present rate of production (July, 1881) in the flouring mills of Washburn, Crosby & Co., Minneapolis, Minn., is such that the average product of a man's labor is the flour required for 3,985 persons, allowing three-fourths of a pound daily per individual, and considering that consumption continues one day more per week than production. These mills employ 281 men (who work twelve hours per day—a part from noon to midnight and a part from midnight to noon), exclusive of workmen not connected directly with milling, such as carpenters, millwrights, machinists and laborers. The total daily production with this force is 5,000 barrels of flour per day of twenty-four hours. —E. J. L.

‡ A blast furnace now in operation in Kentucky has run off *forty tons* of iron per day for several successive days. By the aid of recent improvements, a better quality of metal is obtained from very refractory ores than was formerly obtained from ore more easily worked.—E. J. L.

mous structures, capable of running off from three to five thousand kilograms at a heat, if operated with charcoal, and from ten to eighteen thousand kilograms if operated with coke; and the average daily product of the labor of a man may be estimated at 150 kilograms of iron. In other terms, the labor of an iron worker is to-day twenty-five times more productive. Note also that the ores mined present more difficulties, and that the product obtained is better. — Another comparison will show us a prodigious growth, made not since the time of Homer or within centuries, but simply within the last three-fourths of a century. Spinning machinery, in fact, which has given rise, as if by enchantment, to so numerous and such fine manufactures, dates no farther back. It was only in 1769 that Arkwright took out his first patent; and only in 1774* that Watt, whose inventions made the steam engine common, took his. The cotton industry, as it exists to-day, is the work of these two men. Thanks to them, admirable spinning machines set in motion hundreds of spindles which are so disposed and combined, that it is calculating largely to estimate five workmen to take charge of two frames connected with 800 spindles, or one workman for 160 spindles. But a good spinning mill of India or Europe makes just as much thread as half a spindle; so that a cotton spinner to-day turns off 320 times more thread than in 1769; in other terms, within a little more than a century, the productive power of man has increased 320 times in that necessary industry. In the spinning of flax, which is of comparatively recent date, one person is sufficient to take care of 120 spindles, which produce as much thread as 240 spinners, and the thread produced is finer. — It has been by combining the advantages of the division of labor with mechanical and steam power that printing has wrought those prodigies which defy all comparison. Workmen transform the copy of the writer into pages of type; but a machine impelled by steam, and aided only by two or three men, spreads the ink over this type, carries the sheets of white paper over it as fast as they are presented, prints them, and delivers them on the other side to the person whose business it is to collect them. There are machines which ordinarily print five or six thousand copies† an hour. How many copyists would be needed to do as quickly and as well? — By the aid of a simple mechanism, called a *slide*, people succeeded in extracting from the depths of impenetrable forests, trees which were there valueless. Such a slide was that of **Alpnach**, in Switzerland, which for several years enabled the century-old trees lost on the heights and in the gorges of Mt. Pilatus to be utilized. By means of plane surfaces ingeniously supported by scaffoldings, passing over precipices, over and under numerous rocks, and following a well-managed gradient, these trees traveled over a space of twelve kilometres (about seven and a half English miles), in two minutes and a half. In six minutes a tree passed from the forest into Lake Lucerne; thence it descended the Reuss, and went by the way of the Aar and the Rhine to the sea. — The progress attained in our day in ordinary transportation is not less phenomenal. When Fernando Cortez arrived in Mexico, everything was transported on the backs of men. This is still the case in many localities in America, Asia, Africa, and even in Europe. Wherever the improvement of the roads would allow transportation on the backs of quadrupeds, the progress has been as thirty kilograms (about sixty-six lbs.), the load of a man, to 200 kilograms (about 440 lbs.) the load of a good horse traveling at a walking pace. Wherever the roads have become passable for carriages the same motive power has been able to draw, on a two-wheeled cart, a weight at least five times greater. On a canal, and with a boat, the same horse draws from eighty to a hundred times more; that is to say, eighty to a hundred thousand kilograms. On railroads, traction is ten times more easy than on ordinary roads. On these, travelers ordinarily go ten (French) leagues or forty kilometres (about twenty-five English miles) an hour; merchandise, four to five leagues. Whole populations and masses of merchandise are transported at one trip, and that at prices extraordinarily reduced, being between twenty and five centimes per ton and per kilometre, according to the kind of merchandise. One makes in a few hours a journey which, not many years ago, required several days, and, a century ago, weeks and even months. In 1763 the public conveyance from Edinburgh to London took a fortnight; in 1835 the stages went this distance in forty-eight hours; to-day the trip may be made by railway in eight hours. Madame de Sévigné tells us that in 1672 it was necessary to sacrifice a month in order to go from Paris to Marseilles, a journey that is made in sixty hours by the ordinary roads, and that can be made in one-third this time by railway. "Time is money," say the English, money that may be saved. "It is the material of which life is made," said Franklin. The economy to the people of the new ways of communication is therefore considerable. Suppose a line of travel frequented by a half million travelers. The saving of an hour for each traveler produces for the whole the sum of 500,000 hours, or 50,000 days, representing a year's manual labor of 166 men who do not increase by one cent the general expense of food, and whose time has a value much superior to that of the average workman. — We may add that in the time of Madame

* Watt took out a patent for his invention in 1769, and in 1775 obtained from parliament a prolongation of his patent for twenty-five years. (See Chambers' Encyc., Art. Watt.) —E. J. L.

† The Walter machine, on which the London "Times" and the New York "Times" are printed, gives 11,000 perfected sheets an hour. The Victory press will print, cut, fold, and paste at the back a twenty-four page sheet at the rate of 7,000 an hour. The Hoe perfecting press will give 12,000 or more perfected sheets in an hour. (See Appleton's Cyclopædia, 1880.)

de Sévigné and even considerably later, such journeys involved perils sufficiently serious for it to be prudent to make one's will. In our day, and notwithstanding the extreme rapidity of steam travel, the chances have been singularly diminished. In England, only one victim (killed or injured) is estimated to 500,000 or 600,000 travelers. — We have just called attention to the fact that the saving produced by inventions for transportation may be estimated in the days' work of men who do not increase the general supply of food. This observation is important, and we ought to extend it to the action of inventions. It was estimated that there were in France, in 1846, nearly 4,400 steam engines, equivalent to 1,100,000 men. These eminently laborious automats, coming to the aid of the human population, content themselves with coal for their only food, and in no way diminish the supply of provisions or make them dearer. — II. *Economic and Moral Effects of Inventions.* It is superfluous to dwell here on the manner in which inventions, the first effect of which is an abundance of products and a lowering of prices, finally result in the possibility of a continually increasing number of the population procuring for themselves these products; and how inventions thus diminish their sufferings, increase their material well-being, and obtain for them the means of participating in the share of intellectual and moral enjoyments of which civilization permits the attainment. (See CONSUMPTION.) The high price of products is the principal obstacle to the progress of society. There is a tendency in society (constantly progressive, but hitherto incapable of attaining its object) toward a condition which may be expressed as being an accumulation of alimentary substances, of those which serve for clothing and for dwellings as well as of objects of science and the arts, so that every man may always be able to procure for himself and his family larger and larger quantities of these objects. This is a result desired alike by the philanthropist, the philosopher, the economist and the statesman; and it is every day approaching realization, through the fecundity of human genius, expressing itself in improvements and inventions of every kind. Formerly the English cotton factories scarcely met the demands for internal consumption, which averaged a decimetre of cloth for each person. To-day they give from sixteen to eighteen metres, and they export considerable quantities. Prices grow lower every day. "Consequently this soft, convenient and useful cloth, formerly so dear and so rare, is to-day within the means of every one. This is almost a revolution in manners. A change has been wrought in domestic life; a love for neatness and a habit of it, have become general; and "cleanliness," as the English preacher, Wesley, said, "is more than a quality: it is a virtue which elevates the soul, because it gives man a sense of his dignity." (Michel Chevalier, *Cours d'Economie Politique*, p. 91.) — In the reign of Henry II. no one had a handkerchief; most of the great lords were themselves obliged to wipe their noses on their elbows. Through the progress in agriculture, navigation, spinning and weaving, most of the French to-day can be provided with some of these aids to neatness. The same is true of shirts, and of all the necessaries of life. In former times, the purchase of a Bible required a small capital; to-day an infinite number of works are sold at only a few sous, and in England and the United States the humblest family can take at least one weekly journal. Only a short time ago traveling was a great luxury; by the improvement of the avenues of communication, it is now within the reach of every one. — The facts which we have given, and others still more numerous which we might recall, prove how mechanical, physical and chemical inventions unite powerfully to realize conditions of liberty and equality, to redeem man from slavery, properly so called, as well as from that other slavery of privation and brutalizing labor, and to elevate him in his own eyes and in those of his fellow creatures. Religion and philosophy have in turn proclaimed these great principles of liberty and equality; but, as M. Aug de Gasparin observes, (*Considérations sur les machines*, Lyons, 1834), they would have remained powerless to give them value without progress in the industries. Slavery, we must not forget, existed among the ancients side by side with philosophy; in modern times it was imported into the colonies and maintained there by Christians, both Catholic and Protestant. Religion and philosophy would alone be incapable of accomplishing the temporal redemption of humanity. Mills have come and freed a host of slaves, who, among the ancients, were engaged in pounding grain in mortars or turning grinding stones by hand; and those whom the lot of war condemned to be simple machines, have been replaced by millers to whom free labor always secures a modest competency, and sometimes wealth and consideration. The sail effected the deliverance of the unfortunate ones who were compelled to ply the oar, a labor so severe that slaves among the ancients, and malefactors, in more recent times, were, under the name of galley-slaves, put to this work. To the sail, steam is added; and henceforth the sufferings of the sailor-boys and the sailors are alleviated; the privations they endure are less severe; their manners become more gentle. Intelligence has come to take the place of force, or better, to direct it, guide it, and make it productive. — What we say of the severe and fatiguing labors, is still more true of the labors of a repulsive and dangerous nature, which scientific processes modify or transform, or of which inventions wholly relieve men. Such, for example, is the new method of gilding and silvering, which dispenses with the intervention of mercury, so destructive of human life; such is the new way of cleaning ditches, which saves laborers from the morbid effects of sulphureted hydrogen, and their too's

from its corrosive power. — Let us also observe that, by favoring the division of labor, mechanical and other improvements bring woman back more and more to the care of the family and of housekeeping, and make it possible for all the faculties of man to be cultivated and made productive in the general interest of humanity. It has been noticed that in England and the United States, where mechanical appliances have been largely developed, women labor very little in the fields, and are not seen bending under the weight of a harvest burden or a basket of manure. This sad spectacle, on the contrary, meets us in many parts of continental Europe, and even in several localities in France. In Paris, itself, in the heart of civilization, it is not rare to see women harnessed to vehicles, or bending under the weight of heavy burdens. It is also in countries where improvements in agriculture have been the greatest, that it most fully employs the resources of mechanics, the power of animals and the teachings of science; in countries where transportation is the easiest, that the means of subsistence are produced with the fewest hands, and consequently that a greater number of minds can turn to other branches of human activity, such as the industries, commerce, the arts and philosophic and scientific researches, the influence of which then makes itself felt on laboring men and indeed on all humanity. — There is one last remark we wish to make. Certainly, every one is of the opinion that industrial improvements, machinery and other applications of science, give nations a greater desire to have security maintained, and that, by binding people more closely together through the growing exchange of products, of ideas, of sentiments and of esteem, their influence has already made war, conquest and domination unpopular; and every day this same cause renders more difficult the return of that folly of princes and peoples, an impious recourse to arms. But on this point there is a still more direct influence of inventions and the genius of invention, which we must here take into account. In becoming perfected, instruments of destruction, by one of those admirable apparent contradictions of which Providence holds the secret, become in fact less to be dreaded. There has been less destruction of human life since the invention of cannon. Battles where guns are used are relatively less fierce than those with swords; a few projectiles intelligently thrown can take the place of those impetuous assaults after which the conquered were put to the sword, and the conquerors, mad with victory, marked their pathway with blood. It is because the certainty of destruction has been increased by the improvements in firearms; and it is in the nature of the most courageous even, to shun such a certainty. — We have, as we think, sufficiently analyzed the power of inventions, and their industrial and social effects. We have, however, said nothing of the services rendered humanity by printing, nothing of the influence of the improvements in the means of communication, both by land and by sea, nothing of postal communication, of the mariner's compass, or of the electric telegraph! III. *Objections made to Inventions; Inventions always useful to Society and to Labor in general.* The case of inventions has been won in political economy; but the prejudice which condemns them has still too many echoes in society for us to here pass over in silence the arguments which perpetuate it. Let us proceed with them in due order. Here is the fundamental objection, which goes to the heart of the problem, and which is the root of the thicket of sophisms formed by all the others. People can not and do not deny the prodigious effects of the employment of machines and the resulting economy of productive force; but they say (and this was the very objection of Montesquieu*), that this economy for some is compensated by the loss of others, and that finally society grows poorer by the amount of labor saved by the invention and lost to those of its members whom it deprives of work. — We will not dwell on the question of justice which meets us here. John produces an article under certain conditions, and makes me pay a certain price for it; Paul exercises his ingenuity, and finds a way to do better and to offer me the article at a lower price. By what right does John keep the monopoly of doing worse? In virtue of what justice is Paul not to be permitted to do better, and I compelled to buy of one rather than the other? But we will not dwell on this. It is not correct to say that society loses, and on this point we will give the words of Bastiat: "Jack had two francs with which he was employing two workmen. But he conceives an arrangement of ropes and weights which shortens the labor by half. He therefore obtains the same result, saves a franc and discharges a workman. He discharges a workman: *this is what people see.* * * But behind the half of the phenomenon *which people see*, there is another half *which they do not see.* They do not see the franc saved by Jack and the necessary results of that saving. Since, in consequence of his invention, Jack spends but one franc for manual labor, in the pursuit of a particular advantage, he has a franc remaining. If then there is in the world a workman with unemployed hands, there is also a capitalist who offers

* Montesquieu said: "Those machines which aim to shorten the process are not always useful. If an article sells at a middling price one equally advantageous for the buyer and the workman who made it, any machines which should simplify the process of manufacture, that is to say, which should diminish the number of workmen, would be injurious; and if mills propelled by water power were not established everywhere, I should not believe them as advantageous as people say they are, because they have deprived a great number of people of an opportunity to work cut off the use of the water from many fields, and have made many others lose their fruitfulness." (*Esprit des Lois*, book xviii., chap. xv.) We reproduce here the whole substance of Montesquieu on this subject. We should remark that the illustrious publicist knew nothing of the marvels of modern industry, and that he wrote before Adam Smith and his successors had thrown upon economic questions the light to which his superior reason would not have been insensible.

this unemployed franc. These two elements meet and combine, and it is as clear as daylight that between the demand and supply of labor, and the demand and supply of wages, the relation is in no respect changed. The invention and the one workman paid with the first franc now perform the work which was formerly accomplished by two workmen. The second workman, paid with the second franc, produces a new piece of work. What then has been changed in the world? There is one more object in the country that can satisfy human desire, in other terms, the invention is a gratuitous conquest, a gratuitous profit to humanity. * * * *Its final result is an increase of satisfaction for the same amount of labor.* Who gains this additional satisfaction? First, the inventor, the capitalist, the first one who employs the invention successfully, and this is the reward of his genius and of the risk he has taken. In this case, as we have just seen, he realizes a saving in the expense of production, which, in whatever way it may be spent (as it always is), employs just as many hands as the invention has caused to be discharged. But soon competition forces him to lower his selling price in proportion to the saving in expense. And then it is no longer the inventor who gets the profit from the invention, but it is the buyer of the product, the consumer, the public, including the workman—in a word, mankind. And *what people do not see*, is that the saving thus effected by all consumers creates a fund from which wages get a supply, which makes up for that which the invention had stopped. Thus, to recur to the above-mentioned example: Jack obtains a product by expending two francs in wages. Thanks to his invention, the manual labor costs him only one franc. So long as he sells the product at the same price, there is one less workman occupied in making this especial product: *this, people see;* but there is one workman more employed by means of the franc which Jack has saved: *this, they do not see.* When, in the natural course of things, Jack is compelled to lower the price of his product a franc, he no longer realizes a saving by the invention: then he will no more have an extra franc at his disposal, with which to command, of the labor in the nation, another product. But, in this respect, the purchaser is put in his place, and this purchaser is mankind. Whoever buys his product pays for it a franc less, saves a franc, and necessarily holds this saving, at the service of the wages fund: *this, again, people do not see.** — Applying this demonstration to the example of the water mill, which we gave at the beginning, we find that instead of paying at least 290 francs per day to those who turn the grinding stone, the consumers of flour, which is made in mills, turn over these 290 francs into the common fund of wages, from which those who turned the stones and who will now employ their time at some other occupation to produce something else useful to society, will derive the benefit. It is, therefore, not true that society loses by the employment of a new invention which saves money to the buyer. For this saving is simply changed in direction: as the industries are conjoined in their interests, what is economized in one, goes to another. They form, as Bastiat has also said, a vast whole of which all the parts communicate by hidden channels: and consequently economy does not occur at the expense of labor and wages. —Another demonstration may be given that inventions do not injure society. It is that which J. B. Say (*Nouveaux Principes d'Economie Politique*, vol. i., chap. vi.) addresses particularly to Sismondi, taking up the objection of Montesquieu and starting with the premise that the wants of nations are a fixed quantity, that, in consequence, every time that consumption exceeds the means of production, every new discovery is a benefit to society, and that when production suffices fully for consumption, every similar discovery is a calamity. At the outset we should remark, that Sismondi grants the utility of inventions in a case which, taking everything into consideration, is the general case, and J. B. Say, in fact, to reply to him has only to deny that the wants of society are a fixed and assignable quantity; because population increases, because every day we make use of products unknown to those who came before us, because, as the invention reduces the expense of production, the lowering of the price of the product incites to an increase of consumption, which necessitates an increase of production, and, in the end, the employment of as many men, or even more, after the invention as before it (we shall revert to this point); because, finally, the products created by a producer furnish him the means of buying the products created by another, and in consequence of this production both are better supplied. And here J. B. Say calls to his aid the theory of markets, on which he has thrown so much light. He also cites the development of two great parent industries, very modest in their beginnings, but which the genius of invention has developed so enormously and so rapidly that they have become trunks with almost innumerable branches, employing a thousand times as many laborers as formerly.† These two

* *Ce qu'on voit et ce qu'on ne voit pas*, (What people see, and what they do not see), brochure in 16mo, p. 50. (This pamphlet is one of Bastiat's essays on Political Economy, and included in the published American translation of the same.)—E. J. L.

† In England, before the invention of machines, there were estimated to be only 5,200 spinners at small wheels, and 2,700 weavers; in all, 7,900 workmen, while in 1787, ten years after the number of spinners, according to the report of an investigating committee, was estimated at 105,000, and of weavers, 247,000; in all, 352,000 workmen. Since then, machinery has changed, the same work is performed with much fewer workmen, and steam has taken the place of men in many kinds of labor, and yet the number of workmen has increased. Mr. Baines, in his "History of the Cotton Manufacture," (London, 1835), has shown that in 1833 there were 237,000 workmen spinning or weaving at machines, and 250,000 weaving by hand, in all, 487,000 persons. By grouping the workmen in the side industries, such as cloth printing, tulles, cap making, etc., Mr. Baines reaches 800,000 or 1,500,000, if the old men,

industries are printing and spinning cotton. We might mention many others, and prove by statistics, that at the end of a certain time the new industry engages, either directly or indirectly, a larger working population. This demonstration corroborates the preceding. Alone, it would be insufficient; for it would leave one to conclude that in the case (very rare, it is true) where the special consumption of the product in question remains stationary or nearly so, the invention is an injury to labor, which is incorrect; for not only does it not harm society, but it is of advantage to it by putting it in the way of increasing its gratifications without increased effort, and by giving it an opportunity to accumulate an increase of capital, with which it can pay for more labor. — Other minor objections have been made to inventions. It has been said that they impose upon man oppressive toil. But this conclusion has been drawn from a few particular cases which have not been clearly brought under the general rule. To any one who has a little acquaintance with industrial occupations as a whole, this assertion has no foundation. If inventions have one evident, incontestable effect, it is to simplify and lighten labor. It has been said that they render industrial labor irregular, by promoting alternations of activity and complete stagnation, and consequently exhausting the workman by over-work and condemning him afterward to poverty. This objection is likewise the expression of imperfect observations. The employment of inventions supposes establishments on a large scale, whose proprietors have invested a large amount of capital. Now, it is only at the last extremity that those who carry on such establishments stop their business, because they do not wish to lose interest on their capital and general expenses; and experience proves that before suspending work, these business men sacrifice their own interests and even knowingly incur losses in hope of better days. These efforts to continue production are less in establishments which do not employ inventions, and which, in the alternative of suspending labors or continuing them at a loss, hesitate less to discharge their workmen. Inventions have also been accused of promoting division of labor, over-stimulating the increase of the manufacturing population, leading to excessive production and industrial crises, and bringing on a decline in wages and too severe labor. These are all objections which, were they well founded (which we are not willing to admit), would be wrongly attributed to inventions. The latter are sometimes the effect and sometimes the cause of a greater division of labor; but this division is one of the greatest means of progress, and the charges brought against it will hardly bear examination. (See DIVISION OF LABOR.) It is not to inventions that we should impute the incitement to self-multiplication among the working population, but to the system of protection and prohibition. Inventions have more properly the reverse effect, by lightening the occupations of man and thereby improving his morals. Excess of production and crises also arise from causes entirely different. (See CRISES, PRODUCTION.) As to decline in wages and the excessive length of a day's labor, these result from an excess of working population, a subject which will be presented and developed under the word POPULATION. We can, however, say here that the condition of the working classes in our day, compared with that of times more remote, when inventions were not common, and that the condition of the working classes of manufacturing and agricultural countries where the employment of inventions is considerable, compared with that of the same classes where inventions are rarely used, proves that the facts observed are at variance with the objections just stated. Sixty years ago the great mass of the English and French people were not nearly so well provided with necessary articles. Nor must we look to Egypt or any other country still destitute of inventions, for comfort, morality and intelligence. — IV. *Inventions may displace Workmen; numerous circumstances which counterbalance this disadvantage.* If we consider only the workmen whose place the invention takes, we see at once men deprived of their work, their means of living, and obliged to seek other occupations, to put themselves to a new apprenticeship, and to suffer the privations of a stoppage; hence, anxiety and suffering "Here," says Rossi, (*Cours d'Economie Politique*, 2d vol., 10th lesson), "we have a grave fact, a fact which the defenders of inventions would be wrong to question. * * When it was claimed that this fact merited little consideration; when it was asserted that laborers passed readily at once from one kind of work to another; that the increase of products and the decline in prices, and the increasing general consumption, caused the same producer soon to demand again, notwithstanding the inventions, the same number of workmen as before, I do not hesitate to say, the question was evaded, and, to a certain point, the true results of the operation were concealed." We will add, that it would be interpreting Rossi erroneously, to adjudge him hostile to inventions. If he does not defend them, it is, as he says, because they defend themselves. They mark industrial progress, and "industrial progress nothing can arrest."* We agree with Rossi that

women and children are counted; and 2,000,000, if he includes the joiners and masons who build the factories, and the locksmiths who make the machines, without counting the women and the old men.

* Ricardo (chap. xxxi. of his "Principles" added to the 4th edition, translated into French in the *Collection des Principaux Economistes*,) examines the exceptional and theoretical case of sudden invention and application. He shows, likewise, that, in certain given cases, the invention or the industrial improvement may augment the net product while diminishing the raw product, and may displace workmen. But Ricardo is not on that account hostile to inventions. He says (p. 240, M'Culloch's edition): "The statements which I have made will not, I hope, lead to the inference that machinery should not be encouraged. To elucidate the principle, I have been supposing that improved

it is well, in political economy, not to evade difficulties; but, happily, we have a statement to insert here, of several circumstances which can, and which in fact do, diminish the inconveniences which may temporarily result to the working class from the introduction of inventions which accelerate production. 1. New inventions are generally expensive, and a large amount of capital is needed to put them in operation. If this difficulty does not prevent their final adoption, it at least delays it. Convincing proof of this can be found in the history of most industries. 2. The routine spirit, the dread of innovations, and the fear of losing capital, delay the application of new inventions, render the transition gradual, and sometimes prevent the appearance of any inconveniences. 3. In proportion as the arts become more nearly perfect, the invention of machines becomes more difficult. There is a degree of art in which blind force is made to execute all that is possible to it, and where man fulfills only a purely intellectual function. — But in the century which has just elapsed, and which is so remarkable for the progress of the sciences and the industries, certain classes of workmen have been most cruelly affected. In our times we may mention those of Belgian Flanders, whom the introduction of flax-spinning, added to other causes, reduced to poverty. (See *Etudes d'Economie Politique et Statistique*, by M. Wolowski; Guillaumin, Paris, 1848.) Because of these facts, writers have thought they must make out a case against new inventions, industrial innovations, and the general displacement of labor and capital. In whatever has been said, no one has thus far been able to refute the body of considerations which we have presented. We should add, many of the opponents of inventions and of industrial improvements used this theme to exaggerate the defects of present society, which they proposed to reconstruct from the foundation, and that it was to them a literary or scientific instrument, far more than an economic or scientific discussion. —To recapitulate: those who have rejected inventions have seen that they were obliged to oppose the increase of useful things, oppose economy in production, the attainment of a result with diminished effort; in short, to maintain the theory of poverty; and more than one has used faulty logic. But let us revert to the displacement of workmen. Means have been sought to remedy this evil, which, happily, is temporary and transient. Barbarians thought they could proscribe machines. The reader will hardly permit us to stop to consider this opinion. To reject machines is to reject every invention, every improvement, every innovation, every step forward. And, as every man thinks, invents and perfects more or less in his especial business, it would be necessary to decree immobility of intellect, the death of humanity. It is absurd: that is all. As for the rest, we join in Ricardo's remark (p. 241, M'Culloch's edition of Ricardo's works): "The employment of machinery could never safely be discouraged in a state, for if capital is not allowed to get the greatest net revenue that the use of machinery will afford here, it will be carried abroad, and this must be a much more serious discouragement to the demand for labor than the most extensive employment of machinery; for while a capital is employed in this country it must create a demand for some labor; machinery can not be worked without the assistance of men; it can not be made but with the contribution of their labor. By investing part of a capital in improved machinery, there will be a diminution in the progressive demand for labor; by exporting it to another country, the demand will be wholly annihilated." There are people who dare not go so far, and who propose to prevent or prohibit only certain inventions, perhaps the most complicated, or those which take the most work from the workman, or the newest. But if one should ask the authors of these propositions to themselves classify the inventions to be preserved or destroyed, to be allowed or proscribed, they would really not know how to reply. If steam is to be rejected, why not the power of wind or water? Why mills to grind the grain? Why stones? And would the plowshare, which does the work of ten men working with a spade, find favor? We are indeed, we repeat, still wholly absurd, and we must make haste to rid ourselves of our absurdity. But, do you ask what we must do? Let us first tell what has been proposed. —M. de Sismondi, the most serious opponent of machines, draws no definite conclusion. Only one may say that the logic of his criticism, inspired by honest feeling, but based on imperfect observation, leads to the abandonment of the division of labor, of machines, and of manufactures, and to a return to a patriarchal state of society, which M. Proudhon has defined as "the system of every one at his own abode, every one for himself, in the most literal acceptation of the phrase." M. Proudhon adds: "It is to go backward; it is impossible" J. B. Say had already said so to M. de Sismondi; but it is well to have it repeated to him by the harsh criticism of the Malthusians (*Contradictions Economiques*, 1st vol., iv., § iii.) — The communists and socialists reasoned thus: "Since the object of inventions is to render man as rich as possible with the least labor, since the natural agents must do everything for all, inventions ought to belong to the community." Then follow, as remedies for the evils attributed to inventions, the various new systems of social organization. It is not for us here to discuss these illusions. (See SOCIALISM.) — Another opinion arises from this, without being as logical: it is that of those who have proposed an association

machinery is *suddenly* discovered, and extensively used; but the truth is, that these discoveries are gradual, and rather operate in determining the employment of the capital which is saved and accumulated, than in diverting capital from its actual employment." (See, farther on, another quotation from the same author.)

of the inventors, proprietors and workmen. This is another utopia, which it would take too much time to discuss here; we confine ourselves to its mere mention. — It has been proposed that the workmen should be indemnified by the inventors, or by the capitalists and manufacturers who make use of the new inventions. Here arises at once a question of justice, property and rights. But, the question of justice aside, who does not know the uncertainties of new enterprises, the perplexities and mortifications of inventors and those who first apply the inventions! Should not these also have a right to indemnification? And then who, pray, would not have a right to complain of the wrong done him by any innovation, any improvement whatever? Has any one dreamed of the indemnities which would have been due for the application of steam, for the introduction of stages, canals or locomotives? — People can not insist on this order of ideas, and so they propose that the state be the chief indemnifier. But if one only means philanthropy and alms, we will remark, at the outset, that the state has no other pockets than those of its citizens, and that the most numerous class of citizens are the poorest We admit, however, that there may be a case in which humanity and prudence would recommend either the creation of public works to give temporary relief to the displaced workmen, or some other kind of assistance. These are precarious means; but there are no others; and the final conclusion of this matter is, that the bad effects of an invention being always exceeded by the social advantages it secures, will be so much the less felt by the workmen it displaces, as the industry prospers the more, and the unclassed laborers the more readily find again a remunerative occupation and are able, from previous savings, to provide for their necessities during stoppages. — In the number of means for contending with the disadvantages of inventions should then be found a general diffusion of the first principles of political economy, in the schools, by the aid of which the children, who will some day be workmen, would begin to comprehend the true nature of things, and would be fortified in advance against the prejudices which incite them later to hate and oppose inventions, or to depend upon chimerical means for subsistence. — V. *Conclusion* To recapitulate: the question of inventions is one of the most clearly resolved in political economy. — The right to invent, to improve, and to apply, is unassailable in itself. Moreover, its prohibition is impossible. — In the second place, society derives from every rational, mechanical, scientific, administrative or other change, more satisfactions for less effort, satisfactions which can be measured by the effective power of modern industries. — In the third place, the improvements made in the industries are not long in curing the individual evils, which sometimes, but not always, result from the displacement of labor and capital. These evils can not be compared with the advantages which counterbalance them, and they are so much the less as the industry is the more prosperous. — Finally, we can do no better than close with one of the observations with which we began, and we borrow the words of Bastiat: "There is a natural inclination in men to go, unless forcibly prevented, to a good market, that is to say, to that which, with equal satisfaction, saves them labor, whether this good market comes from a skillful foreign producer or from a skillful mechanical producer. The theoretical objection made to this inclination is the same in both cases. In both cases it is accused of paralyzing labor. Now labor rendered not *inert*, but *disposable*, is precisely what determines this inclination; and this is why, in both cases, it is opposed by the same practical obstacle, viz., force. The legislator *prohibits* foreign competition and interdicts mechanical competition: for what other means exist of arresting an inclination natural to all men, except to take away their liberty? In many countries, it is true, the legislator strikes at only one of these two kinds of competition, and contents himself with lamenting the other: this proves only one thing, which is that, in this country, the legislator is inconsistent. This need not surprise us: on a wrong road, people are always inconsistent; if it were not so mankind would be destroyed. Never have we seen and never shall we see a false principle carried out to the extreme. I have elsewhere said: Inconsistency is the limit of absurdity I might have added: it is at the same time the evidence of it." (Bastiat, *Ce qu'on voit et ce qu'on ne voit pas ;* Paris, Guillaumin, 1850. brochure in 16mo, p 49) Nothing can be more just than these words of our illustrious co-worker and friend. — The question of inventions did not engage the attention of Adam Smith; yet a part of his celebrated chapter on division of labor relates to this subject. J. B. Say contributed much to its elucidation, first in his *Treatise*, afterward in his *Course*, 1st part, chaps. xviii. and xix. See also the *Course*, by Florez Estrada, chap. ix.; the first lessons, by M. Michel Chevalier; the *Elements*, by M Joseph Garnier, etc. See also the pamphlet by M. A. Gasparin, often quoted above. Malthus and Rossi have said little on this subject. Ricardo has developed some particular points in his *Principles*, chap. xxxi. (See above.) Sismondi has only spoken of it in one very short chapter, devoted likewise to the effects of division of labor, which circumstance produces a certain confusion in his objections. Socialistic schools and political pamphleteers have, in turn, exaggerated the advantages or disadvantages of inventions M. Proudhon has, in *Contradictions Economiques*, given considerable attention to inventions. He is favorable to this species of improvement; he analyzes and combats the various means proposed to neutralize directly the displacement of workmen which a new invention may occasion. (See CAPITAL, DIVISION OF LABOR, FREE TRADE, INDUSTRY, MACHINES) JOSEPH GARNIER.

IOWA, a state of the American Union, formed from the "Louisiana purchase." (See ANNEXATIONS, I.) After the organization of the state of Missouri in 1820–21 (see COMPROMISES, IV.; MISSOURI), the territory north of that state extending to British America, and lying between the Mississippi and Missouri rivers, was neglected by congress until the act of June 28, 1834, made it a part of the territory of Michigan "for the purpose of temporary government"; the act of April 20, 1836, took it from Michigan territory, after July 3 following, and added it to Wisconsin territory; and the act of June 12, 1838, erected it into the territory of Iowa, after July 3 following. Oct. 7, 1844, a convention of delegates from the southern part of the territory formed a state constitution, claiming about the same boundaries as at present. This territory seemed to congress unreasonably large, and the act of March 3, 1845 (see FLORIDA), while admitting the state, assigned to it as a western boundary the meridian of 17° 30′ west of Washington, and as a northern boundary the parallel passing through the mouth of the Blue Earth river, in the present state of Minnesota; Iowa would thus have been about half as wide as at present, and slightly longer from north to south. The boundaries having been submitted to the people of Iowa, in accordance with section four of the act, were rejected by a vote of 7,235 for and 7,656 against it, and Iowa remained a territory. A convention, which met May 4, 1846, at Iowa City, formed a new state constitution, which was ratified by popular vote, Aug. 3. It defined the state boundaries as follows: "Beginning in the middle of the main channel of the Mississippi river at a point due east of the middle of the mouth of the main channel of the Des Moines river; thence up the Des Moines river to the northern boundary of Missouri; thence westward on that line to the Missouri river; thence up the Missouri to the Big Sioux river; thence up the Big Sioux to the parallel of 43° 30′ north latitude; thence east on that line to the Mississippi river and down the Mississippi to the beginning." A supplementary act of congress of Aug. 4, 1846, accepted the boundaries thus defined, and the state was finally admitted by act of Dec. 28, 1846. — The constitution of 1846 prohibited slavery, the loaning of state credit to individuals or corporations, the contraction of a state debt of more than $250,000 or county debt to more than 5 per cent. of its property valuation, and the granting of charters except by general laws; made the sessions of the legislature biennial and the governor's term two years; restricted the suffrage to white males; and fixed the capital at Des Moines. A new constitution, formed by a convention which met Jan. 19, 1857, and ratified by popular vote Aug. 3, changed none of the above particulars, and no change has since been made except that the word "white" was stricken out of it in 1868. — The political history of Iowa falls into two periods, 1846–54 and 1855–81. In the first of these the state was democratic in all elections, presidential, congressional and state, except that a whig congressman was chosen in one of the two districts in 1848. The general election of 1854 was the turning point between the two periods; in it the republicans succeeded in electing the governor, one of the two congressmen, a heavy majority of the lower house of the legislature, and came one short of a majority in the upper house. One result was the election of James Harlan to the United States senate. Since that time (1855–81) the democratic party has been practically a nonentity in the state. Until 1859 one of the United States senators (chosen in 1853) was a democrat, and in 1854 and in 1874 a democrat was chosen in one of the congressional districts; these, and from 20 to 40 of the 150 members of the biennial legislatures, have been the extent of democratic influence upon the politics of the state. The republicans have elected all the governors, United States senators and representatives (with three exceptions), and have maintained from 60 to 70 per cent. of the popular vote. In 1874 the democrats, taking the name of "anti-monopolists," succeeded in electing one of the nine representatives, in the northeastern or Dubuque district, by a majority of but 63 in a vote of 22,069; in 1878 two of the representatives, Weaver and Gillette, were "greenbackers," the former from the southern or Keokuk district, and the latter from the southwestern district of the state; but in all these cases the lost district was again carried by the republicans. (See PROHIBITION.) — This almost invariable regularity has operated very much to the disadvantage of the public men of the state. One party has always been careless, and the other party hopeless, as to the result of Iowa's vote; and the favors of the national parties have been reserved for the public men of states whose vote was more doubtful. Consequently, though Iowa has never lacked able men, their services have been better appreciated by the state than by the nation. Among them are W. B. Allison, republican representative 1863–71, United States senator 1873–85; Wm. W. Belknap, secretary of war under Grant (see ADMINISTRATIONS, IMPEACHMENTS, VII.); James W. Grimes, first republican governor of the state, United States senator 1859–71; James Harlan, United States senator 1855–65 and 1866–73, and secretary of the interior in 1865; John A. Kasson, representative 1863–7 and 1873–7, and minister to Austria 1877–81; Samuel J. Kirkwood, governor of the state, United States senator 1866–7 and 1877–81, and secretary of the interior under Garfield (see ADMINISTRATIONS); and George W. McCrary, representative 1869–77, secretary of war under Hayes, and appointed United States circuit judge in 1879. — The name of Iowa was given from that of its principal river, an Indian word said to mean *the sleepy ones;* but its popular name is *The Hawkeye State.* — GOVERNORS: Ansel Briggs (1846–50); Stephen Hempstead (1850–54); Jas. W. Grimes (1854–8); R. P. Lowe (1858–60); S. J. Kirkwood (1860–64); W. M. Stone (1864–8); Samuel Merrill (1868–72), C. C. Carpenter (1872

-6); S. J. Kirkwood (1876–8); John H. Gear (1878–82). — See Poore's *Federal and State Constitutions;* Plumb's *Sketches of Iowa* (1839); Parker's *Iowa as it is* (1855); Barber and Howe's *History of the Western States* (1867); Ingersoll's *Iowa and the Rebellion* (1867); Salter's *Life of J. W. Grimes;* the acts of June 12, 1838, and March 3, 1845, are in 5 *Stat. at Large*, 235, 742, and those of Aug. 4 and Dec. 28, 1846, in 9 *Stat. at Large*, 52, 117; Porter's *West in* 1880, 272.

ALEXANDER JOHNSTON.

IRELAND, an island on the western extremity of Europe, constituting a portion of the state known as the United Kingdom of Great Britain and Ireland, lies between the parallels of 51° 26′ and 55° 21′ north latitude and between 5° 20′ and 10° 26′ west longitude, Greenwich meridian. It is 306 miles long and 182 broad; its superficial area being about 32,713 square miles, or 20,808,320 British statute acres. The interior of the island is in the main a fertile plateau, but toward the shore on the south, west and north, rugged mountains rise irregularly to a height in some places of over 3,000 feet. The coast, on the west especially, is bold, and in many places precipitous; but is, on every side, except on the southern portion of the eastern shore, deeply indented with bays, fiords and estuaries, affording natural harbors of great capacity. The scenery is strikingly picturesque; in some parts of unsurpassed beauty. The southern and western counties, however, contain many tracts of bleak and desolate country. In the low-lying parts of the island there are vast areas of peat moors or "bogs," embedded in or beneath which are found the remains of primeval forests. There is historical certainty that more than a thousand years ago the island was richly timbered from sea to sea; but the destruction of the woods by the English power in the course of its five centuries of warfare with the natives, has left Irish landscape on the whole exceptionally bare of trees. There are numerous lakes; some of considerable size. The principal river, the Shannon, flows into the Atlantic on the western side of the island; the Lee, the Blackwater, and the combined Suir, Barrow and Nore reach the sea on the south coast; the Bann and the Foyle on the north; and the Slaney, the Liffey and the Boyne on the east. Of the cities and towns of Ireland, few can be deemed important as to size or commercial activity; the principal of them being Dublin, Cork, Belfast, Waterford, Limerick and Derry. The first named city is, as it has been since the reign of King John, in the thirteenth century, the national metropolis and seat of government. The country is politically divided into four provinces; these being subdivided into thirty-two counties.— The climate of the country is mild and genial; more moist than that of France or Britain, but much less rigorous than that of either in winter. Although coal, iron, copper, lead, silver and gold have at one period or another been mined in Ireland, shafts and adits of long-forgotten times being occasionally discovered, the mineral resources of the country, judged by practical experience, are poor. Manufacturing industries, unless on a very insignificant scale, are almost unknown, outside the province of Ulster; the great bulk of the inhabitants being engaged in agricultural pursuits. The population was, at the last census, 5,159,839; exhibiting a serious and steady decrease since 1841, when it was 8,175,124.* — Ireland is governed by a viceroy, subject to the imperial cabinet in London, and is represented in the imperial parliament by 103 members in the house of commons, out of the 652 who constitute that body. Out of 494 princes, peers and bishops, who sit in the house of lords, 28 are titularly Irish. — Few European countries are possessed of authentic historical data reaching to an age so remote as that to which the ancient records or memorials of Ireland in one shape or another extend. Like all old countries it has its fabulous and legendary periods; but reasonable certainty is attainable at a much earlier period in Irish history than it is in most other cases. The inhabitants of Ireland, of what may be called the native race, belong to the great Celtic family. For two thousand years past they have claimed to be pre-eminently "Milesians," that is to say, descended from an expedition of conquerors, led by the three sons of a military chief named Milesius, who, according to well received tradition, landed and subdued the country some ten or twelve centuries before the birth of Christ. But inasmuch as at least two distinct colonizations had previously been effected, and as the Milesians simply reduced their predecessors into subjection, and did not extirpate them, it is clear the general population in the course of time became more or less a combination of the new elements and the old. The Milesians originally came from a birthplace variously fixed in Persia, Syria and Phœnicia, and indisputably were of eastern origin. They were a race of soldiers and statesmen, conquerors and lawgivers. It was they who virtually organized and constituted the Ireland known to history for the last 1,500 years. The political system they established was a strange mixture of a republican monarchy and a military aristocracy. The country was divided into five sub-kingdoms, an Ard-Ri (literally high-king) being supreme sovereign. This chief-king was elected from the reigning family or dynasty; the electors being the clan chiefs, these latter in their own sphere being elected by the clans. A parliament or "feis" assembled triennially at Tard in which sat the princes, chiefs, judges, high priests, brehons and bards of the whole nation. This legislative body, one of the earliest known in history, revised the old laws and enacted new ones, very much as modern senates and assemblies do. On the introduction of Christianity by St. Patricius or Patrick in the fifth century, the existing code of laws was referred to a commission, consist-

* It is calculated that in 1847 the population was about 9,500,000.

ing of one chief, one brehon and one Christian bishop, with a view to purging it of pagan ideas and adapting the statutes of Erin to Christian principles. The body of laws thus revised and codified are now, by order of the British government, being translated and published, as a rare and valuable treasury of ancient jurisprudence, parliament making an annual grant for the purpose ever since 1852. — Such was the constitution and polity which prevailed in Ireland down to the sixteenth century, a period of more than 2,000 years. From about the year 200 B. C. to A. D. 800, the Ireland of ancient history may be said to have attained its zenith of power and reputation. In the three centuries which followed the introduction of Christianity, the country was pre-eminently the great centre of scholastic and missionary enterprise in western Europe. To its free schools and universities flocked students from every part of christendom, and Irish missionaries and teachers spread throughout the known world. With the incursions of the fierce and savage Northmen or Danes, plundering and desolating hordes of pagan marauders, which began about the close of the eighth century, commenced the disorganization and wreck of the Milesian nation. These hordes, just then the scourge of western Europe, never were able to conquer the country as they did the neighboring island of Britain; but an intermittent war of utter barbarism, prolonged through 300 years, utterly demoralized it, and almost extinguished a civilization that had been the light of western Europe in its time. From A. D. 900 to A. D. 1170, with the exception of a brilliant interval of a few years under Brian I., who broke forever the Danish power, disintegration rapidly made way. The idea of a common national interest or a central national authority was almost totally discarded. Each sub-king fought for his own hand, and the post of Ard Ri was claimed by various competitors in reckless and exhausting contests that bathed the land in blood. — Meanwhile, England, that had yielded more or less easily to every invader, Saxon, Dane and Roman, once more received a new yoke. Its new conquerors were the Normans, who, fortunately for its future welfare, were strong enough to weld, albeit by ruthless process, the Danish, Saxon and British kingships and communities of England into a single political system. By the middle of the twelfth century the Normans had well consolidated their new kingdom, while Ireland had been steadily breaking into fragments. One of the Irish sub-kings, MacMurrough, prince of Leinster or Lagenia, revolting against the Ard-Ri, who had indeed deposed him, applied to Henry II. of England for help in his quarrel. Henry gave him permission to seek auxiliaries or mercenaries among the Norman English knights and free-lances. One of these, surnamed Strongbow, accepted MacMurrough's terms, and swiftly landing a powerful force on the Leinster shore, succeeded in restoring him to his principality. These Norman adventurers, brave, skillful and highly disciplined, saw a splendid opportunity for pushing their fortunes in the distracted and faction-torn condition of Ireland. They helped now one chief, now another, always on terms of payment highly advantageous to themselves, and soon their marvelous success and their daring ambition excited the jealousy and anger of King Henry. He called on them to return to England. Strongbow made various excuses for disobeying, and Henry, to the great satisfaction of the Irish princes, announced that he would proceed to Ireland in person to investigate the conduct of the Norman adventurers. He did so come to Ireland, and at once assumed the rôle of arbitrator or authoritative regulator of affairs, civil and ecclesiastical, pretending, as to the latter especially, that he had got a bull from his countryman, Pope Adrian, commissioning him to restore order in Ireland. The Irish princes did not quite realize all that this exercise of quasi-friendly offices involved, until long after Henry had returned to England. When they did, that is to say, when they found the Norman auxiliaries, one of their own body, converted into the garrison of a foreign king, they were dismayed. Some at once resisted; others diplomatized; a few submitted. Some felt the reality of the change; others did not. For centuries after the so-called "conquest" by Henry II., most of the native chiefs ruled their principalities or made war on one another, just as they did before a Norman had set foot on the Irish shore. Fitfully but gradually the Anglo-Normans pushed their power; but it was not until the close of the sixteenth century, or more than four hundred years after Henry's landing, that the struggle of native Irish sovereignty against English rule closed in the tacit surrender of Ireland to James I. — During the latter half of the last century of the above period, a new element of antagonism was imported into the conflict. Religious animosity was added to race hatred and national hostility. The English peers and people followed Henry VIII. into the reformation; followed Queen Mary out of it, and Queen Elizabeth into it again. The Irish, on the other hand, clung more devotedly than ever to the Catholic faith; a circumstance of contrast which has largely contributed ever since to keep the two peoples distinct, and which, allied with race influences and national traditions, marks each with a separate individuality. With the reign of James I. began the political system which, with little variation, still exists in the union of Ireland under one crown with Scotland and England. England came in by succession to the Scottish king, and by a remarkable coincidence or concurrence Ireland at the same moment virtually surrendered to the sovereignty of a Gaelic prince, sprung from a race kindred to its own. Throughout the whole Stuart period, from 1600 to 1700, the national feeling and actions of Ireland, with a loyalty fatal to Irish welfare, were displayed on the side of the dynasty thus accepted. In the

victorious rebellion of the English republicans against the duplicity of Charles I., as well as in the still more successful English revolt against the despotism of James II., the Irish remained steadfast to the royalist cause; and, in the result, paid a dreadful penalty for such disastrous fidelity. The soil of the country was declared forfeit by the existing owners, and was parceled out as spoil among the soldiery of the Cromwellian and Williamite armies; hundreds of thousands of acres were bestowed on the mistresses and on the natural offspring of William and the early Hanoverian kings, while the native gentry, beggared and homeless, were banished and proscribed, and the general body of the people reduced to a condition little short of outlawry. Under what is known as the "penal code" from 1700 to 1775, the bulk of the population were forbidden to educate their children, to attend religious worship, to carry arms, to learn a trade, or to hold property. The schoolmaster and the priest had each a price on his head; and statutes of George I. and George II. went so far as to make it felony to send an Irish child abroad to receive the education forbidden at home. There was one circumstance, which, apart from the shocking barbarity of the "penal code," has made it rankle in the breasts of the Irish to the present hour; namely, that it was laid upon them in flagrant violation of a solemn treaty signed between the English and Irish commanders, duly countersigned by royal commissioners on king William's part, at the close of the Williamite struggle in 1691. Although the splendid army of Scandinavians, Dutch, Swiss, Prussians, Huguenot-French and English, which the prince of Orange led into Ireland, had defeated the raw levies of the Irish royalists at the Boyne, and, more by happy accident than generalship, driven them from their position at Aughrim, he was again and again defeated before the walls of Limerick, which city was defended by Gen. Sarsefield, in command of the Irish armies of King James.* At length, William, who was a brave soldier and a statesman, saw the wisdom of arranging terms with such a foe; and accordingly, on Oct. 3, 1691, articles of capitulation were negotiated, whereby the Irish army, retaining its arms, colors, bands and transport stores, marched out with the honors of war, free either to enter the service of King William or to sail for France where King James now resided as guest and ally of Louis XIV. The "civil articles" of the treaty of Limerick stipulated, in substance, that there was to be no proscription, no confiscation, no disarmament, and that the exercise of the Catholic religion should be as free as it had been in the reign of King Charles II. After the rough draft had been agreed upon, but before the fair copy was signed by Gen Sarsefield, the arrival of a French fleet with considerable aid in men, money and stores was announced to the Irish commander, and he was entreated not to sign the treaty; he replied, sorrowfully, that the news reached him an hour too late, that his honor and the honor of Ireland were pledged, and should not be broken. No sooner, however, had the Irish army sailed away to France than the treaty covenants, despite the protests and endeavors of King William, were cast to the winds. Angered at the idea of having no spoil by confiscation to divide, the anti-Stuart faction, now dominant in the Irish parliament, refused to approve the king's treaty, and, by stopping the supplies, compelled William to yield. Thereupon commenced the proscriptive legislation, known as the "penal code." The more severe these enactments grew, the more alarmed the dominant party became lest the Irish masses should rebel against them; and thus further and further severity was deemed necessary, as repression and alarm acted and reacted on one another. As a matter of fact, not even during the memorable Scottish risings of 1715 and 1745, which so nearly restored the Stuart line, did the Irish at home give pretext or justification for such a policy. The self-expatriated Irish battalions, however, now serving as an Irish brigade in the service of France, took heavy reprisals on the English power, confronting it on every battle-field, and deciding by their impetuous valor the fortunes of many an eventful day. At Fontenoy, fought May 11, 1745, by a French army of 45,000 men under Marshal Saxe, in presence of the king and the dauphin, against an English force of 65,000 men under the duke of Cumberland, victory was snatched from the British commander at the close of the day by a decisive charge of the Irish regiments. It was on the arrival of the dispatches which announced the fate of Fontenoy, that George II., much of a soldier and little of a bigot, is said to have exclaimed, "Curse upon the laws that deprive me of such subjects."—In the minds of many besides King George, a reaction against the terrible rigor of the "penal code" had, by this time, set in: and events were drawing near, which rendered its continuance impossible. According to the political constitution, which the Anglo Norman sovereigns conferred on their colony in Ireland, that country was annexed to the British crown, but not placed under the legislative action of the English parliament. On the contrary, it had a parliament of its own, supreme as to Irish affairs. When Henry VII. was strengthening his royal prerogative and generally centralizing his government, he had a statute passed by a subservient Anglo-Irish parliament at Drogheda, known as "Poynings Law," rendering the Irish parliament subject to the control of the English legislature The unconstitutionality of this law was always asserted, and "Poynings Act" was disregarded by Irish parliaments in the reigns of Charles I., Charles II. and James II. The Williamite parlia-

* A worthy counterpart to this defense of Limerick was the heroic conduct of the Protestant Williamite garrison and population of Derry, who, despite the most cruel privations, gallantly kept the city against a Stuart-Irish besieging force, until the arrival of a relieving expedition.

ment in London, however, from the first claimed the power to bind Ireland; a claim from time to time contested by jurists and public writers on the Irish side, who, though thoroughly Protestant, and attached to the new dynasty and the English connection, vehemently repudiated the idea of such subjection in legislative matters. The dispute was embittered by the manner in which the London government repressed Irish trade and manufactures. An address to William III., from English manufacturers, complaining of too successful Irish competition, elicited from that monarch a remarkable promise that "he would do all that in him lay to discourage manufactures in Ireland." This royal pledge unhappily was only too well fulfilled. The Irish parliament of 1719, in the midst of its penal legislation against the conquered Catholics, openly resisted the doctrine of subordination. The Irish house of lords forbade the sheriff of Kildare to execute a decree of the English peers; whereupon the latter body retaliated by reaffirming "Poynings Law" in still more galling terms. The controversy, with little respite, went on up to 1775, when there rolled across the Atlantic a tocsin of liberty in the echoes of Bunker Hill. By this time a patriot party had appeared in the Irish parliament, a parliament in which no Catholic was allowed to sit, led by Lord Charlemont, Lord Kildare, Flood, Hussey-Burgh, Sir Lucius O'Brien and Ponsonby, later on by the man, the splendor of whose fame truly illumines this page of Ireland's history, the illustrious Henry Grattan. Encouraged by the conduct of the American colonists, they grappled boldly with the oppressions and corruptions of the government; their earliest efforts being devoted successfully to the liberation of Irish trade from the fetters that had crippled and well nigh destroyed it. They next claimed the restoration of the ancient freedom of the Irish parliament. King George and his cabinet resisted while they could, but the concession was inevitable. Sorely straitened by the effort to subjugate Washington and his colonial levies, the London government had to withdraw the troops from Ireland, which was now garrisoned and guarded by a national volunteer army of 150,000 men. The volunteers, who were citizens as well as soldiers, enthusiastically sustained the movements of Grattan. A thoroughly national spirit was aroused through out the island. The long-oppressed Catholic millions clasped hands with the long dominant Protestant colony or garrison. With the capitulation of the British armies to Washington and the recognition of American independence, vanished the last hope of successfully combating the Irish demand for a free parliament. A solemn treaty, in the form of a statute of the British parliament, 22 Geo. III., chap. 28, renounced "forever" the usurpation of "Poynings Law," and covenanted that the ancient constitutional right of Ireland to be bound only by laws of a free Irish parliament should henceforth be "unquestioned and unquestionable" The effect of this measure of national liberty seemed to be magical. In the ten years that followed, Irish trade and commerce expanded in a degree never known before or since. The spirit of tolerance also for a moment prevailed, and some of the most grievous of the penal laws were repealed. The country seemed to go forward on the road of progress by leaps and bounds under the guardianship of the free parliament won by Grattan and the volunteers. This great victory, as well as the previous recovery of commercial freedom, was long retarded by the restricted franchise and anomalous usages under which the parliament of the period was returned The representation of many boroughs was literally owned by aristocratic proprietors; and presentation to a seat in the house of commons was bought and sold like any other marketable title or commodity. The national party under Grattan now directed their attention to a reform of a system so fatal to public liberty. The British minister, on the other hand, the American war being over, had his hands free, and he determined to maintain a system which would enable him in a few years, by the expenditure of money in purchase of seats, to subvert all that Grattan had accomplished and overturn the treaty arrangement of 22 Geo. III , chap. 28. The struggle progressed for seven years with increasing earnestness on each side, when suddenly an event occurred which threw the great game totally into the hands of the British minister and swept the Irish popular party into a situation that proved disastrous. The French revolution of 1789 burst forth like the blaze of a tremendous conflagration. The governing classes all over Europe were stunned with horror and dismay. The friends of popular liberty hailed the event with joy. In Ireland, the property classes, flinging all other considerations aside, rallied to the side of governmental authority, so as to strengthen the bulwark against republican principles. The government, thus re-enforced, at once assumed a stern and haughty attitude toward anything in the nature of popular discontent or democratic manifestations. The Irish national reform movement, after struggling for a few years with such a state of things, eventually broke to pieces; its leaders differing widely on the new doctrines or principles launched in Paris. Some sided with the government, rather than embarrass the arm of authority at such a moment; others were for pushing the movement forward on still broader lines; while many, Grattan himself included, retired from the scene, as if foreseeing what was about to happen. The advanced section, driven from their open movement, all aflame with the new gospel of liberty, equality and fraternity, and infuriated by the English minister's design of betraying or subverting the settlement of 1782, enrolled themselves in a secret revolutionary conspiracy for the overthrow of British rule in Ireland. Although their main reliance was naturally on the bulk of the population, who were Catholics, the original founders

and earliest adherents of the enterprise were Protestants; chiefly Ulster Presbyterians. Later on, men of all religious creeds, and unquestionably men of the purest motives and loftiest character, embraced the design. Lord Edward Fitzgerald, son of the duke of Leinster, was at the head of affairs; its ablest organizer, Theobald Wolfe Tone, being stationed in Paris as accredited agent or ambassador to the French directory. The government early discerned the advantage which an abortive insurrection would give them in persuading the property classes to "draw closer to the centre of power and authority" by consolidating the parliaments; and for a time the proceedings of the revolutionists were viewed with secret satisfaction. By the end of 1796, however, this feeling gave place to alarm when it was found that the French directory had determined seriously to assist the Irish party. This determination was made plain by the dispatch of a powerful expedition under Gen. Roche toward the close of the year. A storm dispersed Roche's flotilla, only a few vessels of which reached the bay of Bantry on the southwest coast of Ireland. The government now sought to force the hand of Lord Edward, by compelling him to take the field before another expedition could be prepared. To this end "martial law" was proclaimed, and shocking means were used to goad the populace quickly into a rising. While it was yet uncertain how far these tactics would succeed, an overwhelming blow fell on the revolutionary party. Their central council or directory were surprised and seized in the very act of deliberating on the question of immediate operations; and a few days subsequently Lord Edward was captured, after a desperate struggle, in which he was mortally wounded. Less by concerted action than as an impulse of desperation, the insurrection now broke forth in four or five of the Irish counties—Antrim, Wexford, Wicklow, Kildare and Carlow. In Wexford the outburst was almost entirely the result of the forcing process above referred to. The people, half-armed and wholly undisciplined, took the field in rude array. Destitute as they were of military leaders, equipment or resources, they nevertheless through several months fought a fierce campaign which the entire available strength of the government forces barely sufficed eventually to subdue. Like all other bursts of popular passion this rising was marked by some lamentable excesses; or rather, in a struggle in which "no quarter for rebels" was the watchword on the one side, and in which discipline in the popular camp could be but slender, episodes of savage vengeance were in a sense inevitable. The rising in Ulster had been quickly and easily suppressed, and all the other counties of Ireland lay quiescent during the Wexford revolt. Disaffection and desire to rebel was intense; but a conviction prevailed that insurrection single-handed against Great Britain must absolutely fail, and another French expedition was expected. When it did arrive, under Gen. Humbert, who landed at Killala in the northwest of Ireland in August, 1798, with a force of a little over 1,000 men, the government was flushed with victory and the populace utterly overawed. Humbert defeated a force of nearly 5,000 opposing British troops at Castlebar; but eventually had to surrender to an overwhelming force under Lord Cornwallis. The after-scenes of this insurrection were barely less tragic than the struggle in the field. The scaffold and the executioner long plied their dreadful work, completing what the fusillade began. It was at such a moment Pitt produced his long meditated scheme for breaking the treaty of 1782, and abolishing the Irish parliament. Even amid the gloomy horrors of 1799 his proposal was at first defeated in the Irish parliament; the constitutional nationalists under Grattan, Curran, Charlemont, Parnell, Ponsonby and Plunkett making a last desperate effort of resistance. By the next year, however, Pitt had expended nearly £2,000,000 in buying up what were called "proprietary boroughs," and otherwise purchasing votes sufficient to secure a majority, and in 1800 his scheme of "union" was carried through. By this time Bonaparte had become the terror, as he subsequently very nearly became the conqueror of Europe. England alone successfully defied and victoriously encountered him. On English soil alone it may be said constitutional government for the time dared to exist in the old hemisphere. For fifteen years all other political issues seemed abandoned or forgotten in view of the titanic struggle which culminated and closed at Waterloo. Beyond a madly hopeless attempt of the youthful enthusiast, Robert Emmett, in 1803, to renew the insurrectionary enterprise of 1798, Ireland may be said to have lain sullenly dormant, through the eventful years that saw the meteoric course of Napoleon. When next an Irish question challenged public attention, new elements of political power, new leaders, new tactics, came into view. Hitherto the Irish Catholics, nine-tenths of the population, being forbidden the rights of citizenship, had to depend for public advocacy on those noble-minded Protestants, like Grattan and Curran and Parnell, who, from a pure love of justice, espoused their cause. The Ireland which had legal or political existence in the eighteenth century was merely the handful of Anglo-Irish Protestants settled in the country. The millions of Celtic bondsmen around them counted for nothing in the state, except as material for taxation. The bondsmen now arose and strode into the political arena to determine their own fortunes. The political Ireland that appeared with the nineteenth century was a Celtic Ireland; or, rather, an Ireland that excluded none and embraced all Irish-born men of whatever race or class or creed. The question of Catholic emancipation had early enlisted the efforts of Grattan and other of the Protestant patriot leaders in Ireland; and even in 1799 had made such way in England that Pitt pledged

himself to make it one of the first measures the united parliament would pass. George III. absolutely refused, however, to entertain the question, and it was put aside. Forth from the ranks of the Irish Catholics there came a leader of their own race and faith destined to make king and cabinet alike feel his power. This was Daniel O'Connell, who, for nearly half a century, was the foremost political figure in Irish history. He aroused and combined the masses of the people; he covered the country with the network of a vast organization, and soon six millions of people, fired with enthusiasm and determined to be free, were disciplined to obey his will. The government sternly combated the movement; forbade it, proclaimed it, persecuted it, punished it—all in vain. O'Connell was no sooner suppressed in one shape than he reappeared in another. Again and again the king and the government declared that no concession could be made to demagogues and agitators; that the law would be vindicated, and established institutions in church and state upheld. Although no actual outbreak occurred, the state of affairs in Ireland was critical in the extreme. In 1829 the duke of Wellington, who had taken office expressly on a pledge of opposition to emancipation, announced to the king that it was a choice between its concession or civil war, civil war in which a vast body of English popular opinion would side with the Irish people and in which the Irish regiments of the army dare not be called upon to act against their countrymen. King, cabinet and parliament forthwith saw the question in a new light, and the penal code was in effect expunged from the statute book. From this period may be said to date a series of efforts on the part of British statesmen to grapple with the more prominent or pressing of Irish grievances; seldom or never, however, until popular complaint of them, long neglected or resisted, had developed into disorder, disaffection and violence. Between 1829 and 1835 the country was convulsed with a struggle against "tithes." The Protestant clergy were authorized to levy on the agricultural inhabitants, nearly all of them Catholics, a tenth of the produce of the land. After three or four years of stormy agitation, disfigured by deplorable outrage and violence, the people at length combined in a national "strike" against tithes. This proved effectual. A law was passed abolishing tithes in form; that is to say, adding them to the landlords' rent, and compelling the landlord, to whom the amount was paid in rent, to pay it over to the clergy *minus* 25 per cent. for the trouble of collection. These victories encouraged O'Connell to undertake an enterprise more serious and more formidable than any he had yet attempted, namely, an endeavor to recover the separate parliamentary constitution of Ireland subverted by Pitt in 1800, or, as it was called, to "repeal the union." The Irish masses were now full of confidence in the ability of their leader to accomplish anything he took in hand. Their social and physical condition was still painfully low. The grinding exactions of exorbitant land rent left the agricultural population, as a royal commission of inquiry under Lord Devon declared them to be, "the worst housed, the worst fed and the worst clad peasantry in Europe." They retained, however, the hopeful buoyancy of their Celtic nature, and the marvelous success of the total abstinence or "temperance" movement under Father Mathew (a Catholic priest of Cork city) had enormously elevated their *morale*. The abolition of the Irish parliament in 1800 had at the time been vehemently resisted by the ultra-Protestant party in Ireland; but when, in 1840, O'Connell, the Catholic leader, took up the question of its recovery, it was found that their attitude had totally changed. The parliament and the nation which they had contended for was one from which papists were excluded. So far from favoring legislative restoration now that the Catholics had been emancipated, they ardently implored the government to maintain the union, and not to deliver them up to "popish ascendency." O'Connell's movement, therefore, though it was sustained by more than three-fourths of the people of Ireland, encountered from the outset the mistrust, the dread or the hostility of the Irish Protestants. The full power of England was pledged to oppose it as an attempt to dismember the empire. The Irish leader found himself in a critical position. The government, so far from yielding to the popular demand, plainly meant to encounter it by force. Were England engaged at that moment in any serious foreign complication, concession would have been inevitable. But never in her history was she more great, more powerful or more strong. She was at peace with all foreign nations, and, possessed of a giant's strength, was ready to use it in stamping out once and forever this dangerous Irish idea of national autonomy. O'Connell's embarrassment was all the greater because there had now grown up around him a race of young men who scorned his exaggerated love of the peaceful ways of moral suasion, and who held the lawfulness of Ireland recovering the rights she claimed by armed resort if practicable. This conflict between the "moral force" and "physical force" principles of what were called respectively the "Old Ireland" and "Young Ireland" parties, rent the great Irish movement in twain. In the midst of the controversy there fell on the country a calamity that buried all political thought or effort for the time. This was the Irish famine of 1847-9. In the autumn of 1846 the potato crop, which formed almost the sole support of the population, was struck with blight and rotted in the ground. All could see the awful consequences that were at hand; yet the action of the government was disastrously tardy, circumlocutory, blundering and impotent. The people perished in hundreds of thousands amid scenes of anguish and horror beyond human power adequately to portray. Howsoever cul-

pable the inefficient action of the government in coping with the difficulty, the conduct of the English people was truly noble. They poured princely subscriptions into the treasuries of various relief associations, and did the best that private effort could achieve to mitigate the dreadful affliction. Nearly every country in the world joined in the Samaritan endeavor; but foremost and first—far outstripping all the rest, England included—was the land that long had been the free asylum and happy home of expatriated Irishmen, the United States of America. — O'Connell died, aged and heart-broken, in May, 1847. In February, 1848, revolution in Paris once more sent the impulse of insurrection through Europe; and once more Ireland yielded to its influence. The Young Ireland party took the field, or rather vainly attempted to do so, under William Smith O'Brien. The leaders of this abortive movement were everything but good revolutionists. They were men of genius, poets, scholars artists, orators; men of the purest and loftiest aims, fired with the generous enthusiasm of youth, maddened by the famine scenes around them. But they were utterly incompetent as military conspirators, and their attempt broke down on the threshold. It cost Ireland, however, a heavy penalty in the dispersion of a school of intellectual culture and activity, even the early-checked labors of which have left a deep imprint on the literature and the politics of that country. There followed upon the famine of 1847 and the abortive insurrection of 1848, a period of utter prostration. To the dreadful havoc of the famine there was now added wholesale eviction and expatriation of the ruined tenantry. In many parts of the island "clearances," as they were called, swept away the entire human population of the district, in order that vast bullock-ranges, sheep runs or grouse-moors might take the place of homesteads and villages. The human suffering involved in this policy can only be estimated by those who know how passionately the Irish peasant clings to the spot, however humble, which has been the birthplace and the home of his forefathers. In truth, the eviction scenes of that period, 1849 to 1860, rendered inevitable the events that have convulsed Irish society for the last twenty years. Hundreds of thousands of the eviction victims perished by the roadsides or in the pauper barracks. Other hundreds of thousands fled or were deported to America. They went with bursting hearts, ready to embrace any enterprise, no matter how wild and hopeless, that promised vengeance on the power that had driven them forth. As early as 1858 some of the exiled Young Ireland leaders conceived the idea of utilizing for revolutionary purposes this feeling on the part of the American Irish. The result was the organization of the Fenian conspiracy by Mr. James Stephens and Col. John O'Mahoney. Keenly alive to the causes of failure in 1848, the Fenian leaders aimed at careful preparation and extensive military organization. Notwithstanding the strong opposition of the Catholic clergy, and the dissuasions or protests of those nationalists who believed insurrection impracticable and mischievous, they pushed their enrollment with intense ardor and earnestness, and succeeded in establishing the most wide-spread and formidable revolutionary movement known in Irish history since 1798. In armament they were utterly deficient, but their organization and discipline were on the whole remarkably perfect. The government throughout was kept well informed by its spies in the conspiracy, and in 1865 swooped suddenly down on the leaders in Dublin, seizing the subordinates simultaneously all over the country. The organization never recovered from this fatal blow, although for fully two years subsequently it made desperate and persistent efforts to reconstitute itself, and at length, in March, 1867, gave the signal for a national uprising. The moment the long formidable secret society came out into the open, its great spell was shattered. It was found to be just as deficient as the much-blamed Young Ireland movement of 1848 in the most elementary conditions of military existence. The fortitude, devotion and heroism exhibited by its members in the dock and in the dungeon enlisted for them the sympathy of thousands who had condemned that enterprise; and even among English statesmen the feeling spread that the Irish question must be dealt with by remedial, not by repressive, measures. Mr. Gladstone, as leader of the liberal party of England, gave eloquent expression to this conviction; and announced that, to begin with, the Irish state church, as a badge of conquest and an oppressive burden, must be swept away. In the general election of 1868 he was returned to office with an enormous majority, and, well fulfilling his promise, he forthwith carried through parliament an act for disendowing and disestablishing the Irish Protestant state church. Practically, the measure was one of disestablishment alone; for as to endowment, he was able so skillfully to arrange the financial portion of his scheme that not a shilling less income than before was secured to the church. This reform he followed up in 1870 by an act which aimed at settling the still more important and much more exigent question of land tenure in Ireland. The latter attempt fell lamentably short of the real necessities of the situation; a shortcoming which occasioned great disappointment Meanwhile, in the twelvemonth that followed on the disestablishment of the church, there ensued the most remarkable transformation ever witnessed in Irish politics. The Protestant "conservative" party—peers and commoners, land lords, merchants and aristocrats—reached out hands to the Catholic millions, and openly offered to join them in a national movement for the restoration of Irish parliamentary independence. This, no doubt, was in some degree through resentment on their part against England for selfishly throwing them over and repealing the union between the churches. But it was also

largely through genuine conviction that a wise compromise between total separation by rebellion, and national extinction by the domination of the London parliament, ought to be presented to a people so plainly determined not to acquiesce in the existing state of things. Mr. Isaac Butt, an Irish Protestant barrister of great eminence, may be said to have negotiated the remarkable alliance or fusion of parties, creeds and sections, which, under the name of the "Irish Home Rule Association," made its appearance in 1870. The programme of this movement was, on the one hand, reconciliation between Catholic and Protestant Irishmen, between peers and peasants, liberals and conservatives; and, on the other, reconciliation between Ireland and England, on the basis of a federal union, whereby Ireland should enjoy such legislative and administrative autonomy as is possessed by a state in the American republic. Even among the Fenian or separatist party this experiment was favorably regarded as presenting the minimum of a satisfactory compromise, and in a few years the movement took such hold on Irish public opinion that, tried by every test known to constitutional countries—parliamentary, municipal and township elections—the national will has, ever since, year by year, with more and more determination declared itself for "Home Rule," as the scheme is called. In 1872 the old system of election procedure was replaced by ballot-voting, whereby for the first time the Irish people were enabled freely to manifest their views in the election of representatives. In the next following general election of members to the imperial parliament in 1874, the home rule party carried fifty-seven out of one hundred and three Irish seats. In the elections of 1880 they carried sixty-five, and it is computed that on the next occasion they will return at least seventy five or eighty members. Despite the strong parliamentary majority from Ireland in favor of national autonomy, the cabinet of Mr. Disraeli in 1874, and down to 1880, backed by their powerful following in parliament, imperiously refused every measure of reform or amelioration which the Irish party demanded. With especial earnestness and perseverance the Irish members year by year besought the government to deal with the land question as one which might any day lead to a catastrophe. Their warnings were disregarded; their efforts at remedial legislation were haughtily overborne by enormous majorities of British and Scotch votes. In 1878 the harvest was a failure in Ireland and in England. In 1879 it was almost a total loss in the former country; and a gloom of terror darkened the land. A repetition of 1847 seemed at hand. Now, however, there was seen a startling change in the spirit and action of the people, as compared with their conduct in that year. In stern and resolute tones they announced that the subsistence of a toiling population was a first charge on the land, and on the earliest whisper of landlord preparations for a gigantic eviction campaign, the whole island sprang to action with a cry that the hour had come when feudal landlordism must fall. Throughout 1880 and 1881 there raged in Ireland a fierce and implacable social war, with such evil concomitants of incidental disorder, violence and outrage as usually attend upon popular convulsions Mr. Gladstone and the liberal party were restored once more to power by the general election of 1880 In 1881 the great English statesman took the Irish question in hand; bringing in a coercion bill in January, and a land bill in April of that year. The former added fuel to the flame in Ireland, by its Draconian severity, exceeding anything known outside of Russia. The land bill, on the other hand, was a measure of noble and comprehensive character. It did not "disendow and disestablish" Irish landlordism, but it stripped it of the despotic power it had so mercilessly and disastrously used in the past. Justly irritated by the coercion act, and bitterly disappointed that the new land law did not wholly abolish landlordism, the Irish tenant-farmers at first received the latter measure in a sullen and almost hostile temper. The disposition manifested by Mr Gladstone, however, in 1882, to supplement its beneficent provisions wherever needful, and the growing conviction that the measure could be worked so as to accomplish before many years the gradual establishment of a "peasant proprietary," may be said to have brought the people of Ireland to recognize in the land act of 1881 a charter of liberty and a guarantee of a peaceful and happy future. — The character, temperament and habits of the Irish people have naturally been influenced by the vicissitudes of their stormy history. Among the peasantry the regretable effects of their furtive life in the penal times can even still be discovered in various ways. It is only within the past half century that the two races—the Anglo-Irish and Celtic Irish—have fused in any marked degree. The people are brave, naturally quick-witted and intelligent hardy, laborious, inured to toil, patient in privation, hospitable, warm in their affections, devoted in their fidelity to friends; but dangerously fierce and quick in anger, easily aroused and quickly allayed Their deeply religious fervor and their passionate love of country are perhaps the most prominent traits in their character. In public life they are capable of great achievements under the influence of enthusiasm, hope or confidence; but are impatient of results, exhibit a lack of plodding perseverance and cool, methodical action. In fine, the buoyant and volatile temperament of the Celt largely prevails; yet their more extensive intercourse with other peoples of late has considerably developed in them a steadiness and seriousness of purpose which has attracted general attention. Since 1830 education has made great progress among the Irish people; and their material condition has on the whole been vastly improved; but the start was from a point painfully low. It must be long before they can fully recover from the dreadful

effects of those not remote centuries during which education was "felony by law." Throughout the period that gave to English literature the works of Spenser, Shakspeare, Milton, Bacon and "Rare Ben Johnson," of Dryden, Pope and Addison—the period during which it may be said the intellect of the modern English nation was being formed and cultivated and its civilization moulded and refined—Ireland was having the eyes of the mind put out, and intellectual blindness and habits and tastes of barbarism forced upon her. That dreadful policy has been abandoned, and at length the Irish race are being allowed access to the blessings of education. Between 1831 and 1840 a system of primary schools was established by the government, which, although ill recommended in many respects to popular confidence and favor, has been almost universally availed of; it may now be said that in every cottage in Ireland the school and the printing press have wrought or are working a marvelous revolution. — Despite all disadvantages, Ireland makes a goodly show on the roll of scholars, poets, authors, *savants*, soldiers and statesmen of the world. Swift, Goldsmith, Sheridan, Moore, Banin, Griffin, Carleton and Lever, in literature; Burke, Grattan, Curran, Plunkett, Richard Lalor Shiel, O'Connell, Duffy, Magee (bishop of Peterborough), Butt and Lord Dufferin, in oratory, statesmanship and politics, are familiar names. In the last generation Wellington, and in the present the only two capable generals England has in command, Sir Garnet Wolseley and Gen. Roberts, have been contributed by Ireland. Hogan, Foley, McDowell and Farrell, as sculptors; Maclise and O'Connor, as painters; Balfe and Wallace, as musical composers; Prof. Tyndall and Dr. Haughton, as scientists—all Irishmen, are honorably known. The two most competent historians of our own times in the English language, Mr. Lecky and Mr. Justin McCarthy, are Irishmen. In the camps and courts and cabinets of friendly foreign states, from Vienna to Madrid, and from Paris to St. Petersburg, men of Irish race have long been marked to eminence and fame. Finally, it may be said that the labor, industry and enterprise of Irishmen have largely contributed to the prosperity and power of those comparatively new states in the western and southern hemispheres that promise to exercise potential influence on the future of the world. — (See GREAT BRITAIN.) THE TEMPLE, LONDON.

ITALY, Kingdom of. I. *Unification.* The kingdom of Italy has an area of 114,296 square miles, with a population of 28,200,000 (26,801,154, census of 1871), or 237 inhabitants to the square mile, with an increase of 7.1 per cent. every ten years. On Dec. 31, 1861, the average population per square kilometre was 84, with an excess of males over females in the proportion of 1,000 to 996. In 1882 the population per English square mile was 248. We shall relate succinctly the events which preceded the establishment of the kingdom of Italy, up to the time of Rome becoming the capital. Before 1859 the provinces which now compose this kingdom were grouped into several states After a fortunate war with Austria, the French and Sardinian troops, the latter re-enforced by volunteers from all Italy, expelled the Austrians from Lombardy. July 11, 1859, in the preliminary treaty of Villafranca (on the Mincio) the emperor of Austria ceded that province to the emperor of the French, who made it over to the king of Sardinia. The annexation of these provinces to Sardinia had been already voted by 561,002 in favor of it to 681 against it, in the plebiscitum of June 8, 1848, the effects of which had been suspended by the victories of the Austrian armies, and the reoccupation of the country which followed them. The preliminaries of Villafranca were ratified at Zurich by the treaty bearing the name of that city, and the date of Nov. 10, 1859. — While the struggle was going on in Lombardy, Tuscany, Parma and Modena and the northeastern portion of the States of the Church rose in insurrection. The grand duchy of Tuscany and the duchy of Modena were governed by the sovereigns of the house of Hapsburg-Lorraine; at Parma reigned a branch of the Spanish bourbons. In the month of September, 1859, four bodies, elected by universal suffrage, met at Florence, at Parma, at Modena and at Bologna; these voted, 1, the abolition of their old form of government; 2, annexation to the kingdom of Sardinia, under the constitutional monarchy of Victor Emmanuel II. of the house of Savoy. These unanimous decisions of the four assemblies were submitted to a direct vote of the people in March, 1860. They were ratified by 792,577 votes, out of 807,502 votes cast. This vote of annexation was accepted by the king of Sardinia, upon whom his old parliament had conferred full powers, April 23, 1859. The annexation of Parma, Modena and the northeastern portion of the States of the Church which had been united under a provisional government, was decreed March 18, 1860; that of Tuscany, the 22d of the same month. At the same time the election of deputies was proceeded with, who were to represent the annexed provinces in the parliament of Sardinia. The elections took place Feb. 29, 1860. Parliament opened at Turin, April 2, and again ratified the annexation vote in its session of April 13. — The old kingdom of Sardinia (which had before the war 5,000,000 inhabitants, and from which Savoy and the arrondissement of Nice had been detached by the treaty of March 24, approved by the law of June 11, 1860, and followed by the annexation vote,) contained, including the annexed provinces, a population of 11,000,000 in June, 1860. — But the march of events did not stop here. In various parts of Sicily feeble attempts at insurrection took place, which failed. A few bands of insurgents sustained themselves in that island, when Gen. Garibaldi, who had distinguished himself in

the war of the preceding year, embarked with 1,000 volunteers at Genoa, May 5, 1860, on two merchant steamers. He ran the gauntlet of the Neapolitan cruisers, and disembarked under their fire at Marsala, Sicily, on May 11. Upon reaching land, he formally took possession of the government of the island, in the name of Victor Emmanuel II., king of Italy. May 15, 1860, there was a bloody fight at Calatafini, where the troops of the king of Naples were repulsed After a series of fights and marches, Garibaldi entered Palermo, the capital of the island, the garrison having capitulated June 5. Of the royal troops there remained only a garrison in the citadel of Messina, when Garibaldi descended into Calabria, Aug. 21. Sept. 7, 1860, he became master of Naples, without firing a shot. — While this was taking place in the south, the corps of the royal army of Sardinia advanced through Roman territory, in which was assembled a corps under the orders of General Lamorcière. After the battle of Castelfidardo, (Sept. 18, 1860), the pontifical army was dispersed. The garrison of Ancona sustained a siege by land and sea for some days. On the 29th of the month it was forced to surrender. — The army, with King Victor Emmanuel himself at its head, next advanced toward the frontiers of the old kingdom of Naples Oct. 17 there was a skirmish at Isernia, and on the 26th, one at Teano. Several bloody fights had taken place between Garibaldi's volunteers and the Neapolitan troops, in the country surrounding Capua, then in a state of siege. This city surrendered on Nov. 2, and King Victor Emmanuel entered Naples on the 7th. Francis II. had shut himself up in the stronghold of Gaëta, with a very respectable army; the garrisons of Civitella del Tronto, in Abruzzo, and of Messina still held out for him; Gaëta surrendered Jan. 13, Messina on the same day, and the citadel of Civitella del Tronto on March 20, 1861. — While these military movements were taking place, the people of Marches, Umbria, Naples and Sicily came together Oct. 21, 1860, to decide upon a form of government. The plebiscitum of Marches pronounced in favor of their annexation to the constitutional monarchy of Victor Emmanuel, king of Sardinia, by 133,077 against 1,212 votes. The plebiscitum of Umbria gave 97,040 votes for and 380 against annexation. In the plebiscitum of Naples and Sicily the Italian formula was adopted, "one and indivisible," under King Victor Emmanuel and his legitimate descendants. This formula obtained 1,302,064 votes in the Neapolitan provinces, and 432,053 in Sicily, or, in all, 1,734,117 votes against 10,979. The king, to whom parliament had given full power in the matter, in the sessions of Oct. 31 and Dec. 3, 1860, accepted these plebiscita, and sanctioned the uniting of these provinces into one state by royal decree, Dec. 17. Jan. 23, new general elections were held. Parliament assembled at Turin, Feb. 17, and one month after (March 17, 1861) was cast the vote of the two chambers, proclaiming the kingdom of Italy, with a population then of 21,776,953. Count Camille de Cavour, Victor Emmanuel's first minister, the mighty inspirer of the policy which resulted in the unity of Italy, died June 6 Baron Bettino Ricasoli, who had been dictator in Tuscany, before the annexation of that province to Sardinia, and who formed a new ministry, succeeded him. Baron Ricasoli, resigned March 2, 1862. His successor was M. Urban Ratazzi, head of a new ministry, which lasted until Dec. 8. Then still another was formed, under the leadership of Louis Charles Farini, formerly dictator in the provinces of Parma, Modena and the northeastern part of the States of the Church. M. Farini retired March 24, and the leadership of the ministerial council devolved upon M. Mark Minghetti, minister of finance — Since 1849 France had maintained an armed force at Rome; by a treaty signed at Paris Sept. 15, 1864, between the two governments of France and Italy, it was stipulated that France should withdraw her troops as fast as the organization of the army of the pope could be proceeded with; the evacuation to take place, however, within two years. Italy agreed, on her part, not to attack the pope's territory, and even to repel any attack upon it from without, and she became responsible for a proportionate part of the debt of the old States of the Church. By a subsequent agreement the Italian government engaged to transfer the capital of the kingdom from Turin to Florence. Unfortunately things had not gone smoothly nor without bloodshed at Turin The ministry led by M. Minghetti gave place, Sept. 24, to a new administration directed by Gen. La Marmora The transfer of the seat of government to Florence was nevertheless sanctioned by the law of Dec. 11, 1864. The central administrations began to remove toward the middle of the following year. Parliament was opened Nov. 18, 1865, in the new capital of the kingdom. — June 17, 1866, war having broken out between Prussia and Austria, Italy, which had bound itself to Prussia by a secret treaty, declared war against Austria. After the battles of Sadowa in Bohemia, and Custozza in Italy, hostilities were suspended. July 5, the emperor of Austria ceded Venetia to the French emperor, who declared that it had been taken from Italy, and should be restored to her in time of peace. There were held negotiations on the part of Italy, for the cession of Trentin, or Tyrolean Italy, which came to naught. The treaty of peace between Austria and Prussia was signed Aug. 23, 1866, and between Austria and Italy, Oct 3 of the same year. As the consent of the people to these measures had been stipulated, they were consulted Oct. 21 and 22, and gave 647,246 votes for union with the kingdom of Italy, and 69 against. The annexation of Venetia was sanctioned by royal decree, Nov. 4, 1866, and ratified by the law of July 18, 1867. — The Ricasoli ministry, which had succeeded the La Marmora government at the breaking out of hostilities, handed in their resig-

nations, April 4, 1867. A new ministry under Ratazzi succeeded it. The evacuation of the pontifical states, stipulated in the agreement of Sept. 24, 1864, had been accomplished within the specified time. In September, 1867, Gen. Garibaldi proposed to attack them with bands of volunteers; the royal government not succeeding in preventing an armed invasion, the French interfered, and the Garibaldians were defeated and put to rout at Mentana, (Nov. 3, 1867). From the effect of these events the Ratazzi ministry had fallen. Gen. Menabrea became chief of the new cabinet, appointed Oct. 24, and which remained in power until Dec. 14, 1869 From that time until July, 1873, the administration was intrusted to the Sanza ministry Then it passed into the hands of the Minghetti ministry, which embraced several members of the former cabinet — In 1870 war broke out between France and Prussia. After the first disasters France recalled her troops from Rome. Passion ran high; the national will clamored loudly for Rome, its natural capital. Parliament had already unanimously recognized it as such, March, 1861. A new outbreak was inevitable, an armed repression would only have arrayed the government against the country, and would perhaps have been unsuccessful. A plenipotentiary was sent to negotiate with the pope, but could come to no agreement with him. Then a division, commanded by Gen. Cadorna, advanced upon Rome; the assault was made Sept. 20. A breach was already opened when the foreign troops forming the pontifical army capitulated. — Oct. 2, 1870, the Roman plebiscitum was held, which resulted in 133,681 for, and 1,507 against. A royal decree of Oct. 9, 1870, declared Rome and its provinces integral parts of the kingdom; it guaranteed to the pope his dignity, inviolability, the personal prerogatives due to a sovereign, and reserved the right to establish, by a special law, the necessary guarantees for the independence of the holy father, and the exercise of the spiritual authority of the holy see. The annexation of Rome and its provinces was ratified by law, Dec. 31, 1870. The guarantees of the holy father and the holy see were sanctioned by the law of May 13, 1871. The removal of the government to Rome was decreed by law, Feb. 3, 1871. The new legislature, the eleventh since the promulgation of the constitutional statute by Charles Albert, king of Sardinia, the fourth since the proclamation of the kingdom of Italy, began its session there Nov. 27, 1871.— II. *Constitution.* The charter, granted by Charles Albert, March 4, 1848, to the kingdom of Sardinia, was accepted the same year in Lombardy by the "act of fusion." It was also accepted by the plebiscita, which we have just referred to. This charter is therefore the constitutional charter of the kingdom of Italy. The following are its provisions: The government is monarchical and representative; the succession is regulated by the salic law. The king attains his majority at the age of eighteen During his minority the regency devolves upon his nearest male relative; or, male relatives failing, upon the queen mother. At the commencement of each reign, and for its entire duration, the civil list is fixed by vote of parliament. The old dotation in the state budget was augmented after the proclamation of the kingdom of Italy. Later it was reduced, by consent of the king, and is now (1882) 16,250,000 francs. The dotation of the crown, not personal property, consists of villas, palaces and castles. The allowances of the princes of the royal family amounted to 1,600,000 francs in 1873. The legislative power is divided between the king and the two chambers, the senate and chamber of deputies. The construction of the laws is also within the province of the legislative power. The executive power belongs to the king, who has supreme command of the army, declares war, makes treaties of peace, of alliance and of commerce, with the assent of the chambers, when they involve special expense or changes in the territory of the state. The king appoints responsible ministers, and no act of the king is valid unless countersigned by one of these. The king appoints also to all the offices of state, gives his sanction to laws, and sees to their execution. He has the right of pardon. The two chambers are convoked each year by the king. He can prorogue them, and can even dissolve the chamber of deputies. But in the latter case he must call a new one within three months. The initiative in the making of laws belongs to the two chambers as well as to the king. Nevertheless, all laws imposing taxes must first be passed by the chamber of deputies. The Catholic religion, professed by the vast majority of the citizens, is the religion of the state; other religions are tolerated. Nevertheless, the principle of toleration toward dissenting religions is in reality liberty of conscience. All citizens are equal before the law; they enjoy the same civil and political rights, and must contribute to the expenses of the state in proportion to their means. Personal liberty is guaranteed; domicile is inviolable, the press is free, and the right of assembly acknowledged Property is inviolable, save in the case of the exercise of the right of eminent domain, when damages are allowed. Taxes can only be imposed by law, and every citizen has the right to petition the chambers. The princes of the royal family are senators, with the right of a seat in the senate at the age of twenty-one; they vote at the age of twenty-five. The other senators, to an unlimited number, are appointed for life by the king. They must be at least forty years old. Senators are appointed from among bishops, archbishops, deputies, ministers, ambassadors, magistrates of the court of appeals, general officers; councilors of state and chancellors of the exchequer; prefects; men who have done honor in any way to their country; and those who pay more than 3,000 francs direct taxes. In 1880 the senate was composed of 270 members. The senate is the high court of justice, for the trial of crimes of high treason, and of ministers impeached by the chamber of

deputies. To be a deputy, a person must be a citizen of the kingdom in the full exercise of his civil and political rights, and must have completed his thirtieth year. The deputy's term of office is five years. The chamber of deputies alone has the right to impeach ministers. The two chambers sit at the same time. Each chamber governs itself. Senators and deputies are not salaried. The sessions are public. Resolutions are adopted by an absolute majority of votes. Members of the two chambers can not be held accountable for opinions delivered or votes cast during session. Each chamber judges of the validity of the nomination or election of its members. At each new session the president and vice presidents of the senate are appointed by the king. The other members of the board of officers are elected by the senators. The chamber of deputies names its own board of officers, including the president. Except in case of *flagrante delicto*, a senator can not be arrested. It is the same with the deputies, during the session of the chamber. Nevertheless, the two chambers can consent to the arrest of their members at the request of judicial authority. Both senators and deputies take before their respective chambers the oath of fidelity to king, country and laws. Judges and magistrates are appointed by the king; they are irremovable three years after their nomination. There can be no special courts nor jurisdiction. Sessions of courts are public. — Such are the general principles of the constitution of the kingdom of Italy, embodied in the statute granted March 4, 1848. The electoral law proclaimed shortly after the statute of March 4, gave one deputy to every 25,000 inhabitants, which made 204 deputies for the old kingdom of Sardinia. After the annexation of Lombardy, a law of Nov. 20, 1859, modified this proportion, and provided for one deputy to every 30,000 inhabitants; so that there were, after the other annexations from central Italy, 387 deputies. After the plebiscita of 1860, the proportion was changed again, and it is now (1882) one deputy to every 40,000 inhabitants. After the annexation of Venetia and Rome the number of deputies increased. In 1873 it was 507, and in 1880, 508. To enjoy the electoral right, one must be a citizen by birth or naturalization, be twenty-five years of age, and know how to read and write. The electors of certain provinces, designated in the electoral law, are provisionally exempt from compliance with this last condition. Electors must, besides, pay forty francs annually in direct taxes, or pay for the hiring of a location for the carrying on of commerce, art, or some business, a fixed rent, varying, however, according to the population of the communes where the industry is established. — The conditions of the electoral law are not imposed upon the following persons: members of academies; members of chambers of industry and commerce; professors of arts, sciences and letters; civil and military employés; persons decorated with a national order; laureates of universities; persons exercising the liberal professions; and brokers approved by the government. Nor are the above conditions necessary to eligibility to the position of deputy; the exercise of civil and political rights and to be thirty years of age are sufficient. Functionaries and employés paid by the state are not eligible. Nevertheless, functionaries and employés belonging to the following categories can be admitted to the chamber of deputies, to the extent of one fifth of the whole number. Ministers of state, who are not counted in this fifth, and secretaries general of the ministries; members of the council of state, and of the courts of cassation and appeal, to the exclusion of those charged with the administration of public affairs, superior officers of the army and navy, provided they be elected outside of the district of their command; members of the superior council of public instruction, public health, public works and mines; finally, professors in universities. The members of the clergy are not eligible when they have charge of souls or a fixed residence, for example, bishops, vicars, chapter-canons, etc. — The electoral lists are prepared by the municipalities, and they are subjected to annual revision by the same authority. Those interested may object to the formation of these lists; in case of refusal on the part of the municipalities to right the matter, the person so objecting can petition the court of appeals. Each electoral college may be divided into several sections. The electoral colleges are convoked by royal decree, within three months from the expiration of the quinquennial mandate, or of the dissolution of the chamber, within one month, in case of vacancy by death, resignation or any other cause. To be elected on the first ballot, the candidate must get a number of votes equal to one-third of the electors registered, and one-half of those voting. In default of which, eight days after, those two candidates are voted for who obtained the highest number of votes the first time. In both cases the president of the board of officers proclaims the deputy elected, provided it be ratified by the chamber, to which are now sent his credentials, together with protests and objections, if there be any. — III. *Administration*. The executive power belongs to the king, who wields it through nine responsible ministers, to wit: Minister of foreign affairs; of the interior; of finance; of pardon, justice and worship; of public instruction; of war; of the navy, of public works; of agriculture, industry and commerce. One of these ministers presides at the meetings of the ministries. The powers and privileges of each are determined by law. Nearly the whole system of administrative laws has been renewed since the foundation of the kingdom of Italy. On March 20, 1865, were enacted the laws for the administration of communes and provinces, public safety, public health, the council of state and public works. From April 29, 1869, dates the law for the administration and general accountability of the state. The executive power is based

upon a council of state, which has a consulting voice in all affairs referred to it by ministers, or which are within its province by law. The administration decides no legal controversies Its power to do so was abolished by law, March 20, 1865. Every question of a civil or political right, even where the state is interested, is within the province of the ordinary courts. The council of state is called on to settle controversies concerning jurisdiction. — The kingdom is divided into 69 provinces; these are subdivided into 274 arrondissements, and the arrondissements into 9,438 communes Each province is administered by a prefect, each arrondissement by a subprefect. In the Venetian provinces each district is administered by a commissioner. The syndic (mayor) is chief of the municipal administration. He is appointed by the king from among the municipal councilors. Each prefect is assisted by a council, whose members are nominated by the king. Side by side with the "prefecture," there is an elective council for the province, having an administrative representation in the provincial deputation. In the arrondissement, besides the prefect or subprefect, there is a questor, a delegate or commissioner of public safety. In each chief town of a province there is a recruiting commission, and in the capitals of provinces and districts commissions of public health meet, and there is a board of education In the capital of a canton there is a judge and a commissioner of public safety. In each commune there is an elective municipal council, with an administrative committee, composed of assessors, presided over by the mayor. Each province has its own budget. The provincial council votes it; the provincial deputation, appointed by the provincial council, administers it. The sources of revenue of the provinces are made up of the incomes from patrimonial estates and trifling additions to the state taxes. The commune also has its budget. The municipal council votes it; the committee of assessors (junta) and the mayor administer it. The sources of revenue of the commune are like those of the province, and, besides, the commune has tolls and local taxes. — The councils, both of commune and province, by the law of March 20, 1865, are elected by a relative majority of votes. The duration of their office is five years. At the close of every year, one-fifth of the council goes out. In the first four years the members retiring are chosen by lot; in the subsequent years, by seniority. Retiring members are indefinitely re-eligible. They receive no remuneration. The king can dissolve communal and provincial councils, in the interest of public order, but must cause them to be renewed within three months. During the interval, communal and provincial affairs are administered by a royal commissioner. The legal age of an administrative elector is twenty-one years; the other electoral conditions are almost the same as for political elections. Nevertheless, the amount of taxes qualifying an elector is but twenty-five francs in communes of more than 60,000 inhabitants; twenty francs in those of from 20,000 to 60,000 inhabitants; fifteen francs in those of from 10,000 to 20,000; ten francs in those of from 3,000 to 10,000; and five francs in those of less than 3,000 inhabitants. A person may be an administrative elector in one or several communes, in one or several provinces, if he have a residence, estate or establishment there. The administrative electoral lists are drawn up and revised like the political electoral lists, and the electors have the same right of objection. — The communal council is composed of eighty members in communes of more than 250,000 inhabitants, of sixty in those of more than 60,000, of forty in those of from 30,000 to 60,000, of thirty in those of from 10,000 to 30,000, of twenty in those of from 3,000 to 10,000, and of fifteen in the smallest communes. The junta, or board of assessors, is appointed by the council, by absolute majority of votes. The assessors are ten in number, with four substitutes, in cities of 250,000 inhabitants; eight, with four substitutes, in those of more than 60,000; six, with two substitutes, in those of more than 30,000; four in those of from 3,000 to 30,000 inhabitants; and two in communes of less than 3,000 inhabitants, with two substitutes. The communal councils assemble in ordinary session twice in the year, in spring and in autumn. In extraordinary session they may come together at any time, subject to the authorization of the prefect of the province. — The council, not the junta, appoints and dismisses all employés of the commune; deliberates upon all administrative matters, contracts and everything touching the interests of the commune. It passes laws concerning local magistracies, institutions of benevolence and instruction, police and local sanitary matters; also laws for the collection of local taxes. All available funds must be employed Among the obligatory communal expenses the law enumerates the salary of a secretary, office expense, cost of recovering taxes, cost of preserving the property of the communal patrimony, the construction of roads, the keeping in repair of roads and public places, elementary instruction, the national guard, lighting, cemeteries, subscription to the "bulletin of laws," electoral boards and local police. The council is obliged to concur with the state or the province, and with the union or *consorzio* of the communes interested, in certain expenses fixed by law. All other expense is optional. The budgets for the communes of 1870 amounted to, receipts, 338,978,834 francs, and expenses, 341,150,600 francs. The subprefect decides whether or not the deliberations are conformable with the laws. He can suspend the execution of them, except in case of urgent need; the prefect may, in case of need, annul the deliberations of the council. The law determines what deliberations of the communal councils must be approved by the provincial deputation, or by the king. From the decision of the prefect, or of the provincial depu-

tation presided over by the prefect, there is an appeal to the king, who submits the question to the council of state. — The provincial councils (general councils) are composed of sixty members in provinces of more than 600,000 inhabitants, fifty in those of from 400,000 to 600,000, forty in those of from 200,000 to 400,000, and twenty in all others. The provincial councils assemble regularly in ordinary session the first Monday in September of each year; they can be convoked in extraordinary session by the prefect. Their deliberations usually concern the founding of public provincial establishments; secondary and technical instruction; provincial roads; the support of the insane and of foundlings; the preservation of monuments and archives; the regulation of the streams, etc., and, in general, all the administrative affairs in which the province has an interest. The provincial council takes charge of the charitable, benevolent and religious institutions; gives its opinion upon proposed changes of territorial limits, on the construction of roads, on tolls and markets, and on the establishment of associations between communes, and between tax payers (*consorzii*). The provincial deputation, which has the "guardianship" of the communes, is composed of ten members in provinces of more than 600,000 inhabitants, eight in those of more than 300,000, and six in the others, with substitutes to the number of four in the first class and two in the others. The provincial budgets, not including that of the province of Rome, amounted, in 1870, to 78,766,736 francs, receipts, and to 79,109,567 francs, expenditures. — IV. *Finance.* The law of April 29, 1869, established the general principles of the financial administration The minister of finance prepares each year the general plan of the budget of the receipts and expenditures of the state. For this purpose each of the other ministers transmits to him the plan for the particular budget of his own department. In the budget ordinary receipts and expenditures are first entered, followed by the extraordinary. Every item of extraordinary expenditure exceeding the sum of 30,000 francs must first be approved by special law. — The financial year coincides with the solar year (Jan. 1 to Dec. 31). It is never longer, and the account of the financial year relates only to the actual receipts and expenditures of that year. In the first two weeks of March the minister of finance must present to parliament a scheme for the budget of each ministry, and one including all of these, indicating the provisions made for the receipts and expenditures of the following year. These estimates are approved before Jan. 1. During the same two weeks in March the minister of finance must present a general and definitive budget for the current year, together with the modifications of the provisions of the first budget, already approved, and giving account of the balances of the preceding year. To this definitive budget is added a statement of the condition of the treasury. — The collection of direct taxes has been regulated, since Jan. 1, 1873, by the law of April 20, 1871 By virtue of this law there must be a collector of taxes for each commune or union of communes (*consorzio*). He is paid by the communes; the office is by them awarded to the highest bidder, for a term of five years. The collector is also charged with the collection of the taxes of the state, as well as those of the communes and provinces, according to lists which are furnished him. He is responsible for the sum total of his lists, even for the sums which he may not have collected. In the chief city of each province a receiver general collects the sums due by the collectors of taxes for the state and province, and is responsible for them, even for those not collected. The office of receiver general is sold at auction, for a term of five years, and he is remunerated from the provincial funds. The taxes on landed property have been made uniform by the laws of July 14, 1864, and May 25, 1865 The whole financial system was then unified, and now all citizens are subjected to the same taxes throughout all the provinces of the kingdom; though the islands of Sardinia and Sicily are exempt from the duty on salt, and the latter from that on tobacco even, the cultivation and sale of this plant having remained free there. The taxes of the kingdom may be divided as follows: 1, taxes on landed property; 2, taxes on the income from personal property; 3, taxes on the grinding of cereals, 4, taxes on affairs, such as the right of registration, on civil acts, on the right of succession and judicial acts, stamp duties, etc ; 5, taxes on the cultivation of tobacco, except in Sicily, and on the manufacture of beer, soda waters and alcoholic drinks; 6, taxes on articles of consumption in city and country communes, (with the exception of flour, meat and drinks, all articles of consumption may be subjected to communal dues, and besides, the commune can add its own taxes to those of the government), 7, taxes on foreign commerce, customs and rights of navigation, (raw material is exempt from all impost laws, and the tariff on the other products of industry and manufacture is extremely moderate—no prohibition nor differential law is insisted upon); 8, the government monopolies, such as the sale of salt and tobacco, 9, lotteries; 10, the profits of the public services, such as the postal system, telegraph, etc ; 11, the revenues from domains, and the receipts of the railroads operated by the state, 12, contingent revenues of divers kinds; 13, reimbursements and regular receipts; 14, ecclesiastical revenues. — V. *Administration of Justice.* The kingdom of Italy obtained a uniform civil legislation by the code promulgated June 25, 1865; in it, civil marriage and the equality of males and females in the right of inheritance were established. Tuscany only has her own peculiar penal code, whereas all the other provinces have one and the same, the penal code was modified in a few respects for the Neapolitan provinces, for the purpose of lightening the penalties imposed for certain offenses. Capital punishment

is effaced from the code of Tuscany. Commercial legislation, as well as codes of procedure, are the same throughout the kingdom; the codes of commerce and civil procedure date from June 25, 1865; those of criminal procedure from Nov. 26, 1865. Nevertheless, there are five courts of cassation. They are held at Milan, Florence, Naples, Palermo and Rome, and are called upon to decide, in matters civil and criminal, cases of violation or false application of the law. The courts of appeal do not render final judgment, but reject the opinion or reverse the decision of the first judges and send the case to another tribunal. The law of Dec. 6, 1865, made the judicial organization uniform throughout the realm. It embraces the court of appeals, appel late courts, courts of assize, tribunals of com merce, civil and correctional courts and pretors In each commune there is a justice of the peace, in the large communes, several There is a public prosecutor for the court of appeals, as well as for the civil and correctional courts. Justices of the peace are appointed by the king. Their services are gratuitous They decide without the formality of procedure, and render final judgment in petty cases, involving personal or real property to a sum of not more than thirty francs. They act as arbiters when their advice is demanded in disputes between residents of the same commune. Where there is no justice of the peace these duties devolve upon the syndic, or mayor Every judicial district (the judicial district consists of one or several communes and even of part of one) has a pretor, who decides in the first instance in civil and commercial cases involving as much as 1,500 francs, and in offenses against police regulations. The civil and correctional tribunals have jurisdiction over one or several administrative districts. There are 162 of them. They pronounce in the second instance upon the decisions of the pretors, and in the first instance upon civil matters, which are relegated to them by law, as well as crimes. Connected with these tribunals there are one or several judges, charged with the examination of criminal matters.— The members of the tribunals of commerce are appointed by the king on the recommendation of the chambers of commerce respectively; there are sixty-eight of these in the whole kingdom. The tribunals decide in cases deferred to them by the commercial code and other laws. The courts of appeal are twenty in number, of which three have altogether four detached sections, which sit outside of the city, the residence of the court. Thus, there are twenty-four cities with a court of appeals, or a section of one. The courts of appeal take cognizance in the second instance of cases already judged by the district and commercial courts, and of complaints in matters of election. They decide, moreover, on the acts relative to the record of crimes to be sent before the court of assize. Each court and even separate section of appeals consist of three chambers, viz. civil chamber, chamber of correction and chamber of accusation. Five councilors at least must be present in civil cases, six in correctional appeals, and three in the chamber of accusation, to make a decision valid. The courts of assize are convened every year by royal decree at the time and place determined by law. The jurisdiction of each court of assize embraces that of one or of several tribunals. Each court of assize is composed of three councilors of the court of appeal, to which the decisions of the court of assize may be carried for approval or reversal; they are charged with the making up of the record of cases, and the application of the law after the verdict of the jury. The jury is composed of twelve men, chosen by lot from among the electors, of fully thirty years of age, and able to read and write. The court of assize has cognizance of ordinary crimes, misdemeanors of the press, and political misdemeanors. Appeal can be taken against the decision of the court of assize. —Crimes of high treason and political trials of ministers come under the jurisdiction of the senate, which is erected into a high court of justice on such occasions The public ministry represents the executive power in relation to judicial authority. The functions of the public ministry are exercised in relation to the judges of districts by the delegate of public surety (police commissioner), or by the mayor, or by a fiscal procurator. In the tribunals of the arrondissements the public ministry is represented by the procurator of the king; before appellate courts and the court of appeals, by the attorney general. The public ministry has charge of state actions against criminals. It has the right of appeal to the higher court in the interest of public order and law.— The defense, by courtesy, of the poor, in civil and penal cases before tribunals and courts (judicial aid) is confided by the president of the tribunal or of the court to some lawyer practicing within its jurisdiction. Counsel for defendants, under such circumstances, who take the case without remuneration, have to defend, in both civil and criminal courts, individuals and moral bodies admitted to judicial aid, according to rules determined by law.—VI. *Worship; Relations of Church and State* Almost all Italians (99.7 per cent.) profess the Catholic religion. In the north a few valleys of the Alps, on the side of Pignerol, are inhabited by Vaudois, descended from the partisans of Peter Valdès. They have a temple at Turin. A few ancient Albanians, living in scattered localities in southern Italy, along the shore of the Adriatic, profess the United Greek faith. There are 40,000 or 50,000 Jews and 30,000 to 40,000 Protestants. Altogether, the members of non-Catholic religions do not number over 100,000 The principle of toleration in religion is embodied in the constitution of March 4, 1848, and has been interpreted and widely applied in the most liberal sense. Churches and temples may be erected by non-Catholics and kept open to the public, but the permission of the government must first be had. This permission is not neces-

sary for the Catholics. The discussion of religious matters is entirely free.—The relations of church and state are regulated by the law of May 13, 1871, which at the same time determines the prerogatives of the sovereign pontiff and the holy see. According to this law the person of the pope is sacred and inviolable. Attempts against his person or instigation to such action, as well as public insult and injury, are punished with the same penalties as are the same crimes and misdemeanors against the person of the king. These crimes come under public jurisdiction and are taken cognizance of by the high court of assize. The Italian government renders the sovereign pontiff within the territory of the realm the sovereign honors and pre-eminence of honor accorded to him by Catholic sovereigns The pope has the power of retaining the usual number of guards attached to his person and palace. The holy see is made the same allowance—3,225,000 francs—that it received in the budget of the pontifical states; this allowance is inscribed on the ledger of the public debt as a perpetual annuity, and inalienable in the name of the holy see, payable even during the vacancy of the holy see; and it is exempt from all sorts of taxes and burdens, whether governmental, provincial or communal. It is provided that the sovereign pontiff shall continue to enjoy the palaces of the Vatican and of the Lateran with all their dependencies; as well as the villa of Castel Gondolfo. The said palaces, villa and surroundings, with their museums, libraries and art collections, are inalienable, exempt from all taxes, and not subject to the exercise of the right of eminent domain by the state. During the vacancy of the holy see no authority can, for any reason whatsoever, interfere with or restrict the personal liberty of the cardinals; the government is pledged to see that the conclave and the œcumenical councils are troubled by no violence. The representative or agent of public authority can penetrate into the palaces and places which are the habitual residence or temporary dwelling of the sovereign pontiff, or in which may be assembled a conclave or an œcumenical council. It is prohibited to pay visits of examination, search, or to remove papers, documents, books or registers, in the pontifical offices or congregations, when such are of a purely spiritual character. The sovereign pontiff is entirely free to perform all the functions of his spiritual ministry, and to cause to be affixed to the doors of the basilicas and churches of Rome the acts of that ministry Those ecclesiastics, who, in the exercise of their functions, participate in the production of these acts, are subject to no search, investigation or prosecution by reason of them; any strangers at Rome, invested with ecclesiastical functions, enjoy the personal guarantees of Italian citizens. The ambassadors of foreign governments to the holy see enjoy all the prerogatives and privileges of diplomatic agents, granted by international law. The representatives of the see at foreign courts are insured the same guarantees and immunities, both going and coming.—It is provided that the sovereign pontiff shall have the right to correspond freely with the episcopacy and the whole Catholic world, without any interference on the part of the Italian government. He can establish at the Vatican or his other residences, post and telegraph offices with his own employés. The pontifical postoffice may correspond directly, in sealed envelope, with the offices of foreign administrations, or deliver its own correspondence through the Italian office. In both cases the transportation of the pontifical mail is exempt from all taxation or expense on Italian territory. Couriers expedited in the name of the sovereign pontiff are put on the same footing as those of the ministries of foreign governments. It is also provided that the pontifical telegraph office shall be connected with the general system of the realm, at the expense of the state; that its telegrams shall be received and sent as telegrams of the state, and shall be free of charge; that the same advantages shall be granted in the case of messages presented at any regular office by order of the pope, and messages addressed to him shall be exempt from the charges made against the person to whom the telegram is sent.—In the city of Rome and its six suburban sees, the seminaries, academies, colleges and other Catholic institutions, established for the purpose of ecclesiastical education, depend solely on the holy see, without any interference on the part of the school authorities of the realm. All restrictions on the right of assembly of the Catholic clergy are removed. The government renounces the right of nomination to and patronage of the major benefices; bishops are not obliged to take the oath of fidelity to the king. The major and minor benefices can only be conferred upon citizens of the realm, except in the city of Rome and in its suburban sees.—The royal *exequatur* and *placet* have been abolished; likewise every other form of governmental authorization of the publication and execution of the acts of ecclesiastical authority Nevertheless, until the reorganization, preservation and administration of ecclesiastical property shall have been provided for by a special law, the acts of the ecclesiastical authorities, having for their object the disposal of church property, and provision for major and minor benefices, except those of Rome and its suburban sees, shall remain subject to the *exequatur* and *placet*. In matters spiritual and disciplinary, there is no appeal from the acts of the ecclesiastical authorities, on the other hand, they can not execute their decrees by the aid of the state. Cognizance of the legal effects of such acts and of every act of ecclesiastical authority belongs to civil jurisdiction; these acts are devoid of all force and effect, if contrary to the laws of the state, to public order, or if they violate the rights of individuals; if they constitute a crime, they come under a penal code. The royal decree of June 23, 1871, regulates the concession of the *placet* and *exequatur*; by article

five of this decree, a person invested with a benefice can not take possession of it until his title be provided with the royal *placet* or *exequatur*.—A law of July 7, 1866, suppressed all orders, all religious corporations and congregations. The members of these moral bodies, even mendicants, were allowed a life pension of 600 francs or less, according to the age of the pensioners. Their possessions were made over to the state.—The number of archbishops having dioceses is 47; of bishops, 217; in all, 264. It may be well to note here that in the diocese of Milan the Ambrosian rite is still in use. The Milanese or Ambrosian church, although one with the Roman Catholic, is distinct from the latter in its ritual, its celebration of the mass, the breviary, and especially in the administration of the sacraments, beginning with baptism by immersion. The revenue of the property of the secular clergy, administered by themselves, is estimated at 55,000,000 francs at the very least. To this we must add the tithes levied by the clergy upon the harvests in several provinces, and the fees for baptisms, marriages, funerals, etc.—VII. *Public Instruction.* The fundamental law of public instruction is that of Nov. 13, 1859, modified for the provinces of Tuscany and the old kingdom of Naples at the time of its promulgation in those countries. A few other modifications have been effected by laws common to the whole kingdom. Education is of three degrees, namely: elementary, secondary and superior. Secondary instruction is divided into classical and technical. Higher education comes within the province of the universities and higher institutions of learning. Secondary *classical* instruction is given in the lyceums and gymnasia (colleges); secondary *technic* instruction, in the schools and institutes of technology; elementary instruction is given in the communal schools. We have enumerated elementary instruction as among the obligatory communal expenses. Universities and lyceums are supported by the state. Gymnasia and schools of technology are at the charge of the communes in which they are established. Technological institutes are maintained by the provinces. However, in the case of the two latter categories, the state contributes toward their expenses to the amount of half the salaries of the faculties.—VIII. *Public Charity.* Benevolent institutions are numerous in Italy. Every commune supports one or more. They are regulated by the law of Aug. 3, 1862. Provinces maintain at their expense foundling and insane asylums These institutions are administered by a bureau of charity in each commune. This bureau is appointed by the municipal council, and has a president, with four or eight members, according to the population of the place. The president's term of office is four consecutive years; the other members' service expires, one each year for four years; but they are always re-eligible. The municipal council may elect a special board or bureau for an institution, when the board of charity does not suffice. Institutions, whose manner of administration has been predetermined by the act establishing them, are without the jurisdiction of the latter. Every year a budget of receipts and expenditures is prepared. This is approved by the provincial deputation, to whom are also referred the rules of government, the sales, purchases, acceptances or refusals of bequests and the authorization to sue. However, permission to acquire property through legacies is definitely granted by the government. When an institution is subventioned by the state, its budget must have the approval of the minister of the interior. The latter has, moreover, the right of surveillance and control of the administration of all charities. In cases provided for by law, institutions may be reformed, or even transformed, when they no longer serve their purpose. This has been done in the case of asylums for pilgrims and neophytes, institutions created for the ransoming of Christian slaves in heathen countries, etc. The demand for reform or transformation is addressed to the council of the province by the municipal council. The prefect then submits it to the minister of the interior, who acts upon the instruction of the state council. All new foundations of benevolent or charitable institutions must be authorized by the government.—IX. *Military Organization.* The kingdom comprises sixteen territorial divisions. There are twenty-eight fortresses and fifty-three military districts. Four general commands of army corps are established in Rome, Verona, Naples and Palermo. By the Sardinian law of March 20, 1854, which, after the annexation, went into force throughout the whole kingdom, every citizen is subject to conscription as soon as he has completed his twentieth year, and even before that age in case of war. All the young men born in the same year form a class from which is drawn the yearly contingent, fixed by law. This contingent is distributed by arrondissements, in proportion to the number of those inscribed upon the lists of the class, which is chosen by lot to enter the army. The direction of the conscription, according to the law of March 29, 1865, is confided to a function ary of the administration, to the prefects and the subprefects; its execution devolves upon a council of conscription in each arrondissement. The latter is composed of the prefect or subprefect, two provincial councilors and two army officers. It is assisted by the administrative officer and a doctor. The mayors of each commune enroll the names of the young men upon the recruiting lists. After these have been published, lots are drawn; after that, the council of conscription visits the enlisted, and pronounces upon their right to claim exemption from the service. The men chosen by lot to form the annual contingent form the first category. They are called to the army, and are assigned according to their aptitudes, to one or another corps of the army; the rest form the second category, and are subject to military services for forty days in each year.—The law of July 19, 1871,

modified the organic recruiting law, and instituted a provincial militia. It provides for the voluntary enlistment for one year, under certain conditions, of young men who wish to become proficient in the art of arms. All exemption from military service has been done away with, except the substitution of a brother, and this liberation, dependent upon the payment of a premium fixed by law (2,600 francs in 1871 and 1872), only transfers the young man from the first to the second category. University students, students of medicine, pharmacy, surgery and veterinary pupils enrolled in the second category, are exempt at their request from military instruction; but they are liable, in time of war, to be called upon to serve in their capacity of doctor, surgeon, etc., up to the age of thirty-four years. A like exemption may be claimed by ecclesiastical students. Both classes are deprived of this right of exemption, if, at the age of full twenty-five years, they have not received their professional diplomas, or taken higher orders. The volunteers of one year receive no pay. At the end of their time, if they have given proof of sufficient military knowledge, they may claim exemption upon paying a premium not exceeding one-third of that fixed in ordinary cases; or they may be transferred into the provincial militia, even with the rank of officer, after an examination as to fitness. Besides the voluntary enlistment of a year, there is, for young men of, at the least, seventeen years of age, a kind of volunteering called permanent, that is, for eight years of service; also a form called temporary enlistment. Aliens, and in general all volunteers not included in the recruiting lists, are accepted only for eight years of service. Soldiers, discharged at the close of their term of obligatory service, may re-enlist voluntarily for a term of not less than three years. In time of war volunteers for the duration of the war are enrolled. All citizens are subject to military service. The provincial militia is composed of men of the first category, who are in the three or four last years of their service, and men of the second category, who are in the four or five last years of service. The government may claim the services of soldiers of the militia to re-enforce the active army in time of war. Cavalrymen, artillerymen and men of the artillery train and sanitary corps are attached to the active army during their entire term of service. The officers are chosen from among soldiers who have quit active service by reason of retirement, voluntary resignation or permanent leave, and who wish to join the provincial militia. They receive an allowance, to which may be added a pension. — By the law of military organization passed Sept. 30, 1873, the standing army of Italy is divided into seven general commands, or *corps d'armée*, each consisting of three divisions, and each division of two brigades; four or six battalions of "bersaglieri," or riflemen, two regiments of cavalry, and from six to nine companies of artillery. The actual strength of the rank and file of the army at the end of December, 1878, was 199,557 men (peace footing), and 444,509 men (war footing), with 15,110 officers. The national militia is composed of 232 battalions of infantry, each of four companies, of fifteen battalions of "bersaglieri" cavalry; of sixty battalions of artillery; and of ten companies of engineers. The time of service in the standing army is three years in the infantry and five years in the cavalry. A certain number, distinguished as "soldati d'ordinanza," to which class belong the carabinieri and some of the administrative troops, have the option to serve eight years complete, and are then liberated without further liability to arms. In the army of reserve the time of service is nine years. — The naval army, that is, the gunners and marine infantry, is recruited from among the young men forming the yearly military contingent. There is a special conscription for sailors and mechanics of the navy. The term of service of conscription in the navy is eight years; of volunteers, until they are forty years old. — The navy of the kingdom of Italy consisted, at the end of December, 1881, of 88 steamers, afloat or building, armed with 684 guns. The navy was manned in 1880 by 11,200 sailors, and 660 engineers and working men, with 1,271 officers, the chief of them one admiral, one vice-admiral, 10 rear-admirals and 83 captains. The marines consisted of two regiments, comprising 205 officers and 2,700 soldiers. The merchant marine comprises 18,800 sailing vessels, with a tonnage of 990,000, and carrying a total of 184,000 seamen. The number of steam vessels is rapidly increasing. In 1872 there were 120 of these, with a tonnage of 33,000. The regular and coral fisheries give employment to 11,600 boats and 31,000 men.

GASPAR FINALI.

— X. *Economic and Commercial History.* The economic and commercial history of the times that extend from the crusades to the discovery of America, is in great measure Italian history. There will certainly be no one who will dare to call a useless work or a vain complacency of learned men, this investigation in the volume of history of the titles of Italian one time supremacy. The picture of the glory and of the treasures acquired by Italians, in the countries where they traded, ought to serve as a stimulus to imitation. After the changes that have happened he would be foolish who should dream of new domains on the coasts of the seas of the east. But the navigation of these seas is open, and if the times which Providence is preparing will be so favorable to the nations living on the shores of the Mediterranean that a part of the commerce with Asia shall take again its former route, it will then be known how profitable the results will be. It suffices to call to mind the geographical position of the Italian peninsula that we may recognize how Italian traders were naturally invited to be the first to take in hand the productions of Asia and Africa, from the ports of Egypt

and Syria or of the Black sea; and how, transporting them along the Mediterranean, they could furnish all christendom therewith, while greatly advantaging themselves. — At this epoch America had no existence for Europe; all the products in which the latter was lacking, and therefore obliged to demand of other parts of the world, came from Asia and Africa only. The countries of the east, in which nature has with so much liberality lavished her gifts, are in part bathed by those same seas that surround Italy. Greece, Syria and all Asia Minor offered to Italian traders excellent dépôts for the storing or exchange of their goods. The countries situated in proximity to the Black sea were almost all barbarous, and therefore could ill compete with the hardy Italian navigators, who visited the colonies founded by their valorous fellow-citizens around the Euxine, to receive the merchandise which caravans had brought from the central regions of Asia and even from the remote shores of the gulfs of Arabia and Bengal—merchandise which was then by them distributed through all Europe. Let us remember these conditions, in part natural and physical, in part economic and civil, to which of necessity their commerce was subject, and we shall be able to form some idea of the necessary and spontaneous superiority which these conferred on the merchants of Italy. — If we examine on the map the respective positions of the various provinces of Italy we shall see that lower Italy and Sicily must have been, at the time of which we speak, the principal seats and richest emporiums of this trade. On one side Naples commanded the Tyrrhenian sea. Tarento on the other side, and the cities of Puglia and Calabria, were those whose navigators could most immediately communicate, by passing through the Ionian sea, with the islands of the Archipelago and the ports of the Levant. Sicily, in turn, saw extending before her the coasts of Africa and Egypt, forming one of the principal routes of commerce. And yet history, reserving only the brief period during which Amalfi deservedly proclaimed herself queen of the seas, far from presenting lower Italy as having the palms of commerce, places her below Pisa, Genoa and Venice. Although this fact may at first sight appear strange enough, it will not be difficult to find a reasonable explanation thereof. — Sad consequences to commerce proceeded from feudalism, that form of social administration in which is to be found the real cause of the mercantile inferiority of Naples and Sicily. The isolation, says Giuliano Ricci, in which they live in the midst of the state, withdraws both plebeians and patricians from extended commerce and perfected industry, interrupting or rendering slow and difficult all communications and relations of interest, at the same time that it paralyzes undertakings of every kind. Hence it is that Norman feudalism withered the municipalities in the south of Italy, and paralyzed that commerce and those manufactures which prospered in the north, and which might have found in the south, through the convenience of its ports and the nearness of the springs and routes of commerce, favor and encouragement. If feudalism was not the cause, how is it that from Brindisi, mistress of the mouths of the Adriatic, commerce thrust itself to the lagoons of Venice, from Syracuse and Amalfi to Pisa and Genoa? — But, as above indicated, Amalfi, situated on the gulf of Salerno, had its period of prosperity. It is even the first Italian city of which we can infer with certainty the maritime commerce with the Levant. Obliged to contend against the Arabs and Saracens, its navigation received an extraordinary increase; and in the year 849 saved Rome from a threatening invasion. At Palermo, at Syracuse, at Messina, its traders possessed storehouses and agencies; and the vessels of Amalfi, from the tenth century, were to be met in the ports of Beyroot and Alexandria, employed in the transportation of pilgrims to the Holy Land and in mercantile operations. By the route of Durazzo they trafficked meantime with the Greek empire, and at Constantinople obtained conspicuous privileges. During the brief periods of its prosperity Amalfi could count 50,000 inhabitants; its money was current throughout all Italy and the Levant, and the famous *Tavole Amalfitane* formed a maritime code imitated by later and foreign legislation. Of Flavio Gioïa, a citizen of Amalfi, and of the mariner's compass, we need say nothing here. But foreign conquest and military fury soon brought to ruin this great prosperity. The Normans, in 1131, deprived Amalfi of its liberty; and, soon after, a fleet from Pisa assaulted and sacked it, reducing it to a heap of ruins. Amalfi fell at the very moment in which Italian commerce generally was rising, and Pisa and Genoa obtained the rich heritage. — From the tenth to the twelfth century Pisa was the principal commercial mart of Italy. The Arno, then navigable right under its walls, made almost a maritime city of it, while at the same time opening up a channel into the interior of Tuscany. Pisa, in whose deserted streets to-day the grass is growing, had, in the times of its splendor, as many as 200,000 inhabitants. The frequent irruptions of the Saracens, from one of which it was freed by the prowess of its heroine, Cinzica Sismondi, had obliged Pisans to acquire skill also in the use of arms; and the common peril had induced the Genoese to unite with their rivals against the infidels, from whom the two republics snatched the dominion of Sardinia, which was afterward to become the apple of discord. In 1087 the Genoese and Pisans combined made an expedition against Tunis; and the Tuscan navigators made conquests besides on their own account, among others those of Corsica and the Balearic isles, from which able mariners were recruited. — That which distinguished Pisa from the other Italian republics was the liberal policy with which its ports were opened to strangers. But the Genoese contemplated with an evil eye the dominion of the Mediterranean being con-

tended for by the Pisans, for whom they were reserving the same fate which the latter had inflicted on Amalfi. The possession of Corsica and Sardinia was the occasion and pretext of war; a war of extermination, from which the greater profit was drawn by the queen of the Adriatic, which with secret joy beheld, as a spectator, the terrible injuries which its two sisters on opposite shores were inflicting on each other. — In the first and second crusades the Pisans had taken a leading part, obtaining, as a reward, great privileges in the Levant, and fortresses and establishments upon all the coasts of Syria and Asia Minor. Jaffa, St. John d'Acre, Tripoli, Laodicea and Antioch were almost entirely in their power. At Tyre they had founded a company, religious and at the same time mercantile, called, as if by antiphrasis, that of the Humble, (*societas humiliorum*) devoted to trade, principally to the weaving of wools. — These great successes increased all the more the rancor and envy of the Ligurian metropolis which, toward the end of the twelfth century, definitively took away from Pisa the two islands so long disputed; and in 1283, near the reef of Meloria, the Pisan fleet and grandeur were destroyed. And not even content with this, the Genoese stirred up internal factions, which soon covered with blood the banks of the Arno; and, to deliver a last blow to their former rivals, and excite a formidable competition to the Pisan port, in 1421 they sold to Florence the harbor of Leghorn for 100,000 gold crowns. — The discords of the Italian cities were always the principal cause that prevented the peninsula not only from uniting to form a powerful nation, but likewise from preserving the palms of civilization and commerce acquired with so much toil and blood. And yet it must be confessed, that, in the history of the world, those intestine strifes themselves were the occasion of some good and the cause of a progress which otherwise would with difficulty have been obtained. From the most painful evils Providence knows how to draw out germs of future advantage for the human family. Previous to the great epoch of the Italian republics, war was carried on ordinarily through mere thirst for conquest, by barbarous and ferocious soldiers, who fought only for the sake of fighting and destroying. Italian communes, on the contrary, introduced a new kind of wars, commercial ones, from motives of interest; they destroyed but for the sake of producing, of accumulating; wealth was their object, as much at least as glory. Besides, but for the profound rivalry which divided those municipalities into inimical camps, and obliged them to perform deeds of prodigious heroism, can we believe they would have become so great? In order to be great it is necessary to be able to love strongly and hate strongly; and it is quite doubtful whether hatred or love contributed most to the greatness of Italy. Heaven forbid that we should say this as a justification or apology for the miserable fratricidal arms, the eternal cause of Italian weakness and shame at this time; but impartial history must explain the facts it relates and not shrink from confessing the benefits which often had their origin in the most deplorable misfortunes; and we can have no doubt that these mercantile wars were a notable social progress in comparison with former wars of conquest and invasion. — Genoa and Venice alone remained to contend for the empire of the seas. It is known how Venice arose. Attila had passed the Alps, sacked and reduced Aquileia to ashes; he was threatening to descend on Rome. The inhabitants of the destroyed city and of the neighboring country sought refuge on the sandy islets of the lagoons, and founded there, in the year 450 after Christ, a species of federative republic, in which each of the isles was governed by its own tribunes. Fishing and the production of salt were the first industries of the little nation. The security they enjoyed, in the midst of the sea upon their rocks, invited new colonists, and little by little this became so conspicuous as to be able to neutralize the importance of Ravenna, the capital of the empire of the Ostrogoths. When Justinian, emperor of the east, declared war against the latter, and sent his generals, Belisarius and Narsetes, to subdue them, Venice afforded to the Greeks the aid of its fleet The battle of Vesuvius put an end to the Gothic dominion, and the exarchate of Ravenna inherited its power. But, hard pressed by the Lombards, the conquerors of the valley of the Po, the exarchs sought to make friends of a city that could do them great service, and granted Venice important privileges and commercial liberties. When Charlemagne descended into Italy to wrench the iron crown from King Desiderio, the Venetians, most skillful in profiting by every propitious occasion, won to themselves the friendship of the new Cæsar by aiding him in the siege of Pavia, and obtained as their reward the right of trading in his Italian states. Meanwhile the Greek empire, menaced by the Arabs, the Bulgarians and the Hungarians, was going to decay; and Venice, quick at all times to take advantage of circumstances, offered subsidies which were dearly requited. Fiscal exemptions, agencies and establishments in Roumelia and Constantinople itself, the conquest of Dalmatia—such were the rewards granted to the Venetians. In proportion as the circle of their political power was enlarged did they feel the necessity of modifying their internal constitution, giving it greater force and unity. They had already substituted the authority of a single doge for that of several tribunes The Venetian oligarchy, glorious and illustrious, succeeded the democracy, and became the granite base upon which was to rest the whole machinery of the state. Ancona and Comacchio, which in the matter of trade had shown some disposition to rival Venice, had fallen under the blows of the Saracens and the Narentine pirates, and the queen of the Adriatic let them succumb without aiding them. — The Grecian emperors had helped to promote the crusades, but were not long in repenting of it. The Frank

warriors, who remained for some time in Byzantium, committed violence and abuses; the Italian traders obtained important privileges, which Constantinople granted through fear of the Turks and from a desire to make powerful friendships. The Venetian agency (*fattoria*) in the suburb of Pera, had about 10,000 inhabitants and formed a little state, capable at times of neutralizing the power and authority of the local government. The tortuous and disloyal policy of the Byzantine emperors could not long remain faithful to treaties concluded with neighbors so formidable. And their perfidy, already long suspected, appeared manifest in the conduct of the emperor, Emmanuel Commenus, who, in 1172, being refused by the Venetians their aid in his affair with William, king of Sicily, caused to be confiscated all their vessels with their cargoes, and all they possessed in his states, arresting even a great number of their citizens.—The republic of St. Mark was not one to tolerate such an unjust affront, and the opportunity of obtaining revenge for it did not long delay. When the fourth crusade was undertaken in 1202, Venice not only took upon itself the transport of the whole army, but prepared, besides, an expedition of its own, under the command of the doge, Enrico Dandolo. But not against the Turks, rather against the Greeks were these troops directed. Constantinople was taken, and the Latin empire was substituted there in 1204. The entire suburb of Pera, the Morea with the most fertile islands of the Archipelago, fell to the lot of Venice; which, in this manner, became once more preponderant in the commerce of the Levant, in which the Genoese and Pisans, at a former period, had been its victorious rivals.—Genoa, though prosperous and rich, had until now remained second to Venice. The industrious character of the Ligurians, and the advantages of the site they occupy, ill adapted to agriculture and marvelously fitted for navigation, had early made them a people of traders, to such a degree that a proverb ran: *Genuensis, ergo mercator*. They were burning with the desire to supplant the Venetians in the Levant and to substitute their own power there. Able and astute politicians, the Genoese saw that Venetian power rested principally on the duration and force of the Latin empire of Byzantium; and that this destroyed, the other would also fall. They resolved, therefore, to use every means for the restoration of the Greek emperors; and they succeeded in their well-imagined enterprise.—Michele VIII., Paleologus, implored the aid of the Genoese, who carried him in a fleet in 1261 to Constantinople, whence the Franks and Venetians were driven out; and Genoa obtained of the new lord all the possessions and privileges which its rival had enjoyed. Thus the capital of Liguria became the first commercial power of Europe; and, as Scherer justly observes, if the enterprising audacity and the fearless courage of its inhabitants had been governed by a wiser policy, they might long have preserved their supremacy. But the internal administration of Genoa was profoundly unlike that of Venice, and the Genoese were different men. The Venetian government represented a system strong, permanent, lasting; it was an edifice soundly established on the basis of an aristocracy prudent and ambitious. That of Genoa, on the contrary, was uncertain, fluctuating, torn by continual factions, and led from one novelty to another. If the comparison is allowable, we would say that Venice was the England and Genoa the France of Italy. Hence it happened that Genoa, having reached the summit of grandeur and prosperity, was not long in falling into decay, while Venice, on the contrary, though passing through the most contrary vicissitudes, knew how to maintain itself strong and respected.—If the Genoese had allied themselves with the schismatic Greeks to make war on the Venetians, the latter, less delicate still and less scrupulous, had leagued themselves with the Turks to bring the Genoese to ruin. Those trading peoples knew well how to compromise with their conscience and faith whenever their interests were at stake, or whenever they wished to satisfy their mutual hatred. But, in order to explain this point of Italian history, a few considerations are needed. There were then two principal routes by which the goods from Asia could reach the seas of Europe. One of these, from the Persian gulf, along the course of the Euphrates and the Tigris, extended as far as Trebizond and the other ports of the Black sea. And of this the Genoese, after the last revolution, had become masters. The other was that which, by means of the Red sea and Egypt, ended at Alexandria, where, although the Genoese had their agencies, there was still a possibility of competing with them. And all the more since the first of the two routes, in consequence of the commencing decadence of the caliphate, had become insecure on account of the brigands who infested it; while, on the contrary, in Egypt, under the military rule of the mamelukes, order and security reigned. Whence it was that when the Genoese seized the trade of Constantinople and the Black sea, the Venetians turned all their attention to the possession of Alexandria.—Papal Rome had, by a pontifical edict, forbidden any direct relations with the infidels. But Venice, by the astuteness of diplomacy and rich presents, knew how to obtain a special dispensation, thanks to which the Roman court granted to those traders permission to send a limited number of vessels to Egypt and Syria. But soon even that last clause limiting the vessels fell into disuse, and Venice directed to those ports the principal efforts of its policy and navigation, and concluded several advantageous treaties with the mameluke sultans. It must be said that Genoa had not been a whit more particular than its rival, and had, some thirty years before, signed a treaty with the Tunisians.—Thanks to this new commercial revolution, favored by the Venetians,

Alexandria became, at the commencement of the fourteenth century, the centre and emporium of Indian trade. The Venetians carried there the productions of Italian industry, such as wool, arms, mirrors, glass, and the wares of other European countries; and exported thence drugs, spices, pearls, precious stones, ivory, cotton, Indian silk, and the indigenous products of Egypt. — The Genoese, though preponderant on the Bosphorus and the Euxine, could not long remain indifferent to the sturdy competition of the Venetians in the Italian seas. They also tried to obtain privileges in Egypt; and inasmuch as the sultans were interested in giving permission to every trading people who could bring abundance to their markets, they were not backward in satisfying them, so that the two great rivals soon met face to face on the banks of the Nile. On the other hand, the Venetians had not left their competitors tranquil on the Black sea; and in Trebizond they had strengthened themselves anew. From these causes there arose a mortal war between the two republics, which lasted from 1356 to 1380, and which terminated, after various vicissitudes, with the discomfiture of the Genoese, and the prostration of the contending parties, to the profit of the common enemy the Turk, who threatened to advance and confound in the same ruin the conqueror and the conquered. — But before occupying ourselves with the decadence of Italian commerce, we think it opportune to inform our readers with respect to some most important points appertaining to the epoch of its grandeur. We have related, according to chronological order, the vicissitudes of that memorable epoch; but let us stop to consider the various characters that distinguished it. And first of all it is well to make special mention of the Genoese colonies; which we do all the more willingly inasmuch as the government and legislation of these in many respects may truly be adduced as models. — The Black sea had, as we have indicated above, come almost entirely into the power of the Genoese. Taking possession of ancient Theodosia, they named it Caffa, from the name of one of the family, Caffaro, which gave to Genoa one of its best historians. The vicinity of the Mongol Tartars obliged the Genoese to fortify the city of Tauris and surround it with walls; but well knowing that the power and security of states rest upon good and strong internal regulations more than on bulwarks, they busied themselves in constituting there a regular and free government, composed of a consul, two councils, greater and lesser, a parliament, intendants, purveyors, a mint, chancellors, keepers of the keys, agents, captains of the town, of the port, of the market, and of stores. — All the consuls of the Genoese colonies, the first day they entered office, swore to observe the regulations of the republic, and to render justice to all. The consul of Caffa remained in office one year, which being finished, he was to lay aside his dignity immediately under penalty of 500 Genoese *lire;* but if his successor had not already come, three days before the expiration of his term he was to convoke the greater council (of twenty-four members), and invite it to elect the consul. The one chosen remained in office only three months, and could be reconfirmed until the arrival of the one sent from Genoa. The consul could not undertake anything without the approval of said council, which had to concur, at least by a two-thirds vote, for the sanction of any scheme. The greater council elected two key-bearers, who had charge of the money of the commune of Caffa. The lesser council (of six members) appointed every three months two agents and every six months two comptrollers That which was especially laudable was that Genoa left to its colonies a sufficient liberty of internal administration. The magistrates of the republic were forbidden to meddle with the election of those of Caffa, except, as has been stated, the consul and his chancellor, representing the executive power of the colony. The consul was prohibited receiving any gift whose value should exceed the sum of ten *soldi* (cents) under penalty of four times the value. A month after his return to Genoa he came before the auditors, and before showing the operations of his administration the auditors (or syndics) were to consult with two or four of the best merchants of Caffa The auditors of the colony had the duty of inspecting the acts of the other magistrates. The officials over merchandise, victuals, money, etc., superintended these various branches of colonial police — Similar to that of Caffa was arranged the administration of the other Genoese establishments on the Black sea, such as Cambalo (Balaclava), Trebizond, Amastri, Tana and Soudah. — The trade of Tauris contributed much to the wealth of Genoa; the Genoese exported thence salt, corn, timber, commodities which abounded there. In similar manner the skins and wool of the Crimea were exchanged for other merchandise of Greece and Roumania, especially wines. The Russians brought skins of the ermine, the lynx and other animals. The Tartars furnished linens, cottons and silk goods By the caravans of Astracan there came the hair of Angora, used in the weaving of camlets, which the Genoese manufactured in a masterly way and sold at Constantinople, Cyprus, Alexandria and Nicosia. Finally, the colonists carried on a commerce of an infamous kind, carrying away from the Caucasus young creatures of tender age and both sexes, and selling them as slaves to barbarous nations, chiefly to the sultan of Egypt. This traffic had been carried on by the Greeks, and was exercised by the Genoese, the Venetians and the Turks, who continued it until, in 1829, the treaty of Adrianople put an end to it The daring of the Genoese, shown in penetrating and spreading themselves everywhere with their commerce, is truly worthy of marvel. Along the mountains that flank the empire of Trebizond, toward its southern and eastern part, they went as far as Erzeroum, in Armenia, and thence to Tauris, in

Persia. Marco Polo found them navigating the Caspian. As far as Tauris their caravans carried the wares obtained from Caffa and Galata, and exchanged them for those which the Asiatics brought along the Euphrates and through the deserts. But often it happened that instead of intrusting their goods to other hands, the Ligurian traders would themselves venture into the regions to the south and east of Persia. According to the testimony of the Englishman Anderson, the Genoese coins were very common at Calicut, on the coast of Malabar; and from a letter written in 1326 by Andrea da Perugia, and referred to in volume fifth of the annals of Vadding, we learn that the traders of Genoa went as far as the port of Zaytoun, in China. Of some other large mercantile stations of the Genoese we shall speak presently in the proper place. — We now turn to the commercial organization of Venice and its principal operations in trade. A peculiar and distinctive character of that republic was the extreme interference of the government in economic and industrial matters. These were affairs of the state. Maritime equipments and charters of vessels were not left to private will, but the government regulated the epochs and conditions of the contracts, the nature and composition of the cargoes, the payments, and the mode of carrying out the speculations. It ordinarily furnished the timber for naval constructions, and most severe laws were in force as to the cutting of forests. The crew and oarsmen (*ciurma*) of an Italian galley were of 220 to 300 men, and they calculated, at Genoa as at Venice, the annual expense of maintaining it at sea, at 120,000 *lire*. It must be remembered that the *ciurma*, or oarsmen, to the number of 110 to 180 (usually galley slaves), were not paid, and were very poorly fed. — We have no very exact statistics of the Venetian marine, it is calculated, however, that in the prosperous times of the republic it possessed 3,000 merchant vessels and forty-five galleys, with crews of 36,000 men. In the arsenal there were 160,000 workmen occupied. At the epoch of its decay, that is, from 1660 to 1797, this arsenal gave to the sea ninety-two ships of the line and twenty-four frigates. He who considers these figures, and remembers that Genoa in 1253 armed 193 galleys against Pisa, and in 1295 equipped against Venice 200, manned by 45,000 combatants, can form an idea of the immense naval force which Italy had then at its disposal. — In the Adriatic an admiral exercised supreme authority, under the title of captain of the gulf, and other similar officers were stationed in the Black sea and in the parts near Cyprus. As long as it was a question of voyaging in the Adriatic, isolated vessels could undertake it, but to go beyond the gulf a great number of vessels united in a convoy and sailed in company, lending each other assistance. The time for departure was fixed by law; the fleet for the Low Countries sailed in April; that for the Black sea in July; that for Alexandria in September, etc. The captain of a ship could not carry goods on his own account on the vessel he commanded, but was allowed to do so on another craft. As soon as the fleet arrived at its port of destination, the authority of the admiral or captain, as far as the trade was concerned, expired, to give place to that of the consul furnished with full powers. — The creation of consuls abroad is likewise of Italian origin. To establish a national authority in the midst of foreign states which, in this respect, renounced in part their territorial authority in favor of the representative of a foreign state, was a thing as difficult as it was necessary to a people which, like the Italian, had so gradually extended the sphere of their relations. Genoa obtained this privilege at Antioch in 1098; at Jaffa, Cesarea and St. John d'Acre in 1105; at Tripoli in 1109; at Laodicea in 1108 and 1127. Pisa obtained the same permission in the principal stations of the Levant in 1105 Venice had consuls at Jaffa from 1099, at Jerusalem in 1111 and 1113, at Antioch in 1167, at Beyroot in 1221. The custom of having consuls abroad, now general, was only introduced at a later date among other nations; and among the towns not Italian, Marseilles and Barcelona were the first to follow, in this, the example of Italian maritime republics. — The Venetian treasury did not claim duties on the goods imported from the Levant by the armed galleys, but those which arrived on unarmed vessels, belonging to private individuals, paid an ad valorem duty of 5 per cent. In general, goods could be exported free. A mass of minute prescriptions emanated from the grand council as to commerce and navigation; and woe to the captain or merchant who dared to detract from that inflexible authority. But such was the habit of conforming to the regulations, such the universal conviction that trade was the first of state affairs, that the most noble families, at Venice as at Genoa, willingly educated their sons to commerce, although thus restrained. And it was a misfortune that the Italians of those days accustomed themselves to that protecting government in such a way, because when, the times having changed, it became necessary for individuals to act for themselves, they found themselves unfitted to meet the competition of nations newly entered into the lists, and fell behind like men from whom the daily care of their guardian had taken away the full and free use of their members. — From the year 1172 the republic of St. Mark created a tribunal charged with the superintendence of arts and trades. The quality and quantity of raw materials were exposed to severe examination. It was forbidden to any workman to engage in more than one industry, so that, with the division of labor, perfection might be assured. Weaving had made very great progress, and it was at Venice, in 1429, that was made public the first collection of receipts and processes employed for the dyeing of stuffs. The trade in drugs had propagated among the people a great deal of practical knowledge of chemistry.

Skins were prepared and gilded in that market with a superiority that all admitted. The laces known as Venice point, hardware, sugar refineries, the works for the manufacture of glass and mirrors, feared no rivals. There was a law prohibiting a Venetian artisan from leaving his own country, for fear he might carry to foreigners a knowledge of industrial progress; whoever infringed this regulation received, in the first place, an order to return; if he resisted, his nearest relatives were arrested and remained in custody until the guilty one could be reached by assassins who slew him. A strange mixture of barbarism and civilization truly was the organization of the Italian republics! — One of the most potent instruments of commerce and production is credit, which accelerates the circulation of capital and gives a value to the capital, time. Venice was the first city that saw rise in its own bosom one of those institutions of credit which were then called *monti* or *banchi*, and are now named banks (*banche*). In 1171 was founded that bank of deposit which opened credits to whomsoever would entrust to it sums of money to facilitate its payments and transfers of cash. The office did not make any charge for custody or commission, nor did it pay any interest to depositors, but its certificates of deposit were accepted in circulation as if they were money. The bank paid at sight, in coin, the drafts that were presented and accepted. It was established as a principle that the bank, on receiving sums deposited, should credit the depositor only the intrinsic value, that is, the weight in fine metal, without taking account of the extrinsic value, in order to avoid the losses that occurred from the frequent monetary alterations which foreign governments did not scruple to make. And in consonance therewith it was decided that payments should only be made in effective ducats, whose quality was finer and less subject to alteration than other coins. Hence it was that the paper of the bank obtained a favor, a premium over all other titles of credit, and even over other representatives of coined money. Economy in the use of coin, promptness of payments by means of transfers upon their registers, stability of value in not being exposed to the perpetual oscillations of the market: such were the three supreme advantages which the bank of Venice offered, since then imitated in the greater number of commercial countries. — The traffic in salt was one of the principal branches of the Venetian administration. It was collected from Istria, Dalmatia, Sicily and the coast of Africa; and Venice became the great emporium of salt for all the south and east of Europe. At first this traffic was free to all on the payment only of a tenth; subsequently the state took it into its own hands — There exists a discourse, pronounced in 1421 before the grand council by the doge Tommaso Mocenigo, which throws much light upon the finances and commerce of Venice. We see from it, among other things, that the duchy of Milan had to settle every year at Venice accounts that amounted to 1,600,000 ducats; and that 94,000 pieces of cloth were exported during the same period to that province The total value of the Venetian commerce with Lombardy was estimated at 28,800,000 ducats. It must be remembered that while Venice was carrying on a trade so gigantic, it possessed at the same time to an eminent degree the genius of politics, of the fine arts, of letters and the sciences The fatherland of Marco Polo, of Giosafatte Barbaro, and other great voyagers and merchants, was likewise that of painters like Titian, of men of science and letters like Frà Paolo Sarpi — Before descending to an examination of the causes that precipitated from so lofty a height the Italian maritime republics, it is well to cast a rapid glance upon the communes of the interior of Italy — Tuscany was, in common with Flanders and Brabant, the most industrial European country of the middle ages; and if Pisa, Genoa and Venice took the lead on the sea, Florence was ahead in manufactures and banking. The silk and wool fabrics of Florence enjoyed great fame as far back as the thirteenth century, and in order to procure the necessary supply of wool, the Florentines possessed agencies and branch houses in the principal emporiums, the single family of the Alberti had, about the middle of the fourteenth century, establishments at Bruges, Avignon, Naples, Barletta and Venice. From England and France came the common wools, and the fine qualities from Spain. In 1338 there existed at Florence 200 woolen factories, producing yearly 80,000 pieces From France, Great Britain and the Low Countries were collected rough cloths to a value of 300,000 gold crowns, which received in Florence a new preparation, of which the Florentines possessed the secret, in keeping with the taste of the Levantine markets for which they were destined. Indigo, cochineal, orchal and other substances had been for a long time employed by the Florentine dyers who were famous throughout Europe. Up to the fifteenth century Florence had been compelled to make use of other nations as intermediaries for the transportation of its productions Not having any port of its own, it was accustomed to use that of Pisa, which had granted to the sister town freedom from fiscal dues. But this privilege was taken away as soon as the rapid development of its commerce aroused the jealousy of the Pisans; and then Florence saw itself constrained to come to terms with Sienna to export its products from the port of Talamore. When Pisa, ruined by its wars with Genoa, fell itself in decadence, it sought anew the friendship of Florence, which once more began to make use of the former's port. But every friendly relation between the two Tuscan republics ceased when Genoa in 1421 had sold to Florence the port of Leghorn. Placed thus in contact with the sea, the Florentine republic could devote itself to navigation; it created a special administration under the title of "magistracy of the consuls of the sea;"

built an arsenal and dockyard; obtained at Alexandria in Egypt the same privileges which Pisa had first enjoyed there; ordained that twelve young men of the most conspicuous families should embark every year to initiate themselves, in the respective countries, in the trade of the Levant. The mercantile fleet of Florence was divided into two squadrons, that of the east and that of the west, but the total force never exceeded eleven great and fifteen small galleys. — Banking in Florence was carried on on a very large scale, and the bankers of that metropolis had correspondents, agents and branches in the principal seats of commerce of the then known world. In Italy alone one could count eighty Florentine houses exclusively devoted to this lucrative business. The princes of nearly the whole of christendom were debtors in important sums to the bankers of Florence, and the greater part of the historic patrician families descend from those mercantile houses. The Pazzis, the Capponis, the Buondelmontis, the Corsinis, the Falconieris, the Portinaris and the Medicis, were devoted to commerce. But unable to resist the temptations of a fortune always constant, and blinded by their success, the bankers of Florence enlarged to excess the sphere of their operations, and were involved in an immense bankruptcy, whose consequences were felt in the most distant seats of trade. — We can not take leave of the past of Florence without indicating how it occupied, on other grounds, an important place in the history of commerce and political economy. It was the first town, perhaps, which contributed valuable authors to mercantile science. Three Florentine traders, Pegoletti, Antonio da Uzzano and Bernardo Davanzati, have left the most ancient treatises on commercial matters. The first two arranged, with great order and method, in their works, varied information upon goods, moneys, weights and measures, usages, book-keeping, insurance and charters. The third, celebrated for his translation of Tacitus, composed two lessons upon moneys and exchange, which are, even at the present day, models of clearness and elegance for writings of that class. — For flourishing agriculture, for active commerce and for good social organization, Lombardy was famous in the times of Italian grandeur. When the renowned confederation of the towns of upper Italy, formed under the name of the "Lombard League," came out victorious from the long war of Frederic Barbarossa, and constrained the haughty emperor to acknowledge and sanction the independence of those municipalities by the peace of Constance (1183), the world saw of what marvels Italy would be capable if united in one single will. But victory separated those valorous communities which danger had united, and the former strife recommenced once more, so that their political power was of but short duration. Their industries, however, remained prosperous and their accumulated wealth was increasing. — In foreign countries Lombard was synonymous with merchant and banker, and to-day still, in London and other metropolitan cities, they preserve the name of Lombard street for one of the principal thoroughfares. They, in fact, in the twelfth century, were the first to compete with the Jews in the art of exchange and lending at interest; in which profession, however, they soon met the competition of the Caorsini, so-called by antonomasia because the inhabitants of the town of Cahors in Languedoc also had devoted themselves quite early to this lucrative branch of trade. They lent upon security, exacting for their money an interest proportioned to the risk incurred; and as this was great in those calamitous times, the interest was consequently very high. In order to protect poor debtors religion then came to the rescue: two monks, Barnaba da Terni and Bernardino da Feltre, founded the first *monti di pietà*, charitable establishments that lent gratuitously upon pledge, which, however, were not long in degenerating and becoming usurious, so that Barianno slily vituperated them by naming them *monti di empietà* (impiety). — One of the economic glories of Lombardy was the construction of those navigable and irrigating canals which served as models for the hydraulic works of foreign nations. As far back as 1179 the Milanese made a commencement of the canal which was called *Ticinello* and afterward *Naviglio Grande*. — But it is necessary to pause in the description of the commercial and economic glories of the Italians of the middle ages; and it will be well at present to inquire what causes of decadence were so potent as to drag such grandeur down to ruin. According to some, one must needs blame as the only cause the single fact of the maritime discoveries of the Portuguese and Spaniards occurring toward the close of the fifteenth century; which, by changing the routes of commerce, took away from Italians their superiority in the trade of the Levant and transferred it to western nations. The passage to India by the cape of Good Hope and the discovery of the new world were, according to them, the sole reasons by which Genoa and Venice were precipitated from the summit of grandeur. This opinion we deem superficial, derived principally from the unfortunate tendency which Italians have to hope for too much, and to fear to excess events that are fortuitous or independent of them. A soothing thing it is to human sluggishness and national vanity to say, if we were great and now have descended from our former splendor, the fault is not ours, but rather that of fate or chance, which chooses to give to other nations the pre-eminence which we have lost without any fault of our own. Now we believe but little in the effects of chance upon the destiny of nations, and much, on the contrary, in the sway of natural, economic laws. — Undoubtedly those discoveries contributed to accelerate the decadence of the Italian communes, because the geographical and political relations of the diverse portions of the world being changed, the navi-

gation being diverted from the Mediterranean to the ocean, Italians were no longer the only ones to traffic with eastern countries, and to serve as intermediaries between them and the west. But the decadence, by this cause hastened and converted into regular ruin, had already some time before commenced; and Italians would have been quite able to overcome foreign competition as they had already conquered other obstacles not less important, if they had still been young and vigorous, in place of nourishing within their own bosoms the germs of senile corruption. In addition to the discoveries of the Iberians, there were, in our opinion, three causes of the decay of Italian commerce. The first is to be sought in the weakening of Italian public spirit. In the fifteenth century the states of the peninsula had reached the summit of civilization and were commencing to descend the great arc of which they had touched the top. In the fortunate period from 1100 to 1400 the Italian communes, having achieved their liberties, afforded the most celebrated examples to be found in history of activity, skill, diligence, virtue and heroism. Not in commerce alone, but in every art and branch of science were Italians then first and unique While Italian navigators were victoriously scouring the seas, and Italian bankers establishing agencies and houses in the most distant countries; while moles were hardily constructed and lighthouses erected, and canals and harbors excavated; while industries were flourishing and commerce was enriching Italy; at that very period all hearts were palpitating with the love of country, and were ready to swear it in Pontis and to combat for it at Legnano or Campaldino; warriors, men of science, citizens, Italians, were great none the less that they were merchants. And it is this simultaneousness of all the glories that constitutes the profound difference between the Italian communes and the Hanseatic Flemings. The latter for a long time were nothing but traders; Italians were all they chose to be, and wished to excel in everything, But, little by little, such great virtue became corrupt; minds became less jealous for liberty; to the strong and sublime literature of Dante succeeded the soft and effeminate kind of which Petrarch had been the innocent initiator; customs degenerated from their former austerity; luxury and dissipation squandered capital and contaminated morality; and to such a state as this were Italians reduced when the news reached them that Vasco de Gama had weathered the "cape of tempests" and Columbus had landed at San Salvador. What wonder if they allowed themselves to be surprised by these great facts and found themselves powerless to profit by them! If Genoa and Venice had still been what they were in the thirteenth and fourteenth centuries, they would have equipped their fleets and despatched them beyond the pillars of Hercules, and would have known how to reap their part as well, and certainly not the smallest, in the new conquests of Europeans. — The second cause that rendered Italians feeble and unfit to resist unforeseen misfortune, sprang from the intestine wars of which Italy was at all times the theatre. Her great cities considered each other always as so many states not only separated, but as enemies. The idea that they belonged to the same nation never dawned upon the minds of the doges of Genoa and Venice. Pisa brought ruin upon Amalfi, Genoa cast Pisa to the ground; the war of Chioggia exhausted Genoa and left Venice weakened. Florence was at war with Pisa and Sienna; Milan with Pavia; and so it continued for three or four centuries, this Iliad of Italian woes. But why speak alone of contests between the various cities? Each municipality was divided and lacerated by many parties; the victory of one was the signal for the exile of the other. The houses of the vanquished were razed to the ground, and their wealth dispersed. So far from remaining astonished at the decadence of Italian greatness, Italians ought rather to wonder at its long duration. They had been able for three or four centuries to fill the world with their name, while in the fatherland they were killing each other in turn' These wars were the principal cause of the weakening and ruin of Italy, a ruin which the coming of Charles VIII., of Louis XII, of Charles V., of Francis I, the league of Cambray, the policy of the Sforzas, the Medici and the Farnese, did much to accelerate. — In the third place, a great political and military event, of which the Levant was the bloody theatre, contributed to take away Italian supremacy The Turks, for a long time at war with the Greeks, increasing in strength and boldness since their Asiatic rivals, the descendants of Timour, had re-entered their steppes, after having established themselves in Roumania, were threatening Constantinople, which in 1453 was occupied by Mohammed II The Genoese colony of Galata fell with Byzantium; and the other Italian establishments in the Archipelago, Asia Minor and the Black sea, fluctuated for some time, exposed to continual peril, until they also came under the power of the infidel. By the events which placed the Black sea under the authority of the Genoese, this republic, more than its rival Venice, had to suffer from an event so mournful. Venice, besides, had been able at an early date to come to terms with the Turks, and its potent oligarchy, with varying fortune, was still able to govern and make itself respected after that catastrophe. — If intellectual culture would suffice to constitute the civilization of a people, and if the splendor of letters, of science and the arts, were sufficient to render a nation happy, no other country could have the right to a more legitimate pride than that which Italians could nourish as to their own deeds in the sixteenth, seventeenth and eighteenth centuries. But poets, sculptors, painters, and men of science themselves do not avail to make a country great, when by the side of a few eminent celebrities lives a common people ignorant and idle; when tyranny and corruption are weakening, debasing

and profoundly vitiating the national character. When a country has given birth to a Columbus, a Vespucci, a Cabot, a Verazzani, and permits these great men to achieve their sublime undertakings under a foreign flag, that country has ceased to take part in commercial history. Pigafetta of Vicenza, the companion of Magellan in his circumnavigation, described his memorable voyage; and the Venetian Ramusio published the recitals of illustrious discoveries; both these historians unwittingly cast a slur upon their own country, which, unmindful that it had once ruled the seas, was then yielding to other nations the palm of victory.

GEROLOMO BOCCARDO.

— XI. *Agricultural, Industrial and Commercial Resources.* The kingdom of Italy comprises 25,000,000 hectares of productive land, and 4,500,000 hectares covered by mountains, rivers, roads, cities, etc. These 25,000,000 hectares form about 5,000,000 estates or properties, and may be subdivided as follows: arable land and vineyards, 12,000,000 hectares; meadow land, mostly irrigated, 1,200,000 hectares; rice fields, 150,000 hectares; olive orchards, 590,000 hectares; chestnut plots, 600,000 hectares; forests, 4,400,000 hectares; pasturage, 5,600,000 hectares; marshy and uncultivated land, 4,000,000 hectares. — The average net income of a landed proprietor is computed to be 80 francs per hectare; which would be 2,000,000,000 francs for the total ground rent of Italy. This capitalized at 4 per cent. would amount to a principal of 50,000,000,000 francs. The average annual wheat production is estimated at 36,000,000 hectolitres; of rice, 1,600,000 hectolitres; of maize, 19,000,000 hectolitres. Adding the production of barley, oats, chestnuts, potatoes, etc., we have an annual production of 91,000,000 hectolitres. — The wine production is very abundant, and the qualities various. The wines most highly esteemed are those of Asti, in Piedmont, Montepulcians and Broglio in Tuscany, Capri and *Lacryma Christi* at Naples, those of Syracuse and Marsala in Sicily. The average production of wine is 26,000,000 hectolitres yearly. The cultivation of hemp is restricted principally within the provinces of Bologna, Ferrara, Forli and Ravenna. The product is estimated at 4,500,000 kilogrammes. The cultivation of tobacco is free in Sicily and Sardinia; it is also grown in Ancona, Pesaro, Umbria, Benevento and Terra d'Otranto Little cotton is grown as yet; a few fine bales were nevertheless sent to the London exposition of 1862. The American civil war, or the cotton crisis resulting from it, gave a lively impetus to its cultivation. The zone favorable to the growth of cotton commences at the forty-third degree, or the mouth of the Tronto, on the Adriatic, and extends along the southern coast to the promontory of Piombino, on the Mediterranean; it embraces the Neapolitan provinces, Sicily and Sardinia. Limiting this zone to lands in the vicinity of the sea, we would have 2,000,000 hectares suitable to the growth of cotton; 450 kilogrammes per hectare may be harvested in Italy; the costs of production come to about 200 francs, and the cotton can be ordinarily sold at from 1.30 francs to 1 50 francs per kilogramme. — Italian industry does not rank high in Europe, but is, notwithstanding, of some importance. Her mines yield iron, (especially in the island of Elba), beautiful marbles, lead and copper (in Sardinia), sulphur (in Sicily and Romania), salt, borax, etc. Among the most extensive industries we may cite that of silk culture (210 kilogrammes of cocoons or 13,200,000 kilogrammes of raw silk in 1871). The value of the pottery, porcelain and glassware manufactured in 2,300 establishments by 80,000 workmen, is estimated at 50,000,000 francs. The exportation of straw hats from Tuscany amounts to 15,000,000 francs annually. Tissues of all sorts are also made, arms, and many other things. — The value of the commerce of Italy in 1871 was 2,048,000,000 francs, as follows: imports, 1,085,000,000 francs; and exports, 963,000,000 francs. The principal exports were: cereals, 101,000,000 francs; fruits, flowers and fodder, 60,000,000 francs; silk, 383,000,000 francs; straw hats, 11,000,000 francs; olive oil, 126,000,000 francs; chemical products, 24,000,000 francs; wines, 14,000,000 francs; live stock, 59,500,000 francs. The commercial operations of the ten years 1862–71, not including transit trade, are represented in the following table:

YEARS	Imports	Exports
	Francs.	Francs.
1862	830,029,347	577.468 357
1863	902,185.066	633,854,052
1864	923,775,994	573,465,693
1865	965,173.672	558,285,576
1866	870,048,517	617,688.681
1867	885 910,961	739,975,677
1868	896,569,122	787,101,477
1869	936,522,834	791,588,898
1870	995,717,683	756,276,905
1871	963,698,441	1.085 459.567

The following table exhibits the total revenue and expenditure of Italy, together with the annual deficits in each of the years 1875–9:

YEARS	Total Revenue	Total Expenditure	Deficits.
	Lire.	Lire	Lire
1875	1,336,307,886	1,494,152,530	157,844,644
1876	1.344,710,190	1,472,941,860	128,231,670
1877	1,389,109,906	1,422,877,431	33,767,525
1878	1.425,583,965	1.412,683,266	*12,900,699
1879	1,435,828.569	1,468,212.943	32,384,374

The following are the budget estimates for the year 1881:

Sources of Revenue.	Lire.
1. Ordinary revenue:	
Direct taxes, including house duty	867,188,646
Indirect taxes and monopolies	627,318,488
State lottery	70,500.000
Post, state railways and telegraphs	99,898,577
Ecclesiastical and state domains	31,811,910
Miscellaneous receipts	20,684,192
Total ordinary revenue	1,217,351.763
2 Extraordinary revenue	7,982,271
3. Special revenue, including loans	199,975.775
Total revenue	1,425,309,809

* Surplus.

Branches of Expenditure.	Lire.
Consolidated fund	736,259,237
Ministry of finance	131,525,489
" justice and worship	28,244,822
" foreign affairs	6,343,761
" public instruction	28,581,923
" the interior	58,744,465
" public works	166,465,912
" war	214,736,427
" the navy	46,134,661
" agriculture	9,675,291
Total expenditure	1,426,711,988

According to these returns, there was a deficit of 1,402,179 lire in 1881, which supplementary, or extraordinary expenses, incurred afterward, increased largely, the amount of which, however, was not made public. — The public debt at the end of 1878, was made up of the following liabilities:

	Lire.
Funded debt inscribed in the "Libro Grande,"	7,091,829,661
Redeemable debt in the "Rentes" of 3 and 5 per cent	1,642,773,107
Treasury bonds	183,010,500
Paper currency	840,000,000
Total debt	9,757,613,268

As a guarantee for the issued treasury bonds and of paper currency, which has a forced circulation, the government has deposits of certificates of the funded debt, bearing no interest, in the national bank of Italy. The total amount of these deposits was calculated at 1,150,000,000 lire, at the end of 1878 — The following table shows the total imports and exports of the kingdom in each of the five years 1876–80:

YEARS	Imports.	Exports.
	Lire	Lire
1876	1,330,147,820	1,216,921,205
1877	1,154,303,039	966,523,543
1878	1,070,802,615	1,040,789,434
1879	1,262,044,668	1,100,961,109
1880	1,224,812,701	1,130,659,312

—Italy possessed in 1871, 6,287 kilometres of railways in operation; 7,800 kilometres of national highway; 19,600 kilometres of provincial roads, and 90,000 kilometres of communal roads. In 1876 it had 7,704 kilometres of railways, and in 1879, 8,210 kilometres. — If we should now compare the actual state of affairs of Italy with that existing prior to the formation of the kingdom, we should at once see the immense intellectual, material and economical progress that has been made within a few years; in a word, the great rapidity with which Italy has advanced on the road to civilization. She may well congratulate herself on her political unity, achieved after so much effort. —BIBLIOGRAPHY. GASPAR FINALI.

J

JACKSON, Andrew, president of the United States 1829–37, was born in Waxhaw settlement, N. C., March 15, 1767, and died at "The Hermitage," near Nashville, Tenn., Jan. 8, 1845. He was admitted to the bar in 1786, settled in Nashville, and there became prominent as a prosecuting officer and in the state militia. He was a democratic representative 1796–7, and United States senator 1797–8. He distinguished himself in service against the southern Indians in the

war of 1812, was made major general in the regular army, and inflicted a total defeat upon the British army near New Orleans, Jan. 8, 1815. After a few years of further service (see ANNEXATIONS, II.), he again became United States senator from Tennessee (1823–5). In 1824–5 he was defeated as a candidate for the presidency (see DISPUTED ELECTIONS, II.), but the defeat resulted in a complete upheaval of political conditions in which almost all the political leaders hitherto prominent disappeared. Jackson and Clay withstood it. Calhoun's state did not feel it, and Adams reappeared in another field (see those names); with these exceptions there is an almost entire change of persons in politics after 1828. Jackson was elected president in 1828 and again in 1832, and after the close of his second term retired to private life. — Jackson's early opportunities for education were very limited, and the unceasing action of his maturer years left him little time to remedy this defect. He is said, on very good authority, to have believed that the earth was flat; his familiar letters are disfigured by grammatical and other mistakes; and his public papers were always carefully revised, and often entirely written, by trusted subordinates. When forced to rely altogether upon his own pen he was apt to slip, as in his once famous general order of 1814, in which he told his army that the infliction of partial evils for an ultimate good was a dispensation of Providence, "and perhaps a wise one." It is an open secret that his nullification proclamation was the work of Edward Livingston, and his bank veto that of Amos Kendall (see NULLIFICATION; BANK CONTROVERSIES, III.); nevertheless, in all cases, it is equally certain that Jackson allowed his subordinates only the privilege of expressing his ideas and policy, and that he expected from them a certain mechanical skill of expression, not the inception of a policy. Any influence upon him by subordinates was only obtained by indirection or by force of sympathy. — In temper Jackson was arbitrary, forceful, persistent, not at all impulsive but willing to yield to his naturally hot temper, on occasion; in brief, he was force personified, not aggressive force merely, but the force of self-control as well. According to the necessity of the case, he could either maintain equanimity against every exasperation, or pass into a fit of passion more demoniacal than human. In politics he was the legitimate successor of Jefferson as the assertor of individual rights against the tendency to class formation, but with this difference, that in Jefferson's time individualism claimed only recognition, while in Jackson's it had advanced to more active life. Under Madison, Monroe and Adams features had become powerful in the government which can only seem evil from the individual point of view: the incorporation of a bank to do government work, the protection of various classes of manufactures by tariff taxation, and the expenditure of public money upon roads and canals. Against all these Jackson fought as actively as Jefferson did passively. On the other hand, Jackson's individualism did not prevent him, as it did Jefferson, from being a thoroughly national man, for in Jackson's time individualism had taken a place as a co-ordinate factor in the national development. It is easy to mark the points in Jefferson's teachings from whose unhealthy development arose the Calhoun idea of nullification, but it would be impossible to imagine such a process in Jackson's case. Jefferson and Jackson had the same ultimate but a different immediate object: the former to protect the individual through the states; the latter to protect the individual through the nation. Jefferson would have opposed nullification in 1831–2, but not with the heat and sense of personal antipathy which Jackson exhibited. — The events of Jackson's administrations are elsewhere given. (See ANTI-MASONRY; CHEROKEE CASE; BANK CONTROVERSIES, III.; DEPOSITS, REMOVAL OF; CENSURES, I.; INTERNAL IMPROVEMENTS; VETO; NULLIFICATION; DEMOCRATIC PARTY, IV.; SLAVERY.) The name given to his term of office by von Holst — "the reign of Andrew Jackson" — is in a sense correct. It was a mild species of that Cæsarism to which all republics seem to turn naturally, in emergencies of war or peace. In any just estimate of the political career of the United States, it is worthy of notice, on the one hand, that the nearest approaches to Cæsarism have been the perfectly constitutional administrations of Jackson and Lincoln; and, on the other, that the nearest approaches to aristocracy have been found in grants of special privileges, for general benefit, to certain corporations or manufactures. Such a record is at least fair for a republic. — Jackson's administrations, however, are notable for the complete failure of one point of the American democratic idea. "Rotation in office," the notion that *all* public servants must be elected for short terms and easily removable by the people, was first announced in theory by Jefferson, and first attempted in practice by Jackson. The result is elsewhere treated. (See CIVIL SERVICE REFORM.) — The best life of Jackson is Parton's. A corrective to it, in many respects, may be found in 2 von Holst's *United States*, though this author allows to Jackson's opponents the right to follow the line of expediency in politics which he generally refuses to Jackson himself. For this, however, the cardinal dogma of Jackson's party is principally responsible. (See DEMOCRATIC PARTY, VI.) A slightly different view from Parton's will be found in 1 Benton's *Thirty Years' View*. See also authorities under DEMOCRATIC PARTY and WHIG PARTY; authorities under articles above referred to, and TENNESSEE; Eaton's *Life of Jackson* (1818); Goodwin's *Life of Jackson* (1832); Jenkins' *Life of Jackson* (1847); *Harper's Magazine*, January, 1855; Baldwin's *Party Leaders;* Sargent's *Public Men and Events;* Mayo's *Political Sketches;* J. A. Hamilton's *Reminiscences;* *Memoirs of Jas. G. Bennett;* Prof. W. G. Sumner's

Life of Jackson. (1882); and a list of 210 works having reference to Jackson, following the preface in 1 Parton's *Life of Jackson*.

ALEXANDER JOHNSTON.

JAPAN. The empire of Japan comprises a chain of volcanic islands stretching between Kamschatka and Formosa, off the east coast of Asia. The first settlers known to history coming from the Asian main-land, with their faces set to the eastward, gave the new country the name Nihon (sun-root, or sun-rise), which by the operation of Grimm's law becomes Nippon. Dai (great) is often added, making the name Dai Nihon, or Dai Nippon. Other native terms in common use are Yamato, after the central and ancient province which was the seat of the early mikados; O Yashima (the eight great islands), Toyo-akitsu (dragon-fly shape), and a wonderful variety of poetical and religious appellations, often with *kuni* (country) added. Tei-koku (country ruled by the Heavenly dynasty), and Kokoku (the mikado's empire), with or without Nihon added, are official titles. The Coreans use the term Il-pon, and the Chinese Jih-pun, or Ju-pun, with *kwo* (country) added; which when Marco Polo in the thirteenth century heard, he wrote Zi pan-gu, which in Europe became "Japan." It is doubtful whether this country was heard of in Europe until Polo's time, though undoubtedly known to the Arabs, Persians and Hindoos, as Japanese records attest. Japan has now for her neighbors, Russia, Corea and China; while the possessions of the United States, Great Britain and France are within the limits of neighborhood. The great length of the empire, as contrasted with its narrowness, is remarkable. It lies between the 55th and 24th degrees of north latitude, and the 124th and 130th degrees of longitude east from Greenwich; yet the greatest breadth of its main island is but 350 miles. Japan comprises Chishima (thousand islands) or the Kurile chain, Yezo, Hondo (main island), Shikoku (four provinces), Kiushiu (nine provinces), Riu Kiu (fringe of tassels) or the Loo Choo group, with Sado, Oki, Iki, Tsushima, and the Goto and Bonin clusters, with the smaller islets, numbering in all not far from 3,000. The area of the empire approximates 150,000 square miles—the size of Dakota, or one-fourth more than that of the United Kingdom of Great Britain and Ireland, or one-thirty-third that of the Chinese empire. The *do* or geographical subdivisions are based upon lines furnished by the mountain ranges of the main island, and the sea barriers. These *do* or circuits, called "Eastern Sea," "Eastern Mountain," "Northern Land," "Mountain Back," "Mountain Front," "Southern Sea," "Western Sea," and "Northern Sea," with the "Five Home" provinces, and the "Two Islands," are similar, in effect, to our grouping of states, "Eastern," "Middle," "Southern," etc. They contain 71 provinces, which are again divided into over 700 *kori*. In actual administration, the province boundaries are ignored, and *ken*, or prefecture, is made the political unit. The *ken* now number thirty-six, and there are also three *fu* or imperial cities, Tōkiō, Ozaka and Kiōto. — The population of the empire, by the carefully executed census of 1880, is 34,338,404; 17,419,785 males and 16,918,619 females. The Chinese and white foreigners living in the open ports number about 4,000. The natives are of homogeneous stock, with the exception of the slightly varied Riu Kiuans, and the 12,000 Ainos of Yezo, who are distinct in physical features and language. Though there are marked peculiarities of speech in the various provinces, especially in Satsuma, yet the ordinary people from remote localities can, with little or no difficulty, understand each other; in this respect differing greatly from the Chinese. The speech of the educated class varies from the vulgar usage mainly in the employment of more honorifics and terms of Chinese origin or pronunciation. The colloquial language of the people is a mirror of their inborn courtesy. The book language varies from the spoken tongue, yet not so much as in China. The present agents of social progress, common schools and newspapers, are rapidly causing these differences to disappear, and preparing the way for a new era in the cultivation of the national language, so long neglected for the Chinese. — The surface of the country is almost entirely mountains and valleys, with few large plains or great rivers, but with many fertile inland valleys. The climate may be said, in general, to equal any in the temperate zone Lofty mountains and volcanoes abound, and the phenomena of earthquakes have, doubtless, their influence on the Japanese mind and temperament. The soil is not the most productive, but persistent human labor and the application of fertilizers, compel a fair yield of food crops The national diet is 90 per cent. vegetable, with fish and game, but with little flesh of domestic animals. A marvelous variety of vegetable products is utilized as food, but the number of cattle as compared with the population is but 2 to 100; whereas in the United States it is 73 to 100. In minerals, scientific surveys show that the country is not rich, though fairly furnished with the precious metals; while coal and iron are abundant, especially in Yezo, the estimated amount of workable fuel being equal to a thousand times the present annual output of England. The fauna is comparatively meagre Most of the Japanese people are devoted to agriculture, and a rough estimate, based upon the census, shows, farmers, 15,000,000; artisans, 700,000; merchants, 1,300,000; miscellaneous, 2,130,000. In the last class are many seamen and fishermen, the vast number of indentations in the coast line affording employment to these classes, and greatly influencing the national development. The Japanese reckon over fifty harbors, many of which are suitable for the entry of vessels of heavy tonnage. — The physical situation and configuration of the Japanese archipel-

ago, with the forces of nature and religion acting upon this insular people, have produced a civilization and mental traits strikingly different from those of the Chinese. In spite of the fact of Japan's great indebtedness to China for many elements of culture, the islanders are at many points the antipodes of their older and more conservative neighbors on the main-land. Japan makes the claim, unique among nations, of having been constantly governed from the beginning of history by one changeless dynasty of sovereigns. Though her history is young, compared with that of China, beginning, as the natives believe, from 660 B. C., yet, unlike her larger rival, her throne has been filled by but one family—the nameless line of the mikados. Intense loyalty to the throne characterizes the Japanese people, and unique in history is the fact that no Japanese subject has ever attempted to seize the throne itself, or to found a new imperial dynasty. Yet the measure of power possessed by the sovereign and the form of actual administration have several times suffered radical change. The history of the measure of the mikado's authority is the political history of Japan. Rai Sanyo, the greatest of native historiographers, treats the actual history since the middle ages under the title *guai*, (outside, foreign, military), while the *nai* belongs to things of the gods and emperors. Japan having no invaders, and scarcely any foreign influences acting as factors of political history, the reacting forces were the throne and the camp, the mikado and shōgun. The internal history is that of the imperial palace; the external, that outside it. From the seventh to this nineteenth century, simple feudalism, centralized monarchy, the rise and struggles for power of rival noble families sprung from sires of imperial blood, civil war, dual system of government with two "capitals," complex feudalism, and finally the return to centralization with a drift toward modern constitutional and limited monarchy, are among the phases of Japan's political development. —The origin of the Japanese people is enveloped in thick clouds of untrustworthy legend, which critical processes of study are only beginning to clear away. The people, as we now find them, are evidently the resultant of several ethnic stocks, among which are the Ainos of the north, and the Malay or Nigrito elements from the south, though the latest and dominant invaders—the Asiatic Normans of this Britain of the east—were most probably of the same race from the Amoor valley which is represented in the Coreans of to-day. These people, crossing over from the peninsula, and landing on the southern and western coasts, entered at various points from Kiushiu to Echizen. They were already organized under forms of feudalism, and when, through the first trustworthy light of tradition, we are able to distinguish historic figures, we find a powerful tribe dominating the central portion of the main island from Idzumo to Yamato. By their prowess, arms, intelligence and discipline they rapidly subdue the surrounding tribes in every direction. The mikado is their chief, and his captains or lords hold their lands of him, by feudal tenure. These people worship the sun and forces of nature, and the mikado and great men claim kindred with the heavenly gods, and after death are deified and worshiped. The cardinal doctrines of their cult are purity, and reverence for the spirits of the departed This simple faith, Kami-no-michi, (the way of the gods), afterward called, in imported Chinese equivalent, Shinto, becomes a tremendous engine to complete the work of conquest, and to identify government and religion with the family whose chief is the mikado. As the area of conquest is increased, the mikado is obeyed, though with frequent revolts which compel constant war, and with frequent raids into and from Corea, over all the islands south of the thirty-seventh parallel of latitude. This is the picture of primitive Japan, before the advent of Chinese arts and letters, or of Buddhism: an agricultural people, inhabiting villages, but often called upon to invade or repel the attacks of their "savage" neighbors, so called. Their political life is simple feudalism, and their religion a rudimentary cult. They are without letters, or means of recording time beyond the methods employed by the North American Indians. The level of their civilization was probably about that of the Iroquois of New York, yet with a tendency toward higher development. Into this simple national life a marvelous infusion of new germs and perfected forms of culture was poured, when, during the fourth and fifth centuries of our era, there were introduced, through Corea, the letters, writing, almanacs, arts and sciences of China, together with Corean teachers, artisans, and an increasing train of civilizing influences. This was the first of the three great waves of civilization from the west to Japan. The second was from Europe in the sixteenth century, and the third from the United States and the world in the nineteenth century. In 552 A. D. there were introduced from Shinra, in Corea, to the imperial residence at Nara, then the capital, the images, sutras, literature and teachers of a new religion that was destined to completely overshadow the indigenous cult. This religion was Buddhism. Though bitterly opposed at first from patriotic and conservative motives, the faith of India spread steadily until it embraced the archipelago. From this time forth, the court at Nara became the centre of art, science and letters, as well as of religion and government. In 645 A. D. history began to be founded on chronology, and a system of registering dates was begun. In 712 A. D. literary culture had so far advanced that books were composed, political and statistical documents compiled, and the floating legends crystallized in the Kojiki (Book of Traditions), and the Nihongi (Chronicles of Japan)—the Eddas, or Bibles of the Japanese. In these books the scheme of creation is fully stated, in

the following order: Chaos, separation of heaven and earth, evolution of a germ or sprout from which other beings evolved or sprouted, tending toward perfection of form, until finally sex or differentiation was apparent. Then the creator and creatrix, Izanagi and Izanami, stood on the High Plain of Heaven, and Izanagi plunged his glittering spear into the turbid waters of chaos beneath. The drops trickling from the weapon, solidified and became Onokoro-Jima (island of the congealed drop) or Awaji. Other islands were formed by their creative power, and Great Japan was gradually finished. The sun and moon were evolved from the earth. Of their offspring, Ama-Térasu (heaven-illuminating), their daughter, was given the sun for her kingdom, and Susanoö, her brother, the moon for his realm, while many lesser *kami*, or gods, were created to inhabit the earth. These in time becoming unruly, Ama-Térasu, the "sun-goddess," sent her grandson Ninigi to earth to rule. Descending from Heaven, with a great retinue, and bearing the three divine regalia—mirror, seal (or crystal ball) and sword—Ninigi reached the mountain of Kirishima in Kiushiu. His great-grandson, whose mother was a sea-monster, was Jimmu Tenno, who set out on the conquest of the islands Advancing through Kiushiu, he reached the neighborhood of Kiōto, and "ascended the throne" 660 B. C. The first seventeen mikados, in the line founded by the alleged person, to whom many centuries afterward the name and title Jimmu Tenno were given, are credited with an average life of 108 years, and an average reign of 62 years. In Japanese mythology, "the earth" means Japan, the mikado (sacred gate, or sublime porte) is the Tenno (son of Heaven) and the representative and incarnation of the Heavenly Gods, and the Japanese equivalent of 1882 A. D. is the "2542d year of the Japanese empire"; April 3d being duly observed by all the people as the date of Jimmu's "coronation." There have been, including Jingu Kōgō, 123 mikados (seven of whom were females, and two of whom reigned twice, under different names), the average length of the reigns being twenty-one years; or, excepting the first seventeen on the list, and not counting the present ruler, the average is thirteen years. The great influence of Chinese culture on Japanese politics was soon shown in the creation of a library of books on government, the codification of the laws, and a profound change in the form of government The centralizing system of the Tang dynasty of China, with boards or ministries, was in 603 A. D. substituted for simple feudalism previously in force. Under the Jin Gi Kuan (Council of the Gods of Heaven and Earth) were the eight boards (*sho*) or ministries of the interior, ceremonies, civil affairs, revenue and census, war, justice, treasury and imperial household. In 786 A. D. the Dai Jō Kuan (Council of the Great Government) was formed, superseding the Jin Gi Kuan in the control of the eight boards. In it were the four great ministers of state, Dai Jō Dai Jin (Great Minister of the Great Government), Sa Dai Jin, U Dai Jin, Nai Dai Jin (Minister of the Left, Right, Interior) Under them were the eight boards. The country was divided into districts (*gun*) over which governors, appointed by the Dai Jō Kuan for four years, and sent out from the capital, ruled. These *gun* were subdivided into *ken* or prefectures. This was the *gun-ken* system, which lasted from the seventh to the twelfth century, and a virtual return to which, since 1868, has constituted "the recent revolutions in Japan" — This centralizing system was not relished by the tribes distant from the capital. Under feudalism, comparative freedom was the rule, but now close obedience to the governors from the Dai Jō Kuan, and prompt payment of taxes, were enforced. The natural consequence was, that revolts became so frequent as to require something like a permanent militia to suppress them. The farmers were so often enrolled, that numbers of them, usually the more robust, abandoned their usual labor of tilling the soil, and became professional soldiers. The generals (shōgun) who led the expeditions to chastise the rebels were chosen from those noble families of the capital, which had been founded by the sons of the mikados by concubines. At the court, the mikados no longer living the active life of warriors in the field, became students, monks, Buddhist devotees, or gave themselves up to debauchery. Succession to the throne, in case of failure of direct issue, was then, as now, provided for from the four Shin-no or relatives of the imperial houses. Their numerous offspring outside of the legitimate line were provided for by being made founders of families, on the condition that neither they nor their descendants should ever lay claim to the throne, though the mikado's wives, or empresses, could be taken from them. Thus, in succession, the Fujiwara, Taira, Minamoto, and many other less famous families, sprung up. In the development of their history it resulted that the Fujiwara monopolized the civil offices; while the Taira and Minamoto furnished the military leaders, under the red and the white flags respectively The precedent was early established that the Dai Jō Dai Jin must be of Fujiwara blood; as was, later, that which permitted a shōgun to be taken only from the Minamoto stock. As successive expeditions made the sceptre of the mikado respected from Yezo to Satsuma, the soldiers throughout the country gradually became attached in loyalty to their captains rather than to the distant and shadowy court at Nara, or Kiōto. More and more the fighters became separated from the tillers of the soil, and made the material for a new order of things. The existence of this military class was recognized by the court as early as the eighth century; and by the eleventh the real power was in their hands, while that of the court weakened. Bred to arms, suffering and rejoicing in common, the relation of the warriors and commanders grew from that of leader and led to that of lord and retainer. The substance of

authority was with the generals (shōgun); the shadow was with the once active warrior-mikado, now become a puppet-figure set up and pulled down at the will of palace officials. During the twelfth century most of the emperors were children, and reigned only in the nursery. The orders of the court, which sought to sever the relation of lord and vassal, by forbidding the men-at-arms to follow either the red or the white banner, were ignored. Though despised as *buké* (military or inferior courtiers) by the *kugé* (civil court-nobles) the Minamoto and Taira families gradually encroached upon the administrative power, so that at Kiōto (made the capital in 794 A. D.) the Taira leader, Kiyomori, became successful in palace intrigues. At the opening of the twelfth century most of the high offices of the court and provinces were filled by Taira men, who exceeded the Fujiwara in nepotism. Until 1156 the followers of the red and white flags were friendly rivals. In that year a quarrel in Kiōto broke out between them, the prize of victory being possession of the palace, and the person of the mikado, the fetich and talisman in Japanese politics. Whichever party holds this divine personage has the loyal army (*kuan-gun*) and the imperial court, and constitutes the government; the other party are *chotéki*, or rebels. Blood was shed in this first feud. The Taira were victors; the palace was first garrisoned by a military clan. Then began that domination of the military classes which, with few intermissions, lasted until 1868. Intoxicated with success, Kiyomori, defying precedent, became in 1161 Dai Jō Dai Jin, and by marrying his daughter to the boy emperor, Takakura, became the virtual ruler of Japan. He planned the extermination of his enemies, and in 1181 died, asking with his last breath that the head of Yoritomo (chief of the Minamotos) be cut off and placed upon his tomb. With the help of a prince of the blood, Yoritomo now rose, even through defeat, to power. Calling his followers together, he founded the city of Kamakura, twelve miles from the modern Yokohama. In 1182 the Minamoto army entered Kiōto, and Yoshitsuné, their leader, drove the Taira south, and in a great land and naval battle near Shimonoséki, nearly annihilated them. The white flag was now triumphant everywhere. Yoshitsuné, shamefully treated by his jealous brother, fled to Yezo, and thence, it is said, to Manchuria, becoming the great conqueror known as Genghis Khan. In 1190 the foundations of the second feudal system of Japan were laid by Yoritomo, under whose influence his captains and retainers were appointed *military* magistrates throughout the eastern half of the country. He secured from the court this division of the two governmental functions: collection of the land taxes, and maintenance of public order, which had been before united in the *ken* governors appointed by the Dai Jō Kuan, for terms of four years. Yoritomo himself was invested with a *civil* title, which made him the chief of these *military* magistracies. The system worked so well in the eastern provinces, that it was gradually extended to the central and western provinces, and thus the ambition of Yoritomo was effectually concealed; until, in 1192, being able to control the court, he was created Sei-i Tai Shōgun, or Great General for the quelling of Barbarians, and the complete separation of the civil and military functions of government was thus, in effect, attained. Henceforward, until 1868, the throne and the camp were the two factors of history, and Japan had two capitals and two rulers. Yoritomo died in 1198, and his line ended in 1219. The Hōjō family of rulers, following out Yoritomo's plans, set up puppet shōguns to be the figure-heads of government at Kamakura, themselves holding the reins of power. It was during their rule, that Japan, through Marco Polo, was made known to Europe, the Mongols repulsed, and Buddhism revived and extended. The Hōjō came to an end through misgovernment and luxury, in 1333 A. D., being overthrown by Nitta Yoshisada, who fought in the name of the mikado, and whose portrait now adorns the national "greenback" bank note currency. For two years the shōgunate was in abeyance, and the mikadoate existed feebly. The rewards to the victors were in the form of fiefs of land, so firmly had the procedure of feudalism become fixed. A quarrel over an unfair division of rewards led a rival captain, Ashikaga Takauji, to seize Kamakura again, and the duarchy was restored. Setting up Kogen, a scion of imperial blood, as mikado, and his claims being resisted by the court, civil war at once broke out and raged for fifty-six years, reducing the land to desolation. A compromise and union was made in 1392, and the usurping branch of the imperial family became extinct in a few generations, and the original line of rulers filled the impotent throne. The Ashikaga line of shōguns reared higher the edifice of feudalism, by making the military magistracies hereditary in the families of their own nominees The details and etiquette which characterized the Japanese as known to Europeans were settled; castles were built; and the rise and fall of daimiō families, with almost constant civil war, the decay of the shōgun's power, the neglect of learning, contrasting with the spectacular splendors of feudalism, the transformation of the Buddhist monks into clerical militia, and the ravaging of the coasts of Corea and China by Japanese pirates, belong to this period (1335–1573). In many interesting aspects the state of society in Japan under the Ashikagas was marvelously like that of feudal Europe. In 1539 the first Europeans landed in Japan, bringing gunpowder and firearms, thus introducing new elements in Japanese civilization The Jesuit missionaries, then in the freshness of their astonishing vigor, led by Xavier, in 1542 entered Japan and speedily secured a following of thousands of converts, while at the same time the Portuguese merchants opened a thriving trade in the southern ports. — In the latter half of the sixteenth century began another series of influ-

ences upon Japan from Europe and the outer world, which for nearly eighty years poured a steady infusion of new ideas into the national mind. The chronic state of war in Japan at this period hindered the due influence of western ideas, which, though without the effect of the earlier importation from Corea in the fifth and sixth centuries, vastly enlarged the horizon of the native mind. Heretofore, also, a salient point in Japanese history was the rise to power of *noble* families. The striking phenomena of this pivotal half-century was the rise to loftiest power of three individuals of plebeian origin. Nobunaga, born in 1533, extinguished the Ashikaga line, endeavored to curb the rampant Buddhist power, favored Christianity for political purposes, endeavored to unify all Japan and to reduce the feudal chaos and anarchy to order, under and for the mikado. He rose to be Nai Dai Jin, but was assassinated in 1582. His retainer Hidéyoshi (Taiko Sama) completed his work, curbing even the proud Satsuma clan, laid the foundations of the policy afterward carried out by Iyéyasu invaded Corea, to give the warlike clans employment after being thus suddenly pacified after chronic war, and perhaps to be rid of his Christian soldiers, and then turned his attention to the Jesuits, whom he banished with partial success. Setting aside the precedent requiring the Dai Jō Dai Jin to be of Fujiwara blood, he himself filled that office. He died in 1599. Tokugawa Iyéyasu, a retainer of Hidéyoshi, who founded the city of Yedo and the Tokugawa line of shōguns, succeeded, after the battle of Sékigahara, in 1600, in obtaining the appointment, in 1603, of Sei-i Tai Shōgun, and thenceforth devoted himself to a policy of unification, peace, the perfection of the duarchy, and the promotion of learning. Henceforth, like a crystal which, by the laws of its formation, secures perfection by casting out whatever is foreign to its substance, the history of Japan, expelling all outer influences, crystallized into the elaborate feudal and dual systems, which excited the wonder of Europeans. Long after the last traces of feudalism had begun to fade out of Europe, Japan was perfecting as minute and peculiar a form of it as the world ever saw. In 1637 Christianity was annihilated by the massacre at Shimabara, and all foreigners were expelled and warned off, except a dozen or so of Hollanders imprisoned, for the sake of trade, and limited to an annual ship's visit from Europe, upon Dé-shima (outside island), near Nagasaki. The throne and the camp were now perfectly separate; Kiōto was the fountain of honors and titles, Yedo, of power and revenue. "The mikado all men love, the shōgun all men fear," was taught in every household. Learning revived, and profound peace for 254 years followed. Fifteen shōguns of Tokugawa blood ruled in Yedo — "The history of Japan, as manifested in the current of events since the advent of Commodore Perry, has its sources in a number of distinct movements, some logically connected, others totally distinct from the rest. They were intended to effect. 1, The overthrow of the shōgun, and his reduction to his proper level as a vassal; 2, The restoration of the true emperor to power; 3, The abolition of the feudal system, and a return to the ancient imperial régime; 4, The abolition of Buddhism, and the establishment of pure Shinto, as the national faith and the engine of government. These four movements were historically and logically connected. The fifth was the expulsion of the 'foreign barbarians,' and the dictatorial isolation of Japan from the rest of the world; the sixth, the abandonment of this design, the adoption of western civilization, and the entrance of Japan into the comity of nations. The origin of the first and second movements must be referred to a time distant from the present by a century and a half; the third and fourth to a period within the past century; the fifth and sixth to an impulse developed mainly within the memory of young men now living" ("North American Review," April, 1875—"The Mikado's Empire," p 291.) Into the details of these internal movements we have not space to enter. Suffice it to say that the seed of them was sown when the ancient texts, so long neglected during two centuries of civil war, were deciphered, re-edited and studied, when the scholars of Mito had published their historical researches, and when Rai Sanyo had written his masterpiece, Nihon Guaishi ("Military History of Japan"), all of which opened the eyes of students to the fact that the shōgun was a usurper and the mikado the true sovereign. When all within the country was ripe for revolution, the coming of foreigners precipitated the crisis. The resultant of the two motions—that within and that without—was an acceleration of movement in the unexpected direction of western civilization such as has astonished the world, and the Japanese themselves. In producing the results which opened this secluded nation to the world, the United States has borne an honorable and leading part, as becomes her geographical position. The edict of Iyéyasu, compelling all native craft to be built so as to be unseaworthy, was the cause of hundreds of fishing and trading junks being driven by storms into the Kuro Shiwo, the gulf stream of the Pacific, whence they stranded on the Aleutian islands and along the coast of America from Alaska to San Francisco. Over fifty known instances of such wrecks with survivors on board, since 1785, are recorded. ("The Mikado's Empire," Appendix.) The majority of these waifs were picked up by captains of American ships. In 1837 Mr. Clarence A. King dispatched the American brig Morrison from Macao to Yedo bay to return three shipwrecked Japanese picked up in Washington territory. The ship was fired upon, and returned. In 1839, 1840 and 1841 American captains rescued more waifs, one of whom afterward translated Bowditch's "Navigator" into Japanese, and in 1860 sailed a Japanese steam vessel across the Pacific. In 1845 Capt.

Mercator Cooper of the Manhattan, rescued at sea, and delivered up near Yokohama, twenty-two Japanese. In the same year Gen. Zadoc Pratt, of Ulster county, N. Y., chairman of the committee on naval affairs in congress, on the 15th of February, reported a bill for the effecting of commercial arrangements with Japan and Corea. In 1848 Commodore Biddle, with the United States steamers, Vincennes and Columbus, was sent to open trade if possible, but without success. Two American ships having been wrecked on the Japan coasts, Commodore Glyn on the Preble was sent to Nagasaki to bring away the sailors, all of whom had been required, in Dutch fashion, to trample on the crucifix to show that they were not Portuguese. The discovery and settlement of California and the increase of our Asiatic trade and whale fishery in the Pacific increased the desire to have access to Japanese ports, while the increasing frequency of shipwreck made such access necessary. Daniel Webster, secretary of state, prepared a letter from the president to the "emperor" (shōgun) of Japan, but the expedition was delayed until after his death, when Matthew C. Perry was appointed commander and envoy. With consummate tact, Perry, arriving in the bay of Yedo, July 8, 1853, after stating his object, left, but appeared again, and with a fuller force, Feb. 12, 1854. In the negotiations, Perry treated with the shōgun (an official of the sixth rank; though of *de facto* power) as if he were the emperor; while the latter styled himself "Tycoon" (*Taikun*, great prince). Treaties on the Perry model were soon after made with England, France, Russia and Holland, until twenty nations had entered into relations with Japan. These outward events only served to precipitate the crisis within. Enraged at the signing of a treaty, the admittance of foreigners on the sacred soil of the God-country, and the culmination of a long series of usurpations by assumption of the title of tycoon, the "patriots" or mikado reverencers raised the cry, "Honor the mikado and expel the barbarian." Townsend Harris, the consul general of the United States, secured a second convention with the Yedo government, which the regent Ii signed without the consent of the mikado. This fanned the flames of patriotism, and at once began a systematic assassination of foreigners, and the firing of their legations. The daimiōs broke through the law of centuries compelling their residence at Yedo, and the political centre of gravity shifted to Kiōto. To further embroil the shōgun with the treaty powers, fresh acts of violence were committed, and, as a result, Kagoshima in Satsuma and Shimonosŏki in Chōshiu were bombarded; the former by a British, the latter by an allied squadron; and heavy indemnities were exacted. Kiōto was burned in the civil war between the Chōshiu clan and the Yedo troops. On Jan. 3, 1868, the coalition of clans hostile to the shōgun secured possession of the palace and the person of the mikado, and proclaimed the ancient form of government. When, therefore, the followers of the shōgun Keiki, who had resigned his title and authority, regretted his action and attempted to re-enter Kiōto in force, they were fired on, and in the three days battle of Fushimi beaten, thus becoming *choteki*. The result of the two years civil war which followed with American rifles and the iron-clad ram Stonewall on the loyal side, was that the mikado's authority was re-established all over Japan, and the ancient imperial régime established. Among the first acts of the new government was to ratify the treaties in the name of the mikado, to make Yedo the *kio* or capital, which they named Tōkiō, to take from the mikado an oath and promise to establish a national deliberative assembly to decide measures by public opinion, and to seek for intellect and learning from foreign countries, "to establish the foundations of the empire." Rapidly in succession followed the abolition of the feudal system, the mediatizing of the daimiōs, and the commutation of the hereditary pensions of the *samurai* or military class, the reconstruction of society into three classes, the restoration of the *eta* to citizenship, and reforms innumerable on a national scale. Fourteen years of absolute government have followed the restoration. The new rulers, nearly all of whom were men sprung from the middle class, had their hands too full to remind the mikado of his oath, or to wish it fulfilled. Other able men outside the government firmly demanded that the promise be kept, and the vigorous press and able political lecturers—new engines in politics—seconded the demand. Meanwhile in the southern part of Japan, the samurai, their occupation gone, irritated at the unforeseen drift of the restoration, using various pretexts—under all of which was plainly visible the warlike spirit of feudalism and Old Japan—rose repeatedly in rebellion, which taxed the power of the new government to the utmost, and, during the Satsuma uprising in 1877, threatened its very existence. To suppress these, cost the nation 20,000 lives and $100,000,000. This sum, with the amount expended on national improvements, lighthouses, railroads, commuting pensions of the samurai, etc., etc., has created a national debt (June, 1880) of $358,040,000. At last, in 1881, the government yielded to the pressure of a growing public opinion, and the mikado issued a proclamation granting the formation and powers of a true national deliberative assembly in 1890. — The constitution of the government is as follows: The supreme council (Dai Jō Kuan), consisting of the premier (Dai Jō Dai Jin) two vice-premiers (U Dai Jin and Sa Dai Jin), a varying, but small, number of councilors (Sangi), and the ministers or heads of departments of foreign affairs, interior, finance, war, marine, public works, justice, colonies and agriculture, all of whom receive salaries much lower than those of a corresponding grade in western countries. The second of the governing bodies of the state is the senate, or Genro-in (house of elders), composed of nobles, and men

of eminent service or political ability, nominated and paid by the government. Its powers are more restricted than those of the British house of lords, the initiative of its business being given by the Dai Jō Kuan, though the tendency of its nature is to broaden the law-making power. In 1878 a long step was taken toward representative institutions, by the formation of local assemblies sitting once a year, dealing, under the supervision of the minister of the interior, with questions of local taxation, with the right of petition to the central government on other matters of local interest. The qualifications of members and electors, men only, are limited by ability to read and write, and the payment of an annual land tax of at least $5. Under the Dai Jō Kuan, are the three cities and the thirty-five *ken*, which are ruled by governors (*rei*). The three classes of society are nobility (kuazoku), gentry (shizoku), and common people (heimin). Under every department the work of administration has been more or less conformed to modern and western procedure and usage, a fair proportion being based on American models. In foreign affairs, legations and consulates are now established in many foreign capitals and ports, and the steady aim is now to obtain from the treaty powers recognition of Japan's sovereignty, the removal of the extra-territoriality clauses from the treaties, and the right to regulate her own tariff and commerce. In finance, the total revenue, for 1879–80, was $61,860,000; and the expenditure, $59,610,000. The chief revenue is from the land tax, which, in 1877, was lowered to 22 per cent. upon the assessed value. $108,680,000 of paper money is in circulation. Of the total debt of $358,040,000, five-sevenths was inherited from the past, incurred in commuting pensions, assuming the debts of the daimiōs, etc. 152 national banks, established on the American principle, possess a capital of $41,921,100, and have reduced the rate of interest from 14 to 11.2 per cent., besides greatly developing commercial enterprise and general prosperity. The whole amount of taxation levied by the government, in nineteen kinds, is $54,550,000, of which the land tax yielded, in 1879–80, $41,900,000, or about four-fifths of the whole; customs duties yielding, in 1878, $2,350,000, and all other taxes $8,670,000. The value of the government assets, forest and building land, public works, etc., etc., is appraised at $300,000,000. 4,000 miles of telegraph connect the chief towns of Japan with the rest of the world. Postal lines, on which a letter may be sent for two cents, amount to 40,000 miles, and Japan is in the international postal union, besides having at home all the equipment necessary even to postal cards and savings banks, and forwarding nearly 50,000,000 covers annually. About 100 miles of railroad lines are opened. Thirty-five lighthouses, besides buoys, beacons and harbor improvements, have greatly aided foreign as well as native commerce. 460,000 vessels of native model and 400 of foreign, many of them steamers, form the mercantile marine, and 27 vessels, with 4,242 men and 149 guns, compose the navy. 400,000 wheeled vehicles in the country now pay tax, though before 1868 they were in very limited use, horses for draught being nearly unknown. The army, on a peace footing, consists of 35,560 men, and in war time of 50,230, with a reserve of 20,000 men. The police force, which in spirit and organization equals the army and can be used as military, numbers 23,334 men. Newspapers, 211 in number, have an aggregate circulation of 29,000,000 copies. The number of schools in 1879 was 25,459, with 59,825 teachers (of whom 1,558 were female), and 2,162,962 scholars (of whom 568,220 were girls). The voluntary private contributions in aid of education, from 1872 to 1879, were $9,000,000. The old judicial system has been reformed; the penal laws are based on the Code Napoleon, and the system of tribunals from the supreme court (Dai Shin In) in Tōkiō to the humblest magistrate's bar, are being steadily conformed in theory and practice to the models of christendom. The mere statement of these facts is sufficient to prove the sincerity of Japan's purpose to cast away the Chinese and adopt the western model of progressive civilization. In spite of many mistakes and discouragements her rulers have persevered, until it is doubtful whether history has recorded so sudden and thorough a transformation of an entire nation. Christianity is also working among the masses, the way being well prepared for her by the rapid adoption of those institutions and forms of life with which this faith always assimilates. (See also COREA, MUTSUHITO, RIU KIU, and biographical notices of Japanese statesmen in this work.) The ministers of the United States to Japan have been: Townsend Harris, consul general (1856–61). Robert H. Pruyn (1861–5); R. Van Valkenburgh (1866–70) — these three were of New York, the two latter being ministers resident; Charles E. De Long of Nevada (1870–74) and John A. Bingham of Ohio (1874–82) being ministers plenipotentiary. — Among the numerous writers on Japan, Kaempfer, Thunberg and Tetsingh are the best among the older ones. Of modern writers before the restoration, F. L. Hawks' *Narrative of the American Expedition under Commodore Perry*, R. Hildreth's *Japan as it was and is*, Boston, 1855, and R. Alcock's *The Capital of the Tycoon*, London, 1863, are best suited to the student of political science. Writers since the restoration are F. O. Adams, *History of Japan*, London, 1875; W. E. Griffis, *The Mikado's Empire* (History, Travels, Essays, Social and Political Life, Statistics, etc.), New York, 1876–8; G. Bousquet, *Le Japan de nos jours*, Paris, 1877; C. Le Gendre, *Progressive Japan*, New York, 1878; E. J. Reed, *Japan*, London, 1881; J. J. Rein, *Japan, Natur und Volk des Mikadoreiches*, Leipzig, 1881. Especially valuable are the *Transactions of the Asiatic Society of Japan*, 1872–8, and the various publications in English issued by the Japanese government.

W. E. GRIFFIS.

JAY, John, was born in New York city, Dec. 1 (O. S.), 1745, and died at Bedford, N. Y., May 17, 1829. He was graduated at Columbia in 1764, was admitted to the bar in 1768, and took high rank as a lawyer. He was a leader in the early revolutionary movements in New York and in forming the state constitution in 1776. He was a delegate to congress 1774–7 and 1778–9, was on its leading committees, and was president during his last term. In the meantime he had also been chief justice of his state, 1778–9. In 1779 he became minister to Spain, and was one of the American negotiators in 1783. Returning in the following year he became secretary of foreign affairs until 1789. Sept. 24, 1789, he was appointed chief justice of the United States. (See JAY'S TREATY.) Before his return from the English negotiation he was elected governor of New York by the federalists, was re-elected, and served until 1801. He had been nominated in 1792, but was defeated by the official rejection of a part of the popular vote. (See NEW YORK.) In 1801 he retired peremptorily and permanently from public life. (See FEDERAL PARTY.) — Jay's best political writings are his early revolutionary state papers, his share of the "Federalist" (see that title), and his opinion in Chisholm *vs.* Georgia. (See JUDICIARY.) His instinctive integrity is well marked by his indorsement on the back of a letter from an influential federalist, written after the democratic victory in New York in 1800, and suggesting the calling of a special session of the federalist legislature to assume legally the appointment of electors: "Proposing a measure for party purposes, which I think it would not become me to adopt" — See Jay's *Life of Jay;* Sparks' *Life and Writings of Jay;* Renwick's *Life of Jay;* Jenkins' *Governors of New York,* 74; 2 Flanders' *Chief Justices;* Van Santvoord's *Chief Justices;* Parton's *Life of Burr,* 253; 37 Harper's *Magazine;* 1 Hammond's *Political History of New York* (see index).

ALEXANDER JOHNSTON.

JAY'S TREATY (IN U. S. HISTORY). The acknowledgment of the independence of the United States by the definitive treaty of peace of Sept. 3, 1783, made the United States a member of the family of nations *de jure,* but not *de facto.* The articles of confederation had given congress the power of "entering into treaties and alliances, provided that no treaty of commerce shall be made whereby the legislative power of the respective states shall be restrained from imposing such imposts and duties on foreigners as their own people are subjected to, or from prohibiting the exportation or importation of any species of goods or commodities whatsoever." This restriction upon the powers of congress practically prohibited the negotiation of any commercial treaty, since it was impossible that any other government would knowingly concede valuable commercial privileges to the citizens of the United States in return for a treaty which the government of the United States had no power to enforce, and which the respective states had a vested right to nullify at pleasure. Under the confederation, treaties, having more or less bearing upon commerce, were, it is true, negotiated with the Netherlands (Oct. 8, 1782), with Sweden (April 3, 1783), with Prussia (Sept. 10, 1785), and with the Barbary States (see ALGERINE WAR); but all these treaties contained stipulations really beyond the powers of congress, and were only allowed to exist without objection because of the almost entire absence of present commercial intercourse between the United States and the other contracting parties. The most important commerce of the United States was then with Great Britain, and that country not only refused to make any provisions for commercial relations in the definitive treaty of peace, but continued her refusal to make a commercial treaty with the United States throughout the period of the confederation and until 1794. Powers to make such a treaty were given to the American commissioners in 1783, to John Adams in 1785, to Gouverneur Morris in 1789, and to Thomas Pinckney in 1792, but the British government preferred to regulate trade with America by act of parliament. — By the terms of the definitive treaty of peace special obligations were imposed upon both parties Great Britain agreed to withdraw her fleets and armies from the United States without carrying away negroes; and the United States agreed that there should be no lawful impediment to the collection of debts due to British subjects, and that congress should "recommend" to the states the restoration of the confiscated estates of tories and a cessation of confiscations for the future. The use of the word "recommend," and the contemporary debates in parliament, show that the British commissioners fully understood the limitations upon the powers of congress at the time; nevertheless, though congress punctually fulfilled its agreement by twice strongly recommending the state legislatures, in 1783 and 1787, to abstain from further confiscations, the British government chose to consider the inattention of the state legislatures an infraction of the treaty, and refused to withdraw its troops from the northwestern forts. Until 1796, therefore, the posts of Michilimackinac, Detroit, Fort Erie, Niagara, Oswego, Oswegatchie (on the St. Lawrence), and Point au fer and Dutchman's Point (on Lake Champlain) all lying within the territory of the United States, were garrisoned by British troops, whose officers exercised jurisdiction over the surrounding country. After Wayne's victory over the Indians in 1794, it was with great difficulty that the American general restrained his troops from assaulting and capturing a newly built British fort, just south of Detroit, which they met in the pursuit. As a matter of course, this refusal to withdraw the British troops was a very fair excuse for the state legislatures to continue their inattention to the recommendations of congress. — After the inauguration of the new form of government in

1789, under which entire constitutional power over treaties was intrusted to the federal government, two efforts were made by President Washington, as above stated, in 1789 and 1792, to establish commercial relations with Great Britain on a treaty basis; but the British government, apparently unconscious or unwilling to believe that a vigorous national government, capable of retaliation, had been developed in the United States, persisted in its course of unfriendliness, refusing to send a minister resident to the United States, to pay for about 3,000 negroes carried away by retiring British fleets, to enter into a commercial treaty, or to order the evacuation of the northwestern posts. — In arranging the duties on imports the 1st congress made no attempt at retaliation upon Great Britain, but was governed mainly by the pressing necessity for raising a revenue, though protection to American interests was also kept in view. Great Britain's continued refusal to enter into a commercial treaty gradually brought up the idea of retaliation, and a house resolution of Feb. 23, 1791, called out an elaborate report from Jefferson, secretary of state, dated Dec. 16, 1793, upon "the nature and extent of the privileges and restrictions of the commercial intercourse of the United States with foreign nations" The strongest points which this celebrated report made against Great Britain were that parliament had only consented to modify the original prohibition of any American trade with Great Britain by allowing American productions to be carried thither in American ships; and that even this privilege was made dependent on the king's permission, given annually by proclamation, in default of which American vessels would be again entirely interdicted from British ports. The report advised a resort to the power of congress to "regulate commerce with foreign nations," 1, by favoring the commerce of any nation which should remove or modify its restrictions upon American commerce, and 2, by an exactly equivalent retaliation upon any nation which should impose high duties upon American productions, prohibit them altogether, or refuse to receive them except in American vessels. — Jefferson's report fired a train which very nearly resulted in a war with Great Britain. To the inflammable material previously accumulated in the grievances against that country, the interests attaching to the French revolution had already been added, and the anti-neutral "orders in council" to the British navy raised popular excitement almost to the war point during the winter of 1793–4; so that the proposal of retaliation was not at any time discussed from an economic point of view, but was supported by the republicans (or democrats), and opposed by the federalists, mainly because it was considered a means of throwing the moral weight of pronounced American sympathy into the anti-British scale, while avoiding open war in alliance with the French republic. (See DEMOCRATIC-REPUBLICAN PARTY, II.; FEDERAL PARTY, I.; EMBARGO, I.) The first step was the introduction of a series of resolutions in the house, Jan 3, 1794, by Madison, designed to carry Jefferson's second recommendation into effect. The first resolution, asserting the general principle of retaliation, passed the house, Feb. 3, by a vote of 51 to 46, and the other resolutions were postponed until March by their supporters to await the progress of events. But in the meantime the anti-British feeling in the house had been growing steadily stronger. Madison's resolutions were practically superseded, March 26, by the passage of a joint resolution laying an embargo on ships in American ports; on the following day a proposition was introduced by Jonathan Dayton, a New Jersey federalist, to sequester all debts due by Americans to British subjects, and turn them into a fund for indemnifying American sufferers from British spoliations, and this, in its turn, was superseded by a proposition, April 7, to prohibit commercial intercourse between the United States and Great Britain, after November 1 following, until the latter country should cease its anti-neutral naval policy and evacuate the northwestern posts. Before the non intercourse resolution could be passed, President Washington again intervened, as he had done a year before (see GENET, CITIZEN), to check the torrent of anti-British feeling and action, and, April 16, sent to the senate the nomination of John Jay as minister extraordinary to Great Britain, for the purpose of securing peace and "a friendly adjustment of our complaints." The nomination was confirmed by the senate, 18 to 8, nevertheless the house persisted in passing, by a vote of 58 to 38, April 21, its non-intercourse resolution, which was only defeated in the senate by the casting vote of the vice-president. — The president had abandoned his first selection, Hamilton, for the mission, chiefly on consideration of the bitter opposition which would inevitably meet any treaty negotiated by him. His second choice, Jay, was a much more fitting one, his great ability, tact, diplomatic skill and experience, popularity, known moderation, and freedom from partiality either to France or to Great Britain, made him, to quote Hamilton's own words to the president, "the only man in whose qualifications for success there would be thorough confidence, and him whom alone it would be advisable to send." There were but two objections to his nomination, his position as chief justice, and the needlessness of any extraordinary nomination while there was already a minister to Great Britain. It is difficult to answer the former objection; only imperative necessity and the lack of pressing occupation for the court itself, could excuse such an experiment upon the independence of the judiciary. In the second objection there was no force. In nominating Jay, the president had made an opportunity to declare that his confidence in Mr. Pinckney, the resident minister in London, was undiminished. The *extraordinary* nomination had a different reason, it was intended and seems to have

been taken as an assurance to Great Britain that the *executive* of the United States intended, if possible, to maintain neutrality. No such assurance was necessary to France, for that country was already assured of the mass of popular sympathy in the United States. In this case, therefore, Washington deliberately cast the weight of his personal and official influence into the lighter scale, as Adams, his successor, in the exactly parallel case of 1798–9, threw his into the opposite scale when it became the lighter. (See X. Y. Z. MISSION, EXECUTIVE.) — Jay reached London June 15, and entered without difficulty or delay upon the work of his mission with Lord Grenville, the English negotiator; and the two arranged the terms of a treaty, Nov. 19, in twenty-eight articles. Of the three American claims, the treaty settled but one outright: the northwestern posts were to be surrendered on or before June 1, 1796, but no compensation was to be paid for their previous wrongful detention; the American claims for compensation for illegal seizures were to be referred to commissioners for settlement; and the claims for compensation for negroes carried away were waived by Jay because of the flat refusal of the English negotiator to consider them. (See SLAVERY.) Joint commissioners were to settle the northeastern and the (then) northwestern boundary of the United States, and the British debts whose collection had been prevented during the confederation; and no debts were in future to be confiscated by either party in the event of war. These points having been settled in the first ten articles, which were to be permanent, the other articles made up a treaty of commerce and navigation, limited to twelve years. Trade between the United States and the British dominions in Europe was to be reciprocally free; direct American trade to the British East Indies, but not the coasting trade there, was permitted; trade to the British West Indies, in vessels of not more than seventy tons, was permitted; and neither country was to allow its citizens to accept commissions of war against the other, or to permit privateers of a third (enemy) power to arm, enlist men, or take prizes within cannon shot of its coast. Neutral persons unlawfully commissioned or enlisted were to be considered pirates. Contraband goods were specified in general terms, and it was agreed that such articles as provisions, when made contraband by particular circumstances, should be paid for, and that the forfeiture of contraband goods should not forfeit the whole cargo. The article relating to West Indian trade was specially limited to two years after the conclusion of peace between Great Britain and powers at war with her in 1794, and the Americans were to renounce, in return for it, the exportation of sugar, molasses, cocoa, coffee, and cotton, to Europe. — June 8, 1795, the treaty was laid before the senate in special session, and after a secret debate of over two weeks it was ratified, June 24, by a vote of 20 to 10, the exact two-thirds majority necessary for the ratification of a treaty; but the ratification was made conditional on the addition of an article to suspend that part of the 12th article relating to the West Indian trade. The principal objection to this article arose from its prohibition of the exportation of certain articles, above named, from the United States. The colonial system of European nations then included a general prohibition of trade to their colonies; and when Great Britain permitted a modified trade to her West Indian colonies, she demanded in return a renunciation of American trade in sugar, etc., in order that these colonial productions should not thus be indirectly transmitted through the United States to foreign nations. Jay seems not to have known that the culture of cotton had already been introduced into the United States. The additional article was finally added to the treaty, Oct. 28, 1795, but full navigation with the British West Indies was not obtained until October, 1830. — Jay had reached New York, May 28, and from that time the whole country had been intensely anxious to know the nature of the treaty. After its ratification by the senate that body had still prohibited its publication; but, while the president was still in doubt whether or not to complete the conditional ratification by his signature, Senator Mason, of Virginia, sent a copy of the treaty, June 29, to the Philadelphia "Aurora," a democratic newspaper, for publication. Its appearance in print, July 2, was the signal for an outbreak of political excitement which was probably never paralleled until slavery took a place in politics. The newspapers were filled with articles, signed with Latin names, Cato, Camillus, Caius, Atticus, Decius, and Cinna, in the fashion of the time, mainly against the treaty; and town meetings and mass meetings, from Boston to Savannah, passed resolutions calling upon the president to withhold his signature. The ablest series of letters was that of Hamilton in defense of the treaty, over the signature of Camillus; the most venomous was that of "A Calm Observer," in the "Aurora," commonly attributed to John Beckley, clerk of the house. At first the attacks were directed against Jay; and the treaty, in its implied recognition of the British right of search, impressment and power to make any class of goods contraband, in its regulation of the West Indian trade, and in its failure to obtain compensation for the retention of the northwestern posts or for the negroes carried away from New York city, offered so many vulnerable points that attack was easy. The opponents of the treaty, however, went further than mere resolutions. Jay was repeatedly burned in effigy, and one society "lamented the want of a guillotine" for him; in New York Hamilton was stoned while defending the treaty at a public meeting; in Philadelphia the mob burned a copy of the treaty before the British minister's house; and in Charleston, after a meeting led by John Rutledge, who had just been appointed chief justice in Jay's place, the British flag was dragged through the streets and burned before the house of the British consul. — Notwith-

standing the defects of the treaty, Washington believed it to be the best that could be obtained, and signed it, sending to the British government, at the same time, an urgent remonstrance against a recent order in council which made provisions contraband. The remonstrance secured the repeal of the order. The democratic leaders (see DEMOCRATIC-REPUBLICAN PARTY, II.) of the republican party at once attacked the president personally, with the object of destroying his influence in congress and of inducing the house to deny the appropriation (about $90,000) necessary for carrying the treaty into effect. From August until the following spring the attacks upon the president became progressively more open and bitter. From the beginning he was accused of usurpation, in collusion apparently with the senate majority, in having negotiated a treaty which endeavored to shut out the house of representatives from a share in the constitutional powers of regulating commerce, of establishing rules of naturalization, of defining piracy, of making rules concerning captures, and of laying taxes. Side issues were then brought in: he was accused of having neglected to ransom American captives in the Barbary States, of having written letters designed to procure submission to Great Britain during the revolution, and of having drawn more than his salary from the treasury. Only the last named charges seem to have moved the president, though he complained that they were all couched "in terms so exaggerated and indecent as could scarcely be applied to a Nero, a notorious defaulter, or even to a common pickpocket." The alleged letters he demonstrated to be forgeries, and the secretary of the treasury disproved the other charge. But toward the time when congress was to meet, the attacks on the main issue grew warmer; an impeachment of the president was suggested; hints were given of the necessity of a Brutus for this "step-father of his country"; and some effect was produced not only on congress but on state legislatures. The house of delegates of Virginia, Nov. 20, voted down a resolution expressing their undiminished confidence in the president; and the federal house of representatives, Dec. 16, struck out a paragraph declaring their confidence in the president, which their committee had inserted in their draft of a reply to the message. — On the other hand, the tide had really been turning, throughout the country, not so much in favor of the treaty as in support of Washington. The other state legislatures, with the exception of South Carolina, refused to follow Virginia's lead, and either voted strong declarations of their confidence in the president, or refused to consider the matter; commercial bodies of all the states approved the treaty; and the current of public meetings, at first entirely against the treaty, had turned before February, 1796. Nevertheless, a struggle in congress was inevitable, and it began with a resolution offered in the house, March 2, 1796, by Edward Livingston, of New York, calling on the president for Jay's instructions. Upon this resolution the debate lasted from March 7 until March 24, when it was passed by a vote of 62 to 37. March 30, the president, although he had already published the instructions by sending them to the senate, refused, as a matter of precedent, by yielding to the demand for the envoy's instructions, to countenance the idea that the assent of the house was necessary to the validity or execution of a treaty. April 7, the house, by resolution, which was passed by a vote of 57 to 35, declared that it claimed no agency in the making of treaties, but that it claimed, as part of congress, a right to deliberate upon the expediency of carrying into effect a treaty containing regulations on the subjects given by the constitution to the control of congress. April 15, debate began upon a federalist resolution that the treaty ought to be carried into effect. The first vote was taken in committee of the whole, April 29, and stood 49 to 49, but the speaker, though opposed to the treaty, voted for the resolution in order to give further opportunity to consider it. The report of the committee of the whole was considered in the house, on the following day, and a proposition was made to amend the resolution so as to read "That, although, in the opinion of this house, the treaty was highly objectionable," it was nevertheless expedient, considering all the circumstances, to carry it into effect. By the casting vote of the speaker, the vote standing 48 to 48, the word "highly" was stricken out; the entire amendment was then lost by a vote of 49 to 50; and the original report was adopted by a vote of 51 to 48. This ended the first and greatest struggle in congress against the application of the treaty power. — The conflict had the good result of laying open to view a difficulty in the practical workings of the constitution, which could not well have been guarded against, and which has only been avoided by the steadily forbearing and pacific policy of successive executives. (See EXECUTIVE.) The treaty power is certainly limited, but it is impossible to locate the limiting line exactly. Treaties are not, as it is sometimes loosely said, "the supreme law of the land"; "this constitution, and the laws of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made, under the authority of the United States," together make up the supreme law of the land, and treaties, therefore, can at best hold but a co-ordinate rank. It is easy to see that a treaty involving the establishment of a foreign prince upon the throne of the United States, though made under every constitutional form, would be invalid, and that Jay's treaty, though clashing slightly with the powers of congress, was not invalid; but between these two extreme cases there are countless supposable cases open to question. It is impossible, for instance, to believe that in 1798 a federalist house of representatives would have voted money for the execution of a treaty of offensive and defensive alliance with France, passed by a democratic

president and senate. It is equally impossible to conceive a republican house of representatives in 1882 submitting to the abolition of the protective system and the establishment of free trade by treaties made by a democratic president and senate. And yet the reasoning of Washington's message of March 30, 1796, makes it the duty of the house in *all* these cases to remain entirely passive. Perhaps the easiest solution of the difficulty is that offered by Story, as cited below: "Whether there are any other restrictions [than that treaties shall not abrogate the organic law] necessarily growing out of the structure of the government, will remain to be considered whenever the exigency shall arise." — Curiously enough, when the difficulty next appeared for consideration, upon the annexation of Louisiana by treaty in 1803 (see ANNEXATIONS, I.), the federalists opposed, and the republicans supported, the supremacy of the treaty power and the obligation upon the house to execute its arrangements. In 1819–20 (see COMPROMISES, IV.) the difficulty did not appear naturally, but was forced in, for it is not easy to see, in a treaty stipulation for all "the privileges of citizens" to the people of Louisiana, an obligation upon congress to admit any state government which they might form. The question was again unsuccessfully raised when the bills appropriating money for the Gadsden purchase in 1854 and for the Alaska purchase in 1867 (see ANNEXATIONS, V., VI.), came before the house. In future discussions of the question, however, it must be remembered that the final decision of the house to vote the money necessary for the execution of a treaty has never yet been made on the distinct ground of obligation to do so; expediency has so far been the only test. — In examining the question the reader will find most useful an opinion of Caleb Cushing and an article by Dr. Spear, both cited among the authorities; the former inclines toward, and the latter against, the supremacy of treaties over laws. — See authorities under CONFEDERATION, ARTICLES OF; 1 Lyman's *Diplomacy of the United States*, 190; Trescott's *Diplomacy of the Administrations of Washington and Adams*, 119; 4 Hildreth's *United States*, 522, 544; 1 Schouler's *United States*, 289; 2 Sparks' *Life of Gouverneur Morris*, 4; 1 Benton's *Debates of Congress*, 22, 458, 639; 1 Wait's *State Papers*, (2d edit.), 422, (Jefferson's report); 2 J. ALEXANDER JOHNSTON.

JEFFERSON, Thomas, vice-president of the United States 1797–1801, and president 1801–9, was born at Shadwell, Va., April 2, 1743, and died at Monticello, Va., July 4, 1826. He was graduated at William and Mary college in 1762, was admitted to the bar in 1767, was a member of the house of burgesses 1769–74 (see REVOLUTION) and of the continental congress 1775–8 (see DECLARATION OF INDEPENDENCE), and was governor of Virginia 1779–81. He served as minister, first to Europe in general and then to France, 1784–9, and became secretary of state at the formation of the constitution. (See ADMINISTRATIONS, I.) His subsequent public career is a part of the history of the party which he founded. (See DEMOCRATIC-REPUBLICAN PARTY, I.–III.) — An estimate of Jefferson's character and work involves much the same difficulties as in the case of his great rival, Hamilton. (See HAMILTON, ALEXANDER.) Each was opposed in his own way to the advance of that curious complication of conflicting forces whose sum makes up American political history, and each has had warm, and often unreasonable, assailants and apologists. But, as Jefferson's maintenance of individual liberty involved an opposition to the development of nationalization in the United States, his private and public character have been subjected to criticism more minute, merciless and bitter than has ever been applied to Hamilton's. His infidelity, his cowardice, his shiftiness, his love of theory and lack of practicality, his bigotry in applying his theories to his opponents and his looseness in applying them to his friends or to himself, and, above all, his responsibility for the doctrine of nullification, have been dealt with by hands more skillful than have ever attacked Hamilton. The country has, in one sense, been growing away from Jefferson and toward Hamilton, so that the latter has always been, and will always be, more sure of a sympathetic criticism from the abler class of critics than the former. — Jefferson's "infidelity" seems to have early settled down into a mild form of unitarianism, and his letters and those of President John Adams, show that the two were almost entirely at one in all essential points of religious belief. The different treatment of the two men, in this regard, by standard writers, is characteristic. In Adams' case, it is always slurred over as a matter interesting only to himself; in Jefferson's, the language of the orthodox New England clergy of his time is still the canon of criticism. The charge of cowardice rests only on his hurried escape from the British, while governor of Vir-

ginia. His responsibility for the doctrine of nullification is elsewhere considered. (See NULLIFICATION.) The charge of shiftiness and other bad qualities above specified rests on a different basis. It is really due to the needlessly high plane on which he set his political theory to work. His doctrine that every broad construction of the doubtful powers of the federal government is a violation of the organic law, is, in brief, *illegal*, was never recognized by his opponents or maintained in practice by himself or his disciples. The former recognized only expediency or inexpediency as a test of construction; and the latter, whenever they yielded in any degree to the irresistible current of events and relaxed their rule of action, laid themselves open to the charges of bigotry in applying their political theory to their opponents and of looseness in applying it to themselves. (See DEMOCRATIC-REPUBLICAN PARTY, VI.) — Before 1789 Jefferson's political work consisted in his authorship of the act for religious toleration in Virginia, and of the declaration of independence. After 1789 his work consisted in the organization of the democratic-republican party (which see). This last work deserves consideration from several different sides. 1. From the point of view of the individual it was almost wholly beneficent. The individual American citizen is very largely indebted to the spread of Jeffersonian ideas for his unrestricted right of suffrage, his voluntary religious status, and his active individualistic life, free equally from the control of classes and from sympathy with the prejudices of classes, to which Hamilton was strongly addicted. 2. From the point of view of the states its influence was mixed, good and bad. On the one hand, by maintaining between the individual and the national government the shield of a powerful series of state corporations, it protected the individual, simplified the work of the national government, and made its expansion over an enormous territory a possibility and a success. On the other hand, its secondary development was naturally into a state feeling for the sake of the state or of a section, not of the individual. (See STATE SOVEREIGNTY.) On the whole, in spite of the heavy weight of the war of the rebellion in the scale of evil, the good seems to have largely predominated. 3. From the national point of view the influence of Jefferson's work seems at first sight to have been wholly bad. It hampered the efficiency of the national government, indirectly endangered its existence by the development of the excrescence of state sovereignty, and in a variety of ways impeded the growth of a real national feeling. Nevertheless, even in this apparent evil, the good has predominated. If the growth of national feeling has been slower because of the adverse influence of Jeffersonian ideas, it has been all the healthier for it, and will last the longer. Rapid growth implies early decay, and it is almost equally reason for gratitude that the national idea has been established and that it has been established slowly and naturally. Again, while Jefferson's work could never have prevented the final establishment of nationality, it has succeeded in guarding under it the rights of the individual, for which the original Hamiltonian idea had comparatively little regard. (See NATION.) On the whole, the ultimate combination of the two forces could hardly be better stated than in the words of a writer in "The Nation" (cited under HAMILTON, ALEXANDER): "At the present moment Jefferson rules in the manner and after the methods prescribed by Hamilton. Hamilton's theory perished before the advance of democratic principles; but Jefferson utterly failed to destroy the wise system devised by his opponent."—Jefferson's *Works* have been twice collected The best and most comprehensive edition is that of H. A. Washington in nine volumes (1853); the most convenient is that of T. J Randolph, in four volumes (1829). The best *Life* is that of H. S. Randall (1858); see also Carpenter's *Memoirs of Jefferson* (1809). Rayner's *Life of Jefferson* (1834); Tucker's *Life of Jefferson* (1837); Smuckers' *Life and Times of Jefferson* (1839); DeWitt's (Church's trans.) *Jefferson and the American Democracy* (1862); Parton's *Life of Jefferson* (1874); Abbott's (or Lincoln's) *Lives of the Presidents;* 1 *Statesman's Manual* (for his messages); 2 Brougham's *Eminent Statesmen* (edit. 1854), 320, Parker's *Historic Americans*, 235; Cobb's *Miscellanies*, 5; *Atlantic Monthly*, January, 1862; *Lippincott's Magazine*, September, 1868, *National Quarterly Review*, March, 1875. The favorable view of Jefferson's work will generally be found in the authorities under DEMOCRATIC REPUBLICAN PARTY; the other side in the authorities cited under FEDERAL PARTY, see also Danvers' *Picture of a republican magistrate of the new school* (1808); H. Lee's *Observations on the Writings of Jefferson* (1832); Dwight's *Character of Jefferson, as exhibited in his Writings* (1839). For his private life see J. E. Cooke's *Youth of Jefferson* (1854); Pierson's *Jefferson at Monticello* (1862), S. N. Randolph's *Domestic Life of Jefferson* (1871), and his autobiography in his *Works*.

ALEXANDER JOHNSTON.

JOHNSON, Andrew, president of the United States 1865–9, was born at Raleigh, N. C., Dec. 29, 1808, and died in Carter county, Tenn., July 31, 1875. After holding various state offices, he served as representative from Tennessee (democratic) 1843–53, as governor 1853–7, and United States senator 1857–62. He was appointed military governor of Tennessee (see that state) in 1862, and in 1864 was elected vice-president by the republican party. He became president upon President Lincoln's death, and served until 1869. (For the political events of his administration see RECONSTRUCTION; FREEDMEN'S BUREAU; CIVIL RIGHTS BILL; TENURE OF OFFICE; VETO, IMPEACHMENTS, VI.; REPUBLICAN PARTY.) He was again elected United States senator in 1875, serving until his death. — President Johnson was an exceptionally favorable and fortunate specimen

of the southern "poor white." He was absolutely without the influences of early education until after his character had been fairly formed: it was only after his marriage that he was taught by his wife to read, write and cipher, and he then passed almost at once from the tailor's bench into politics. In this field he was steadily battling against "the aristocracy," from his first formation of a working-man's party in Greenville, Tenn., in 1828, up to the day on which, as president, he offered heavy rewards for the arrest of Jefferson Davis and the other alleged participants in Lincoln's assassination. To his mind the great work had then been done by the overthrow of the slaveholding aristocracy, and the status of the negro in the south was a question of almost as great difficulty as before. When congress undertook to reconstruct southern state governments, and to compel southern whites to recognize the political equality of the negro in the work, congress, in Johnson's eyes, took the place of oppressor upon the southern people which the "aristocracy" had held before the war, and he simply changed his opposition accordingly. It does not matter whether reconstruction by congress was accomplished wisely or unwisely: it is certain that President Johnson was eminently unfitted by nature, by education, and by life-long devotion to an entirely different object, to deal with the problem of reconstruction. The tone of his answer to the first negro delegation which met him after his accession to the presidency was sufficient to forewarn his failure, and to show the reason for it. Even his sincerity, his persistency, and a certain frankness which was often far from engaging, made him a more certain victim to the difficulties of his position. — See Savage's *Living Representative Men*, 347; Savage's *Life and Public Services of Andrew Johnson;* Moore's *Life and Speeches of Andrew Johnson;* Foster's *Life and Speeches of Andrew Johnson;* and authorities under articles referred to.

ALEXANDER JOHNSTON.

JOHNSON, Herschel V., was born in Burke county, Ga., Sept. 18, 1812, and died in Georgia, Aug 16, 1880. He was graduated at Franklin college in 1834, was admitted to the bar in 1837, was democratic United States senator from Georgia 1848–9, was governor of Georgia 1853–7, and received the democratic nomination for the vice-presidency in 1860 in place of Benj. Fitzpatrick, declined. (See DEMOCRATIC-REPUBLICAN PARTY, V.) He was in the senate of the confederate states, 1864–5.

JOHNSON, Reverdy, was born at Annapolis, Md., May 21, 1796, and died there, Feb. 10, 1876. He was admitted to the bar in 1815, was a whig United States senator 1845–9, attorney general under Taylor, democratic United States senator 1863–8, and minister to England 1868–9. (See ALABAMA CLAIMS.)

JOHNSON, Richard Mentor, vice-president of the United States 1837–41 (see DISPUTED ELECTIONS, III.), was born at Bryant's Station, Ky., Oct. 17, 1781, studied law, and became a colonel of volunteers in the war of 1812. He was a democratic representative in congress 1807–19 and 1829–37, and United States senator 1820–29. He was the democratic candidate in 1840 for vice-president, but was defeated. (See DEMOCRATIC-REPUBLICAN PARTY, IV.)

JOINT RULE. (See PARLIAMENTARY LAW.)

JOURNAL. (See PARLIAMENTARY LAW.)

JUDAISM. (See MOSAISM.)

JUDICIARY, Elective. The term judiciary is very generally used to designate the collective body of the judges. It is also used to designate that branch of the government in which judicial power is vested, and the officials serving thereunder. In this more comprehensive sense, in which the word will generally be used in this article, it would include sheriffs, coroners, justices of the peace, commissioners of jurors, marshals, constables, bailiffs, and all the clerks and other subordinates of the courts of every grade; and among them would be county clerks, and other keepers of judicial records. The keepers of land titles, as distinguished from the keepers of judicial records, can in no sense, perhaps, be regarded as judicial subordinates; yet it seems plain that the same consideration which should govern the selection of the latter should also prevail in the selection of the former. In a sense it may be said that the sheriff is an executive rather than a judicial officer; for he is to help preserve the peace, which is a part of the duty of the president—to take care that the laws are faithfully observed. The sheriff is also to arrest offenders, which is an executive act and yet the execution of a judicial order. In a similar sense it may be held that the judges themselves are but subordinates of the executive for executing the laws. Blackstone, the great commentator on English laws, thus views the matter, presenting the judges as representatives of the king for doing justice. Indeed, kings originally dispensed justice in person, and the judges were at first selected as their substitutes. In its last analysis the distinction between executive and judicial officers is lost in metaphysics. — The arguments for and against an elective judiciary strike deep both into the theory and into the practical effects of government. Mr. Mill declares ("Considerations on Representative Government," London, 1861, p. 31) that "all the difference between a good and a bad system of judicature lies in the contrivances adopted for bringing whatever moral and intellectual worth exists in the community to bear upon the administration, and making it duly operative on the result." Without much considering either theory or experience, we have in later years yielded with equal facility

to blind hopes of reform from mere change, and to cunning devices of partisans for attaining their own ends. The consequences have been disastrous. The great contrariety of methods which now prevails for selecting judges, and the serious abuses which exist in our judicial administration, equally illustrate the gravity of the question and the lack of well considered views in regard to it. — Considered upon theory, a fundamental and radical view of the matter which seems favorable to the election of judges would be this: that each department of the government alike should rest upon the direct approval of the people. The president and the governors, who are at the head of the executive departments, are elected, and they appoint their subordinates The members of the assemblies and the senates, which are at the head of the legislative department, are elected, and they appoint their subordinates. Why should not the judges of the courts—the heads of the other departments—who appoint their subordinates, be also elected? Yet neither the president nor the members of the national senate are elected by the people; and if the analogy as to the appointment of subordinates is to be followed, all the officials before named, subordinate to the courts, would have to be appointed or nominated by them, subject to confirmation by the senates, which would make appointive many judicial officers who are now elective. — But the view just considered overlooks other considerations quite as fundamental and far more important. Members of congress and of legislatures are representative officers sent to speak and act in conformity to the interests and opinions of sections and classes which they represent, not forgetting, however, the general welfare; and that because the great body of the people can not appear in their own behalf. These interests and opinions frequently change. The views of the majority must prevail. These views are generally expressed through a party. It is not, therefore, practicable to disregard the political opinion or the party of a representative official. A real representation is manifestly attainable only through popular elections and short terms of office. The representation would be all the more exact and complete if the official term were but a year; or but for six months, as was once the case in Connecticut and Rhode Island; or but for two months, as was for a time the fact in some of the Italian republics. So, too, the president and governors, as to a part of their functions, are representative officers, taking part in making the laws. For that reason they should be elected and for short terms. Other parts of the functions of those officers are not representative, but are strictly executive, and to a large extent are merely ministerial; involving the business details of the great departments, where the tenure of the inferior officers should be irrespective of party politics. The prostitution for party ends in this branch of executive duties has developed the demand for civil service reform. (See the article under this head.) — On these theories our national and all our earlier state constitutions were framed When we come to the judiciary the facts are widely different. There is nothing representative in its functions; nothing dependent upon majorities or party policies; nothing that should conform to mere opinions or interests, whether general or local. To interpret the laws according to their meaning and to adjudicate the controversies on the basis of principle and justice —absolutely, universally, continuously, in every part of the country and for every citizen irrespective of his peculiar opinions and interests—constitute the supreme duty and safety. For a judicial officer, in the discharge of his duty, to yield to the popular majority or to make a compromise based on the conflicting interests and opinions of the people, as a legislator may in many cases fitly do, is the beginning of corruption and despotism. The very nature of such functions, the need of conforming to fixed principles and of resisting all temporary interests and emotions—not less than the need of long experience for giving a steady, intelligent and consistent interpretation to the statutes—proclaim the utility of a stable judicial tenure—of long terms of office, if indeed any fixed term be provided. To stand upon the precedents and to give effect to the statutes according to their legal import, however the majority may clamor and whatever the interest of his section or his party, is the test and the glory of the true judge It is for the public interest, therefore, that the manner of his selection and the influences thrown about him should be such as most tend to develop a judicial frame of mind, and to make him stand more in fear of the common sense, of propriety and justice, than of any party or any combination of private interests. He whose duties require him to be impartial toward all, ought not to be able to see in the members of one party only those who voted for him, and in the other only those who voted against him. For these reasons, if the election of judges is defensible, it can hardly be on any ground of principle, but must be solely because, as matter of experience, the practical effects of that method of choice have been found beneficial — It may be said, irrespective of all such analogies, that to question the capacity of the people to select the highest officials of any kind is to distrust republican institutions. Without here considering what methods republican governments have provided in this particular, it is well to note an important distinction between judicial and other officers In the case of representative officers the decisive question, whether the candidates would be representative of the interests and opinions of the people, is peculiarly one of which the voters are the most competent judges. And whenever the qualifications and duties of an officer are such as fall within the common intelligence and experience of the voters, there are abundant reasons why their selection may be safely trusted to them. Such

would not seem to be the facts in the case of judges. No one but well educated lawyers of large practical experience, and of such none but those of a well balanced, candid judgment, (or to use a phrase which in itself illustrates the limitation intended), none but those of a "judicial frame of mind," are fit to be made judges. The wisest choice is limited, first, to the members of a single learned profession, and, next, to that portion of its members which, very generally, have qualities the least likely to arrest popular observation; and of which, persons of a high order of intelligence, who are likely to be presidents, governors and legislators, are (outside of the legal profession itself) by far more competent judges than the average voter. The average citizen may decide, intelligently, whether a given lawyer would be a good representative of his district, or can make an effective speech before a jury, or is a man of good reputation, but he can hardly form a very intelligent opinion as to his having that exact knowledge of the law and that sound judicial judgment which qualify him beyond his fellows for the bench. As a general rule it may be said that the lawyers, above the inferior class, having the more showy endowments by which the average citizens would be impressed, as well as those who are most likely to seek and gain popularity in partisan circles, are precisely those who are least likely to possess the qualities most needed on the bench. Though there are exceptions, yet, as a rule, those lawyers most competent to be judges are those who practice least before juries, where the people are present, and most in the higher courts, where the people are not present.— Looking at the matter, therefore, in the light of principle, and assuming that neither corrupt motives nor partisan coercion much affect the choice, it would seem that we should be likely to secure the better lawyers for judges by making their selections through appointments rather than through popular elections. When such vicious influences are powerful, the problem becomes exceedingly complicated. It is possible to conceive a state of facts under which, temporarily, the appointing power might be more demoralized than the public conscience, and therefore that unworthy men could be appointed judges when they could not be elected. The nearest approach to that state of facts, perhaps, was under the council of appointment many years since in the state of New York, and again during the domination of Tammany Hall, in New York city. Yet Barnard, Cardozo, McCunn and all the judicial officers of a lower grade, by which New York was disgraced, were elected by popular vote. No judges of capacity or character so low had ever reached the bench until many years after 1846, when judges were first made elective in that state. And if it be conceivable that a governor and legislature, or either acting alone, would have put such men upon the bench, it is certainly impossible that any worse could have been selected. That the wide-spread bribery and corruption of the voters by which, through popular elections, such men reached the bench, were far more disastrous than anything which would have attended the appointment of the same men, can hardly be doubted. And it is not conceivable as a continuing condition, or except under very anomalous circumstances, that the moral tone of those who would control nominations can be lower than that of those who would control the action of the party majorities, by which, after appointments have given place to popular voting, the choice of judges is almost invariably given these officers. Whenever in a community there is such independence of partisan bias and coercion that the voters will leave their party, or the judicial candidate of their party, in order to vote for a better candidate of the other party, or in order to vote for some better man of their own party than its convention has nominated, it is quite certain that the appointing power must be in worthy hands. The very causes which would produce a bolt from the nomination of a bad candidate, would secure the election of governors and legislators who would not venture to prostitute a power of appointing judges We are therefore, in this view of the matter, thrown back again upon the relative merits, intrinsically considered, of the two possible methods of selection. — If from theory we turn to practice, we find that almost the sole experience of an elective judiciary among the more enlightened nations is limited to this country, and to the last thirty-eight years. Yet at an early period most of the sheriffs in England were chosen by the inhabitants of the several counties, though some of them were hereditary. But tumultuous elections caused them to be made appointive in the time of Edward II., and such they have since remained. A statute of Richard II. (well worthy our consideration) provides that no person shall be selected by those having the appointing power for justices of the peace or sheriff, "that *such either privately or openly* to be put in the office, but only such as they shall judge to be the best and most efficient." Office seekers are thus made ineligible. Coroners in England have, from early times, been chosen for life by the freeholders of the county court, and upon this precedent our practice of electing coroners seems to have been based; though in England, as with ourselves, the popular election of such officers has been found as vicious in its effects as it is repugnant to all sound principles. No other judicial officers have been elective in Great Britain. — The inconsiderate facility with which judicial officers were first made elective in the early years of this generation, is a striking and significant fact in our politics. But the authors of the "Federalist" pointed out that, by reason of the few who can give intelligent consideration to judicial matters, changes could be made in the judicial department more easily than in the others. In 1787, when the federal constitution was adopted, each of the thirteen states, except Rhode Island and Con-

necticut which had retained their charters, were under constitutions of their own creation. The elections of judges, and (with slight exceptions) the elections of judicial officers of every grade, were unknown except in Georgia. In Massachusetts, Maryland and New Hampshire the judges were appointed by the executive. In New York and Pennsylvania the appointments were made by the executive and a council of appointment. In Delaware the executive and the legislature appointed. In New Jersey, Virginia, North Carolina and South Carolina they were appointed by the legislature. In South Carolina the legislature appointed justices of the peace and sheriffs, and in Georgia it appointed justices of the peace and registers of probate. The tenure was generally that of good behavior. The one striking exception to these general principles was the first constitution of Georgia, adopted in 1777, which contains very peculiar provisions. The legislature was a single body. Juries were made judges of both the law and the facts. No person could practice law without a permit from the legislature. The judges of the two higher courts were made *elective by popular vote for one year only.* This seems to be the first instance of the election of judges by popular vote, or of their being given a fixed term in this country. Two years later the term in Georgia was extended to three years and a state senate was created, but judges were left elective. The elective system did not give satisfaction, and it greatly divided public opinion. Before 1852 judges had become appointive by the legislature. In that year they were again made elective by the people. In 1861 it was provided that the governor should nominate and the senate confirm them; the highest grade holding for a term of twelve years. Georgia has not since made her judges elective.— The debates pending the adoption of the federal constitution, equally with its provisions, disclose a profound sense of the need of making the bench independent of the pressure of partisan and selfish interests. Neither the president, who is to nominate, nor the senators who are to confirm, are directly elected by the people. The judges are to hold their places "during good behavior," and they are to "receive for their services a compensation which shall not be diminished during their continuance in office." The general purity, efficiency and dignity of the federal courts, the high estimation in which they have been uniformly held by the people, as well as the indisposition to make any change in the method of selecting the federal judges, would seem to be the best test of principles upon which these courts are based. A proposition to make the judges of the supreme and other federal courts elective by popular vote would doubtless be received with something like universal repugnance; and few, probably, would think it could be carried into practice without serious danger to the government. — The partisan interests and theories which, during the last forty years, have caused so great changes in the judiciaries of the states, have produced obvious effects upon the federal courts. The federal judges in the territories have been made appointive for a term of only four years; thereby involving their tenure in presidential elections, and tempting them to take part in local politics; a temptation of which it is easy to trace the mischievous consequences in the judicial administration of the territories. It would seem to be plain that such a term of office, illustrating the advance of the spoils system in our politics, is repugnant to the spirit if not to the letter of the federal constitution, which declares that the judges, both "of the supreme and *inferior* courts, shall hold their offices during good behavior." Is not a territorial court an "inferior" court? The lamentable effects upon the federal judiciary, of bringing party politics upon the bench, and of state judges standing as candidates for political offices, is further illustrated in the apparent willingness of the late chief justice of the supreme court and of several associate justices in recent years, to be presented as candidates for the presidency. And when, soon after his appointment, Chief Justice Waite refused the use of his name as a presidential candidate, for the reason that it would compromise the becoming independence of his position, he displayed a high sense of duty and propriety which deserves more attention than it has received. When, in his letter of refusal, he inquired whether, "if he allowed his name to be used to promote a political combination," * * "he could, in all cases, remain an unbiased judge in the estimation of the people," and further declared that "there can be no doubt that, in these days of politico-juridical questions, it is highly dangerous to have a judge who looks beyond the judiciary to his personal ambition," he acted upon reasons which condemn the whole theory under which popular elections and short terms of office have made the judiciary of so many states responsive to political influence and party majorities. The causes which, in the last thirty-five years, have led to the selection of so many judges by popular elections and for short terms, were of slow growth. They need not be traced here; but see TERM AND TENURE OF OFFICE, and SPOILS SYSTEM. — Prior to 1820 the subordinate officers of the executive departments (with the single exception of marshals) had no fixed terms. In that year collectors, district attorneys and some others were given a term of four years. The change was made without debate and in obedience to a growing demand for more patronage, re enforced by increasing despotism in party management. Jackson's administration explained the significance of the changes. Under him, in 1832, Marcy of New York proclaimed, in the senate, the doctrine that "to the victor belong the spoils," which shows pretty clearly the spirit that was then being developed in his state. (See SPOILS SYSTEM.) In 1836 a four years' term was extended to all postmasters having a salary of $1,000

and over. This increased patronage but emboldened the demand for more places to fill, to which each of those laws was a surrender. Had not the provisions of the federal constitution been in the way, it may well be feared that the offices to which the four years term was extended would have been made elective. But why should not judges as well as postmasters and collectors have short terms? And since a state may be induced to elect them, why should they not, as well as legislators, be elected by the people? This was the logic of the patronage mongers and the spoilsmen. When urged by persuasive orators before popular audiences of farmers and lumbermen in the border states, it is by no means easy to resist. Nor is it much less effective with a large class of voters in the older states, when jointly urged by the lawyers who wish the ways easy and numerous to the bench, and by the politicians who seek more patronage to disperse and more frequent elections to manipulate. Judges were made elective in Missouri in 1820; in Mississippi in 1832; in Alabama in 1833; in each case for short terms; being for the presidential period of only four years in Mississippi. But the latter state, alarmed at the prospect, has since made her judges appointive. These dates indicate the development of those influences which introduced partisan proscription at about the same period into the executive service of the nation. It was natural that New York, where the spoils system was most developed, should be the first of the older states to commit her judiciary to popular elections and short terms. In 1846 she made her judges elective for the first time, and reduced the tenure of good behavior to a term of eight years. Various subordinate judicial officers were also made elective. The state was divided into eight judicial districts, and the judges were declared elective by popular vote separately in each of these districts. To careful observers the injurious effects of the new system very soon appeared, in a vicious partisan activity steadily increased, in judges who were greater politicians and lesser lawyers than had before been on the bench, and in more uncertainty in the law and less respect for the courts. The deplorable corruption in the judiciary of that state to which such abuses finally led, need not be described The purest and ablest of the judges, lawyers and statesmen of New York, and the great body of her more enlightened citizens, have joined in lamenting this introduction of judicial elections. They made an effort in 1873 to reverse the disastrous experiment, but partisan influence prevailed; though the term has been extended from eight years to fourteen; the districts have been reduced from eight to four; the highest court has been made permanent; and in New York city the elective system for inferior criminal justices was overthrown, and such justices have been made appointive; important steps back toward the original system for which public opinion in that state is steadily growing more favorable.

—On the occasion of the election in 1873 the association of the bar of New York city (composed of more than 700 of the leading members, after full discussion) adopted, by a majority of more than five to one, a statement of reasons why judicial elections had been disastrous and should be abandoned in that state, from which we make the following extracts: "The change to an elective system was not made because the people demanded it, or because the method of appointment in this state or elsewhere had developed any judicial abuses; for there was no such demand; and in the whole period prior to 1846 not a scandal had touched the character of a single New York judge in connection with his judicial functions." * * "When the elective system was submitted to the people in 1846, there was almost no discussion before them." * * "Judicial elections have, in our opinion, as a rule, been unfavorable to the selection of men of the greatest ability and attainments for the bench, and not less unfavorable to the prevalence of courage and fidelity in the discharge of judicial functions. The judicial canvass is in its very nature demoralizing; and the temptation is dangerously strong to make commitments unfavorable to justice. The judge who reaches the bench through a party contest at the polls, where one portion of the people support and the other oppose him, by no means finds it as easy to be impartial, nor do lawyers and suitors find it as easy to believe him impartial, as if he had been appointed by the governor and confirmed by the senate." * * "Such selections have also been prejudicial to learning and character among lawyers. Lawyers of inferior capacity, aspiring to the bench, have been induced to intrigue for caucus and party influence, and thus the more honorable conditions of professional advancement have been disparaged and neglected. Much in the same ratio in which inferior lawyers have been able to reach the bench, under the elective system, persons of small education and uncertain character have made their way at the bar." * * "The election of judges, by giving more offices to be made the subject of bargaining and intrigues by the managers of popular elections, has increased the number and power of those party mercenaries who live by the spoils of elections, and the same cause has aggravated the excessive power of the mere party majority." * * "It has been one of the results of our elective system"—responding to party majorities and local influences—"that our decisions have wanted consistency, and our whole judicial system has been fluctuating and feeble. In the period during which Massachusetts has had only eighteen supreme court judges, or judicial terms, and all England has had only forty-one in her three higher law courts, New York had had *one hundred and sixty* judges or judicial terms, in her supreme court, and *one hundred and twenty* in her court of appeals. And our excessive appeals and overrulings and reversals of decisions have been much in the

same ratio as compared with those of England and Massachusetts." * * "This system, to the knowledge of all of us, calls to the polls every vicious and criminal voter by all the direct interest he feels in his own safety for the past, and by his hopes of impunity for the future It appeals to the honest and virtuous voter only by a remote interest, or a mere disinterested sense of duty." — In the work of Mr. Mill, already cited, he says: "Of all officers of government, those in whose appointment any participation of popular suffrage is the most objectionable are judicial officers. While there are no functionaries whose especial and professional qualifications the popular judgment is less fitted to estimate, there are none in whose conduct absolute impartiality and freedom from connection with politicians are of anything like equal importance. The practice, introduced by some of the new or revised state constitutions of America, of submitting judicial offices to periodical popular re elections, will be found, I apprehend, to be one of the most dangerous errors ever committed by democracy." — Massachusetts, New Hampshire, Connecticut, Vermont, Rhode Island and New Jersey have never adopted the elective system; though Connecticut introduced a term of eight years for her appointive judges. New Hampshire has on two occasions—and apparently only in order to give the dominant party an opportunity to secure patronage—abolished its judicial system and created another into the offices of which the dominant party proceeded to put its favorites by appointment. Pennsylvania was but four years behind New York in yielding to the pressure for the election of judges; exchanging, in 1850, her appointments and her tenure of good behavior for popular elections and a term of eight years. The effects, only a little less disastrous than in New York, caused the term to be extended to twenty-one years in 1874. In 1875 Missouri, the first state after Georgia to adopt the elective system, was compelled for the same reasons to extend her judicial terms from six to ten years. Ohio also has felt the same influences. Her constitution of 1802 made her judges appointive by the general assembly for seven years. In 1851 the term was reduced to five years, and the judges were not only made elective but they were required to be residents of the district where they were elected. These facts sufficiently indicate the causes to which the change of system has been due and its effects, and we have not space for further particulars. It would be instructive, if we had space, to point out the uncertainty in the law, the increased litigation, the greater number of appeals, the loss of respect for the courts, and the incompetency upon the bench, which have been the consequence of these short terms and of popular elections. — There appear to be twenty-four states in which the judges are now elective by the people. The terms vary in length from two years in Vermont—though Vermont keeps her judges, by reappointments, a long time in office—to twenty-one years in Pennsylvania; the average length being about ten years. In most of the states where the judges are appointed, there is no fixed term, but a tenure of good behavior. Nearly all the recent changes in the judicial system where terms exist, have increased their length. Several states have within a few years returned to the method of appointment. The spirit of reaction against an elective political judiciary appears to be still on the increase. — There is one part of the system of popular elections, that of electing the superior judges in separate districts, which hardly fails to have a pernicious influence, for, while suggesting to the people the idea that judicial action should be representative, it also brings the judges into a dangerous dependence upon local interests and feelings. They are naturally expected by the people of their district to so interpret the law as to protect their part of the state. Some of the states have even required each judge to be a resident of the district where he is elected; as if he was, in a strict sense, a representative officer. This district system is unfavorable to the election of the abler men whose reputations are known over the whole state. A very ordinary lawyer may secure popularity in a district. It is of the utmost importance that the people should feel that the interpretation of the law and the principles of justice are the same not only at all times but in every part of the state, identical in spirit, uniform in administration, recognizing neither locality nor occupation. This local district system teaches the contrary. There is reason to think that not a few decisions made by these local judges, which have in so many instances been reversed on appeal, can be traced to the bias or the fears which have been caused by such local influences. Between such causes and the effects of short terms and of electing popular lawyers by popular votes, the proportion of appeals and of reversals of decisions in our state courts is not probably approached in the judicial procedure of any other enlightened nation. — It may be said in defense of the method of popular election, that no people under republican institutions can reasonably expect to secure judges, on the average, above the standard which the people regard as appropriate for the bench, and that, by allowing every man to vote, the result will represent that standard. Abstractly considered, this view has much force. But we have seen that there are peculiar reasons why the people generally are not likely to rightly estimate judicial qualifications. Besides, it follows, almost as a necessity, that the nominations for judges are made by the same party conventions which nominate representative officers, and that the election of both is, for that reason, generally dependent upon the same party management. The better class of voters who desire learned and able judges more than party victories, do not all belong to one party. They are kept from acting together, and their influence is divided and weakened by

the very process of putting the candidates in nomination. These facts, besides constantly teaching the people that a judge is both a representative official and a party candidate, tend to cause the members of one party to expect favor and the other to fear injustice from the bench where he presides. The very fact of the nomination being made by one party tends to cause a distrust of the candidate on the part of the members of the other. Many decisions involve, if not party questions yet the interests of party chieftains. Nor are these the only cases in which lawyers and their clients do not disregard the politics of a judge and the obligations implied in his election. In the case of an appointment, it is only a few and not the whole voting population that get heated and prejudiced from the method of the selection. And it is not only the people who by the very methods of election are drawn into distrusts and divisions, but the bar itself. Its members belong to the different parties; and on the platforms and at the polls the elective system divides them into advocates and opponents of the candidates before some of whom they are to ask impartial judgments for their clients, among whom the same divisions have been in the same way produced. That this false teaching has affected the public estimate of the relation which judges should sustain toward politics, can hardly be doubted. Where is the statesman among us who would dare put forward a candidate for a judge who was not of his own party? The nomination even of Mr. Conkling, the most intense partisan of his time, for the supreme bench, has just met with only moderate dissent. But in Great Britain, where an elective judiciary is unknown, Mr. Gladstone has just made Sir John Holker, the tory attorney general of Lord Beaconsfield, a lord-justice of appeal, with the approval of his own party. When the ordinary voter casts his ballot, the fit inquiries he makes are these: Does the candidate uphold the principles of my party? Will he protect the interests of my district? These questions he can properly answer. But, when among the same parcel of votes he finds one the wise and just casting of which requires him to disregard those principles and to rise above those interests, and to answer this question alone: Is this candidate an upright lawyer, having that learning, experience and judicial frame of mind which fit him for the bench? it will be fortunate indeed if he shall have both the freedom from party bias and the special information needed to answer that question properly. — It seems quite clear that during the period in which there was the strongest tendency to make judges elective and their terms short, there was also a tendency, stronger than ever before, to reduce the period of study and the scrutiny of examinations, required for admission to the bar and for graduation at the law schools. And, on the other hand, since the reaction against popularizing the judiciary, these periods of study have been generally increased and the examinations for admission to the bar have generally been made more severe. The law schools and the rules of court in the state of New York and the law school at Harvard university may, among others, be cited as examples of the true significance of the reaction. — It can not be doubted that the evils which have attended an elective judiciary, as well as the causes which have enlisted supporters for it, have been in an influential manner connected with the growth of the spoils system in our executive administration. The patronage of bestowing the subordinate appointments under the judges has been a chief object on the part of the partisan managers who have generally dictated the judicial nominations. We have no space for presenting the facts But in New York, and in varying degrees elsewhere, this patronage has been apportioned and made sure of before the nominations have been made. The tender of the nominations has been accompanied with a demand of the patronage, and without the pledge of it the nomination would be withdrawn. In New York the subordinate positions under the judges have been crowded with supernumeraries in order to make places for the dependents of great politicians and for those henchmen who were effective at the polls. The shorter the terms and the more compliant the candidate, the more abundant and valuable is this patronage to the party manipulators. We may be sure this evil and kindred abuses will increase with the growth of cities and the development of luxury. Already in New York there are good reasons for believing that judicial nominations have very recently been made upon the condition of the payment of a large sum into the treasury of the party making them. If the reform methods already shown to be practicable (see CIVIL SERVICE REFORM) shall be introduced, according to which real tests of merit, and not mere official favoritism and partisan influence, will secure entrance to these subordinate places, the zeal of parties for judicial elections would be greatly abated. It would then be far easier to return to the method of appointment, whereby the growing evils of too many elective officers would be diminished, at the same time that some of the most objectionable accompaniments of appointments would be removed. For, it is equally true that the patronage of these subordinate places has been the cause of what has been most objectionable and corrupt when judges have been appointed as well as when they have been elected. — The method of selecting judges by appointment has not been uniform. In several states they are selected by the legislature alone; in others they are nominated by the governor and confirmed by the senate; in others still they have been nominated by the governor and confirmed by the two houses of the legislature. Changes so frequent and methods so discordant are abundant proof that the whole subject needs careful study; and they make it probable that some better system

may yet be devised for separating the judiciary from party politics and active interests, while uniting the better men of both parties in common efforts for advancing the fittest lawyers to the bench. — Of all departments of the government the judiciary is that which needs to be most self-poised and most independent of party politics and temporary interests and excitements And yet, if it is not by popular elections made directly dependent upon such influences, it is by appointments made to rest upon the favor of presidents, governors and legislators, by whom those influences are, both in theory and in fact, represented. In other words, our appointments for one department stand upon the two others as a basis. The problem is to give the judiciary an independent foundation, and yet as far as practicable a non-partisan and non-representative foundation. There is also a great need of a more thorough supervision than we now have of the action of our judicial tribunals—of those of the lowest rank not less than those of the higher; and of the doings of sheriffs, coroners, marshals, constables, jailers, wardens, and of the whole prison system as well—the results of which should every year be presented in full detailed reports. The comparative expense and efficiency under each court and the other several classes of officers should be made public. Such reports would bring to light and hence defeat much extravagance, injustice and inefficiency. They would at the same time increase the official sense of responsibility. We have been treating the administration of justice, and especially the duties of subordinate judicial officers, as if they only concerned the localities. We have allowed something like secrecy and great confusion and injustice in our lower courts. May it not be practicable, especially in the larger states where the need will be greatest, to create a body which, in addition to performing these latter duties of supervision, shall be clothed with the authority (now accorded to governors) of making judicial nominations? It might also have the duty of presenting impeachments of judicial officers now given to legislative assemblies. It is very likely that strong objections will at first be made to so novel a mode of nominations. But it may be hoped that on reflection no objection can be sustained which would not be equally valid against a nomination by a governor, while various objections to the latter would be avoided. If such a body or board could be made up of three or five ex judges of the higher courts, (either to be elected, or to succeed to their places *ex officio*), with terms so arranged that changes in the board should be gradual, it would seem that nominations might be made that would be in great measure free from party politics and mere local interests. Men long trained to judicial habits would not bring the political ambition, spirit or dependence of a newly elected governor. It would also be possible, and largely upon the basis of English statutes, to greatly increase the peril of making appointments and removals for unjustifiable reasons. We have thus far treated the power of nomination rather as a perquisite than as a trust, (see REMOVALS), and from this cause have sprung grave objections to the appointment of judges, which it is quite possible to remove by adequate legislation. DORMAN B. EATON.

JUDICIARY (IN U. S. HISTORY). Under the colonial régime the judges held office at the king's pleasure. In Virginia, Maryland and New England the assemblies were at first the final court on appeal, and the New England assemblies for this reason assumed the special title of "the great and general court" (see ASSEMBLIES); but the crown ultimately succeeded in maintaining its right to appoint all the judges, though the assemblies retained the right to pay them. (See REVOLUTION.) When royal authority was overthrown, the control of the judiciary fell to the states. In Massachusetts, New York and Maryland their appointment was given to the governor and council; in the other states, to the legislature. There was no federal judiciary, and congress was dependent upon state courts for the definitive interpretation even of the articles of confederation. In territorial disputes between the states congress was itself a court, (see CONFEDERATION, ARTICLES OF, IX); and by the ordinance of April 5, 1781, congress established courts for the trial of piracies and felonies on the high seas; but there was no power in either case to enforce decisions. This lack of any general judicial power, extending throughout the states, and empowered to define the boundaries of federal authority and to enforce its decisions by federal power, was one of the most serious evils of the confederation, and there was hardly any opposition in the convention to the proposition for supplying it by the creation of the judiciary system of the United States. — I. ORIGIN. The "Virginia plan," as introduced, May 29, 1787, in the convention, proposed in its ninth resolution that "a national judiciary be established, to consist of one or more supreme tribunals and of inferior tribunals, to be chosen by the national legislature, to hold their offices during good behavior," and to have jurisdiction over all "questions which may involve the national peace and harmony." In committee of the whole, June 4, "the first clause, that a national judiciary be established, passed in the affirmative, *nem. con.*" June 13 the jurisdiction of federal judges was limited to "cases which respect the collection of the national revenue, impeachments of any national officers, and questions which involve the national peace and harmony"; and their appointment was given to the senate. July 18, it was proposed to give the appointment to the executive, with the advice and consent of the senate, as was finally decided; but this was lost, July 21, and the judiciary resolution went unchanged to the committee of detail, Aug. 4, except that congress was to appoint inferior judges. The report

of the committee, Aug. 6, did not essentially change the jurisdiction or constitution of the judiciary. It was not until the report of the committee of eleven, Sept. 4, that the judiciary took its present form: the appointment of the judges was given to the president with the confirmation of the senate; and the power of trying impeachments was taken from it and given to the senate. Its jurisdiction had previously been settled, Aug. 27, and was perfected by the committee on revision, appointed Sept 8. In their report it stands as it was finally adopted. (See CONSTITUTION, ART. III.) — In the constitution of the federal judiciary two points are to be specially noted, before considering its history and jurisdiction. 1. The supreme court itself was the only one which was imperatively called for by the constitution; inferior courts were to be such as "congress may from time to time ordain and establish"; but in all the courts the judges were to hold office during good behavior, and their salaries were not to be *diminished* during their continuance in office. Congress, by the judiciary act of 1789, organized the district and circuit court system of inferior tribunals, from which scarcely any essential departure has since been made. (See FEDERAL PARTY, I.) The territorial courts are not a part of the judiciary contemplated by the constitution, but are organized under the sovereign power of the federal government over the territories; their judges, therefore, hold office for a term of four years. There are also consular courts, held by American consuls in foreign countries, such as Egypt and China, which have sometimes even acted as courts of probate; but these are entirely out of the scope of any constitutional view, and if defensible at all can only be defended under the treaty power. 2. To create a judiciary, and even to assign to it a jurisdiction, did not seem sufficient to bind down the state courts which had hitherto been sole possessors of judicial powers. The constitution, therefore, further provides (in article VI.) that the constitution, and the laws and treaties made by virtue of it, shall be "the supreme law of the land, and the judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding." This, the most sweeping and energetic of the very few distinctly national features of the constitution, seems hardly to have been taken at its full measure by the convention itself. There was no such provision in the "Virginia" or nationalizing plan; it was first introduced in the "Jersey plan," June 15; and when brought up, June 27, by Luther Martin, then the most ultra of particularists, "was agreed to, *nem. con.*" Nor was there any more opposition to the two slight changes, Aug. 23 and 25, which brought the clause into exactly its present form. It seems to have been regarded mainly as a repetition of the *promise* of the states "that they shall abide by the determinations of the United States in congress assembled," which had been the only guarantee for the faithful observance of the articles of confederation. It would probably have amounted to no more than this but for the coincident creation of the federal judiciary. The conjunction, accidental or purposed, of the two provisions had an effect that could hardly have been anticipated. By defining *law*, as well as law courts, it vested in the federal judiciary the power to define the boundary line between federal and state powers, and bound the state judges to acquiescence. When the consequences became apparent, an instant revulsion followed. Jefferson and the whole democratic party at once denied the "power of the federal government thus to define its authority"; and on their accession to power in 1801 the "supreme law" clause became a practical nullity until toward 1820, when the judiciary, under the lead of Chief Justice Marshall, again began its assertion. It met with renewed opposition, which was gradually weakened until the close of the rebellion left the "supreme law" clause universally acknowledged as above stated. (See KENTUCKY RESOLUTIONS, CHEROKEE CASE, NULLIFICATION, PERSONAL LIBERTY LAWS.) However necessary it may be, it is certainly open to one criticism. The judiciary has always held that it can not interfere with the *political* exercise of power by congress or the president. It is evident, then, that there is a large class of cases in which the supreme court, by its own decisions, can not and will not act as the "interpreter of the constitution," (see STATE SOVEREIGNTY, SECESSION), and in these cases congress and the president must be the final judges of their own powers. The United States is thus practically made a national democracy, limited only by its own desire for representative institutions and for the preservation of state lines. To some minds this has always seemed a national tyranny; to others, the surest method of encouraging the political self-control of congress, the president, the state governments, and the national democracy itself. — II. HISTORY. One of the first subjects which claimed the attention of congress under the constitution was the organization of the judiciary. A committee to prepare a bill for that purpose was appointed in the senate, April 7, 1789, the day after the first permanent organization of that body. The first judiciary act became law Sept. 24, 1789. It provided for a supreme court, to consist of a chief justice and five associate justices, and to hold two sessions annually, in February and August, at the seat of government; for district courts, each to cover within its jurisdiction a state, or some defined part of a state, as the district of Maine in Massachusetts, or the district of Kentucky in Virginia; for circuit courts, each to cover within its jurisdiction several districts, to hold two courts annually in each circuit, and to be presided over by one of the supreme court justices and the district judge of the district; for a marshal and an attorney for each district; for an attorney general of the United States; and for forms of writ and process. This organization, produced without

any precedents as guides, has remained substantially unaltered to the present day. The number of supreme court justices has been gradually enlarged to nine, eight associate justices and a chief justice; a distinct class of circuit judges has been created; the territorial limits of the circuits have been variously modified; the number of districts has been increased from fifteen to fifty-three; but the organization is still the same. — The only doubtful point in the organization of the judiciary was, whether the circuit courts, presided over by supreme court justices, were "inferior courts," such as congress was authorized to establish. This, with other reasons, led to the passage of the act of Feb. 13, 1801, which organized a distinct class of circuit courts, with sixteen justices to preside over them. The appointees were federalists; their clerks and other officers were of the same party; and the whole bill was denounced by the democrats as a federalist scheme to provide offices for life for a number of federalist politicians who were now to lose all hold on power. The story that President Adams was kept busy until midnight of his last day of office in signing commissions under the act, seems to have given strength to the popular clamor for the removal of the "midnight judges." It was difficult to find a way to the removal, for the constitution distinctly provided that the term of all judges should be during good behavior. The democratic majority, however, decided that the official existence of the judges was bound up with that of their courts, and the act of March 8, 1802, got rid of the judges by abolishing their courts and restoring the old circuit court system. The ousted judges petitioned congress for employment or for pay, but were refused both. — Suits "between a state and citizens of another state" are placed by the constitution under the jurisdiction of the supreme court. Suits were at once begun in the supreme court against various states, but it was not until February, 1793, in the case of Chisholm *vs.* Georgia, that the court decided that such suits would lie against a state as against any other corporation. Georgia protested, and refused to appear; judgment by default was given for the plaintiff in February, 1794; but its execution was stopped by the adoption of the 11th amendment. (See CONSTITUTION, III.) The jurisdiction of the court was thus limited to suits in which a state is plaintiff and a citizen or citizens of another state defendants. — Among the last appointments of President Adams were those of certain justices of the peace in the District of Columbia which the incoming president, Jefferson, refused to complete. An attempt was made through the supreme court to compel completion of the appointments. In this case, Marbury *vs.* Madison (the secretary of state), the court laid down the rule, to which it has always adhered, that "questions in their nature political, or which are by the constitution and laws submitted to the executive, can never be made in this court." By observing this rule the judiciary has successfully avoided any clashing with the other departments of the government. (See EXECUTIVE, III.) — For the first thirty years of its history the federal judiciary came very little into contact or antagonism with state sovereignty or state courts. The first occasion of heart-burning was removed by the 11th amendment, and thereafter the supreme court carefully avoided any conflict until 1806, when, for the first time in our history, a state law was "broken." (See YAZOO FRAUDS.) The war of 1812 increased the national feeling so widely that the federal judiciary could not but reflect it. The first case which brought the change to clear view was that of Martin *vs.* Hunter's Lessee, in February, 1816. The 25th section of the act of 1789 had given a right of appeal to the supreme court from a final judgment of a *state* court in what are now often called "federal questions," that is, in questions whose decision invalidates any law or treaty of the United States, or upholds a state law claimed to be repugnant to "the constitution, treaties or laws of the United States." In February, 1813, the Virginia court of appeals refused to obey a mandate of the supreme court in an appeal of this kind, on the ground that no act of congress could constitutionally give any such right of appeal. Story's opinion in the above case in 1816, and still more Marshall's in the case of Cohen *vs.* Virginia, in February, 1821, upheld the constitutionality of the 25th section, and in doing so brought out for the first time to full view the "supreme law" clause of the constitution, with all its consequences. These, and the almost contemporary bank cases of McCulloch *vs.* Maryland, in February, 1819, and Osborn *vs* The Bank of the United States, in February, 1824, (see BANK CONTROVERSIES, III), roused immediate opposition. Their root doctrines were ably controverted by Judge Roane, of Virginia, in a series of articles in the Richmond "Enquirer," May 10–July 13, 1821, over the signature of "Algernon Sidney", were warmly dissented from by at least one of the supreme court justices; and organized opposition to them in several of the states was only checked by the overshadowing importance of the Missouri question. (See COMPROMISES, IV.) Nevertheless the federal judiciary swept on to the assumption of its full limits of power. In 1827, in the Ogden case, it overthrew the insolvency laws of the states; and in 1831 it brought the state of New York before it, at the suit of New Jersey, in order to decide a disputed question of boundary. In January, 1838, the "Democratic Review" thus angrily summed up the progress of the federal judiciary since the beginning of the century: "Nearly every state of the Union, in turn, had been brought up for sentence; Georgia, New Jersey, Virginia, New Hampshire, Vermont, Louisiana, Missouri, Kentucky, Ohio, Pennsylvania, Maryland, New York, Massachusetts, South Carolina, (Delaware just escaped over Black-bird creek), all passed through the Caudine forks of a subjugation which has more

than revived the suability of states. Beginning with Madison's case, there are nearly forty of these political fulminations from 1803 to 1834, viz.: one each in 1806, 1812 and 1813, two in 1815, one in 1816, four in 1819, three in 1820, two in 1821, two in 1823, two in 1824, one in 1825, four in 1827, five in 1829, three in 1830, two in 1832, two in 1833, and one in 1834; a great fabric of judicial architecture as stupendous as the pyramids and as inexplicable." The development was undoubtedly checked by the failure of the supreme court to compel obedience by Georgia in 1832 (see CHEROKEE CASE); but it was entirely arrested for a time by the political revolution in the court itself in 1835–7. In this brief space the seats of two associate justices and the chief justice were vacated by death or resignation, two new justiceships were created, and the appointments by Jackson and Van Buren completely changed the complexion of the court. In 1845–6 three new vacancies occurred which were filled by democratic appointments, and the court thereafter was rather a check than a provocative to the advance of the nationalizing spirit. (See NATION, III.; DRED SCOTT CASE.)—The outbreak of the rebellion in 1861 found the national government divided in politics: congress and the president were republican; the supreme court was unanimously democratic, and two of its members, Catron and Wayne, were from the seceding states of Tennessee and Georgia respectively. Nevertheless, except in one instance (see HABEAS CORPUS), there was no sign of variance; the same court which had pronounced the Dred Scott decision unhesitatingly upheld the power of the national government to prosecute war against the rebellion. (See INSURRECTION, I.) The circuits in the seceding states were suspended during the war and after its close until (in 1867) martial law had ceased to operate, for the obvious reason, as given by Chief Justice Chase, that "members of the supreme court could not properly hold any court the proceedings or process of which was subject, in any degree, to military control." Circuit courts were held by various district judges in seceding states, but the supreme court declined to consider appeals from them. — The first reconstruction act, as originally introduced, Feb. 6, 1867, prohibited the granting of writs of *habeas corpus* in the insurrectionary states without military permission; as passed, March 2, 1867, it contained no such provision, but reached much the same end by directing the punishment of disorders and violence to be by military commission. (See RECONSTRUCTION.) As the process of reconstruction went on, its leaders began to entertain more misgivings as to the possible action of the supreme court. One McArdle, in Mississippi, had obtained a writ of *habeas corpus* from a federal circuit judge to the military commission which was trying him. The circuit court refusing to discharge him, he appealed to the supreme court, and it seemed likely that the fate of the whole scheme of reconstruction would be involved in the final decision of the court. An act of congress was therefore passed repealing that section of the act of Feb. 5, 1867, which authorized such appeals in *habeas corpus* cases. The bill was vetoed, March 25, 1868, and passed over the veto. A bill also passed the house to forbid a declaration of the unconstitutionality of any act of congress by the supreme court, unless two-thirds of the justices should concur; but it failed in the senate. — The misgivings of congressional leaders had been unfounded. In December, 1868, the court fully sustained reconstruction by congress, in the case of Texas *vs.* White. It was already becoming republican in its sympathies by new appointments, and the continued control of the appointing power by the republican party made it progressively more so, until there is now (1882) but one democratic justice in the court, S. J. Field. In December, 1869, there was still some doubt as to the political leanings of the court. It then decided against the constitutionality of the action of congress, in 1862, in giving a legal tender character to the paper currency, but in March following, a new judgeship having been created by law and another new judge having been appointed to fill a vacancy, the legal tender question was again introduced, and the previous decision was reversed by the votes of the two new judges. In 1873, in the slaughter-house cases, the court began its construction of the war amendments, and upheld the validity of congressional action under them. This work it has not yet carried to its completion. (See CONSTRUCTION, III.)—The powers and duties of the district and circuit courts are great, but not extraordinary. Those of the supreme court can not be paralleled or approached by those of any other judicial body which has ever existed. The imagination of a lawyer of earlier times could hardly have soared to the ideal of a court empowered to wipe out at a touch the legislation not only of great states like New York, equal in population and wealth to at least a kingdom of the second class, but even of that which is now the most powerful republic, and will very soon be the most powerful nation, of the world. And the powers of the court are not based on its overmastering force, for it has always carefully avoided the use or even the suggestion of force. It is, said Marbois long ago, a power "which has no guards, palace or treasures, no arms but truth and wisdom, and no splendor but its justice and the publicity of its judgments" Its controlling influence, nevertheless, is firmly established, though very charily used. Congress and the president would resort to almost any expedient rather than have the supreme court formally pronounce against them; a law which this court has finally declared unconstitutional can be disobeyed or set at defiance with impunity all over the country, for no other court would allow a conviction under it; and, apart from both these considerations, the popular reverence for the court's wisdom and discretion is so deeply

fixed that its final decision has been sufficient, as in the case of the general election law in 1879, to control even the passionate feeling of a great national party. This influence is due not only to the distinguished ability of the members of the court, but to their invariable integrity, freedom from partisan feeling, and self-restraint. Throughout the whole history of the court there has never been the faintest suspicion upon the integrity of the supreme court justices; and this is equally true of the inferior courts, with the single exception of one district judge in Louisiana in 1872–3. (See LOUISIANA.) Nearly every justice has been prominent in politics before his appointment, and some of them, as Taney, Barbour, Woodbury and Chase, very actively; but all have dropped partisanship on entering the court. The drift of the court this way or that has been due to no desire for party advantage, but to the general cast of mind of its majority for the time being. Even the Dred Scott decision must fairly be ascribed to the honest conviction of the court. The self-restraint of the court has been equally conspicuous. Its greatest period of amplification, 1815–35, was not a usurpation, but a long delayed assumption of its legitimate powers; and since that time it has not hesitated to decide, again and again, in favor of states and individuals and against the federal government or even against the jurisdiction of the supreme court itself. — The chief justices have been as follows, with the dates of their appointments: John Jay, of New York, Sept. 26, 1789; John Rutledge, of South Carolina, July 1, 1795 (rejected by the senate); Wm. Cushing, of Massachusetts, Jan. 27, 1796 (declined); Oliver Ellsworth, of Connecticut, March 4, 1796; John Jay, of New York, Dec. 19, 1800 (declined); John Marshall, of Virginia, Jan. 31, 1801; Roger Brooke Taney, of Maryland, March 15, 1836; Salmon Portland Chase, of Ohio, Dec. 6, 1864; Morrison R. Waite, of Ohio, Jan. 21, 1874. The first associate justices, appointed Sept. 26, 1789, were John Rutledge, Wm. Cushing, John Blair, of Virginia, James Wilson, of Pennsylvania, and Robt. H. Harrison, of Maryland. The court is now constituted as follows: Chief Justice Morrison R. Waite, of Ohio, Jan. 21, 1874; Samuel F. Miller, of Iowa, July 16, 1862; Stephen J. Field, of California, March 10, 1863; Joseph P. Bradley, of New Jersey, March 21, 1870; John M. Harlan, of Kentucky, Nov. 29, 1877; Wm. B. Woods, of Georgia, Dec. 21, 1880; Stanley Matthews, of Ohio, May 12, 1881; Horace Gray, of Massachusetts, Dec. 20, 1881; Samuel Blatchford, of New York, March 13, 1882. Among the associates in the intervening period are the following: Wm. Paterson, of New Jersey, 1793–1806; Samuel Chase, of Maryland, 1796–1811 (see IMPEACHMENTS, II.); Bushrod Washington, of Virginia, 1798–1829; William Johnson, of South Carolina, 1804–34; Thomas Todd, of Kentucky, 1807–26; Brockholst Livingston, of New York, 1806–23; Joseph Story, of Massachusetts, 1811–45, (see his name); Gabriel Duval, of Maryland, 1811–36; Smith Thompson, of New York, 1823–43; John McLean, of Ohio, 1829–61; Henry Baldwin, of Pennsylvania, 1830–44; James M. Wayne, of Georgia, 1835–67; Philip P. Barbour, of Virginia, 1836–41; John Catron, of Tennessee, 1837–65; Peter V. Daniel, of Virginia, 1840–60; Samuel Wilson, of New York, 1845–72; Levi Woodbury, of New Hampshire, 1846–51; Robert C. Grier, of Pennsylvania, 1846–69; Benj. R. Curtis, of Massachusetts, 1851–7; Nathan Clifford, of Maine, 1858–82; David Davis, of Illinois, 1862–77; Noah H. Swayne, of Ohio, 1862–81. — III. SUPREME COURT. No attempt is here made to give the practice of the federal courts. For information under this head the reader is referred to the treatises cited among the authorities It is only intended to give a general idea of the jurisdiction of the court.—1. *Original Jurisdiction.* According to the 3d article of the constitution the court is to have original jurisdiction, that is, suits are to be *begun* in this court, in but two classes of cases, those which "affect" ambassadors, other public ministers, and consuls, and those in which a state shall be a party. Cases "affect" an ambassador only by personally concerning him. By the 11th amendment the state can only be a party as plaintiff; but the power to issue writs of error to state courts often brings a state before the supreme court as defendant. The judiciary act of 1789 undertook to give the supreme court further original jurisdiction in the issue of writs of mandamus, but the court itself, in the case of Marbury *vs.* Madison, decided that congress had no such power. — 2. *Appellate Jurisdiction.* This necessarily covers the original jurisdiction of the district and circuit courts, and cases under it come into the supreme court on appeal. It includes "all cases of admiralty and maritime jurisdiction; controversies to which the United States shall be a party; controversies between citizens of different states, and between citizens of the same state claiming lands under grants of different states;" and "federal questions," that is, "all cases, in law and equity, arising under this constitution, the laws of the United States, and treaties made, or which shall be made, under their authority." How far congress may also give to inferior courts any part of the supreme court's original jurisdiction, is an unsettled question. — The act of 1789 provided for the admiralty jurisdiction of the inferior courts; but it was long held that this extended no further than the ebb and flow of the tide. The growth of inland navigation began to suggest the idea that the admiralty jurisdiction should properly extend to navigable rivers and lakes also. In 1825, in the case of The Steamboat Thomas Jefferson, the supreme court, following English definitions, declined to assume any inland admiralty jurisdiction. The act of congress of Feb. 26, 1845, gave such jurisdiction, in cases of tort and contract, in the case of vessels of more than twenty tons engaged in commerce on lakes and navigable

waters between different states or with a foreign nation. In 1851, in the case of The Genesee Chief, the court upheld the act, and federal courts at once proceeded to act under it. Since that time, however, the court has swerved toward the opinion that the admiralty jurisdiction had never been limited to the ebb and flow of the tide; that neither the act of 1789 nor that of 1845 was intended as a restraining act; and that inland maritime jurisdiction is fully conferred by the constitution itself. This has been the fixed doctrine of the court since 1866–8. — The idea that the federal courts possessed a common law criminal jurisdiction was held by the first corps of supreme court justices, and was not formally disavowed for many years. (See ALIEN AND SEDITION LAWS.) Since 1810 the criminal jurisdiction of the judiciary has been limited to offenses against acts passed under such powers of congress as those to lay and collect taxes, etc., to regulate commerce, to punish counterfeiting and felonies committed on the high seas, and to govern the territories. (See CONSTITUTION, ART. I.; CONGRESS, POWERS OF.) The 14th and 15th amendments, which give congress power to enforce them by appropriate legislation, have enlarged the criminal jurisdiction of the judiciary also. — IV. CIRCUIT COURTS. The original jurisdiction of these courts comes under the appellate jurisdiction of the supreme court. From the final decision of the circuit court, when the matter in dispute exceeds the value of $5,000, an appeal lies to the supreme court. The amount was $2,000 until May 1, 1875, when it was increased by the act of Feb. 16, 1875. Patent and revenue cases are not limited as to amount involved. — The number of associate justices was originally five; was increased to six in 1807; was increased to eight in 1837; was increased to nine in 1863; was decreased to eight in 1865, and to seven in 1867; and was increased to eight in 1870. — Besides the associate justices of the supreme court, who, with the district judges, were to hold circuit courts, there is now a distinct class of circuit judges, nine in number. In each circuit, court may be held by the associate justice alone, by the circuit judge alone, by the two together, or by either one with the district judge. — Each circuit is composed of several states; the process of the court, however, is not limited by circuit lines, but runs everywhere throughout the territory of the United States. Territorial arrangements have varied from time to time. The following gives the number of the circuits in 1882, the states composing each, and the names of the associate justice and circuit judge of each: 1. Maine, New Hampshire, Massachusetts and Rhode Island—Horace Gray, John Lowell; 2. Vermont, Connecticut and New York—Samuel Blatchford, William J. Wallace; 3. New Jersey, Delaware and Pennsylvania—Joseph P. Bradley, Wm. McKennan; 4. Maryland, Virginia, West Virginia and North and South Carolina—Chief Justice Waite, Hugh L. Bond; 5. Georgia, Florida, Alabama, Mississippi, Louisiana and Texas—Wm B. Woods, Don A. Pardee; 6. Ohio, Michigan, Kentucky and Tennessee—Stanley Matthews, John Baxter; 7. Indiana, Illinois and Wisconsin —John M. Harlan, Thomas Drummond; 8. Minnesota, Iowa, Missouri, Kansas, Arkansas, Nebraska and Colorado—Samuel F. Miller, George W. McCreary; 9. California, Oregon and Nevada — Stephen J. Field, Lorenzo Sawyer. — V. DISTRICT COURTS. The territorial unit for these courts is in general still the state, but the growth of population, or other reasons, has caused the division of the following states into more than one district: Alabama, 3; Arkansas, 2; Florida, 2; Georgia, 2; Illinois, 2; Michigan, 2; Mississippi, 2; Missouri, 2; New York, 3; North Carolina, 2; Ohio, 2; Pennsylvania, 2; Tennessee, 2; Texas, 3; Virginia, 2; Wisconsin, 2 From these courts an appeal lies to the circuit court where the matter in dispute is of a greater value than $500, and a "federal question" is involved. — VI. TERRITORIAL COURTS. Though these courts are not strictly a part of the federal judiciary, as provided for in the constitution, an appeal lies from them to the supreme court. The history and practice of this class of judicial bodies will be found very fully treated in the case of Clinton *vs.* Englebrecht, cited among the authorities, to which the reader is referred. — VII. PROPOSED AMENDMENTS Space will not allow any consideration of the various changes which have been proposed in judiciary legislation, with a view to relieving the supreme court of some portion of its rapidly accumulating business. It is only designed to notice the amendments to the constitution which were proposed at various times in the first forty years of our history for the purpose of vitally altering the constitution of the judiciary. No such change has been seriously proposed since 1840. — 1. The failure of the Chase impeachment (see IMPEACHMENTS, II.) brought out the following amendment, proposed in the house by John Randolph, March 1, 1805: "The judges of the supreme and all other courts of the United States shall be removed by the president, on the joint address of both houses of congress, requesting the same, anything in the constitution of the United States to the contrary notwithstanding." It was postponed to the following session, was again introduced Feb 24, 1806, but was never brought to a final vote. It was reintroduced in the house, Jan. 29, 1811, by Wright, of Maryland, but the house refused to consider it; again in the senate, March 18, 1816, by Nathan Sanford, of New York, but without success. — 2. The revival of the "supreme law" clause by the supreme court, heretofore referred to, caused the introduction in the senate, Jan. 14, 1822, by Richard M. Johnson, of Kentucky, of the following amendment: "That in all controversies where the judicial power of the United States shall be so construed as to extend to any case in law or equity, arising under the constitution, the laws of the United States, or treaties made, or which shall be made, under their author-

ity, and to which a state shall be a party; and in all controversies in which a state may desire to become a party, in consequence of having the constitution or laws of such state questioned, the senate of the United States shall have appellate jurisdiction." The amendment was not brought to a vote. Johnson's speech upon it, as cited among the authorities below, is a very convenient résumé of the cases up to its date in which the federal judiciary had come into conflict with the states. — 3. Propositions were made in the house, Jan. 28, 1831, and Jan. 24, 1835, to amend the constitution by limiting the term of office of federal judges; but the former was voted down, and the latter was not considered. These ended the attempts to change the basis of the existence of the federal judiciary. ALEXANDER JOHNSTON.

JULIAN, George W., was born near Centerville, Indiana, May 5, 1817, was the free-soil candidate for vice-president in 1852, was a free-soil congressman 1849–51, and a republican congressman 1861–71. A. J.

JURY, Trial by. The jury system, both as a judicial and as a political institution, is one of the most conspicuous features in the modern state, and it is peculiarly the offspring of the English people. It has been carried into the remotest parts of the earth and established there by Englishmen, and in those parts of the civilized world into which it has not been introduced by them, it has been established by others, who confessedly adopted it from England. Our own writers have made the system of trial by jury the subject of extravagant praises, and those of other peoples have lauded it as one of the foundations of English greatness and of English liberty. De Tocqueville, for instance, says, "If it had been as easy to remove the jury from the manners as from the laws of England, it would have perished under the Tudors; and the civil jury did in reality, at that period, save the liberties of England." Other writers have in like manner exalted it, and at every new distribution of political power on the continent, trial by jury has been specified as one of the rights of the people, the introduction or extension of which has been most loudly demanded. — There have been many theories of the origin of the jury, which need here only to be referred to; they are elaborated in the works the titles to which are given at the end of this article. From them it will be seen that the jury has been derived from the institutions of the Greeks and Romans, as well as from the earliest tribunals of the Teutonic peoples, and that analogies have been carefully drawn between it and the ancient Scandinavian assemblies. Blackstone thinks it was in use "among the earliest Saxon colonies"; it was long popularly supposed to have been established as a completed institution by Alfred the Great, and it has been traced to the *assises de Jerusalem* of Godfrey de Bouillon, and thought to have been introduced into England by the Normans. Without considering any of these theories, and without undertaking to fix the very time or place of the origin of the jury system, it will be sufficient for the purposes of this article to begin with that in its history which is certain, and to give a brief account, I., of its development from that point; II., of its present form, III., of its extension; and IV., of its advantages, its evils and the remedies for them. — I. *History.* The jury was undoubtedly developed from the early judicial customs of the Teutonic peoples, and can be directly connected with the system of compurgation which prevailed among the Anglo Saxons. Its positive history may be said to begin with a trial between Gundolph, the bishop of Rochester, and Pichot, one of the king's sheriffs, of the title to certain lands in Kent, of which the ownership was in dispute between the king and St. Andrew. This is the first case of which we have any record, in which the decision was rendered by a limited number of suitors, or *pares curiæ*, upon oath. From the record it appeared that the king commanded that all the men of that county, Kent, should be convened, in order to decide which had

the better title. But they, being intimidated by the sheriff, affirmed it to be the land of the king rather than that of St. Andrew. The bishop of Baieux, the king's justiciary, however, did not trust to their decision, and commanded, that if they knew what they said to be true, they should select twelve of their number, who should confirm by their oath that which all had said; but the twelve, after they had retired to consult and had been alarmed by a message from the sheriff, swore on returning, that what they had already said was true. And so the land remained in the king's hands. But in the same year, a monk by the name of Grim came to the bishop, and, having heard what the twelve had sworn, with wonder and detestation asserted that they were all of them perjured. For Grim himself had been the overlooker of the lord of Fracheham, and had taken services and customs for that manor, and had had one of those who had so sworn under him in the same manor. This was communicated by the bishop of Rochester to the bishop of Baieux, to whom Grim gave the same account. The justiciary then caused one of those who had so sworn to come before him, who, when he had come, falling at the bishop's feet, confessed his guilt. Another, who had sworn the first, made the like confession. The rest of the jurors were then, by the order of the bishop as justiciary, sent to London. All being assembled at London, it was adjudged both by French and English that all the twelve were perjured. On this condemnation the bishop of Rochester had his land again. It appears also, from this account, that twelve others *de melioribus comitatus* were called to account for having confirmed what the others had sworn, and that when these affirmed that they had not agreed with those who had so sworn, the bishop said they should prove their assertion by the ordeal of iron; this they promised to do, but being unable to perform their promise, were by the judgment of the county fined in the penalty of £300 to the king. (*Textus Roffensis*, Thorpe. 31.) Mr. Forsyth insists that the twelve here were merely compurgators, while Mr. Starkie thinks the case a precedent which must have had much weight, and which established if it did not introduce the trial by jury. The weight of authority, as well as the apparent probabilities of the case, indicate that the practice or custom described in the foregoing account was the beginning from which that institution which was incontestably the trial by jury was developed by the Norman lawyers during the time of the Plantagenets. — The next landmark is the treatise of Glanvil, which was written about 1187. Glanvil speaks of trial by ordinary assize and *jurata patriæ* as forms of trial already in existence, and thus describes the grand assize which has been recently established as a method of trying the title to land, rights of advowson, and claims of vassalage. "This," he says, "is a certain royal benefit bestowed upon the people and emanating from the clemency of the prince, with the advice of his nobles—*regale beneficium clementia principis populis indultum*. So effectually does this proceeding preserve the lives and civil condition of men, that every one may now possess his right in safety at the same time that he avoids the doubtful event of a duel. This legal institution flows from the most profound equity * * *; by so much as the testimony of many credible witnesses in judicial proceedings preponderates over that of one only, by so much greater equity is this institution regulated than that of the duel; for, since the duel proceeds upon the testimony of one juror, this constitution requires the oaths of twelve lawful men at least." (Glanvil, lib. ii., c. 7.) He then continues to describe the workings of the grand assize as follows: "When the assize proceeds to make the recognition, the right will be well known either to all the jurors, or some may know it and some may not, or all may be alike ignorant concerning it. If none of them are acquainted with the truth of the matter, and this be testified upon their oaths in court, recourse must be had to others until such can be found who do know the truth of it. Should it, however, happen that some of them know the truth of the matter and some not, the latter are to be rejected, and others summoned to court, until twelve at least can be found who are unanimous. But if some of the jurors should decide for one party, and some of them for the other, then others must be added until twelve at least can be obtained who agree in favor of one side. Each of the knights summoned for this purpose ought to swear that he will neither utter that which is false nor knowingly conceal the truth. With respect to the knowledge requisite on the part of those sworn, they should be acquainted with the merits of the cause, either from what they have personally seen and heard or from the declaration of their fathers, and from other sources equally entitled to credit as if falling within their own immediate knowledge."— From this description it is clear that at this time the jurors of the grand assize were mere recognitors, that is, that they were to deliver their verdict upon their own knowledge of the facts in question. In order to obtain the required unanimous verdict of the twelve, resort was had to the practice of afforcing, by which was meant, dropping jurors who were ignorant of the facts in cases of disagreement, and adding others in their stead, until twelve were obtained who were unanimous. Afforcement, however, appears to have very early fallen into disuse, and there was some doubt whether thereafter the verdict should be rendered by a majority of the original jurors—as was done, for instance, in one case in 20 Edw. III., in which C. J. Thorpe took a verdict from eleven of the jurors, for which, however, he was reproved—or whether a unanimous verdict was required, which latter rule seems to have become established during the reign of Edward III. The names of those who were to serve on the grand assize being known beforehand, endeavors to make sure of a favorable verdict were naturally to be anticipated, and in proof of this fact it is to be no-

ticed that three different statutes of Edward III. are directed against the bribing of jurors. — The precise time of the establishment of the grand assize is not known, but the use of recognition by twelve or more witnesses is provided for in the constitutions of Clarendon, 1164, in cases of dispute as to the title of lands between a layman and a clerk, and the statute of Northampton, 1176, provides for the recognition of the claims of heirs before the itinerant justices. The grand assize was, it has been suggested, only the technical form of the *jurata patriæ*, which was a form of trying the title to lands by the swearing as to the same by the whole community, and afterward by a number selected from the community. Certainly the distinction between the *jurata patriæ* and the grand assize seems to have been very early lost, and both became known as the jury. With the establishment of justices in Eyre and the increasing number of suitors who resorted to the king's courts, the grand assize superseded the ordinary assize referred to by Glanvil, and recognition of facts in the manner described by him became part of its regular business. Trials in these courts were both by assizes and juries, but the former gradually fell more and more into disuse, although as a distinct manner of trial it existed until 1838, and was only abolished by 3 and 4 Wm. IV., c. 27. — The writers succeeding Glanvil are Bracton, Britton, and the author of Fleta, by each of whom the jury of the assize is further described. Bracton, stating the grounds for exemption from service on the jury, says, that the same causes which disqualified a man from testifying were good grounds of objection to his serving on the assize, and he enumerates as such, conviction for perjury, serfdom, consanguinity, affinity, and enmity or close friendship with the other party; and he continues, the objections having been disposed of, the jury were sworn and retired to consult upon the verdict, and until they had agreed no one was allowed access to them. If they could not agree, new recognitors, equal in number to the minority, were added, and the verdict was then rendered by the twelve who were found to agree. If, however, any of the jurors were ignorant of the facts of the case, others who knew the truth, were added in their stead, and the truth was then declared. Down to the time of the writers last mentioned the jurors were, as we have seen, mere recognitors deciding upon their own knowledge. The next step forward consisted in adding to their own knowledge that of others, thus making the jurors judges of evidence; but before considering this, it is proper to examine the jury for the presentment and trial of criminals. Its origin is not clear, but from the time of Henry IV. its development is marked by stages which correspond to those in the history of the assize It has been supposed that a law of Ethelred, which is still extant, was the source both of this and of our whole system of jury trial. That law reads as follows: "Et habeantur placita in singulis Wapentachiis; et exeant seniores xii. tayni et prepositus cum eis, et jurent super sanctuarium quod eis dabitur in manus quod neminem innocentem velint accusare vel noxium concelare et omnis infamatus homo vadat ad triplex ordalium, vel reddat quadruplum." But while the whole jury system can not be traced to this statute, as some writers seem to have supposed, the jury provided for by it may certainly be considered the foundation of the subsequent grand jury. The criminal jury has also been traced to this statute, but not definitely, and while its origin may not be determined, its history, says Mr. Stubbs, from the year 1166 is clear, and he continues: "By the assize of Clarendon, inquest is to be made through each county and through each hundred, by twelve lawful men of the hundred and by four lawful men of each township, by their oath, that they will speak the truth. By these, all persons of evil fame are to be presented to the justices, and then to proceed to the ordeal. If they fail in the ordeal, they undergo the legal punishment; if they sustain the ordeal, yet as the presentment against them is based on the evidence of the neighborhood on the score of bad character, they are to abjure the kingdom. The jury of presentment is reduced to a still more definite form, and receives a more distinct representative character in the assizes of Northampton, and in the articles of visitation of 1194 In the latter capitulary the plan used for nominating the recognitors of the grand assize is applied to the grand jury, for so the body now constituted may be termed. In the first place, four knights are to be chosen for the whole county, who by their oath shall choose two lawful knights of each hundred or wapentake, or, if knights be wanting, legal and free men, so that these twelve may answer under all heads concerning the whole hundred or wapentake. The heads on which they answer include not only the assizes which have been already referred to in connection with the jury, but all the pleas of the crown, the trial of malefactors and their receivers, as well as a vast amount of fiscal business. The latter development of these juries does not fall under our present inquiry, but it may be generally stated thus. At an early period, even before the abolition of ordeal by the Lateran council of 1215, a petty jury was allowed to disprove the truth of the presentment, and after the abolition of ordeal that expedient came into general use. The further change in the character of the jurors by which they became judges of fact instead of witnesses, is common to the civil and criminal jury alike." (Stubbs' "Constitutional History of England," vol. i., chap. xiii.) — We have now only to follow the course of that change. The first step toward it was, as has been seen, the addition of witnesses to the jury. The verdicts of both the jurata and the assize were in the beginning based exclusively upon the personal knowledge of the jurors. Naturally, however, each juror must have more or less supplemented his own knowledge by that of his cojurors. This would be espe-

cially true in cases where the issues were complicated, and the appreciation of this inevitable fact very soon created two apparent exceptions to the rule that verdicts were rendered only upon the personal knowledge of the jurors. These were, first, the trial *per patriam et testes*, which had become a common practice during the reign of Henry III., in cases where the question was of the existence of a deed; and, second, the trial *per sectam*, which appears to have grown up between the time of Glanvil who does not mention it, and of Bracton who describes it. The trial *per patriam et testes* was at first allowed only in cases where deeds were in dispute, and it grew naturally from the early practice of deciding such cases by single combat, in which one of the attesting witnesses served as the plaintiff's champion. When the single combat fell into disuse, the writ to the sheriff, in those cases which had formerly been decided in this manner, commanded him to summon the witnesses named in the deed, which had been brought into court, together with a certain number of witnesses, to make recognition as to the fact in dispute. Subsequently merchants and traders were in like manner allowed to prove the fact of payment or of debt, *per testes et patriam*. The trial *per sectam* was where a party had made his claim *inde producit sectam, i. e.*, offered to produce a number of witnesses who had been present at the transaction in dispute, to sustain his position. If the defendant could then produce a greater number of *secta*, he had his cause; if not, he lost it: but if he offered any other defense than a denial, such as a deed, then the plaintiff was not allowed to offer rebutting *secta*, but the trial must be had *per patriam*, or *per patriam et testes nommatio in carta quam*, etc These exceptional methods of trial prepared the way for the change from mere recognition by the jurors on their own knowledge, to the system in which the jury ceased to be witnesses, and gave their verdict upon the evidence submitted to them by others. The first step toward this important change which can be clearly distinguished, is the adjoining of the witnesses to the jury, in the twenty-third year of Edward III. This was for the purpose of assisting the jury by means of the knowledge of the witnesses so adjoined. The latter, however, had no voice in the verdict, which was to be accepted even though it was opposed to the evidence of these witnesses. The range of the jury was thus greatly extended; and although the jurors still decided on their own knowledge, and were still, therefore, taken from the vicinage, this enlargement of the sources of their knowledge carried with it some important consequences. First, the educating influence of service on the jury was greatly increased by requiring jurors to draw conclusions from the testimony of others. Second, it was the foundation for the law of evidence. Very early, great care had been found necessary to exclude from the consideration of the jury all improper or corrupted evidence. This was done by requiring the evidence to be given in the presence of the court, and subsequently by the establishment of rules respecting its production. This change began probably very soon after witnesses were adjoined to the jury, as is shown by the report of a case in the eleventh year of Henry III., in which a verdict was set aside because a jury, on retiring to consider their verdict, had taken with them an escrow which had neither been proved in evidence nor delivered to the court. A third consequence of this enlargement of the functions of the jury was the creation of a field of activity for the advocate. With the handling of witnesses and the construction of their testimony for the juries, came the opportunity for the whole of the lawyer's forensic activity. Finally, it is to be noticed that through this change the cruel practice of attainting the jury fell into disuse. Attainting the jury was the only means of obtaining a new trial in cases of a mistaken or corrupt verdict. Twenty-four jurors were summoned to try the truth of the former verdict, and if they found the former jury to have rendered a false verdict, all of its members were arrested and imprisoned, their lands and chattels forfeited, they became no longer "oathesworthe," says Bracton, and at one period it was provided that their wives and children should be turned out of their homes, and their houses and fields destroyed—a punishment which, however, was subsequently commuted by a pecuniary penalty. So long as the verdict of the jurors was rendered solely on their own knowledge, a verdict which was false must have involved perjury, and these severe punishments were perhaps justifiable; but when the verdict might, if wrong, be merely in consequence of a mistaken view of the evidence of the witnesses, such punishment became manifestly excessive. Some attempts to punish jurors under color of attaint were made under the Tudors, and the system of attaints was then expressly repudiated; but although it had long fallen into complete abeyance, it was not abolished until 6 George IV. After its disuse the means of correcting mistakes in a verdict were left unprovided for until the seventeenth century, when the introduction of new trials afforded a remedy, and the first of these of which we have any record was in 1665.—The last step in the history of the development of the jury, is the limitation of its functions to rendering a decision solely upon the evidence submitted to it by the witnesses, and in eliminating the traces of the original functions of the jurors as recognitors and mere witnesses. The principles which necessitated such a change it has been said are obvious: the discovery of the truth was made more difficult, rather than more certain, by the fact of the residence of the jurors in the neighborhood of the disputed fact, and the rules as to venue grew after awhile so complicated and troublesome that it became desirable to get rid of them. The number of hundredors on the inquest was altered from time to time, and finally the laws requiring jurors to be summoned from the hundred or vicinage were abolished in all civil actions by 4 and 5 Anne,

c. 16, and 24 Geo. II., c. 18, and the jurors were thereafter drawn from the whole county. These statutes, says Mr. Starkie, are indirect authorities for the position that jurors should not still render verdicts on their knowledge of the facts. The granting by the courts of new trials, on the ground that the verdict was against evidence, is a direct authority to the same effect. In the first year of Anne's reign this transition may be said to have been completed and clearly defined by a decision found in 1 Salk., 405, to the effect that if a jury give a verdict of their own knowledge they should so inform the court *that they may be sworn as witnesses*, and that they ought fairly to tell the court that they had evidence to give as witnesses, before they were sworn as jurors. — We have thus arrived at the existing form of the jury. Resting upon the earliest legal institutions of the Teutonic races, it was at first a body chosen for its special knowledge of the facts in dispute, the members of which decided those facts upon their personal knowledge of them. Next, witnesses were added, and the jurors decided upon the evidence given by them as well as upon their own personal knowledge. Finally, the witnesses were separated from the jury, and the jurors became thereby the judges of the evidence of witnesses, and found their verdict solely from such evidence. — The origin of the rule that the verdict of the jury, both in civil and criminal cases, should be unanimous, lies in the fact that the jurors were at first only witnesses. The opinion of twelve was fixed as the least amount of evidence which would be accepted as final, and the jury was afforced until at least twelve agreed. In what manner *twelve* came to be selected as the requisite number, admits perhaps of no more scientific explanation than that offered in the "Guide to English Juries, by a Person of Quality," published in 1682, and ascribed to Lord Somers. The author says: "In analogy, of late the jury is reduced to the number of twelve; like as the prophets were twelve to foretell the truth; the apostles twelve, to preach the truth; the discoverers twelve, sent into Canaan to seek and report the truth; and the stones twelve, that the Hierusalem is built on; and as the judges were anciently twelve to try and determine matters of law; and always when there is any waging law, there must be twelve to swear in it." — II. *Present State of the System.* The jury, the growth of which has thus been outlined, was cherished by the English colonists who brought it hither, as one of the dearest of their institutions. It was in general use during the colonial period, and it is expressly protected by the 5th, 7th and 8th amendments to the constitution of the United States, and in the constitutions of most of the states. From these constitutions, and from the statutes passed under them, it appears that in this country the system of trial by jury in criminal cases is universal, and that while in civil causes it is generally used, it may, in most of the states, be waived upon the consent of the parties. Four distinguishing elements also are manifest. — 1. The jury must be composed of twelve persons. It is, however, provided in Arkansas, Colorado, Connecticut, Indiana, Iowa, Kentucky, New York and Texas, that the parties may agree upon a smaller number in certain cases. In several of the states, also, provision is made for a jury of six in the justices' and county courts, and the constitutions of Georgia, Colorado, Louisiana and Michigan declare that the legislatures of these states *may* provide for a jury of less than twelve, but of this power no use has been made. — 2. The jury must be drawn from the vicinage — the district or county within which the trial is held — and from the whole number of the qualified citizens not expressly exempted by statute. The origin of the rule as to vicinage has already been given. The statutory definitions of those qualified to serve are, generally, that a juror must be in possession of his faculties and of fair character and intelligence. In some states a property qualification is also required. It seems clear from these statutes that jury service is a duty due from the citizens to the state, which the state may exact from all, and which it does exact from the largest possible number. Certain persons are exempted because their occupations are either necessary to the public or are of such a nature that they can not be delegated, or that they can not be withdrawn from them without great loss. These exemptions include, generally, all public officers, active professional men, teachers, telegraph operators and firemen; and the exemption laws in many states throw a curious and suggestive light upon the progress and pursuits of their people. Such, for instance, are those in the west, exempting one miller to each grist mill, and a ferryman to each ferry, in the east, exempting factory employés, bankers and police; in New York, exempting employés upon the canals; and in Kentucky the disqualification of any one as a grand juror who within six months preceding has for a reward stood a horse, jack or bull. In the states of Kentucky, Oregon and Maryland, the statutes declaring who may be summoned still speak only of *white* persons. These provisions, however, have been made practically nugatory by the decisions of the United States supreme court in Strauder *vs.* West Virginia, 100 U. S. 303, Virginia *vs.* Rives, 100 U. S. 313, Ex parte Virginia, 100 U. S. 340; and Neal *vs.* Delaware, 103 U. S. 370. These cases declare the civil rights bill constitutional, and hold that, under it and the 14th amendment, it was a right of colored men, when charged with criminal offenses, to be tried by a jury indifferently selected without regard to the color of the jurors. The decision in Ex parte Virginia goes further, and decides that the enjoyment of this right by colored criminals renders it necessary that colored men shall be called to serve, and thus indicates that jury service is to be considered not only as a duty which may be exacted by the state, but as a privilege which may be claimed by the individual. — 3. The verdict of the jury must be unanimous. This is the invariable rule

in criminal cases; generally also in civil cases; but in California three-fourths may render a verdict in such cases, and in Louisiana "if nine or more agree upon a verdict it shall be recorded." The historical origin of the requirement of unanimity has been given, but it appears now to be arbitrary and unreasonable, and the tendency of the better professional opinion seems to be clearly in favor of a modification of the rule. The law writers and philosophers have been unsparing in its condemnation. Hallam speaks of it as "a preposterous relic of barbarism"; Bentham disapproves of it; the common law commissioners in 1830 said, "It is difficult to defend the justice or wisdom of the rule"; and, in his "Fundamental Constitution of Carolina," Locke declared, "that it should not be necessary for a jury to agree, but that the verdict should be according to the opinion of the majority."—4. The jury must be impartial. This is of its essence. It is in the main sought to be accomplished by the manner of selecting the jurors, and by giving to the parties the right of challenging the jurors chosen. *First.* Manner of selecting jurors. The method of selecting ordinary jurors is invariably by some form of lot. Lists of jurors are prepared by designated county officers, and from these lists county or court officers select the panel required, usually by drawing the requisite number of names from a box containing all of those upon the prepared list. The particular arrangements, however, are various, and minutely regulated in each state by statute. The complaints and criticisms of the jury system arise largely from the execution of these statutes, and in several of the large cities a class of hangers-on about the court houses, and of disreputable attorneys, have become known as "jury fixers." They pretend to be, and in many cases undoubtedly are, able, through political influence or open bribery, to secure the impaneling upon a jury of one or more persons through whom a disagreement or verdict may be obtained. It need only, however, be pointed out that such results are attained through the evasion or breach of purely administrative laws. Such abuses furnish an argument for the purification and reform of the civil service of that locality in which they occur, but they have nothing whatever to do with the merits or demerits of the system of trial by jury. In 1879 congress sought to provide a remedy for some of the alleged evils in the selection of jurors in the United States courts, by enacting that all jurors should be "publicly drawn from a box containing the names of not less than 300 persons, * * *, which names shall have been placed therein by the clerk of such court and a commissioner to be appointed by the judge thereof, which commissioner shall be a citizen of good standing, residing in the district in which such court is held, and a well known member of the principal political party in the district in which the court is held opposing that to which the clerk may belong, the clerk and said commissioner each to place one name in said box alternately, without reference to party affiliations, until the whole number required shall be placed therein." The effect of this law, as was well said by Gen. Garfield in the debate upon its passage, is "to put into the jury box a man recognized as a political partisan, and then another beside him recognized as belonging to another political party, to administer justice." While it is difficult to ascertain accurately how such a statute really operates, it seems to be the fact, that in certain political cases, such as those for the violation of the election laws, it amounts to a legalization of "jury fixing." Nevertheless the general adoption of such a system as is provided for by this statute has been urged as a remedy for the packing of juries. But it is an aggravation, not a remedy. *Second.* The right of challenging. Challenges may be made, First, to the array, which is an objection to the entire panel as arranged by the officers in charge because of some error or partiality in obtaining the panel, which must, from its nature, necessarily affect all the jurors obtained. Second, to the poll, for which the causes are: 1st, *propter honoris respectum*, as when a peer is summoned, which does not exist in the United States; 2d, *propter defectum*, which may arise from a lack of the statutory qualifications; 3d, *propter affectum*, which may arise from partiality on account of relationship, from an interest in the result of the trial, from conscientious scruples in capital cases, or from declarations of opinion as to the result; 4th, *propter delictum*, or conviction of a crime. In some states all challenges are decided by the court; in others, triers are appointed by the court, usually two in number, to try whether the jurors challenged "stand indifferently." Third. Peremptory challenges. It is provided that any person on trial for a capital offense or other felony, and, in some states, also for a misdemeanor, shall be entitled to challenge peremptorily, without assigning any cause, a fixed number of jurors. — Under this head of securing impartiality in the jury there are also to be noticed special provisions in some of the states, such as that in New York providing for a "foreign jury" in cases where a claim involving a general interest of the inhabitants of a particular place or county is to be litigated, and it is thought that an impartial jury can not be had in that county or in the neighboring county. In such cases a jury from another county can be obtained, upon sufficient proof of the circumstances. Such also is the provision for trial by a jury *de mediatate linguæ*, which may still be had in Kentucky. This is a jury one-half of which must consist of aliens, and may be had whenever one of the parties is an alien. It originated in a charter of Edward I. providing for the safety of foreign merchants sojourning in his realm, and was abolished in that realm by the naturalization act in 1844. With these safeguards thrown about the system it is next provided in Arkansas, California, Colorado, Connecticut, Iowa, Kansas, Kentucky, Massachusetts, Michigan, Minnesota,

Nebraska, New Jersey, New York, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, the Virginias, and in the United States courts, that a jury may be waived in all civil cases upon the consent of the parties, which must usually be written, and filed with the clerk of the court. In Florida and Missouri a jury may be waived in cases of misdemeanor as well as in civil cases, in Indiana it may be waived in all cases not capital, and in Maryland in all cases. A provision in Connecticut for the waiver of a jury in criminal cases was repealed in 1878. — That which has thus far been said upon the present state of the jury system is applicable mainly to the petit or trial jury. There is also to be considered *The Grand Jury*. This, in criminal cases, presents by an indictment an accusation against an offender, to a court having jurisdiction to take proceedings for his arrest and punishment. The members of the grand jury are drawn by the sheriff or other county officer, and are usually twenty-three in number. Having listened to a charge by the judge, they retire to consider the complaints, and hear the witnesses produced before them. They are the exclusive judges of the evidence submitted to them, and twelve of them at least must agree that it makes out a *prima facie* case against the accused, before the grand jury can find a "true bill," as it is called, against him. If they deem the evidence insufficient for this purpose, they "ignore" the bill. The prosecuting officers of the county present the indictments, with the testimony in support of the same, to the grand jury, and are allowed to be present and advise them, except when they are taking a vote. The proceedings of the grand jury are secret. The constitutions or statutes of the states all provide that no person shall be held to answer for a capital or otherwise infamous crime unless on presentment or indictment of a grand jury. The origin of this rule has been seen. In England, especially during the Stuart reigns, it proved to be another and valuable safeguard for the liberty of the individual, and in times of great popular excitement it might still prove to be necessary as such, with us. It seems now, however, to be cumbersome and generally superfluous. As a matter of fact the duties of the grand jury are substantially performed by the district attorney; and if the inferior magistrates empowered to commit offenders deserve any confidence at all, it should be unnecessary to have the grand jury again go over the ground which has already been covered by them, in order to put an accused person on his trial. — *Coroners' Juries*. It is provided that whenever any person shall have been found dead or dangerously wounded, the body must remain untouched until the arrival of the coroner, who shall then summon a jury of twelve, or of between nine and fifteen persons, from among those qualified for jury service in that county, but who must not be related to the deceased or to his slayer, if he be known or suspected. The jury thus impaneled must then, together, view the body, after which they retire and take testimony as to the manner of the death or wounding. They shall then return a written verdict setting forth the time and place at which the deceased or wounded came to his death or was wounded, who he was, at whose hands it came about, and all the circumstances concerning the same. If any of these facts shall remain unknown to the jury, they shall set that forth. In England a person accused by the coroner's jury may be put on his trial at assizes without further indictment. In Massachusetts the office of coroner has been abolished, and in other states, and especially in large cities, a strong feeling exists that some much more efficacious method may be devised of determining the cause of death, and the identity of the criminal, if there be one, than by the machinery of the coroner and his jury. — *The Special Jury*. This, says Blackstone, was "originally introduced in trials at bar when the causes were of too great nicety for the discussion of ordinary freeholders." Generally in this country where it is made, on proper affidavits, to appear to a court that a fair and impartial trial by jury of an issue of fact can not be had, or that the importance or intricacy of the case demands a special jury, the court will order such a jury to be struck. This is done by the selection, by some county officer, in the presence of the parties or their attorneys, of forty-eight persons from those upon the jury lists. He must select those whom he considers most indifferent to the parties, and best fitted to decide the cause, and from this number the parties strike off alternately the names of proposed jurors until but twenty four remain, from which list the trial jury is then selected in the usual manner. Trials by a special jury are seldom granted; that of Tweed in New York is the most notable recent instance. — *Sheriffs' Juries* are impaneled by that officer to try the title to goods seized by him when they are claimed by a third party. Sheriffs' or special juries are likewise granted in proceedings *de lunatico inquirendo*, and in most of the states also, under certain special laws, such as that to inquire into the value of property claimed as exempt from execution under the homestead acts, and to inquire into various questions of fact arising under laws relating to highways. *A Jury of Matrons* was formerly impaneled upon a writ *de ventre inspiciendo*, in cases where a widow was supposed to intend to defraud the next heir, by claiming falsely to be with child, for the purpose of determining whether she was or not, and also in cases where a female under sentence of death claimed to be pregnant. In the latter case a jury of physicians, as in New York, is now usually provided for. — From the time of Queen Anne, at least, the province of the jury has been to decide the facts in issue upon the evidence of the witnesses, and to render a statement of their decision, called a verdict, *vere dictum*, to the court. In criminal cases this may be partial, finding the accused guilty on some counts and acquitting him

on the rest, or finding one of several accused guilty, and acquitting the others. A general verdict pronounces upon all of the issues, and a special verdict finds only the facts, leaving the court to decide which of the parties should receive judgment, and the courts of most states may direct a special verdict, which must be in writing. The verdict being rendered may be set aside by the court if contrary to the evidence, or if the court holds it to be for an excessive amount, in civil cases. With the growth of democratic ideas there has been a manifest tendency to make the juries in criminal cases the judges of the law as well as of the facts. And in several of the states of the Union they are expressly made such, in cases of libel. This provision has a common origin with the English libel act of 1792, providing that the jury may in libel cases render a general verdict of guilty or not guilty upon the whole matter put in issue, which sprang from Lord Mansfield's celebrated charge and judgment in Rex *vs.* Woodfall, and the ensuing discussion thereon. Our provisions, however, are much broader than Fox's act. In some of the United States—Georgia, Louisiana, Maryland, and optionally in Minnesota—in all criminal cases the jury are to be the judges of both law and fact, a provision which, in Illinois at least, has been practically annulled by the supreme court of that state, and the repeal of which has been actively urged. In Indiana the province of the judge has been further encroached upon by a provision giving to the jury which convicts an offender of a capital offense, the right to decide whether he shall be punished by death. — III. *The Extension of the Jury System into Foreign Countries.* In Scotland the jury seems to have been established at as early a date as in England, but though preserved in criminal it was very early discontinued in civil cases. In criminal cases the Scotch jury has always consisted of fifteen persons, a majority of whom may render a verdict, which need not be "guilty" or "not guilty" as elsewhere, but may be "not proven," which releases the accused while it brands him with the accusation. The civil jury was reintroduced into Scotland by 15 George III., c. 42, in a special court established for the purpose. That court has now, however, been abolished, and the civil jury is used as in England, except that if the jurors fail to agree within six hours they must be discharged. In Ireland the jury is substantially the same as in England, and when provision was made in the repression bill of 1882 for trials in certain cases without juries, the Irish judges met and passed resolutions protesting. In the island of Jersey the grand custoumier of Normandy is still the authority, and some curious features prevail. The petit jury in criminal cases consists of policemen, and an appeal may be taken from their verdict to the grand enquete or jury of twenty-three. — In France. The national assembly declared, April 30, 1790, that there should be a jury in criminal cases, and that there should not be a jury in civil cases. Since that time the principle of trial by jury has remained settled, although almost numberless changes have been made in the features of the system by some sixty different laws on the subject. At present there is no civil jury except *en matiere d'expropriation*, and in criminal cases trial may be had by jury only in cases of felony. There is no grand jury; the verdict of the trial jury is rendered by the majority, and may be accompanied by a recommendation to mercy. No person can serve upon a jury who has not reached thirty years of age and is not in the full enjoyment of his civil and political rights. — In Germany. The jury was introduced by the French into the Rhine lands during the revolution, and has been, with many fluctuations, confirmed and extended in criminal cases since that time. It was established in Prussia in 1819, and again by the constitution of 1848, and by the law of June 3, 1849, but political offenses were withdrawn from its operation in 1851. The system was also adopted by Bavaria and Hesse in 1848, by Würtemberg and Baden in 1849, and by Austria in 1850. With the agitation of the question of a common criminal procedure for the new empire, the abolition of trial by jury was seriously considered. Prussia first proposed the substitution of sheriffs' courts in its stead, but this had to be relinquished, in consequence, as one writer naively remarks, of the overwhelming prejudice of the "non-jurists" — the people — in favor of the jury system. Finally, by sections 79–99 of the *Gerichtsverfassungsgesetz* all criminal offenses except treason, political crimes, and offenses of the press, are made triable by jury. — In Belgium the jury has existed since the separation from Holland, and it is especially provided by the constitution that political offenses and those of the press shall be tried by jury. — In Switzerland all crimes against the confederation are to be tried by jury. For other crimes each canton has its own machinery; in Geneva, the most important, the jury is in vogue, and a verdict is permitted of "guilty under extenuating circumstances" and "guilty under very extenuating circumstances." The jury system has, of course, been established in all the colonies of Great Britain substantially as in the mother country, and is in use in all the South American republics. It was introduced into Greece in 1834, and is guaranteed by the constitution of 1844. It was also established in Portugal in 1837. It has been introduced into Spain, into Italy, into Brazil, and finally into Russia, where the first trial by jury was held Aug 8, 1866; and in each of these countries the verdict is rendered, as in France, by the majority. — IV. *Advantages of the Jury, its Evils and the Remedies* In summarizing the advantages of the jury system it is to be said, that as a political institution the jury has been, and still is, a necessary and most efficacious guaranty against the arbitrary exercise of power; that it diminishes the inevitable antagonism between the government of the state and its individual members by increasing the par

ticipation of the latter; that jury service is one of the duties of citizenship the performance of which best fits men to enjoy the privileges thereof, since it imposes upon individuals a sense of responsibility which directly educates their sense of personal dignity and self-respect. As a judicial institution the jury secures the publicity of the administration of justice, which is one of the safeguards of its purity. A number of ordinary men chosen as jurors are, it is thought, better judges of the ordinary facts of life than any judge or bench can be—a fact which is expressed in Lord Campbell's remark so often quoted of Lord Mansfield's juries at Guildhall, "He learned from them the usages of trade, and in return he took great pains in explaining to them the principles of jurisprudence by which they were to be guided."—The jury is also claimed to be a most valuable if not necessary protection for the individual against great impersonal corporations by which so much of the business of the world is coming to be done; and finally, it obviates the consequences of a rigid application of the logical rules of law; it "relieves against the procrustean application of legal technicalities." On the other hand, it is asserted that the jury affords an opportunity for bribery and corruption which is constantly used; that the practical workings of the jury system are so bad that those persons who still have faith in it are theorists, who really know nothing about it; that it is a source of vast and useless inconvenience to business men; and that in all cases where corporations are concerned its verdicts are hopelessly biased. When we come to the remedies, however, the statements are less precise. The radical remedies which have been proposed look toward the complete abolition of the jury, and the substitution therefor of benches of judges, from whose decision, it is even said, there should be no appeal, but most of these propositions ignore the fact that the jury is a great historical institution, which is everywhere closely interwoven with the whole fabric of the society and the government of English peoples, and that it can not, therefore, even if it be true that it has had its day, be dealt with thus lightly. Most of these propositions, also, are characterized by a certain petulance, and obviously proceed not from a view of the whole system, but from the observation of its operation in a particular instance or in a particular locality. By way of a demonstration of the absurdity of the system as it now is, these propositions have often been prefaced by a supposition of what the views of a learned oriental would be when the jury was first explained to him, and this, although it is tolerably clear from the last thousand years of the world's history, that the views of "a learned oriental," upon any governmental topic, though sometimes interesting, are not of importance. It is further to be remarked, that most of the criticism of the jury system proceeds from the great cities where the conditions of life and society are abnormal, and would, as it is easy to see, affect any substitute for the jury quite as unfavorably as they are said to affect the jury itself. Furthermore, as has already been pointed out, much of that criticism is misdirected; it should be applied to the administrative laws, to the manner of their execution, and to the view of their duties which is taken by the people themselves. With the segregation of occupations, and the close attention which every man is compelled to give to his own, individuals find that jury service is an inconvenience and a cause of pecuniary damage; and in New York, at least, they embark in almost open corruption to escape from it. But they find every other public service equally inconvenient. So, through the natural division of labor, the whole business of politics has fallen into the hands of a class as distinct as that of those engaged in any other pursuit, and it may be that, in like manner, the public will have in time to be relieved of the duty of jury service; but the approach of that possibility has nothing to do with the workings of the jury system. From the cloud of criticisms, however, just and unjust, some measures may be concluded to be remedial and desirable. 1. The amendment of the laws relating to the drawing of jurors, so as to place that operation under officers immediately responsible to the judges. 2. The vesting in and exercise by the judges of a wider discretion to excuse jurors from jury service on the grounds of their personal inconvenience. 3. The establishment in the cities of courts of arbitration of three or more judges. 4 Allowing verdicts to be rendered by three-fourths or two thirds of the jury, either absolutely, or if, after a certain number of hours, the jurors fail to arrive at unanimity. 5. Allowing persons committed by magistrates to be put on their trial without further indictment. 6. The abolition of coroners' juries, or else their elevation by making their findings of guilt equivalent to indictments by a grand jury. Such changes, or some of them, may be wise, and would be accepted as desirable. It is, however, beyond question that the very great preponderance of the best opinion is decidedly in favor of the maintenance of the jury substantially as it now exists, and it is impossible to rise from a survey of the whole system without being impressed with the soundness of the conclusions of Mr. Justice Miller, of the United States supreme court, who, in an address before the New York state bar association in 1878, remarked, "It is probably wise that no man shall be convicted of an infamous crime until twelve fair-minded men are convinced of his guilt. I am also forced to admit, however, that even in civil cases my experience as a judge has been much more favorable to jury trials than it was as a practitioner. And I am bound to say that an intelligent and unprejudiced jury, when such can be obtained, who are instructed in the law with clearness and precision, are rarely mistaken in regard to facts which they are called upon to find." Nor would it be possible to conclude such a survey without full concurrence in the admirable language of Lord Coleridge, who, in charging the grand jury at Exeter,

said, in words which are as applicable and as true in America as they were in England, "I think it unwise, in a complicated state of society like ours, to look at things in themselves alone, and without considering what bearing they have upon the whole machinery of society. The interests of a great number of persons in the discharge of justice, the education to a certain extent which the jury system affords to a large number of persons in our community, is a matter that is far too much lost sight of; and I should think, for my own part, that if it were true that in particular cases a better result might have been arrived at by the single judgment of a judge, than by the united judgment of a judge and jury—if that were so, upon which I express no opinion for the moment—I should say that the advantage was ill purchased by the separation of the general mass of the people from any share in the administration of our courts of justice. I believe that much of the satisfaction which I hope and trust does exist with our administration of justice as a whole, and with all its faults—for, like every other human institution, it has its faults —may to a great extent be traced to the large infusion of what I may call the popular element, and the popular element in the administration of our system of justice is the jury." — BIBLIOGRAPHY. FREDERICK W. WHITRIDGE

JUSTICE. In the most general acceptation of the term, justice is a moral virtue which leads us to render to every one that which is his due, and to respect the rights of others. The term is sometimes used as synonymous with fullness of right and reason. It is used especially to designate the act of recognizing the rights of a person; and, more particularly, in the language of politics and administration, it is used to indicate the exercise of the power to declare the right, to pass sentence, and, if need be, to inflict punishment. — The Roman law defined justice to be, the constant and perpetual disposition to render every man his due. This is the definition of justice which has been most generally accepted by jurisconsults and publicists. — We may now inquire whether there is a natural justice anterior to all positive law, or whether express laws are necessary to create moral qualities. These questions which men have differed on, both in antiquity and in our own times, belong entirely, as d'Auguesseau rightly says, to the domain of the metaphysics of jurisprudence; and we need not concern ourselves with them when treating not of man in the savage state, but of man in society. — It is certain that men can not live in society without their interests and their passions causing difficulties and differences between them, difficulties and differences which the parties interested can neither properly weigh nor settle. Hence the necessity that some power be instituted to solve these difficulties and settle these differences. This power may be exercised by the father of the family, by elders, by the chiefs of the tribe, by lords or princes, by peoples or kings; it may be exercised directly or by delegates for that purpose; but the power is necessarily found in every country. — The right to administer justice is one of the attributes of sovereignty. It is both a right and a duty. — Justice emanates from the people or the sovereign, according to the form of the government. Hence the old legal formula, *de par le Roi*, by order of the king, a formula which Bentham treated as insignificant, when he demanded that its place should be taken by the nobler form, *de par justice*, by the order of justice. — There are political schools which distinguish the judicial power from the executive power and the legislative power. But if all are agreed in considering the distinction between the legislative power and the executive power, a distinction to be found in the constitutions of nearly all modern states,* as

* Notably is this the case in the constitution of the United States and the constitutions of the several states of the Union. Says Judge Cooley, the eminent American jurist (Constitutional Limitations, p. 34): "Certain things are to be looked for in all these instruments [the constitutions of the several states of the American Union]. We are to expect * * * that the usual checks and balances of republican government, in which consist its chief excellencies, will be retained. The most important of these are the separate departments for the exercise of legislative, executive and judicial power; and these are to be kept as distinct and separate as possible, except in so far as the action of one is made to constitute a restraint upon the action of the others, to keep them within proper bounds, and to prevent
